

## ADM809-5S/L

### FEATURES

**Specified over Temperature**  
**Low Power Consumption (17  $\mu$ A)**  
**Precision Voltage Monitor: 3 V, 5 V Options**  
**Reset Assertion Down to 1 V  $V_{CC}$**   
**30 ms Min Power-On Reset**  
**Logic Low  $\overline{\text{RESET}}$  Output**  
**Available in SOT-23 and SC70 Packages**

### APPLICATIONS

**Microprocessor Systems**  
**Computers**  
**Controllers**  
**Intelligent Instruments**  
**Automotive Systems**

### GENERAL DESCRIPTION

The ADM809-5S/L supervisory circuit monitors the power supply voltage in microprocessor systems. It provides a reset output during power-up, power-down, and brownout conditions. On power-up, an internal timer holds reset asserted for 55 ms. This holds the microprocessor in a reset state until conditions have stabilized. The  $\overline{\text{RESET}}$  output remains operational with  $V_{CC}$  as low as 1 V. The ADM809-5S/L provides an active low reset signal ( $\overline{\text{RESET}}$ ).

The reset comparator features built-in glitch immunity, making it immune to fast transients on  $V_{CC}$ .

The ADM809-5S/L consumes only 17  $\mu$ A, making it suitable for low power portable equipment.

\*Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum ratings for extended periods of time may affect device reliability.

## CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADM809-5S/L features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION

$t_1 = \overline{\text{RESET}} \text{ TIME} = 55\text{ms TYP.}$   
 $V_{\text{REF}} = \overline{\text{RESET}} \text{ VOLTAGE THRESHOLD}$

## INTERFACING TO OTHER DEVICES' OUTPUT

The ADM809-5S/L is designed to integrate with as many devices as possible and therefore has an output dependent on  $V_{CC}$ . Because of this design approach, interfacing this device to other devices is simplified.

## ENSURING A VALID RESET OUTPUT DOWN TO $V_{CC} = 0$ V

When  $V_{CC}$  falls below 0.8 V, ADM809-5S/L's  $\overline{RESET}$  no longer sinks current. A high impedance CMOS logic input connected to  $\overline{RESET}$  may, therefore, drift to undetermined logic levels. To eliminate this problem, a 100 k $\Omega$  resistor should be connected from  $\overline{RESET}$  to ground.

Figure 3. Ensuring a Valid  $\overline{RESET}$  Output Down to  $V_{CC} = 0$  V

## BENEFITS OF A VERY ACCURATE $\overline{RESET}$ THRESHOLD

In other microprocessor supervisory circuits, tolerances in supply voltages lead to an overall increase in  $\overline{RESET}$  tolerance levels due to the deterioration of the microprocessor  $\overline{RESET}$  circuit's power supply. The possibility of a malfunction during a power failure is greatly reduced because the ADM809-5S/L series can operate effectively even when there are large degradations of the supply voltages. Another advantage of the ADM809-5S/L series is its very accurate internal voltage reference circuit. These benefits combine to produce an exceptionally reliable voltage monitor circuit.

## INTERFACING TO MICROPROCESSORS WITH MULTIPLE INTERRUPTS

In a number of cases, it is necessary to interface many interrupts from different devices (i.e., thermal, attitude, and velocity sensors). The ADM809-5S/L can easily be integrated into existing interrupt-handling circuits (Figure 6) or used as a standalone device.
