

SUMMARY

High performance 32-bit/40-bit floating point processor optimized for high performance audio processing

Single-instruction, multiple-data (SIMD) computational architecture

On-chip memory, ADSP-21371—1M bits of on-chip SRAM and 4M bits of on-chip mask-programmable ROM

On-chip memory, ADSP-21375—0.5M bits of on-chip SRAM and 2M bits of on-chip mask-programmable ROM

Code compatible with all other members of the SHARC family

The ADSP-21371/ADSP-21375 processors are available with a 200/266 MHz core instruction rate with unique audiocentric peripherals such as the digital applications interface, S/PDIF transceiver, serial ports, precision clock generators, and more. For complete ordering information, see [Ordering Guide on Page 52](#).

DEDICATED AUDIO COMPONENTS

ADSP-21371—S/PDIF-compatible digital audio receiver/transmitter

ADSP-21371—8 dual data line serial ports that operate at up to 50 Mbps on each data line — each has a clock, frame sync, and two data lines that can be configured as either a receiver or transmitter pair

16 PWM outputs configured as four groups of four outputs

ROM-based security features include

- JTAG access to memory permitted with a 64-bit key
- Protected memory regions that can be assigned to limit access under program control to sensitive code

PLL has a wide variety of software and hardware multiplier/divider ratios

Available in a 208-lead LQFP_EP package

REVISION HISTORY

9/09—Rev. B to Rev. C

Corrected all outstanding document errata. Also replaced core clock references (CCLK) in the timing specifications with peripheral clock references (PCLK).

Added operating conditions and electrical characteristics for the 1.0 V, 200 MHz parts.

For this revision the following sections have been removed. For information see the *ADSP-2137x SHARC Processor Hardware Reference*: “Address Data Pins as Flags”, “Address/Data Modes”, Core Instruction Rate to CLKIN Ratio Modes.”

GENERAL DESCRIPTION

The ADSP-21371/ADSP-21375 SHARC[®] processors are members of the SIMD SHARC family of DSPs that feature Analog Devices' Super Harvard Architecture. The processors are source code compatible with the ADSP-2126x, ADSP-2136x, and ADSP-2116x DSPs, as well as with first generation ADSP-2106x SHARC processors in SISD (single-instruction, single-data) mode. The processors are 32-bit/40-bit floating-point processors optimized for high performance automotive audio applications with their large on-chip SRAM and mask-programmable ROM, multiple internal buses to eliminate I/O bottlenecks, and an innovative digital applications interface (DAI).

As shown in the functional block diagram on Page 1, the processors use two computational units to deliver a significant performance increase over the previous SHARC processors on a range of DSP algorithms. Fabricated in a state-of-the-art, high speed, CMOS process, the processors achieve an instruction cycle time of 3.75 ns at 266 MHz. With its SIMD computational hardware, the processors can perform 1.596 GFLOPS running at 266 MHz.

Table 1 shows performance benchmarks for these devices. Table 2 shows the features of the individual product offerings.

Table 1. Processor Benchmarks (at 266 MHz)

| Benchmark Algorithm | Speed (at 266 MHz) |
|---|--------------------|
| 1024 Point Complex FFT (Radix 4, With Reversal) | 34.5 μs |
| FIR Filter (per Tap) ¹ | 1.88 ns |
| IIR Filter (per Biquad) ¹ | 7.5 ns |
| Matrix Multiply (Pipelined) | |
| [3 × 3] × [3 × 1] | 16.91 ns |
| [4 × 4] × [4 × 1] | 30.07 ns |
| Divide (y/x) | 13.1 ns |
| Inverse Square Root | 20.4 ns |

¹ Assumes two files in multichannel SIMD mode

Table 2. ADSP-21371/ADSP-21375 Features

| Feature | ADSP-21371 | ADSP-21375 |
|-------------------------------------|-------------------|-------------------|
| Frequency | 266 MHz (3.75 ns) | 266 MHz (3.75 ns) |

| Feature | ADSP-21371 | ADSP-21375 |
|------------------------------------|------------------|------------------|
| Digital Peripheral Interface (DPI) | Yes | Yes |
| S/PDIF Transceiver | Yes | No |
| SPI | 2 | 2 |
| TWI | Yes | Yes |
| Package | 208-Lead LQFP_EP | 208-Lead LQFP_EP |

The diagram on Page 1 shows the two clock domains that make up the ADSP-2137x processors. The core clock domain contains the following features:

- Two processing elements, each of which comprises an ALU, multiplier, shifter, and data register file
- Data address generators (DAG1, DAG2)
- Program sequencer with instruction cache
- PM and DM buses capable of supporting four 32-bit data transfers between memory and the core at every core processor cycle
- One periodic interval timer with pinout
- On-chip SRAM (1M bit, ADSP-21371; 0.5M bit, ADSP-21375)
- On-chip mask-programmable ROM (4M bit, ADSP-21371; 2M bit, ADSP-21375)
- JTAG test access port for emulation and boundary scan. The JTAG provides software debug through user breakpoints which allow flexible exception handling.

The diagram on Page 1 also shows the peripheral clock domains (also known as the I/O processor) and contains the following features:

- IOD0 (peripheral DMA) and IOD1 (external port DMA) buses for 32-bit data transfers
- Peripheral and external port bus for core connection
- Digital applications interface that includes four precision clock generators (PCG), an S/PDIF-compatible digital audio receiver/transmitter, an input data port (IDP), eight serial ports, eight serial interfaces, a 20-bit parallel input port (PDAP), and a flexible signal routing unit (DAI SRU).
- Digital peripheral interface that includes two timers, one UART, two serial peripheral interfaces (SPI), a 2-wire interface (TWI), and a flexible signal routing unit (DPI SRU).
- External port with AMI and SDRAM controller
- Four units for PWM control
- One MTM for internal to internal memory transfers

ADSP-21371/ADSP-21375

SHARC FAMILY CORE ARCHITECTURE

The ADSP-21371/ADSP-21375 processors are code compatible at the assembly level with the ADSP-2136x, ADSP-2126x, ADSP-21160x, and ADSP-21161N, and with the first generation ADSP-2106x SHARC processors. The ADSP-21371/ADSP-21375 processors share architectural features with the ADSP-2126x, ADSP-2136x, and ADSP-2116x SIMD SHARC processors, as shown in Figure 2 and detailed in the following sections.

SIMD Computational Engine

The processors contain two computational processing elements that operate as a single-instruction, multiple-data (SIMD) engine. The processing elements are referred to as PEX and PEY, and each contains an ALU, multiplier, shifter, and register file. PEX is always active, and PEY may be enabled by setting the PEYEN mode bit in the MODE1 register. When this mode is enabled, the same instruction is executed in both processing elements, but each processing element operates on different data. This architecture is efficient at executing math intensive DSP algorithms.

Entering SIMD mode also has an effect on the way data is transferred between memory and the processing elements. When in SIMD mode, twice the data bandwidth is required to sustain computational operation in the processing elements. Because of this requirement, entering SIMD mode also doubles the bandwidth between memory and the processing elements. When using the DAGs to transfer data in SIMD mode, two data values are transferred with each access of memory or the register file.

Independent, Parallel Computation Units

Within each processing element is a set of computational units. The computational units consist of an arithmetic/logic unit (ALU), multiplier, and shifter. These units perform all operations in a single cycle. The three units within each processing element are arranged in parallel, maximizing computational throughput. Single multifunction instructions execute parallel ALU and multiplier operations. In SIMD mode, the parallel ALU and multiplier operations occur in both processing elements. These computation units support IEEE 32-bit single-precision floating-point, 40-bit extended precision floating-point, and 32-bit fixed-point data formats.

Figure 2. SHARC Core Block Diagram

Data Register File

Each processing element contains a general-purpose data register file. The register files transfer data between the computation units and the data buses, and store intermediate results. These 10-port, 32-register (16 primary, 16 secondary) register files, combined with the SHARC's enhanced Harvard architecture, allow unconstrained data flow between computation units and internal memory. The registers in PEX are referred to as R0–R15 and in PEY as S0–S15.

Context Switch

Many of the processor's registers have secondary registers that can be activated during interrupt servicing for a fast context switch. The data registers in the register file, the DAG registers, and the multiplier result register all have secondary registers. The primary registers are active at reset, while the secondary registers are activated by control bits in a mode control register.

Universal Registers

Universal registers can be used for general purpose tasks. The USTAT (4) registers allow easy bit manipulations (Set, Clear, Toggle, Test, XOR) for all system registers (control/status) of the core.

The data bus exchange register PX permits data to be passed between the 64-bit PM data bus and the 64-bit DM data bus, or between the 40-bit register file and the PM data bus. These registers contain hardware to handle the data width difference.

Timer

The processors contain a core timer that can generate periodic software interrupts. The core timer can be configured to use FLAG3 as a timer expired signal.

Single-Cycle Fetch of an Instruction and Four Operands

The processors feature an enhanced Harvard architecture in which the data memory (DM) bus transfers data and the program memory (PM) bus transfers both instructions and data (see [Figure 2](#)). With the processor's separate program and data memory buses and on-chip instruction cache, the processor can simultaneously fetch four operands (two over each data bus) and one instruction (from the cache), all in a single cycle.

Instruction Cache

The processors include an on-chip instruction cache that enables three-bus operation for fetching an instruction and four data values. The cache is selective—only the instructions whose fetches conflict with PM bus data accesses are cached. This cache allows full speed execution of core, looped operations such as digital filter multiply-accumulates, and FFT butterfly processing.

Data Address Generators with Zero-Overhead Hardware Circular Buffer Support

The processors's two data address generators (DAGs) are used for indirect addressing and implementing circular data buffers in hardware. Circular buffers allow efficient programming of delay lines and other data structures required in digital signal

processing, and are commonly used in digital filters and Fourier transforms. The two DAGs contain sufficient registers to allow the creation of up to 32 circular buffers (16 primary register sets, 16 secondary). The DAGs automatically handle address pointer wraparound, reduce overhead, increase performance, and simplify implementation. Circular buffers can start and end at any memory location.

Flexible Instruction Set

The 48-bit instruction word accommodates a variety of parallel operations, for concise programming. For example, the processors can conditionally execute a multiply, an add, and a subtract in both processing elements while branching and fetching up to four 32-bit values from memory—all in a single instruction.

On-Chip Memory

The ADSP-21371 processor contains 1 megabit of internal RAM and four megabits of internal mask-programmable ROM (see [Table 3 on Page 6](#)) and the ADSP-21375 processor contains 0.5 megabits of internal RAM and two megabits of internal mask-programmable ROM (see [Table 4 on Page 7](#)). Each block can be configured for different combinations of code and data storage. Each memory block supports single-cycle, independent accesses by the core processor and I/O processor. The processor's memory architecture, in combination with its separate on-chip buses, allow two data transfers from the core and one from the I/O processor, in a single cycle.

The ADSP-21371 processor's SRAM can be configured as a maximum of 32k words of 32-bit data, 64k words of 16-bit data, 21.3k words of 48-bit instructions (or 40-bit data), or combinations of different word sizes up to 1 megabit. All of the memory can be accessed as 16-bit, 32-bit, 48-bit, or 64-bit words. A 16-bit floating-point storage format is supported that effectively doubles the amount of data that may be stored on-chip. Conversion between the 32-bit floating-point and 16-bit floating-point formats is performed in a single instruction. While each memory block can store combinations of code and data, accesses are most efficient when one block stores data using the DM bus for transfers, and the other block stores instructions and data using the PM bus for transfers.

Using the DM bus and PM buses, with one bus dedicated to a memory block, assures single-cycle execution with two data transfers. In this case, the instruction must be available in the cache.

On-Chip Memory Bandwidth

The internal memory architecture allows four accesses at the same time to any of the four blocks, assuming no block conflicts. The total bandwidth is gained with DMD and PMD buses (2×64 -bits, core CLK) and the IOD0/1 buses (2×32 -bit, PCLK).

ROM-Based Security

The processors have a ROM security feature that provides hardware support for securing user software code by preventing unauthorized reading from the internal code when enabled. When using this feature, the processor does not boot-load any

external code, executing exclusively from internal ROM. Additionally, the processor is not freely accessible via the JTAG port. Instead, a unique 64-bit key, which must be scanned in through the JTAG or Test Access Port will be assigned to each customer. The device will ignore a wrong key. Emulation features and external boot modes are only available after the correct key is scanned.

FAMILY PERIPHERAL ARCHITECTURE

The ADSP-21371/ADSP-21375 family contains a rich set of peripherals that support a wide variety of applications, including high quality audio, medical imaging, communications, military, test equipment, 3D graphics, speech recognition, monitor control, imaging, and other applications.

External Port

The external port on the ADSP-21371/ADSP-21375 SHARC processors provide a high performance, glueless interface to a wide variety of industry-standard memory devices. The 32-bit wide bus (ADSP-21371) may be used to interface to synchronous and/or asynchronous memory devices through the use of its separate internal memory controllers: the first is an SDRAM controller for connection of industry-standard synchronous DRAM devices and DIMMs (dual inline memory module), while the second is an asynchronous memory controller intended to interface to a variety of memory devices. Four memory select pins enable up to four separate devices to coexist, supporting any desired combination of synchronous and asynchronous device types.

Table 4. ADSP-21375 Internal Memory Space

SDRAM Controller

The SDRAM controller provides an interface to up to four separate banks of industry-standard SDRAM devices or DIMMs. Fully compliant with the SDRAM standard, each bank has its own memory select line ($\overline{MS0}$ – $\overline{MS3}$), and can be configured to contain between 16M bytes and 256M bytes of memory. SDRAM external memory address space is shown in [Table 5](#).

The controller maintains all of the banks as a contiguous address space so that the processor sees this as a single address space, even if different size devices are used in the different banks.

A set of programmable timing parameters is available to configure the SDRAM banks to support slower memory devices. The memory banks can be configured as 16 bits wide or as 32 bits wide. The SDRAM controller address, data, clock, and command pins can drive loads up to 30 pF. For larger memory systems, the SDRAM controller external buffer timing should be selected and external buffering should be provided so that the load on the SDRAM controller pins does not exceed 30 pF.

Table 5. External Memory for SDRAM Addresses

| Bank | Size in Words | Address Range |
|--------|---------------|-------------------------|
| Bank 0 | 62M | 0x0020 0000–0x03FF FFFF |
| Bank 1 | 64M | 0x0400 0000–0x07FF FFFF |
| Bank 2 | 64M | 0x0800 0000–0x0BFF FFFF |
| Bank 3 | 64M | 0x0C00 0000–0x0FFF FFFF |

Note that the external memory bank addresses shown in [Table 5](#) are for normal word accesses. If 48-bit instructions are placed in any such bank (with two instructions packed into three 32-bit locations), then care must be taken to map data buffers in the same bank. For example, if 2k instructions are placed starting at the bank 0 base address (0x0020 0000), then the data buffers can be placed starting at an address that is offset by 3k words (0x0020 0C00).

External Memory Code Execution

The program sequencer can execute code directly from external memory bank 0 (SRAM, SDRAM) over the 48-bit external port data bus (EPD). This allows a reduction in internal memory size, thereby reducing the die area. With external execution, programs run at slower speeds since 48-bit instructions are fetched in parts from a 16-bit external bus coupled with the inherent latency of fetching instructions from SDRAM. Fetching instructions from external memory generally takes 1.5 peripheral clock cycles per instruction. Non SDRAM external memory address space is shown in [Table 6](#).

Table 6. External Memory for Non SDRAM Addresses

| Bank | Size in Words | Address Range |
|--------|---------------|-------------------------|
| Bank 0 | 14M | 0x0020 0000–0x00FF FFFF |
| Bank 1 | 16M | 0x0400 0000–0x04FF FFFF |
| Bank 2 | 16M | 0x0800 0000–0x08FF FFFF |
| Bank 3 | 16M | 0x0C00 0000–0x0CFF FFFF |

External Port Throughput

The throughput for the external port, based on 133 MHz clock and 32-bit data bus, is 177M bytes/s for the AMI and 532M bytes/s for SDRAM.

Asynchronous Memory Controller

The asynchronous memory controller provides a configurable interface for up to four separate banks of memory or I/O devices. Each bank can be independently programmed with different timing parameters, enabling connection to a wide variety of memory devices including SRAM, ROM, flash, and EPROM, as well as I/O devices that interface with standard memory control lines. Bank 0 occupies a 14.7M word window and banks 1, 2, and 3 occupy a 16M word window in the processor's address space but, if not fully populated, these windows are not made contiguous by the memory controller logic. The banks can also be configured as 8-bit or 16-bit wide buses for ease of interfacing to a range of memories and I/O devices tailored either to high performance or to low cost and power.

Pulse-Width Modulation

The PWM module is a flexible, programmable, PWM waveform generator that can be programmed to generate the required switching patterns for various applications related to motor and engine control or audio power control. The PWM generator can generate either center-aligned or edge-aligned PWM waveforms. In addition, it can generate complementary signals on two outputs in paired mode or independent signals in non-paired mode (applicable to a single group of four PWM waveforms).

The entire PWM module has four groups of four PWM outputs each. Therefore, this module generates 16 PWM outputs in total. Each PWM group produces two pairs of PWM signals on the four PWM outputs.

The PWM generator is capable of operating in two distinct modes while generating center-aligned PWM waveforms: single update mode or double update mode. In single update mode the duty cycle values are programmable only once per PWM period. This results in PWM patterns that are symmetrical about the mid-point of the PWM period. In double update mode, a second updating of the PWM registers is implemented at the mid-point of the PWM period. In this mode, it is possible to produce asymmetrical PWM patterns that produce lower harmonic distortion in three-phase PWM inverters.

Digital Applications Interface (DAI)

The digital applications interface (DAI) provides the ability to connect various peripherals to any of the processor's DAI pins (DAI_P1 to DAI_P20).

Programs make these connections using the signal routing unit (SRU), shown in [Figure 1](#).

The SRU is a matrix routing unit (or group of multiplexers) that enables the peripherals provided by the DAI to be interconnected under software control. This allows easy use of the DAI

associated peripherals for a much wider variety of applications by using a larger set of algorithms than is possible with nonconfigurable signal paths.

In the ADSP-21371, the DAI includes eight serial ports, four precision clock generators (PCG), and an input data port (IDP). For the ADSP-21375, the DAI includes four serial ports, four precision clock generators (PCG) and an input data port (IDP).

The IDP provides an additional input path to the core of the processor, configurable as either eight channels of I²S serial data, or a single 20-bit wide synchronous parallel data acquisition port. Each data channel has its own DMA channel that is independent from the processor's serial ports.

Serial Ports

The processors feature eight synchronous serial ports on the ADSP-21371 and four on the ADSP-21375. The SPORTs provide an inexpensive interface to a wide variety of digital and mixed-signal peripheral devices such as Analog Devices' AD183x family of audio codecs, ADCs, and DACs. The serial ports are made up of two data lines, a clock, and frame sync. The data lines can be programmed to either transmit or receive and each data line has a dedicated DMA channel.

For the ADSP-21371, serial ports are enabled via 16 programmable pins and simultaneous receive or transmit pins that support up to 32 transmit or 32 receive channels of audio data when all eight SPORTs are enabled, or eight duplex TDM streams of 128 channels per frame.

For the ADSP-21375, serial ports are enabled via eight programmable pins and simultaneous receive or transmit pins that support up to 16 transmit or 16 receive channels of audio data when all four SPORTs are enabled, or four duplex TDM streams of 128 channels per frame.

The serial ports operate at a maximum data rate of 50 Mbps. Serial port data can be automatically transferred to and from on-chip memory via dedicated DMA channels. Each of the serial ports can work in conjunction with another serial port to provide TDM support. One SPORT provides two transmit signals while the other SPORT provides the two receive signals. The frame sync and clock are shared.

Serial ports operate in five modes:

- Standard DSP serial mode
- Multichannel (TDM) mode with support for packed I²S mode
- I²S mode
- Packed I²S mode
- Left-justified sample pair mode

Left-justified sample pair mode is a mode where in each frame sync cycle two samples of data are transmitted/received—one sample on the high segment of the frame sync, the other on the low segment of the frame sync. Programs have control over various attributes of this mode.

Each of the serial ports supports the left-justified sample pair and I²S protocols (I²S is an industry-standard interface commonly used by audio codecs, ADCs, and DACs such as the

Analog Devices AD183x family), with two data pins, allowing four left-justified sample pair or I²S channels (using two stereo devices) per serial port, with a maximum of up to 32 I²S channels. The serial ports permit little-endian or big-endian transmission formats and word lengths selectable from 3 bits to 32 bits. For the left-justified sample pair and I²S modes, data-word lengths are selectable between 8 bits and 32 bits. Serial ports offer selectable synchronization and transmit modes as well as optional μ -law or A-law companding selection on a per channel basis. Serial port clocks and frame syncs can be internally or externally generated.

The serial ports also contain frame sync error detection logic where the serial ports detect frame syncs that arrive early (for example frame syncs that arrive while the transmission/reception of the previous word is occurring). All the serial ports also share one dedicated error interrupt.

S/PDIF-Compatible Digital Audio Receiver/Transmitter

The ADSP-21371 S/PDIF receiver/transmitter has no separate DMA channels. It receives audio data in serial format and converts it into a biphasic encoded signal. The serial data input to the receiver/transmitter can be formatted as left justified, I²S or right justified with word widths of 16, 18, 20, or 24 bits.

The serial data, clock, and frame sync inputs to the S/PDIF receiver/transmitter are routed through the signal routing unit (SRU). They can come from a variety of sources such as the SPORTs, external pins, the precision clock generators (PCGs), and are controlled by the SRU control registers.

The ADSP-21375 does not have an S/PDIF-compatible digital receiver/transmitter.

Input Data Port (IDP)

The IDP provides up to eight serial input channels—each with its own clock, frame sync, and data inputs. The eight channels are automatically multiplexed into a single 32-bit by eight-deep FIFO. Data is always formatted as a 64-bit frame and divided into two 32-bit words. The serial protocol is designed to receive audio channels in I²S, left-justified sample pair, or right-justified mode. One frame sync cycle indicates one 64-bit left/right pair, but data is sent to the FIFO as 32-bit words (that is, one-half of a frame at a time). The processor supports 24- and 32-bit I²S, 24- and 32-bit left-justified, and 24-, 20-, 18- and 16-bit right-justified formats.

Precision Clock Generator (PCG)

The precision clock generators (PCG) consist of four units, each of which generates a pair of signals (clock and frame sync) derived from a clock input signal. The units, A, B, C, and D, are identical in functionality and operate independently of each other. The two signals generated by each unit are normally used as a serial bit clock/frame sync pair.

ADSP-21371/ADSP-21375

Digital Peripheral Interface (DPI)

The digital peripheral interface provides connections to two serial peripheral interface (SPI) ports, one universal asynchronous receiver-transmitter (UART), 12 flags, a 2-wire interface (TWI), and two general-purpose timers.

Serial Peripheral (Compatible) Interface

The ADSP-21371/ADSP-21375 SHARC processors contain two serial peripheral interface ports (SPIs). The SPI is an industry-standard synchronous serial link, enabling the SPI-compatible ports of the processors to communicate with other SPI compatible devices. The SPI consists of two data pins, one device select pin, and one clock pin. It is a full-duplex synchronous serial interface, supporting both master and slave modes. The SPI port can operate in a multimaster environment by interfacing with up to four other SPI-compatible devices, either acting as a master or slave device.

The SPI-compatible peripheral implementation also features programmable baud rates and clock phases and polarities. The SPI-compatible port uses open drain drivers to support a multimaster configuration and to avoid data contention.

UART Port

The processors provide a full-duplex Universal Asynchronous Receiver/Transmitter (UART) port, which is fully compatible with PC-standard UARTs. The UART port provides a simplified UART interface to other peripherals or hosts, supporting full-duplex, DMA-supported, asynchronous transfers of serial data. The UART also has multiprocessor communication capability using 9-bit address detection. This allows it to be used in multidrop networks through the RS-485 data interface standard. The UART port also includes support for 5 to 8 data bits, 1 or 2 stop bits, and none, even, or odd parity. The UART port supports two modes of operation:

- PIO (programmed I/O) – The processor sends or receives data by writing or reading I/O-mapped UART registers. The data is double-buffered on both transmit and receive.
- DMA (direct memory access) – The DMA controller transfers both transmit and receive data. This reduces the number and frequency of interrupts required to transfer data to and from memory. The UART has two dedicated DMA channels, one for transmit and one for receive. These DMA channels have lower default priority than most DMA channels because of their relatively low service rates.

The UART port's baud rate, serial data format, error code generation and status, and interrupts are programmable. The port:

- Supports bit rates ranging from $(f_{PCLK}/1,048,576)$ to $(f_{PCLK}/16)$ bits per second.
- Supports data formats from 7 to 12 bits per frame.
- Can be configured to generate maskable interrupts for both transmit and receive operations.

In conjunction with the general-purpose timer functions, auto-baud detection is supported.

Peripheral Timers

Two general-purpose timers can generate periodic interrupts and be independently set to operate in one of three modes:

- Pulse waveform generation mode
- Pulse width count/capture mode
- External event watchdog mode

Each general-purpose timer has one bidirectional pin and four registers that implement its mode of operation: a 6-bit configuration register, a 32-bit count register, a 32-bit period register, and a 32-bit pulse width register. A single control and status register enables or disables the general-purpose timers independently.

2-Wire Interface Port (TWI)

The TWI is a bidirectional 2-wire serial bus used to move 8-bit data while maintaining compliance with the I²C bus protocol. The TWI master incorporates the following features:

- Simultaneous master and slave operation on multiple device systems with support for multi master data arbitration
- Digital filtering and timed event processing
- 7-bit addressing
- 100 kbps and 400 kbps data rates
- Low interrupt rate

I/O PROCESSOR FEATURES

The I/O processor provides many channels of DMA and controls the extensive set of peripherals described in the previous sections.

DMA Controller

The processor's on-chip DMA controller allows data transfers without processor intervention. The DMA controller operates independently and invisibly to the processor core, allowing DMA operations to occur while the core is simultaneously executing its program instructions. DMA transfers can occur between the ADSP-2137x processor's internal memory and its serial ports, the SPI-compatible (serial peripheral interface) ports, the IDP (input data port), the parallel data acquisition port (PDAP), or the UART (see [Table 7](#)).

Table 7. DMA Channels

| Peripheral | ADSP-21371 | ADSP-21375 |
|--------------------|------------|------------|
| SPORT | 16 | 8 |
| PDAP | 8 | 8 |
| SPI | 2 | 2 |
| UART | 2 | 2 |
| EP | 2 | 2 |
| MTM/DTCP | 2 | 2 |
| Total DMA Channels | 32 | 24 |

Delay Line DMA

The processors provide delay line DMA functionality. This allows processor reads and writes to external delay line buffers (and hence to external memory) with limited core interaction.

Scatter/Gather DMA

The ADSP-2137x processor provides scatter/gather DMA functionality. This allows processor DMA reads/writes to/from non-contiguous memory blocks.

SYSTEM DESIGN

The following sections provide an introduction to system design options and power supply issues. For complete system design information, see the *ADSP-2137x SHARC Processor Hardware Reference*.

Program Booting

The internal memory of the processor boots at system power-up from an 8-bit EPROM via the external port, an SPI master, or an SPI slave. Booting is determined by the boot configuration (BOOT_CFG1–0) pins in [Table 8](#). Selection of the boot source is controlled via the SPI as either a master or slave device, or it can immediately begin executing from ROM.

Table 8. Boot Mode Selection

| BOOT_CFG1–0 | Boot Mode |
|-------------|------------------|
| 00 | SPI Slave Boot |
| 01 | SPI Master Boot |
| 10 | EPROM/FLASH Boot |
| 11 | Reserved |

The “Running Reset” feature allows programs to perform a reset of the processor core and peripherals, but without resetting the PLL and SDRAM controller, or performing a boot. The RESETOUT pin acts as the input for initiating a running reset.

Power Supplies

The processors have separate power supply connections for the internal (V_{DDINT}), and external (V_{DDEXT}) power supplies. The internal supplies must meet the 1.2 V requirement. The external supply must meet the 3.3 V requirement. All external supply pins must be connected to the same power supply.

Target Board JTAG Emulator Connector

Analog Devices DSP Tools product line of JTAG emulators uses the IEEE 1149.1 JTAG test access port of the processor to monitor and control the target board processor during emulation. Analog Devices DSP Tools product line of JTAG emulators provides emulation at full processor speed, allowing inspection and modification of memory, registers, and processor stacks. The processor’s JTAG interface ensures that the emulator will not affect target system loading or timing.

For complete information on Analog Devices’ SHARC DSP Tools product line of JTAG emulator operation, see the appropriate “Emulator Hardware User’s Guide”.

DEVELOPMENT TOOLS

The processors are supported with a complete set of CROSSCORE® software and hardware development tools, including Analog Devices emulators and VisualDSP++® development environment. The same emulator hardware that supports other SHARC processors also fully emulates the ADSP-21371/ADSP-21375.

The VisualDSP++ project management environment lets programmers develop and debug an application. This environment includes an easy to use assembler (which is based on an algebraic syntax), an archiver (librarian/library builder), a linker, a loader, a cycle-accurate instruction-level simulator, a C/C++ compiler, and a C/C++ runtime library that includes DSP and mathematical functions. A key point for these tools is C/C++ code efficiency. The compiler has been developed for efficient translation of C/C++ code to DSP assembly. The SHARC processor has architectural features that improve the efficiency of compiled C/C++ code.

The VisualDSP++ debugger has a number of important features. Data visualization is enhanced by a plotting package that offers a significant level of flexibility. This graphical representation of user data enables the programmer to quickly determine the performance of an algorithm. As algorithms grow in complexity, this capability can have increasing significance on the designer’s development schedule, increasing productivity. Statistical profiling enables the programmer to nonintrusively poll the processor as it is running the program. This feature, unique to VisualDSP++, enables the software developer to passively gather important code execution metrics without interrupting the real-time characteristics of the program. Essentially, the developer can identify bottlenecks in software quickly and efficiently. By using the profiler, the programmer can focus on those areas in the program that impact performance and take corrective action.

Debugging both C/C++ and assembly programs with the VisualDSP++ debugger, programmers can

- View mixed C/C++ and assembly code (interleaved source and object information)
- Insert breakpoints
- Set conditional breakpoints on registers, memory, and stacks
- Perform linear or statistical profiling of program execution
- Fill, dump, and graphically plot the contents of memory
- Perform source level debugging
- Create custom debugger windows

The VisualDSP++ IDDE lets programmers define and manage DSP software development. Its dialog boxes and property pages let programmers configure and manage all of the SHARC development tools, including the color syntax highlighting in the VisualDSP++ editor. This capability permits programmers to:

- Control how the development tools process inputs and generate outputs

ADSP-21371/ADSP-21375

- Maintain a one-to-one correspondence with the tool's command line switches

The VisualDSP++ Kernel (VDK) incorporates scheduling and resource management tailored specifically to address the memory and timing constraints of DSP programming. These capabilities enable engineers to develop code more effectively, eliminating the need to start from the very beginning, when developing new application code. The VDK features include threads, critical and unscheduled regions, semaphores, events, and device flags. The VDK also supports priority-based, preemptive, cooperative, and time-sliced scheduling approaches. In addition, the VDK was designed to be scalable. If the application does not use a specific feature, the support code for that feature is excluded from the target system.

Because the VDK is a library, a developer can decide whether to use it or not. The VDK is integrated into the VisualDSP++ development environment, but can also be used via standard command line tools. When the VDK is used, the development environment assists the developer with many error-prone tasks and assists in managing system resources, automating the generation of various VDK based objects, and visualizing the system state, when debugging an application that uses the VDK.

Use the Expert Linker to visually manipulate the placement of code and data on the embedded system. View memory utilization in a color-coded graphical form, easily move code and data to different areas of the processor or external memory with the drag of the mouse, examine run time stack and heap usage. The Expert Linker is fully compatible with the existing Linker Definition File (LDF), allowing the developer to move between the graphical and textual environments.

In addition to the software and hardware development tools available from Analog Devices, third parties provide a wide range of tools supporting the SHARC processor family. Hardware tools include SHARC processor PC plug-in cards. Third party software tools include DSP libraries, real-time operating systems, and block diagram design tools.

Designing an Emulator-Compatible DSP Board (Target)

The Analog Devices family of emulators are tools that every DSP developer needs to test and debug hardware and software systems. Analog Devices has supplied an IEEE 1149.1 JTAG Test Access Port (TAP) on each JTAG DSP. Nonintrusive in-circuit emulation is assured by the use of the processor's JTAG interface—the emulator does not affect target system loading or timing. The emulator uses the TAP to access the internal features of the processor, allowing the developer to load code, set breakpoints, observe variables, observe memory, and examine registers. The processor must be halted to send data and commands, but once an operation has been completed by the emulator, the DSP system is set running at full speed with no impact on system timing.

To use these emulators, the target board must include a header that connects the DSP's JTAG port to the emulator.

For details on target board design issues including mechanical layout, single processor connections, signal buffering, signal termination, and emulator pod logic, see the *EE-68: Analog Devices*

JTAG Emulation Technical Reference on the Analog Devices website (www.analog.com)—use site search on “EE-68.” This document is updated regularly to keep pace with improvements to emulator support.

Evaluation Kit

Analog Devices offers a range of EZ-KIT Lite[®] evaluation platforms to use as a cost effective method to learn more about developing or prototyping applications with Analog Devices processors, platforms, and software tools. Each EZ-KIT Lite includes an evaluation board along with an evaluation suite of the VisualDSP++ development and debugging environment with the C/C++ compiler, assembler, and linker. Also included are sample application programs, power supply, and a USB cable. All evaluation versions of the software tools are limited for use only with the EZ-KIT Lite product.

The USB controller on the EZ-KIT Lite board connects the board to the USB port of the user's PC, enabling the VisualDSP++ evaluation suite to emulate the on-board processor in-circuit. This permits the customer to download, execute, and debug programs for the EZ-KIT Lite system. It also allows in-circuit programming of the on-board Flash device to store user-specific boot code, enabling the board to run as a stand-alone unit without being connected to the PC.

With a full version of VisualDSP++ installed (sold separately), engineers can develop software for the EZ-KIT Lite or any custom defined system. Connecting one of Analog Devices JTAG emulators to the EZ-KIT Lite board enables high speed, non-intrusive emulation.

ADDITIONAL INFORMATION

This data sheet provides a general overview of the processor's architecture and functionality. For detailed information on the core architecture and instruction set, refer to the *ADSP-2137x SHARC Processor Hardware Reference*.

PIN FUNCTION DESCRIPTIONS

The following symbols appear in the Type column of [Table 9](#):
 A = asynchronous, I = input, O = output, S = synchronous,
 (A/D) = active drive, (O/D) = open drain, and T = three-state,
 (pd) = pull-down resistor, (pu) = pull-up resistor.

Table 9. Pin Descriptions

| Name | Type | State During and After Reset | Description |
|-----------------------|---|------------------------------|--|
| ADDR ₂₃₋₀ | O/T (pu) | Pulled high/ driven low | External Address. The processor outputs addresses for external memory and peripherals on these pins. |
| DATA ₃₁₋₀ | I/O (pu) | Pulled high/ pulled high | External Data. The data pins can be multiplexed to support the external memory interface data (I/O), the PDAP (I) (PDAP for ADSP-21371), FLAGS (I/O) and PWM (O). After reset, all DATA pins are in EMIF mode and FLAG(0–3) pins are in FLAGS mode (default). When configured in the IDP_PDAP_CTL register, IDP channel 0 scans the external port data pins for parallel input data. PDAP over 16-bit external port DATA is not supported on the ADSP-21375 processor. |
| DAI_P ₂₀₋₁ | I/O with programmable (pu) ¹ | Pulled high/ pulled high | Digital Applications Interface Pins. These pins provide the physical interface to the DAI SRU. The DAI SRU configuration registers define the combination of on-chip audio-centric peripheral inputs or outputs connected to the pin and to the pin's output enable. The configuration registers of these peripherals then determine the exact behavior of the pin. Any input or output signal present in the DAI SRU may be routed to any of these pins. The DAI SRU provides the connection from the serial ports, the S/PDIF module (ADSP-21371), IDP (2), and the PCGs (4), to the DAI_P ₂₀₋₁ pins. Pullups can be disabled via the DAI_PIN_PULLUP register. |
| DPI_P ₁₄₋₁ | I/O with programmable (pu) ¹ | Pulled high/ pulled high | Digital Peripheral Interface. These pins provide the physical interface to the DPI SRU. The DPI SRU configuration registers define the combination of on-chip peripheral inputs or outputs connected to the pin and to the pin's output enable. The configuration registers of these peripherals then determines the exact behavior of the pin. Any input or output signal present in the DPI SRU may be routed to any of these pins. The DPI SRU provides the connection from the timers (2), SPIs (2), UART (1), flags (12), and general-purpose I/O (9) to the DPI_P ₁₄₋₁ pins. Pull-ups can be disabled via the DPI_PIN_PULLUP register. |
| ACK | I (pu) | | Memory Acknowledge. External devices can deassert ACK (low) to add wait states to an external memory access. ACK is used by I/O devices, memory controllers, or other peripherals to hold off completion of an external memory access. |
| \overline{RD} | O/T (pu) | Pulled high/ driven high | External Port Read Enable. \overline{RD} is asserted whenever the processor reads a word from external memory. \overline{RD} has a 22.5 k Ω internal pull-up resistor. |
| \overline{WR} | O/T (pu) | Pulled high/ driven high | External Port Write Enable. \overline{WR} is asserted when the processor writes a word to external memory. \overline{WR} has a 22.5 k Ω internal pull-up resistor. |
| \overline{SDRAS} | O/T (pu) | Pulled high/ driven high | SDRAM Row Address Strobe. Connect to SDRAM's RAS pin. In conjunction with other SDRAM command pins, defines the operation for the SDRAM to perform. |
| \overline{SDCAS} | O/T (pu) | Pulled high/ driven high | SDRAM Column Address Select. Connect to SDRAM's CAS pin. In conjunction with other SDRAM command pins, defines the operation for the SDRAM to perform. |
| \overline{SDWE} | O/T (pu) | Pulled high/ driven high | SDRAM Write Enable. Connect to SDRAM's WE or W buffer pin. |

ADSP-21371/ADSP-21375

Table 9. Pin Descriptions (Continued)

| Name | Type | State During and After Reset | Description |
|--|--|------------------------------|---|
| SDCKE | O/T (pu) | Pulled high/ driven high | SDRAM Clock Enable. Connect to SDRAM's CKE pin. Enables and disables the CLK signal. For details, see the data sheet supplied with the SDRAM device. |
| SDA10 | O/T (pu) | Pulled high/ driven low | SDRAM A10 Pin. Enables applications to refresh an SDRAM in parallel with a non-SDRAM accesses. This pin replaces the DSP's A10 pin only during SDRAM accesses. |
| SDCLK | O/T | High-Z/driving | SDRAM Clock. |
| \overline{MS}_{0-1} | O/T (pu) | Pulled high/ driven high | Memory Select Lines 0–1. These lines are asserted (low) as chip selects for the corresponding banks of external memory. The \overline{MS}_{3-0} lines are decoded memory address lines that change at the same time as the other address lines. When no external memory access is occurring the \overline{MS}_{3-0} lines are inactive; they are active however when a conditional memory access instruction is executed, whether or not the condition is true. The \overline{MS}_1 pin can be used in EPORT/FLASH boot mode. For more information, see the <i>ADSP-2137x SHARC Processor Hardware Reference</i> . |
| FLAG[0]/ $\overline{IRQ0}$ | I/O | FLAG[0] INPUT | FLAG0/Interrupt Request0. |
| FLAG[1]/ $\overline{IRQ1}$ | I/O | FLAG[1] INPUT | FLAG1/Interrupt Request1. |
| FLAG[2]/ $\overline{IRQ2}$ / $\overline{MS2}$ | I/O with programmable pu (for MS mode) | FLAG[2] INPUT | FLAG2/Interrupt Request/Memory Select2. |
| FLAG[3]/ TMREXP/ $\overline{MS3}$ | I/O with programmable pu (for MS mode) | FLAG[3] INPUT | FLAG3/Timer Expired/Memory Select3. |
| TDI | I (pu) | | Test Data Input (JTAG). Provides serial data for the boundary scan logic. TDI has a 22.5 k Ω internal pull-up resistor. |
| TDO | O/T | | Test Data Output (JTAG). Serial scan output of the boundary scan path. |
| TMS | I (pu) | | Test Mode Select (JTAG). Used to control the test state machine. TMS has a 22.5 k Ω internal pull-up resistor. |
| TCK | I | | Test Clock (JTAG). Provides a clock for JTAG boundary scan. TCK must be asserted (pulsed low) after power-up or held low for proper operation of the processor. |
| \overline{TRST} | I (pu) | | Test Reset (JTAG). Resets the test state machine. \overline{TRST} must be asserted (pulsed low) after power-up or held low for proper operation of the processor. \overline{TRST} has a 22.5 k Ω internal pull-up resistor. |
| \overline{EMU} | O/T (pu) | | Emulation Status. Must be connected to the processor. Analog Devices DSP Tools product line of JTAG emulators target board connector only. \overline{EMU} has a 22.5 k Ω internal pull-up resistor. |
| CLK_CFG ₁₋₀ | I | | Core to CLKIN Ratio Control. These pins set the start up clock frequency. See the <i>ADSP-2137x SHARC Processor Hardware Reference</i> for a description of the clock configuration modes. Note that the operating frequency can be changed by programming the PLL multiplier and divider in the PMCTL register at any time after the core comes out of reset. |
| BOOT_CFG ₁₋₀ | I | | Boot Configuration Select. These pins select the boot mode for the processor. The BOOT_CFG pins must be valid before reset is asserted. See the <i>ADSP-2137x SHARC Processor Hardware Reference</i> for information about boot modes. |

Table 9. Pin Descriptions (Continued)

| Name | Type | State During and After Reset | Description |
|--|----------|------------------------------|--|
| $\overline{\text{RESET}}$ | I | | Processor Reset. Resets the processor to a known state. Upon deassertion, there is a 4096 CLKIN cycle latency for the PLL to lock. After this time, the core begins program execution from the hardware reset vector address. The $\overline{\text{RESET}}$ input must be asserted (low) at power-up. |
| XTAL | O | | Crystal Oscillator Terminal. Used in conjunction with CLKIN to drive an external crystal. |
| CLKIN | I | | Local Clock In. Used in conjunction with XTAL. CLKIN is the processor clock input. It configures the processor to use either its internal clock generator or an external clock source. Connecting the necessary components to CLKIN and XTAL enables the internal clock generator. Connecting the external clock to CLKIN while leaving XTAL unconnected configures the processor to use the external clock source such as an external clock oscillator. CLKIN may not be halted, changed, or operated below the specified frequency. |
| $\overline{\text{RESETOUT}}$ / $\overline{\text{RUNRSTIN}}$ | I/O (pu) | | Reset Out/Running Reset In. The default setting is reset out. This pin also has a second function as $\overline{\text{RUNRSTIN}}$, which is enabled by setting bit 0 of the RUNRSTCTL register. For more information, see the <i>ADSP-2137x SHARC Processor Hardware Reference</i> . |

¹Pull-up can be enabled/disabled, value of pull-up cannot be programmed.

¹ Specifications subject to change without notice.

² Applies to output and bidirectional pins: ADDR23-0, DATA31-0 (DATA15-0 on ADSP-21375), $\overline{\text{RD}}$, $\overline{\text{WR}}$, FLAG3-0, DAI_Px, DPI_Px, $\overline{\text{EMU}}$, TDO, $\overline{\text{SDRAS}}$, $\overline{\text{SDCAS}}$, $\overline{\text{SDWE}}$, $\overline{\text{SDCKE}}$, SDA10, and SDCLK.

³ See [Output Drive Currents on Page 45](#) for typical drive current capabilities.

⁴ Applies to input pins: BOOT_CFGx, CLKCFGx, TCK, $\overline{\text{RESET}}$, CLKIN.

⁵ Applies to input pins with 22.5 kΩ internal pull-ups: $\overline{\text{TRST}}$, TMS, TDI.

⁶ Applies to three-statable pins: FLAG3-0.

⁷ Applies to three-statable pins with 22.5 kΩ pull-ups: DAI_Px, DPI_Px, $\overline{\text{EMU}}$.

⁸ Typical internal current data reflects nominal operating conditions.

⁹ See Engineer-to-Engineer Note "Estimating Power Dissipation for ADSP-2137x SHARC Processors" (EE-318) for further information.

¹⁰ Applies to all signal pins.

¹¹ Guaranteed, but not tested.

PACKAGE INFORMATION

The information presented in [Figure 3](#) provides details about the package branding for the ADSP-21371/ADSP-21375 processor. For a complete listing of product availability, see [Ordering Guide on Page 52](#).

Figure 3. Typical Package Brand

Table 10. Package Brand Information

| Brand Key | Field Description |
|-----------|---------------------|
| t | Temperature Range |
| pp | Package Type |
| Z | RoHS Compliant Part |
| ccc | See Ordering Guide |
| vvvvv.x | Assembly Lot Code |
| n.n | Silicon Revision |
| yyww | Date Code |

MAXIMUM POWER DISSIPATION

See Engineer-to-Engineer Note “Estimating Power Dissipation for ADSP-2137x SHARC Processors” (EE-318) for detailed thermal and power information regarding maximum power dissipation. For information on package thermal specifications, see [Thermal Characteristics on Page 46](#).

ABSOLUTE MAXIMUM RATINGS

Stresses greater than those listed in [Table 11](#) may cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions greater than those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 11. Absolute Maximum Ratings

| Parameter | Rating |
|--|------------------|
| Internal (Core) Supply Voltage (V_{DDINT}) | -0.3 V to +1.5 V |
| External (I/O) Supply Voltage (V_{DDEXT}) | -0.3 V to +4.6 V |
| Input Voltage -0.5 V to V_{DDEXT} | +0.5 V |
| Output Voltage Swing -0.5 V to V_{DDEXT} | +0.5 V |

Table 11. Absolute Maximum Ratings (Continued)

| Parameter | Rating |
|---------------------------------|-----------------|
| Load Capacitance | 200 pF |
| Storage Temperature Range | -65°C to +150°C |
| Junction Temperature under Bias | 125°C |

ESD SENSITIVITY

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

TIMING SPECIFICATIONS

Use the exact timing information given. Do not attempt to derive parameters from the addition or subtraction of others. While addition or subtraction would yield meaningful results for an individual device, the values given in this data sheet reflect statistical variations and worst cases. Consequently, it is not meaningful to add parameters to derive longer times. See [Figure 37 on Page 45](#) under [Test Conditions](#) for voltage reference levels.

Switching Characteristics specify how the processor changes its signals. Circuitry external to the processor must be designed for compatibility with these signal characteristics. Switching characteristics describe what the processor will do in a given circumstance. Use switching characteristics to ensure that any timing requirement of a device connected to the processor (such as memory) is satisfied.

Timing Requirements apply to signals that are controlled by circuitry external to the processor, such as the data input for a read operation. Timing requirements guarantee that the processor operates correctly with other devices.

Core Clock Requirements

The processor’s internal clock (a multiple of CLKIN) provides the clock signal for timing internal memory, processor core, and serial ports. During reset, program the ratio between the processor’s internal clock frequency and external (CLKIN) clock frequency with the CLK_CFG1-0 pins.

The processor’s internal clock switches at higher frequencies than the system input clock (CLKIN). To generate the internal clock, the processor uses an internal phase-locked loop (PLL, see [Figure 4](#)). This PLL-based clocking minimizes the skew between the system clock (CLKIN) signal and the processor’s internal clock.

ADSP-21371/ADSP-21375

Voltage Controlled Oscillator

In application designs, the PLL multiplier value should be selected in such a way that the VCO frequency never exceeds f_{VCO} specified in Table 14.

- The product of CLKIN and PLLM must never exceed $1/2 f_{VCO}$ (max) in Table 14 if the input divider is not enabled (INDIV = 0).
- The product of CLKIN and PLLM must never exceed f_{VCO} (max) in Table 14 if the input divider is enabled (INDIV = 1).

The VCO frequency is calculated as follows:

$$f_{VCO} = 2 \times PLLM \times f_{INPUT}$$

$$f_{CCLK} = (2 \times PLLM \times f_{INPUT}) \div (2 \times PLLD)$$

where:

f_{VCO} = VCO output

PLLM = Multiplier value programmed in the PMCTL register. During reset, the PLLM value is derived from the ratio selected using the CLK_CFG pins in hardware.

PLLD = 1, 2, 4, 8 based on the PLLD value programmed on the PMCTL register. During reset this value is 1.

f_{INPUT} = Input frequency to the PLL.

$f_{INPUT} = CLKIN$ when the input divider is disabled or
 $f_{INPUT} = CLKIN \div 2$ when the input divider is enabled

Note the definitions of the clock periods that are a function of CLKIN and the appropriate ratio control shown in Table 12. All of the timing specifications for the ADSP-2137x peripherals are defined in relation to t_{PCLK} . See the peripheral specific section for each peripheral's timing information.

Table 12. Clock Periods

| Timing Requirements | Description |
|---------------------|---|
| t_{CK} | CLKIN Clock Period |
| t_{CCLK} | Processor Core Clock Period |
| t_{PCLK} | Peripheral Clock Period = $2 \times t_{CCLK}$ |

Figure 4 shows core to CLKIN relationships with external oscillator or crystal. The shaded divider/multiplier blocks denote where clock ratios can be set through hardware or software using the power management control register (PMCTL). For more information, see the ADSP-2137x SHARC Processor Hardware Reference.

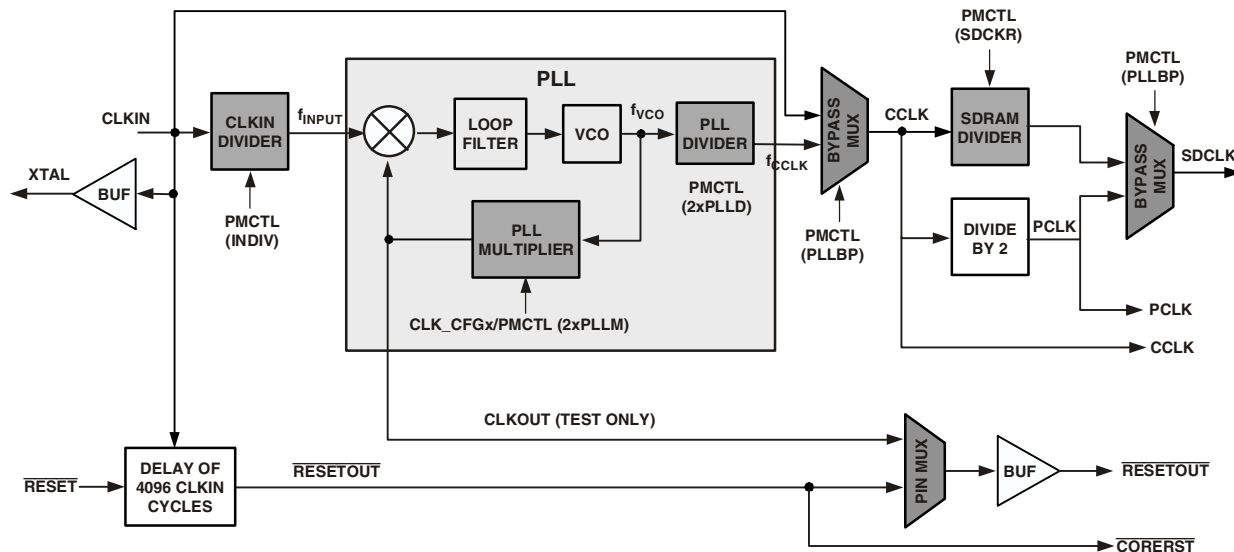

Figure 4. Core Clock and System Clock Relationship to CLKIN

Power-Up Sequencing

The timing requirements for processor startup are given in [Table 13](#).

Note that during power-up, a leakage current of approximately 200 μA may be observed on the $\overline{\text{RESET}}$ pin. This leakage current results from the weak internal pull-up resistor on this pin being enabled during power-up.

Table 13. Power Up Sequencing Timing Requirements (Processor Startup)

| Parameter | | Min | Max | Unit |
|---------------------------------|---|--|------|---------------|
| <i>Timing Requirements</i> | | | | |
| t_{RSTVDD} | $\overline{\text{RESET}}$ Low Before $V_{\text{DDINT}}/V_{\text{DDEXT}}$ On | 0 | | ns |
| t_{VDDDEVDD} | V_{DDINT} on Before V_{DDEXT} | -50 | +200 | ms |
| t_{CLKVDD}^1 | CLKIN Valid After $V_{\text{DDINT}}/V_{\text{DDEXT}}$ Valid | 0 | 200 | ms |
| t_{CLKRST} | CLKIN Valid Before $\overline{\text{RESET}}$ Deasserted | 10^2 | | μs |
| t_{PLLST} | PLL Control Setup Before $\overline{\text{RESET}}$ Deasserted | 20^3 | | μs |
| <i>Switching Characteristic</i> | | | | |
| t_{CORERST} | Core Reset Deasserted After $\overline{\text{RESET}}$ Deasserted | $4096 \times t_{\text{CK}} + 2 \times t_{\text{CCLK}}^{4,5}$ | | |

¹Valid $V_{\text{DDINT}}/V_{\text{DDEXT}}$ assumes that the supplies are fully ramped to their 1.2 and 3.3 volt rails. Voltage ramp rates can vary from microseconds to hundreds of milliseconds depending on the design of the power supply subsystem.

²Assumes a stable CLKIN signal, after meeting worst-case startup timing of crystal oscillators. Refer to your crystal oscillator manufacturer's datasheet for startup time. Assume a 25 ms maximum oscillator startup time if using the XTAL pin and internal oscillator circuit in conjunction with an external crystal.

³Based on CLKIN cycles.

⁴Applies after the power-up sequence is complete. Subsequent resets require a minimum of four CLKIN cycles for $\overline{\text{RESET}}$ to be held low in order to properly initialize and propagate default states at all I/O pins.

⁵The 4096 cycle count depends on t_{SRST} specification in [Table 15](#). If setup time is not met, one additional CLKIN cycle may be added to the core reset time, resulting in 4097 cycles maximum.

Figure 5. Power-Up Sequencing

ADSP-21371/ADSP-21375

Clock Input

Table 14. Clock Input

| Parameter | 266 MHz | | Unit | |
|----------------------------|----------------------------------|--------------------|------|-----|
| | Min | Max | | |
| <i>Timing Requirements</i> | | | | |
| t_{CK} | CLKIN Period | 22.5 ¹ | 100 | ns |
| t_{CKL} | CLKIN Width Low | 11.25 ¹ | 45 | ns |
| t_{CKH} | CLKIN Width High | 11.25 ¹ | 45 | ns |
| t_{CKRF} | CLKIN Rise/Fall (0.4 V to 2.0 V) | | 6 | ns |
| t_{CCLK} ² | CCLK Period | 3.75 | 10 | ns |
| f_{VCO} | VCO Frequency | 200 | 800 | MHz |

¹ Applies only for CLKCFG1-0 = 00 and default values for PLL control bits in the PMCTL register.

² Any changes to PLL control bits in the PMCTL register must meet core clock timing specification t_{CCLK} .

Figure 6. Clock Input

Clock Signals

The processor can use an external clock or a crystal. See the CLKIN pin description in Table 9. Programs can configure the processor to use its internal clock generator by connecting the necessary components to CLKIN and XTAL. Figure 7 shows the component connections used for a crystal operating in fundamental mode. Note that the clock rate is achieved using a 16.67 MHz crystal and a PLL multiplier ratio 16:1 (CCLK:CLKIN achieves a clock speed of 266 MHz). To achieve the full core clock rate, programs need to configure the multiplier bits in the PMCTL register.

R2 SHOULD BE CHOSEN TO LIMIT CRYSTAL DRIVE POWER. REFER TO CRYSTAL MANUFACTURER'S SPECIFICATIONS

*TYPICAL VALUES

Figure 7. 266 MHz Operation (Fundamental Mode Crystal)

Reset

Table 15. Reset

| Parameter | Min | Max | Unit |
|---|-------------------|-----|------|
| <i>Timing Requirements</i> | | | |
| t_{WRST}^1 $\overline{\text{RESET}}$ Pulse Width Low | $4 \times t_{CK}$ | | ns |
| t_{SRST} $\overline{\text{RESET}}$ Setup Before CLKIN Low | 8 | | ns |

¹Applies after the power-up sequence is complete. At power-up, the processor's internal phase-locked loop requires no more than 100 μs while $\overline{\text{RESET}}$ is low, assuming stable V_{DD} and CLKIN (not including start-up time of external clock oscillator).

Figure 8. Reset

Running Reset

The following timing specification applies to $\overline{\text{RESETOUT}}/\overline{\text{RUNRSTIN}}$ pin when it is configured as $\overline{\text{RUNRSTIN}}$.

Table 16. Running Reset

| Parameter | Min | Max | Unit |
|---|-------------------|-----|------|
| <i>Timing Requirements</i> | | | |
| $t_{WRUNRST}$ Running $\overline{\text{RESET}}$ Pulse Width Low | $4 \times t_{CK}$ | | ns |
| $t_{SRUNRST}$ Running $\overline{\text{RESET}}$ Setup Before CLKIN High | 8 | | ns |

Figure 9. Running Reset

ADSP-21371/ADSP-21375

Core Timer

The following timing specification applies to FLAG3 when it is configured as the core timer (TMREXP pin).

Table 17. Core Timer

| Parameter | Min | Max | Unit |
|---------------------------------|-------------------------|-----|------|
| <i>Switching Characteristic</i> | | | |
| t_{WCTIM} TMREXP Pulse Width | $4 \times t_{PCLK} - 1$ | | ns |

Figure 10. Core Timer

Interrupts

The following timing specification applies to the FLAG0, FLAG1, and FLAG2 pins when they are configured as $\overline{IRQ0}$, $\overline{IRQ1}$, and $\overline{IRQ2}$ interrupts as well as the DAI_P20-1 and DPI_P14-1 pins when they are configured as interrupts.

Table 18. Interrupts

| Parameter | Min | Max | Unit |
|---|-------------------------|-----|------|
| <i>Timing Requirement</i> | | | |
| t_{IPW} \overline{IRQx} Pulse Width | $2 \times t_{PCLK} + 2$ | | ns |

Figure 11. Interrupts

Timer PWM_OUT Cycle Timing

The following timing specification applies to Timer0 and Timer1 in PWM_OUT (pulse-width modulation) mode. Timer signals are routed to the DPI_P14-1 pins through the DPI SRU. Therefore, the specifications provided below are valid at the DPI_P14-1 pins.

Table 19. Timer PWM_OUT Timing

| Parameter | Min | Max | Unit |
|-------------------------------------|-------------------------|---|------|
| <i>Switching Characteristic</i> | | | |
| t_{PWMO} Timer Pulse Width Output | $2 \times t_{PCLK} - 2$ | $2 \times (2^{31} - 1) \times t_{PCLK}$ | ns |

Figure 12. Timer PWM_OUT Timing

Timer WDT_CAP Timing

The following timing specification applies to Timer0 and Timer1 in WDT_CAP (pulse width count and capture) mode. Timer signals are routed to the DPI_P14-1 pins through the SRU. Therefore, the specifications provided below are valid at the DPI_P14-1 pins.

Table 20. Timer Width Capture Timing

| Parameter | Min | Max | Unit |
|-----------------------------|---------------------|---|------|
| <i>Timing Requirement</i> | | | |
| t_{PWI} Timer Pulse Width | $2 \times t_{PCLK}$ | $2 \times (2^{31} - 1) \times t_{PCLK}$ | ns |

Figure 13. Timer Width Capture Timing

ADSP-21371/ADSP-21375

Pin to Pin Direct Routing (DAI and DPI)

For direct pin connections only (for example, DAI_PB01_I to DAI_PB02_O).

Table 21. DAI/DPI Pin to Pin Routing

| Parameter | Min | Max | Unit |
|--|-----|-----|------|
| <i>Timing Requirement</i> | | | |
| t_{DPIO} Delay DAI/DPI Pin Input Valid to DAI/DPI Output Valid | 1.5 | 10 | ns |

Figure 14. DAI/DPI Pin to Pin Direct Routing

Precision Clock Generator (Direct Pin Routing)

This timing is only valid when the SRU is configured such that the precision clock generator (PCG) takes its inputs directly from the DAI pins (via pin buffers) and sends its outputs directly to the DAI pins. For the other cases, where the PCG's

inputs and outputs are not directly routed to/from DAI pins (via pin buffers) there is no timing data available. All timing parameters and switching characteristics apply to external DAI pins (DAI_P01 through DAI_P20).

Table 22. Precision Clock Generator (Direct Pin Routing)

| Parameter | 1.2 V, 266 MHz | | Unit |
|----------------------------------|---|---|--|
| | Min | Max | |
| <i>Timing Requirements</i> | | | |
| t_{PCGIP} | Input Clock Period | $t_{PCLK} \times 4$ | ns |
| t_{STRIG} | PCG Trigger Setup Before Falling Edge of PCG Input Clock | 4.5 | ns |
| t_{HTRIG} | PCG Trigger Hold After Falling Edge of PCG Input Clock | 3 | ns |
| <i>Switching Characteristics</i> | | | |
| t_{DPCGIO} | PCG Output Clock and Frame Sync Active Edge Delay After PCG Input Clock | 2.5 | 10 |
| $t_{DTRIGCLK}$ | PCG Output Clock Delay After PCG Trigger | $2.5 + ((2.5) \times t_{PCGIW})$ | $10 + ((2.5) \times t_{PCGIW})$ |
| $t_{DTRIGFS}$ | PCG Frame Sync Delay After PCG Trigger | $2.5 + ((2.5 + D - PH) \times t_{PCGIW})$ | $10 + ((2.5 + D - PH) \times t_{PCGIW})$ |
| t_{PCGOW}^1 | Output Clock Period | $2 \times t_{PCGIW} - 1$ | ns |

D = FSxDIV, PH = FSxPHASE. For more information, see the ADSP-2137x SHARC Processor Hardware Reference, "Precision Clock Generators" chapter.

¹Normal mode of operation.

ADSP-21371/ADSP-21375

Flags

The timing specifications provided below apply to the FLAG3-0 and DPI_P14-1 pins, and the DATA31-0 pins. See [Table 9](#) on [Page 13](#) for more information on flag use.

Table 23. Flags

| Parameter | Min | Max | Unit |
|--|-------------------------|-----|------|
| <i>Timing Requirement</i> | | | |
| t_{FIPW} DPI_P14-1, DATA31-0, FLAG3-0 _{IN} Pulse Width | $2 \times t_{PCLK} + 3$ | | ns |
| <i>Switching Characteristic</i> | | | |
| t_{FOPW} DPI_P14-1, DATA31-0, FLAG3-0 _{OUT} Pulse Width | $2 \times t_{PCLK} - 2$ | | ns |

Figure 16. Flags

SDRAM Interface Timing

Maximum SDRAM frequency for 1.2 V is 133 MHz SDCLK.

Table 24. SDRAM Interface Timing¹

| Parameter | 1.2 V, 266 MHz | | Unit |
|----------------------------------|--|------|------|
| | Min | Max | |
| <i>Timing Requirements</i> | | | |
| t_{SSDAT} | DATA Setup Before SDCLK | 0.58 | ns |
| t_{HSDAT} | DATA Hold After SDCLK | 2.2 | ns |
| <i>Switching Characteristics</i> | | | |
| t_{SDCLK} | SDCLK Period | 7.5 | ns |
| t_{SDCLKH} | SDCLK Width High | 3 | ns |
| t_{SDCLKL} | SDCLK Width Low | 3 | ns |
| t_{DCAD} | Command, ADDR, Data Delay After SDCLK ² | 5.3 | ns |
| t_{HCAD} | Command, ADDR, Data Hold After SDCLK ² | 1.3 | ns |
| t_{DSDAT} | Data Disable After SDCLK | 5.3 | ns |
| t_{ENSDAT} | Data Enable After SDCLK | 1.6 | ns |

¹ For $F_{CLK} = 133$ MHz (SDCLK ratio = 1:2).

² Command pins include: \overline{SDCAS} , \overline{SDRAS} , \overline{SDWE} , \overline{MSx} , SDA10, and SDCKE.

Figure 17. SDRAM Interface Timing for 133 MHz SDCLK

ADSP-21371/ADSP-21375

Memory Read—Bus Master

Use these specifications for asynchronous interfacing to memories. Note that timing for ACK, DATA, \overline{RD} , \overline{WR} , and strobe timing parameters only apply to asynchronous access mode.

Table 25. Memory Read—Bus Master

| Parameter | | 1.2 V, 266 MHz | | Unit |
|----------------------------------|---|------------------------|------------------------|------|
| | | Min | Max | |
| <i>Timing Requirements</i> | | | | |
| t_{DAD} | Address, Selects Delay to Data Valid ^{1,2} | | $W + t_{SDCLK} - 5.12$ | ns |
| t_{DRLD} | \overline{RD} Low to Data Valid ¹ | | $W - 3$ | ns |
| t_{SDS} | Data Setup to \overline{RD} High | 2.2 | | ns |
| t_{HDRH} | Data Hold from \overline{RD} High ^{3,4} | 0 | | ns |
| t_{DAAK} | ACK Delay from Address, Selects ^{2,5} | | $t_{SDCLK} - 10. + W$ | ns |
| t_{DSAK} | ACK Delay from \overline{RD} Low ⁴ | | $W - 7.0$ | ns |
| <i>Switching Characteristics</i> | | | | |
| t_{DRHA} | Address Selects Hold After \overline{RD} High | RHC + 0.38 | | ns |
| t_{DARL} | Address Selects to \overline{RD} Low ² | $t_{SDCLK} - 3.3$ | | ns |
| t_{RW} | \overline{RD} Pulse Width | $W - 1.4$ | | ns |
| t_{RWR} | \overline{RD} High to \overline{WR} , \overline{RD} , Low | $HI + t_{SDCLK} - 0.8$ | | ns |

$$W = (\text{number of wait states specified in AMICTLx register}) \times t_{SDCLK}$$

$$HI = RHC + IC \quad (RHC = (\text{number of Read Hold Cycles specified in AMICTLx register}) \times t_{SDCLK})$$

$$IC = (\text{number of idle cycles specified in AMICTLx register}) \times t_{SDCLK}$$

$$H = (\text{number of hold cycles specified in AMICTLx register}) \times t_{SDCLK}$$

¹ Data delay/setup: System must meet t_{DAD} , t_{DRLD} , or t_{SDS} .

² The falling edge of MSx, is referenced.

³ Note that timing for ACK, DATA, \overline{RD} , \overline{WR} , and strobe timing parameters only apply to asynchronous access mode.

⁴ Data hold: User must meet t_{HDRH} in asynchronous access mode. See [Test Conditions on Page 45](#) for the calculation of hold times given capacitive and dc loads.

⁵ ACK delay/setup: User must meet t_{DAAK} , or t_{DSAK} , for deassertion of ACK (low). For asynchronous assertion of ACK (high) user must meet t_{DAAK} or t_{DSAK} .

Figure 18. Memory Read—Bus Master

Memory Write—Bus Master

Use these specifications for asynchronous interfacing to memories. Note that timing for ACK, DATA, \overline{RD} , \overline{WR} , and strobe timing parameters only apply to asynchronous access mode.

Table 26. Memory Write—Bus Master

| Parameter | 1.2 V, 266 MHz | | Unit |
|----------------------------------|---|-----|------|
| | Min | Max | |

| <i>Switching Characteristics</i> | | | |
| t_{DAWH} | Address, Selects to \overline{WR} Deasserted ² | | ns |
| t_{DAWL} | Address, Selects to \overline{WR} Low ² | | ns |
| t_{WW} | \overline{WR} Pulse Width | | ns |
| t_{DDWH} | Data Setup Before \overline{WR} High | | ns |
| t_{DWHA} | Address Hold After \overline{WR} Deasserted | | ns |
| t_{DWHd} | Data Hold After \overline{WR} Deasserted | | ns |
| t_{DATRWH} | Data Disable After \overline{WR} Deasserted ⁴ | | ns |
| t_{WWR} | \overline{WR} High to \overline{RD} Low | | ns |
| t_{DDWR} | Data Disable Before \overline{RD} Low | | ns |
| t_{WDE} | \overline{WR} Low to Data Enabled | | ns |

$W = (\text{number of wait states specified in AMICTLx register}) \times t_{SDCLK}$ $H = (\text{number of hold cycles specified in AMICTLx register}) \times t_{SDCLK}$

¹ ACK delay/setup: System must meet t_{DAAK} , or t_{DSAK} , for deassertion of ACK (low). For asynchronous assertion of ACK (high) user must meet t_{DAAK} or t_{DSAK} .

² The falling edge of MSx is referenced.

³ Note that timing for ACK, DATA, \overline{RD} , \overline{WR} , and strobe timing parameters only applies to asynchronous access mode.

⁴ See [Test Conditions on Page 45](#) for calculation of hold times given capacitive and dc loads.

Figure 19. Memory Write—Bus Master

ADSP-21371/ADSP-21375

Serial Ports

To determine whether communication is possible between two devices at clock speed n , the following specifications must be confirmed: 1) frame sync delay and frame sync setup and hold, 2) data delay and data setup and hold, and 3) serial clock (SCLK) width.

Serial port signals are routed to the DAI_P20–1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DAI_P20–1 pins.

Table 27. Serial Ports—External Clock

| Parameter | 1.2 V, 266 MHz | | Unit |
|---|------------------------------------|------|------|
| | Min | Max | |
| <i>Timing Requirements</i> | | | |
| t_{SFSE}^1 Frame Sync Setup Before SCLK (Externally Generated Frame Sync in either Transmit or Receive Mode) | 2.5 | | ns |
| t_{HFSE}^1 Frame Sync Hold After SCLK (Externally Generated Frame Sync in either Transmit or Receive Mode) | 2.5 | | ns |
| t_{SDRE}^1 Receive Data Setup Before Receive SCLK | 2.5 | | ns |
| t_{HDRE}^1 Receive Data Hold After SCLK | 2.5 | | ns |
| t_{SCLKW} SCLK Width | $(t_{PCLK} \times 4) \div 2 - 0.5$ | | ns |
| t_{SCLK} SCLK Period | $t_{PCLK} \times 4$ | | ns |
| <i>Switching Characteristics</i> | | | |
| t_{DFSE}^2 Frame Sync Delay After SCLK (Internally Generated Frame Sync in either Transmit or Receive Mode) | | 10.5 | ns |
| t_{HOFSE}^2 Frame Sync Hold After SCLK (Internally Generated Frame Sync in either Transmit or Receive Mode) | 2 | | ns |

| $t_{DDTLFSE}^1$ Data Delay from Late External Transmit Frame Sync or External Receive Frame Sync with MCE = 1, MFD = 0 | | 10 | ns |
| $t_{DDTENFS}^1$ Data Enable for MCE = 1, MFD = 0 | 0.5 | | ns |

¹The $t_{DDTLFSE}$ and $t_{DDTENFS}$ parameters apply to left-justified sample pair as well as DSP serial mode, and MCE = 1, MFD = 0.

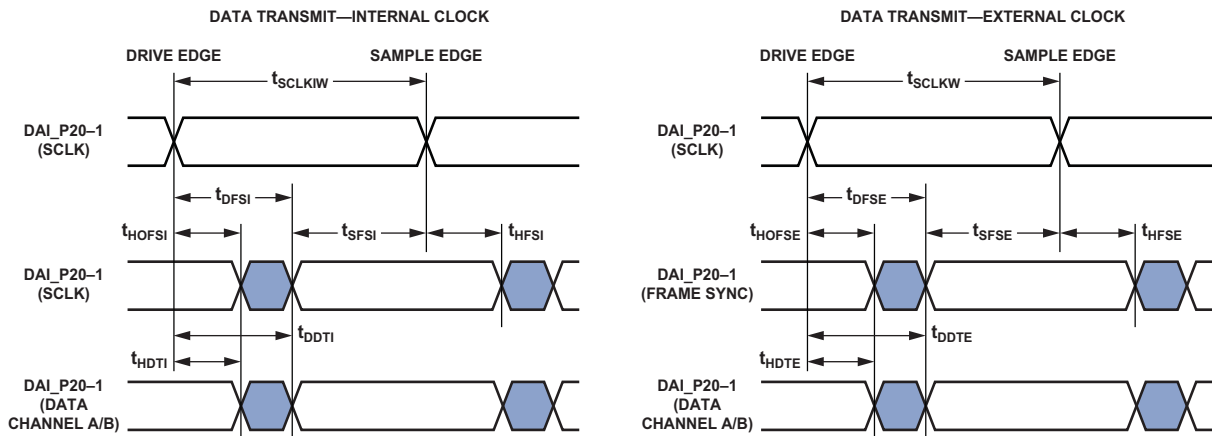

NOTES
 1. SERIAL PORT SIGNALS (SCLK, FS, DATA CHANNEL A/B) ARE ROUTED TO THE DAI_P20-1 PINS USING THE SRU. THE TIMING SPECIFICATIONS PROVIDED HERE ARE VALID AT THE DAI_P20-1 PINS. THE CHARACTERIZED SPORT AC TIMINGS ARE APPLICABLE WHEN INTERNAL CLOCKS AND FRAMES ARE LOOPED BACK FROM THE PIN, NOT ROUTED DIRECTLY THROUGH THE SRU.

Figure 20. External Late Frame Sync¹

¹This figure reflects changes made to support left-justified sample pair mode.

NOTES
 1. EITHER THE RISING EDGE OR THE FALLING EDGE OF SCLK (EXTERNAL OR INTERNAL) CAN BE USED AS THE ACTIVE SAMPLING EDGE.

NOTES
 1. EITHER THE RISING EDGE OR THE FALLING EDGE OF SCLK (EXTERNAL OR INTERNAL) CAN BE USED AS THE ACTIVE SAMPLING EDGE.

Figure 21. Serial Ports

ADSP-21371/ADSP-21375

Input Data Port (IDP)

The timing requirements for the IDP are given in Table 31. IDP signals are routed to the DAI_P20-1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DAI_P20-1 pins.

Table 31. Input Data Port (IDP)

| Parameter | 1.2 V, 266 MHz | | Unit |
|----------------------------|--|----------------------------------|------|
| | Min | Max | |
| <i>Timing Requirements</i> | | | |
| t_{SIFS}^1 | Frame Sync Setup Before Serial Clock Rising Edge | 3.8 | ns |
| t_{SIHFS}^1 | Frame Sync Hold After Serial Clock Rising Edge | 2.5 | ns |
| t_{SISD}^1 | Data Setup Before Serial Clock Rising Edge | 2.5 | ns |
| t_{SIHD}^1 | Data Hold After Serial Clock Rising Edge | 2.5 | ns |
| $t_{IDPCLKW}$ | Clock Width | $(t_{PCLK} \times 4) \div 2 - 1$ | ns |
| t_{IDPCLK} | Clock Period | $t_{PCLK} \times 4$ | ns |

¹ The data, serial clock, and frame sync signals can come from any of the DAI pins. Serial clock and frame sync can also come via PCG or SPORTs. PCG's input can be either CLKIN or any of the DAI pins.

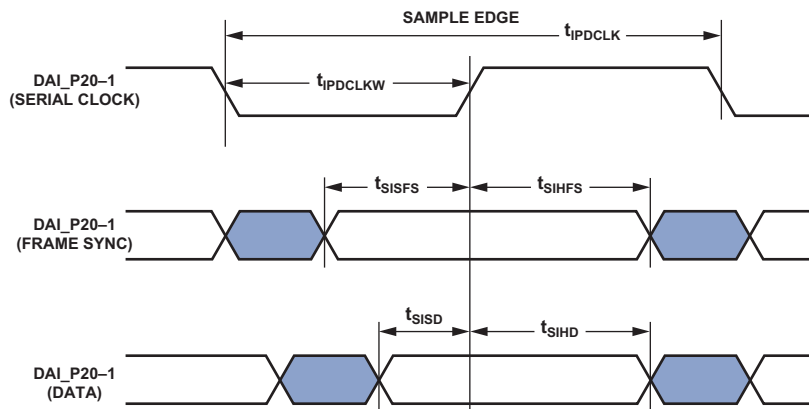

Figure 22. IDP Master Timing

Parallel Data Acquisition Port (PDAP)

The timing requirements for the PDAP are provided in [Table 32](#). PDAP is the parallel mode operation of Channel 0 of the IDP. For details on the operation of the PDAP, see the PDAP chapter of the *ADSP-2137x SHARC Processor Hardware Reference*.

Note that the 20-bits of external PDAP data can be provided through the external port DATA31–12 pins. On the ADSP-21375 processors, PDAP can not be multiplexed on the external port (since only DATA15–0). Use the SRU DAI instead.

Table 32. Parallel Data Acquisition Port (PDAP)

| Parameter | Min | Max | Unit |
|----------------------------------|--|-----|----------------------------------|
| <i>Timing Requirements</i> | | | |
| $t_{SPCLKEN}^1$ | PDAP_CLKEN Setup Before PDAP_CLK Sample Edge | | ns |
| $t_{HPCLKEN}^1$ | PDAP_CLKEN Hold After PDAP_CLK Sample Edge | | ns |
| t_{PDSD}^1 | PDAP_DAT Setup Before Serial Clock PDAP_CLK Sample Edge | | ns |
| t_{PDHD}^1 | PDAP_DAT Hold After Serial Clock PDAP_CLK Sample Edge | | ns |
| t_{PDCLKW} | Clock Width | | $(t_{PCLK} \times 4) \div 2 - 3$ |
| t_{PDCLK} | Clock Period | | $t_{PCLK} \times 4$ |
| <i>Switching Characteristics</i> | | | |
| t_{PDHLDD} | Delay of PDAP Strobe After Last PDAP_CLK Capture Edge for a Word | | $2 \times t_{PCLK} + 3$ |
| $t_{PDSTRIB}$ | PDAP Strobe Pulse Width | | $2 \times t_{PCLK} - 1$ |

¹Data source pins are DATA31–12 or DAI pins. Source pins for serial clock and frame sync are: 1) DATA11–10 pins, 2) DAI pins

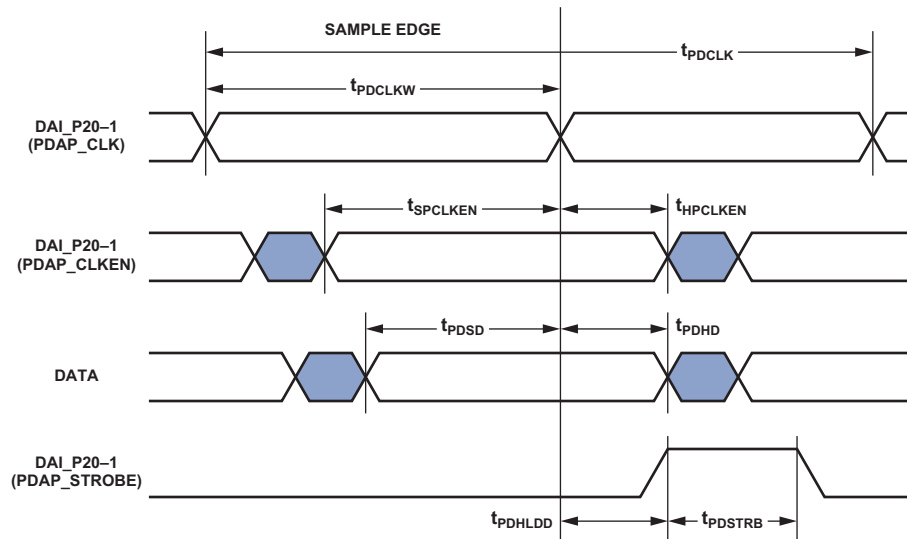

Figure 23. PDAP Timing

ADSP-21371/ADSP-21375

Pulse-Width Modulation Generators (PWM)

For the ADSP-21371, the following timing specifications apply when the DATA31–16 pins are configured as PWM.

Pulse-width modulation generator information does not apply to the ADSP-21375.

Table 33. Pulse-Width Modulation (PWM) Timing

| Parameter | Min | Max | Unit |
|-----------------------------------|---------------------------|--------------------------------------|------|
| <i>Switching Characteristics</i> | | | |
| t_{PWMW} PWM Output Pulse Width | $t_{PCLK} - 2.5$ | $(2^{16} - 2) \times t_{PCLK} - 2.5$ | ns |
| t_{PWMP} PWM Output Period | $2 \times t_{PCLK} - 2.5$ | $(2^{16} - 1) \times t_{PCLK} - 2.5$ | ns |

Figure 24. PWM Timing

S/PDIF Transmitter

For the ADSP-21371, serial data input to the S/PDIF transmitter can be formatted as left-justified, I²S, or right-justified with word widths of 16-, 18-, 20-, or 24-bits. The following sections provide timing for the transmitter.

S/PDIF Transmitter-Serial Input Waveforms

Figure 25 shows the right-justified mode. LRCLK is high for the left channel and low for the right channel. Data is valid on the rising edge of serial clock. The MSB is delayed 12-bit clock periods (in 20-bit output mode) or 16-bit clock periods (in 16-bit

output mode) from an LRCLK transition, so that when there are 64 serial clock periods per LRCLK period, the LSB of the data will be right-justified to the next LRCLK transition.

S/PDIF transmitter information does not apply to the ADSP-21375.

Figure 26 shows the default I²S-justified mode. LRCLK is low for the left channel and high for the right channel. Data is valid on the rising edge of serial clock. The MSB is left-justified to an LRCLK transition but with a single serial clock period delay.

Figure 27 shows the left-justified mode. LRCLK is high for the left channel and low for the right channel. Data is valid on the rising edge of serial clock. The MSB is left-justified to an LRCLK transition with no MSB delay.

Figure 25. Right-Justified Mode

Figure 26. I²S-Justified Mode

Figure 27. Left-Justified Mode

ADSP-21371/ADSP-21375

S/PDIF Transmitter Input Data Timing

The timing requirements for the S/PDIF transmitter are given in Table 34. Input signals are routed to the DAI_P20-1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DAI_P20-1 pins.

Table 34. S/PDIF Transmitter Input Data Timing

| Parameter | 1.2 V, 266 MHz | | Unit |
|----------------------------|--|-----|------|
| | Min | Max | |
| <i>Timing Requirements</i> | | | |
| t_{SIFS}^1 | Frame Sync Setup Before Serial Clock Rising Edge | 3 | ns |
| t_{SIHRS}^1 | Frame Sync Hold After Serial Clock Rising Edge | 3 | ns |
| t_{SISD}^1 | Data Setup Before Serial Clock Rising Edge | 3 | ns |
| t_{SIHD}^1 | Data Hold After Serial Clock Rising Edge | 3 | ns |
| $t_{SITXCLKW}$ | Transmit Clock Width | 9 | ns |
| $t_{SITXCLK}$ | Transmit Clock Period | 20 | ns |
| $t_{SISCLKW}$ | Clock Width | 36 | ns |
| t_{SISCLK} | Clock Period | 80 | ns |

¹ The data, serial clock, and frame sync can come from any of the DAI pins. Serial clock and frame sync can also come via PCG or SPORTs. PCG's input can be either CLKIN or any of the DAI pins.

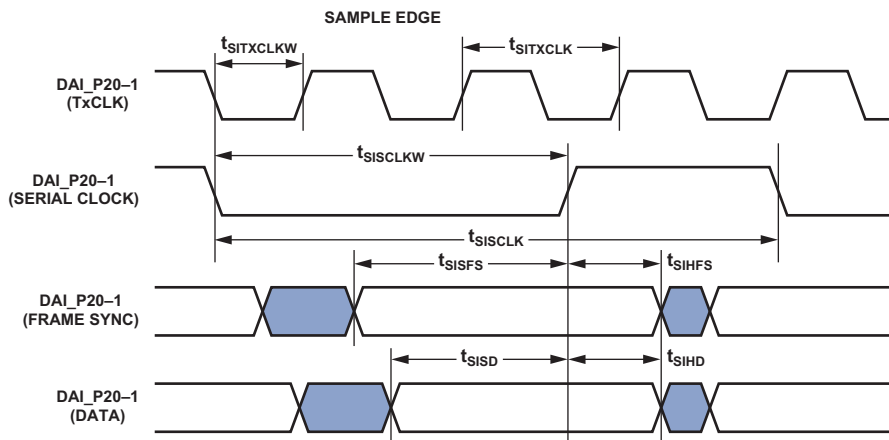

Figure 28. S/PDIF Transmitter Input Timing

Oversampling Clock (TxCLK) Switching Characteristics

The S/PDIF transmitter has an oversampling clock. This TxCLK input is divided down to generate the biphase clock.

Table 35. Oversampling Clock (TxCLK) Switching Characteristics

| Parameter | Max | Unit |
|--|--|------|
| TxCLK Frequency for TxCLK = 384 × Frame Sync | Oversampling Ratio × Frame Sync ≤ 1/ $t_{SITXCLK}$ | MHz |
| TxCLK Frequency for TxCLK = 256 × Frame Sync | 49.2 | MHz |
| Frame Rate (FS) | 192.0 | kHz |

S/PDIF Receiver

For the ADSP-21371, the following section describes timing as it relates to the S/PDIF receiver.

Internal Digital PLL Mode

In the internal digital phase-locked loop mode the internal PLL (digital PLL) generates the $512 \times$ Frame Sync clock. The S/PDIF receiver information does not apply to the ADSP-21375.

Table 36. S/PDIF Receiver Internal Digital PLL Mode Timing

| Parameter | 1.2 V, 266 MHz | | Unit |
|----------------------------------|--|-----|------|
| | Min | Max | |
| <i>Switching Characteristics</i> | | | |
| t_{DFSI} | LRCLK Delay After Serial Clock | | ns |
| t_{HOFSI} | LRCLK Hold After Serial Clock | | ns |
| t_{DDTI} | Transmit Data Delay After Serial Clock | | ns |
| t_{HDTI} | Transmit Data Hold After Serial Clock | | ns |
| t_{SCLKIW}^1 | Transmit Serial Clock Width | | ns |

¹Serial lock frequency is $64 \times$ Frame Sync where FS = the frequency of LRCLK.

Figure 29. S/PDIF Receiver Internal Digital PLL Mode Timing

ADSP-21371/ADSP-21375

SPI Interface—Master

The processor contains two SPI ports. Both primary and secondary are available through DPI only. The timing provided in Table 37 and Table 38 applies to both.

Table 37. SPI Interface Protocol—Master Switching and Timing Specifications

| Parameter | | Min | Max | Unit |
|----------------------------------|---|-------------------------|-----|------|
| <i>Timing Requirements</i> | | | | |
| t_{SSPIDM} | Data Input Valid To SPICLK Edge (Data Input Setup Time) | 8.2 | | ns |
| t_{HSPIDM} | SPICLK Last Sampling Edge To Data Input Not Valid | 2 | | ns |
| <i>Switching Characteristics</i> | | | | |
| $t_{SPICLKM}$ | Serial Clock Cycle | $8 \times t_{PCLK} - 2$ | | ns |
| t_{SPICHM} | Serial Clock High Period | $4 \times t_{PCLK} - 2$ | | ns |
| t_{SPICLM} | Serial Clock Low Period | $4 \times t_{PCLK} - 2$ | | ns |
| $t_{DDSPIDM}$ | SPICLK Edge to Data Out Valid (Data Out Delay Time) | | 2.5 | ns |
| $t_{HDSPIDM}$ | SPICLK Edge to Data Out Not Valid (Data Out Hold Time) | $4 \times t_{PCLK} - 2$ | | ns |
| t_{SDSCIM} | FLAG3-0IN (SPI device select) Low to First SPICLK Edge | $4 \times t_{PCLK} - 2$ | | ns |
| t_{HDSM} | Last SPICLK Edge to FLAG3-0IN High | $4 \times t_{PCLK} - 2$ | | ns |
| t_{SPITDM} | Sequential Transfer Delay | $4 \times t_{PCLK} - 1$ | | ns |

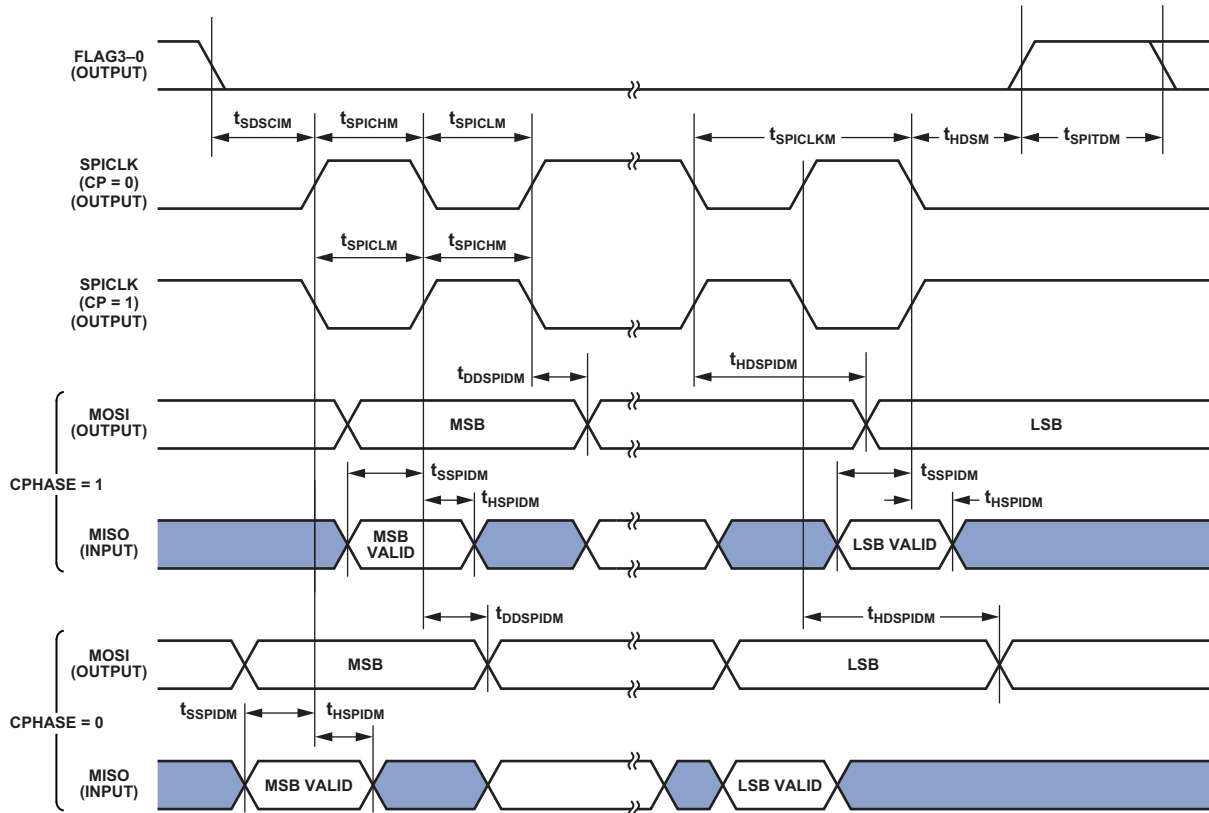

Figure 30. SPI Master Timing

SPI Interface—Slave

Table 38. SPI Interface Protocol—Slave Switching and Timing Specifications

| Parameter | | 1.2 V, 266 MHz | | Unit |
|----------------------------------|---|--|---------------------|------|
| | | Min | Max | |
| <i>Timing Requirements</i> | | | | |
| $t_{SPICLKs}$ | Serial Clock Cycle | $4 \times t_{PCLK} - 2$ | | ns |
| t_{SPICHS} | Serial Clock High Period | $2 \times t_{PCLK} - 2$ | | ns |
| t_{SPICLS} | Serial Clock Low Period | $2 \times t_{PCLK} - 2$ | | ns |
| t_{SDSCO} | \overline{SPIDS} Assertion to First SPICLK Edge CPHASE = 0 CPHASE = 1 | $2 \times t_{PCLK}$ $2 \times t_{PCLK}$ | | ns |
| t_{HDS} | Last SPICLK Edge to \overline{SPIDS} Not Asserted (CPHASE=0) | $2 \times t_{PCLK}$ | | ns |
| t_{SSPIDS} | Data Input Valid to SPICLK edge (Data Input Set-up Time) | 2 | | ns |
| t_{HSPIDS} | SPICLK Last Sampling Edge to Data Input Not Valid | 2 | | ns |
| t_{SDPPW} | \overline{SPIDS} Deassertion Pulse Width (CPHASE=0) | $2 \times t_{PCLK}$ | | ns |
| <i>Switching Characteristics</i> | | | | |
| t_{DSOE} | \overline{SPIDS} Assertion to Data Out Active | 0 | 6.8 | ns |
| t_{DSDHI} | \overline{SPIDS} Deassertion to Data High Impedance | 0 | 6.8 | ns |
| $t_{DDSPIDS}$ | SPICLK Edge to Data Out Valid (Data Out Delay Time) | | 9.5 | ns |
| $t_{HDSPIDS}$ | SPICLK Edge to Data Out Not Valid (Data Out Hold Time) | $2 \times t_{PCLK}$ | | ns |
| t_{DSOV} | \overline{SPIDS} Assertion to Data Out Valid (CPHASE = 0) | | $5 \times t_{PCLK}$ | ns |

Figure 31. SPI Slave Timing

ADSP-21371/ADSP-21375

Universal Asynchronous Receiver-Transmitter (UART) Port—Receive and Transmit Timing

Figure 32 describes UART port receive and transmit operations. The maximum baud rate is $PCLK/16$ where $PCLK = 1/t_{PCLK}$. As shown in Figure 32 there is some latency between the

generation of internal UART interrupts and the external data operations. These latencies are negligible at the data transmission rates for the UART.

Table 39. UART Port

| Parameter | Min | Max | Unit |
|---------------------------------------|----------------|-----|------|
| <i>Timing Requirement</i> | | | |
| t_{TXD}^1 Incoming Data Pulse Width | $16t_{PCLK}-1$ | | ns |
| <i>Switching Characteristic</i> | | | |
| t_{RXD}^1 Incoming Data Pulse Width | $16t_{PCLK}-1$ | | ns |

¹UART signals TXD and RXD are routed through DPI P14-1 pins using the SRU.

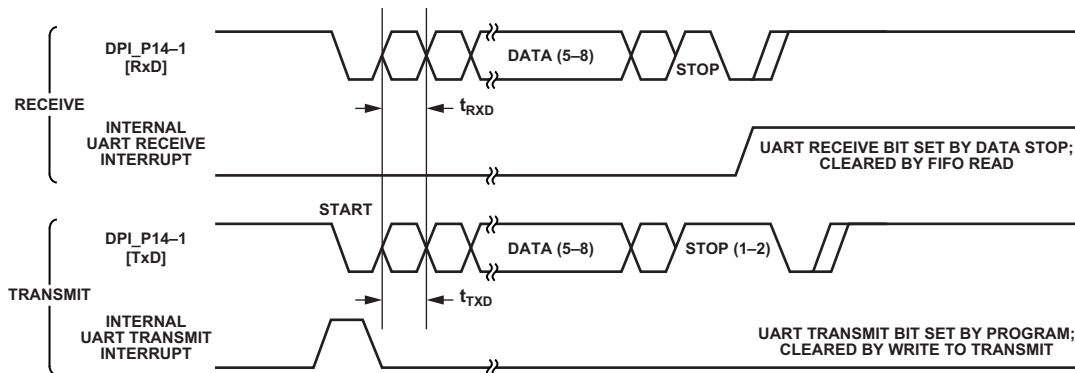

Figure 32. UART Port—Receive and Transmit Timing

TWI Controller Timing

Table 40 and Figure 33 provide timing information for the TWI interface. Input signals (SCL, SDA) are routed to the DPI_P14-1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DPI_P14-1 pins.

Table 40. Characteristics of the SDA and SCL Bus Lines for F/S-Mode TWI Bus Devices¹

| Parameter | | Standard Mode | | Fast Mode | | Unit |
|-------------|--|---------------|-----|-----------|-----|---------|
| | | Min | Max | Min | Max | |
| f_{SCL} | SCL Clock Frequency | 0 | 100 | 0 | 400 | kHz |
| t_{HDSTA} | Hold Time (repeated) Start Condition. After This Period, the First Clock Pulse is Generated. | 4.0 | | 0.6 | | μ s |
| t_{LOW} | Low Period of the SCL Clock | 4.7 | | 1.3 | | μ s |
| t_{HIGH} | High Period of the SCL Clock | 4.0 | | 0.6 | | μ s |
| t_{SUSTA} | Setup Time for a Repeated Start Condition | 4.7 | | 0.6 | | μ s |
| t_{HDDAT} | Data Hold Time for TWI-Bus Devices | 0 | | 0 | | μ s |
| t_{SUDAT} | Data Setup Time | 250 | | 100 | | ns |
| t_{SUSTO} | Setup Time for Stop Condition | 4.0 | | 0.6 | | μ s |
| t_{BUF} | Bus Free Time Between a Stop and Start Condition | 4.7 | | 1.3 | | μ s |

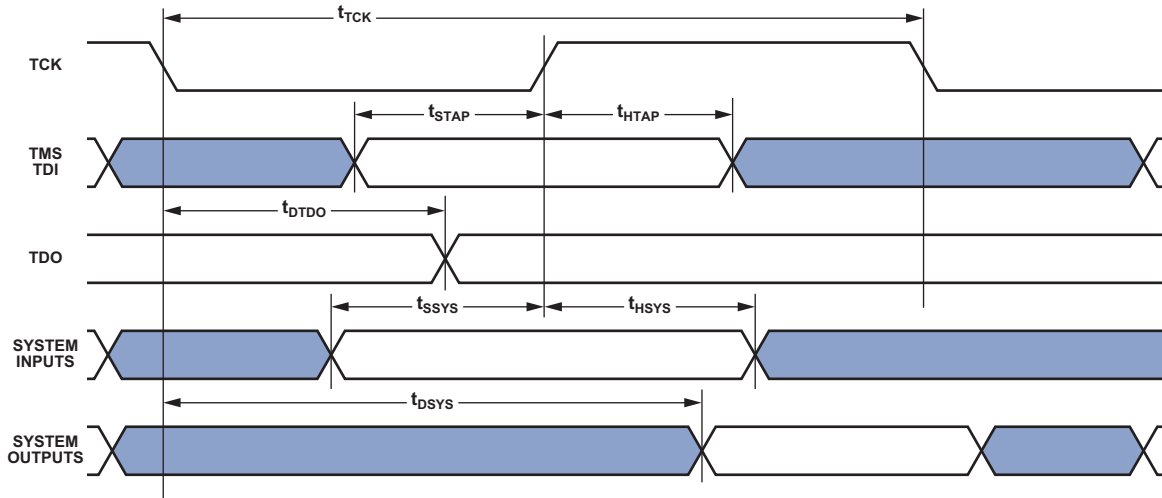

Figure 34. IEEE 1149.1 JTAG Test Access Port

OUTPUT DRIVE CURRENTS

Figure 35 shows typical I-V characteristics for the output drivers of the processors. The curves represent the current drive capability of the output drivers as a function of output voltage.

Figure 35. Typical Drive at Junction Temperature

TEST CONDITIONS

The ac signal specifications (timing parameters) appear in Table 15 on Page 21 through Table 41 on Page 44. These include output disable time, output enable time, and capacitive loading. The timing specifications for the SHARC apply for the voltage reference levels in Figure 36.

Timing is measured on signals when they cross the 1.5 V level as described in Figure 37. All delays (in nanoseconds) are measured between the point that the first signal reaches 1.5 V and the point that the second signal reaches 1.5 V.

Figure 36. Equivalent Device Loading for AC Measurements (Includes All Fixtures)

Figure 37. Voltage Reference Levels for AC Measurements

CAPACITIVE LOADING

Output delays and holds are based on standard capacitive loads: 30 pF on all pins (see Figure 36). Figure 40 shows graphically how output delays and holds vary with load capacitance. The graphs of Figure 38, Figure 39, and Figure 40 may not be linear outside the ranges shown for Typical Output Delay vs. Load Capacitance and Typical Output Rise Time (20% to 80%, V = Min) vs. Load Capacitance.

Figure 38. Typical Output Rise/Fall Time (20% to 80%, V_{DDEXT} = Max)

Figure 39. Typical Output Rise/Fall Time (20% to 80%, V_{DDEXT} = Min)

Figure 40. Typical Output Delay or Hold vs. Load Capacitance (at Ambient Temperature)

Values of θ_{JB} are provided for package comparison and PCB design considerations. Note that the thermal characteristics values provided in Table 42 are modeled values.

Table 42. Thermal Characteristics for 208-Lead LQFP E_PAD (With Exposed Pad Soldered to PCB)

| Parameter | Condition | Typical | Unit |
|----------------|-----------------|---------|-----------------------------|
| θ_{JA} | Airflow = 0 m/s | 17.1 | $^{\circ}\text{C}/\text{W}$ |
| θ_{JMA} | Airflow = 1 m/s | 14.7 | $^{\circ}\text{C}/\text{W}$ |
| θ_{JMA} | Airflow = 2 m/s | 14.0 | $^{\circ}\text{C}/\text{W}$ |
| θ_{JC} | | 9.6 | $^{\circ}\text{C}/\text{W}$ |

| Ψ_{JMT} | Airflow = 2 m/s | 0.45 | $^{\circ}\text{C}/\text{W}$ |
| Ψ_{JB} | Airflow = 0 m/s | 11.5 | $^{\circ}\text{C}/\text{W}$ |
| Ψ_{JMB} | Airflow = 1 m/s | 11.2 | $^{\circ}\text{C}/\text{W}$ |
| Ψ_{JMB} | Airflow = 2 m/s | 11.0 | $^{\circ}\text{C}/\text{W}$ |

THERMAL CHARACTERISTICS

The processor is rated for performance over the temperature range specified in [Operating Conditions on Page 16](#).

Table 42 airflow measurements comply with JEDEC standards JESD51-2 and JESD51-6 and the junction-to-board measurement complies with JESD51-8. Test board design complies with JEDEC standard JESD51-7 (LQFP_EP). The junction-to-case measurement complies with MIL-STD-883. All measurements use a 2S2P JEDEC test board.

To determine the junction temperature of the device while on the application PCB, use

$$T_J = T_{CASE} + (\Psi_{JT} \times P_D)$$

where:

T_J = junction temperature $^{\circ}\text{C}$

T_{CASE} = case temperature ($^{\circ}\text{C}$) measured at the top center of the package

Ψ_{JT} = junction-to-top (of package) characterization parameter is the Typical value from Table 42.

P_D = power dissipation

Values of θ_{JA} are provided for package comparison and PCB design considerations. θ_{JA} can be used for a first order approximation of T_J by the equation

$$T_J = T_A + (\theta_{JA} \times P_D)$$

where:

T_A = ambient temperature $^{\circ}\text{C}$

Values of θ_{JC} are provided for package comparison and PCB design considerations when an external heatsink is required.

PACKAGE DIMENSIONS

The processors are available in a 208-lead RoHS compliant LQFP_EP package.

COMPLIANT TO JEDEC STANDARDS MS-026-BJB-HD

***NOTE:**
 THE EXPOSED PAD IS REQUIRED TO BE ELECTRICALLY AND THERMALLY CONNECTED TO GND. THIS SHOULD BE IMPLEMENTED BY SOLDERING THE EXPOSED PAD TO A GND PCB LAND THAT IS THE SAME SIZE AS THE EXPOSED PAD. THE GND PCB LAND SHOULD BE ROBUSTLY CONNECTED TO THE GND PLANE IN THE PCB WITH AN ARRAY OF THERMAL VIAS FOR BEST PERFORMANCE.

AUTOMOTIVE PRODUCTS

Some ADSP-21371/ADSP-21375 models are available for automotive applications with controlled manufacturing. Note that this special model may have specifications that differ from the general release models.

The automotive grade products shown in [Table 45](#) are available for use in automotive applications. Contact your local ADI account representative or authorized ADI product distributor for specific product ordering information. Note that all automotive products are RoHS compliant.

Table 45. Automotive Products

| Model | Temperature Range ¹ | Instruction Rate | On-Chip SRAM | ROM | Package Description | Package Option |
|-----------------|--------------------------------|------------------|--------------|--------|---------------------|----------------|
| AD21371WBSWZ2xx | -40°C to 85°C | 266 MHz | 1M bit | 4M bit | 208-Lead LQFP_EP | SW-208-1 |
| AD21371WYSWZ1xx | -40°C to 105°C | 200 MHz | 1M bit | 4M bit | 208-Lead LQFP_EP | SW-208-1 |
| AD21375WBSWZ2xx | -40°C to 85°C | 266 MHz | 0.5M bit | 2M bit | 208-Lead LQFP_EP | SW-208-1 |
| AD21375WYSWZ1xx | -40°C to 105°C | 200 MHz | 0.5M bit | 2M bit | 208-Lead LQFP_EP | SW-208-1 |

¹ Referenced temperature is ambient temperature.

ORDERING GUIDE

| Model | Temperature Range ¹ | Instruction Rate | On-Chip SRAM | ROM | Package Description | Package Option |
|----------------------------------|--------------------------------|------------------|--------------|--------|---------------------|----------------|
| ADSP-21371KSWZ-2A ² | 0°C to +70°C | 200 MHz | 1M bit | 4M bit | 208-Lead LQFP_EP | SW-208-1 |
| ADSP-21371KSWZ-2B ² | 0°C to +70°C | 266 MHz | 1M bit | 4M bit | 208-Lead LQFP_EP | SW-208-1 |
| ADSP-21371BSWZ-2B ^{2,3} | -40°C to +85°C | 266 MHz | 1M bit | 4M bit | 208-Lead LQFP_EP | SW-208-1 |
| ADSP-21375KSWZ-2B ² | 0°C to +70°C | 266 MHz | 0.5M bit | 2M bit | 208-Lead LQFP_EP | SW-208-1 |
| ADSP-21375BSWZ-2B ^{2,3} | -40°C to +85°C | 266 MHz | 0.5M bit | 2M bit | 208-Lead LQFP_EP | SW-208-1 |

¹ Referenced temperature is ambient temperature.

² Z = RoHS Compliant Part

³ Available with a wide variety of audio algorithm combinations sold as part of a chipset and bundled with necessary software. For a complete list, visit our website at www.analog.com/SHARC
