XRT91L82

2.488/2.666 GBPS STS-48/STM-16 SONET/SDH TRANSCEIVER

NOTES:

GENERAL DESCRIPTION

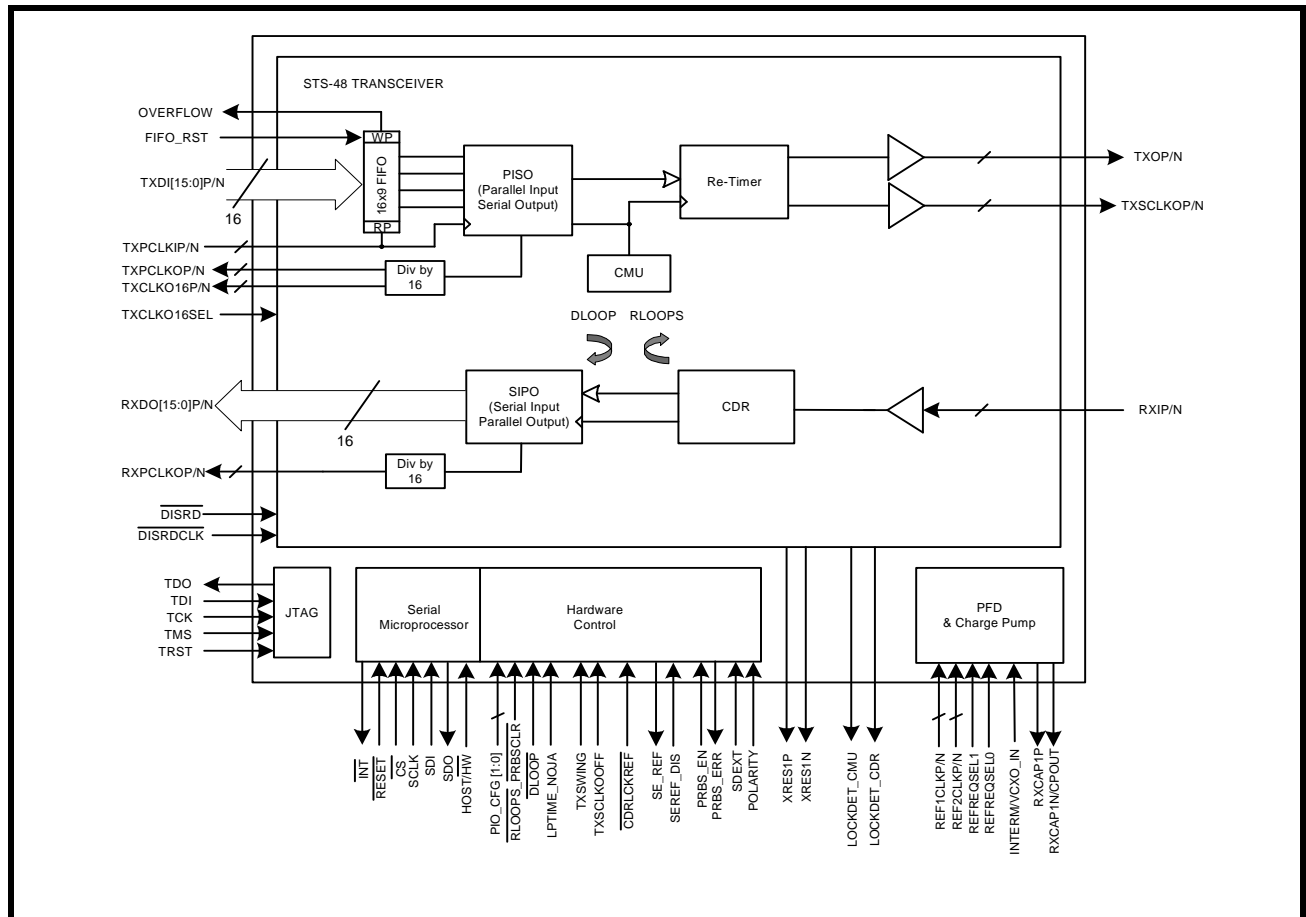

The XRT91L82 is a fully integrated SONET/SDH transceiver for OC-48/STM16 applications supporting the use of Forward Error Correction (FEC) capability. The transceiver includes an on-chip Clock Multiplier Unit (CMU), which uses a high frequency Phase-Locked Loop (PLL) to generate the high-speed transmit serial clock from slower external clock references. It also provides Clock and Data Recovery (CDR) functions by synchronizing its on-chip Voltage Controlled Oscillator (VCO) to the incoming serial data stream. The chip provides serial-to-parallel and parallel-to-serial converters and 16-bit Differential LVDS/LVPECL system interfaces in both receive and transmit directions. The transmit section includes a 16x9 Elastic Buffer (FIFO) to absorb any phase differences between the transmitter clock input and the internally generated transmitter reference clock. In the event of an overflow, an internal FIFO control circuit outputs an OVERFLOW indication. The FIFO under the control of the FIFO_AUTORST register bit

can automatically recover from an overflow condition. The operation of the device can be monitored by checking the status of the LOCKDET_CMU and LOCKDET_CDR output signals. An on-chip phase/frequency detector and charge-pump offers the ability to form a de-jittering PLL with an external VCXO that can be used in loop timing mode to clean up the recovered clock in the receive section.

APPLICATIONS

- SONET/SDH-based Transmission Systems
- Add/Drop Multiplexers
- Cross Connect Equipment
- ATM and Multi-Service Switches, Routers and Switch/Routers
- DSLAMS
- SONET/SDH Test Equipment
- DWDM Termination Equipment

FIGURE 1. BLOCK DIAGRAM OF XRT91L82

FEATURES

- 2.488 / 2.666 Gbps Transceiver
- Targeted for SONET OC-48/SDH STM-16 Applications
- Selectable full duplex operation between standard rate of 2.488 Gbps or Forward Error Correction rate of 2.666 Gbps
- Single-chip fully integrated solution containing parallel-to-serial converter, clock multiplier unit (CMU), serial-to-parallel converter, and clock data recovery (CDR) functions
- 16-bit Differential LVDS/LVPECL signaling data paths, running at 155.52/166.63 Mbps using internal input termination for reduced passive components on board
- Non-FEC and FEC rate REF1CLKP/N and REF2CLKP/N dual reference input ports
- Supports 155.52/166.63MHz or 77.76/83.31MHz transmit and receive external reference input ports
- Optional VCXO input port support multiple de-jittering modes in Host mode
- On-chip phase detector and charge pump for external VCXO based de-jittering PLL
- Internal FIFO decouples transmit parallel clock input and transmit parallel clock output
- Provides Local, Remote Serial modes as well as Loop Timing mode
- Diagnostics features include various lock detect functions and transmit CMU and receive CDR Lock Detect
- Host mode serial microprocessor interface simplifies monitor and control
- Meets Telcordia, ANSI and ITU-T jitter requirements including T1.105.03 - 2002 SONET Jitter Tolerance specification, GR-253 CORE, GR-253-ILR- SONET Jitter specifications.
- Operates at 1.8V CMOS and CML Power with 3.3V I/O
- 950mW Typical Power Dissipation using LVDS Interface
- Package: 15 x 15 mm 196-pin STBGA
- IEEE 1149.1 Compatible JTAG port

The 16-bit parallel interface is multiplexed into the transmit serial output interface, MSB first (TXDI15P/N). TXDI[15:0]P/N 100 Ω internal termination is controlled by INTERM pin or register bit. Inputs are internally biased to VDD_IO - 1V for AC coupled applications.</p> <p>NOTE: The XRT91L82 can accept 166.63 Mbps 16-bit parallel transmit data input for Forward Error Correction (FEC) Applications.</p>
TXOP TXON	CMLDIFF	O	A6 A5	<p>Transmit Serial Data Output</p> <p>The transmit serial data output stream is generated by multiplexing the 16-bit parallel transmit data input into a 2.488 Gbps serial data output stream. In Forward Error Correction, the transmit serial data output stream is 2.666 Gbps.</p>
TXSWING / INT	LVTTL, LVCMOS	I/O	D10	<p>Transmit Serial CML Output Swing Mode</p> <p>Hardware Mode Selects the generated transmit serial CML Output swing to the optical module. "Low" = Low Swing CML Mode "High" = High Swing CML Mode This pin is provided with an internal pull-up.</p> <p>Host Mode This pin is functions as the microprocessor Interrupt Output.</p> <p>NOTE: This pin becomes an open drain output in Host Mode and requires an external pull-up resistor.</p>

TRANSMITTER SECTION

NAME	LEVEL	TYPE	PIN	DESCRIPTION
TXSCLKOP TXSCLKON	CMLDIFF	O	A9 A8	2.488/2.666 GHz Transmit Serial Clock Output A high-speed 2.488/2.666 GHz Transmit serial clock output that can be used to retime TXOP/N.
TXSCLKOOFF /CS	LVTTL, LVCMOS	I	C9	2.488/2.666 GHz Hi-speed Serial Clock Output Tristate Hardware Mode Tristates TXSCLKOP/N output and reduces power consumption. "Low" = TXSCLKOP/N output Enabled "High" = Tristates TXSCLKOP/N output This pin is provided with an internal pull-up. Host Mode This pin is functions as the microprocessor Chip Select Input.
INTERM /VCXO_IN	LVTTL, LVCMOS /SE- LVCMOS	I	E4	Transmit Parallel Bus Input Internal Termination Hardware Mode Provides 100Ω line-to-line internal termination to TXDI[15:0]P/N and TXPCLKIP/N. "Low" = Disabled "High" = TXDI[15:0]P/N and TXPCLKIP/N internally terminated. This pin is provided with an internal pull-down. Host Mode - Voltage Controlled 77.76/83.31 MHz or 155.52/166.63 MHz External Oscillator Input This 77.76/83.31 MHz or 155.52/166.63 MHz Single-Ended LVCMOS clock input is used for the transmit PLL jitter attenuation. ALTFREQSEL register bit determines the value used as the reference. Software register bit VCXOSEL allows the selection of the De-Jitter VCXO Mode. See ALTFREQSEL and VCXO_SEL software register bit description for more details.
TXPCLKIP TXPCLKIN	LVDS, LVPECL Diff	I	P11 P10	Transmit Parallel Clock Input 155.52 MHz clock input used to sample the 16-bit parallel transmit data input TXDI[15:0]P/N. TXPCLKIP/N 100 Ω internal termination is controlled by INTERM pin or register bit. TXPCLKIP/N inputs are internally biased to VDD_IO - 1V for AC coupled application. NOTE: The XRT91L82 can accept a 166.63 MHz transmit clock input for Forward Error Correction (FEC) Applications.
TXPCLKOP TXPCLKON	LVDS, LVPECL Diff	O	P8 P7	Transmit Parallel Clock Output This 155.52 MHz clock can be used for the downstream device to generate the TXDI[15:0]P/N data and TXPCLKIP/N clock input. This enables the downstream device and the STS-48 transceiver to be in synchronization. NOTE: The XRT91L82 can output a 166.63 MHz transmit clock output for Forward Error Correction (FEC).

1.0 FUNCTIONAL DESCRIPTION

The XRT91L82 Transceiver is designed to operate with a SONET Framer/ASIC device and provide a high-speed serial interface to optical networks. The Transceiver converts 16-bit parallel data at 155.52/166.63 MHz to a serial CML bit stream at 2.488/2.666 Gbps and vice-versa. It implements a clock multiplier unit (CMU), SONET/SDH serialization/de-serialization (SerDes), and receive clock and data recovery (CDR) unit. The Transceiver is divided into Transmit and Receive sections and is used to provide the front end component of SONET equipment, which includes primarily serial transmit and receive functions.

1.1 Hardware Mode vs. Host Mode

Functionality of the STS-48/STM-16 Transceiver can be configured by using either Host mode or Hardware mode. Hardware mode is selected by pulling HOST/HW "Low" or leaving this pin unconnected. The transceiver functionality is then controlled by the hardware pins described in the Hardware Pin Descriptions. However, if Host mode is selected by pulling HOST/HW "High", the functionality is controlled by programming internal R/W registers using the Serial Microprocessor interface. Whether using Host or Hardware mode, the functionality remains the same. Therefore, the following sections describe the functionality rather than how each function is controlled. The Hardware Pin Descriptions and the Register Bit Descriptions concentrate on configuring the device.

1.2 Clock Input Reference

The XRT91L82 can accept both 155.52 MHz non-FEC or 166.63 MHz FEC clock input at REF1CLKP/N and/or REF2CLKP/N as its internal timing reference for generating higher speed clocks. The reference clock can be provided with one of two frequencies chosen by REFREQSEL[1:0]. The reference frequency options for the XRT91L82 are listed in **Table 3**.

TABLE 3: REFERENCE FREQUENCY OPTIONS (NORMAL MODE/ FEC RATE)

REFREQSEL [1:0]	CMU REFERENCE CLOCK FREQUENCY	CDR REFERENCE CLOCK FREQUENCY	REF1CLK CLOCK FREQUENCY	REF2CLK CLOCK FREQUENCY	TRANSMIT DATA RATE	RECEIVE DATA RATE
00	REF1CLK	REF1CLK	155.52 MHz non-FEC	not used	2.488 Gbps non-FEC	2.488 Gbps non-FEC
01	REF1CLK	REF2CLK	155.52 MHz non-FEC	166.63 MHz FEC	2.488 Gbps non-FEC	2.666 Gbps FEC
10	REF2CLK	REF1CLK	155.52 MHz non-FEC	166.63 MHz FEC	2.666 Gbps FEC	2.488 Gbps non-FEC
11	REF2CLK	REF2CLK	not used	166.63 MHz FEC	2.666 Gbps FEC	2.666 Gbps FEC

1.3 Alternate Clock Input Reference (Host Mode Only)

In Host mode, the XRT91L82 has the option to accept a lower reference frequency of 77.76 MHz non-FEC or 83.31 MHz FEC clock input at REF1CLKP/N and/or REF2CLKP/N. To use this feature, register bit ALTFREQSEL must be set "Low" on bit- D5 of "Configuration Control Register (0x07h)". The alternate reference frequency options are listed below in **Table 4**.

TABLE 4: ALTERNATE REFERENCE FREQUENCY OPTIONS (NORMAL MODE/ FEC RATE) HOST MODE ONLY

REFREQSEL [1:0]	CMU REFERENCE CLOCK FREQUENCY	CDR REFERENCE CLOCK FREQUENCY	REF1CLK CLOCK FREQUENCY	REF2CLK CLOCK FREQUENCY	TRANSMIT DATA RATE	RECEIVE DATA RATE
00	REF1CLK	REF1CLK	77.76 MHz non-FEC	not used	2.488 Gbps non-FEC	2.488 Gbps non-FEC
01	REF1CLK	REF2CLK	77.76 MHz non-FEC	83.31 MHz FEC	2.488 Gbps non-FEC	2.666 Gbps FEC
10	REF2CLK	REF1CLK	77.76 MHz non-FEC	83.31 MHz FEC	2.666 Gbps FEC	2.488 Gbps non-FEC
11	REF2CLK	REF2CLK	not used	83.31 MHz FEC	2.666 Gbps FEC	2.666 Gbps FEC

1.4 Data Latency

Due to different operating modes and data logic paths through the device, there is an associated latency from data ingress to data egress. Table 5 specifies the data latency for a typical path.

TABLE 5: DATA INGRESS TO DATA EGRESS LATENCY

MODE OF OPERATION	DATA PATH	CLOCK REFERENCE	MAXIMUM REFNCLK CLOCK CYCLES
Thru-mode	Data on TXDI[15:0]P/N to data on TXOP/N	REF1CLKP/N or REF2CLKP/N Clock	18 to 20

1.5 Forward Error Correction (FEC)

Forward Error Correction is used to control errors along a one-way path of communication. FEC sends extra information along with data which can be used by a receiver to check and correct the data without requesting re-transmission of the original information. It does so by introducing a known structure into a data sequence prior to transmission. The most common methods are to replace a 14-bit data packet with a 15-bit codeword structure, or to replace a 17-bit data packet with an 18-bit codeword structure. The XRT91L82 supports FEC by accepting a clock input reference frequency of 83.31 or 166.63 MHz. Both reference frequencies allows the transmit 16-bit parallel data input to be applied to the STS-48 transceiver at 166.63 Mbps which is converted to a 2.666 Gbps serial output stream to an optical module. A simplified block diagram of FEC is shown in Figure 2.

FIGURE 2. SIMPLIFIED BLOCK DIAGRAM OF FORWARD ERROR CORRECTION

1.6 PRBS Pattern Generator and Analyzer

The XRT91L82 contains an on-chip Pseudo Random Binary Sequence (PRBS) generator and detector for diagnostic purpose. With the PRBS_EN asserted, the transmitter will send out PRBS pattern of 2²³-1 in STS-48/48c or STM-16 rate. At the same time, the receiver PRBS detector is also enabled. Whenever the PRBS detector is not in sync, the PRBS_ERR bit will be set to "1". To clear the erred condition, PRBSCLR must be toggled "Low." If the correct PRBS pattern is detected by the receiver, then PRBS_ERR pin will go "Low" to

indicate PRBS synchronization has been achieved, otherwise PRBS_ERR will remain "1." PRBSCLR shares pin F11 with RLOOPS. Serial Remote Line Loopback (RLOOPS) is disabled when PRBS_EN is enabled.

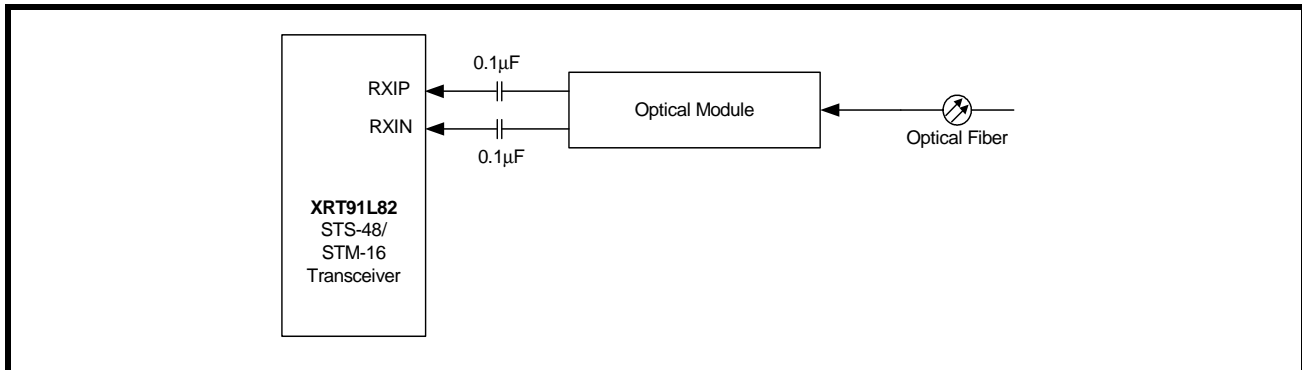

2.0 RECEIVE SECTION

The receive section of XRT91L82 includes the differential inputs RXIP/N, followed by the clock and data recovery unit (CDR) and receive serial-to-parallel converter. The receiver accepts the high-speed Non-Return to Zero (NRZ) serial data at 2.488/2.666 Gbps through the differential input interfaces RXIP/N. The clock and data recovery unit recovers the high-speed receive clock from the incoming scrambled NRZ data stream. The recovered serial data is converted into 16-bit-wide 155.52/166.63 Mbps parallel data and presented to the RXDO[15:0]P/N parallel interface. This parallel interface can be configured for Differential LVPECL/LVDS operation. A divide-by-16 version of the high-speed recovered clock, RXPCLKOP/N is used to synchronize the transfer of the 16-bit RXDO[15:0]P/N data with the receive portion of the upstream device. Upon initialization or loss of signal or loss of lock the 155.52 MHz or 166.63 MHz external local reference clock is used to start-up the clock recovery phase-locked loop for proper operation.

2.1 Receive Serial Input

The receive serial CML inputs are applied to RXIP/N. The receive serial inputs can be AC or DC coupled to an optical module or an electrical interface. A simplified AC coupled block diagram is shown in **Figure 3**.

FIGURE 3. RECEIVE SERIAL INPUT INTERFACE BLOCK

NOTE: Some optical modules integrate AC coupled capacitors within the module. If so, the external AC coupled capacitors are not necessary and can be excluded.

The 2.488/2.666 Gbps high-speed differential CML RXIP/N input swing characteristics is shown in **Table 6**..

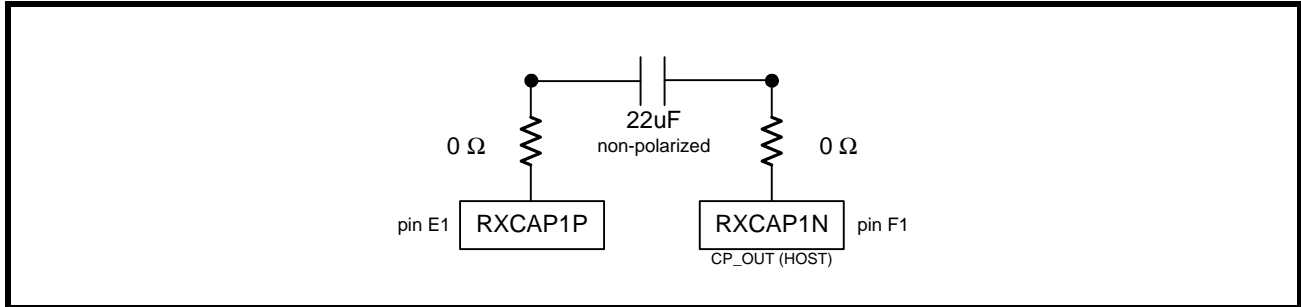

TABLE 6: DIFFERENTIAL CML INPUT SWING PARAMETERS

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNITS
ΔV_{INDIFF}	Differential Input Voltage Swing	100		2000	mV
ΔV_{INSE}	Single-Ended Input Voltage Swing	50		1000	mV
ΔV_{INBIAS}	Input Bias Range (AC Coupled)	$VDD_CML - 0.4$		$VDD_CML - 0.2$	V
R_{DIFF}	Differential Input Resistance	80	100	120	Ω

2.2 External Receive Loop Filter Capacitors

These external loop filter 0Ω resistors and 22μF non-polarized capacitor provide the necessary components to achieve the required receiver jitter performance. They must be well isolated to prohibit noise entering the CDR block. **Figure 4** shows the pin connections and external loop filter components. The external loop filter is not needed while in host mode and RXCAP1N becomes the charge pump output for the external VCXO.

FIGURE 4. EXTERNAL LOOP FILTER

2.3 Receive Clock and Data Recovery

The clock and data recovery unit accepts the high-speed NRZ serial data from the differential CML receiver and generates a clock that is the same frequency as the incoming data. The clock recovery utilizes REF1CLKP/N and/or REF2CLKP/N to train and monitor its clock recovery PLL. Initially upon startup, the PLL locks to the local reference clock within ±500 ppm. Once this is achieved, the PLL then attempts to lock onto the incoming receive data stream. Whenever the recovered clock frequency deviates from the local reference clock frequency by more than approximately ±500 ppm, the clock recovery PLL will switch and lock back onto the local reference clock. When this condition occurs the PLL will declare Loss of Lock and the LOCKDET_CDR signal will be pulled "Low." Whenever a Loss of Lock/Loss of Signal Detection (LOSD) event occurs, the CDR will continue to supply a receive clock (based on the local reference clock) to the upstream framer device. A Loss of Lock condition will also be declared when the external SDEXT becomes inactive. When the SDEXT is de-asserted by the optical module or when DISRD is asynchronously asserted "Low," receive parallel data output will be forced to a logic zero state for the entire duration that a LOSD condition is detected or for as long as DISRD is asserted "Low." This acts as a receive data mute upon LOSD function to prevent random noise from being misinterpreted as valid incoming data. When the SDEXT becomes active and the recovered clock is determined to be within ±500 ppm accuracy with respect to the local reference source, the clock recovery PLL will switch and lock back onto the incoming receive data stream and the lock detect output (LOCKDET_CDR) will go active. **Table 7** specifies the Clock and Data Recovery Unit performance characteristics.

TABLE 7: CLOCK AND DATA RECOVERY UNIT PERFORMANCE

NAME	PARAMETER	MIN	TYP	MAX	UNITS
REF_DUTY	Reference clock duty cycle	45		55	%
REF_TOL	Reference clock frequency tolerance ¹	-20		+20	ppm
OCLK_JIT	Clock output jitter generation with 155.52 MHz reference clock		5	7	mUI _{rms}
OCLK_JIT	Clock output jitter generation with 166.63 MHz reference clock		5	7	mUI _{rms}
TOL_JIT	Input jitter tolerance with 1 MHz < f < 20 MHz PRBS pattern	0.35	0.5		UI
OCLK_FREQ	Frequency output	2.488		2.667	GHz
OCLK_DUTY	Clock output duty cycle	45		55	%

Jitter specification is defined using a 12kHz to 20MHz appropriate SONET/SDH filter.

¹Required to meet SONET output frequency stability requirements.

2.4 External Signal Detection

XRT91L82 supports external Signal Detection (SDEXT). The external Signal Detect function is supported by the SDEXT input. This input is coming from the optical module through an output usually called “SD” or “FLAG” which indicates the lack or presence of optical power. Depending on the manufacturer of these devices, the polarity of this signal can be either active "Low" or active "High." The SDEXT and POLARITY inputs are Exclusive OR’ed to generate the internal Loss of Signal Detect (LOSD) declaration and Mute upon LOSD control signal. Whenever an external SD is absent, the XRT91L82 will automatically force the receive parallel data output to a logic state "0" for the entire duration that a LOSD condition is declared as well as update the status registers whenever the host mode serial microprocessor interface feature is active. This acts as a receive data mute upon LOSD function to prevent random noise from being misinterpreted as valid incoming data. **Table 8** specifies SDEXT declaration polarity settings

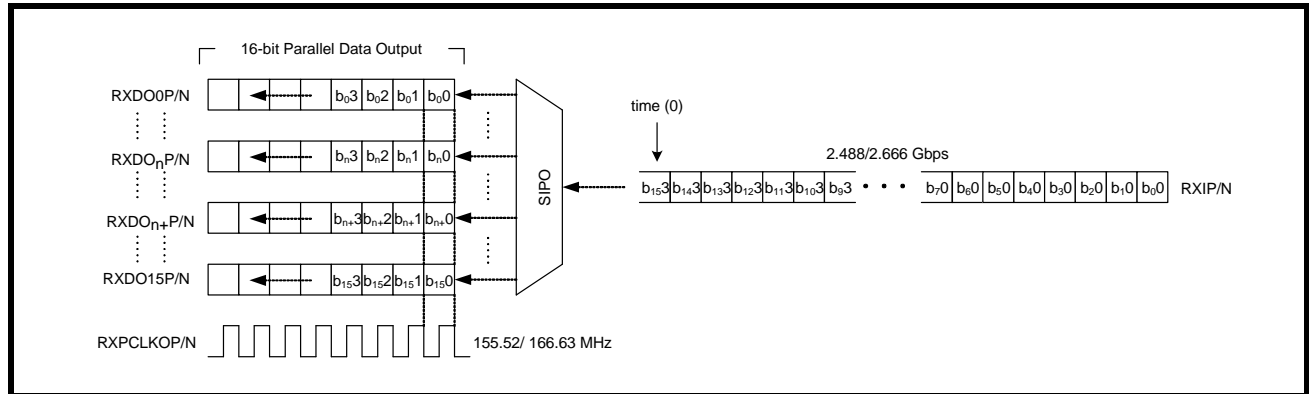

TABLE 8: LOSD DECLARATION POLARITY SETTING

SDEXT	POL	LOS	INTERNAL SIGNAL DETECT (SDEXT [XOR] POL)	$\overline{\text{DISRD}}$	$\overline{\text{RLOOPS}}$	$\overline{\text{DLOOP}}$	RX PARALLEL MUTE	SERIAL TX MUTE
X	X	X		1	1	0	No	No
0	0	Inactive	Active Low. Optical signal presence indicated by SDEXT logic 0 input from optical module. LOSD not declared.	0	X	X	Yes	No
0	1	Active	Active High. Optical signal presence indicated by SDEXT logic 1 input from optical module. LOSD declared.	1	0	0	No	Yes
				1	0	1	Yes	Yes
1	0	Active	Active Low. Optical signal presence indicated by SDEXT logic 0 input from optical module. LOSD Declared.	1	1	1	Yes	No
1	1	Inactive Normal Mode	Active High. Optical signal presence indicated by SDEXT logic 1 input from optical module. LOSD not declared.	1	1	1	No	No

2.5 Receive Serial Input to Parallel Output (SIPO)

The SIPO is used to convert the 2.488/2.666 Gbps serial data input to 155.52/166.63 Mbps parallel data output which can interface to a SONET Framer/ASIC. The SIPO bit de-interleaves the serial data input into a 16-bit parallel output to RXDO[15:0]P/N. A simplified block diagram is shown in **Figure 5**.

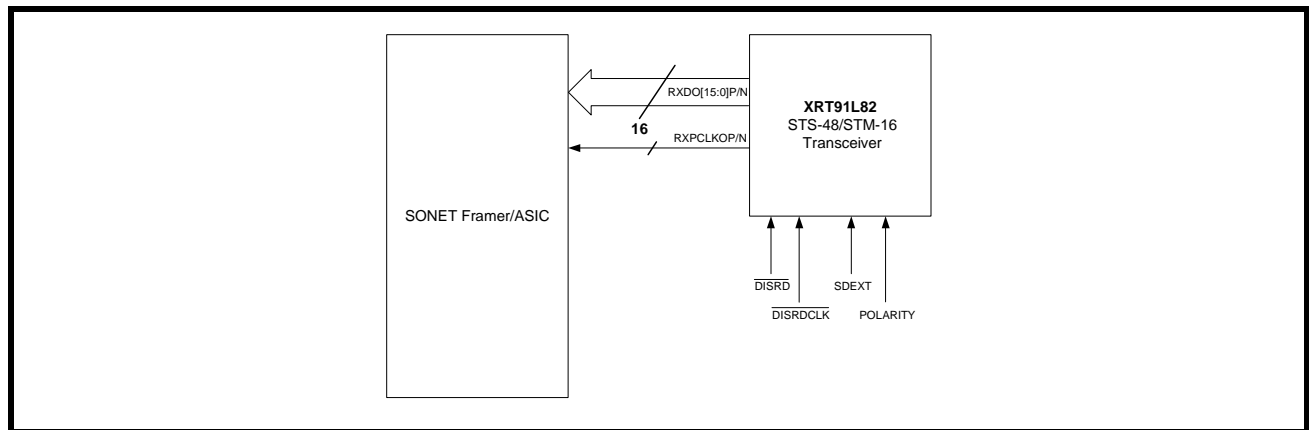

FIGURE 5. SIMPLIFIED BLOCK DIAGRAM OF SIPO

2.6 Receive Parallel Output Interface

The 16-bit LVDS, Differential LVPECL 155.52/166.63 Mbps parallel data output of the receive path is used to interface to a SONET Framer/ASIC synchronized to the recovered clock. A simplified block diagram is shown in **Figure 6**.

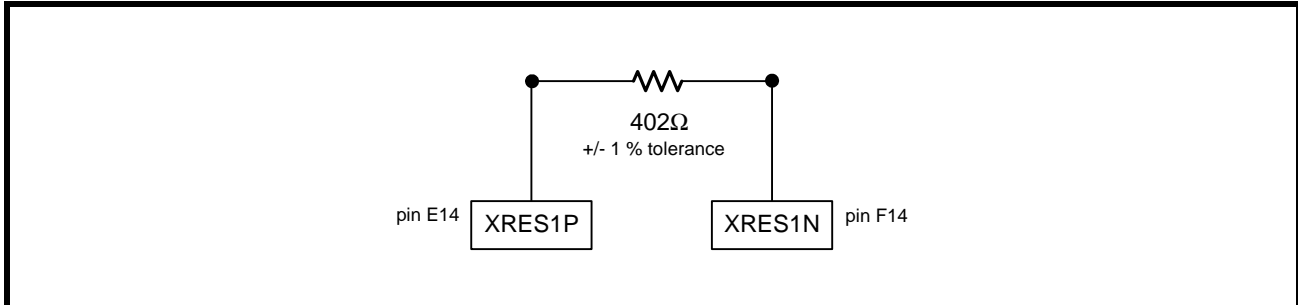

FIGURE 6. RECEIVE PARALLEL OUTPUT INTERFACE BLOCK

2.7 Receive Parallel Interface LVDS Operation

When operating the 16-bit Differential bus in LVDS mode, a 402Ω external resistor is needed across XRES1P and XRES1N to properly bias the RXDO[15:0]P/N and RXPCLKOP/N pins. **Figure 7** shows the proper biasing resistor installed.

FIGURE 7. LVDS EXTERNAL BIASING RESISTORS

2.8 Parallel Receive Data Output Disable/Mute Upon LOSD

The parallel receiver data outputs are automatically pulled "Low" during a LOSD condition to prevent data chattering. However, the user must select the proper SDEXT polarity for the optical module used. In addition, by pulling $\overline{\text{DISRD}}$ "Low", the receiver data outputs will be muted asynchronously or forced to a logic state of "0" regardless of the data input stream.

2.9 Parallel Receive Clock Output Disable

Like $\overline{\text{DISRD}}$, $\overline{\text{DISRDCLK}}$ is used to mute the parallel receiver clock output RXPCLKOP/N regardless of the data input stream. By pulling $\overline{\text{DISRDCLK}}$ "Low", the receiver clock output will be asynchronously muted whenever desired.

2.10 Receive Parallel Data Output Timing

The receive parallel data output from the STS-48/STM-16 receiver will adhere to the setup and hold times shown in **Figure 8** and **Table 9**.

FIGURE 8. RECEIVE PARALLEL OUTPUT TIMING

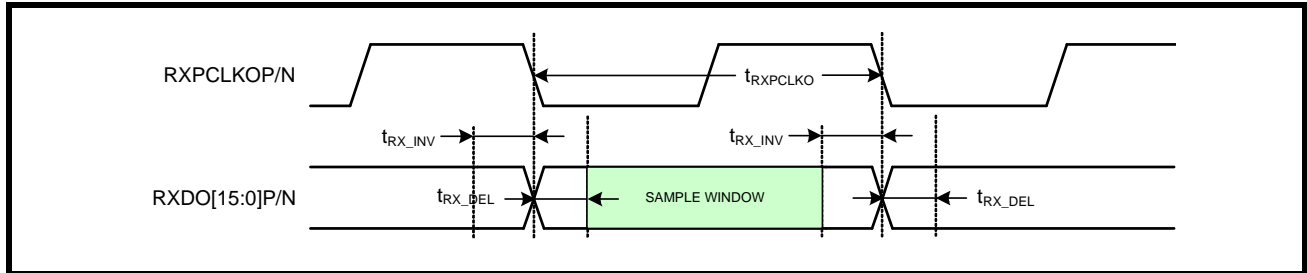

TABLE 9: RECEIVE PARALLEL DATA AND CLOCK OUTPUT TIMING SPECIFICATIONS

SYMBOL	PARAMETER	MIN	TYP	MAX	UNITS
t_{RX_PCLKO}	Receive parallel clock output period (155.52 MHz non-FEC rate)		6.43		ns
t_{RX_PCLKO}	Receive parallel clock output period (166.63 MHz FEC rate)		6.00		ns

3.0 TRANSMIT SECTION

The transmit section of the XRT91L82 accepts 16-bit parallel data and converts it to serial CML data output intended to interface to an optical module. It consists of a 16-bit parallel Differential LVPECL/LVDS interface, a 16x9 FIFO, Parallel-to-Serial Converter, a clock multiplier unit (CMU), a Current Mode Logic (CML) differential line driver, and Loop Timing modes. The CML serial data output rate is 2.488/2.666 Gbps for STS-48 applications. The high frequency serial clock is synthesized by a PLL, which uses a low frequency clock as its input reference. In order to synchronize the data transfer process, the synthesized 2.488/2.666 GHz serial clock output is divided by sixteen and the 155.52/166.63 MHz clock is presented to the upstream device to be used as its timing source.

3.1 Transmit Parallel Input Interface

The parallel data from an upstream device is presented to the XRT91L82 through a 16-bit Differential LVPECL/LVDS/Single-Ended LVPECL parallel bus interface TXDI[15:0]P/N. The data is latched into a parallel input register on the rising edge of TXPCLKIP/N. If the SONET Framer/ASIC is synchronized to the same timing source as the XRT91L82, the transmit data and clock input can directly interface to the STS-48/STM-16 transceiver. However, if the SONET Framer/ASIC is synchronized to a separate crystal, the XRT91L82 has two clock output references that can be used to synchronize the SONET Framer/ASIC. TXPCLKOP/N is a 155.52/166.63 MHz Differential LVPECL/LVDS clock output source that is derived from the CMU synthesized clock. TXCLKO16P/N is a 155.52/166.63 MHz or 19.44/20.83 MHz Differential LVPECL/LVDS auxiliary clock output source that is also derived from the CMU synthesized clock. Either of these two clock output sources can be used to synchronize the SONET Framer/ASIC to the XRT91L82. A simplified block diagram of the parallel interface is shown in **Figure 9**.

FIGURE 9. TRANSMIT PARALLEL INPUT INTERFACE BLOCK

3.2 Transmit Parallel Data Input Timing

When applying parallel data input to the transmitter, the setup and hold times should be followed as shown in **Figure 10** and **Table 10**. **Table 11** shows the parameters for TXPCLKOP/N clock output.

FIGURE 10. TRANSMIT PARALLEL INPUT TIMING

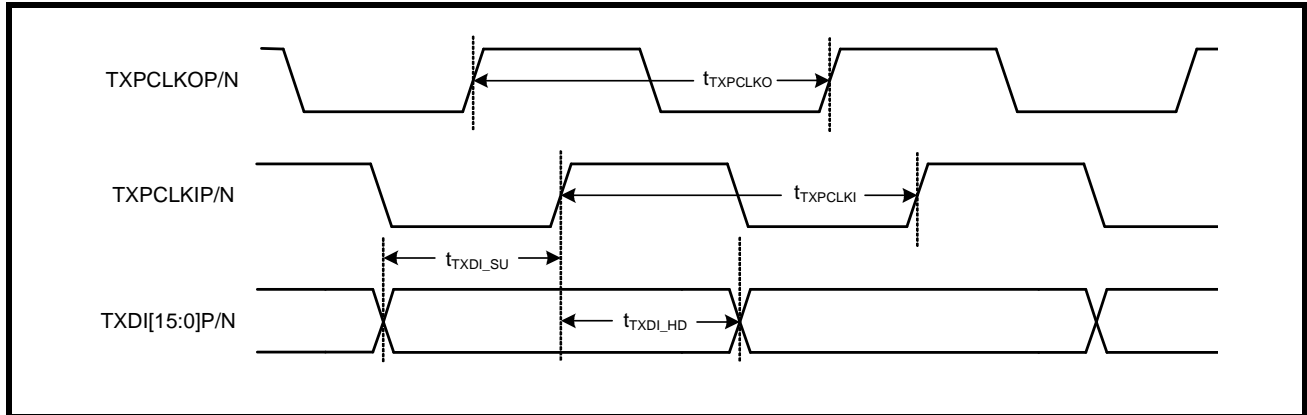

TABLE 10: TRANSMIT PARALLEL DATA AND CLOCK INPUT TIMING SPECIFICATION

SYMBOL	PARAMETER	MIN	TYP	MAX	UNITS

t_{TXPCKO}	Transmit parallel clock output period (166.63 MHz FEC rate)		6.00		ns
TX_{DUTY}	TXPCLKOP/N Duty Cycle	45		55	%

3.3 Transmit FIFO

The Parallel Interface also includes a 16x9 FIFO that can be used to eliminate difficult timing issues between the input transmit clock and the clock derived from the CMU. The use of the FIFO permits the system to tolerate an arbitrary amount of delay and jitter between TXPCLKOP/N and TXPCLKIP/N. The FIFO can be initialized when FIFO_RST is asserted and held "High" for 2 cycles of the TXPCLKOP/N clock. When the FIFO_RST is de-asserted, it will take 8 to 10 TXPCLKOP/N cycles for the FIFO to flush out. Once the FIFO is centered, the delay between TXPCLKOP/N and TXPCLKIP/N can decrease or increase up to two periods of the low-speed clock. Should the delay exceed this amount, the read and write pointers will point to the same word in the FIFO resulting in a loss of transmitted data (FIFO overflow). In the event of a FIFO overflow, the FIFO control logic will initiate an OVERFLOW signal that can be used by an external controller to issue a FIFO RESET signal.

In Host Mode, the transceiver under the control of the FIFO_AUTORST register bit can automatically recover from an overflow condition. When the FIFO_AUTORST register bit is set to a "High" level, once an overflow condition is detected, the chip will set the OVERFLOW pin to a high level and will automatically reset and center the FIFO. **Figure 11** provides a detailed overview of the transmit FIFO in a system interface.

FIGURE 11. TRANSMIT FIFO AND SYSTEM INTERFACE

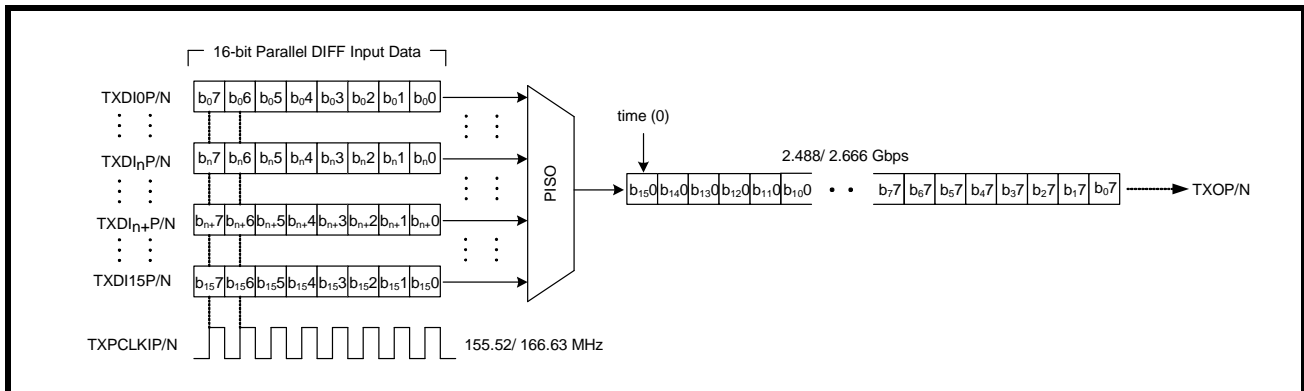

3.4 FIFO Calibration Upon Power Up

It is required that the FIFO_RST pin be pulled "High" for 2 TXPCLKOP/N cycles to flush out the FIFO after the device is powered on. If the FIFO experiences an Overflow condition, FIFO_RST can be used to manually reset the FIFO. In Host Mode, the STS-48 transceiver has an automatic FIFO reset register bit that will allow the FIFO to automatically reset upon an Overflow condition. FIFO_AUTORST register bit should be pulled "High" to enable the automatic FIFO reset function.

3.5 Transmit Parallel Input to Serial Output (PISO)

The PISO is used to convert 155.52/166.63 Mbps parallel data input to 2.488/2.666 Gbps serial data output which can interface to an optical module. The PISO bit interleaves parallel data input into a serial bit stream taking the first bit from TXDI15P/N, then the first bit from TXDI14P/N, and so on as shown in **Figure 12**.

FIGURE 12. SIMPLIFIED BLOCK DIAGRAM OF PISO

3.6 Clock Multiplier Unit (CMU) and Re-Timer

The high-speed serial clock synthesized by the CMU is divided by 16 and is then presented to the upstream device as TXPCLKOP/N clock. The upstream device should use TXPCLKOP/N as its timing source. The upstream device then generates the TXPCLKIP/N clock that is phase aligned with the transmit data and provides it to the parallel interface of the transmitter. The data must meet setup and hold times with respect to TXPCLKIP/N. The XRT91L82 will latch TXDI[15:0]P/N on the rising edge of TXPCLKIP/N. The clock synthesizer uses a PLL to lock to the differential input reference clock REF1CLKP/N and REF2CLKP/N. REF1CLKP/N and/or REF2CLKP/N input can accept a clock from a Differential LVPECL crystal oscillator that has a frequency accuracy better than 20ppm in order for the TXSCLKOP/N frequency to have the accuracy required for SONET systems. It will then use this reference clock to generate the 2.488/2.666 GHz STS-48/STM-16 serial clock output TXSCLKOP/N and in addition feed this high-speed synthesized clock to the PISO. The Retimer will then align the transmit serial data from the PISO with this 2.488/2.666 GHz synthesized clock to generate the output TXOP/N. **Table 12** specifies the Clock Multiplier Unit performance characteristics.

In Host Mode, the clock synthesizer can also be driven by an optional external VCXO for loop timed or local reference de-jitter applications. VCXO_IN can be connected to the output of a VCXO that can be configured to clean up the recovered received clock coming from CP_OUT in loop timing mode before being applied to the input of the transmit CMU as a reference clock. In addition, the internal phase/frequency detector and charge pump, combined with an external VCXO can alternately be used as a jitter attenuator to de-jitter a noisy system reference clock such as REF1CLKP/N or REF2CLKP/N prior to it being used to time the CMU. The following Section 3.7, "Loop Timing and Clock Control," on page 28 illustrate the use of this method.

TABLE 12: CLOCK MULTIPLIER UNIT PERFORMANCE

NAME	PARAMETER	MIN	TYP	MAX	UNITS
REFDUTY	Reference clock duty cycle	45		55	%
REFTOL	Reference clock frequency tolerance ¹	-20		+20	ppm
REFSTS48	Reference clock jitter limits from 12 KHz to 20 MHz			-61	dB _C
OCLKJIT	Clock output jitter generation with 155.52 MHz reference clock		3.2	5.0	mUI _{rms}
OCLKJIT	Clock output jitter generation with 166.63 MHz reference clock		3.2	5.0	mUI _{rms}
OCLKFREQ	Frequency output	2.488		2.667	GHz
OCLKDUTY	Clock output duty cycle	45		55	%

Jitter specification is defined using a 12kHz to 20MHz appropriate SONET/SDH filter.

¹Required to meet SONET output frequency stability requirements.

3.7 Loop Timing and Clock Control

Two types of loop timing are possible in the XRT91L82.

In the Hardware mode, the loop timing (without an external VCXO) is controlled by the LOOPTM_NOJA pin. This mode is selected by asserting the LOOPTM_NOJA signal to a "High" level. When the loop timing mode is activated, the external local reference clock to the input of the CMU is replaced with the 1/16th of the high-speed recovered receive clock coming from the CDR. Under this condition both the transmit and receive sections are synchronized to the recovered receive clock. The normal looptime mode directly locks the CMU to the recovered receive clock with no external de-jittering.

In Host Mode, loop timing performance can be further improved using an external VCXO-based PLL to clean up the jitter of the recovered receive clock. In this case the VCXO_SEL register bit should be set "High." By doing so, the CMU receives its reference clock signal from an external VCXO connected to the VCXO_IN input. The LOOPTM_JA register bit must also be set "High" in order to select the recovered receive clock as the reference source for the de-jitter PLL. In this state, the VCXO will be phase locked to the recovered receive

2.488/2.666 GBPS STS-48/STM-16 SONET/SDH TRANSCEIVER

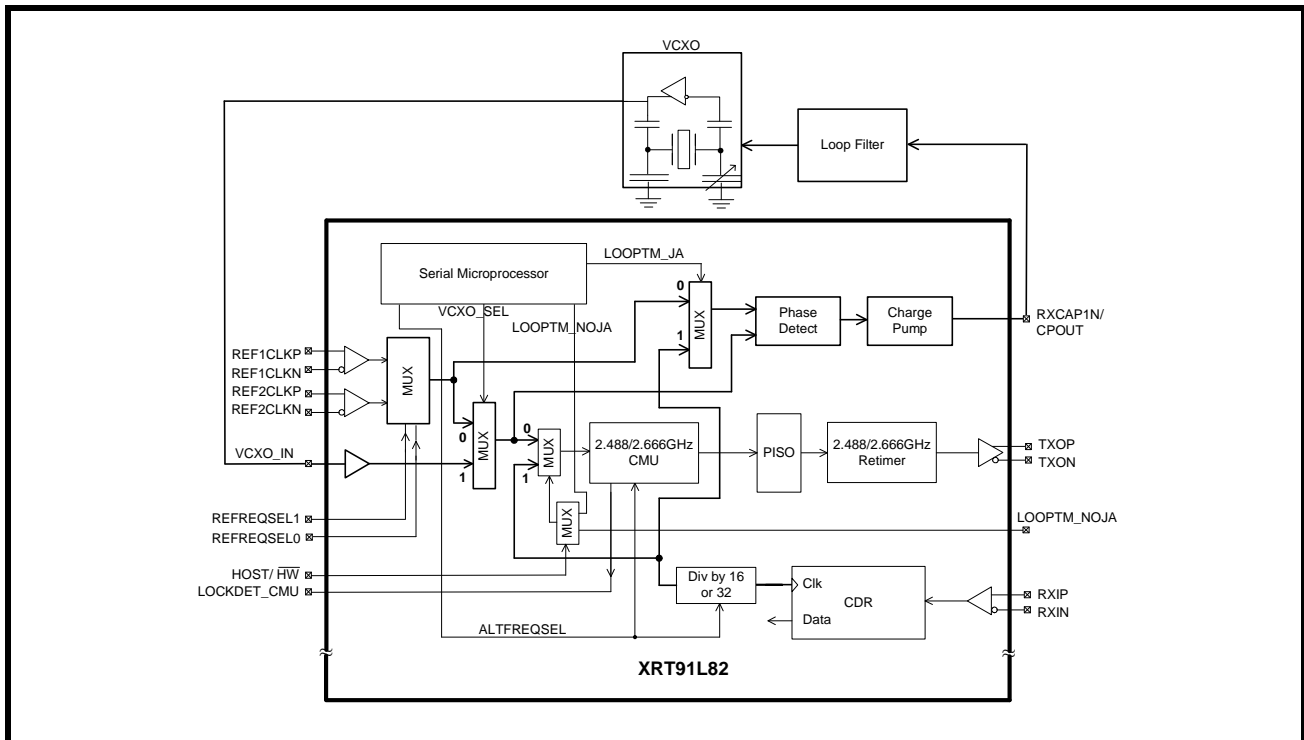

clock through a narrowband loop filter. The use of the on-chip phase/frequency detector with charge pump and an external VCXO to remove the transmit jitter due to jitter in the recovered clock is shown in **Figure 13**.

The on-chip phase/frequency detector can also be used to remove the jitter from a noisy reference signal that is applied to the REF1CLKP/N or REF2CLKP/N inputs. In this case the LOOPTM_NOJA register bit should be set "Low," the VCXO_SEL set "High," and the LOOPTM_JA register bit set "Low." In this configuration, the REF1CLKP/N or REF2CLKP/N CMU reference signal is used as the reference to the de-jitter PLL and the de-jittered output of the phase locked VCXO is used as the timing reference to the CMU. **Table 13** provides configuration for selecting the loop timing and reference de-jitter modes.

TABLE 13: LOOP TIMING AND REFERENCE DE-JITTER CONFIGURATIONS

VCXO_SEL (REGISTER BIT)	LOPTM_JA (REGISTER BIT)	LOPTM_NOJA (PIN/REGISTER BIT)	CONFIGURATION	ACTION
0	0	0	HARDWARE AND HOST MODE	Normal mode
0	0	1	HARDWARE AND HOST MODE	Loop timing without de-jitter VCXO
1	0	0	HOST MODE ONLY	REF1CLKP/N or REF2CLKP/N reference de-jitter VCXO
1	1	0	HOST MODE ONLY	Loop timing with de-jitter VCXO

FIGURE 13. LOOP TIMING MODE USING AN EXTERNAL CLEANUP VCXO (HOST MODE ONLY)

3.8 External Loop Filter (Host Mode Only)

During Host Mode operation, RXCAP1N becomes the charge pump output CP_OUT. As shown in **Figure 13**, the internal charge pump is used to drive an external loop filter and external VCXO. The charge pump current is fixed at 250uA. **Figure 14** is a simplified block diagram of the external loop filter and recommended values.

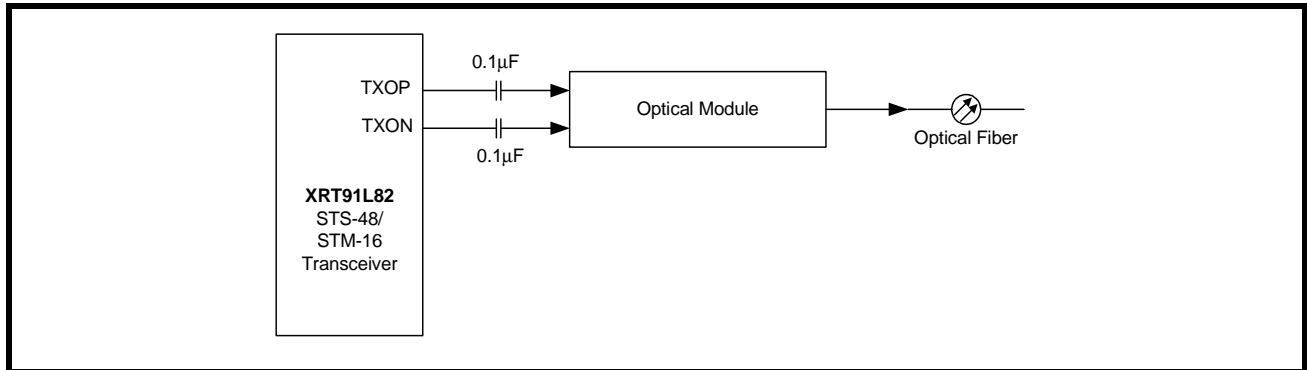

FIGURE 14. SIMPLIFIED DIAGRAM OF THE EXTERNAL LOOP FILTER

3.9 Transmit Serial Output Control

The 2.488/2.666 Gbps transmit serial output is available on TXOP/N pins. The transmit serial output can be AC or DC coupled to an optical module or electrical interface. A simplified AC coupling block diagram is shown in **Figure 15**.

FIGURE 15. TRANSMIT SERIAL OUTPUT INTERFACE BLOCK

NOTE: Some optical modules integrate AC coupled capacitors within the module. If so, the external AC coupled capacitors are not necessary and can be excluded.

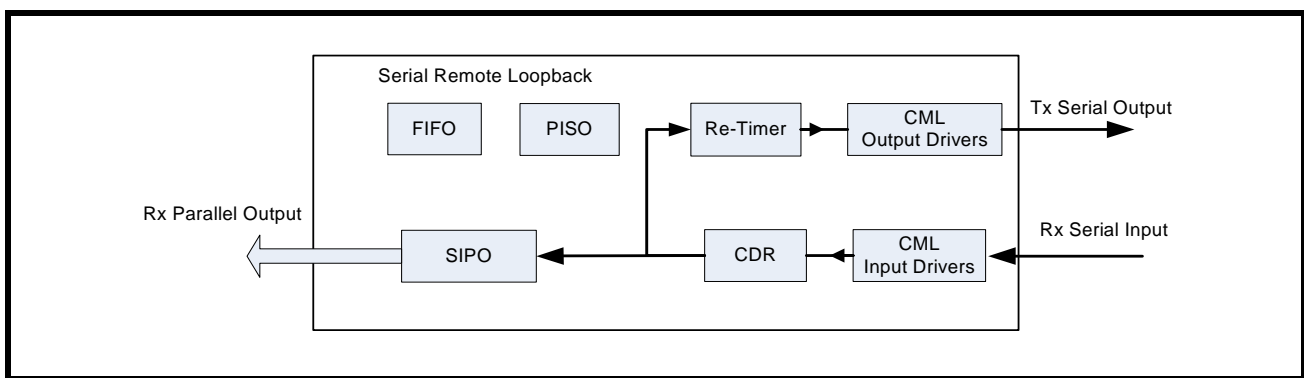

The 2.488/2.666 Gbps high-speed differential CML output TXOP/N swing mode can be controlled through an pin called TXSWING. Setting this pin "Low" enables Low Swing Mode and lowers power consumption. Setting this pin "High" configures the transmit serial output for High Swing Mode. **Figure 24** shows the differential voltage swing definitions.

4.0 DIAGNOSTIC FEATURES

4.1 Serial Remote Loopback

$\overline{\text{RLOOPS_PRBSCLR}}$ is a dual function pin that serves as both serial remote loopback enable and PRBS error clear function. The serial remote loopback function is activated by setting $\overline{\text{RLOOPS_PRBSCLR}}$ "Low". When serial remote loopback is activated, the high-speed serial receive data from RXIP/N is presented at the high-speed transmit output TXOP/N, and the high-speed recovered clock is selected and presented to the high-speed transmit clock output TXSCLKOP/N. During serial remote loopback, the high-speed receive data (RXIP/N) is also converted to parallel data and presented at the low-speed receive parallel interface RXDO[15:0]P/N. The recovered receive clock is also divided by 16 and presented at the low-speed clock output RXPCLKOP/N to synchronize the transfer of the 16-bit received parallel data. In PRBS Test Mode, serial remote loopback is not available when the PRBS generator and analyzer is enabled. This pin serve as the PRBS error clear ($\overline{\text{PRBSCLR}}$) function to reset the PRBS_ERR error output indicator. A simplified block diagram of serial remote loopback is shown in **Figure 16**.

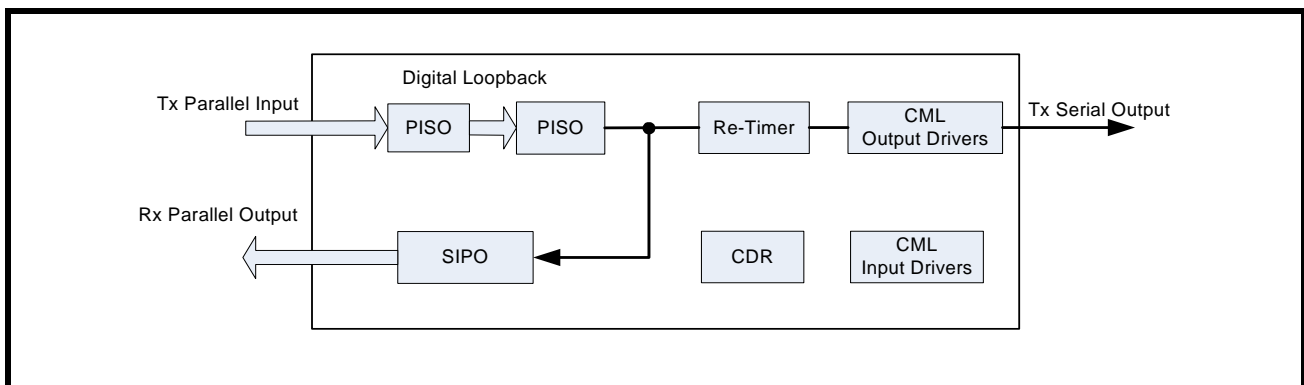

FIGURE 16. SERIAL REMOTE LOOPBACK

4.2 Digital Local Loopback

The digital local loopback is activated when the $\overline{\text{DLOOP}}$ signal is set "Low." When digital local loopback is activated, the high-speed data from the output of the parallel to serial converter is looped back and presented to the high-speed input of the receiver serial to parallel converter. The CMU output is also looped back to the receive section and is used to synchronize the transfer of the data through the receiver. In Digital loopback mode the transmit data from the transmit parallel interface TXDI[15:0]P/N is serialized and presented to the high-speed transmit output TXOP/N along with the high-speed transmit clock which is generated from the clock multiplier unit and presented to the TXSCLKOP/N pins. A simplified block diagram of digital loopback is shown in **Figure 17**.

FIGURE 17. DIGITAL LOOPBACK

4.3 SONET Jitter Requirements

SONET equipment jitter requirements are specified for the following three types of jitter. The definitions of each of these types of jitter are given below. SONET equipment jitter requirements are specified for the following three types of jitter.

4.3.1 Jitter Tolerance:

Jitter tolerance is defined as the peak-to-peak amplitude of sinusoidal jitter applied on the input OC-N equipment interface that causes an equivalent 1dB optical power penalty. OC-1/STS-1, OC-3/STS-3, OC-12/STS-12 and OC-48/STS-48 category II SONET interfaces should tolerate, the input jitter applied according to the mask of **Figure 18**, with the corresponding parameters specified in the figure.

FIGURE 18. JITTER TOLERANCE MASK

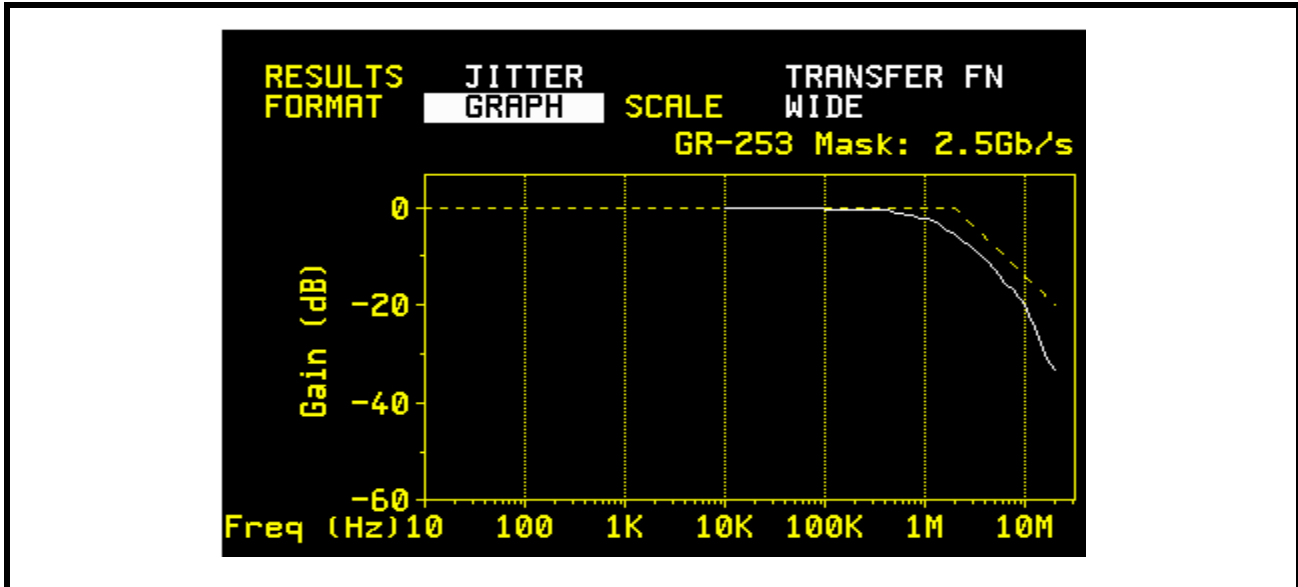

FIGURE 19. XRT91L82 MEASURED JITTER TOLERANCE IN LOOP TIMING MODE AT 2.488 GBPS STS-48/STM-16

4.3.2 Jitter Transfer

Jitter transfer is defined as the ratio of the jitter on the output of STS-N to the jitter applied on the input of STS-N versus frequency. Jitter transfer is important in applications where the system is utilized in the loop-timed mode, where the recovered clock is used as the source of the transmit clock.

FIGURE 20. XRT91L82 MEASURED JITTER TRANSFER IN LOOP TIMING MODE AT 2.488 GBPS STS-48/STM-16

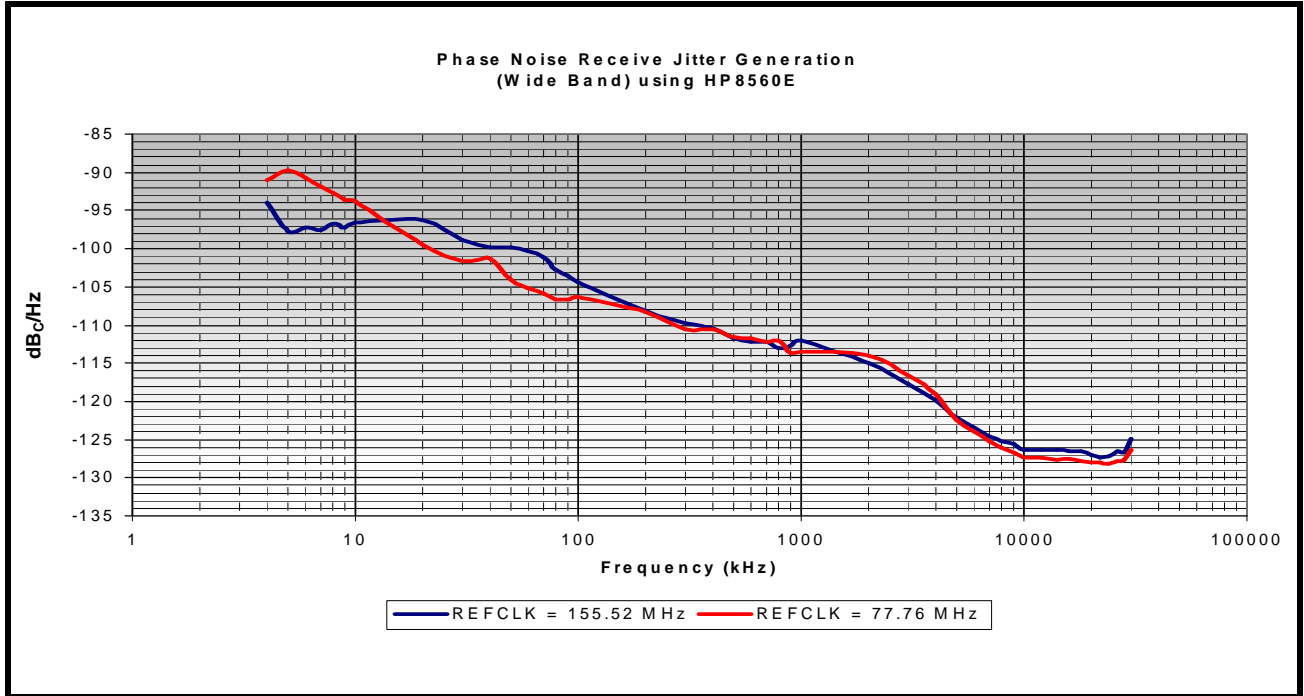

4.3.3 Jitter Generation

Jitter generation is defined as the amount of jitter at the STS-N output in the absence of applied input jitter. The Bellcore and ITU requirement for this type jitter is 0.01UI rms measured with a specific band-pass filter.

For more information on these specifications refer to Bellcore TR-NWT-000253 sections 5.6.2-5 and GR-253-CORE section 5.6.

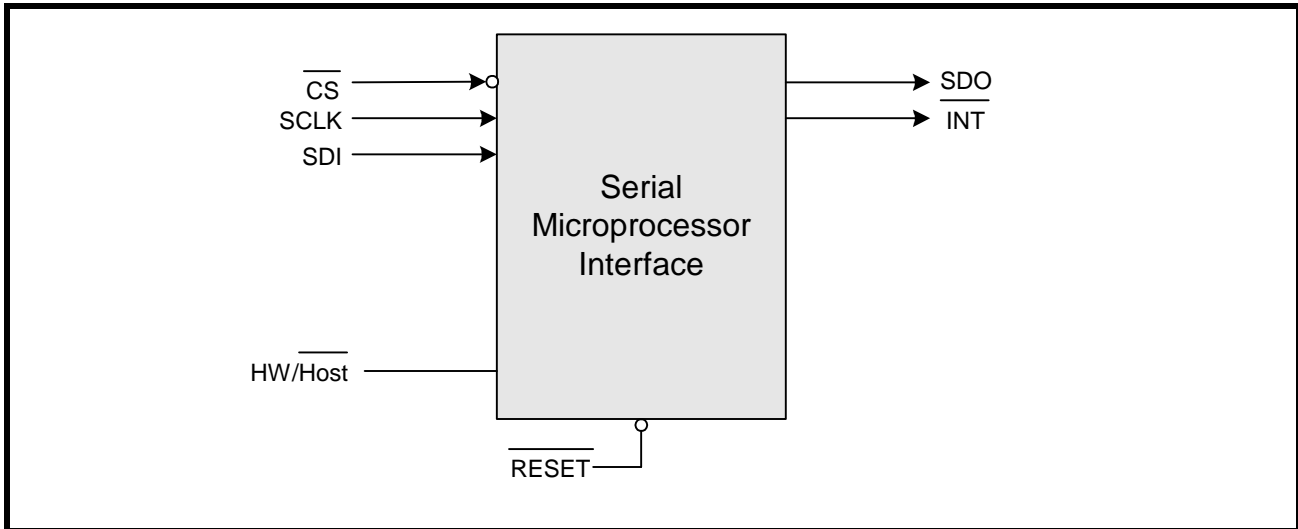

FIGURE 21. XRT91L82 MEASURED ELECTRICAL PHASE NOISE TRANSMIT JITTER GENERATION AT 2.488 GBPS

5.0 SERIAL MICROPROCESSOR INTERFACE BLOCK

The serial microprocessor uses a standard 3-pin serial port with \overline{CS} , SCLK, and SDI for programming the transceiver. Optional pins such as SDO, INT, and \overline{RESET} allow the ability to read back contents of the registers, monitor the transceiver via an interrupt pin, and reset the transceiver to its default configuration by pulling reset "Low" for more than 30ns. A simplified block diagram of the Serial Microprocessor is shown in **Figure 22**.

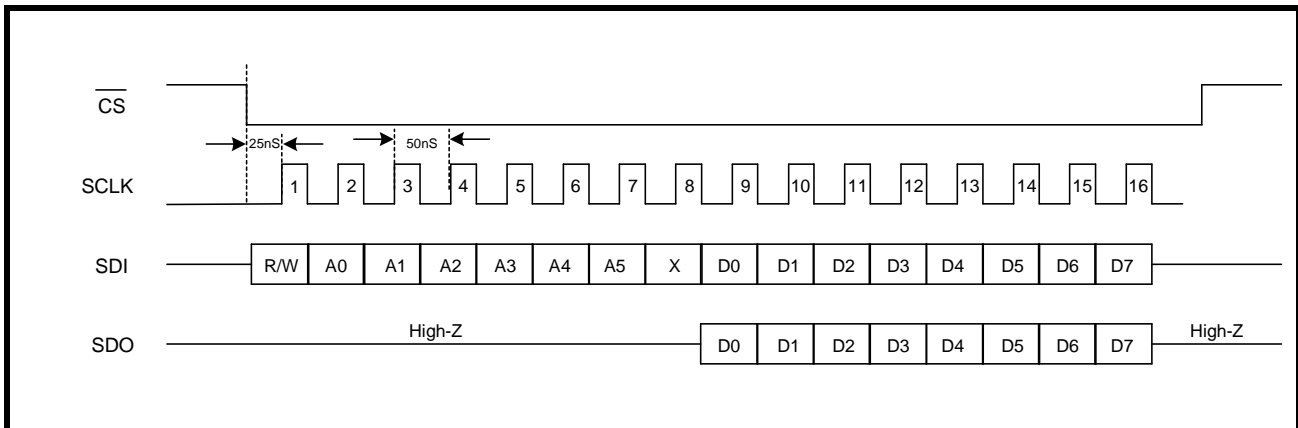

FIGURE 22. SIMPLIFIED BLOCK DIAGRAM OF THE SERIAL MICROPROCESSOR INTERFACE

5.1 SERIAL TIMING INFORMATION

The serial port requires 16 bits of data applied to the SDI (Serial Data Input) pin. The Serial Microprocessor samples SDI on the rising edge of SCLK (Serial Clock Input). The data is not latched into the device until all 16 bits of serial data have been sampled. A timing diagram of the Serial Microprocessor is shown in **Figure 23**.

FIGURE 23. TIMING DIAGRAM FOR THE SERIAL MICROPROCESSOR INTERFACE

NOTE: The serial microprocessor interface does **NOT** support "burst write" or "burst read" operations. Chip Select (active "Low") **must be de-asserted** at the end of every single write or single read operation.

5.2 16-BIT SERIAL DATA INPUT DESCRIPTION

The serial data input is sampled on the rising edge of SCLK. In readback mode, the serial data output is updated on the falling edge of SCLK. The serial data must be applied to the transceiver LSB first. The 16 bits of serial data are described below.

5.2.1 R/W (SCLK1)

The first serial bit applied to the transceiver informs the microprocessor that a Read or Write operation is desired. If the R/W bit is set to "0", the microprocessor is configured for a Write operation. If the R/W bit is set to "1", the microprocessor is configured for a Read operation.

5.2.2 A[5:0] (SCLK2 - SCLK7)

The next 6 SCLK cycles are used to provide the address to which a Read or Write operation will occur. A0 (LSB) must be sent to the transceiver first followed by A1 and so forth until all 6 address bits have been sampled by SCLK.

5.2.3 X (Dummy Bit SCLK8)

The dummy bit sampled by SCLK8 is used to allow sufficient time for the serial data output pin to update data if the readback mode is selected by setting R/W = "1". Therefore, the state of this bit is ignored and can hold either "0" or "1" during both Read and Write operations.

5.2.4 D[7:0] (SCLK9 - SCLK16)

The next 8 SCLK cycles are used to provide the data to be written into the internal register chosen by the address bits. D0 (LSB) must be sent to the transceiver first followed by D1 and so forth until all 8 data bits have been sampled by SCLK. Once 16 SCLK cycles have been complete, the transceiver holds the data until CS is pulled "High" whereby, the serial microprocessor latches the data into the selected internal register.

5.3 8-BIT SERIAL DATA OUTPUT DESCRIPTION

The serial data output is updated on the falling edge of SCLK9 - SCLK16 if R/W is set to "1". D0 (LSB) is provided on SCLK9 to the SDO pin first followed by D1 and so forth until all 8 data bits have been updated. The SDO pin allows the user to read the contents stored in individual registers by providing the desired address on the SDI pin during the Read cycle.

D5	Reserved	This Register Bit is Not Used	X	X
D4	Reserved	This Register Bit is Not Used	X	X
D3	$\overline{\text{DISRD}}$	Receive Parallel Data Output Disable If this bit is set to "0", the 16-bit parallel receive data output will asynchronously mute. "0" = Forces RXDO[15:0]P/N to a logic state "0" "1" = Normal Mode	R/W	1
D2	$\overline{\text{DISRDCLK}}$	Receive Parallel Clock Output Disable This bit is used to asynchronously control the activity of the parallel receive clock output. "0" = Forces RXPCLKOP/N to a logic state of "0" "1" = Normal Mode	R/W	1
D1	TXSCLKOOFF	Transmit Serial Clock Output Tristate This bit is used to control the activity of the 2.488/2.666 GHz differential serial clock output. Tristating TXSCLKOP/N output reduces power consumption. "0" = TXSCLKOP/N output Enabled "1" = TXSCLKOP/N output Tristated	R/W	1
D0	$\overline{\text{CDRLCKREF}}$	CDR's Recovered High-speed Serial Clock Reference Controls CDR's operation. "0" = Forced to lock to CDR PLL reference training clock "1" = Normal Operation (Locked to incoming serial data)	R/W	1

TABLE 20: MICROPROCESSOR REGISTER 0X05H BIT DESCRIPTION

DIAGNOSTIC CONTROL REGISTER (0X05H)				
BIT	NAME	FUNCTION	Register Type	Default Value (HW reset)
D7	Reserved	This Register Bit is Not Used	X	X
D6	Reserved	This Register Bit is Not Used	X	X
D5	PRBS_INV	2²³-1 PRBS Pattern Invert This bit will invert each of the Pseudo Random Binary Sequence pattern bit from "0" to "1" and from "1" to "0." "0" = Normal Operation "1" = PRBS bit patterns inverted.	R/W	0
D4	PRBS_EN	2²³-1 PRBS TEST Pattern Enable Generates 2 ²³ -1 Pseudo Random Binary Sequence test patterns and analyzes in the receiving block for correct sequence pattern. "0" = Normal Mode "1" = PRBS pattern generator and analyzer Enabled. NOTE: A Local Loopback of some type such as Digital Local Loopback or an optical cable loopback is expected to be used in conjunction with PRBS_EN in order for the PRBS analyzer to receive the PRBS pattern.	R/W	0
D3	Reserved	This Register Bit is Not Used	X	X
D2	$\overline{\text{DLOOP}}$	Digital Local Loopback Digital local loopback allows the transmit input pins to be looped back to the receive output pins for local diagnostics. The transmit serial data output is valid during the digital loopback. "0" = Enable Digital Local Loopback "1" = Disabled NOTE: $\overline{\text{RLOOPS}}$ should be disabled when $\overline{\text{DLOOP}}$ is enabled.	R/W	1
D1	$\overline{\text{RLOOPS}}$	Serial Remote Loopback Serial remote loopback allows the receive serial input pins to be looped back to the transmit serial output pins for remote diagnostics. The receive data output is valid during a serial remote loopback. "0" = Enable Remote Serial Loopback "1" = Disabled NOTE: $\overline{\text{DLOOP}}$ should be disabled when $\overline{\text{RLOOPS}}$ is enabled.	R/W	1
D0	Reserved	This Register Bit is Not Used	X	X

TABLE 21: MICROPROCESSOR REGISTER 0x06H BIT DESCRIPTION

TIMING CONTROL REGISTER (0x06H)				
BIT	NAME	FUNCTION	Register Type	Default Value (HW reset)
D7	VCXOLKEN	De-Jitter PLL Lock Detect Enable This bit enables the VCXO_IN input lock detect circuit to be active. "0" = VCXO Lock Detect Disabled "1" = VCXO Lock Detect Enabled	R/W	0
D6	LOOPBW	CMU Loop Band Width Select This bit is used to select the bandwidth of the clock multiplier unit of the transmit path to a narrow or wide band. Use Wide Band for clean reference signals and Narrow Band for noisy references. "0" = Wide Band (4x) "1" = Narrow Band (1x)	R/W	0
D5	Reserved	This Register Bit is Not Used	X	X
D4	Reserved	This Register Bit is Not Used	X	X
D3	Reserved	This Register Bit is Not Used	X	X
D2	VCXO_SEL	VCXO De-Jitter Select This bit selects either the normal REF1CLKP/N and REF2CLKP/N or the de-jitter VCXO_IN as a reference clock to the CMU. "0" = Normal REF1CLKP/N and/or REF2CLKP/N Mode "1" = De-Jitter VCXO Mode	R/W	0
D1	LOOPM_JA	Loop Timing With Jitter Attenuation The LOOPM_JA bit must be set to "1" in order to select the recovered receive clock as the reference source for the de-jitter PLL. "0" = Disabled "1" = Loop timing with de-jitter PLL Activated	R/W	0
D0	LOOPM_NOJA	Loop Timing With No Jitter Attenuation When the loop timing mode is activated, the external local reference clock input to the CMU is replaced with the 1/16th or 1/32nd (ALTFREQSEL option available in Host Mode) of the high-speed recovered receive clock coming from the CDR. "0" = Disabled "1" = Loop timing Activated	R/W	0

7.0 ELECTRICAL CHARACTERISTICS

ABSOLUTE MAXIMUM RATINGS

Thermal Resistance of STBGA Package... $\Theta_{JA} = 25^{\circ}\text{C/W}$	Operating Temperature Range.....-40°C to 85°C
Thermal Resistance of STBGA Package... $\Theta_{JC} = 10^{\circ}\text{C/W}$	Case Temperature under bias.....-55°C to 125°C
ESD Protection (HBM).....>2000V	Storage Temperature-65°C to 150°C

ABSOLUTE MAXIMUM POWER AND INPUT LOGIC SIGNALS

SYMBOL	TYPE	PARAMETER	MIN	TYP	MAX	UNITS
VDD _{1.8}		1.8V Digital and Analog Power Supplies	-0.5		3.6	V
VDD _{IO}		3.3V LVPECL/LVDS Input Power Supply	-0.5		6.0	V
	LVPECL	DC logic signal input voltage	-0.5		VDD _{IO} +0.5	V
	LVDS	DC logic signal input voltage	-0.5		VDD _{IO} +0.5	V
	LVTTL/ LVCMOS	DC logic signal input voltage	-0.5		5.5	V
	LVCMOS	DC logic signal output voltage	-0.5		VDD _{IO} +0.5	V
	LVPECL	Input current	-100		100	mA
	LVTTL/ LVCMOS	Input current	-100		100	mA

NOTE: Stresses listed under Absolute Maximum Power and I/O ratings may be applied to devices one at a time without causing permanent damage. Functionality at or above the values listed is not implied. Exposure to these values for extended periods will severely affect device reliability.

POWER AND CURRENT DC ELECTRICAL CHARACTERISTICS

SYMBOL	PARAMETER	MIN	TYP	MAX	UNITS	CONDITIONS
VDD _{1.8}	CML and CMOS Power Supply Voltage	1.710	1.8	1.890	V	
AVDD _{TX}	Transmit Power Supply Voltage (AVDD _{TX})	1.710	1.8	1.890	V	
AVDD _{RX}	Receiver Power Supply Voltage (AVDD _{RX})	1.710	1.8	1.890	V	
VDD _{IO}	LVPECL or LVDS Input and Digital I/O Power Supply Voltage	3.135	3.3	3.465	V	
P _{R18}	1.8V Power Supply Noise Rejection Ratio			50	mVP-P	6 KHz - 2 MHz
P _{R33}	3.3V Power Supply Noise Rejection Ratio			50	mVP-P	6 KHz - 2 MHz
I _{DD_1.8LVDS}	1.8V Total Power Supply Current		310	375	mA	LVDS
I _{DD_IOLVDS}	3.3V Total Power Supply Current		120	145	mA	LVDS

POWER AND CURRENT DC ELECTRICAL CHARACTERISTICS

SYMBOL	PARAMETER	MIN	TYP	MAX	UNITS	CONDITIONS
I _{DD_1.8LVPECL}	1.8V Total Power Supply Current		310	375	mA	LVPECL
I _{DD_IOLVPECL}	3.3V Total Power Supply Current		370	445	mA	LVPECL
P _{LVDS}	Total Power Dissipation		950	1140	mW	LVDS
P _{LVPECL}	Total Power Dissipation		1780	2150	mW	LVPECL

FIGURE 24. DIFFERENTIAL VOLTAGE SWING DEFINITIONS (INPUT OR OUTPUT) FOR CLOCK AND DATA

COMMON MODE LOGIC SIGNAL DC ELECTRICAL CHARACTERISTICS

Test Condition: VDD _{1.8} = 1.8V ± 5%, VDD _{IO} = 3.3V ± 5% unless otherwise specified							
SYMBOL	TYPE	PARAMETER	MIN	TYP	MAX	UNITS	CONDITIONS
DV _{OUT-DIFF}	CML	Output Differential Voltage Clock	700		1400	mV	HighSwing TXSWING=1 Figure 24
ΔV _{OUTSE}	CML	Output Differential Voltage Clock	350		700	mV	HighSwing TXSWING=1
DV _{OUT-DIFF}	CML	Output Differential Voltage Data	800		1400	mV	HighSwing TXSWING=1
ΔV _{OUTSE}	CML	Output Differential Voltage Data	400		700	mV	HighSwing TXSWING=1
DV _{OUT-DIFF}	CML	Output Differential Voltage Clock	450		900	mV	Low Swing TXSWING=0
ΔV _{OUTSE}	CML	Output Differential Voltage Clock	225		450	mV	Low Swing TXSWING=0
DV _{OUT-DIFF}	CML	Output Differential Voltage Data	550		1050	mV	Low Swing TXSWING=0
ΔV _{OUTSE}	CML	Output Differential Voltage Data	275		525	mV	Low Swing TXSWING=0

Test Condition: $V_{DD_{1.8}} = 1.8V \pm 5\%$, $V_{DD_{IO}} = 3.3V \pm 5\%$ unless otherwise specified							
SYMBOL	TYPE	PARAMETER	MIN	TYP	MAX	UNITS	CONDITIONS
V_{IDIFF}	CML	Input Differential Voltage	200		1000	mV	Differential Mode.
$V_{ISINGLE}$	CML	Input Single-Ended Voltage Swing	100		500	mV	Differential Mode.
V_{IBIAS}	CML	Input Bias Range (AC Coupled)	1.0		1.4	V	Differential Mode.
R_{DIFF}	CML	Input Differential Resistance	75		125	Ω	

LVPECL LOGIC SIGNAL DC ELECTRICAL CHARACTERISTICS

Test Condition: $T_A = 25^\circ C$, $V_{DD_{1.8}} = 1.8V \pm 5\%$, $V_{DD_{IO}} = 3.3V \pm 5\%$ unless otherwise specified							
SYMBOL	TYPE	PARAMETER	MIN	TYP	MAX	UNITS	CONDITIONS
V_{OH}	LVPECL	Output High Voltage	$V_{DD_{IO}} - 1.15$		$V_{DD_{IO}} - 0.735$	V	
V_{OL}	LVPECL	Output Low Voltage	$V_{DD_{IO}} - 1.95$		$V_{DD_{IO}} - 1.495$	V	
V_{ODIFF}	LVPECL	Output Differential Voltage Swing	1		2	V	See Figure 24
V_{IH}	LVPECL	Input High Voltage	$V_{DD_{IO}} - 1.2$		$V_{DD_{IO}} - 0.7$	V	Differential and Single-Ended
V_{IL}	LVPECL	Input Low Voltage	$V_{DD_{IO}} - 2.0$		$V_{DD_{IO}} - 1.40$	V	Differential and Single-Ended
V_{IDIFF}	LVPECL	Input Differential Voltage	0.4		2.4	V	Differential Mode. See Figure 24

LVDS LOGIC SIGNAL DC ELECTRICAL CHARACTERISTICS

Test Condition: $T_A = 25^\circ C$, $V_{DD_{1.8}} = 1.8V \pm 5\%$, $V_{DD_{IO}} = 3.3V \pm 5\%$ unless otherwise specified							
SYMBOL	TYPE	PARAMETER	MIN	TYP	MAX	UNITS	CONDITIONS
V_{OH}	LVDS	Output High Voltage			1680	mV	100 Ω line - line
V_{OL}	LVDS	Output Low Voltage	810			mV	100 Ω line - line
V_{ODIFF}	LVDS	Output Differential Voltage Swing	450		1320	mV	100 Ω line - line See Figure 24
$V_{OSINGLE}$	LVDS	Output Single-Ended Voltage Swing	225		660	mV	100 Ω line - line
V_{IH}	LVDS	Input High Voltage			2400	mV	
V_{IL}	LVDS	Input Low Voltage	800			mV	
V_{IDIFF}	LVDS	Input Differential Voltage Swing	200		1300	mV	
$V_{ISINGLE}$	LVDS	Input Single-Ended Voltage Swing	100		650	mV	

LVTTTL/LVCMOS SIGNAL DC ELECTRICAL CHARACTERISTICS

Test Condition: $T_A = 25^\circ\text{C}$, $V_{DD\ 1.8} = 1.8\text{V} \pm 5\%$, $V_{DD_IO} = 3.3\text{V} \pm 5\%$ unless otherwise specified							
SYMBOL	TYPE	PARAMETER	MIN	TYP	MAX	UNITS	CONDITIONS
V_{OH}	LVC MOS	Output High Voltage	2.93		V_{DD_IO}	V	$I_{OH} = -1.0\text{mA}$
V_{OL}	LVC MOS	Output Low Voltage	0		0.2	V	$I_{OH} = 1.0\text{mA}$
V_{IH}	LVTTTL/ LVC MOS	Input High Voltage	2.2		3.3	V	
V_{IL}	LVTTTL/ LVC MOS	Input Low Voltage	-0.5		0.7	V	
I_{IH}	LVTTTL/ LVC MOS	Input High Current		50	500	μA	$2.2\text{V} < V_{IN} < 3.3\text{V}$ $V_{IN} = 2.4\text{V}$ typical
I_{IL}	LVTTTL/ LVC MOS	Input Low Current			-500	μA	$-0.5\text{V} < V_{IN} < 0.7\text{V}$
I_{LEAK}	LVTTTL/ LVC MOS	Input Leakage Current	-10		10	μA	$V_{IN} = V_{DD_IO}$ or $V_{IN} = 0$
I_{LEAK_PU}	LVTTTL/ LVC MOS	Input Leakage Current with Pull-Up Resistor	61.3		216	μA	$V_{IN} = 0$
I_{LEAK_PD}	LVTTTL/ LVC MOS	Input Leakage Current with Pull-Down Resistor	61.3		216	μA	$V_{IN} = V_{DD_IO}$

NOTE: All input control pins are LVCMOS and LVTTTL compatible. All output control pins are LVCMOS compatible only.
