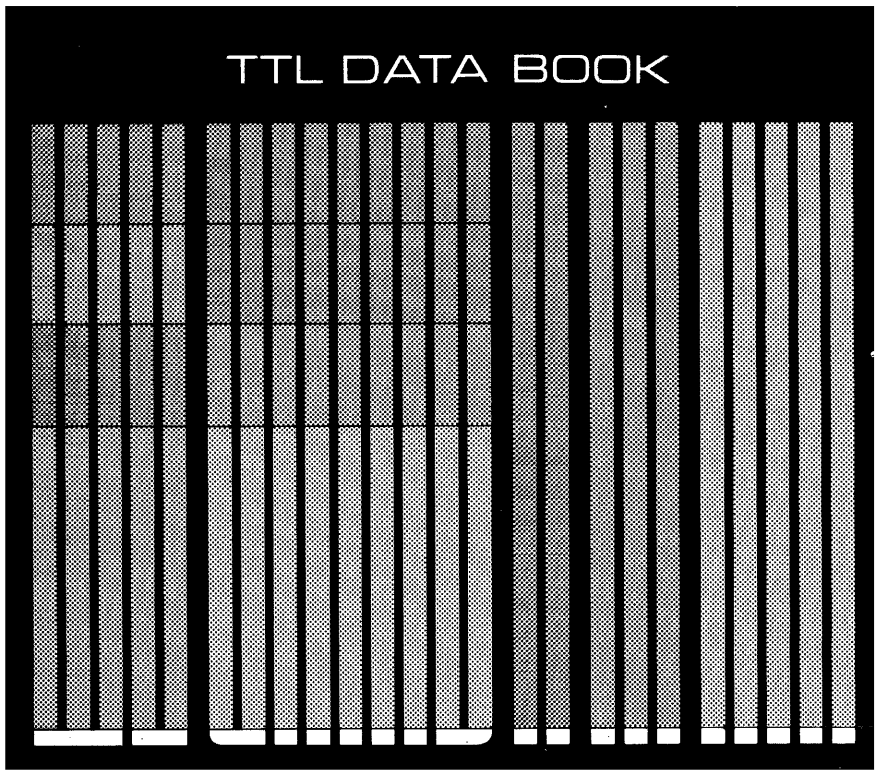
TTL DATA BOOK



MADE IN FAIRCHILD

Fairchild Semiconductor TTL Data Book Contents And Section Selector

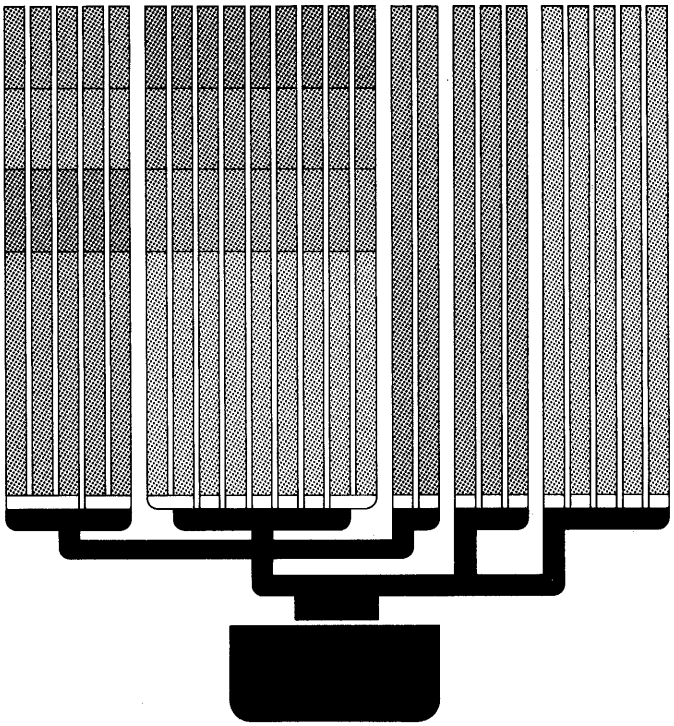
If you know the correct 5400, 7400, 9300 or 9600 device type number, find the correct page in the Numerical Index.

If you are trying to choose the best device for your application, consult the Selector guides.

If you need the package dimensions for a specific device, see Packaging Information.

If you need the exact, or nearest Fairchild equivalent to another manufacturer's device, consult the Cross Reference Guide.

The Fairchild Semiconductor TTL Data Book



The TTL Family

Fairchild's TTL Family is the most complete line of TTL products available today. There are over 250 circuit functions with more than 100 MSI devices from which to choose. The family consists of logic, memory and interface functions, and is a unique blend of Fairchild proprietary circuits and a large number of second source devices which have achieved wide market acceptance.

Fairchild's family of functions has been designed to provide the system designer with a complete line of standard off-the-shelf functional building blocks that can be interfaced directly with each other in the same system to provide the optimum Speed/Power combination.

9000	Medium Speed SSI
9H00	High Speed SSI
9L00	Low Power SSI
9N00	Standard SSI
9S00	Schottky SSI
9300	Standard MSI
93L00	Low Power MSI
93S00	Schottky MSI
9600	Monostable SSI
93400	Memory Elements

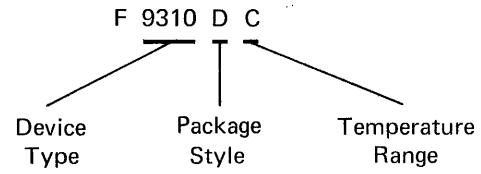
ORDER INFORMATION

A simplified ordering procedure for Fairchild digital integrated circuits is introduced with the publication of this catalog. Three basic units of information are contained in the new order code:



Device Type

Four to seven alpha numeric characters define the device functional and electrical characteristics, as specified in the data sheets.

Package Style

One letter represents the basic package style.

D = Dual In-Line Ceramic (Hermetic)
E = Plastic Can
F = Flat Package (Hermetic)
H = Metal Can
P = Dual In-Line Plastic

Different outlines exist within each package style to accomodate the various die sizes and numbers of leads. Specific dimensions for each package can be found in the "Packaging Information" section.

Temperature Range

Two Basic temperature grades are in common use:

C = Commercial-Industrial, 0°C to +70°C (or 75°C)
M = Military, −55°C to +125°C

Exact values and conditions are indicated on the data sheets.

Examples

(a) 93L28FM

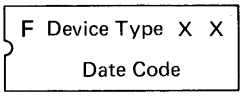
This number code indicates a 93L28 register in a flat package with military temperature rating capability.

(b) 9317BDC

This number code indicates a 9317 decoder/driver with B voltage option in a ceramic dual in-line package with commercial temperature rating.

Device Identification/Marking

All Fairchild standard catalog digital circuits will be marked as follows:



When more than one number is in common use for a device, slash marking with both numbers may be used. Example: 74H04/9H04.

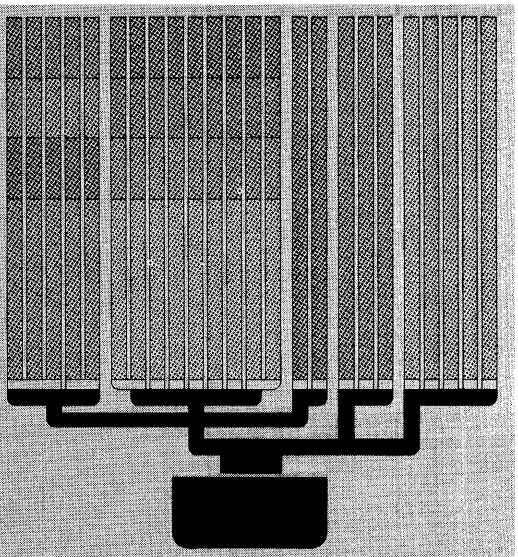
Mil Spec 38510 Processing

Additional processing to Fairchild Unique 38510 specifications is indicated by noting the appropriate requirements after the standard order code.

Detailed ordering procedures are provided in the OEM price list.

Old Order Codes

Devices may continue to be purchased against old order codes (Example: U7B931059X). However, all products will be marked with new order codes unless otherwise specified.



Numerical Index

If you know the correct 5400, 7400, 9300 or 9600 device type number, find the correct page in the Numerical Index.

Selector Guide and Functional Index

The following selector guides provide a comparison of the key parameters for all Fairchild TTL devices. They should be used to help determine the most suitable device for a specific application. Final selection should be made using the appropriate data sheet.

Charts are provided covering the following device categories.

SSI

Gates, Buffers and Inverters
Flip-Flops
Monostables
Interface-Drivers
Interface-Receivers
Interface-Level Translators

MSI/MEMORIES

Arithmetic Operators
—Adders, ALU.S, Comparators, Multipliers, Parity Checkers.
Counters
Decoders-Display
Decoders/Demultiplexers
Encoders
Latches
Memories [RAM (Read/Write), ROM, Associative]
Multiplexers
Registers

SINGLE FLIP-FLOP SELECTOR GUIDE

	OUTPUT CHANGES ON POSITIVE GOING EDGE	OUTPUT CHANGES ON NEGATIVE GOING EDGE

	 **9001/74105** 50 MHz/16 ns		
EDGE TRIGGERED	 **9N70/7470** 35 MHz/27 ns	 **9H101/74H101** 50 MHz/16 ns	 **9H102/74H102** 50 MHz/16 ns

DUAL FLIP-FLOP SELECTOR GUIDE

MASTER/SLAVE	 **9020** 50 MHz/16 ns	 **9N73/7473 • 9N107/74107** 20 MHz/25 ns **9H73/74H73** 30 MHz/22 ns	
	 **9022** 50 MHz/16 ns	 **9N76/7476** 20 MHz/25 ns **9H76/74H76** 30 MHz/22 ns	 **9H78/74H78** 30 MHz/22 ns
EDGE TRIGGERED	 **9024** 25 MHz/22 ns **9L24** 8 MHz/66 ns **9S109** 100 MHz/7 ns	 **9H103/74H103** 50 MHz/16 ns	 **9H106/74H106** 50 MHz/16 ns
		 **9H108/74H108** 50MHz/16 ns	 **9S112/74S112** 125 MHz/5 ns
	 **9N74/7474** 25 MHz/20 ns **9H74/74H74** 43 MHz/13 ns **9S74/74S74** 100 MHz/7 ns	 **9S113/74S113** 125 MHz/5 ns	 **9S114/74S114** 125 MHz/5 ns

MASTER/SLAVE (or "ONES CATCHING" MASTER/SLAVE)—The master is sensitive to input conditions during the active portion of the clock pulse.
EDGE TRIGGERED — Only sensitive to input conditions immediately prior to active clock edge.

SSI • GATES, BUFFERS AND INVERTERS

TTL Loading Rules

All devices in the Fairchild TTL family have compatible logic levels. Standard, low power and high speed device, may be mixed in a system to obtain the optimum cost, power, speed combination.

To simplify design calculations the different loading rules of each series have been normalized to one standard set of conditions.

TTL LOADING RULES

All Transistor Transistor Logic integrated circuits are derived from the simple gate schematic shown in Figure 1.

The output is LOW (logic "0") only if both inputs A and B are HIGH (logic "1"). This is defined as a positive logic NAND gate.

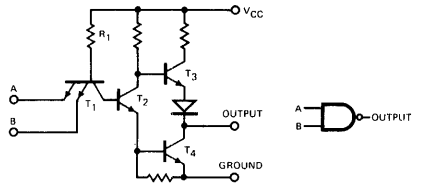

FIGURE 1

Input Characteristics

A low voltage at inputs A or B will cause current to flow out of the forward biased base-emitter diode of the multi-emitter transistor (T_1). When the voltage level at A or B or both is less than 2 $V_{BE(SAT)}$ levels, the current supplied by R_1 will flow out of the LOW input terminal (see Figure 2) keeping transistors T_2 and T_4 turned off. If both inputs A and B are raised to a HIGH voltage level, the base-emitter diodes of the input transistor (T_1) will be reverse biased. The current supplied by R_1 will then flow through the base-collector diode of T_1 (see Figure 3) turning on transistor T_2 and T_4. The HIGH level input voltage source must be capable of supplying leakage current to the reverse biased input transistor. Because of the NPN action of the input device, this leakage current is referred to as inverse beta current. The value of the input LOW current and input HIGH leakage current is dependent on the value of R_1. The value of this resistor is chosen to optimize the specific speed/power performance characteristics of each device.

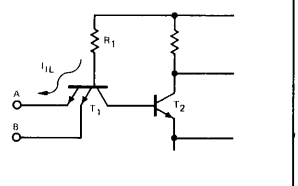

FIGURE 2

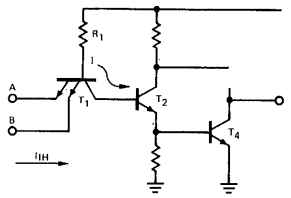

FIGURE 3

Output Characteristics

The fan out or drive capability of a TTL device reflects its ability to sink current in the output LOW (logic "0") state (see Figure 4) and to source or drive current in the output HIGH (logic "1") state (see Figure 5).

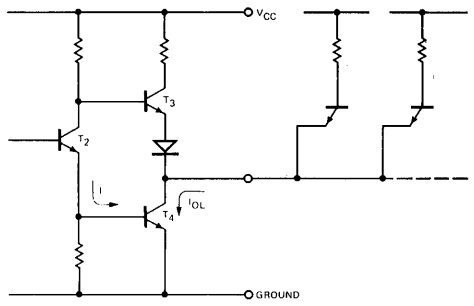

FIGURE 4

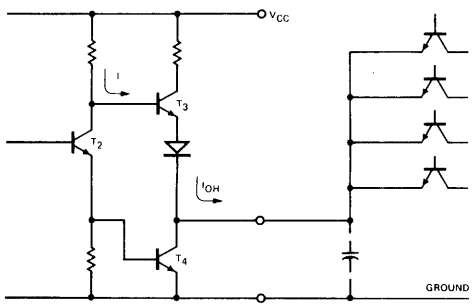

FIGURE 5

In the output LOW state the "phase splitter" transistor T_2 is "on". It supplies base drive to the output pull down transistor (T_4). The amount of base drive required for the pull down transistor is dependent on the worst case beta of the device and the fan out (I_{OL}) sink current requirements of the circuit. The output HIGH drive current (I_{OH}) of the device is supplied from the pull up transistor (T_3). When the phase splitter transistor (T_2) is turned "off", the pull up transistor is turned "on". This presents a low impedance drive source at the output. Although the static I_{OH} requirements of most circuits is less than 0.5 mA, about 35 mA is made available at the instant of LOW to HIGH output transition to charge up the distributed line, board and package capacitances encountered in most system designs. Different types of pull up circuits are used to achieve faster system speeds by minimizing HIGH output impedance and the resulting RC time constant.

Normalized Fan In/Fan Out Rules

In order to simplify designing with Fairchild TTL devices, the input and output loading parameters of all families are normalized to the following values:

1 Unit TTL Load (U.L.) = 40 μA in the HIGH state (logic "1")
= 1.6 mA in the LOW state (logic "0")

Input loading and output drive factors of all products described in this catalog are related to these definitions.

Examples — Input Load

1. A 9N00/7400 gate, which has a maximum I_{IL} of 1.6 mA and I_{IH} of 40 μA is specified as having an input load factor of 1 U.L. (Also called a fan in of 1 load.)
2. The 93H72, which has a value of I_{IL} = 3.2 mA and I_{IH} of 80 μA on the CP terminal, is specified as having an input load factor of $\frac{3.2\text{ mA}}{1.6\text{ mA}}$ or 2 U.L.

Examples — Output Drive

1. The output of the 9N00/7400 will sink 16 mA in the LOW (logic "0") state and source 800 μA in the HIGH (logic "1") state. The normalized output LOW drive factor is therefore $\frac{16\text{ mA}}{1.6\text{ mA}}$ = 10 U.L. and the output HIGH drive factor is $\frac{800\ \mu\text{A}}{40\ \mu\text{A}}$ = 20 U.L.

Relative load and drive factors for the basic TTL gate families specified in this catalog are given in Table 1.

Table I

FAMILY	INPUT LOAD		OUTPUT DRIVE	
	HIGH	LOW	HIGH	LOW

9L00	0.5 U.L.	0.25 U.L.	10 U.L.	2.5 U.L.
9N00/7400	1 U.L.	1 U.L.	20 U.L.	10 U.L.
9S00/74S00	1.25 U.L.	1.25 U.L.	25 U.L.	12.5 U.L.

Values for MSI devices vary significantly from one element to another. Consult the appropriate data sheet for actual characteristics.

DC Noise Margin

The loading rules defined above have been determined under test conditions chosen to insure useful worst case noise margin values over the full temperature and supply voltage ranges specified for the Fairchild TTL families.

Noise margin is defined in Figure 6 as the difference between the worst case output logic voltage and the worst case input voltage which guarantees the desired output level.

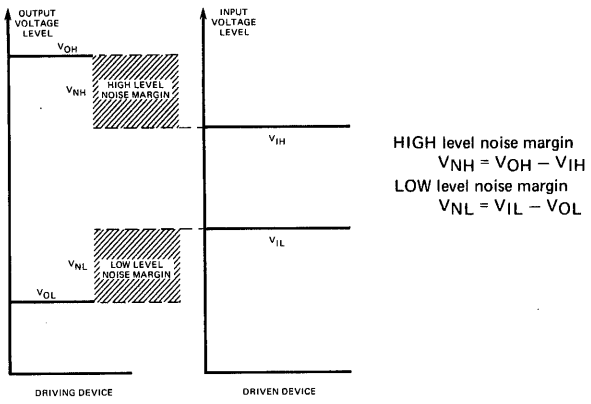

FIGURE 6

Table II below lists the worst case dc logic levels for Fairchild TTL devices.

Table II

PARAMETER	DEFINITION	9300 9N/54, 74 9H/54H, 74H	93L00 9L00	93S00 9S/74S	9S/54S
V_{OH}	Minimum Output Voltage in the HIGH State	2.4 V	2.4 V	2.5 V	2.7 V
V_{OL}	Maximum Output Voltage in the LOW State	0.4 V	0.3 V	0.5 V	0.5 V
V_{IH}	Minimum Voltage Level Which is Guaranteed to be Interpreted as a HIGH at the Input	2.0 V	2.0 V	2.0 V	2.0 V
V_{IL}	Maximum Voltage Level Which is Guaranteed to be Interpreted as a LOW at the Input	0.8 V	0.7 V	0.8 V	0.8 V

Example

1. The worst case guaranteed dc noise margin for a 9300 MSI interfacing with another 9300 MSI is therefore:

$$V_{NH} = 2.4 - 2.0 = 400 \text{ mV}$$
$$V_{NL} = 0.8 - 0.4 = 400 \text{ mV}$$

2. The worst case guaranteed noise margin for a 74S00 gate driving a 7400 gate is therefore:

$$V_{NH} = 2.7 - 2.0 = 700 \text{ mV}$$
$$V_{NL} = 0.8 - 0.5 = 300 \text{ mV}$$

Wired-OR Applications

Certain TTL devices are provided with an "open" collector output to permit the Wired-OR (actually Wired-AND) function. This is achieved by connecting open collector outputs together and adding an external pull up resistor.

The value of the pull up resistor is determined by considering the fan out of the OR tie and the number of devices in the OR tie. The pull up resistor value is chosen from a range between a maximum value (established to maintain the required V_{OH} with all the OR tied outputs HIGH) and a minimum value (established so that the OR tie fan out is not exceeded when only one output is LOW).

Minimum and Maximum Pull Up Values

$$R_X \text{ (Min.)} = \frac{V_{CC} \text{ (max.)} - V_{OL}}{I_{OL} - N_2 I_{IL}}$$

$$R_X \text{ (Max.)} = \frac{V_{CC} \text{ (min.)} - V_{OH}}{N_1 I_{CEX} + N_2 I_{IH}}$$

Where

R_X = External Pull Up Resistor
N_1 = Number of Wired-OR Outputs
N_2 = Number of Input Unit Loads Being Driven
$I_{CEX}(I_{OH})$ = Output HIGH Leakage Current
I_{OL} = LOW Level Fan Out Current of Driving Element
I_{IH} = Input HIGH U.L. (40 μA)
I_{IL} = Input LOW U.L. (1.6 mA)
V_{OL} = Output LOW Voltage Level (0.4 V)
V_{OH} = Output HIGH Voltage Level (2.4 V)
V_{CC} = Power Supply Voltage

Example: Four 9N01/7401 gates driving four other gate or MSI inputs.

$N_1 = 4$
$N_2 = 4$ (U.L.)
$I_{CEX} = 250\ \mu A$
$I_{OL} = 16$ mA
$I_{IH} = 40\ \mu A$
$I_{IL} = 1.6$ mA
$V_{OL} = 0.4$ V
$V_{OH} = 2.4$ V

$$R_X \text{ (min.)} = \frac{5.25 \text{ V} - 0.4 \text{ V}}{16 \text{ mA} - 4(1.6 \text{ mA})} = \frac{4.85 \text{ V}}{9.6 \text{ mA}}$$

$$R_X \geqslant 505\ \Omega$$

$$R_X \text{ (max.)} = \frac{4.75 \text{ V} - 2.4 \text{ V}}{4(0.250 \text{ MA}) + (0.04 \text{ mA})} = \frac{2.35 \text{ V}}{1.16 \text{ mA}}$$

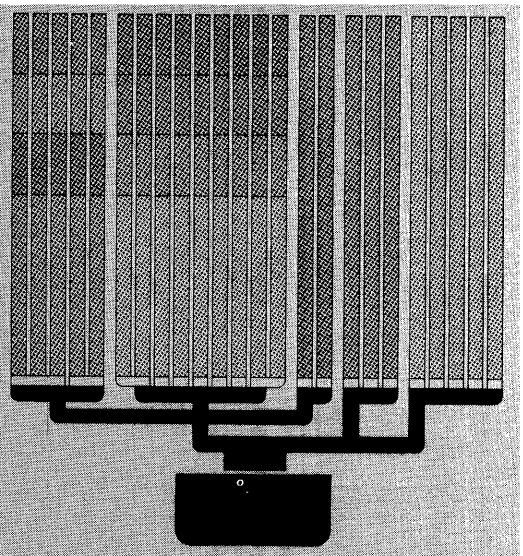
$$R_X \leqslant 2.03\ \text{k}\Omega$$

Unused Inputs

To minimize noise sensitivity and optimize switching times, unused inputs of all TTL circuits should be held between 2.4 V and the absolute maximum 5.5 V. This eliminates the effect of the distributed capacitance associated with the floating input, and ensures that no degradation will occur in the propagation delay times.

Possible ways of handling unused inputs are:

1. Connect unused inputs to a used input if maximum HIGH level fan out of the driving output will not be exceeded. Each additional input presents a full load to the driving output at a HIGH level voltage but adds no loading at a LOW level voltage. The HIGH level fan out for all circuits has been specified at double the LOW level fan out specifically to provide for this method of treating unused inputs.
2. Connect unused inputs to V_{CC} through a 1 kΩ resistor. If a transient exceeding the 5.5 V maximum rating should occur, the impedance will be high enough to protect the input. One to 25 unused inputs may be connected to each 1 kΩ resistor.
3. Tie the inputs to the output of an unused gate in the system. The gate must provide a constant HIGH level output.
4. Connect unused inputs to an independent supply voltage in the range of 2.4 V to 3.5 V.



SSI
9000, 9H(54/74H), 9L, 9N(54/74) and 9S(54/74S) Series Data Sheets

This section comprises data sheets on the five basic Fairchild TTL/SSI series.

9000
9H00/54H, 74H00
9L00
9N00/54, 7400
9S00/54S, 74S00

Devices are presented in alpha-numerical sequence, with the exception of the 9000. elements. All 9000 series functions are grouped together at the beginning of this section.

TTL/SSI INTRODUCTION

INTRODUCTION – The Fairchild TTL/SSI line offers the designer a broad selection of gates and flip-flops for use with Fairchild MSI, Interface and Memory products in implementing TTL system designs. These TTL/SSI functions are available for use in military and industrial temperature range applications. These products are available in the popular Dual In-Line package as well as flat packages. All Fairchild TTL products are logic and supply voltage compatible so that circuit families may be mixed within a system for optimum speed, power and economy.

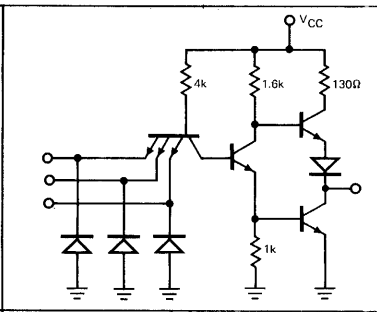
9N/54, 74 SERIES TTL/SSI

FEATURES

- 10 ns Typical Gate Delay
- 10 mW Typical Gate Power Dissipation
- Input Clamp Diodes Minimize Termination Effects
- Military and Industrial Temperature Range
- Available in DIP and Flat Packages

DESCRIPTION

The 9N/54, 74 Series is a broad family of SSI devices which are pin and function identical with the popular 7400 series. These gates and binaries are available in industrial and military temperature ranges in both DIP and Flat packages. The line included NAND gates, NOR gates, Exclusive-OR gates, AND gates, open collector gates as well as single and dual flip-flops.



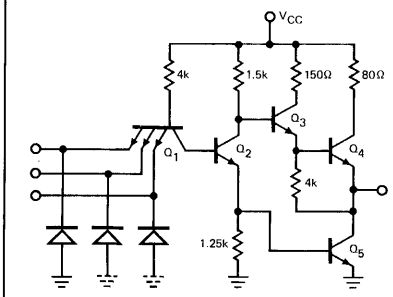
9000 SERIES TTL/SSI

FEATURES

- 8 ns Typical Gate Delay
- 10 mW Typical Gate Power Dissipation
- Input Clamp Diodes Reduce Termination Effects
- Darlington Output Stage Increases Circuit Speed
- Military and Industrial Temperature Range
- Available in DIP and Flat Packages

DESCRIPTION

The 9000 Series of gates and flip-flops offers a family of high speed functions with speed and power specifications in between the 9N/54, 74 Series and the 9H/54H, 74H Series. The Darlington output stage provides faster switching times and increased capacitive drive capability over the 9N/54, 74 Series.



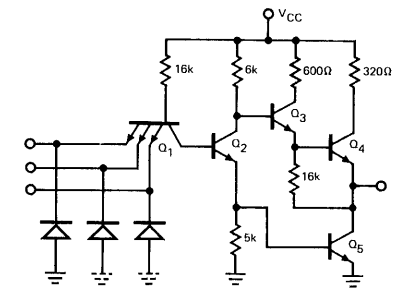
9L SERIES LPTTL/SSI

FEATURES

- 20 ns Typical Gate Delay
- 2 mW Typical Gate Power Dissipation
- Input Clamp Diodes Minimize Termination Effects
- Darlington Output Stage Increases Circuit Speed
- Military and Industrial Temperature Range
- Available in DIP and Flat Packages

DESCRIPTION

The 9L Series of low power TTL gates and flip-flops offers a speed/power trade-off well suited to both industrial and military applications. The power is one fourth that of a standard TTL gate and typical system speeds of up to 10 MHz are possible. The 9L Series TTL/SSI functions are used with the 93L low power TTL/MSI devices to implement low power, moderate speed systems.



9H/54H, 74H SERIES HSTTL/SSI

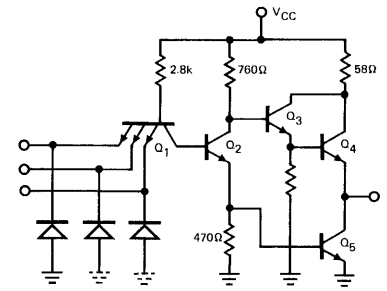
FEATURES

- 6 ns Typical Gate Delay
- 22 mW Typical Gate Power Dissipation
- Input Clamp Diodes to Minimize Termination Effects
- Darlington Output State to Increase Circuit Speed
- Military and Industrial Temperature Range
- Available in DIP and Flat Packages
- 11 Functions Available

DESCRIPTION

The 9H/54H, 74H Series is a line of high speed gates and flip-flops which are pin and function identical with the popular 74H00 Series.

These devices are used with the 9300 and 93H Series of TTL/MSI devices to substantially reduce critical path delay times and enhance overall system speeds.



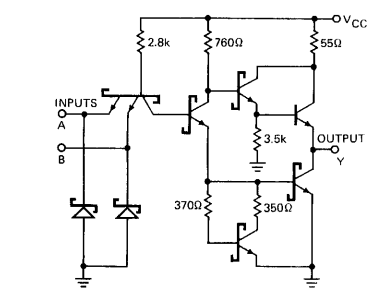
9S/54S, 74S SERIES TTL/SSI

FEATURES

- 3 ns Typical Gate Delay
- 125 MHz Typical Input Clock Frequency for J-K Flip-Flops
- 22 mW Gate Power Dissipation
- Input Clamp Diodes to Minimize Termination Effects
- Low Output Impedance to Drive High Capacitive Loads

DESCRIPTION

The 9S00 Series is a line of super high speed devices featuring Schottky-barrier diode clamping on all normally saturated devices. The result is an overall improvement in propagation delays and greatly reduced sensitivity of delay times to temperature variation. These gate and flip-flop functions can be used with Fairchild's 93S00 Series of MSI Schottky-clamped logic elements to achieve the highest possible system speeds and still maintain typical 1.0 V noise immunity.



ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65°C to +150°C
Temperature (Ambient) Under Bias	−55°C to +125°C
V_{CC} Pin Potential to Ground Pin	−0.5 V to +7.0 V
*Input Voltage (dc)	−0.5 V to +5.5 V
*Input Current (dc)	−30 mA to +5.0 mA
Voltage Applied to Outputs (Output HIGH)	0.5 V to +V_{CC}
Output Current (dc) (Output LOW)	
9N/54,74 and 9L Series	+30 mA
9000, 9H and 9S Series	+50 mA
See Detail Data Sheets for Buffer Drive Capability.	

*Either Input Voltage limit or Input Current limit is sufficient to protect the inputs.

INPUT AND OUTPUT LOAD FACTORS FOR THE 9000 SERIES GATES & FLIP-FLOPS

The test conditions and resulting limits for the input and output levels of the 9000 Series gates and flip-flops differs from the other 9N, 9H, 9L, and 9S series of devices. These 9000 Series levels and conditions are equivalent to the other families for all practical purposes. For instance, an input HIGH level current guaranteed to be 60 μA when measured at 4.5 V, will be less than 40 μA for most operating conditions. Therefore, the load factors for the 9000 Series has been normalized to simplify system design considerations.

NAND GATES – 9002, 9003, 9004, 9007 AND 9012*
HEX INVERTER – 9016 AND 9017*

The 9002, 9003, 9004, 9007 and 9012 are active LOW level output AND gates commonly known as NAND gates. The 9016 and 9017 are hex inverters with input and output characteristics identical to NAND gate. The variety of gate combinations provides the system designer the utmost in logic flexibility and reduces package count.

EXTENDABLE AND-OR-INVERT GATES – 9005, 9008
EXTENDER – 9006

The TTL 9005 and 9008 are AND-OR-INVERT gates which may be OR extended with the use of the 9006. For noise immunity and operating level curves, refer to the gate section.

QUAD EXCLUSIVE OR GATE – 9014

The 9014 consists of four exclusive OR gates, useful in a large number of code conversion, parity generation/checking, and comparison applications. Two of the gates have an additional complemented output for greater system flexibility. The 9014 has high speed, high fanout capabilities and is compatible with all members of the Fairchild TTL family.

JK FLIP-FLOPS – 9000, 9001
DUAL JK FLIP-FLOPS – 9020, 9022

DESCRIPTION – The TTL 9000 series has four flip-flops to satisfy the storage requirements of a logic system. All are master/slave JK designs and have the same high speed and high noise immunity as the rest of the 9000 series. As with the gates, all inputs have diode clamps to reduce ringing caused by long lines and impedance mismatches.

The JK type flip-flop was chosen for all flip-flop elements in this family because of its inherent logic power. The input function required to produce a given sequence of states for a JK flip-flop will, in general, contain more "don't care" conditions than the corresponding function for an RS flip-flop. These additional "don't care" conditions will, in most cases, reduce the amount of gating elements required to implement the input function.

The master/slave design offers the advantage of a dc threshold on the clock input initiating the transition of the outputs, so that careful control of clock pulse rise and fall times is not required.

Data is accepted by the master while the clock is in the LOW state. Refer to the truth table for definition of HIGH and LOW data. Transfer from the master to the slave occurs on the LOW to HIGH transition of the clock. When the clock is HIGH, the J and K inputs are inhibited.

A joint (JK) input is provided for all flip-flops in this family. This common input removes the necessity of gating the clock signal with an external gate in many applications. This not only reduces package count, but also reduces the possibility of clock skew problems, since with internal gating provided, all flip-flops may be driven from a common clock line. Several TTL drivers may be used in parallel to drive this common clock line if the load exceeds the F.O. capability of the 9009 buffer.

The asynchronous inputs provide ability to control the state of the flip-flop independent of static conditions of the clock and synchronous inputs. Both asynchronous set and clear are provided on all flip-flops except the 9020, which because of a logic trade-off has only clear inputs. The set or clear pin being LOW absolutely guarantees that one output will be HIGH, but if opposing data is present at the synchronous inputs and the flip-flop is clocked, the LOW output may momentarily spike HIGH synchronous with a positive transition of the clock. If the LOW output of the flip-flop is connected to other flip-flop inputs clocked from the same line, the spike will be masked by the clock. If the clock is suspended during the time when the asynchronous inputs are activated, no spike will occur. When the spikes can cause problems, a simple solution is to common the joint JK inputs with the synchronous set or reset signal.

H	H	SYNCHRONOUS INPUTS CONTROL	

SYNCHRONOUS OPERATION – The truth table defines the next state of the flip-flop after a LOW to HIGH transition of the clock pulse. The next state is a function of the present state and the J and K inputs as shown in the table.

The J and K inputs in the table refer to the basic flip-flop J and K inputs as indicated on the logic diagrams. These internal inputs are for every flip-flop the result of a logic operation on the external J and K inputs. This operation is represented symbolically by AND gates in the logic diagram for each flip-flop. Logic diagrams are in accordance with MIL Standard 806B.

The L* symbol in the J and K input column is defined as meaning that **input does not go HIGH at any time while the clock is LOW.**

The H* symbol in the J or K input column is defined as meaning that the **input is HIGH at some time while the clock is LOW.**

The X symbol indicates that the condition of that input has no effect on the next state of the flip-flop.

The H and L symbols refer to steady state HIGH and LOW voltage levels, respectively.

UNUSED INPUTS – The 9001, 9020 and 9022 all have active level LOW synchronous inputs. When not in use they must be grounded. All other unused inputs, including asynchronous, should be tied HIGH for maximum operating speed.

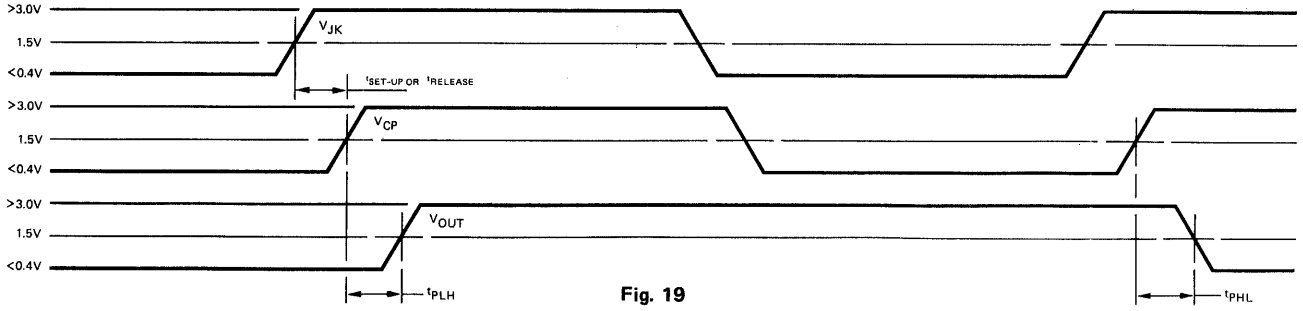

Fig. 19

SWITCHING TEST NOTES

t_{PLH} and t_{PHL}

1. V_{JK} should be kept at the HIGH logic level when performing t_{PLH}/t_{PHL} tests.
2. Drive the clock pulse input with a suitable pulse source. t_{PLH} and t_{PHL} delays are as defined in the waveforms.

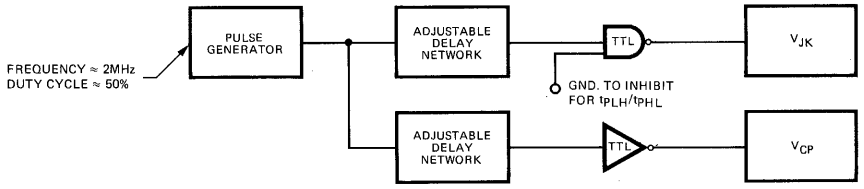
$t_{set\text{-}up}$

1. $t_{set\text{-}up}$ is defined as the minimum time required for a HIGH to be present at a synchronous logic input at any time during the LOW state of the clock in order for the flip-flop to respond to the data.
2. The test for $t_{set\text{-}up}$ is performed by adjusting the timing relationship between the V_{CP} and V_{JK} inputs to the $t_{set\text{-}up}$ minimum value. A device that passes the test will have the output waveform shown. The output of a device that does not pass the $t_{set\text{-}up}$ test will remain at a static logic level (no switching will occur).

$t_{release}$

1. $t_{release}$ is defined as the maximum time allowed for a HIGH to be present at a synchronous logic input at any time during the LOW state of the clock and not be recognized.
2. The test for $t_{release}$ is performed by adjusting the timing relationship between V_{CP} and V_{JK} to the $t_{release}$ maximum value. The outputs of devices that pass will remain at static logic levels. In order to check both J and K sides of the flip-flop it is necessary to perform the test with the flip-flop in each of its two possible states, i.e., set and clear. This can be accomplished by making use of the appropriate direct inputs to establish the state before a test. The outputs of devices that do not pass the $t_{release}$ test will exhibit pulses instead of static levels.

RECOMMENDED INPUT PULSE SOURCES



DTL9932 gates with adjustable capacitors connected from extender inputs to ground make suitable delay elements.

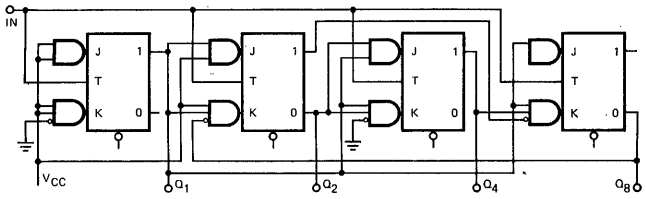
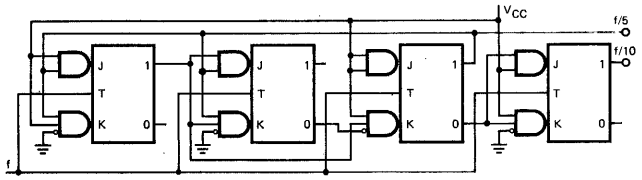
APPLICATIONS

SYNCHRONOUS BDC COUNTER



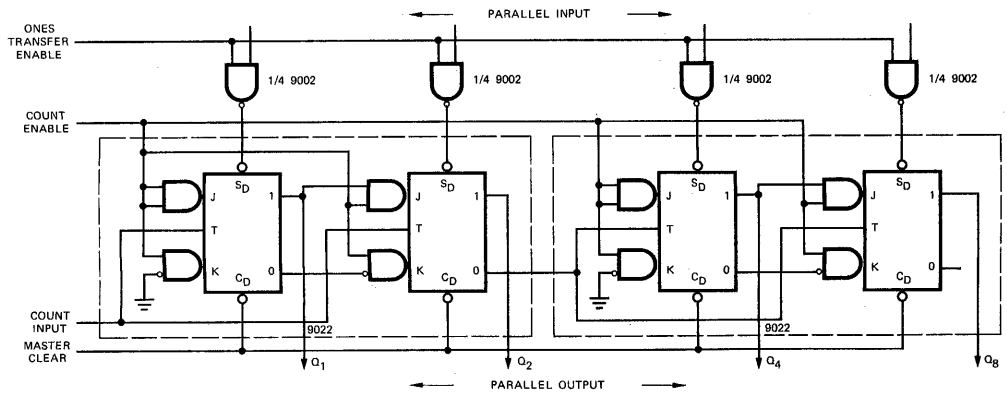
Two TTL 9020 Dual Flip-Flops require no additional gating to produce a fully synchronous 8421 code BCD Counter.

DIVIDE BY TEN COUNTER



Two TTL 9020 Dual Flip-Flops require no additional gating elements to produce divide by ten circuit with a square wave divide by ten output and a divide by five output.

BINARY COUNTER WITH ASYNCHRONOUS PARALLEL LOAD AND CLEAR



Binary counter using synchronous 2-bit stages with trickle down between stages illustrates method of utilizing dual JK flip-flops having common clocks in counter applications.

DUAL J$\overline{K}$ (OR D) FLIP-FLOP – 9024

The 9024 consists of two high speed, completely independent transition clocked J$\overline{K}$ flip-flops. The clocking operation is independent of rise and fall times of the clock waveform. The J$\overline{K}$ design allows operation as a D flip-flop by simply connecting the J and $\overline{K}$ pins together.

I_{CC}	Current Drain				9.0	14			mA	Per Flip-Flop in Worst Logic State	

NOTES:
1. The maximum V_{CC} value of 8.0 V is not the primary factor in determining the maximum V_{CC} which may be applied to a number of interconnected devices. The voltage at a HIGH output is approximately 1 V_{BE} below the V_{CC} voltage, so the primary limit on the V_{CC} is that the voltage at any input may not go above 5.5 V unless the current is limited, so this effectively limits the system V_{CC} to approximately 7.0 V.
2. Because of the input clamp diodes, excess current can be drawn out of the inputs if the dc input voltage is more negative than −0.5 V. The diode is designed to clamp off large negative ac swings associated with fast fall times and long lines. This maximum rating is intended only to limit the steady state input voltage and current.
3. Postive current is into device and negative current is out of device.
4. Denotes maximum current under normal operation. These currents may increase up to 4 I_{IL} if J, $\overline{K}$ = HIGH and S_D = LOW.

RECOMMENDED OPERATING CONDITIONS

PARAMETER	9H00XM/54H00XM			9H00XC/74H00XC			UNITS
	MIN.	TYP.	MAX.	MIN.	TYP.	MAX.	
Supply Voltage V_{CC}	4.5	5.0	5.5	4.75	5.0	5.25	Volts
Operating Free-Air Temperature Range	−55	25	125	0	25	70	°C
Input Loading for Each Input			1.25			1.25	U.L.

X = package type; F for Flatpak, D for Ceramic Dip, P for Plastic Dip. See Packaging Information Section for packages available on this product.

ELECTRICAL CHARACTERISTICS OVER OPERATING TEMPERATURE RANGE (Unless Otherwise Noted)

SYMBOL	PARAMETER	LIMITS			UNITS	TEST CONDITIONS (Note 1)		TEST FIGURE
		MIN.	TYP. (Note 2)	MAX.				
V_{IH}	Input HIGH Voltage	2.0			Volts	Guaranteed Input HIGH Voltage		1
V_{IL}	Input LOW Voltage			0.8	Volts	Guaranteed Input LOW Voltage		2
V_{OH}	Output HIGH Voltage	2.4			Volts	V_{CC} = MIN., I_{OH} = −0.5 mA, V_{IN} = 0.8 V		2
V_{OL}	Output LOW Voltage			0.4	Volts	V_{CC} = MIN., I_{OL} = 20 mA, V_{IN} = 2.0 V		1
I_{IH}	Input HIGH Current			50	μA	V_{CC} = MAX., V_{IN} = 2.4 V	Each Input	4
				1.0	mA	V_{CC} = MAX., V_{IN} = 5.5 V		
I_{IL}	Input LOW Current			−2.0	mA	V_{CC} = MAX., V_{IN} = 0.4 V, Each Input		3
I_{OS}	Output Short Circuit Current (Note 3)	−40		−100	mA	V_{CC} = MAX.		5
I_{CCH}	Supply Current HIGH		10	16.8	mA	V_{CC} = MAX., V_{IN} = 0 V		6
I_{CCL}	Supply Current LOW		26	40	mA	V_{CC} = MAX., V_{IN} = 4.5 V		6

SWITCHING CHARACTERISTICS (T_A = 25°C)

SYMBOL	PARAMETER	LIMITS			UNITS	TEST CONDITIONS	TEST FIGURE
		MIN.	TYP.	MAX.			
t_{PLH}	Turn Off Delay Input to Output		5.9	10	ns	V_{CC} = 5.0 V C_L = 25 pF R_L = 280Ω	T
t_{PHL}	Turn On Delay Input to Output		6.2	10	ns		

NOTES:
(1) For conditions shown as MIN. or MAX., use the appropriate value specified under recommended operating conditions for the applicable device type.
(2) Typical limits are at V_{CC} = 5.0 V, 25°C.
(3) Not more than one output should be shorted at a time, and duration of short-circuit test should not exceed 1 second.

LPTTL/SSI 9L00

LOW POWER QUAD 2-INPUT NAND GATE

DESCRIPTION — The low power TTL/SSI 9L00 consists of four NAND gates. Each gate has two inputs and performs positive logic. The 9L00 is designed for low power and medium speed operation.

- **TYPICAL PROPAGATION DELAY OF 20 ns**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**
- **ALL CERAMIC "HERMETIC" 14-LEAD DUAL IN-LINE AND FLAT PACKAGES**
- **TTL COMPATIBLE**

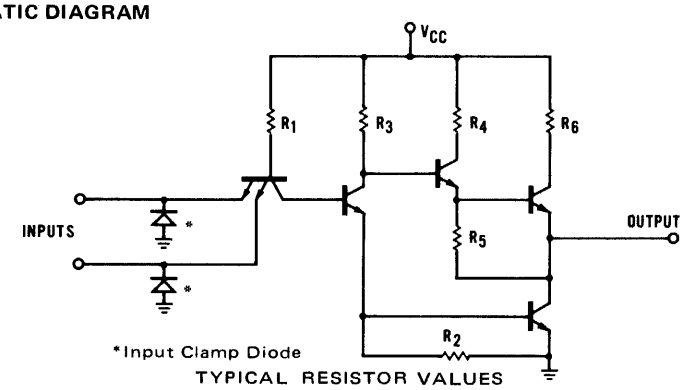
PIN NAMES

INPUTS (Pins 1, 2, 4, 5, 9, 10, 12, 13)
OUTPUTS (Pins 3, 6, 8, 11)

LOADING	
HIGH	LOW
0.5 U.L.	0.25 U.L.
10 U.L.	2.5 U.L.

1 Unit Load (U.L.) = 40 μA HIGH/1.6 mA LOW.

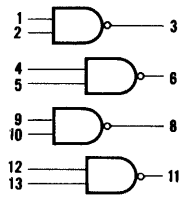
SCHEMATIC DIAGRAM



TYPICAL RESISTOR VALUES

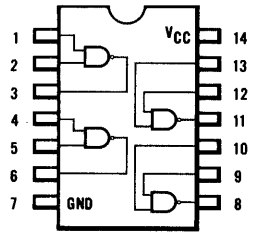
R_1 = 16 kΩ R_3 = 6 kΩ R_5 = 16 kΩ
R_2 = 5 kΩ R_4 = 600 Ω R_6 = 320 Ω

LOGIC SYMBOL

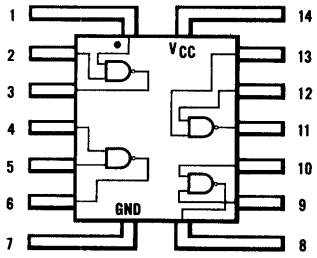


V_{CC} = PIN 14
GND = PIN 7

CONNECTION DIAGRAM
DIP (TOP VIEW)



FLATPAK (TOP VIEW)



ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65°C to +150°C
Temperature (Ambient) Under Bias	−55°C to +125°C
V_{CC} Pin Potential to Ground Pin	−0.5 V to +7.0 V
*Input Voltage (dc)	−0.5 V to +5.5 V
*Input Current (dc)	−30 mA to +5.0 mA
Voltage Applied to Outputs (Output HIGH)	−0.5 V to +V_{CC} value
Output Current (dc) (Output LOW)	+30 mA

*Either Input Voltage limit or Input Current limit is sufficient to protect the inputs.

GUARANTEED OPERATING RANGES

PART NUMBER	SUPPLY VOLTAGE (V_{CC})			TEMPERATURE
	MIN.	TYP.	MAX.	
9L00XM	4.5 V	5.0 V	5.5 V	−55°C to 125°C
9L00XC	4.75 V	5.0 V	5.25 V	0°C to 75°C

X=package type; F for Flatpak, D for Ceramic Dip, P for Plastic Dip. See Packaging Information Section for packages available on this product.

ELECTRICAL CHARACTERISTICS OVER OPERATING TEMPERATURE RANGE (Unless Otherwise Noted) (See Notes 1, 2)

SYMBOL	PARAMETER	LIMITS MIN.	LIMITS TYP. Note 3	LIMITS MAX.	UNITS	CONDITIONS	
V_{OH}	Output HIGH Voltage	2.4	3.6		Volts	V_{CC} = MIN., I_{OH} = −0.4 mA, V_{IN} = V_{IL}	
V_{OL}	Output LOW Voltage		0.1	0.3	Volts	V_{CC} = MIN., I_{OL} = 4.0 mA, V_{IN} = V_{IH}	
V_{IH}	Input HIGH Voltage	2.0			Volts	Guaranteed input LOW threshold voltage for all inputs	
V_{IL}	Input LOW Voltage			0.7	Volts	Guaranteed input HIGH threshold voltage for all inputs	
I_{IL}	Input LOW Current		−0.25	−0.4	mA	V_{CC} = MAX., V_{IN} = 0.3 V, Other Input = 4.5V	
I_{IH}	Input HIGH Current		2.0	20	μA	V_{CC} = MAX., V_{IN} = 2.4 V	Other Input = 0.0V
				1.0	mA	V_{CC} = MAX., V_{IN} = 5.5 V	
I_{SC} (Note 4)	Output Short Circuit Current	−10	−22	−40	mA	V_{CC} = MAX., V_{OUT} = 0.0 V, Inputs Grounded	
I_{CC}	Power Supply Current		0.9	1.56	mA	V_{CC} = MAX., Inputs HIGH	
	per Gate		0.28	0.41	mA	V_{CC} = MAX., Inputs LOW	

NOTES:
1. Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
2. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
3. Typical limits are at V_{CC} = 5.0 V, 25°C, and max. loading.
4. Not more than one output should be shorted at a time.

SWITCHING CHARACTERISTICS (T_A = 25°C)

SYMBOL	PARAMETER	LIMITS MIN.	LIMITS TYP.	LIMITS MAX.	UNITS	CONDITIONS

(3) Not more than one output should be shorted at a time, and duration of short-circuit test should not exceed 1 second.

LPTTL/SSI 9L04
LOW POWER HEX INVERTER

DESCRIPTION — The low power TTL/SSI 9L04 consists of six TTL gates, each performing a single inversion function. Designed for low power, medium speed operation, the 9L04 is very useful where a number of complement signals are desired simultaneously.

- **TYPICAL PROPAGATION DELAY OF 20 ns**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**
- **ALL CERAMIC "HERMETIC" 14-LEAD DUAL IN-LINE AND FLAT PACKAGES**
- **TTL COMPATIBLE**

PIN NAMES

	LOADING	
	HIGH	LOW
INPUTS (Pins 1, 3, 5, 9, 11, 13)	0.5 U.L.	0.25 U.L.
OUTPUTS (Pins 2, 4, 6, 8, 10, 12)	10 U.L.	2.5 U.L.

1 Unit Load (U.L.) = 40 μA HIGH/1.6 mA LOW.

SCHEMATIC DIAGRAM

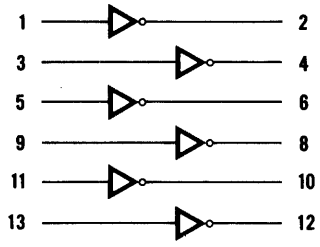
TYPICAL RESISTOR VALUES

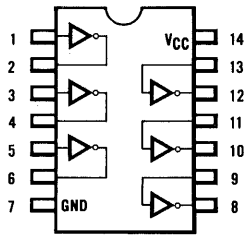
R_1 = 16 kΩ R_3 = 6 kΩ R_5 = 16 kΩ
R_2 = 5 kΩ R_4 = 600 Ω R_6 = 320 Ω

LOGIC SYMBOL

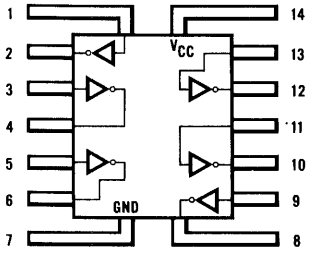


V_{CC} = Pin 14
GND = Pin 7

CONNECTION DIAGRAMS
DIP (Top View)



FLATPAK (Top View)



ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65°C to +150°C
Temperature (Ambient) Under Bias	−55°C to +125°C
V_{CC} Pin Potential to Ground Pin	−0.5 V to +7.0 V
*Input Voltage (dc)	−0.5 V to +5.5 V
*Input Current (dc)	−30 mA to +5.0 mA
Voltage Applied to Outputs (Output HIGH)	−0.5 V to +V_{CC} value
Output Current (dc) (Output LOW)	+30 mA

*Either Input Voltage limit or Input Current limit is sufficient to protect the inputs.

GUARANTEED OPERATING RANGES

PART NUMBER	SUPPLY VOLTAGE (V_{CC})			TEMPERATURE
	MIN.	TYP.	MAX.	
9L04XM	4.5 V	5.0 V	5.5 V	−55°C to 125°C
9L04XC	4.75 V	5.0 V	5.25 V	0°C to 75°C

X = package type; F for Flatpak, D for Ceramic Dip, P for Plastic Dip. See Packaging Information Section for packages available on this product.

ELECTRICAL CHARACTERISTICS OVER OPERATING TEMPERATURE RANGE (UNLESS OTHERWISE NOTED) (See Notes 1 & 2)

SYMBOL	PARAMETER	LIMITS			UNITS	CONDITIONS
		MIN.	TYP. Note 3	MAX.		
V_{OH}	Output HIGH Voltage	2.4	3.6		Volts	V_{CC} = MIN., I_{OH} = −0.4 mA, V_{IN} = V_{IL}
V_{OL}	Output LOW Voltage		0.1	0.3	Volts	V_{CC} = MIN., I_{OL} = 4.0 mA, V_{IN} = V_{IH}
V_{IH}	Input HIGH Voltage	2.0			Volts	Guaranteed input logical HIGH voltage for all inputs
V_{IL}	Input LOW Voltage			0.7	Volts	Guaranteed input logical LOW voltage for all inputs
I_{IL}	Input LOW Current		−0.25	−0.4	mA	V_{CC} = MAX., V_{IN} = 0.3 V
I_{IH}	Input HIGH Current		2.0	20	μA	V_{CC} = MAX., V_{IN} = 2.4 V
				1.0	mA	V_{CC} = MAX., V_{IN} = 5.5 V
I_{SC} (Note 4)	Output Short Circuit Current	−10	−22	−40	mA	V_{CC} = MAX., V_{OUT} = 0.00 V, Inputs grounded
I_{CC}	Power Supply Current		0.9	1.56	mA	V_{CC} = MAX., Input HIGH
	per Gate		0.28	0.45	mA	V_{CC} = MAX., Input LOW

NOTES: 1. Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
2. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
3. Typical limits are at V_{CC} = 5.0 V, 25°C, and max. loading.
4. Not more than one output should be shorted at a time.

HEX INVERTER BUFFER/DRIVER
(WITH OPEN-COLLECTOR HIGH-VOLTAGE OUTPUT)

DESCRIPTION – These TTL/SSI hex inverter buffer/driver feature high voltage open collector output for interfacing with high level circuits (such as MOS), or for driving high current loads (such as lamps or relays) and are also characterized for use as inverter buffers for driving TTL inputs. For increased fan out, several inverters in a single package may be paralleled. The 9N06/5406, 7406 have minimum breakdown voltages of 30V and the 9N16/5416, 7416 have minimum breakdown voltages of 15V. The maximum sink current is 30 mA for the 9N06/5406 and 9N16/5416 and 40 mA for the 9N06/7406 and 9N16/7416.

NOTES:
(1) For conditions shown as MIN. or MAX., use the appropriate value specified under recommended operating conditions for the applicable device type.
(2) Typical limits are at V_{CC} = 5.0 V, 25°C.
* Max. 17 ns at 125°C

HEX BUFFER/DRIVER
(WITH OPEN-COLLECTOR HIGH-VOLTAGE OUTPUT)

DESCRIPTION – These TTL/SSI hex buffer/driver feature high voltage open collector output for interfacing with high level circuits (such as MOS), or for driving high current loads (such as lamps or relays) and are also characterized for use as buffers for driving TTL inputs. For increased fan out, several buffers in a single package may be paralleled. The 9N07/5407, 7404 have minimum breakdown voltages of 30V and the 9N17/5417, 7417 have minimum breakdown voltages of 15V. The maximum sink current is 30 mA for the 9N07/5407 and 40 mA for the 9N07/7407 and 9N17/7417.

NOTES:
(1) For conditions shown as MIN. or MAX., use the appropriate value specified under recommended operating conditions for the applicable device type.
(2) Typical limits are at V_{CC} = 5.0 V, 25°C.

DUAL NAND SCHMITT TRIGGER

DESCRIPTION — The 9N13/5413, 7413 are dual Schmitt triggers functions, compatible with standard TTL output logic levels. Each function is essentially a 4-input NAND gate with different input threshold levels for positive and negative going signals. Typically the hysteresis, the difference between the two threshold levels, is 800 mV.

On-chip temperature compensation ensures excellent stability of the hysteresis over a wide temperature range. Typically the hysteresis changes by 3% over the range of –55°C to +125°C, the upper threshold changes by 1% over the same range. The 9N13/5413, 7413 can be triggered from slow input ramps and straight dc levels.

ELECTRICAL CHARACTERISTICS (9N23/7423 Circuits Only) Using Expander Inputs, V_{CC} = 4.75 V, T_A = 0°C

SYMBOL	PARAMETER	LIMITS MIN.	LIMITS TYP.	LIMITS MAX.	UNITS	TEST CONDITIONS	TEST FIGURE
I_X	Expander Current			3.1	mA	V_1 = 0.4 V, I_{OL} = 16 mA	28
$V_{BE(Q)}$	Base-Emitter Voltage of Output Transistor Q			1.0	Volt	I_{OL} = 16 mA, I_1 = 0.62 mA, R_1 = 0	29
V_{OH}	Output HIGH Voltage	2.4	3.3		Volts	I_{OH} = –400 µA, I_1 = 0.27 mA, I_2 = –0.27 mA	30
V_{OL}	Output LOW Voltage		0.22	0.4	Volts	I_{OL} = 16 mA, I_1 = 0.43 mA, R_1 = 130Ω	29

SWITCHING CHARACTERISTICS (T_A = 25°C) (Note 4)

SYMBOL	PARAMETER	LIMITS MIN.	LIMITS TYP.	LIMITS MAX.	UNITS	TEST CONDITIONS
t_{PLH}	Turn Off Delay Input to Output		13	22	ns	V_{CC} = 5.0 V, C_L = 15 pF, R_L = 400Ω
t_{PHL}	Turn On Delay Input to Output		8.0	15	ns	

NOTES:
(1) For conditions shown as MIN. or MAX., use the appropriate value specified under recommended operating conditions for the applicable device type. Expander inputs X and $\overline{X}$ are open.
(2) Typical limits are at V_{CC} = 5.0 V, 25°C.
(3) Not more than one output should be shorted at a time.
(4) Switching characteristics of the 9N23/5423, 7423 are tested with the expander pins open.

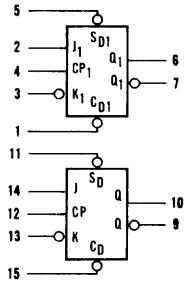
LPTTL/SSI 9L24

LOW POWER DUAL $J\overline{K}$ (OR D) FLIP-FLOP

DESCRIPTION – The Low Power TTL/SSI 9L24 consists of two completely independent transition clocked $J\overline{K}$ flip-flops. The clocking operation is independent of rise and fall times of the clock waveform. The $J\overline{K}$ design allows operation as a D flip-flop by simply connecting the J and $\overline{K}$ pins together.

- DUAL RANK TYPE CIRCUIT
- SEPARATE CLOCKS
- SEPARATE ASYNCHRONOUS SET AND CLEAR INPUTS
- 10 MHz TYPICAL TOGGLE FREQUENCY
- TYPICAL POWER DISSIPATION OF 30mW
- INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS
- ALL CERAMIC "HERMETIC" 16-LEAD DUAL IN-LINE AND FLAT PACKAGES
- TTL COMPATIBLE

LOGIC SYMBOL



V_{CC} = PIN 16
GND = PIN 8

PIN NAMES		LOADING HIGH	LOADING LOW
$J, J_1, \overline{K}, \overline{K}_1$	Flip-Flop Inputs	0.5 U.L.	0.25 U.L.
$\overline{S}_D, \overline{S}_{D1}$	Set Inputs	1.0 U.L.	0.5 U.L.
$\overline{C}_D, \overline{C}_{D1}$	Clear Inputs	2.0 U.L.	0.75 U.L.
CP, CP_1	Clock Inputs	1.0 U.L.	0.5 U.L.
$Q, \overline{Q}, Q_1, \overline{Q}_1$	Flip-Flop Outputs	10 U.L.	2.5 U.L.

1 Unit Load (U.L.) = 40 μA HIGH/1.6 mA LOW.

I_{CC}	Power Supply Current		6.0	8.8	mA	V_{CC} = MAX.

NOTES:

(1) Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.

(2) The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.

(3) Denotes maximum current under normal operation. These currents may increase up to 4 I_{IL} if J, $\overline{K}$ = Logic HIGH and $\overline{S}_D$ = Logic LOW.

(4) Typical limits are at V_{CC} = 5.0 V, 25°C, and max. loading.

(5) Not more than one output should be shorted at a time.

SWITCHING CHARACTERISTICS (T_A = 25°C, V_{CC} = 5.0 V, C_L = 15 pF)

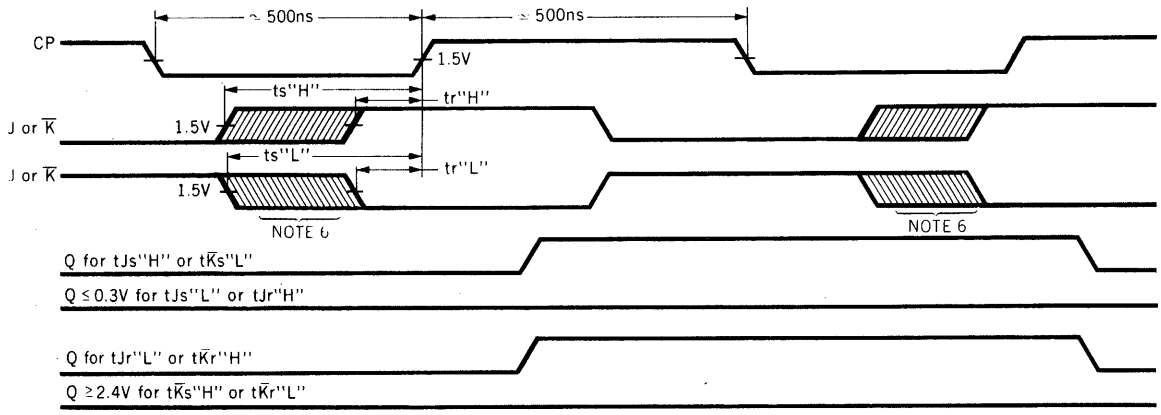
5

SET UP TIME – t_s is defined as the time required for the new logic level to be present at the J or $\overline{K}$ inputs prior to the clock transition from LOW to HIGH in order for the flip-flop to respond to the new $J\overline{K}$ mode.

RELEASE TIME – t_r is defined as the time allowed for a new logic level to be present at the J or $\overline{K}$ inputs prior to the clock transition from LOW to HIGH in order for the flip-flop not to respond to the new $J\overline{K}$ mode. A negative Release Time means the new logic level must not occur until after the clock transition.

SET UP AND RELEASE WAVEFORMS



Note (6) FORBIDDEN ZONE, if data changes during the shaded time, the state of the outputs cannot be predetermined.

FIG.1

SWITCHING WAVEFORMS

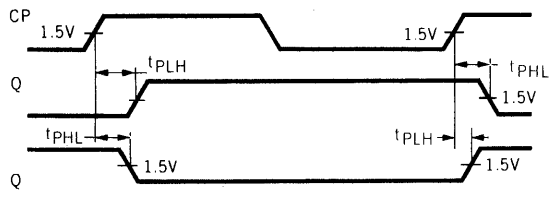


FIG.2

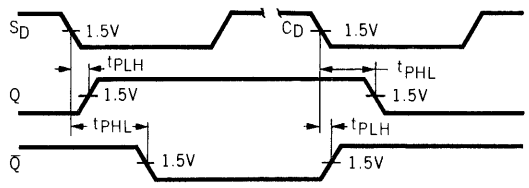

FIG.3

QUAD 2-INPUT HIGH VOLTAGE INTERFACE NAND GATE

DESCRIPTION — These open-collector NAND gates feature high output voltage ratings for interfacing with low threshold voltage MOS logic circuits or other 12V systems. Although the output is rated to withstand 15V, the V_{CC} terminal is connected to the standard 5V source. The output transistor will sink 16 mA while maintaining a low-level output voltage of 0.4V maximum thus providing a high fan out driver with the nominal power dissipation standard Series 9N/54, 74 gates.

LPTTL/SSI 9L54

LOW POWER AND-OR-INVERT GATE

DESCRIPTION — The Low Power TTL/SSI 9L54 is a four wide, 2-2-2-3-input AND-OR-INVERT Gate. It is designed for low power and medium speed operation.

- **TYPICAL POWER DISSIPATION OF 10 mW**
- **TYPICAL DELAY OF 25 ns**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**
- **HIGH CAPACITIVE DRIVE CAPABILITY**
- **TTL COMPATIBLE**
- **ALL CERAMIC "HERMETIC" PACKAGES**

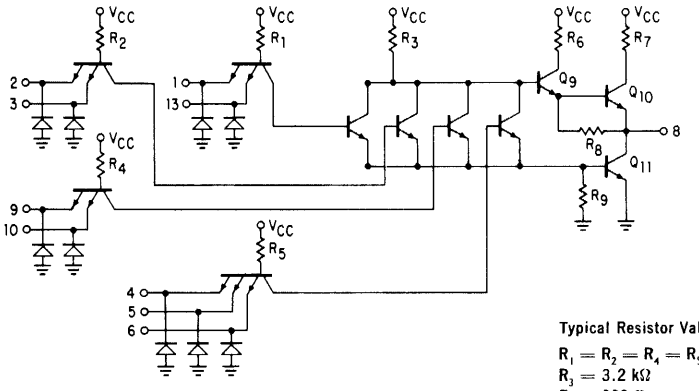
PIN NAMES

INPUTS (Pins 1, 2, 3, 4, 5, 6, 9, 10, 13)
OUTPUT (Pin 8)

LOADING	
HIGH	LOW
0.75 U.L.	0.38 U.L.
10 U.L.	2.5 U.L.

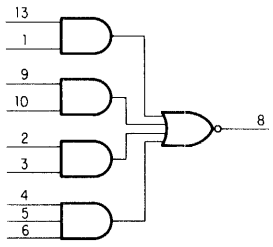
1 Unit Load (U.L.) = 40μA HIGH/1.6 mA LOW.

SCHEMATIC DIAGRAM



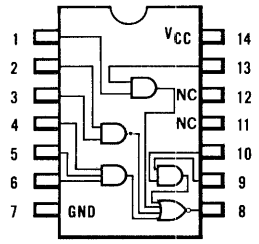
Typical Resistor Values
$R_1 = R_2 = R_4 = R_5 = 10.4\ k\Omega$
$R_3 = 3.2\ k\Omega$
$R_6 = 600\ \Omega$
$R_7 = 320\ \Omega$
$R_8 = 16\ k\Omega$
$R_9 = 2.66\ \Omega$

LOGIC SYMBOL

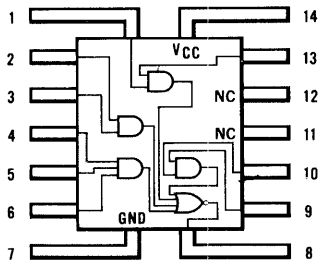


V_{CC} = Pin 14
Gnd = Pin 7

CONNECTION DIAGRAMS
DIP (TOP VIEW)



FLATPAK (TOP VIEW)



NC = No Internal Connection

ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65°C to +150°C
Temperature (Ambient) Under Bias	−55°C to +125°C
V_{CC} Pin Potential to Ground Pin	−0.5 V to +7.0 V
*Input Voltage (dc)	−0.5 V to +5.5 V
*Input Current (dc)	−30 mA to +5.0 mA
Voltage Applied to Outputs (Output HIGH)	−0.5 V to +V_{CC} value
Output Current (dc) (Output LOW)	+30 mA

*Either Input Voltage limit or Input Current limit is sufficient to protect the inputs.

GUARANTEED OPERATING RANGES

PART NUMBER	SUPPLY VOLTAGE (V_{CC})			TEMPERATURE
	MIN.	TYP.	MAX.	
9L54XM	4.5V	5.0V	5.5V	−55°C to 125°C
9L54XC	4.75V	5.0V	5.25V	0°C to 75°C

X = package type; F for Flatpak, D for Ceramic Dip, P for Plastic Dip. See Packaging Information Section for packages available on this product.

ELECTRICAL CHARACTERISTICS OVER OPERATING TEMPERATURE RANGE (Unless Otherwise Noted) (See Notes 1 & 2)

SYMBOL	PARAMETER	LIMITS			UNITS	CONDITIONS
		MIN.	TYP. (Note 3)	MAX.		
V_{OH}	Output HIGH Voltage	2.4	3.3		Volts	V_{CC} = MIN., I_{OH} = -0.4 mA, V_{IN} = V_{IL}
V_{OL}	Output LOW Voltage		0.1	0.3	Volts	V_{CC} = MIN., I_{OL} = 4.0 mA, V_{IN} = V_{IH}
V_{IH}	Input HIGH Voltage	2.0			Volts	Guaranteed input logical HIGH voltage for all inputs

I_{CC}	Power Supply Current		2.6	3.7	mA	V_{CC} = MAX., Inputs HIGH
			1.6	2.7	mA	V_{CC} = MAX., Inputs LOW
t_{PLH}	Turn Off Delay		28		ns	V_{CC} = 5.0 V, See Fig. 1
t_{PHL}	Turn On Delay		22		ns	C_L = 15 pF

NOTES:

(1) Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.

(2) The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.

(3) Typical limits are at V_{CC}= 5.0V, 25°C, and max. loading.

(4) Not more than one output should be shorted at a time.

I_{CCL}	Supply Current LOW		7.5	12	mA	V_{CC} = MAX., V_{IN} = 4.5 V		26

NOTES:
(1) For conditions shown as MIN. or MAX., use the appropriate value specified under recommended operating conditions for the applicable device type. Expander pins are open.
(2) Typical limits are at V_{CC} = 5.0 V, 25°C.
(3) Duration of short-circuit test should not exceed 1 second.
(4) Required at all input terminals of either AND section to ensure LOW level at output.
(5) Required at one input terminal of each AND section to ensure HIGH level at output.

† To be announced 1972

EDGE TRIGGERED JK FLIP-FLOP

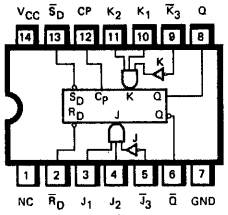
DESCRIPTION – The 9N70/5470, 7470 is a gated input edge triggered JK flip-flop offering direct clear and preset inputs, and complementary Q and $\overline{Q}$ outputs. Information at the J and K inputs is transferred to the outputs on the positive edge of the clock pulse.

Direct-coupled clock triggering occurs at a specific voltage level of the clock pulse, when the clock input threshold voltage has been passed, the gated inputs are locked out.

These flip-flops are designed for medium to high speed applications and offer a significant saving in system power dissipation and package count where input gating is required.

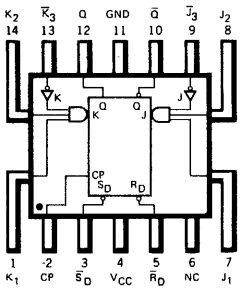
LOGIC AND CONNECTION DIAGRAM

DIP (TOP VIEW)

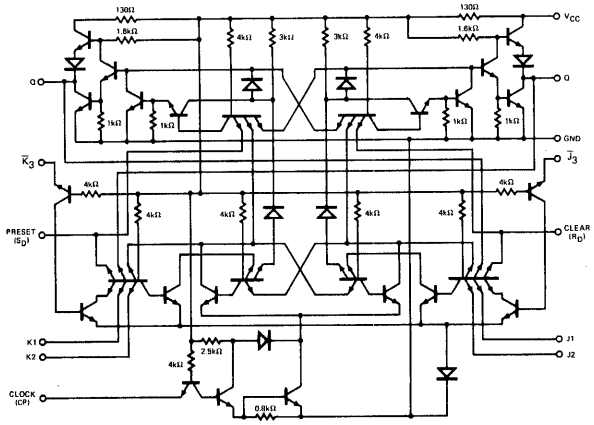


NC – No internal connection.

FLATPAK (TOP VIEW)



SCHEMATIC DIAGRAM



Component values shown are typical.

Positive logic:
LOW input to preset sets Q to HIGH level
LOW input to clear sets Q to LOW level
Preset or clear function can occur only when clock input is LOW

TRUTH TABLE

t_n		t_{n+1}
J	K	Q
L	L	Q_n
L	H	L
H	L	H
H	H	$\overline{Q}_n$

NOTES:
$J = J1 \cdot J2 \cdot \overline{J3}$
$K = K1 \cdot K2 \cdot \overline{K3}$
t_n = Bit time before clock pulse.
t_{n+1} = Bit time after clock pulse.
If inputs $\overline{J3}$ or $\overline{K3}$ are not used they must be grounded.

NOTES:
(1) For conditions shown as MIN. or MAX., use the appropriate value specified under recommended operating conditions for the applicable device type.
(2) Typical limits are at V_{CC} = 5.0 V, 25°C.
(3) Not more than one output should be shorted at a time.

JK MASTER/SLAVE FLIP-FLOP WITH AND-OR INPUTS

DESCRIPTION – The HSTTL/SSI 9H71/54H71, 74H71 is a High Speed JK Master/Slave flip-flop with AND-OR gate inputs. The AND-OR gate inputs for entry into the master section are controlled by the clock pulse. The clock pulse also regulates the circuitry which connects the master and slave sections. The sequence of operation is as follows: 1) Isolate slave from master. 2) Enter information from AND-OR gate inputs to master. 3) Disable AND-OR gate inputs. 4) Transfer information from master to slave. Logic state of J and K inputs must not be allowed to change when the clock pulse is in a HIGH state.

NOTES:
(1) For conditions shown as MIN. or MAX., use the appropriate value specified under recommended operating conditions for the applicable device type.
(2) Typical limits are at V_{CC} = 5.0 V, 25°C.
(3) Not more than one output should be shorted at a time.

DUAL D TYPE EDGE TRIGGERED FLIP-FLOP

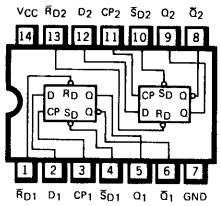
DESCRIPTION — The HSTTL/SSI 9H74/54H74, 74H74 is a High Speed Dual, Edge Triggered flip-flop utilizing TTL circuitry to perform D type flip-flop logic. Each flip-flop has individual clear and preset inputs, and also complementary Q and Q outputs.

Information at input D is transferred to the Q output on the positive going edge of the clock pulse. Clock triggering occurs at a voltage level of the clock pulse and is not directly related to the transition time of the positive going pulse. When the clock input is at either the HIGH or LOW level, the D input signal has no effect.

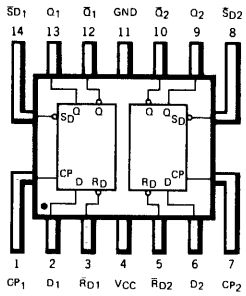
These circuits are fully compatible for use with the Fairchild TTL family. Input clamping diodes are provided to minimize transmission line effects and thereby simplify systems design. Maximum clock frequency is 35 MHz, with a typical power dissipation of 75 mW per flip-flop.

LOGIC AND CONNECTION DIAGRAM

DIP (TOP VIEW)

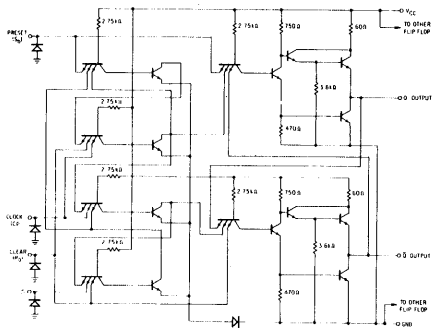


FLATPAK (TOP VIEW)



Asynchronous Inputs:
LOW input to preset sets Q to HIGH level
LOW input to clear sets Q to LOW level
Preset and clear are independent of clock

SCHEMATIC DIAGRAM (EACH FLIP-FLOP)



Component values shown are typical.

TRUTH TABLE (Each Flip-Flop)

DUAL D TYPE EDGE TRIGGERED FLIP-FLOP

DESCRIPTION – The 9N74/5474, 7474 are edge triggered dual D type flip-flops with direct clear and preset inputs and both Q and $\overline{Q}$ outputs. Information at the input is transferred to the outputs on the positive edge of the clock pulse. They are designed for use in medium to high speed applications.

Clock triggering occurs at a voltage level of the clock pulse and is not directly related to the transition time of the positive going pulse. After the clock input threshold voltage has been passed, the data input (D) is locked out and information present will not be transferred to the output.

The 9N74/5474, 7474 have the same clocking characteristics as the 9N70/5470, 7470 gated (edge triggered) flip-flop circuits. They can result in a significant saving in system power dissipation and package count in applications where input gating is not required.

DUAL D-TYPE EDGE TRIGGERED FLIP-FLOP

DESCRIPTION – The 9S74/54S74, 74S74 dual edge-triggered flip-flops utilize Schottky TTL circuitry to produce very high speed D-type flip-flops. Each flip-flop has individual clear and preset inputs, and also complementary Q and $\overline{Q}$ outputs.

Information at input D is transferred to the Q output on the positive-going edge of the clock pulse. Clock triggering occurs at a voltage level of the clock pulse and is not directly related to the transition time of the positive-going pulse. When the clock input is at either the HIGH or LOW level the D-input signal has no effect.

These circuits are fully compatible for use with most TTL or DTL circuits. Maximum clock frequency is 100 MHz with a typical power dissipation of 66 mW per flip-flop.

DUAL JK MASTER/SLAVE FLIP-FLOP WITH SEPARATE PRESETS, CLEARS AND CLOCKS

DESCRIPTION – The HSTTL/SSI 9H76/54H76, 74H76 is a High Speed Dual JK Master/Slave flip-flop with separate presets, separate clears and separate clocks. Inputs to the master section are controlled by the clock pulse. The clock pulse also regulates the circuitry which connects the master and slave sections. The sequence of operation is as follows: 1) Isolate slave from master. 2) Enter information from J and K inputs to master. 3) Disable J and K inputs. 4) Transfer information from master to slave. Logic state of J and K inputs must not be allowed to change when the clock pulse is a HIGH state.

NOTES:
(1) For conditions shown as MIN. or MAX., use the appropriate value specified under recommended operating conditions for the applicable device type.
(2) Typical limits are at V_{CC} = 5.0 V, 25°C.
(3) Note more than one output should be shorted at a time.

DUAL JK MASTER/SLAVE FLIP-FLOP WITH SEPARATE PRESETS, AND A COMMON CLEAR AND CLOCK

DESCRIPTION – The HSTTL/SSI 9H78/54H78, 74H78 is a High Speed Dual JK Master/Slave flip-flop with separate presets, a common clear and a common clock. Inputs to the master section are controlled by the clock pulse. The clock pulse also regulates the circuitry which connects the master and slave sections. The sequence of operation is as follows: 1) Isolate slave from master. 2) Enter information from J and K inputs to master. 3) Disable J and K inputs. 4) Transfer information from master to slave. Logic state of J and K inputs must not be allowed to change when the clock pulse is in a HIGH state.

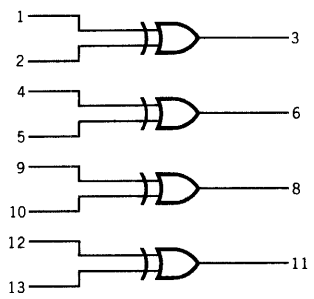
LPTTL/SSI 9L86

LOW POWER QUAD EXCLUSIVE OR GATE

DESCRIPTION — The Low Power TTL/SSI 9L86 consists of four Exclusive OR Gates. Designed for low power, medium speed operation, the 9L86 is useful in large number of code conversion, parity generation/checking and comparison applications. The exclusive OR gate produces an output when the inputs are complementary. The Boolean expression for the device is: $Z = A\bar{B} + \bar{A}B$.

- TYPICAL PROPAGATION DELAY OF 25 ns
- TYPICAL POWER DISSIPATION OF 25 mW
- INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS
- ALL CERAMIC "HERMETIC" 14-LEAD DUAL IN-LINE AND FLAT PACKAGES
- TTL COMPATIBLE

LOGIC SYMBOL



V_{CC} = PIN 14
GND = PIN 7

PIN NAMES

INPUTS (Pins 1, 2, 4, 5, 9, 10, 12, 13)
OUTPUTS (Pins 3, 6, 8, 11)

I_{SC}*	Output Short Circuit Current	−10	−22	−40	mA	V_{CC} = MAX., V_{OUT} = 0.0 V, "A" inputs = 0.0 V, "B" inputs = 4.5 V
I_{CC}	Power Supply Current		6.8	9.5	mA	V_{CC} = MAX., All inputs = 0.0 V
			3.4	5.0	mA	V_{CC} = MAX., "A" inputs = 4.5 V, "B" inputs = 0.0 V
			6.3	9.0	mA	V_{CC} = MAX., All inputs = 4.5 V

NOTES:
1. Conditions for testing, not shown in the Table, are chose to guarantee operation under "worst case" conditions.
2. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
3. Typical limits are at V_{CC} = 5.0 V, 25°C, and max. loading.

* Not more than one output should be shorted at a time.

QUAD 2-INPUT EXCLUSIVE OR GATE

DESCRIPTION — The TTL/SSI 9N86/5486, 7486 is a Quad 2-input Exclusive OR gate designed to perform the function: $Y = A\overline{B} + \overline{A}B$. When the input states are complementary, the output goes to the HIGH level.

Input clamping diodes are provided to minimize transmission line effects. On chip input buffers are also provided to lower the fan in requirement to only 1 U.L. (unit load). The 9N86/5486, 7486 is fully compatible with all members of the Fairchild TTL family.

JK EDGE TRIGGERED FLIP-FLOP WITH AND-OR INPUTS

DESCRIPTION — The HSTTL/SSI 9H101/54H101, 74H101 is a High Speed JK Negative Edge Triggered flip-flop. The AND-OR gate inputs are inhibited while the clock input is LOW; when the clock goes HIGH, the inputs are enabled and data will be accepted. Logic state of J and K inputs may be allowed to change when the clock pulse is in a HIGH state and bistable will perform according to the truth table as long as minimum set up times are observed. Input data is transferred to the outputs on the negative edge of the clock pulse.

NOTES:
(1) For conditions shown as MIN. or MAX., use the appropriate value specified under recommended operating conditions for the applicable device type.
(2) Typical limits are at V_{CC} = 5.0 V, 25°C.
(3) Not more than one output should be shorted at a time and duration of short circuit test should not exceed 1 second.

DUAL JK EDGE TRIGGERED FLIP-FLOP WITH SEPARATE PRESETS, CLEARS AND CLOCKS

DESCRIPTION – The HSTTL/SSI 9H106/54H106, 74H106 is a High Speed JK Negative Edge Triggered flip-flop. They feature individual J, K, clock, and asynchronous preset and clear inputs to each flip-flop. When the clock goes HIGH, the inputs are enabled and data will be accepted. Logic state of J and K inputs may be allowed to change when the clock pulse is in a HIGH state and bistable will perform according to the truth table as long as minimum set up times are observed. Input data is transferred to the outputs on the negative edge of the clock pulse.

DUAL J$\overline{K}$ FLIP-FLOP

DESCRIPTION — The 9S109 consists of two high speed, completely independent transition clocked J$\overline{K}$ flip-flops. The clocking operation is independent of rise and fall times of the clock waveform. The J$\overline{K}$ design allows operation as a D flip-flop by simply connecting the J and $\overline{K}$ pins together. The 9S109 is a pin for pin replacement of the 9024.

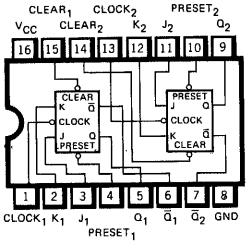
DUAL JK EDGE-TRIGGERED FLIP-FLOP

DESCRIPTION — The 9S112/54S112, 74S112 dual JK flip-flops feature individual J, K, clock, and asynchronous preset and clear inputs to each flip-flop. When the clock goes HIGH, the inputs are enabled and data will be accepted. The logic level of the J and K inputs may be allowed to change when the clock pulse is HIGH and the bistable will perform according to the truth table as long as minimum setup and hold time are observed. Input data is transferred to the outputs on the negative-going edge of the clock pulse.

LOGIC AND CONNECTION DIAGRAM
DIP (TOP VIEW)



Positive logic: LOW input to preset sets Q to HIGH level.
LOW input to clear resets Q to LOW level.
Clear and preset are independent of clock.

I_{IL}	Input LOW Current at	J,K		−0.96	−1.6	mA	V_{CC} = MAX., V_{IN} = 0.5 V
		Clock		−2.8	−4.0		
		Preset		−4.9	−7.0		
I_{OS}	Output Short Circuit Current (Note 3)		−40	−65	−100	mA	V_{CC} = MAX., V_{OUT} = 0V
I_{CC}	Supply Current			30	50	mA	V_{CC} = MAX. (Note 4)

SWITCHING CHARACTERISTICS (T_A = 25°C)

SYMBOL	PARAMETER	LIMITS MIN.	LIMITS TYP.	LIMITS MAX.	UNITS	TEST CONDITIONS
f_{max}	Maximum Clock Frequency	80	125		MHz	V_{CC} = 5.0 V, C_L = 15 pF
t_{PLH}	Turn Off Delay Clear or Preset to Output			7.0	ns	
t_{PHL}	Turn On Delay Clear or Preset to Output			7.0	ns	
t_{PLH}	Turn Off Delay Clock to Output			7.0	ns	
t_{PHL}	Turn On Delay Clock to Output			7.0	ns	

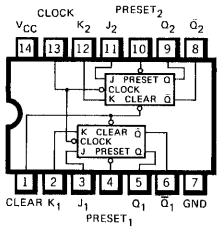
NOTES:
(1) For conditions shown as MIN. or MAX., use the appropriate value specified under recommended operating conditions for the applicable device type.
(2) Typical limits are at V_{CC} = 5.0 V, 25°C.
(3) Not more than one output should be shorted at a time.
(4) I_{CC} is measured with outputs open, clock grounded and J,K, preset and clear at 4.5 V.

5

DUAL JK EDGE-TRIGGERED FLIP-FLOP

DESCRIPTION — The 9S114/54S114, 74S114 offer common clock and common clear inputs and individual J, K, and preset inputs. These monolithic dual flip-flops are designed so that when the clock goes HIGH, the inputs are enabled and data will be accepted. The logic level of the J and K inputs may be allowed to change when the clock pulse is HIGH and the bistable will perform according to the truth table as long as minimum setup times are observed. Input data is transferred to the outputs on the negative-going edge of the clock pulse.

LOGIC AND CONNECTION DIAGRAM
DIP (TOP VIEW)



Positive logic: LOW input to preset sets Q to HIGH level.
LOW input to clear resets Q to LOW level.
Preset and clear are independent of clock.

TRUTH TABLES

t_n		t_n+1
J	K	Q
L	L	Q_n
L	H	L
H	L	H
H	H	$\bar{Q}_n$

Preset	Clear	Q	$\bar{Q}$
L	L	H	H
L	H	H	L
H	L	L	H
H	H	No Change	

NOTES:
A. t_n = Bit time before clock pulse.
B. t_n+1 = Bit time after clock pulse.

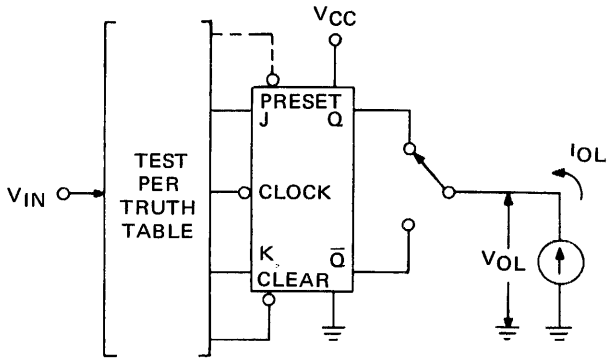
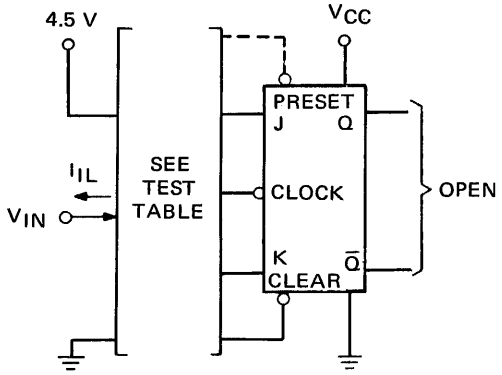
Fig. 46



1. Each flip-flop is tested separately.
2. Each output is tested separately.
3. Preset is applicable for 9H78/54H78, 74H78 only.

Fig. 47



TEST TABLE

Apply V_{IN} (Test I_{IL})	Apply Momentary GND	Apply 4.5 V
Clock	Clear (See Note 2)	J and K
Clear	None	Clock and J
Preset	None (See Note 5)	Clock and K
J	Q (See Note 3)	Clock and Clear
K	$\bar{Q}$ (See Note 3)	Clock and Clear

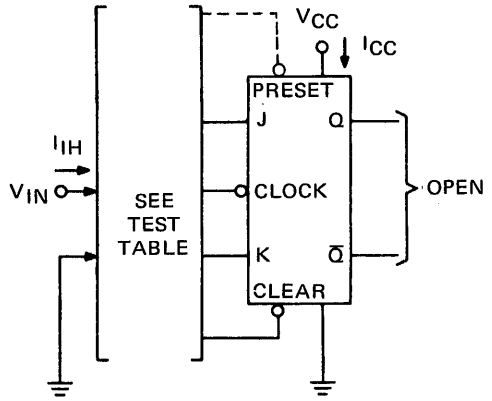
1. Each flip-flop is tested separately.
2. Apply momentary ground, then 4.5 V.
3. After application of momentary ground, Q and $\bar{Q}$ are left floating.
4. Ground all inputs of the unused flip-flop.
5. Preset is applicable for 9N76/5476, 7476 circuits only.

Fig. 48

*Arrows indicate actual direction of current flow.

PARAMETER MEASUREMENT INFORMATION

DC TEST CIRCUITS* (Continued)

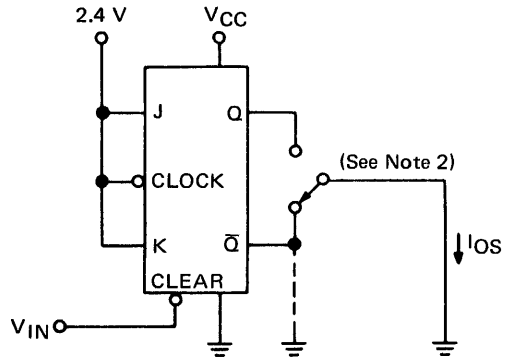


TEST TABLE

Apply V_{IN} (Test I_{IH})	Ground	Apply Momentary GND, then 4.5 V
Clock	Clear, J, and K	None
Clear	Clock and J	None
Preset (See Note 1)	Clock and K	None
J (See Note 1)	Clock and Clear	Preset
K (See Note 1)	Clock and Preset	Clear

1. Preset is applicable for 9N76/5476, 7476 circuits only.
2. I_{CC} is measured (simultaneously for both flip-flops) for the following conditions:
   a. J = K = Clock = Clear = GND. For 9N76/5476, 7476: Preset = 4.5 V.
   b. For 9N73/5473, 7473: J = Clear = 4.5 V, K = GND, and apply momentary 4.5 V, then GND to Clock. For 9N76/5476, 7476: J = K = Clock = Preset = GND, and Clear = 4.5 V.
3. Each flip-flop is tested separately for I_{IH}.

Fig. 49



1. Each flip-flop is tested separately.
2. Test circuit shows setup for testing $\overline{Q}$. When testing Q, apply 2.4 V to Clear, ground $\overline{Q}$, and limit duration of test to 100 ms.

PARAMETER MEASUREMENT INFORMATION

DC TEST CIRCUITS* (Continued)

1. Each flip-flop is tested separately.
2. Apply momentary ground, then 4.5 V.
3. After application of momentary ground (<1 second), Q and $\bar{Q}$ are left floating.
4. Ground all inputs of the unused flip-flop.
5. Preset is not applicable for 9H73/54H73, 74H73.
6. Apply the same conditions simultaneously to both flip-flops when testing the 9H108/54H108, 74H108.

TEST TABLES

9H73/54H73, 74H73
9H76/54H76, 74H76
9H78/54H78, 74H78

Apply V_{IN} (Test I_{IL})	Apply Momentary GND	Apply 4.5 V
Clock	Clear (See Note 2)	J and K
Clear	None	Clock and J
Preset	None (See Note 5)	Clock and K
J	Q (See Note 3)	Clock and Clear
K	$\bar{Q}$ (See Note 3)	Clock and Clear

9H103/54H103, 74H103

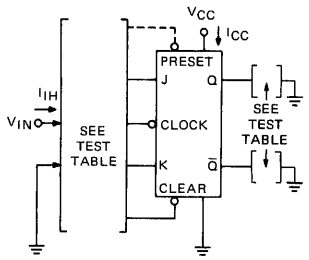
Apply V_{IN} (Test I_{IL})	Apply GND	Apply 4.5 V
Clock	Clear	J, K
Clear	None	Clock, J, K
J	Clear	Clock, K
K†	Q	Clock, Clear, J

†Duration of this test should not exceed 1 second.

9H106/54H106, 74H106
9H108/54H108, 74H108

Apply V_{IN} (Test I_{IL})	Apply GND	Apply 4.5 V
Clock	Clear	J, K, Preset,(Note 6)
Clock	Preset	J, K, Clear,(Note 6)
Clear	None	Clock, Preset, J, K,(Note 6)
Preset	None	Clock, Clear, J, K
J	Clear	Clock, K Preset
K	Preset	Clock, Clear, J

Fig. 125.



1. Preset is not applicable to 9H73/54H73, 74H73; 9H103/54H103, 74H103.
2. I_{CC} is measured (simultaneously for both flip-flops) for the following conditions:
   a. J = K = Clock = Clear = Gnd. Preset (when applicable) = 4.5 V.
   b. For 9H73/54H73, 74H73 and 9H103/54H103, 74H103. J = Clear = 4.5 V, K = Gnd, and apply momentary 4.5 V, then Gnd, to Clock. For 9H76/54H76, 74H76; 9H78/54H78, 74H78; 9H108/54H108, 74H108: J = K = Clock = Preset = Gnd, and Clear = 4.5 V.
3. Each flip-flop is tested separately except where Note 4 is referenced.
4. Apply the same conditions to both flip-flops when testing the 9H108/54H108, 74H108.

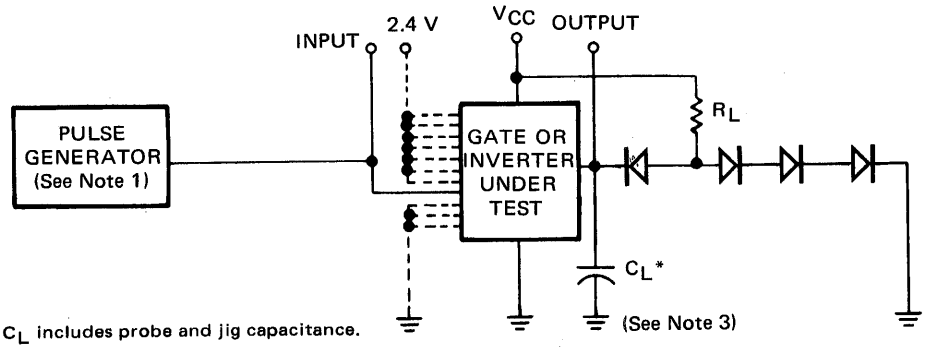
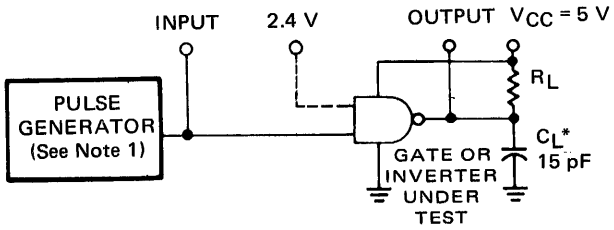
PARAMETER MEASUREMENT INFORMATION

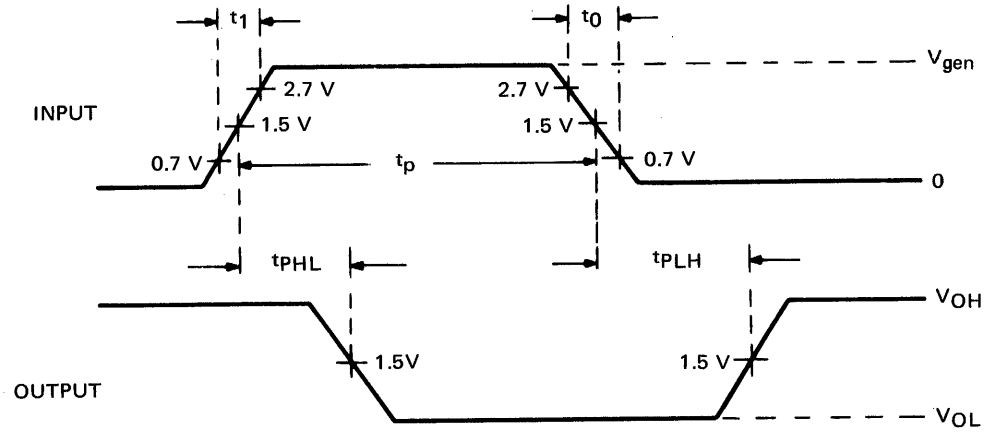
SWITCHING CHARACTERISTICS



TEST CIRCUIT FOR 9N00/5400, 7400; 9N02/5402, 7402; 9N04/5404, 7404; 9N10/5410, 7410; 9N20/5420, 7420; 9N30/5430, 7430; 9N40/5440, 7440; 9N50/5450, 7450; 9N51/5451, 7451; 9N53/5453, 7453 and 9N54/5454, 7454



TEST CIRCUIT FOR 9N01/5401, 7401; 9N03/5403, 7403; 9N05/5405, 7405; 9N39/5439, 7439



VOLTAGE WAVEFORMS

NOTES:

1. The generator has the following characteristics: V_{gen} = 3.5 V, t_0 = 5 ns, t_1 = 10 ns, t_p = 0.5 μs, PRR = 1 MHz, $Z_{out} \approx 50\Omega$.
2. Propagation Delay = $\frac{t_{PHL} + t_{PLH}}{2}$
3. When testing 9N00/5400, 7400 through 9N40/5440, 7440 (except 9N02/5402, 7402), connect all unused inputs to 2.4 V. When testing the 9N02/5402, 7402 or 9N50/5450, 7450 through 9N54/5454, 7454, apply the input pulse to one input of one AND section and 2.4 V to all unused inputs of that AND section. All inputs or unused AND sections are grounded.

NOTES:

1. When testing t_{PHL} and t_{PLH} (all types), the clock input pulse characteristics are: V_{IH} = 3 V, V_{IL} = 0 V, $t_1 = t_0$ = 7 ns, $t_{p(clock)}$ = 20 ns, and PRR = 1 MHz. When testing 9H71/54H71, 74H71; 9H72/54H72, 74H72; 9H73/54H73, 74H73; 9H76/54H76, 74H76 and 9H78/54H78, 74H78 all J and K inputs are at 2.4 V. When testing 9H101/54H101, 74H101; 9H102/54H102, 74H102; 9H103/54H103, 74H103; 9H106/54H106, 74H106 and 9H108/54H108, 74H108 conditions are established to ensure that minimum setup times are verified.
2. When testing f_{clock} of 9H71/54H71, 74H71; 9H72/54H72, 74H72; 9H73/54H73, 74H73; 9H76/54H76, 74H76 and 9H78/54H78, 74H78, the clock input characteristics are: V_{IH} = 3 V, V_{IL} = 0 V, $t_1 = t_0$ = 3 ns, $t_{p(clock)}$ = 12 ns, and PRR = 25 MHz. All J and K inputs are at 2.4 V.
3. When testing f_{clock} of 9H101/54H101, 74H101; 9H102/54H102, 74H102; 9H103/54H103, 74H103; 9H106/54H106, 74H106 and 9H108/54H108, 74H018, the clock input characteristics are: V_{IH} = 3 V, V_{IL} = 0, $t_1 = t_0$ = 3 ns, $t_{p(clock)}$ = 10 ns and PRR = 40 MHz. All J and K inputs are at 2.4 V.
4. See applicable circuit type for actual J and K input configuration and presence of preset or clear functions.
5. C_L includes probe and jig capacitance.

TTL/MONOSTABLE 9600

RETRIGGERABLE RESETTABLE MONOSTABLE MULTIVIBRATOR

DESCRIPTION – The TTL/Monostable 9600 Retriggerable, Resettable Monostable Multivibrator provides an output pulse whose duration and accuracy is a function of external timing components. The 9600 has excellent immunity to noise on the V_{CC} and ground lines. The 9600 uses TTL for high speed and high fanout capability and is compatible with all members of the Fairchild TTL family

- **74 ns TO ∞ OUTPUT PULSE WIDTH RANGE**
- **RETRIGGERABLE 0 TO 100% DUTY CYCLE**
- **RESETTABLE**
- **TTL INPUT GATING – LEADING OR TRAILING EDGE TRIGGERING**
- **COMPLEMENTARY TTL OUTPUTS**
- **OPTIONAL RETRIGGER LOCK-OUT CAPABILITY**
- **IMPROVED PULSE WIDTH TEMPERATURE STABILITY**

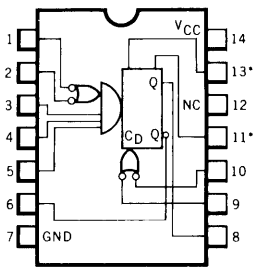
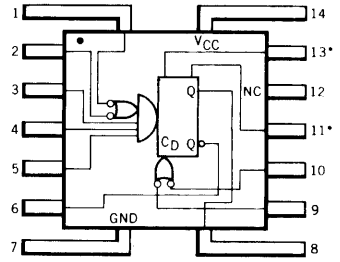
CONNECTION DIAGRAMS
DIP (TOP VIEW)



FLATPAK (TOP VIEW)



*Pins for connecting external timing components.

NC = No Internal Connection

ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	-65°C to +150°C
Temperature (Ambient) Under Bias	-55°C to +125°C
V_{CC} Pin Potential to Ground (See Note 1)	-0.5 V to +8.0 V
Input Voltage (dc) (See Note 2)	-0.5 V to +5.5 V
Input Current (See Note 2)	-30 mA to +5.0 mA
Voltage Applied to Output When Output is HIGH	-0.5 V to +V_{CC} value
Current Into Output When Output is LOW	50 mA

NOTES:

(1) The maximum V_{CC} value of 8.0 volts is not the primary factor in determining the maximum V_{CC} which may be applied to a number of interconnected devices. The voltage at a HIGH output is approximately 1 V_{BE} below the V_{CC} voltage, so the primary limit on the V_{CC} is that the voltage at any input may not go above 5.5 V unless the current is limited. This effectively limits the system V_{CC} to approximately 7.0 volts.

(2) Because of the input clamp diodes, excess current can be drawn out of the inputs if the dc input voltage is more negative than -0.5 V. The diode is designed to clamp off large negative ac swings associated with fast fall times and long lines. This maximum rating is intended only to limit the steady state input voltage and current.

FUNCTIONAL DESCRIPTION – The 9600 monostable multivibrator has five inputs, three active HIGH and two active LOW. This allows leading edge or trailing edge triggering. The TTL inputs make triggering independent of input transition times. When input conditions for triggering are met, a new cycle starts and the external capacitor is rapidly discharged and then allowed to charge. An input cycle time shorter than the output cycle time will retrigger the 9600 and result in a continuous true output. (See Rule 8.) Retriggering may be inhibited by tying the negation ($\overline{Q}$) output to an active LOW input. The output pulse may be terminated at any time by connecting either or both reset pins to a LOW logic level pin. Active pullups are provided on the outputs for good drive capability into capacitive loads.

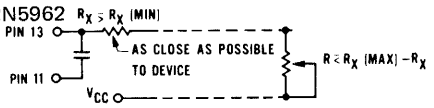
OPERATION RULES

1. An external resistor (R_X) and an external capacitor (C_X) are required as shown in the logic diagram. The value of R_X may vary from 5.0 to 50 kΩ for 0 to +75°C operation and from 5.0 to 25 kΩ for -55 to +125°C operation. C_X may vary from 0 to any necessary value available.
2. The following are recommended fixed values of R_X: R_X = 30 kΩ for 0 to +75°C operation, R_X = 10 kΩ for -55 to +125°C operation.
3. The output pulse width (t) is defined as follows:
   $t = 0.32\ R_X C_X\ [1 + \frac{0.7}{R_X}]$ Where R_X is in kΩ, C_X is in pF, t is in ns; for $C_X < 10^3$ pF, see Fig. 14.
   The value of C_X may vary from 0 to any value necessary and obtainable. If however, C_X has leakage currents approaching 3 μA or if stray capacitance from either pin 11 or pin 13 to ground exceeds 50 pF, the timing equation may not represent the pulse width obtained.
4. If electrolytic type capacitors are to be used, the following three configurations are recommended.

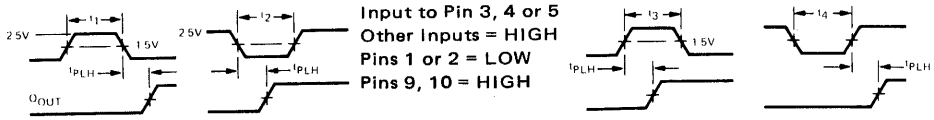
   A. Use with low leakage electrolytic capacitors.
   The normal RC configuration can be used predictably only if the forward capacitor leakage at 5.0 volts is less than 3 μA, and the inverse capacitor leakage at 1.0 volts is less than 5 μA over the operational temperature range and Rule 3 above is satisfied.

   B. Use with high inverse leakage current electrolytic capacitors.
   The diode in this configuration prevents high inverse leakage currents through the capacitor by preventing an inverse voltage across the capacitor.
   $t \approx 0.3\ RC_X$
   The use of this configuration is not recommended with retriggerable operation.

   C. Use to obtain extended pulse widths.
   This configuration obtains extended pulse widths because of the larger timing resistor allowed by Beta multiplication.
   Electrolytics with high inverse leakage currents can be used.
   $R < R_X\ (0.7)\ (h_{FE}Q_1)$ or < 2.5 MΩ, whichever is less
   $R_X(min) < R_Y < R_X(max)$ R_Y of 5 to 10kΩ is recommended.
   Q_1: NPN silicon transistor with h_{FE} requirements of above equations, such as 2N5961 or 2N5962
   $t \approx 0.3\ RC_X$
   The use of this configuration is not recommended with retriggerable operation.

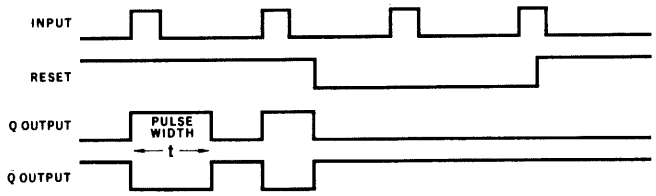


5. This circuit is recommended to obtain variable pulse width by remote trimming.
6. Under any operating condition, C_X and $R_X(min)$ must be kept as close to the circuit as possible to minimize stray capacitance and reduce noise pickup.
7. Input Trigger Pulse Rules (see Triggering Truth Table, after Fig. 15).
   Input to pin 1 or 2. Pins 2 or 1,3,4,5, 9,10 = HIGH.
   t_1, t_3 = Min. positive input pulse width > 40 ns.
   t_2, t_4 = Min. negative input pulse width > 40 ns.



8. The retrigger pulse width is equal to the pulse width t plus a delay time. For pulse widths greater than 500 ns, t_W can be approximated as t.
   $t_W = t + t_{PLH} = 0.32\ R_X C_X\ (1 + \frac{0.7}{R_X}) + t_{PLH}$

   NOTE: Retriggering will not occur if the retrigger pulse comes within ≈0.3 C_X ns after the initial trigger pulse (i.e., during the discharge cycle time).
9. Two overriding active LOW resets are provided. A LOW to either or both resets can terminate any timing cycle and/or inhibit any new cycle until both reset inputs are restored to a HIGH. Trigger inputs will not produce spikes in the output when either or both resets are held LOW.



10. Use of a 0.01 to 0.1 μF bypass capacitor located close to the 9600 is recommended.

TTL/MONOSTABLE 9601

RETRIGGERABLE MONOSTABLE MULTIVIBRATOR

DESCRIPTION – The TTL/Monostable 9601 Retriggerable Monostable Multivibrator provides an output pulse whose duration and accuracy is a function of external timing components. The 9601 has excellent immunity to noise on the V_{CC} and ground lines. The 9601 uses TTL for high speed and high fanout capability and is compatible with all members of the Fairchild TTL family.

FEATURES:

- **50 ns TO ∞ OUTPUT PULSE WIDTH RANGE**
- **RETRIGGERABLE 0 TO 100% DUTY CYCLE**
- **TTL INPUT GATING – LEADING OR TRAILING EDGE TRIGGERING**
- **COMPLEMENTARY TTL OUTPUTS**
- **OPTIONAL RETRIGGER LOCK-OUT CAPABILITY**
- **PULSE WIDTH COMPENSATED FOR V_{CC} AND TEMPERATURE VARIATIONS**

ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65°C to +150°C
Temperature (Ambient) Under Bias	−55°C to +125°C
V_{CC} Pin Potential to Ground (See Note 1)	−0.5 V to +8.0 V
Input Voltage (dc) (See Note 2)	−0.5 V to +5.5 V
Input Current (See Note 2)	−30 mA to +5.0 mA
Voltage Applied to Output When Output is HIGH	−0.5 V to +V_{CC} value
Current Into Output When Output is LOW	50 mA

NOTES:

(1) The maximum V_{CC} value of 8.0 volts is not the primary factor in determining the maximum V_{CC} which may be applied to a number of interconnected devices. The voltage at a HIGH output is approximately 1 V_{BE} below the V_{CC} voltage, so the primary limit on the V_{CC} is that the voltage at any input may not go above 5.5 V unless the current is limited. This effectively limits the system V_{CC} to approximately 7.0 volts.

(2) Because of the input clamp diodes, excess current can be drawn out of the inputs if the dc input voltage is more negative than −0.5 V. The diode is designed to clamp off large negative ac swings associated with fast fall times and long lines. This maximum rating is intended only to limit the steady state input voltage and current.

NC - No Internal Connection

FUNCTIONAL DESCRIPTION

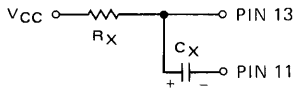
The 9601 monostable multivibrator has four inputs, two active HIGH and two active LOW. This allows a choice of leading edge or trailing edge triggering. The TTL inputs make triggering independent of input transition times. When input conditions for triggering are met, a new cycle starts and the external capacitor is rapidly discharged and then allowed to charge. An input cycle time shorter than the output cycle time will retrigger the 9601 and result in a continuous true output. (See Rule 9.) Retriggering may be inhibited by tying the negation (Q) output to an active LOW input. Active pullups are provided on the outputs for good drive capability into capacitive loads.

OPERATION RULES

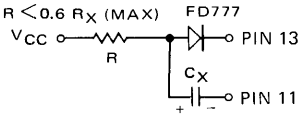
1. An external resistor (R_X) and external capacitor (C_X) are required as shown in the Logic Diagram.
2. The value of R_X may vary from 5.0 to 50 kΩ for 0 to 75°C operation and from 5.0 to 25 kΩ for −55 to +125°C operation.
3. C_X may vary from 0 to any necessary value available. If however, the capacitor has leakages approaching 3.0 μA or if stray capacitance from either terminal to ground is more than 50 pF, the timing equations may not represent the pulse width obtained.
4. The output pulse with (t) is defined as follows:

$$t = 0.32\, R_X C_X \left[1 + \frac{0.7}{R_X}\right]$$ Where R_X is in kΩ, C_X is in pF, t is in ns; for $C_X < 10^3$ pF, see Fig. 12.

5. If electrolytic type capacitors are to be used, the following three configurations are recommended:

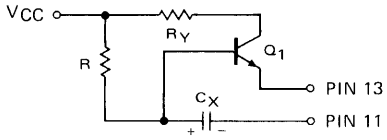


A. For use with low leakage electrolytic capacitors.
The normal RC configuration can be used predictably only if the forward capacitor leakage at 5.0 volts is less than 3 μA, and the inverse capacitor leakage at 1.0 volt is less than 5 μA over the operational temperature range, and Rule 3 above is satisfied.



B. Use with high inverse leakage current electrolytic capacitors.
The diode in this configuration prevents high inverse leakage currents through the capacitor by preventing an inverse voltage across the capacitor.

$$t \approx 0.3\, RC_X$$



C. Use to obtain extended pulse widths:
This configuration obtains extended pulse widths, because of the larger timing resistor allowed by Beta multiplication. Electrolytics with high (>5 μA) inverse leakage currents can be used.

$R < R_X\,(0.7)\,(h_{FE}\,Q_1)$ or < 2.5 MΩ whichever is lesser

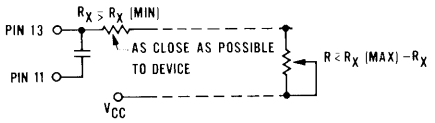
R_X (min) $< R_Y < R_X$ (max) ($5 \leqslant R_Y \leqslant 10$ kΩ is recommended)

Q_1: NPN silicon transistor with h_{FE} requirements of above equations, such as 2N5961 or 2N5962

$t \approx 0.3\, RC_X$

Configuration B and C are not recommended with retriggerable operation.

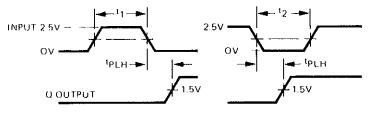
6. To obtain variable pulse width by remote trimming, the following circuit is recommended:



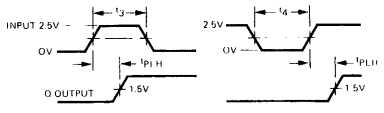
7. Under any operating condition, C_X and R_X (min) must be kept as close to the circuit as possible to minimize stray capacitance and reduce noise pickup.

8. Input Trigger Pulse Rules. (See Triggering Truth Table on page 5.)

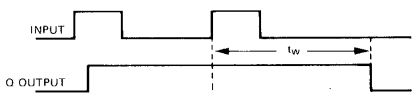
Input to Pin 1 (2)
Pins 2, (1), 3 & 4 = HIGH
t_1, t_4 = Setup time > 40 ns
t_2, t_3 = Release time > 40 ns



Input to Pin 3 (4)
Pin 4 (3) = HIGH
Pins 1 or 2 = LOW



9. The retrigger pulse width is calculated as shown below:



$$t_W = t + t_{PLH} = 0.32\, R_X C_X \left(1 + \frac{0.7}{R_X}\right) + t_{PLH}$$

The retrigger pulse width is equal to the pulse width t plus a delay time. For pulse widths greater than 500 ns, t_W can be approximated as t.

NOTE: Retriggering will not occur if the retrigger pulse comes within ≈ 0.3 C_X ns after the initial trigger pulse. (i.e., during the discharge cycle time.)

10. Use of a 0.01 to 0.1 μF bypass capacitor between V_{CC} and Ground located close to the 9601 is recommended.

TTL/MONOSTABLE 9602

DUAL RETRIGGERABLE RESETTABLE MONOSTABLE MULTIVIBRATOR

DESCRIPTION – The TTL/Monostable 9602 Dual Retriggerable, Resettable Monostable Multivibrator provides an output pulse whose duration and accuracy is a function of external timing components. The 9602 has excellent immunity to noise on the V_{CC} and ground lines. The 9602 uses TTL inputs and outputs for high speed and high fanout capability and is compatible with all members of the Fairchild TTL family.

- **72 ns TO ∞ OUTPUT WIDTH RANGE**
- **RETRIGGERABLE 0 TO 100% DUTY CYCLE**
- **TTL INPUT GATING –LEADING OR TRAILING EDGE TRIGGERING**
- **COMPLEMENTARY TTL OUTPUTS**
- **OPTIONAL RETRIGGER LOCK-OUT CAPABILITY**
- **PULSE WIDTH COMPENSATED FOR V_{CC} AND TEMPERATURE VARIATIONS**
- **RESETTABLE**

ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	–65°C to +150°C
Temperature (Ambient) Under Bias	–55°C to +125°C
V_{CC} Pin Potential to Ground (See Note 1)	–0.5 V to +8.0 V
Input Voltage (dc) (See Note 2)	–0.5 V to +5.5 V
Input Current (See Note 2)	–30 mA to +5.0 mA
Voltage Applied to Output When Output is HIGH	–0.5 V to +V_{CC} value
Current Into Output When Output is LOW	50 mA

NOTES:

1. The maximum V_{CC} value of 8.0 volts is not the primary factor in determining the maximum V_{CC} which may be applied to a number of interconnected devices. The voltage at a HIGH output is approximately 1 V_{BE} below the V_{CC} voltage, so the primary limit on the V_{CC} is that the voltage at any input may not go above 5.5 V unless the current is limited. This effectively limits the system V_{CC} to approximately 7.0 volts.
2. Because of the input clamp diodes, excess current can be drawn out of the inputs if the dc input voltage is more negative than –0.5 V. The diode is designed to clamp off large negative ac swings associated with fast fall times and long lines. This maximum rating is intended only to limit the steady state input voltage and current.

7

FUNCTIONAL DESCRIPTION — The 9602 dual resettable, retriggerable monostable multivibrator has two inputs per function, one active LOW and one active HIGH. This allows leading edge or trailing edge triggering. The TTL inputs make triggering independent of input transition times. When input conditions for triggering are met, a new cycle starts and the external capacitor is rapidly discharged and then allowed to charge. An input cycle time shorter than the output cycle time will retrigger the 9602 and result in a continuous true output. (See Rule 9) The output pulse may be terminated at any time by connecting the reset pin to a logic level LOW. Active pullups are provided on the outputs for good drive capability into capacitive loads. Retriggering may be inhibited by tying $\overline{Q}$ output to an active level LOW input or the Q output to the active level HIGH input.

OPERATION RULES

1. An external resistor (R_X) and external capacitor (C_X) are required as shown in the Logic Diagram.
2. The value of R_X may vary from 5.0 kΩ to 50 kΩ for 0 to 75°C operation. The value of R_X may vary from 5.0 kΩ to 25 kΩ for −55 to +125°C operation.
3. The value of C_X may vary from 0 to any necessary value available. If, however, the capacitor has leakages approaching 3.0 μA or if stray capacitance from either terminal to ground is more than 50 pF, the timing equations may not represent the pulse width obtained.
4. The output pulse with (t) is defined as follows:

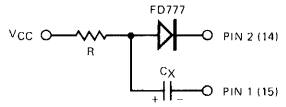
$$t = 0.31\ R_X C_X \left[1 + \frac{1}{R_X}\right]$$ Where

R_X is in kΩ, C_X is in pF
t is in ns
for $C_X < 10^3$ pF, see Fig. 14

5. If electrolytic type capacitors are to be used, the following three configurations are recommended:

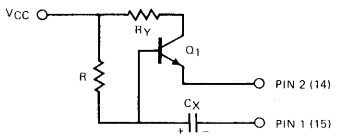
   A. Use with low leakage capacitors:
   The normal RC configuration can be used predictably only if the forward capacitor leakage at 5.0 volts is less than 3μA, and the inverse capacitor leakage at 1.0 volt is less than 5μA over the operational temperature range and Rule 3 above is satisfied.

   B. Use with high inverse leakage current electrolytic capacitors:
   The diode in this configuration prevents high inverse leakage currents through the capacitor by preventing an inverse voltage across the capacitor. The use of this configuration is not recommended with retriggerable operation.



$$t \approx 0.3\ RC_X$$

   C. Use to obtain extended pulse widths:
   This configuration can be used to obtain extended pulse widths, because of the larger timing resistor allowed by beta multiplication. Electrolytics with high inverse leakage currents can be used.



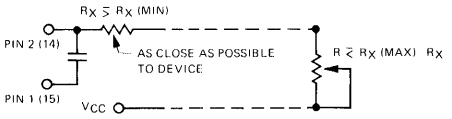
$R < R_X\ (0.7)\ (h_{FE}\ Q_1)$ or < 2.5 MΩ whichever is the lesser
$R_X\ (\text{min}) < R_Y < R_X\ (\text{max})$ $(5 \leq R_Y \leq 10$ kΩ is recommended)

Q_1: NPN silicon transistor with h_{FE} requirements of above equations, such as 2N5961 or 2N5962

$$t \approx 0.3\ RC_X$$

This configuration is not recommended with retriggerable operation.

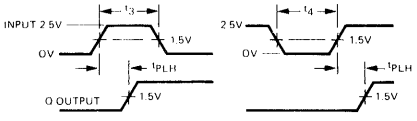
6. To obtain variable pulse width by remote trimming, the following circuit is recommended:



7. Under any operating condition, C_X and R_X (min) must be kept as close to the circuit as possible to minimize stray capacitance and reduce noise pickup.
8. Input Trigger Pulse Rules. See Triggering Truth Table, following pages.

   Input to Pin 5 (11)
   Pin 4 (12) = LOW
   Pin 3 (13) = HIGH
   t_1, t_3 = Min. Positive Input Pulse Width > 40 ns
   t_2, t_4 = Min. Negative Input Pulse Width > 40 ns

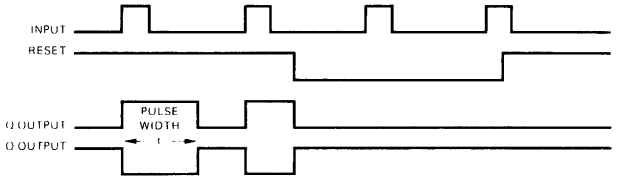
   Input to Pin 4 (12)
   Pin 5 (11) = HIGH
   Pin 3 (13) = HIGH



9. The retriggerable pulse width is calculated as shown below:

$$t_W = t + t_{PLH} = 0.31\ R_X C_X \left(1 + \frac{1}{R_X}\right) + t_{PLH}$$

   The retrigger pulse width is equal to the pulse width (t) plus a delay time. For pulse widths greater than 500 ns, tw can be approximated as t.
   Retriggering will not occur if the retrigger pulse comes within $\approx 0.3\ C_X$ ns after the initial trigger pulse. (i.e., during the discharge cycle)
10. Reset Operation — An overriding active LOW level is provided on each oneshot. By applying a LOW to the reset, any timing cycle can be terminated or any new cycle inhibited until the LOW reset input is removed. Trigger inputs will not produce spikes in the output when the reset is held LOW.



11. V_{CC} and Ground wiring should conform to good high frequency standards so that switching transients on V_{CC} and Ground leads do not cause interaction between one-shots. Use of a 0.01 to 0.1 μF bypass capacitor between V_{CC} and Ground located near the 9602 is recommended.

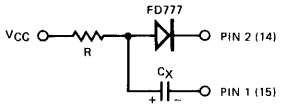
FUNCTIONAL DESCRIPTION – The 96L02 dual resettable, retriggerable monostable multivibrator has two inputs per function, one active LOW and one active HIGH. This allows leading edge of trailing edge triggering. The TTL inputs make triggering independent of input transition times. When input conditions for triggering are met, a new cycle starts and the external capacitor is rapidly discharged and then allowed to charge. An input cycle time shorter than the output cycle time will retrigger the 96L02 and result in a continuous true output. (See Rule 9) The output pulse may be terminated at any time by connecting the reset pin to a logic level LOW. Active pullups are provided on the outputs for good drive capability into capacitive loads. Retriggering may be inhibited by tying the $\overline{Q}$ output to the active level LOW input or the Q output to the active level HIGH input.

OPERATION RULES

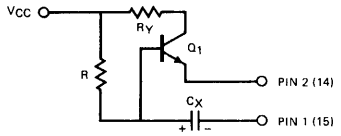
1. An external resistor (R_X) and external capacitor (C_X) are required as shown in the Logic Diagram.
2. The value of R_X may vary from 16 kΩ to 220 kΩ for 0 to 75°C operation. The value of R_X may vary from 20 kΩ to 100 kΩ for –55 to +125°C operation.
3. The value of C_X may vary from 0 to any necessary value available. If, however, the capacitor has leakages approaching 1.0 μA or if stray capacitance from either terminal to ground is more than 50 pF, the timing equations may not represent the pulse width obtained.
4. The output pulse with (t) is defined as follows:
$$t = 0.33\, R_X C_X \left[1 + \frac{3.0}{R_X}\right] \quad (\text{for } C_X > 10^3 \text{ pF})$$
Where R_X is in kΩ, C_X is in pF, t is in ns. For $C_X < 10^3$ pF, see Fig. 1
5. If electrolytic type capacitors are to be used, the following three configurations are recommended:
   A. Use with low leakage capacitors:
   The normal RC configuration can be used predictably only if the forward capacitor leakage at 5.0 V is less than 1.0 μA, and the inverse capacitor leakage at 1.0 V is less than 1.6 μA over the operational temperature range and Rule 3 above is satisfied.

   B. Use with high inverse leakage current electrolytic capacitors:
   The diode in this configuration prevents high inverse leakage currents through the capacitor by preventing an inverse voltage across the capacitor. The use of this configuration is not recommended with retriggerable operation.



$$t \approx 0.3\, RC_X$$

   C. Use to obtain extended pulse widths:
   This configuration can be used to obtain extended pulse widths, because of the larger timing resistor allowed by beta multiplication. Electrolytics with high inverse leakage currents can be used.



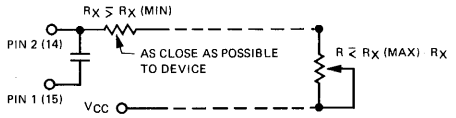
$R < R_X\,(0.7)\,(h_{FE}\,Q_1)$ or <2.5 MΩ whichever is the lesser
R_X (min) $< R_Y < R_X$ (max)

Q_1: NPN silicon transistor with h_{FE} requirements of above equations, such as 2N5961 or 2N5962

$$t \approx 0.3\, RC_X$$

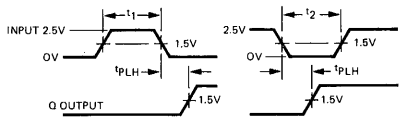
This configuration is not recommended with retriggerable operation.

6. To obtain variable pulse width by remote trimming, the following circuit is recommended:

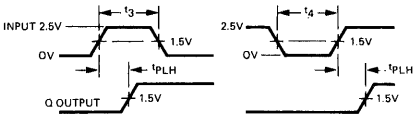


7. Under any operating condition, C_X and R_X (min) must be kept as close to the circuit as possible to minimize stray capacitance and reduce noise pickup.
8. Input Trigger Pulse Rules. See Triggering Truth Table, following pages.

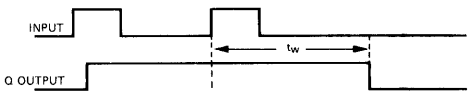
Input to Pin 5 (11)
Pin 4 (12) = LOW
Pin 3 (13) = HIGH
t_1, t_3 = Min. Positive Input Pulse Width > 60 ns
t_2, t_4 = Min. Negative Input Pulse Width > 60 ns



Input to Pin 4 (12)
Pin 5 (11) = HIGH
Pin 3 (13) = HIGH

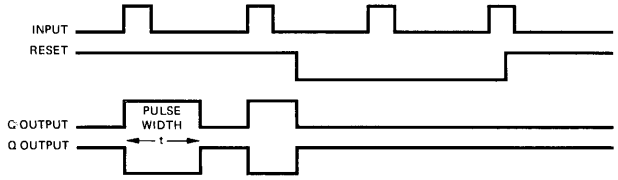


9. The retriggerable pulse width is calculated as shown below:
$$tw = t + t_{PLH} = 0.33\, R_X C_X \left(1 + \frac{3.0}{R_X}\right) + t_{PLH}$$



The retrigger pulse width is equal to the pulse width (t) plus a delay time. For pulse widths greater than 500 ns, tw can be approximated as t. Retriggering will not occur if the retrigger pulse comes within ≈ 0.9 C_X ns after the initial trigger pulse. (i.e., during the discharge cycle)

10. Reset Operation – An overriding active LOW level is provided on each oneshot. By applying a LOW to the reset, any timing cycle can be terminated or any new cycle inhibited until the LOW reset input is removed. Trigger inputs will not produce spikes in the output when the reset is held LOW.



11. V_{CC} and Ground wiring should conform to good high frequency standards so that switching transients on V_{CC} and Ground leads do not cause interaction between one-shots. Use of a 0.01 to 0.1 μF bypass capacitor between V_{CC} and Ground located near the 96L02 is recommended.

ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65°C to +150°C
Temperature (Ambient) Under Bias	−55°C to +125°C
V_{CC} Pin Potential to Ground Pin	−0.5 V to +7.0 V
*Input Voltage (dc)	−0.5 V to +5.5 V
*Input Current (dc)	−30 mA to +5.0 mA
Voltage Applied to Outputs (Output HIGH)	−0.5 V to +V_{CC} value
Output Current (dc) (Output LOW)	+30 mA

*Either Input Voltage Limit or Input Current is sufficient to protect the inputs.

GUARANTEED OPERATING RANGES

PART NUMBER	SUPPLY VOLTAGE (V_{CC})			TEMPERATURE
	MIN.	TYP.	MAX.	
96L02XM	4.5 V	5.0 V	5.5 V	−55°C to 125°C
96L02XC	4.75 V	5.0 V	5.25 V	0°C to 75°C

				1.0	mA	V_{CC} = MAX., V_{IN} = 5.5 V
I_{IL}	Input LOW Current		−0.25	−0.4	mA	V_{CC} = MAX., V_{IN} = 0.3 V
I_{SC} (I_{OS})	Output Short Circuit Current (Note 5)	−2.0		−13	mA	V_{CC} = MAX., V_{OUT} = 1.0 V
I_{CC}	Power Supply Current		10	16	mA	V_{CC} = MAX.

NOTES:
1. The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
2. Conditions for testing, not shown in the table, are chosen to guarantee operation under "worst case" conditions.
3. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltages extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
4. Typical limits are at V_{CC} = 5.0 V, 25°C, and maximum loading.
5. Not more than one output should be shorted at a time.

TTL/MONOSTABLE 9603/54121, 74121
MONOSTABLE MULTIVIBRATOR

DESCRIPTION – The 9603/54121, 74121 is a TTL Monostable Multivibrator with dc triggering from positive or gated negative going inputs and with inhibit facility. Both positive and negative going output pulses are provided with full fan out to 10 normalized loads.

Pulse triggering occurs at a particular voltage level and is not directly related to the transition time of the input pulse. Schmitt-trigger input circuitry for the B input allows jitter-free triggering from inputs with transition times as slow as 1.0 V/S, providing the circuit with an excellent noise immunity of typically 1.2 V. A high immunity to V_{CC} noise of typically 1.5 V is also provided by internal latching circuitry.

Once fired, the outputs are independent of further transitions on the inputs and are a function only of the timing components. Input pulses may be of any duration relative to the output pulse. Output pulse lengths may be varied from 40 ns to 40 s by choosing appropriate timing components. With no external timing components (i.e., pin 9 connected to pin 14, pins 10, 11 open) an output pulse of typically 30 ns is achieved which may be used as a dc triggered reset signal. Output rise and fall times are TTL compatible and independent of pulse length.

Pulse width is achieved through internal compensation and is virtually independent of V_{CC} and temperature. In most applications, pulse stability will only be limited by the accuracy of external timing components.

Jitter-free operation is maintained over the full temperature and V_{CC} range for more than six decades of timing capacitance (10 pF to 10 μF) and more than one decade of timing resistance (2 kΩ to 40 kΩ). Throughout these ranges, pulse width is defined by the relationship $t_{p(out)} = C_T R_T \log_e 2$.

Circuit performance is achieved with a nominal power dissipation of 90 mW at 5.0 V (50% duty cycle) and a quiescent dissipation of typically 65 mW.

Duty cycles as high as 90% are achieved when using R_T = 40 kΩ. Higher duty cycles are achievable if a certain amount of pulse-width jitter is allowed.

Positive logic: See truth table and notes 5 and 6

H = $V_{IH} \geq 2$ V
L = $V_{IL} \leq 0.8$ V

NOTES:
1. t_n = time before input transition.
2. t_{n+1} = time after input transition.
3. X indicates that either a HIGH or LOW, may be present.
4. NC = No Internal Connection.
5. A_1 and A_2 are negative edge triggered-logic inputs, and will trigger the one shot when either or both go to LOW level with B at HIGH level.
6. B is a positive Schmitt-trigger input for slow edges or level detection and will trigger the one shot when B goes to HIGH level with either A_1 or A_2 at LOW level. (See Truth Table.)
7. External timing capacitor may be connected between pin 10 (positive) and pin 11. With no external capacitance, an output pulse width of typically 30 ns is obtained.
8. To use the internal timing resistor (2 kΩ nominal), connect pin 9 to pin 14.
9. To obtain variable pulse width connect external variable resistance between pin 9 and pin 14. No external current limiting is needed.
10. For accurate repeatable pulse widths connect an external resistor between pin 11 and pin 14 with pin 9 open-circuit.

μA9614

DUAL DIFFERENTIAL LINE DRIVER

FAIRCHILD LINEAR INTEGRATED CIRCUIT

GENERAL DESCRIPTION — The μA9614 is a TTL compatible Dual Differential Line Driver. It is designed to drive transmission lines either differentially or single-ended, back-matched or terminated. The outputs are similar to TTL, with the active pull-up and the pull-down split and brought out to adjacent pins. This allows multiplex operation (Wired-OR) at the driving site in either the single-ended mode via the uncommitted collector, or in the differential mode by use of the active pull-ups on one side and the uncommitted collectors on the other (See Fig. 5). The active pull-up is short circuit protected and offers a low output impedance to allow back-matching. The two pairs of outputs are complementary providing "NAND" and "AND" functions of the inputs, adding greater flexibility. The input and output levels are TTL compatible with clamp diodes provided at both input and output to handle line transients.

- **SINGLE 5 VOLT SUPPLY**
- **TTL COMPATIBLE INPUTS**
- **OUTPUT SHORT CIRCUIT PROTECTION**
- **INPUT CLAMP DIODES**
- **OUTPUT CLAMP DIODES FOR TERMINATION OF LINE TRANSIENTS**
- **COMPLIMENTARY OUTPUTS FOR 'NAND', 'AND' OPERATION**
- **UNCOMMITTED COLLECTOR OUTPUTS FOR WIRED-OR APPLICATION**
- **MILITARY TEMPERATURE RANGE**

ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65°C to +150°C
Temperature (Ambient) Under Bias	−55°C to +125°C
V_{CC} Pin Potential to Ground Pin	−0.7 V to +7.0 V
Input Voltage	−0.5 V to +5.5 V
Voltage Supplied to Outputs (Open Collector)	−0.5 V to +12 V
Lead Temperature (Soldering, 60 seconds)	300°C
Internal Power Dissipation (Note 1)	
Ceramic DIP	730 mW
Flatpak	570 mW

NOTE

1. Rating applies to ambient temperatures up to 70°C. Above 70°C derate linearly at 8.3 mW/°C for the Ceramic DIP and 7.1 mW/°C for the Flatpak.

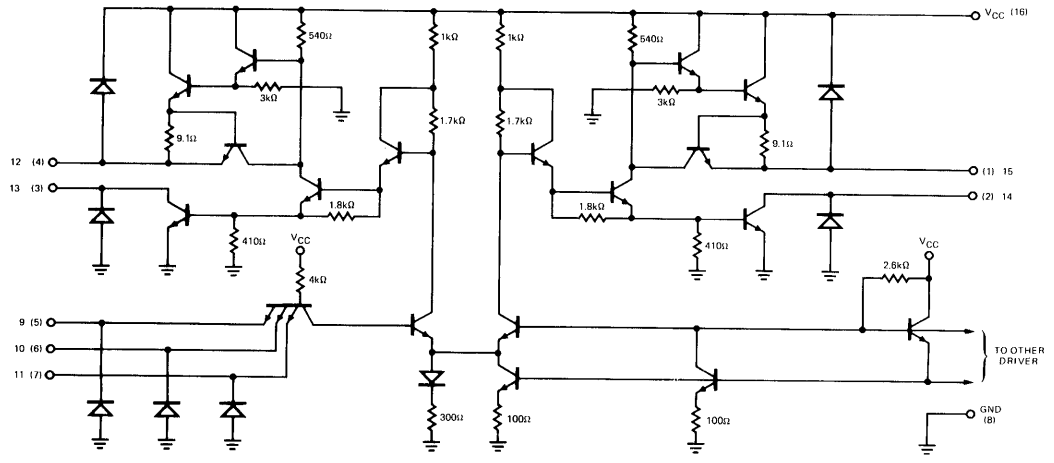
EQUIVALENT CIRCUIT (1/2 9614)



μA9615

DUAL DIFFERENTIAL LINE RECEIVER

FAIRCHILD LINEAR INTEGRATED CIRCUITS

GENERAL DESCRIPTION – The μA9615 is a Dual Differential Line Receiver designed to receive differential digital data from transmission lines and operate over the military and industrial temperature ranges using a single 5 V supply. It can receive ±500 mV of differential data in the presence of high level (±15 V) common mode voltages and deliver undisturbed TTL logic to the output.

The response time can be controlled by use of an external capacitor. A strobe and a 130 Ω terminating resistor are provided at the inputs. The output has an uncommitted collector with an active pull-up available on an adjacent pin to allow either "wire-or" or active pull up TTL output configuration.

- **TTL COMPATIBLE OUTPUT**
- **HIGH COMMON MODE VOLTAGE RANGE**
- **CHOICE OF AN UNCOMMITTED COLLECTOR OR ACTIVE PULL-UP**
- **STROBE**
- **FULL MILITARY TEMPERATURE RANGE**
- **SINGLE 5 V SUPPLY VOLTAGES**
- **FREQUENCY RESPONSE CONTROL**
- **130 Ω TERMINATING RESISTOR**

ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65° C to +150° C
Temperature (Ambient) Under Bias	−55° C to +125° C
V_{CC1} Pin Potential to Ground Pin	−0.5 V to +7.0 V
Input Voltage Referred to Ground (Pins 5, 6, 7, 9, 10, 11)	±20 V
Voltage Applied to Outputs for HIGH Output State without Active Pull Up	−0.5 V to +13.2 V

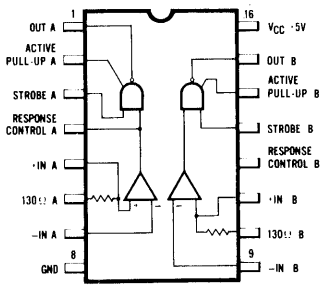
Lead Temperature (Soldering, 60 seconds)	300° C
Internal Power Dissipation (Note 1)	
Ceramic DIP	730 mW
Flatpak	570 mW

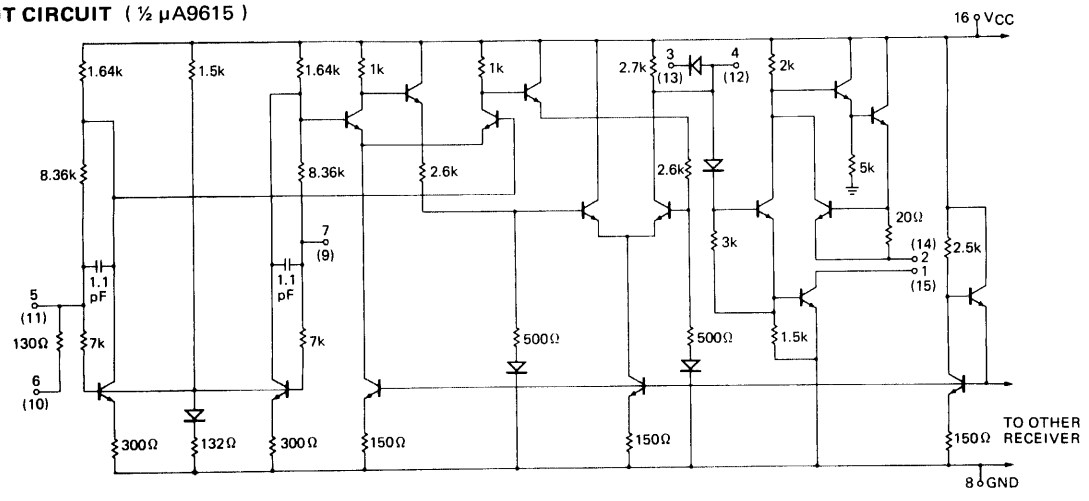
NOTE

1. Rating applies to ambient temperatures up to 70° C. Above 70° C derate linearly at 8.3 mW/° C for the Ceramic DIP and 7.1 mW/° C for the Flatpak Package.

LOGIC DIAGRAM



EQUIVALENT CIRCUIT (½ μA9615)



μA9616

TRIPLE EIA RS-232-C LINE DRIVER

FAIRCHILD LINEAR INTEGRATED CIRCUITS

GENERAL DESCRIPTION – The μA9616 is a Triple Line Driver which meets the electrical interface specifications of EIA RS-232-C and CCITT V.24. Each driver in the μA9616 converts TTL/DTL logic level to EIA/CCITT levels for transmission between data terminal equipment and data communication equipment. The μA9617 performs the complementary functions. The output slew rate is internally limited and can be lowered by an external capacitor; all output currents are short circuit limited. The outputs are protected against RS-232-C fault conditions. A logic HIGH level on the inhibit terminal interrupts signal transfer and forces the output to a $-V_{OUT}$ or MARK state. The μA9616 is constructed on a single silicon chip using the Fairchild Planar* process.

- **INTERNAL SLEW RATE LIMITING**
- **NO EXTERNAL CAPACITORS REQUIRED**
- **THREE CHANNELS PER PACKAGE**
- **MEETS EIA RS-232-C AND CCITT V.24 SPECIFICATIONS**
- **LOGICAL TRUE INHIBIT FUNCTION**
- **SUPPLY INDEPENDENT OUTPUT SWING**
- **OUTPUT CURRENT LIMITING**

μA9617

TRIPLE EIA RS-232-C LINE RECEIVER

FAIRCHILD LINEAR INTEGRATED CIRCUITS

GENERAL DESCRIPTION — The μA9617 is a Triple Line Receiver designed to meet the terminator electrical requirements of EIA RS-232-C AND CCITT V.24. It receives line signals produced by the μA9616, an EIA/CCITT driver, and converts them to TTL compatible logic levels. The inputs have a resistance between 3 kΩ and 7 kΩ and can withstand ±25 V. Each receiver can operate in either hysteresis or non-hysteresis (slicing) modes, and each receiver provides fail-safe operation as defined by Section 2.5 of RS-232-C. Noise immunity may be increased by connecting a capacitor between the response control pin and ground. The μA9617 is constructed on a single silicon chip using the Fairchild Planar* process.

- **MEETS ALL EIA RS-232-C AND CCITT V.24 SPECIFICATIONS**
- **FAIL-SAFE OPERATION**
- **HYSTERESIS OR NON-HYSTERESIS MODE**
- **INDIVIDUAL RESPONSE CONTROLS**
- **TTL COMPATIBLE OUTPUT**
- **SINGLE +5 V SUPPLY**

μA9620

DUAL DIFFERENTIAL LINE RECEIVER

FAIRCHILD LINEAR INTEGRATED CIRCUIT

GENERAL DESCRIPTION – The μA9620 is a Dual Differential Line Receiver designed to receive differential digital data from transmission lines and operate over the military and industrial temperature ranges. It can receive ±500 mV of differential data in the presence of HIGH level (±15 V) common mode voltages and deliver undisturbed TTL logic to the output. In addition to line reception the μA9620 can perform many functions, a few of which are presented in the applications section. It can interface with nearly all input logic levels including CML, CTL, HLLDTL, RTL and TTL. HLLDTL logic can be provided by tieing the output to V_{CC2} (+12 V) through a resistor. The outputs can also be wired-OR. The μA9620 offers the advantages of logic compatible voltages (+5 V, +12 V), TTL output characteristics, and a flexible input array with a high common mode range. The direct inputs are provided in addition to the attenuated inputs (normally used) to allow the input attenuation and response time to be changed by use of external components.

- TTL COMPATIBLE OUTPUT
- HIGH COMMON MODE VOLTAGE RANGE
- WIRED-OR CAPABILITY
- DIRECT INPUTS (A_D, B_D)
- FULL MILITARY TEMPERATURE RANGE
- LOGIC COMPATIBLE SUPPLY VOLTAGES

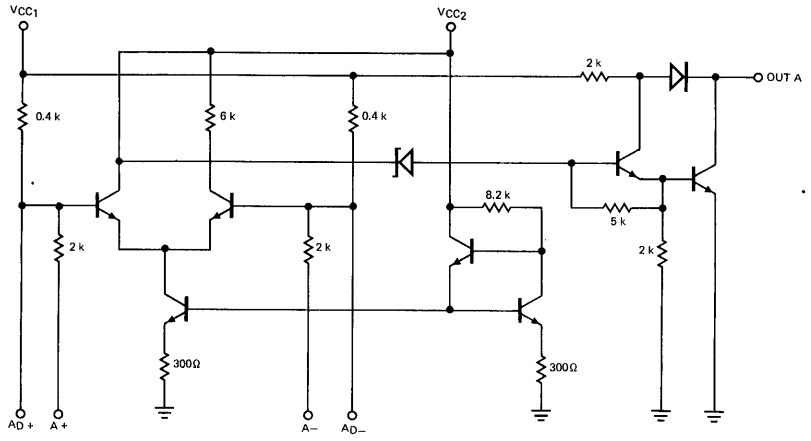
ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65°C to +150°C
Temperature (Ambient) Under Bias	−55°C to +125°C
V_{CC1} Pin Potential to Ground Pin	−0.5 V to +7.0 V
Input Voltage Referred to Ground (Attenuator Inputs)	±20 V
Voltage Applied to Outputs for HIGH Output State	−0.5 V to +13.2 V
V_{CC2} Pin Potential to Ground Pin	V_{CC1} to +15 V
Lead Temperature (Soldering, 60 seconds)	300°C
Internal Power Dissipation (Note 1)	
Ceramic DIP	670 mW
Flatpak	570 mW

NOTE

1. Rating applies to ambient temperatures up to 70°C. Above 70°C derate linearly at 8.3 mW/°C for the Ceramic DIP and 7.1 mW/°C for the Flatpak Package.

EQUIVALENT CIRCUIT



7

μA9621

DUAL LINE DRIVER

FAIRCHILD LINEAR INTEGRATED CIRCUITS

GENERAL DESCRIPTION – The μA9621 was designed to drive transmission lines in either a differential or a single-ended mode. Output clamp diodes and back-matching resistors for 130 Ω twisted pair are provided. The output has the capability of driving high capacitance loads. It can typically switch >200 mA during transients.

- **TTL COMPATIBILITY**
- **TRANSMISSION LINE BACK-MATCHING**
- **OUTPUT CLAMP DIODES**
- **HIGH CAPACITANCE DRIVE**
- **HIGH OUTPUT VOLTAGE**
- **MILITARY TEMPERATURE RANGE**

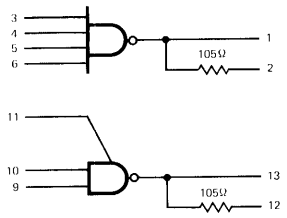
ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65° C to +150° C
Temperature (Ambient) Under Bias	−55° C to +125° C
V_{CC1} Pin Potential to Ground Pin	+3.8 V to +8 V
Input Voltage	−0.5 V to +15 V
Voltage Applied to Outputs	−2 V to +V_{CC1} +1 V
V_{CC2} Pin Potential to Ground Pin	V_{CC1} to +15 V
Lead Temperature (Soldering, 60 seconds)	300° C
Internal Power Dissipation (Note)	
Ceramic DIP	670 mW
Flatpak	570 mW

NOTE

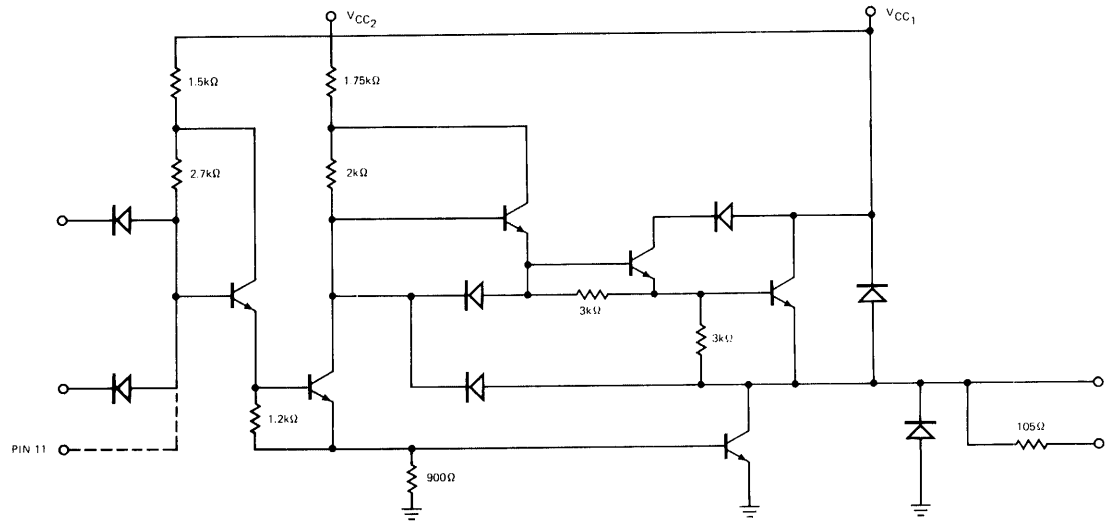
Rating applies to ambient temperatures up to 70° C. Above 70° C derate linearly at 8.3 mW/° C for the Ceramic DIP and 7.1 mW/° C for the Flatpak Package.

LOGIC DIAGRAM



V_{CC_1} = 14, V_{CC_2} = 8, GND = 7

SCHEMATIC DIAGRAM (ONE SIDE ONLY)



μA9622

DUAL LINE RECEIVER

FAIRCHILD LINEAR INTEGRATED CIRCUIT

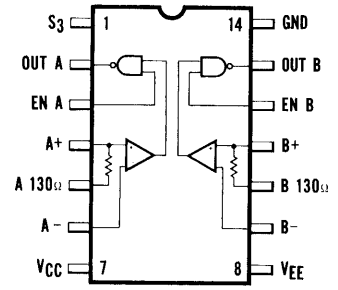
GENERAL DESCRIPTION – The μA9622 is a Dual Line Receiver designed to discriminate a worst case logic swing of 2.0 V from a ±10 V common mode noise signal or ground shift. A 1.5 V threshold is built into the differential amplifier to offer a TTL compatible threshold voltage and maximum noise immunity. The offset is obtained by use of current sources and matched resistors and varies only ±5% (75 mV) over the military and industrial temperature ranges.

The μA9622 allows the choice of output states with the inputs open without affecting circuit performance by use of S_3*. A 130 Ω terminating resistor is provided at the input of each line receiver. An enable is also provided for each line receiver. The output is TTL compatible. The output HIGH level can be increased to +12 V by tieing it to a positive supply through a resistor. The output circuits allow wired-OR operation.

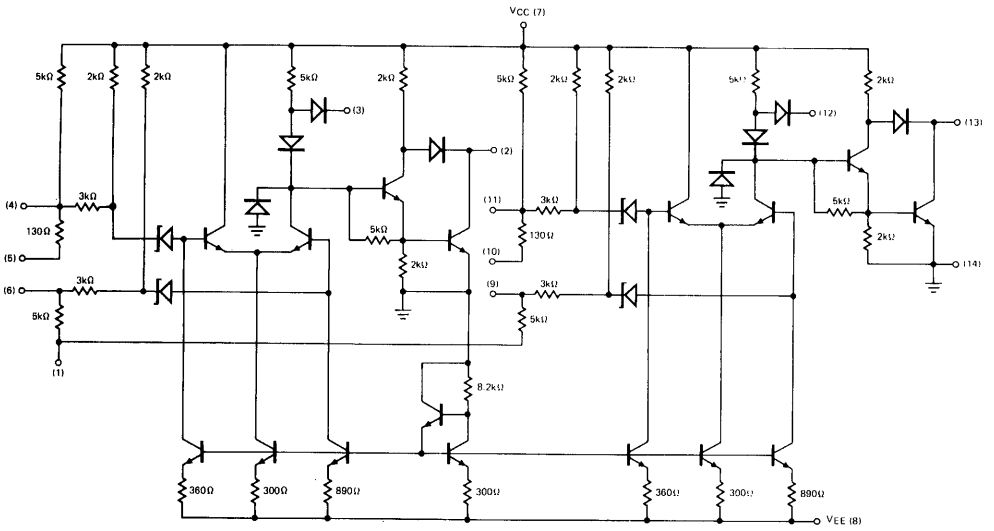
*S_3 connected to V_{CC} – open inputs causes output to be V_{OH}.
S_3 connected to Ground – open inputs causes output to be V_{OL}.

- TTL COMPATIBLE THRESHOLD VOLTAGE
- INPUT TERMINATING RESISTORS
- CHOICE OF OUTPUT STATE WITH INPUTS OPEN
- TTL COMPATIBLE OUTPUT
- HIGH COMMON MODE
- WIRE-OR CAPABILITY
- ENABLE INPUTS
- FULL MILITARY TEMPERATURE RANGE
- LOGIC COMPATIBLE SUPPLY VOLTAGES

LOGIC DIAGRAM



EQUIVALENT CIRCUIT



μA9624 • μA9625

DUAL TTL, MOS INTERFACE ELEMENTS

FAIRCHILD LINEAR INTEGRATED CIRCUITS

GENERAL DESCRIPTION – The μA9624 is a Dual 2-Input TTL Compatible Interface gate specifically designed to drive MOS. The output swing is adjustable and will allow it to be used as a data driver, clock driver or discrete MOS driver. It has an active output for driving medium capacitive loads.

The μA9625 is a dual MOS to TTL level converter. It is designed to convert standard negative MOS logic levels to TTL levels. The μA9625 features a high input impedance which allows preservation of the driving MOS logic level.

Both the μA9624 and μA9625 are available in the 14-lead Ceramic Dual In-Line Package and the 1/4 x 1/4 Flatpak.

NOTE: The TTL and MOS devices manufactured by Fairchild Semiconductor are considered as positive TRUE logic (the more positive voltage level is assigned the binary state of "1" or TRUE). Following MIL-STD-806B logic symbol specifications, the μA9624 is represented as a NAND gate and the μA9625 as a non-inverting buffer. This convention (of assuming MOS as a positive TRUE logic) has not been uniformly accepted by the industry; therefore, it is necessary to note that with negative TRUE MOS logic (the more negative voltage level is assigned the binary state "1" or TRUE), the μA9624 acts as an AND gate and the μA9625 as an inverter.

- **TTL COMPATIBLE INPUTS/OUTPUT**
- **MOS COMPATIBLE OUTPUT/INPUTS**
- **LOW POWER**

μA9644

DUAL HIGH VOLTAGE, HIGH CURRENT DRIVER

FAIRCHILD LINEAR INTEGRATED CIRCUITS

GENERAL DESCRIPTION – The μA9644 is a Dual 4-Input NAND Gate whose output can sink 500 mA in the LOW state, and maintain 30 V in the HIGH state. The outputs are uncommitted collectors in a Darlington configuration which have typical saturation voltages of 0.8 V at low currents and 1.2 V at 500 mA. The inputs are TTL Compatible and feature input clamp diodes. The input fan in requirement is typically 1/2 a normal DTL Unit Load. An input strobe common to both gates in provided, and an expander input node on each gate is available for input diode expansion. Separate ground pins are provided for each gate to minimize ground pin offset voltages at high current levels.

- **500 mA CURRENT SINKING CAPABILITY**
- **OUTPUT VOLTAGES UP TO 30 V**
- **LOW AVERAGE POWER, TYPICALLY 30 mW PER GATE**
- **HIGH SPEED, TYPICALLY 50 ns DELAY TIMES**
- **TTL COMPATIBLE INPUTS**
- **INPUT CLAMP DIODES**
- **LOW FAN IN LOADING REQUIREMENTS**
- **COMMON STROBE INPUT**
- **EXPANDER NODE FOR INPUT DIODE EXPANSION**

ABSOLUTE MAXIMUM RATING

Storage Temperature		−65°C to +175°C
Temperature (Ambient) Under Bias		−55°C to +125°C
V_{CC} Pin Potential to Ground Pin		−0.5 V to +8.0 V
Input Voltages (dc)		−0.5 V to +5.5 V
Voltage Applied to Outputs (Output HIGH)	See Safe Area Curves on following pages	−0.5 V to +30 V
Output Current (dc) (Output LOW)		640 mA
Internal Power Dissipation (Note)		730 mW
Lead Temperature (Soldering, 60 seconds)		300°C

NOTE

Rating applies to ambient temperatures up to 70°C. Above 70°C derate linearly at 8.3 mW/°C for the Ceramic DIP.

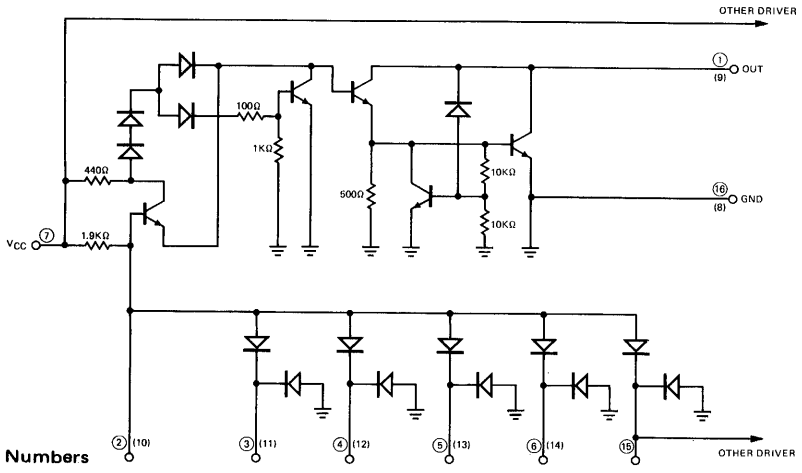
EQUIVALENT CIRCUIT (One of two identical channels)



SN55107 • SN75107 • SN55108 • SN75108

DUAL LINE RECEIVERS

FAIRCHILD LINEAR INTEGRATED CIRCUITS

DESCRIPTION—The SN55107/75107 and SN55108/75108 are high speed, Two-Channel Line Receivers with common voltage supply and ground terminals. They are designed to detect input signals of 25mV (or greater) amplitude and convert the polarity of the signal into appropriate TTL compatible output logic levels. They feature high input impedance and low input currents which induce very little loading on the transmission line making these devices ideal for use in party line systems. The receiver input common mode voltage range is ±3V but can be increased to ±15V by the use of input attenuators. Separate or common strobes are available. The SN55107/75107 circuit features an active pull-up (totem pole output). The SN55108/75108 circuit features an open collector output configuration that permits wired-OR connections. The receivers are designed to be used with the SN55109/75109 and SN55110/75110 line drivers. The SN55107/75107 and SN55108/75108 line receivers are useful in high speed balanced, unbalanced and party line transmission systems and as data comparators.

- **HIGH SPEED**
- **STANDARD SUPPLY VOLTAGES**
- **DUAL CHANNELS**
- **HIGH COMMON-MODE REJECTION RATIO**
- **HIGH INPUT IMPEDANCE**
- **HIGH INPUT SENSITIVITY**
- **INPUT COMMON-MODE VOLTAGE RANGE OF ±3V**
- **SEPARATE OR COMMON STROBES**
- **TTL OR DTL DRIVE CAPABILITY**
- **WIRED-OR OUTPUT CAPABILITY (SN55108/75108 ONLY)**
- **HIGH DC NOISE MARGINS**

SN55109 • SN75109 • SN55110 • SN75110

DUAL LINE DRIVERS

FAIRCHILD LINEAR INTEGRATED CIRCUITS

DESCRIPTION – The SN55109/75109 and SN55110 are Dual Line Drivers featuring independent channels with common supply voltage and ground terminals. The major difference between the SN55109/75109 and the SN55110/75110 drivers is the output-current specification. The output current is nominally 6 mA for the SN55109/75109 and 12 mA for the SN55110/75110. The driver circuits have a constant output that is switched to either of two output terminals by the appropriate logic levels at the input terminals. The output current can be switched off by appropriate logic levels at the inhibit inputs. The circuit also features an inhibit input that is common to both drivers, providing more circuit versatility. The common-mode voltage range of the driver outputs is –3 V to +10 V, which allows a common-mode voltage on the line without affecting the driver performance. For application information see SN55107 • SN75107 • SN55108 • SN75108 Data Sheet.

- **HIGH SPEED**
- **STANDARD SUPPLY VOLTAGES**
- **DUAL CHANNELS**

SN75450

DUAL PERIPHERAL DRIVER

FAIRCHILD LINEAR INTEGRATED CIRCUITS

GENERAL DESCRIPTION — The SN75450 is a versatile general purpose dual interface driver circuit that employs TTL or DTL logic. The SN75450 features two standard series 74 TTL gates and two uncommitted, high current, high voltage transistors offering the system designer the flexibility to tailor the circuit to his application. The SN75450 is useful in high speed logic buffers, power drivers, lamp drivers, relay drivers, line drivers, MOS drivers, clock drivers and memory drivers.

TTL/MSI 9300
4-BIT UNIVERSAL SHIFT REGISTER

DESCRIPTION — The 9300 is a TTL/MSI 4-Bit Universal Shift Register. As a high speed multifunctional sequential logic block, it is useful in a wide variety of register and counter applications. It may be used in serial-serial, shift left, shift right, serial-parallel, parallel-serial, and parallel-parallel data register transfers. This new 9300 replaces the earlier 9300 device in all applications. All requirements of the original 9300 specification are satisified with the minimum shift rate of 15 MHz being improved to 30 MHz.

- **38 MHz TYPICAL SHIFT FREQUENCY**

FUNCTIONAL DESCRIPTION — The logic diagram indicates the functional characteristics of the 9300 4-bit shift register. Several special logic features of the 9300 design which increase the range of useful application are:

1. A J$\overline{K}$ input is provided to the first flip-flop in the register. This type of input is the same as the more common JK input except that the LOW voltage level activates the $\overline{K}$ input. This provides the greater power of the JK type input for most general applications. At the same time the simple D type input most appropriate for a shift register can be easily obtained by tying the two inputs together.
2. There is no restriction on the activity of the J or $\overline{K}$ inputs for logic operation—except for the set up and release time requirements.
3. Parallel inputs for all four stages are provided. These will determine the next condition of the shift register synchronous with the clock input, whenever the parallel enable input is LOW. With the parallel enable input LOW, the element appears as four common clocked D flip-flops. When the parallel enable is HIGH, or not connected, the shift register performs a one bit shift for each clock input. In both cases the next state of the flip-flops occurs after the LOW to HIGH transition of the clock input.
4. An internal clock buffer provides both reduced clock input loading, and the ability to gate the clock with only a single NAND gate.
5. The active HIGH output is provided for all four stages and an active LOW output is provided for the last stage.
6. A master asynchronous reset input allows the setting to zero of all stages independent of any other input condition.

NOTES:
1. The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
2. Conditions for testing, not shown in the table, are chosen to guarantee operation under "worst case" conditions.
3. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
4. Typical limits are at V_{CC} = 5.0 V, 25°C, and maximum loading.
5. Not more than one output should be shorted at a time.

SWITCHING CHARACTERISTICS (T_A = 25°C)

SYMBOL	PARAMETER	LIMITS			UNITS	CONDITIONS	
		MIN.	TYP.	MAX.

t_{pw} ($\overline{MR}$)	Master Reset Pulse Width	25	13		ns	See Fig. 2.	
t_{rec} ($\overline{MR}$)	Recovery Time Master Reset to Clock	25	12		ns		

DEFINITION OF TERMS

SET-UP TIME (t_s) is defined as the minimum time required for the correct logic level to be present at the logic input prior to the clock transition from LOW to HIGH in order to be recognized and transferred to the outputs.

HOLD TIME (t_h) is defined as the minimum time following the clock transition from LOW to HIGH that the logic level must be maintained at the input in order to insure continued recognition. A negative HOLD TIME indicates that the correct logic level may be released prior to the clock transition from LOW to HIGH and still be recognized.

RECOVERY TIME (t_{rec}) is defined as the minimum time required between the end of the Reset pulse and the clock transistion from LOW to HIGH in order to recognize and transfer HIGH Data to the Q outputs.

TTL/MSI 93H00

HIGH SPEED UNIVERSAL 4-BIT SHIFT REGISTER

DESCRIPTION — The 93H00 is a TTL/MSI 4-Bit Universal Shift Register offering a typical shift frequency to 55 MHz and guaranteed minimum value of 45 MHz. These features make the 93H00 useful in a wide range of high speed register and counter applications. These include serial-serial, shift left, shift right, serial-parallel, parallel-serial and parallel-parallel data registers.

The 93H00 is pin compatible with the 9300 and 93L00 shift registers. Major electrical differences are the speed of operation and resulting power dissipation.

- **55 MHz TYPICAL SHIFT FREQUENCY**
- **ASYNCHRONOUS COMMON RESET**
- **J, $\overline{K}$ INPUTS TO FIRST STAGE**
- **SYNCHRONOUS PARALLEL ENTRY**
- **TYPICAL POWER DISSIPATION OF 350 mW**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**
- **PIN FOR PIN COMPATIBLE WITH 9300A AND 93L00 DEVICES**

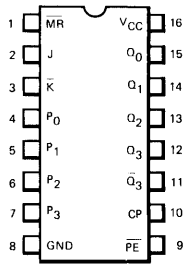
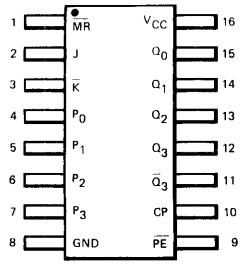
CONNECTION DIAGRAMS

DIP (TOP VIEW)



FLATPAK (TOP VIEW)



FUNCTIONAL DESCRIPTION — The logic diagram indicates the functional characteristics of the 93H00 4-bit shift register. Special logic features of the 93H00 design which increase the range of application are described below:

1. A J$\overline{K}$ input is provided to the first flip-flop in the register. This type of input is the same as the more common JK input except that the LOW voltage level activates the $\overline{K}$ input. This provides the greater power of the JK type input for most general applications. At the same time the simple D type input most appropriate for a shift register can be easily obtained by tying the two inputs together.
2. There is no restriction on the activity of the J or $\overline{K}$ inputs for logic operation—except for the set up and release time requirements.
3. Parallel inputs for all four stages are provided. These will determine the next condition of the shift register synchronous with the clock input, whenever the Parallel Enable input is LOW. With the Parallel Enable input LOW, the element appears as four common clocked D flip-flops. When the Parallel Enable is HIGH, or not connected, the shift register performs a one bit shift for each clock input. In both cases the next state of the flip-flops occurs after the LOW to HIGH transition of the clock input.
4. An internal clock buffer provides both reduced clock input loading, and the ability to gate the clock with only a single NAND gate.
5. The active HIGH output is provided for all four stages and an active LOW output is provided for the last stage.
6. A master asynchronous reset input allows the setting to zero of all stages independent of any other input condition.

NOTES:
1. The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
2. Conditions for testing, not shown in the table, are chosen to guarantee operation under "worst case" conditions.
3. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
4. Typical limits are at V_{CC} = 5.0 V, 25°C, and maximum loading.
5. Not more than one output should be shorted at a time.

SWITCHING CHARACTERISTICS (T_A = 25°C)

SYMBOL	PARAMETER	LIMITS			UNITS	TEST CONDITIONS	
		MIN.	TYP.	MAX.			
f_{sr}	Shift Right Frequency	45	55		MHz	Fig. 4	V_{CC} = 5.0 V, C_L = 15 pF
t_{PLH}	Turn Off Delay from Clock to Output		10	16	ns		
t_{PHL}	Turn on Delay from Clock to Output		14.5	21	ns		
t_{PHL} ($\overline{MR}$)	Turn on Delay from $\overline{MR}$ to Output (Except $\overline{Q}_3$)		21	28	ns	Fig. 5	

SWITCHING SET-UP REQUIREMENTS (T_A = 25°C)

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNITS	TEST CONDITIONS	
t_{pw} (CP)	Clock Pulse Width	12	9.0		ns	Fig. 4	V_{CC} = 5.0 V
t_s (Data)	Set-Up Time Data to Clock	12	6.0		ns	Fig. 6	
t_h (Data)	Hold Time Data to Clock	0	−5.0		ns		
t_s ($\overline{PE}$)	Set-Up Time $\overline{PE}$ to Clock	15	8.0		ns	Fig. 7	
t_h ($\overline{PE}$)	Hold Time $\overline{PE}$ to Clock	0	−7.0		ns		
t_{pw} ($\overline{MR}$)	Master Reset Pulse Width	19	11		ns	Fig. 5	
t_{rec} ($\overline{MR}$)	Recovery Time Master Reset to Clock	7.0	3.0		ns		

SET-UP TIME (t_s) is defined as the minimum time required for the correct logic level to be present at the logic input prior to the clock transition from LOW to HIGH in order to be recognized and transferred to the outputs.

HOLD TIME (t_h) is defined as the minimum time following the clock transition from LOW to HIGH that the logic level must be maintained at the input in order to insure continued recognition. A negative HOLD TIME indicates that the correct logic level may be released prior to the clock transition from LOW to HIGH and still be recognized.

RECOVERY TIME (t_{rec}) is defined as the minimum time required between the end of the reset pulse and the clock transition from LOW to HIGH in order to recognize and transfer HIGH data to the Q outputs.

LPTTL/MSI 93L00
LOW POWER 4-BIT SHIFT REGISTER

DESCRIPTION — The LPTTL/MSI 93L00 4-Bit Shift Register is a medium speed multi-functional sequential logic block, useful in a wide variety of register and counter applications. As a register it may be used in serial-serial, shift left, shift right, serial-parallel, parallel-serial, and parallel-parallel data transfers. The circuit uses TTL technology for high speed and high fanout capability, and is compatible with the Fairchild TTL family.

- 15 MHz TYPICAL SHIFT FREQUENCY
- ASYNCHRONOUS COMMON RESET
- J, $\overline{K}$ INPUTS TO FIRST STAGE
- SYNCHRONOUS PARALLEL ENTRY
- TYPICAL POWER DISSIPATION OF 75 mW
- INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS
- ALL CERAMIC "HERMETIC" 16-LEAD DUAL IN-LINE AND FLAT PACKAGES
- TTL COMPATIBLE

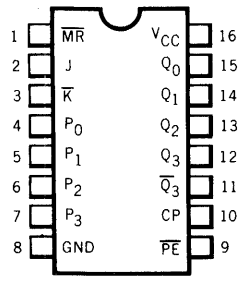
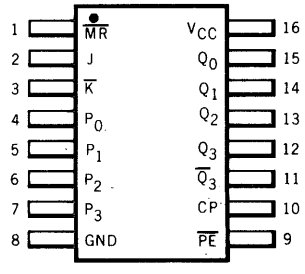
CONNECTION DIAGRAMS
DIP (TOP VIEW)



FLATPAK (TOP VIEW)



FUNCTIONAL DESCRIPTION — The logic diagram indicates the functional characteristics of the 93L00 4-bit shift register. Special logic features of the 93L00 design increase the versatility of this shift register.

1. A J$\overline{K}$ input is provided to the first flip-flop in the register. This type of input is the same as the more common JK input except that the LOW voltage level activates the $\overline{K}$ input. This provides the greater power of the JK type input for most general applications. At the same time the simple D type input most appropriate for a shift register can be easily obtained by tying the two inputs together.
2. There is no restriction on the activity of the J or $\overline{K}$ inputs for logic operation—except for the set up and release time requirements.
3. Parallel inputs for all four stages are provided. These will determine the next condition of the shift register synchronous with the clock input, whenever the parallel enable input is LOW. With the parallel enable input LOW, the element appears as four common clocked D flip-flops. When the parallel enable is HIGH, or not connected, the shift register performs a one bit shift for each clock input. In both cases the next state of the flip-flops occurs after the LOW to HIGH transition of the clock input.
4. An internal clock buffer provides both reduced clock input loading, and the ability to gate the clock with only a single NAND gate.
5. The active HIGH output is provided for all four stages and an active LOW output is provided for the last stage.
6. An asynchronous master reset input allows the setting to zero of all stages independent of any other input condition.

SWITCHING CHARACTERISTICS (T_A = 25°C)

SYMBOL	PARAMETER	LIMITS			UNITS	CONDITIONS
		MIN	TYP	MAX		
f_{sr}	Shift Right Frequency	10	17		MHz	V_{CC} = 5.0 V, C_L = 15 pF (See Fig. 1c)
t_{PLH}	Turn Off Delay		23	35	ns	V_{CC} = 5.0 V, C_L = 15 pF (See Fig. 1a)
t_{PHL}	Turn On Delay		34	51	ns	
t_{PHL} ($\overline{MR}$)	Reset Time for $\overline{MR}$		55	83	ns	

SWITCHING SET-UP REQUIREMENTS (T_A = 25°C)

SYMBOL	PARAMETER	LIMITS			UNITS	CONDITIONS	
		MIN	TYP	MAX			
$t_{pw}CP$	Clock Pulse Width	38	25		ns	Fig. 1c	V_{CC} = 5.0 V, C_L = 15 pF
t_s	Set-up Time	60	35		ns	Fig. 1a	
t_h	Hold Time	0	-22		ns		
t_s ($\overline{PE}$)	Set-up Time for $\overline{PE}$	68	45		ns	Fig. 1b	
t_h ($\overline{PE}$)	Hold Time for $\overline{PE}$	-20	-39		ns		
t_{rec} ($\overline{MR}$)	Recovery Time for $\overline{MR}$	70	45		ns	Fig. 1a	
$t_{pw}\overline{MR}$	Min Reset Pulse Width	53	35		ns		

SET-UP TIME: t_s is defined as the minimum time required for the logic level to be present at the logic input prior to the clock transition from LOW to HIGH in order for the flip-flop(s) to respond.

HOLD TIME (t_h) is defined as the minimum time following the clock transition from LOW to HIGH that the logic level must be maintained at the input in order to insure continued recognition. A negative HOLD TIME indicates that the correct logic level may be released prior to the clock transition from LOW to HIGH and still be recognized.

RECOVERY TIME FOR MR: $t_{rec}(\overline{MR})$ is defined as the minimum time required between the end of the reset pulse and the clock transition from LOW to HIGH in order for the flip-flop(s) to respond to the clock.

TTL/MSI 9301
ONE-OF-TEN DECODER

DESCRIPTION — The 9301 is a Multipurpose Decoder designed to accept four inputs and provide 10 mutually exclusive outputs. The circuit uses TTL for high speed and high fan out capability, and is compatible with all members of the Fairchild TTL family.

- **MULTI-FUNCTION CAPABILITY**
- **MUTUALLY EXCLUSIVE OUTPUTS**
- **GUARANTEED FANOUT OF 10 TTL LOADS OVER THE FULL TEMPERATURE RANGE AND SUPPLY VOLTAGE RANGES**
- **HIGH CAPACITIVE DRIVE CAPABILITY**
- **DEMULTIPLEXING CAPABILITY**
- **TYPICAL POWER DISSIPATION OF 145 mW**
- **THE INPUT/OUTPUT CHARACTERISTICS PROVIDE EASY INTERFACING WITH FAIRCHILD DTL, LPDTL AND TTL FAMILIES**
- **ALL CERAMIC "HERMETIC" 16 LEAD DUAL IN-LINE PACKAGE**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED LINE TERMINATION EFFECTS**

8

FUNCTIONAL DESCRIPTION – The 9301 decoder accepts four active HIGH BCD inputs and provides ten mutually exclusive active LOW outputs, as shown by the logic symbol. The active LOW outputs facilitate addressing other MSI units with active LOW enables.

The logic design of the 9301 ensures that all outputs are HIGH when binary codes greater than nine are applied to the inputs.

The most significant A_3 input produces a useful inhibit function when the 9301 is used as a 1 of 8 decoder.

LPTTL/MSI 93L01

LOW POWER ONE-OF-TEN DECODER

DESCRIPTION – The LPTTL/MSI 93L01 is a Multipurpose Decoder designed to accept four inputs and provide 10 mutually exclusive outputs. The circuit uses TTL technology and is compatible with the Fairchild TTL family.

- **MULTI-FUNCTION CAPABILITY**
- **MUTUALLY EXCLUSIVE OUTPUTS**
- **DEMULTIPLEXING CAPABILITY**
- **TYPICAL PROPAGATION DELAY OF 63 ns**
- **TYPICAL POWER DISSIPATION OF 45 mW**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**
- **ALL CERAMIC "HERMETIC" 16-LEAD DUAL IN-LINE AND FLAT PACKAGES**
- **TTL COMPATIBLE**

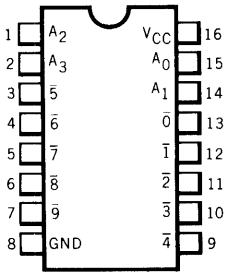
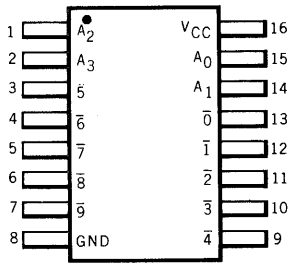
CONNECTION DIAGRAMS
DIP (TOP VIEW)



FLATPAK (TOP VIEW)



FUNCTIONAL DESCRIPTION – The 93L01 decoder accepts four active HIGH BCD inputs and provides ten mutually exclusive active LOW outputs, as shown by logic symbol or diagram. The active LOW outputs facilitate addressing other MSI units with active LOW input enables.

The logic design of the 93L01 ensures that all outputs are HIGH when binary codes greater than nine are applied to the inputs.

The most significant input A_3 produces a useful inhibit function when the 93L01 is used as a 1-of-8 decoder.

TTL/MSI 9302
ONE-OF-TEN DECODER WITH OPEN COLLECTOR OUTPUT

DESCRIPTION – The 9302 is a multipurpose Decoder designed to accept four inputs and provide 10 mutually exclusive outputs. The open collector outputs provide wired-OR capability which can be used for numerous summing, decoding and demultiplexing operations. The circuit uses TTL for high speed and high fan out capability, and is compatible with all members of the Fairchild TTL family.

- **OUTPUTS HAVE WIRED-OR CAPABILITY**
- **PROVIDES CAPABILITY TO GENERATE AND SUM MINTERMS OF 3 OR 4 VARIABLES**
- **ACTIVE LOW OUTPUTS ARE USEFUL FOR DRIVING LOW VOLTAGE LAMPS AND RELAYS**
- **MULTI-FUNCTION CAPABILITY**
- **MUTUALLY EXCLUSIVE OUTPUTS**
- **DEMULTIPLEXING CAPABILITY**
- **TYPICAL POWER DISSIPATION OF 145 mW**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED LINE TERMINATION EFFECTS**

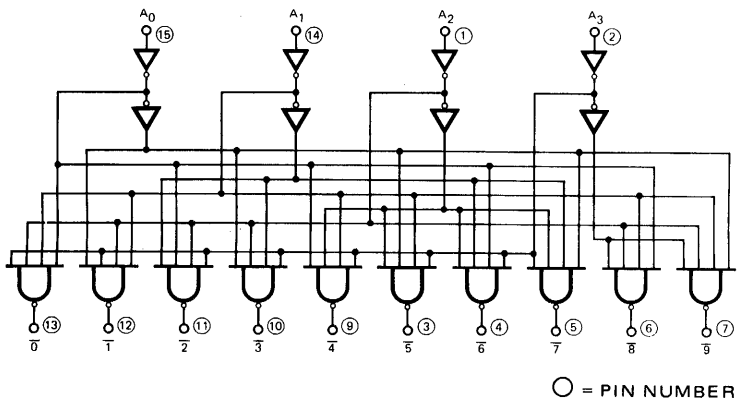
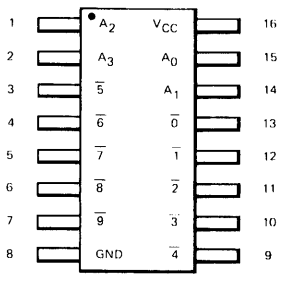
$\overline{0}$ to $\overline{9}$	Outputs, Active LOW (Note b)	10 U.L.

NOTES:
a. Unit Load (U.L.) = 40μA HIGH/1.6mA LOW
b. An external pull-up resistor is needed to provide HIGH level drive capability. The outputs will sink a maximum of 16mA at V_{OUT} = 0.4 V.

LOGIC DIAGRAM



FLATPAK (TOP VIEW)



8

FUNCTIONAL DESCRIPTION – The 9302 decoder accepts four active HIGH BCD inputs and provides ten mutually exclusive active LOW outputs, as shown by the logic symbol. The open collector outputs provide easy summing of input terms. The 9302 provides the capability in one package to generate and sum any or all of the minterms of three variables, or the first 10-of-16 minterms of four variables.

The logic design of the 9302 ensures that all outputs are HIGH when binary codes greater than nine are applied to the inputs.

The most significant input (A_3) produces a useful inhibit function when the 9302 is used as a 1-of-8 decoder.

TTL/MSI 9304
DUAL FULL ADDER

DESCRIPTION — The 9304 consists of two independent, high speed, binary Full Adders. The adders are useful in a wide variety of applications including multiple bit parallel add/serial carry addition, parity generation and checking, code conversion and majority gating. The circuit uses TTL for high speed, high fanout operation and is compatible with all members of the Fairchild TTL family.

- **MULTI-FUNCTION CAPABILITY**
- **8ns CARRY PROPAGATION DELAY**
- **COMPLEMENTARY INPUTS AND OUTPUTS AVAILABLE**
- **TYPICAL POWER DISSIPATION OF 150 mW**
- **THE INPUT/OUTPUT CHARACTERISTICS PROVIDE EASY INTERFACING WITH FAIRCHILD DTL, LPDTL AND TTL FAMILIES**
- **ALL CERAMIC "HERMETIC" 16-LEAD DUAL IN-LINE PACKAGE**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**

PIN NAMES		LOADING (Note a)
FULL ADDER 1

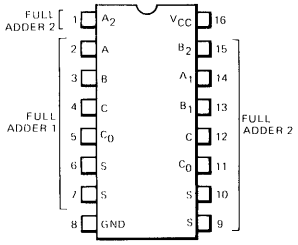
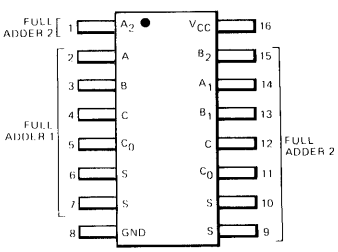
CONNECTION DIAGRAMS
DIP (TOP VIEW)



FLATPAK (TOP VIEW)



FUNCTIONAL DESCRIPTION – The Fairchild 9304 logic block consists of two separate high speed carry dependent sum full adders. This design allows a minimum carry propagation time when the adders are used in ripple carry applications. The adders are identical except that adder 2 has provision for either active HIGH or active LOW inputs at the A and B terminals. The adders produce a LOW carry and both LOW and HIGH sum with active HIGH inputs, a HIGH carry and both HIGH and LOW sum when active LOW inputs are used. This principle of duality is shown below, where the adders are drawn as functional blocks.

TTL/MSI 9305
VARIABLE MODULO COUNTER

DESCRIPTION – The TTL/MSI 9305 is a monolithic, high speed, Variable Modulo Counter circuit, constructed with the Fairchild Planar* epitaxial process. It is a semisynchronous counter which can be programmed without extra logic to provide division or counting by either 2 and 4, 5, 6, 7, 8, or 10, 12, 14, 16. A binary count sequence can be obtained for all of the preceding counter modulos as well as 50% duty cycle output for dividers of 8, 10, 12, 14, 16. The device also features asynchronous overriding master reset and set inputs and the negation output of the final flip-flop output which allows the cascading of stages. The circuit uses TTL for high speed, high fanout operation and is compatible with all other members of the TTL family of digital integrated circuits.

FUNCTIONAL DESCRIPTION – The MSI 9305 consists of four master-slave flip-flops which are separated into two functional units – a single toggle stage and a three stage synchronous counter. All four flip-flops change state on the LOW to HIGH transition of the clock. The three stage counter can be programmed with external connections as shown in the table below to provide modulo of either 5, 6, 7 or 8. This basic configuration allows synchronous binary counting by the last three stages and independent modulo 2 operation with the first single stage.

A four stage binary counter with a modulo of 10, 12, 14 or 16 is obtained by applying the incoming clock to the single toggle stage and feeding its negation output to the clock input of the three stage counter. A 4-stage divider with 50% duty cycle output is produced by feeding the incoming clock to the three stage counter and clocking the single stage with the $\overline{Q}_3$ output. In either the binary or 50% division mode the modulo (10, 12, 14, 16) is determined by the external programming connections for the three stage counter. These 4-stage counters or dividers are not fully synchronous (semisynchronous) but have only one flip-flop ripple delay in either configuration. Counter modulos other than 10, 12, 14, 16 can be formed with a few extra gates.

Several 9305 variable modulo counters programmed in any modulo can be connected together without extra logic to form asynchronous (ripple) type multistage counters. This is done by connecting the $\overline{Q}_3$ output of the less significant counter to the clock input of the following counter.

The Master Set and Reset will asynchronously set or reset all four stages when activated. The active LOW Reset input when LOW will clear the counter, overriding the clock and forcing the outputs (Q_{0-3}) LOW and outputs $\overline{Q}_0$, $\overline{Q}_3$ HIGH. The active LOW Set input when LOW will preset the counter, overriding the clock and forcing the outputs Q_{0-3} HIGH and outputs $\overline{Q}_0$, $\overline{Q}_3$ LOW. The master set provides a synchronous clear, since the first clock pulse following the asynchronous master set will reset all stages. This action is independent of the modulo programmed.

COUNTING MODE

The following are rules specifying the external connections required for various counter and divider modulos.

ASYNCHRONOUS MODE

$\overline{MS}$	$\overline{MR}$	Q_0	$\overline{Q}_0$	Q_1	Q_2	Q_3	$\overline{Q}_3$
L	H	H	L	H	H	H	L
H	L	L	H	L	L	L	H
H	H	COUNT*					

*As determined by programming connections.

PROGRAMMING CONNECTIONS FOR LAST THREE STAGES

S_0	S_1	MODULO
NC	NC	5
Q_1	NC	6
NC	Q_1	6
Q_2	NC	7
NC	Q_2	7
Q_1	Q_2	8
Q_2	Q_1	8

NC = Not Connected

ALTERNATE** PROGRAMMING CONNECTIONS FOR LAST THREE STAGES

S_0	S_1	MODULO
Q_3	Q_3	5
Q_1	Q_1	6
Q_2	Q_2	7
Q_1	Q_2	8
Q_2	Q_1	8

**The alternate programming connections program the counter and conveniently terminate unused select inputs (NC). Since these inputs form the inputs to a single NAND gate (see logic diagram), their connection to the counter outputs for the various count modulos provides the following output drive:

MODULO	OUTPUT	AVAILABLE OUTPUT FANOUT
5	Q_3	14/8
6	Q_1	14/7
7	Q_2	14/7
8	Q_1	15/7
8	Q_2	15/7

CONNECTIONS FOR MODULO 10, 12, 14, 16 BINARY COUNTERS AND 50% DUTY CYCLE DIVIDERS

For Binary Counting $\overline{Q}_0$ connected to CP_1 Incoming clock to CP_0
For 50% Duty Cycle Output $\overline{Q}_3$ connected to CP_0 Incoming Clock to CP_1

I_{CC}	Power Supply Current		42	66	mA	V_{CC} = MAX.

NOTES:
(1) The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
(2) Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
(3) The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
(4) Typical limits are at V_{CC} = 5.0 V, 25°C, and maximum loading.
(5) Not more than one output should be shorted at a time.

t_s is the time required that S_0 must go HIGH before CP_1 clock goes HIGH, such that the circuit recognizes the S_0 as being HIGH. The graph above indicates that times greater than t_s will result in Modulo 5 operation; and that values less than t_s will result in Modulo 6 operation. The shaded area indicates when the input is permitted to change for predictable output performance.

t_{rec} is the time that the $\overline{MR}$ (or $\overline{MS}$) must go HIGH before the clock (CP_1) goes HIGH such that the circuit recognizes the clock (CP_1) pulse.

TTL/MSI 93S05
VARIABLE MODULO COUNTER

DESCRIPTION – The TTL/MSI 93S05 is a monolithic, high speed, Variable Modulo Counter circuit, constructed with the TTL Schottky Barrier Diode process. It is a semisynchronous counter which can be programmed without extra logic to provide division or counting by either 2 and 4, 5, 6, 7, 8, or 10, 12, 14, 16. A binary count sequence can be obtained for all of the preceding counter modulos as well as 50% duty cycle output for dividers of 8, 10, 12, 14, 16. The device also features asynchronous overriding master reset and set inputs and the negation output of the final flip-flop output which allows the cascading of stages. The circuit uses Schottky TTL for super high speed, high fanout operation and is compatible with all other members of the TTL family of digital integrated circuits.

TTL/MSI 9307
SEVEN SEGMENT DECODER

DESCRIPTION — The 9307 is a Seven Segment Decoder designed to accept four inputs in 8421 BCD code and provide the appropriate outputs to drive a seven segment numerical display. The decoder can be used with seven segment incandescent lamp, neon, electro-luminescent, or CRT numeric displays. The 9307 is compatible with all other Fairchild TTL devices.

- **TTL COMPATIBLE**
- **AUTOMATIC RIPPLE BLANKING FOR SUPPRESSION OF LEADING EDGE ZEROES**
- **LAMP INTENSITY MODULATION CAPABILITY**
- **LAMP TEST FACILITY**
- **BLANKING INPUT**
- **ACTIVE HIGH OUTPUTS**
- **ALL CERAMIC "HERMETIC" 16-LEAD DUAL IN-LINE PACKAGE**

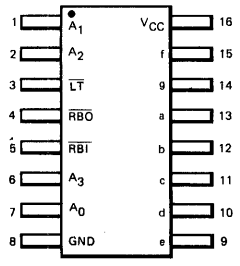
FLATPAK (TOP VIEW)



The 9307 seven segment decoder accepts a 4-bit BCD 8421 code input and produces the appropriate outputs for selection of segments in a seven segment matrix display used for representing the decimal numbers 0–9. The seven outputs (a, b, c, d, e, f, g) of the decoder select the corresponding segments in the matrix shown in Figure 1. The numeric designations chosen to represent the decimal numbers are shown in Figure 3, together with the resulting displays for input code configurations in excess of binary nine.

The decoder has active HIGH outputs so that a buffer transistor may be used directly to provide the high currents required for incandescent displays. If additional base drive current is required external resistors may be added from the supply voltage to the seven segment outputs of the decoders. The value of this resistor is constrained by the 10 mA current sinking capability of the output transistors of the circuit.

The device has provision for automatic blanking of the leading and/or trailing edge zeroes in a multidigit decimal number, resulting in an easily readable decimal display conforming to normal writing practice. In an eight digit mixed integer fraction decimal representation, using the automatic blanking capability, 0060.0300 would be displayed as 60.03 . Leading edge zero suppression is obtained by connecting the Ripple Blanking Output ($\overline{RBO}$) of a decoder to the Ripple Blanking Input ($\overline{RBI}$) of the next lower stage device. The most significant decoder stage should have the $\overline{RBI}$ input grounded; and, since suppression of the least significant integer zero in a number is not usually desired, the $\overline{RBI}$ input of this decoder stage should be left open. A similar procedure for the fractional part of a display will provide automatic suppression of trailing edge zeroes.

The decoder has an active LOW input Lamp Test which overrides all other input combinations and enables a check to be made on possible display malfunctions. The $\overline{RBO}$ terminal of the decoder can be OR-tied with a modulating signal via an isolating buffer to achieve pulse duration intensity modulation. A suitable signal can be generated for this purpose by forming a variable frequency multivibrator with a cross coupled pair of DTL gates.

TTL/MSI 9308
DUAL FOUR-BIT LATCH

DESCRIPTION — The MSI 9308 is a dual 4-Bit Latch designed for general purpose storage applications in high speed digital systems. The 9308 uses TTL technology and is compatible with DTL, TTL, and MSI families. All inputs incorporate diode clamps to ground to reduce negative line transients. All outputs have active pull-up circuitry to provide high capacitive drive and low impedance outputs in both logic states to provide good ac noise immunity.

- ACTIVE LEVEL LOW ENABLE GATE INPUTS
- OVERRIDING MASTER RESET
- 25 ns THROUGH DELAY
- THE INPUT/OUTPUT CHARACTERISTICS PROVIDE DIRECT INTERFACING WITH FAIRCHILD DTL, LPDTL, TTL, AND MSI FAMILIES
- INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS
- HIGH CAPACITIVE DRIVE CAPABILITY
- ALL CERAMIC HERMETIC 24-LEAD DUAL IN-LINE PACKAGE

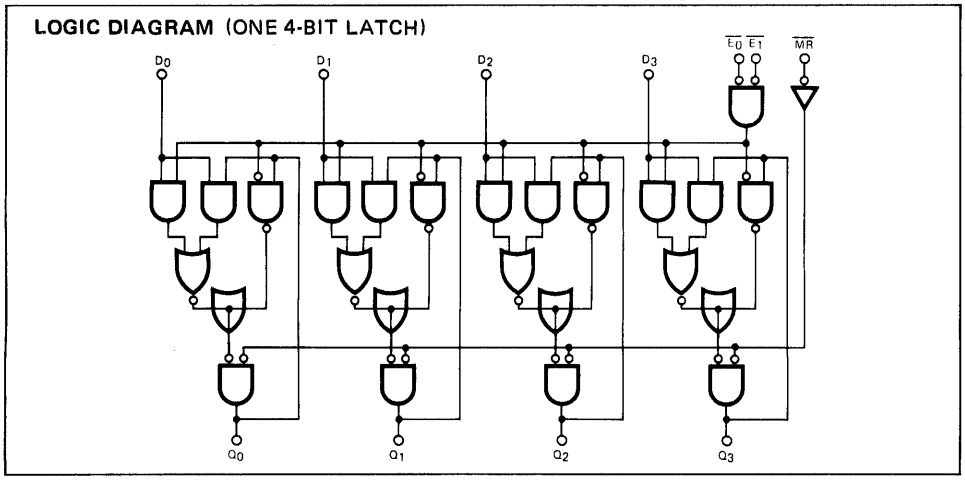
LOGIC DIAGRAM (ONE 4-BIT LATCH)



FUNCTIONAL DESCRIPTION

LATCH OPERATION – Data can be entered into the latch when both of the enable inputs are LOW. As long as this logic condition exists, the output of the latch will follow the input. If either of the enable inputs goes HIGH, the data present in the latch at that time is held in the latch and is no longer affected by data input.

The master reset overrides all other input conditions and forces the outputs of all the latches LOW when a LOW signal is applied to the master reset input.

SWITCHING SET-UP REQUIREMENTS (T_A = 25°C)

SYMBOL	PARAMETER	9308XM(MIL)			9308XC(IND)			UNITS	TEST CONDITIONS	
		MIN.	TYP.	MAX.	MIN.	TYP.	MAX.			
t_s(H)	Set-up Time HIGH Data to Enable	6.0	1.0		10	1.0		ns	Fig. 3	V_{CC} = 5.0 V
t_h(H)	Hold Time HIGH Data to Enable	−4.0	-7.0		−2.0	-7.0		ns		
t_s(L)	Set-up Time LOW Data to Enable	10	7.0		12	7.0		ns		
t_h(L)	Hold Time LOW Data to Enable	4.0	-1.0		8.0	-1.0		ns		
t_{pw} $\overline{E}$	Enable Pulse Width	15			18			ns	Fig. 4	
t_{pw} $\overline{MR}$	Master Reset Pulse Width	15			18			ns	Fig. 5	
t_{rec}	Recovery Time Master Reset to Enable	10			12			ns	Fig. 6	

SET UP TIME: t_s is defined as the time required for the logic level to be present at the Data Input prior to the enable transition from LOW to HIGH in order for the latch to recognize and store the new data.

HOLD TIME: t_h is defined as the minimum time following the Enable transition from LOW to HIGH that the logic level must be maintained at the data input in order to insure continued recognition. A negative Hold Time indicates that the correct logic level may be released prior to the Enable transition from LOW to HIGH and still be recognized.

RECOVERY TIME: t_{rec} is defined as the time that the Enable must remain LOW after the Master Reset transition from LOW to HIGH in order for the latch to recognize and store HIGH data.

SWITCHING CHARACTERISTICS

All delays are measured with V_{CC} = 5.0 V applied to Pin 24 and Pin 12 grounded. Outputs under test are loaded with 15 pF (includes jig and probe). Pins not referenced are not connected.

LPTTL/MSI 93L08
LOW POWER DUAL FOUR-BIT LATCH

DESCRIPTION The LPTTL/MSI 93L08 is a Dual 4-Bit Latch designed for general purpose storage applications in medium speed digital systems. The 93L08 uses TTL technology and is TTL compatible. All inputs incorporate diode clamps to ground to reduce negative line transients. All outputs have active pull-up circuitry to provide high capacitive drive and low impedance outputs in both logic states to provide good ac noise immunity.

- **ACTIVE LEVEL LOW ENABLE GATE INPUTS**
- **OVERRIDING MASTER RESET**
- **TYPICAL PROPAGATION DELAY OF 53 ns**
- **TYPICAL POWER DISSIPATION OF 100 mW**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**
- **ALL CERAMIC "HERMETIC" 24-LEAD DUAL IN-LINE AND FLAT PACKAGES**
- **TTL COMPATIBLE**

TTL/MSI 9309
DUAL FOUR-INPUT MULTIPLEXER

DESCRIPTION — The 9309 is a monolithic, high speed, Dual Four-Input digital Multiplexer circuit, consisting of two multiplexing circuits with common input select logic. Each circuit contains four inputs and fully buffered complementary outputs. In addition to multiplexer operation, the 9309 can generate any two function of three variables. Active pullups in the outputs ensure high drive and high speed performance. Because of its high speed performance and on-chip select decoding, the 9309 may be cascaded to multiple levels so that any number of lines can be multiplexed onto a single output buss. The circuit uses TTL for high speed, high fan out operation and is compatible with all other members of the Fairchild TTL family.

- **MULTIFUNCTION CAPABILITY**
- **25 ns THROUGH DELAY**
- **ON-CHIP SELECT LOGIC DECODING**
- **FULLY BUFFERED COMPLEMENTARY OUTPUTS**
- **THE INPUT/OUTPUT CHARACTERISTICS PROVIDE EASY INTERFACING WITH FAIRCHILD DTL, LPDTL, TTL, AND MSI FAMILIES**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**

PIN NAMES		LOADING (Note a)

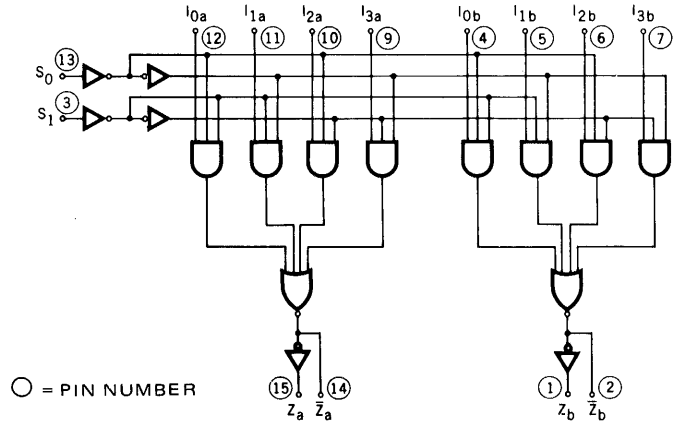
LOGIC DIAGRAM



8

FUNCTIONAL DESCRIPTION – The 9309 dual four-input multiplexer is a member of the Fairchild family of compatible medium scale integrated (MSI) digital building blocks. It provides this family with the ability to select two bits of either data or control from up to four sources, in one package.

The 9309 dual four-input multiplexer is the logical implementation of a two-pole four-position switch, with the position of the switch being set by the logic levels supplied to the two select inputs. Both assertion and negation outputs are provided for both multiplexers. The logic equations for the outputs are shown below:

$Z_a = I_{0a} \cdot \overline{S_1} \cdot \overline{S_0} + I_{1a} \cdot \overline{S_1} \cdot S_0 + I_{2a} \cdot S_1 \cdot \overline{S_0} + I_{3a} \cdot S_1 \cdot S_0$

$Z_b = I_{0b} \cdot \overline{S_1} \cdot \overline{S_0} + I_{1b} \cdot \overline{S_1} \cdot S_0 + I_{2b} \cdot S_1 \cdot \overline{S_0} + I_{3b} \cdot S_1 \cdot S_0$

A common use of the 9309 would be the moving of data from a group of registers to a common output buss. The particular register from which the data came would be determined by the state of the select inputs. A less obvious use is as a function generator. The 9309 can generate any two functions of three variables. This is useful for implementing random gating functions.

LPTTL/MSI 93L09

LOW POWER DUAL FOUR-INPUT MULTIPLEXER

DESCRIPTION – The LPTTL/MSI 93L09 is a Monolithic, Medium Speed, Dual 4-Input Digital Multiplexer. It consists of two multiplexing circuits with common input select logic. Each circuit contains four inputs and fully buffered complementary outputs. In addition to operating as a multiplexer, the 93L09 can generate two functions of three variables. Active pullups in the outputs ensure good drive and speed performance. The 93L09 may be cascaded to multiple levels so that any number of lines can be multiplexed onto a single output buss. The circuit uses TTL technology and is compatible with all other members of the TTL family.

- MULTIFUNCTION CAPABILITY
- ON-CHIP SELECT LOGIC DECODING
- TYPICAL PROPAGATION DELAY OF 48 ns
- TYPICAL POWER DISSIPATION OF 40 mW
- INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS
- ALL CERAMIC "HERMETIC" 16-LEAD DUAL IN-LINE AND FLAT PACKAGES
- TTL COMPATIBLE

FUNCTIONAL DESCRIPTION — The 93L09 dual 4-input multiplexer is a member of the Fairchild family of compatible low power medium scale integrated digital building blocks. It provides this family with the ability to select two bits of either data or control from up to four sources, in one package.

The 93L09 is the logical implementation of two-pole, four-position switch, with the position of the switch being set by the logic levels supplied to the two select inputs. Both assertion and negation outputs are provided for both multiplexers. The logic equations for the outputs are shown below:

$$Z_a = I_{0a} \bullet \overline{S}_1 \bullet \overline{S}_0 + I_{1a} \bullet \overline{S}_1 \bullet S_0 + I_{2a} \bullet S_1 \bullet \overline{S}_0 + I_{3a} \bullet S_1 \bullet S_0$$
$$Z_b = I_{0b} \bullet \overline{S}_1 \bullet \overline{S}_0 + I_{1b} \bullet \overline{S}_1 \bullet S_0 + I_{2b} \bullet S_1 \bullet \overline{S}_0 + I_{3b} \bullet S_1 \bullet S_0$$

The 93L09 is frequently used to move data from a group of registers to a common output buss. The particular register from which the data came would be determined by the state of the select inputs. A less obvious application is as a function generator. The 93L09 can generate two functions of three variables. This is useful for implementing random gating functions.

TTL/MSI 9310•9316
BCD DECADE COUNTER/4-BIT BINARY COUNTER

DESCRIPTION — The 9310 is a High Speed Synchronous BCD Decade Counter and the 9316 is a High Speed Synchronous 4-Bit Binary Counter. They are synchronously presetable, multifunctional MSI building blocks useful in a large number of counting, digital integration and conversion applications. Several stages of synchronous operation are obtainable with no external gating packages required through an internal carry lookahead counting technique.

- SYNCHRONOUS COUNTING AND PARALLEL ENTRY
- DECODED TERMINAL COUNT
- BUILT-IN CARRY CIRCUITRY
- TYPICAL COUNTING FREQUENCY OF 45 MHz
- TYPICAL POWER DISSIPATION OF 325 mW
- THE INPUT/OUTPUT CHARACTERISTICS PROVIDE EASY INTERFACING WITH FAIRCHILD DTL, LPDTL, AND TTL FAMILIES
- INPUT DIODE CLAMPING
- TTL COMPATIBLE

PIN NAMES		LOADING (Note a)
$\overline{PE}$	Parallel Enable (Active LOW) Input	2 U.L.
P_0, P_1, P_2, P_3	Parallel Inputs	2/3 U.L.
CEP	Count Enable Parallel Input	1 U.L.
CET	Count Enable Trickle Input	2 U.L.

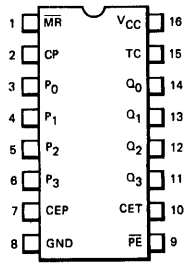
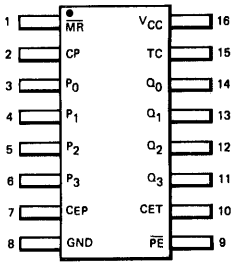
CONNECTION DIAGRAMS
DIP (TOP VIEW)



FLATPAK (TOP VIEW)



FUNCTIONAL DESCRIPTION – The 9310 is a high speed BCD decade counter, and the 9316 is a high speed binary counter. Both counters are fully synchronous with the clock pulse driving four master/slave flip-flops in parallel through a clock buffer. During the LOW to HIGH transition of the clock, the master is inhibited from further change. After the masters are locked out, data is transferred from the master to the slaves and reflected at the outputs. When the clock is HIGH, the masters are inhibited and the master/slave data path remains established. During the HIGH to LOW transition of the clock, the slave is inhibited from further change, followed by the enabling of the masters for the acceptance of data from the counting logic or the parallel entry logic. (See Clock Pulse Characteristics Figure 7)

The three control inputs, Parallel Enable ($\overline{PE}$), Count Enable Parrallel (CEP), and Count Enable Trickle (CET), select the mode of operation as shown in the tables below. When the conditions for counting are satisfied, the rising edge of a clock pulse will change the counters to the next state of the count sequence shown in the State Diagram on the previous page. The Count Mode is enabled when CEP and CET inputs and $\overline{PE}$ are HIGH.

The 9310 and 9316 can be synchronously preset from the four Parallel inputs, (P_{0-3}) when $\overline{PE}$ is LOW. When the Parallel Enable and Clock are LOW, each master of the flip-flops is connected to the appropriate parallel input (P_{0-3}) and the slaves (outputs) are steady in their previous state. When the clock goes HIGH, the masters are inhibited and this information is transferred to the slaves and reflected at the outputs. The parallel enable input overrides both count enable inputs, presetting the counter when LOW.

Terminal count is HIGH when the counter is at terminal count (state 9 for 9310, and state 15 for 9316), and Count Enable Trickle is HIGH, as is shown in the logic equations. Without additional logic, multistage synchronous counting at high speeds is made possible with a high speed lookahead technique utilizing the count enable and terminal count logic. A multistage counter illustrating these techniques is shown and discussed in the application section.

When LOW, the asynchronous master reset overrides all other inputs resetting the four outputs LOW.

Conventional operation of the 9310 • 9316, as shown in the Mode Selection table, requires that the mode control inputs ($\overline{PE}$, CEP, CET) are stable while the clock is LOW. This is no constraint for a normal synchronous system where all signals are generated by the rising edge of the clock.

For some applications, the designer may want to change those inputs while the clock is LOW. In this case the 9310 • 9316 will behave in a predictable manner. For example:

If $\overline{PE}$ goes HIGH while the clock is LOW, but Count Enable is not active during the remaining clock LOW period (i.e. CEP or CET are LOW), the subsequent LOW to HIGH clock transition will change $Q_0 \ldots Q_3$ to the $P_0 \ldots P_3$ data that existed at the set-up time before the rising edge of $\overline{PE}$.

If Count Enable is active (i.e. CEP and CET are HIGH) during some portion of the clock LOW period, but $\overline{PE}$ is HIGH (inactive) during the entire clock LOW period, the subsequent LOW to HIGH clock transition will change $Q_0 \ldots Q_3$ to the next count value.

If $\overline{PE}$ goes HIGH while the clock is LOW, but Count Enable is active (CEP and CET are HIGH) during some portion of the remaining clock LOW period, the 9310 • 9316 will perform a mixture of counting and loading. On the LOW to HIGH clock transition, outputs $Q_0 \ldots Q_3$ will change as the count sequence or the loading requires. Only the outputs that would not change in the count sequence and are also reloaded with their present value stay constant.

f_{count}	Input Count Frequency	30	45		MHz	See Fig. 1	

SWITCHING SET-UP REQUIREMENTS (T_A = 25°C)

SYMBOL	PARAMETER	LIMITS MIN.	LIMITS TYP.	LIMITS MAX.	UNITS	CONDITIONS	
t_{rec}	Recovery Time for $\overline{MR}$	15	11		ns	See Fig. 2	V_{CC} = 5.0 V
$t_{pw}\overline{MR}$	Master Reset Pulse Width	30	23		ns		
$t_{pw}CP$	Clock Pulse Width	17	11		ns	See Fig. 1	
t_s(H) or (L)	Set-up Time Data to Clock	30	20		ns	See Fig. 5	
t_h(H) or (L)	Hold Time Data to Clock	0	−19		ns		
t_s(H)	Set-up Time (HIGH) CE to Clock	22	11		ns	See Fig. 6	
t_h(H)	Hold Time (HIGH) CE to Clock		See Note 6				
t_s(L)	Set-up Time (LOW) CE to Clock		See Note 6				
t_h(L)	Hold Time (LOW) CE to Clock	0	−10		ns		
t_s(H)	Set-up Time (HIGH) $\overline{PE}$ to Clock		See Note 7				
t_h(H)	Hold Time (HIGH) $\overline{PE}$ to Clock	− 7	−19		ns		
t_s(L)	Set-up Time (LOW) $\overline{PE}$ to Clock	30	20		ns		
t_h(L)	Hold Time (LOW) $\overline{PE}$ to Clock		See Note 7				

6. The Set-up Time "t_s(L)" and Hold Time "t_h(H)" between the Count Enable (CEP and CET) and the Clock (CP) indicate that the HIGH to LOW transition of the CEP and CET must occur only while the Clock is HIGH for conventional operation.
7. The Set-Up Time "t_s(H)" and Hold Time "t_h(L)" between the Parallel Enable (PE) and the Clock (CP) indicate that the LOW to HIGH transition of the PE must occur only while the Clock is HIGH for conventional operation.

DEFINITION OF TERMS:

SET-UP TIME (t_s) is defined as the minimum time required for the correct logic level to be present at the logic input prior to the clock transition from LOW to HIGH in order to be recognized and transferred to the outputs.

HOLD TIME (t_h) is defined as the minimum time following the clock transition from LOW to HIGH that the logic level must be maintained at the input in order to insure continued recognition. A negative HOLD TIME indicates that the correct logic level may be released prior to the clock transition from LOW to HIGH and still be recognized.

RECOVERY TIME (t_{rec}) is defined as the minimum time required between the end of the reset pulse and the clock transition from LOW to HIGH in order to recognize and transfer HIGH Data to the Q outputs.

TYPICAL SWITCHING CHARACTERISTICS

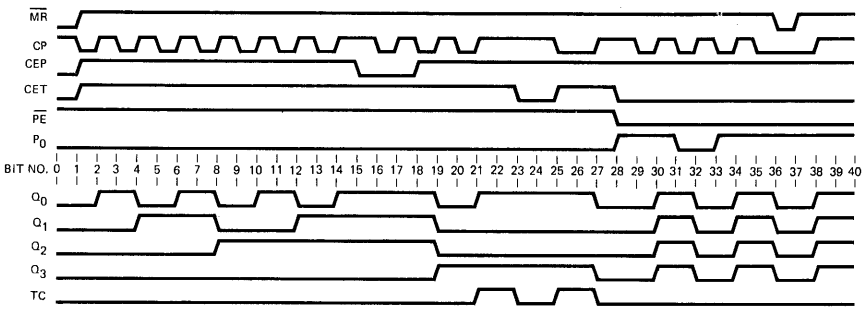
9310 GENERALIZED FUNCTION TEST



MULTISTAGE COUNTING — The 9310 • 9316 counters may be cascaded to provide multistage synchronous counting. Two methods commonly used to cascade these counters are shown in Figures 8 and 9.

In multistage counting, all less significant stages must be at their terminal count before the next more significant counter is enabled. The 9310 • 9316 internally decodes the terminal count condition and "ANDs" it with the CET input to generate the terminal count (TC) output. This arrangement allows one to perform series enabling by connecting the TC output (enable signal) to the CET input of the following stage, Figure 8. The setup requires very few interconnections, but has the following drawback: since it takes time for the enable to ripple through the counter stages, there is a reduction in maximum counting speed. To increase the counting rate, it is necessary to decrease the propagation delay of the TC signal, which is done in the second method.

The scheme illustrated in Figure 9 permits multistage counting up to 11 stages limited by the fan out of the terminal count. For an alternate scheme for more stages see Application Note 184.

The CEP input of the 9310 • 9316 is internally "ANDed" with the CET input and as a result, both must be HIGH for the counter to be enabled. The CET inputs are connected as before except for the second stage. There the CET input is left floating and is therefore HIGH. Also, all CEP inputs are connected to the terminal output of the first stage. The advantage of this method is best seen by assuming all stages except the second and last are in their terminal condition. As the second stage advances to its terminal count, an enable is allowed to trickle down to the last counter stage, but has the full cycle time of the first counter to reach it. Then as the TC of the first stage goes active (HIGH), all CEP inputs are activated, allowing all stages to count on the next clock.

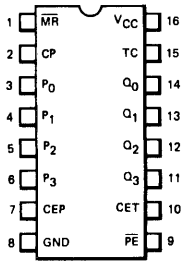
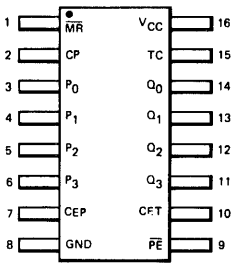
CONNECTION DIAGRAMS
DIP (TOP VIEW)



FLATPAK (TOP VIEW)



FUNCTIONAL DESCRIPTION — The 93L10 is a high speed BCD Decade Counter, and the 93L16 is a high speed Binary Counter. Both counters are fully synchronous with the clock pulse driving four master/slave flip-flops in parallel through a clock buffer. During the LOW to HIGH transition of the clock, the master is inhibited from further change. After the masters are locked out, data is transferred from the master to the slaves and reflected at the outputs. When the clock is HIGH, the masters are inhibited and the master/slave data path remains established. During the HIGH to LOW transition of the clock, the slave is inhibited from further change, followed by the enabling of the masters for the acceptance of data from the counting logic or the parallel entry logic. (See Clock Pulse Characteristics **Figure 7.**)

The three control inputs, Parallel Enable ($\overline{PE}$), Count Enable Parrallel (CEP), and Count Enable Trickle (CET), select the mode of operation as shown in the tables below. When the conditions for counting are satisfied, the rising edge of a clock pulse will change the counters to the next state of the count sequence shown in the State Diagram on the previous page. The Count Mode is enabled when CEP and CET inputs and $\overline{PE}$ are HIGH.

The 93L10 and 93L16 can be synchronously preset from the four Parallel inputs, (P_{0-3}) when $\overline{PE}$ is LOW. When the Parallel Enable and Clock are LOW, each master of the flip-flops is connected to the appropriate parallel input (P_{0-3}) and the slaves (outputs) are steady in their previous state. When the clock goes HIGH, the masters are inhibited and this information is transferred to the slaves and reflected at the outputs. The parallel enable input overrides both count enable inputs, presetting the counter when LOW.

Terminal count is HIGH when the counter is at terminal count (state 9 for 93L10, and state 15 for 93L16), and Count Enable Trickle is HIGH, as is shown in the logic equations. Without additional logic, multistage synchronous counting at high speeds is made possible with a high speed lookahead technique utilizing the count enable and terminal count logic. A multistage counter illustrating these techniques is shown and discussed in the application section.

When LOW, the asynchronous master reset overrides all other inputs resetting the four outputs LOW.

Conventional operation of the 93L10•93L16, as shown in the Mode Selection table, requires that the mode control inputs ($\overline{PE}$, CEP, CET) are stable while the clock is LOW. This is no constraint for a normal synchronous system where all signals are generated by the rising edge of the clock.

For some applications, the designer may want to change those inputs while the clock is LOW. In this case the 93L10•93L16 will behave in a predictable manner. For example:

If $\overline{PE}$ goes HIGH while the clock is LOW, but Count Enable is not active during the remaining clock LOW period (i.e. CEP or CET are LOW), the subsequent LOW to HIGH clock transition will change $Q_0 \ldots Q_3$ to the $P_0 \ldots P_3$ data that existed at the set-up time before the rising edge of $\overline{PE}$.

If Count Enable is active (i.e. CEP and CET are HIGH) during some portion of the clock LOW period, but $\overline{PE}$ is HIGH (inactive) during the entire clock LOW period, the subsequent LOW to HIGH clock transition will change $Q_0 \ldots Q_3$ to the next count value.

If $\overline{PE}$ goes HIGH while the clock is LOW, but Count Enable is active (CEP and CET are HIGH) during some portion of the remaining clock LOW period, the 93L10•93L16 will perform a mixture of counting and loading. On the LOW to HIGH clock transition, outputs $Q_0 \ldots Q_3$ will change as the count sequence or the loading requires. Only the outputs that would not change in the count sequence and are also reloaded with their present value stay constant.

I_{CC}	Power Supply Current		17	27.5	mA	V_{CC} = MAX.

NOTES:
1. The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
2. Conditions for testing, not shown in the table, are chosen to guarantee operation under "worst case" conditions.
3. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
4. Typical limits are at V_{CC} = 5.0 V, 25°C, and maximum loading.
5. Not more than one output should be shorted at a time.

COUNTING APPLICATIONS

For typical counting applications, see Multistage Counter and Synchronous Multistage Counting Scheme in 9310·9316 data sheet in TTL/ MSI section of this catalog.

t_s(H) or (L) t_h(H) or (L)	Set-up Time Data to Clock Hold Time Data to Clock	75 0	50 −20		ns ns	See Fig. 5	
t_s(H)	Set-up Time (HIGH) CE to Clock	26	17		ns	See Fig. 6	V_{CC} = 5.0 V
t_h(H) t_s(L)	Hold Time (HIGH) CE to Clock Set-up Time (LOW) CE to Clock	See Note 6 See Note 6					
t_h(L)	Hold Time (LOW) CE to Clock	0	−17		ns		
t_s(H)	Set-up Time (HIGH) PE to Clock	See Note 7					
t_h(H)	Hold Time (HIGH) PE to Clock	0	−35		ns		
t_s(L)	Set-up Time (LOW) PE to Clock	53	35		ns		
t_h(L)	Hold Time (LOW) PE to Clock	See Note 7					

NOTES:

6. The Set-up Time "t_s(L)" and Hold Time "t_h(H)" between the Count Enable (CEP and CET) and the Clock (CP) indicate that the HIGH to LOW transition of the CEP and CET must occur only while the Clock is HIGH for conventional operation.
7. The Set-up Time "t_s(H)" and Hold Time "t_h(L)" between the Parallel Enable (PE) and the Clock (CP) indicate that the LOW to HIGH transition of the PE must occur only while the clock is HIGH for conventional operation.

DEFINITION OF TERMS:

SET-UP TIME (t_s) is defined as the minimum time required for the correct logic level to be present at the logic input prior to the clock transition from LOW to HIGH in order to be recognized and transferred to the outputs.

HOLD TIME (t_h) is defined as the minimum time following the clock transition from LOW to HIGH that the logic level must be maintained at the input in order to insure continued recognition. A negative HOLD TIME indicates that the correct logic level may be released prior to the clock transition from LOW to HIGH and still be recognized.

RECOVERY TIME (t_{rec}) is defined as the minimum time required between the end of the reset pulse and the clock transition from LOW to HIGH in order to recognize and transfer HIGH Data to the Q outputs.

TTL/MSI 93S10 • 93S16

BCD DECADE COUNTER/4-BIT BINARY COUNTER

TO BE ANNOUNCED

DESCRIPTION — The 93S10 is a super high speed synchronous BCD Decade Counter and the 93S16 is a super high speed synchronous 4-Bit Binary Counter. They are synchronously presetable, multifunctional MSI building blocks useful in a large number of counting, digital integration and conversion applications. Several stages of sunchronous operation are obtainable with no external gating packages required through an internal carry lookahead counting technique. Each device utilizes Schottky TTL processing to achieve the ultra high speeds.

- **TYPICAL COUNTING FREQUENCY OF 100 MHz**
- **SYNCHRONOUS COUNTING AND PARALLEL ENTRY**
- **DECODED TERMINAL COUNT**
- **BUILT-IN CARRY CIRCUITRY**
- **THE INPUT/OUPTUT CHARACTERISTICS PROVIDE EASY INTERFACING WITH FAIRCHILD DTL, LPDTL, AND TTL FAMILIES**
- **INPUT DIODE CLAMPING**

NOTE:
The 93S10 can be preset to any state, but will not count beyond 9. If preset to state 10, 11, 12, 13, 14, or 15, it will return to its normal sequence within two clock pulses.

TTL/MSI 9311
ONE-OF-SIXTEEN DECODER/DEMULTIPLEXER

DESCRIPTION — The 9311 is a TTL/MSI Multi-Purpose Decoder designed to accept four inputs and provide 16 mutually exclusive outputs. The circuit uses TTL for high speed and high fan out capability, and is compatible with all members of the Fairchild TTL family.

- **MUTUALLY EXCLUSIVE OUTPUTS**
- **HIGH CAPACITIVE DRIVE CAPABILITY**
- **DEMULTIPLEXING CAPABILITY**
- **TYPICAL POWER DISSIPATION OF 175 mW**
- **INPUT CLAMP DIODES**
- **2-INPUT ENABLE GATE**
- **TTL COMPATIBLE**

I_{SC} (Note 5)	Output Short Circuit Current	−2.5	−16	−25	mA	V_{CC} = MAX., V_{OUT} = 0.0 V
I_{CC}	Power Supply Current		11.5	16.5	mA	V_{CC} = MAX.

NOTES:
1. The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
2. Conditions for testing, not shown in the table, are chosen to guarantee operation under "worst case" conditions.
3. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
4. Typical limits are at V_{CC} = 5.0 V, 25°C, and maximum loading.
5. Not more than one output should be shorted at a time.

TTL/MSI 9312
EIGHT-INPUT MULTIPLEXER

DESCRIPTION — The 9312 is a monolithic, high speed, Eight-Input digital Multiplexer circuit. It provides in one package the ability to select one bit of data from up to eight sources. The 9312 can be used as a universal function generator to generate any logic function of four variables. Both assertion and negation outputs are provided. TTL circuitry with active pullups on the outputs provides high speed, high fanout operation and is compatible with all other members of the Fairchild TTL family.

- **MULTIFUNCTION CAPABILITY**
- **25 ns THROUGH DELAY**
- **ON-CHIP SELECT LOGIC DECODING**
- **FULLY BUFFERED COMPLEMENTARY OUTPUTS**
- **THE INPUT/OUTPUT CHARACTERISTICS PROVIDE EASY INTERFACING WITH FAIRCHILD DTL, LPDTL, TTL, and MSI FAMILIES**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**

PIN NAMES

		LOADING (Note a)
S_0, S_1, S_2	Select Inputs	1 U.L.
$\overline{E}$	Enable (Active LOW) Input	1 U.L.

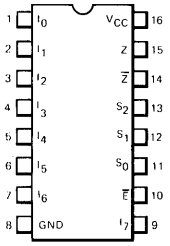
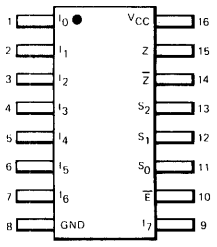
CONNECTION DIAGRAMS
DIP (TOP VIEW)



FLATPAK (TOP VIEW)



FUNCTIONAL DESCRIPTION – The 9312 is a logical implementation of a single pole, eight position switch with the switch position controlled by the state of three Select Inputs, S_0, S_1, S_2. Both assertion and negation outputs are provided. The Enable Input ($\overline{E}$) is active LOW. When it is not activated the negation output is HIGH and the assertion output is LOW, regardless of all other inputs. The logic function provided at the output is:

$$Z = E \cdot (I_0 \cdot \overline{S_0} \cdot \overline{S_1} \cdot \overline{S_2} + I_1 \cdot S_0 \cdot \overline{S_1} \cdot \overline{S_2} + I_2 \cdot \overline{S_0} \cdot S_1 \cdot \overline{S_2} + I_3 \cdot S_0 \cdot S_1 \cdot \overline{S_2} + I_4 \cdot \overline{S_0} \cdot \overline{S_1} \cdot S_2 + I_5 \cdot S_0 \cdot \overline{S_1} \cdot S_2 + I_6 \cdot \overline{S_0} \cdot S_1 \cdot S_2 + I_7 \cdot S_0 \cdot S_1 \cdot S_2).$$

The 9312 provides the ability, in one package, to select from eight sources of data or control information. By proper manipulation of the inputs, the 9312 can provide any logic function of four variables and its negation. Thus any number of random logic elements used to generate unusual truth tables can be replaced by one 9312.

LPTTL/MSI 93L12
LOW POWER EIGHT-INPUT MULTIPLEXER

DESCRIPTION – The LPTTL/MSI 93L12 is a monolithic, medium speed, eight input digital Multiplexer. It provides in one package the ability to select one bit of data from up to eight sources. The 93L12 can be used as a universal function generator to generate any logic function of four variables. Both assertion and negation outputs are provided. TTL circuitry with active pullups on the outputs provides high speed, high fanout operation and is compatible with the Fairchild TTL family.

- **MULTIFUNCTION CAPABILITY**
- **ON-CHIP SELECT LOGIC DECODING**
- **FULLY BUFFERED COMPLEMENTARY OUTPUTS**
- **TYPICAL PROPAGATION DELAY OF 80 ns**
- **TYPICAL POWER DISSIPATION OF 45 mW**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**
- **ALL CERAMIC "HERMETIC" 16-LEAD DUAL IN-LINE AND FLAT PACKAGES**
- **TTL COMPATIBLE**

TTL/MSI 93S12

EIGHT-INPUT MULTIPLEXER

TO BE ANNOUNCED

DESCRIPTION – The 93S12 is a monolithic, super high speed, 8-Input digital Multiplexer circuit utilizing the Schottky TTL process. It provides in one package the ability to select one bit of data from up to eight sources. The 93S12 can be used as a universal function generator to generate any logic function of four variables. Both assertion and negation outputs are provided. TTL circuitry with active pullups on the outputs provides high speed, high fan out operation and is compatible with all other members of the Fairchild TTL family.

- **MULTIFUNCTION CAPABILITY**
- **ON-CHIP SELECT LOGIC DECODING**

TTL/MSI 9313

EIGHT-INPUT MULTIPLEXER WITH OPEN COLLECTOR OUTPUT

DESCRIPTION — The TTL/MSI 9313 is an 8-Input Multiplexer with open collector output. The 9313 has the same pinning and logic configuration as the 9312, but with an open collector $\overline{Z}$ output which allows for easy expansion of input terms. The device can select one bit of data from up to eight sources. It has an active LOW enable, and internal select decoding. The 9313 is fully compatible with all members of the Fairchild TTL family.

- **PIN FOR PIN REPLACEMENT FOR THE SIGNETICS 8231**
- **SAME PINNING AND LOGIC CONFIGURATION AS THE 9312 BUT WITH OPEN COLLECTOR OUTPUT**
- **OPEN COLLECTOR OUTPUT $\overline{Z}$ FOR EASY EXPANSION OF INPUT TERMS (WIRED-OR APPLICATIONS)**
- **MULTIFUNCTION CAPABILITY**
- **ON-CHIP SELECT LOGIC DECODING**
- **FULLY BUFFERED Z OUTPUT**
- **INPUT CLAMP DIODES**
- **TTL COMPATIBLE**

PIN NAMES		LOADING (Note a)
S_0, S_1, S_2	Select Inputs	1 U.L.
$\overline{E}$	Enable (Active LOW) Input	1 U.L.
I_0 to I_7	Multiplexer Inputs	1 U.L.
Z	Multiplexer Output (Note b)	10 U.L.
$\overline{Z}$	Complementary Open Collector Multiplexer Output (Note c)	10 U.L.

NOTES:

a. 1 Unit Load (U.L.) = 40μA HIGH/1.6mA LOW

b. 10 U.L. is the output LOW drive factor and 20 U.L. is the output HIGH drive factor.

c. An external pull-up resistor is needed to provide HIGH level drive capability. This output will sink a maximum of 16 mA at V_{out} = 0.4 V.

FUNCTIONAL DESCRIPTION – The TTL/MSI 9313 is a logical implementation of a single pole, eight-position switch with the switch position controlled by the state of three Select inputs, S_0, S_1, S_2. An open collector output $\overline{Z}$ is provided for easy expansion of input terms. Also a fully buffered Z output is available. The Enable input ($\overline{E}$) is active LOW. When it is not activated the negation output is HIGH and the assertion output is LOW regardless of all other inputs. The logic function provided at the output is:

$Z = E \cdot (I_0 \cdot \overline{S}_0 \cdot \overline{S}_1 \cdot \overline{S}_2 + I_1 \cdot S_0 \cdot \overline{S}_1 \cdot \overline{S}_2 + I_2 \cdot \overline{S}_0 \cdot S_1 \cdot \overline{S}_2 + I_3 \cdot S_0 \cdot S_1 \cdot \overline{S}_2 + I_4 \cdot \overline{S}_0 \cdot \overline{S}_1 \cdot S_2 + I_5 \cdot S_0 \cdot \overline{S}_1 \cdot S_2 + I_6 \cdot \overline{S}_0 \cdot S_1 \cdot S_2 + I_7 \cdot S_0 \cdot S_1 \cdot S_2)$.

The 9313 provides the ability, in one package, to select from eight sources of data or control information. By proper manipulation of the inputs, the 9313 can provide any logic function of four variables and its negation.

NOTES:
(1) The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
(2) Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
(3) The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
(4) Typical limits are at V_{CC} = 5.0 V, 25°C, and max. loading.

WIRED-OR APPLICATIONS

It is possible to perform the "Wired OR" function by connecting the open collector $\overline{Z}$ outputs together and adding an external pull up resistor.

The value of the pull up is determined by considering the fanout of the "OR Tie" and the number of devices in the "OR Tie". The pull up resistor value is chosen from a range between a maximum value (determined such that the required V_{OH} is maintained with all the OR tied outputs off) and a minimum value (determined such that with only one output on in the "OR-Tie", its fanout is not exceeded.

Minimum and Maximum Pull up Values

$$R_X\ (\text{Min.}) = \frac{V_{CC}\ (\text{max.}) - V_{OL}}{I_{OL} - N_2\, I_{IL} - (N_1 - 1)\, I_{IL}}$$

$$R_X\ (\text{Max.}) = \frac{V_{CC}\ (\text{min.}) - V_{OH}}{N_1\, I_{CEX} + N_2\, I_{IH}}$$

Where

N_1 = Number of "Wired OR" Outputs
N_2 = Fanout of "OR Tie"
V_{CC} = Power Supply Voltage
R_X = External Pull-up Resistor
I_{CEX} = Output HIGH Leakage Current on $\overline{Z}$ (150 μA)
I_{IH} = Input HIGH Current (40 μA)
I_{IL} = Input LOW Current (1.6 mA)
V_{OL} = Output LOW Voltage (0.4 V)
V_{OH} = Output HIGH Voltage (2.4 V)
I_{OL} = Maximum Current Sinking Capability of Single Output (16 mA)

Example R_L (Min) and R_L (Max.) for four 9313's OR Tied and driving 1 TTL gate. (Industrial V_{CC} tolerances used)

$$R_X\ (\text{Min.}) = \frac{5.25\ \text{V} - 0.4\ \text{V}}{16\ \text{mA} - 1\ (1.6\ \text{mA}) - (4-1)\ 1.6\ \text{mA}} = \frac{4.85\text{V}}{9.6\ \text{mA}} = 505\ \Omega$$

$$R_X\ (\text{Max.}) = \frac{4.75\ \text{V} - 2.4\ \text{V}}{4\ (150\ \mu\text{A}) + 1\ (40\ \mu\text{A})} = \frac{2.35\text{V}}{640\ \mu\text{A}} = 3.7\ \text{k}\Omega$$

The pull up resistor value (± resistor tolerance) selected should be between these max. and min. values.

Minimum propagation delay results when the minimum value of external pull-up resistor is used in circuit 1. Diodes should be fast recovery 1N4376 or equivalent. External pull-up resistor circuits 2 and 3 give progressively slower propagation delays. (See Figures 9 and 10.)

FUNCTIONAL DESCRIPTION

LATCH OPERATION – The 9314 consists of four latches with a common active LOW enable and active LOW master reset. When the common enable goes HIGH, data present in the latches is stored and the state of a latch is no longer affected by the $\overline{S}$ and D inputs. The master reset when activated overrides all other input conditions forcing all latch outputs LOW.

Each of the four latches can be operated in one of two modes:

D TYPE LATCH – For D type operation the $\overline{S}$ input of a latch is held LOW. While the common enable is active the latch output follows the D input. Information present at the latch output is stored in the latch when the enable goes HIGH.

SET/RESET LATCH – During set/reset operation when the common enable is LOW a latch is reset by a LOW on the D input, and can be set by a LOW on the $\overline{S}$ input if the D input is HIGH. If both $\overline{S}$ and D inputs are LOW, the D input will dominate and the latch will be reset. When the enable goes HIGH, the latch remains in the last state prior to the LOW to HIGH transition.

The two modes of operation of the 9314 latches are shown in the Truth Table below.

8

SWITCHING SET-UP REQUIREMENTS (T_A = 25°C)

SYMBOL	PARAMETER	LIMITS MIN.	LIMITS TYP.	LIMITS MAX.	UNITS	TEST CONDITIONS	
$t_s(H)$	Set-up Time HIGH Data to Enable	5.0	0		ns	Fig. 3	V_{CC} = 5.0 V
$t_h(H)$	Hold Time HIGH Data to Enable	0	−12		ns		
$t_s(l)$	Set-up Time LOW Data to Enable	18	13		ns		
$t_h(L)$	Hold Time LOW Data to Enable	5.0	1.0		ns		
$t_{pw\overline{E}}$	Enable Pulse Width	18	12		ns	Fig. 4	
$t_{pw\overline{MR}}$	Master Reset Pulse Width	18	7.0		ns	Fig. 5	
t_{rec}	Recovery Time Master Reset to Enable	0	−7		ns	Fig. 6	
$t_s(H)$	Set-up Time HIGH Data to Set Input	8.0	0		ns	Fig. 7	
$t_h(L)$	Hold Time LOW Data to Set Input	8.0	0		ns		

SET UP TIME: t_s is defined as the minimum time required for the logic level to be present at the Data Input prior to the enable transition from LOW to HIGH in order for the latch to recognize and store the new data.

HOLD TIME: t_h is defined as the minimum time following the Enable (E) or Set (S) transition from LOW to HIGH that the logic level must be maintained at the input in order to insure continued recognition. A negative Hold Time indicates that the correct logic level may be released prior to the Enable (E) or Set (S) transition from LOW to HIGH and still be recognized.

RECOVERY TIME: t_{rec} is defined as the minimum time that the Enable must remain LOW after the Master Reset transition from LOW to HIGH in order for the latch to recognize and store HIGH data.

SWITCHING CHARACTERISTICS

All delays are measured with V_{CC} = 5.0 V applied to Pin 16 and Pin 8 grounded. Outputs under test are loaded with 15 pF (includes jig and probe). Pins not reference are not connected.

FUNCTIONAL DESCRIPTION

LATCH OPERATION – The 93L14 consists of four latches with a common active LOW enable and active LOW master reset. When the common enable goes HIGH, data present in the latches is stored and the state of a latch is no longer affected by the $\overline{S}$ and D inputs. The master reset when activated overrides all other input conditions forcing all latch outputs LOW.

Each of the four latches can be operated in one of two modes:

D TYPE LATCH – For D type operation the $\overline{S}$ input of a latch is held LOW. While the common enable is active the latch output follows the D input. Information present at the latch output is stored in the latch when the enable goes HIGH.

SET/RESET LATCH – During set/reset operation when the common enable is LOW a latch is reset by a LOW on the D input, and can be set by a LOW on the $\overline{S}$ input if the D input is HIGH. If both $\overline{S}$ and D inputs are LOW, the D input will dominate and the latch will be reset. When the enable goes HIGH, the latch remains in the last state prior to disablement.

The two modes of operation of the 93L14 latches are shown in the Truth Table below.

NOTES:
(1) The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
(2) Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
(3) The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
(4) This current is measured at V_{IN} = 0.0 V to insure that no current is being absorbed by the device internally. The maximum value given guarantees that the maximum instantaneous current that can flow out of the input at V_{IN} = 0.3 V is 0.6 mA.
(5) Typical limits are at V_{CC} = 5.0 V, 25°C, and max. loading.
(6) Not more than one output should be shorted at a time.

SWITCHING CHARACTERISTICS (T_A = 25°C)

SYMBOL	PARAMETER	LIMITS			UNITS	TEST CONDITIONS	
		MIN.	TYP.	MAX.			
t_{PLH}	Turn off Delay Enable to Output		46	80	ns	Fig. 1	V_{CC} = 5.0 V C_L = 15 pF
t_{PHL}	Turn off Delay Enable to Output		51	80	ns		
t_{PLH}	Turn off Delay Data to Output		24	40	ns	Fig. 2	
t_{PHL}	Turn on Delay Data to Output		45	70	ns		
t_{PHL}	Turn on Delay $\overline{MR}$ to Output		28	55	ns	Fig. 5	
t_{PLH}	Turn off Delay Set to Output		35	60	ns	Fig. 7	

SWITCHING SET-UP REQUIREMENTS (T_A = 25°C)

SYMBOL	PARAMETER	LIMITS			UNITS	TEST CONDITIONS	
		MIN.	TYP.	MAX.			
$t_s(H)$	Set-up Time HIGH Data to Enable	15	10		ns	Fig. 3	V_{CC} = 5.0 V
$t_h(H)$	Hold Time HIGH Data to Enable	−10	−20		ns		
$t_s(L)$	Set-up Time LOW Data to Enable	30	20		ns		
$t_h(L)$	Hold Time LOW Data to Enable	0	−10		ns		
$t_{pw}E$	Enable Pulse Width	50	30		ns	Fig. 4	
$t_{pw}MR$	Master Reset Pulse Width	45	25		ns	Fig. 5	
t_{rec}	Recovery Time Master Reset to Enable	−20	−40		ns	Fig. 6	
$t_s(H)$	Set-up Time HIGH Data to Set Input	15	10		ns	Fig. 7	
$t_h(L)$	Hold Time LOW Data to Set Input	0	−4		ns		

SET UP TIME: t_s is defined as the minimum time required for the logic level to be present at the Data Input prior to the enable transition from LOW to HIGH in order for the latch to recognize and store the new data.
HOLD TIME: t_h is defined as the minimum time following the Enable ($\overline{E}$) or Set ($\overline{S}$) transition from LOW to HIGH that the logic level must be maintained at the input in order to insure continued recognition. A negative Hold Time indicates that the correct logic level may be released prior to the Enable ($\overline{E}$) or Set ($\overline{S}$) transition from LOW to HIGH and still be recognized.
RECOVERY TIME: t_{rec} is defined as the minimum time that the Enable must remain LOW after the Master Reset transition from LOW to HIGH in order for the latch to recognize and store HIGH data. A negative Recovery Time indicates that the Enable may go HIGH prior to the Master Reset transition from LOW to HIGH and still retain HIGH data.

TYPICAL SWITCHING CHARACTERISTICS

All delays are measured with V_{CC} = 5.0 V applied to Pin 16 and Pin 8 grounded. Outputs under test are loaded with 15 pF (includes jig and probe). Pins not reference are not connected.

TTL/MSI 9315 (7441)
1-OF-10 DECODER/DRIVER

DESCRIPTION – The TTL/MSI 9315 accepts 1-2-4-8 binary coded decimal inputs and provides ten mutually exclusive outputs to directly control the ionizing potentials of many gas filled cold cathode indicator tubes. The 9315 is similar in operation to the CμL9960, but the 9315 can be driven from any TTL or DTL product.

- **STABLE HIGH VOLTAGE OUTPUT CHARACTERISTICS**
- **DIRECT DISPLAY DRIVE CAPABILITY**
- **BCD ACTIVE LEVEL HIGH INPUTS**
- **BLANKING TEST MODE**
- **–55°C TO +125°C TEMPERATURE CAPABILITY**

ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	–65°C to +150°C
Temperature (Ambient) Under Bias	–55°C to +125°C
V_{CC} Pin Potential to Ground Pin	–0.5 V to +7 V
Input Voltage (dc) (See Note 1)	–1.5 V to +5.5 V
Input Current (dc) (See Note 1)	–10 mA to +1.0 mA
Current into output when output is LOW	10 mA
Current into each output when output is HIGH (See Note 2)	+1.5 mA

Note 1: Either Input Voltage limit or Input Current limit is sufficient to protect the inputs.
2: Total current through all 10 outputs in the HIGH state shall not exceed 2.0 mA.

8

FUNCTIONAL DESCRIPTION – The one-of-ten decoder/driver accepts BCD inputs from all TTL circuits and produces the correct output selection to directly drive gas filled cold cathode indicator tubes. The outputs are selected as shown in the Truth Table. It is capable of driving all known available cold cathode indicator tubes having 7 mA or less cathode current.

Unused input codes 12 and 13 cause all the outputs to remain HIGH, no cathode will be selected. This results in the indicator tube being blanked. Using this feature for blanking may cause a slight glow to appear in the tube.

TTL/MSI 9317B • 9317C
SEVEN SEGMENT DECODER/DRIVER

DESCRIPTION — The 9317 is a TTL/MSI Seven Segment Decoder/Driver designed to accept four inputs in 8421 BCD code and provide the appropriate outputs to drive a seven segment numerical display. The decoder can be used to directly drive seven segment incandescent lamp displays and light emitting diode indicators (or indirectly drive neon, electro-luminescent, numeric displays). The 9317 is compatible with all members of the Fairchild TTL family.

The 9317 is available in two output current and latch voltage versions, the 9317B and C.

- **TTL COMPATIBLE**
- **AUTOMATIC RIPPLE BLANKING FOR SUPPRESSION OF LEADING EDGE ZEROS AND/OR TRAILING EDGE ZEROS**
- **LAMP INTENSITY MODULATION CAPABILITY**
- **LAMP TEST FACILITY**
- **BLANKING INPUT**
- **ACTIVE LOW OUTPUTS**
- **ALL CERAMIC "HERMETIC" 16-LEAD DUAL IN-LINE PACKAGE**
- **DRIVE LAMPS DIRECTLY**
- **CODES IN EXCESS OF BINARY 9 DISABLE OUTPUTS**
- **ENHANCED RELIABILITY WITH UNIQUE NUMERIC ONE DISPLAY POSITION**

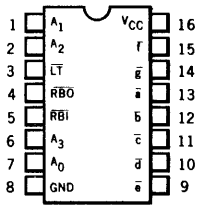
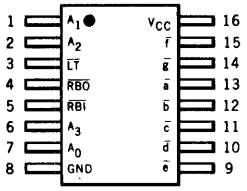
CONNECTION DIAGRAMS
DIP (TOP VIEW)



FLATPAK (TOP VIEW)



FUNCTIONAL DESCRIPTION – The 9317 seven segment decoder/driver accepts a 4-bit BCD 8421 code input and produces the appropriate outputs for selection of segments in a seven segment matrix display used for representing the decimal numbers 0–9. The seven outputs ($\bar{a}$,$\bar{b}$,$\bar{c}$,$\bar{d}$, $\bar{e}$,$\bar{f}$,$\bar{g}$,) of the decoder select the corresponding segments in the matrix shown in Figure 1. The numeric designations chosen to represent the decimal numbers are shown in Figure 3. Code configurations in excess of binary nine disable the outputs.

The decoder has active LOW outputs so that it may be used directly to drive incandescent displays or light emitting diode indicators.

The device has provision for automatic blanking of the leading and/or trailing edge zeros in a multidigit decimal number, resulting in an easily readable decimal display conforming to normal writing practice. In an eight digit mixed interger fraction decimal representation, using the automatic blanking capability, 0060.0300 would be displayed as 60.03. Leading edge zero suppression is obtained by connecting the Ripple Blanking Output ($\overline{RBO}$) of a decoder to the Ripple Blanking Input ($\overline{RBI}$) of the next lower stage device. The most significant decoder stage should have the $\overline{RBI}$ input grounded; and, since suppression of the least significant integer zero in a number is not usually desired, the $\overline{RBI}$ input of this decoder stage should be left open. A similar procedure for the fractional part of a display will provide automatic suppression of trailing edge zeros.

The decoder has an active LOW input Lamp Test which overrides all other input combinations and allows checking on possible display malfunctions. The $\overline{RBO}$ terminal of the decoder can be OR-tied with a modulating signal via an isolating buffer to achieve pulse duration intensity modulation. A suitable signal can be generated for this purpose by forming a variable frequency multivibrator with a cross coupled pair of TTL or DTL gates.

TTL/MSI 9318
EIGHT-INPUT PRIORITY ENCODER

DESCRIPTION – The TTL/MSI 9318 is a Multipurpose Encoder designed to accept eight inputs and produce a binary weighted code of the highest order input. The circuit uses TTL for high speed and high fanout capability, and is compatible with all members of the Fairchild TTL family.

- **MULTI-FUNCTION CAPABILITY**
  - **CODE CONVERSIONS**
  - **MULTI-CHANNEL D/A CONVERTER**
  - **DECIMAL TO BCD CONVERTER**
  - **CASCADING FOR PRIORITY ENCODING OF N BITS**
- **INPUT ENABLE CAPABILITY**
- **PRIORITY ENCODING – AUTOMATIC SELECTION OF HIGHEST PRIORITY INPUT LINE**
- **OUTPUT ENABLE – ACTIVE LOW WHEN ALL INPUTS HIGH**
- **GROUP SIGNAL OUTPUT – ACTIVE WHEN ANY INPUT IS LOW**
- **TYPICAL POWER DISSIPATION OF 250 mW**
- **INPUT/OUTPUT CHARACTERISTICS PROVIDE EASY INTERFACING WITH FAIRCHILD DTL, LPDTL, TTL, AND MSI FAMILIES**
- **ALL CERAMIC HERMETIC 16-LEAD DUAL IN-LINE PACKAGE**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**

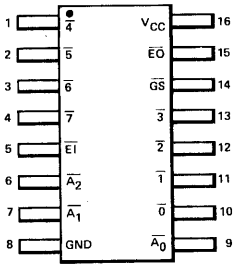
FLATPAK (TOP VIEW)



8

FUNCTIONAL DESCRIPTION – The 9318 8-input priority encoder accepts data from eight active LOW inputs and provides a binary representation on the three active LOW outputs. A priority is assigned to each input so that when two or more inputs are simultaneously active, the input with the highest priority is represented on the output, with input line 7 having the highest priority.

A HIGH on the Input Enable ($\overline{EI}$) will force all outputs to the inactive (HIGH) state and allow new data to settle without producing erroneous information at the outputs.

A Group Signal output ($\overline{GS}$) and an Enable Output ($\overline{EO}$) are provided with the three data outputs. The $\overline{GS}$ is active level LOW when any input is LOW; this indicates when any input is active. The $\overline{EO}$ is active level LOW when all inputs are HIGH. Using the output enable along with the input enable allows priority encoding of N input signals. Both $\overline{EO}$ and $\overline{GS}$ are inactive HIGH when the input enable is HIGH.

NOTES:
1. The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
2. Conditions for testing, not shown in the table, are chosen to guarantee operation under "worst case" conditions.
3. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
4. Typical limits are at V_{CC} = 5.0 V, 25°C, and maximum loading.
5. Not more than one output should be shorted at a time.

TTL/MSI 9321
DUAL ONE-OF-FOUR DECODER

DESCRIPTION — The TTL/MSI 9321 consists of two Independent Multipurpose Decoders, each designed to accept two inputs and provide four mutually exclusive outputs. In addition, an active LOW enable input is provided for each decoder which gives demultiplexing capability. The circuit uses TTL for high speed and high fanout capability, and is compatible with all members of the Fairchild TTL family.

- **MULTI-FUNCTION CAPABILITY**
- **MUTUALLY EXCLUSIVE OUTPUTS**
- **GUARANTEED FANOUT OF 10 TTL LOADS OVER THE FULL TEMPERATURE RANGE AND SUPPLY VOLTAGE RANGES**
- **HIGH CAPACITIVE DRIVE CAPABILITY**
- **DEMULTIPLEXING CAPABILITY**
- **TYPICAL POWER DISSIPATION OF 150 mW**
- **THE INPUT / OUTPUT CHARACTERISTICS PROVIDE EASY INTERFACING WITH FAIRCHILD MSI, DTL, LPDTL AND TTL FAMILIES**
- **ALL CERAMIC "HERMETIC" 16-LEAD DUAL IN-LINE PACKAGE**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED LINE TERMINATION EFFECTS**
- **ACTIVE LOW ENABLE FOR EACH DECODER**

FUNCTIONAL DESCRIPTION – The 9321 consists of two separate decoders each designed to accept two binary weighted inputs and provide four mutually exclusive active LOW outputs as shown in logic symbol. Each decoder can be used as a 4-output demultiplexer by using the enable as a data input.

The active LOW outputs facilitate memory addressing for units such as the 93402 associative memory. The active LOW outputs are also compatible with the active LOW enables of other MSI elements making the 9321 useful in logic selection schemes.

NOTES:
1. The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
2. Conditions for testing, not shown in the table, are chosen to guarantee operation under "worst case" conditions.
3. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
4. Typical limits are at V_{CC} = 5.0 V, 25°C, and maximum loading.
5. Not more than one output should be shorted at a time.

LPTTL/MSI 93L21

LOW POWER DUAL ONE-OF-FOUR DECODER

DESCRIPTION — The LPTTL/MSI 93L21 consists of two independent multipurpose decoders, each designed to accept two inputs and provide four mutually exclusive outputs. In addition an active LOW enable input is provided for each decoder which gives demultiplexing capability. The circuit uses TTL technology and is compatible with the Fairchild TTL family.

- MULTI-FUNCTION CAPABILITY
- MUTUALLY EXCLUSIVE OUTPUTS
- HIGH CAPACITIVE DRIVE CAPABILITY
- DEMULTIPLEXING CAPABILITY
- ACTIVE LOW ENABLE FOR EACH DECODER
- TYPICAL PROPAGATION DELAY OF 50 ns
- TYPICAL POWER DISSIPATION OF 45 mW
- INPUT CLAMP DIODES LIMIT HIGH SPEED LINE TERMINATION EFFECTS
- ALL CERAMIC "HERMETIC" 16-LEAD DUAL IN-LINE AND FLAT PACKAGES
- TTL COMPATIBLE

FUNCTIONAL DESCRIPTION – The 93L21 consists of two separate decoders each designed to accept two binary weighted inputs and provide four mutually exclusive active LOW outputs as shown in logic symbol. Each decoder can be used as a four output demultiplexer by using the enable as a data input.

The active LOW outputs facilitate memory addressing for units such as the 93402 associative memory. The active LOW outputs are also compatible with the active LOW enables of other LPTTL/MSI elements making the 93L21 useful in logic selection schemes.

8

FUNCTIONAL DESCRIPTION — The 9322 quad 2-input multiplexer is a member of the Fairchild family of compatible Medium Scale Integrated (MSI) digital building blocks. It provides this family with the ability to select four bits of either data or control from two sources, in one package. The Enable input ($\overline{E}$) is active LOW. When not activated all outputs (Z) are LOW regardless of all other inputs.

The 9322 quad 2-input multiplexer is the logical implementation of a four-pole, two position switch, with the position of the switch being set by the logic levels supplied to the one select input. The logic equations for the outputs are shown below:

$$Z_a = E \bullet (I_{1a} \bullet S + I_{0a} \bullet \overline{S}) \qquad Z_b = E \bullet (I_{1b} \bullet S + I_{0b} \bullet \overline{S})$$
$$Z_c = E \bullet (I_{1c} \bullet S + I_{0c} \bullet \overline{S}) \qquad Z_d = E \bullet (I_{1d} \bullet S + I_{0d} \bullet \overline{S})$$

A common use of the 9322 is the moving of data from a group of registers to four common output busses. The particular register from which the data comes is determined by the state of the select input. A less obvious use is as a function generator. The 9322 can generate four functions of two variables with one variable common. This is useful for implementing gating functions.

8

FUNCTIONAL DESCRIPTION — The 93L22 quad two-input multiplexer is a member of the Fairchild family of low power medium scale integrated digital building blocks. It provides, in one package, the ability to select four bits of either data or control from four 2-bit sources. The enable input ($\overline{E}$) is active LOW. When not activated all outputs (Z) are LOW regardless of all other inputs. The 93L22 quad two input multiplexer is the logical implementation of a four-pole two position switch, with the position of the switch being set by the logic level supplied to the one select input. The logic equations for the outputs are shown below:

$$Z_a = E \cdot (I_{1a} \cdot S_0 + I_{0a} \cdot \overline{S_0}) \quad Z_b = E \cdot (I_{1b} \cdot S_0 + I_{0b} \cdot \overline{S_0}) \quad Z_c = E \cdot (I_{1c} \cdot S_0 + I_{0c} \cdot \overline{S_0}) \quad Z_d = E \cdot (I_{1d} \cdot S_0 + I_{0d} \cdot \overline{S_0})$$

A common use of the 93L22 is the moving of data from two registers to common output busses. The particular register from which the data came would be determined by the state of the select input. A less obvious use is a function generator. The 93L22 can generate four functions of two variables with one variable common. This is useful implementing gating functions.

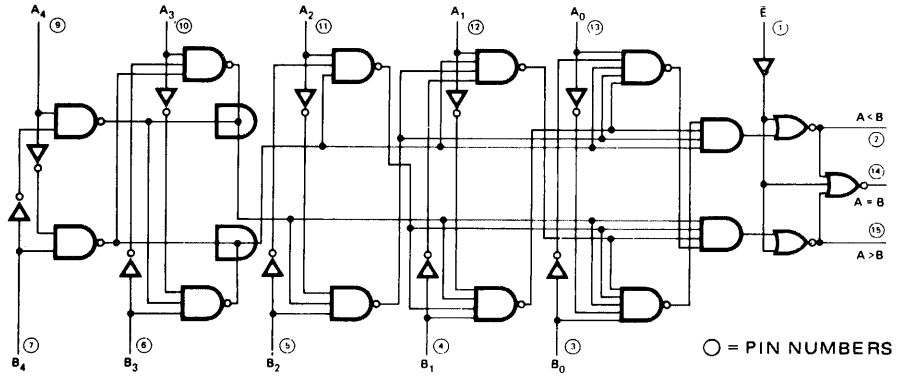
Notes:
a. 1 Unit Load (U.L.) = 40 μA HIGH/1.6 mA LOW
b. 10 U.L. is the output LOW drive factor and 20 U.L. is the output HIGH drive factor

LOGIC DIAGRAM



FUNCTIONAL DESCRIPTION – The 9324 5-bit comparator uses combinational circuitry to directly generate "A greater than B" and "A less than B" outputs. As evident from the logic diagram, these outputs are generated in only three gate delays. The "A equals B" output is generated in one additional gate delay by decoding the "A neither less than nor greater than B" condition with a NOR gate. All three outputs are activated by the active LOW Enable input ($\overline{E}$).

Tying the A > B output from one device into an A input on another device and the A < B output into the corresponding B input permits easy expansion.

The A_4 and B_4 inputs are the most significant inputs and A_0, B_0 the least significant. Thus if A_4 is HIGH and B_4 is LOW, the A > B output will be HIGH regardless of all other inputs except $\overline{E}$.

I_{CC}	Power Supply Current		40	81	mA	V_{CC} = MAX.

NOTES:
1. The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
2. Conditions for testing, not shown in the table, are chosen to guarantee operation under "worst case" conditions.
3. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
4. Typical limits are at V_{CC} = 5.0 V, 25°C, and maximum loading.
5. Not more than one output should be shorted at a time.

LPTTL/MSI 93L24
LOW POWER 5-BIT COMPARATOR

DESCRIPTION — The LPTTL/MSI 93L24 is a Medium Speed Expandable Comparator which provides comparison between two 5-bit words and gives three outputs, "less than", "greater than", and "equal to". A HIGH level on the active LOW enable input forces all three outputs LOW.

- **THREE SEPARATE OUTPUTS . . . A < B, A > B, A = B**
- **EASILY EXPANDABLE**
- **ACTIVE LOW-LEVEL ENABLE INPUT**
- **HIGH DRIVE OUTPUT CIRCUITRY**
- **TYPICAL PROPAGATION DELAY OF 55 ns (A > B)**
- **TYPICAL POWER DISSIPATION OF 52 mW**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**
- **ALL CERAMIC "HERMETIC" 16-LEAD DUAL IN-LINE AND FLAT PACKAGES**
- **TTL COMPATIBLE**

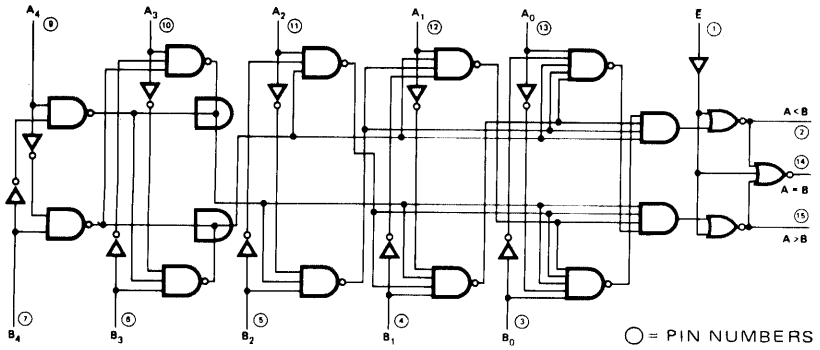
A > B	A Greater than B Output	9 U.L.	2.25 U.L.
A = B	A Equal to B Output	10 U.L.	2.5 U.L.

1 Unit Load (U.L.) = 40μA HIGH/1.6mA LOW.

LOGIC DIAGRAM



FUNCTIONAL DESCRIPTION – The 93L24 5-bit comparator uses combinational circuitry to directly generate "A greater than B" and "A less than B" outputs. As evident from the logic diagram, these outputs are generated in only three gate delays. The "A equals B" output is generated in one additional gate delay by decoding the "A neither less than nor greater than B" condition with a NOR gate. All three outputs are activated by the active LOW enable input ($\bar{E}$).

Tying the A > B output from one device into an A input on another device and the A < B output into the corresponding B input permits easy expansion as shown in Figure 1.

The A_4 and B_4 inputs are the most significant inputs and A_0, B_0 the least significant. Thus if A_4 is HIGH and B_4 is LOW, the A > B output will be HIGH regardless of all other inputs except $\bar{E}$.

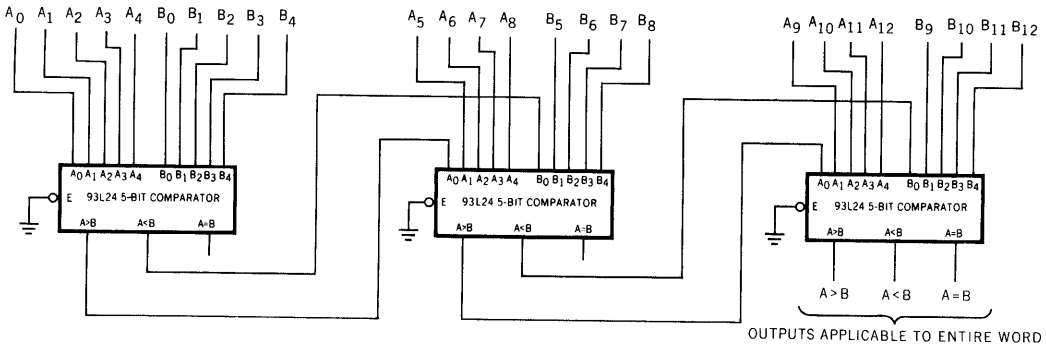
SERIAL EXPANSION OF 93L24 FOR LONGER WORD LENGTHS



For each additional 93L24 added four extra bits can be accommodated.

Fig. 1.

TTL/MSI 9328
DUAL 8-BIT SHIFT REGISTER

DESCRIPTION — The 9328 is a high speed serial storage element providing 16 bits of storage in the form of two 8-bit registers that will shift at greater than 20 MHz rates. The multi-functional capability of this device is provided by several features: 1) Additional gating is provided at the input to both shift registers so that the input is easily multiplexed between two sources. 2) The clock of each register may be provided separately or together. 3) Both the true and complementary outputs are provided from each 8-bit register, and both registers may be master cleared from a common input.

- **20 MHz SHIFT FREQUENCY**
- **TWO INPUT MULTIPLEXER PROVIDED AT DATA INPUT OF EACH REGISTER**
- **GATED CLOCK INPUT CIRCUITRY**
- **BOTH TRUE AND COMPLEMENTARY OUTPUTS PROVIDED FROM LAST BIT OF EACH REGISTER**
- **ASYNCHRONOUS MASTER RESET COMMON TO BOTH REGISTERS**
- **TYPICAL POWER DISSIPATION OF 300 mW**
- **TTL COMPATIBLE**
- **INPUT DIODE CLAMPING**

PIN NAMES		LOADING (Note a)

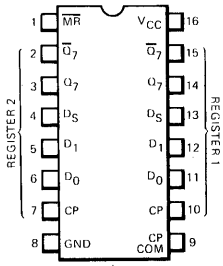
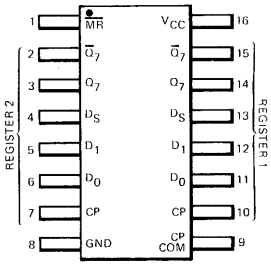
CONNECTION DIAGRAMS DIP (TOP VIEW)



FLATPAK (TOP VIEW)



FUNCTIONAL DESCRIPTION — The two 8-bit shift registers have a common clock input (pin 9) and separate clock inputs (pins 10 and 7). The clocking of each register is controlled by the OR function of the separate and the common clock input. Each register is composed of eight clocked RS master/slave flip-flops and a number of gates. The clock OR gate drives the eight clock inputs of the flip-flops in parallel. When the two clock inputs (the separate and the common) to the OR gate are LOW, the slave latches are steady, but data can enter the master latches via the R and S input. During the first LOW to HIGH transition of either, or both simultaneously, of the two clock inputs, the data inputs (R and S) are inhibited so that a later change in input data will not affect the master; then the now trapped information in the master is transferred to the slave. When the transfer is complete, both the master and the slave are steady as long as either or both clock inputs remain HIGH. During the HIGH to LOW transition of the last remaining HIGH clock input, the transfer path from master to slave is inhibited first, leaving the slave steady in its present state. The data inputs (R and S) are enabled so that new data can enter the master. Either of the clock inputs can be used as clock inhibit inputs by applying a logic HIGH signal. Each 8-bit shift register has a two input multiplexer in front of the serial data input. The two data inputs D_0 and D_1 are controlled by the data select input (D_S) following the Boolean expression:

Serial data in: $S_D = \overline{D}_S D_0 + D_S D_1$

An asynchronous master reset is provided which, when activated by a LOW logic level, will clear all sixteen stages independently of any other input signal.

t_{PHL}	Turn On Delay Clock to Output		22	35	ns		
t_{PHL}	Turn On Delay Master Reset to Q Output		35	50	ns	Fig. 2	
f_{sr}	Shift Right Frequency	20	30		MHz	Fig. 1	

SWITCHING SET-UP REQUIREMENTS (T_A = 25°C)

SYMBOL	PARAMETER	LIMITS MIN.	LIMITS TYP.	LIMITS MAX.	UNITS	TEST CONDITIONS	
t_{pw} (CP)	Clock Pulse Width	25	17		ns	Fig. 1	V_{CC} = 5.0 V
t_{pw} ($\overline{MR}$) (CPH)	Master Reset Pulse Width with Clock HIGH	30	20		ns	Fig. 2	
t_{pw} ($\overline{MR}$) (CPL)	Master Reset Pulse Width with Clock LOW	40	24		ns		
t_s (Data)	Set-up Time Data to Clock	20	10		ns	Fig. 3	
t_h (Data)	Hold Time Data to Clock	0			ns		
t_{rec} ($\overline{MR}$)	Recovery Time Master Reset to Clock	33	19		ns	Fig. 2	

SET-UP TIME (t_s) is defined as the minimum time required for the correct logic level to be present at the logic input prior to the clock transition from LOW to HIGH in order to be recognized and transferred to the outputs.

HOLD TIME (t_h) is defined as the minimum time following the clock transition from LOW to HIGH that the logic level must be maintained at the input in order to insure continued recognition. A negative Hold Time indicates that the correct logic level may be released prior to the clock transition from LOW to HIGH and still be recognized.

RECOVERY TIME (t_{rec}) is defined as the minimum time required between the end of the reset pulse and the clock transition from LOW to HIGH in order to recognize and transfer HIGH Data to the Q outputs.

NOTES:
1. The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
2. Conditions for testing, not shown in the table, are chosen to guarantee operation under "worst case" conditions.
3. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
4. Typical limits are at V_{CC} = 5.0 V, 25°C, and maximum loading.
5. Not more than one output should be shorted at a time.

Fig. 1

TTL/MSI 9334
8-BIT ADDRESSABLE LATCH

DESCRIPTION — The TTL/MSI 9334 is a high speed 8-Bit Addressable Latch designed for general purpose storage applications in digital systems. It is a multifunctional device capable of storing single line data in eight addressable latches, and being a one-of-eight decoder and demultiplexer with active level HIGH outputs. The device also incorporates an active level LOW common clear for resetting all latches, as well as, an active level LOW enable. The 9334 is compatible with all members of Fairchild's TTL family.

- **SERIAL TO PARALLEL CAPABILITY**
- **8-BITS OF STORAGE WITH OUTPUT OF EACH BIT AVAILABLE**
- **RANDOM (ADDRESSABLE) DATA ENTRY**
- **ACTIVE HIGH DEMULTIPLEXING OR DECODING CAPABILITY**
- **EASILY EXPANDABLE**
- **COMMON CLEAR**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**
- **TTL COMPATIBLE**

PIN NAMES

		LOADING (Note a)

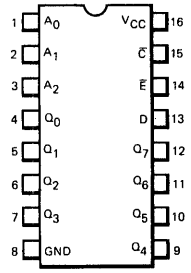
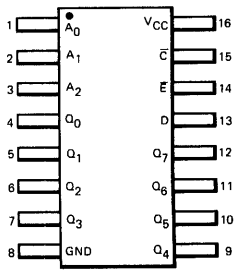
CONNECTION DIAGRAMS
DIP (TOP VIEW)



FLATPAK (TOP VIEW)



FUNCTIONAL DESCRIPTION — The TTL/MSI 9334 has four modes of operation which are shown in the mode selection table. In the addressable latch mode, data on the data line (D) is written into the addressed latch. The addressed latch will follow the data input with all non-addressed latches remaining in their previous states. In the memory mode, all latches remain in their previous states. In the one-of-eight decoding or demultiplexing mode, the addressed output will follow the state of the D input with all other outputs in the LOW state. In the clear mode all outputs are LOW and unaffected by the address and data inputs.

When operating the 9334 as an addressable latch, changing more than one bit of the address could impose a transient wrong address. Therefore, this should only be done while in the memory mode.

The truth table below summarizes the operations of the 9334.

TTL/MSI 9338
8-BIT MULTIPLE PORT REGISTER

DESCRIPTION – The TTL/MSI 9338 is an 8-Bit Multiple Port Register designed for high speed random access memory applications where the ability to simultaneously read and write is desirable. A common use would be as a register bank in a three address computer. Data can be written into any one of the eight bits and read from any two of the eight bits simultaneously. The circuit uses TTL technology and is compatible with all members of Fairchild's TTL family.

- **MASTER/SLAVE OPERATION PERMITTING SIMULTANEOUS WRITE/READ WITHOUT RACE PROBLEMS**
- **SIMULTANEOUSLY READ TWO BITS AND WRITE ONE BIT IN ANY ONE OF EIGHT BIT POSITIONS**
- **READILY EXPANDABLE TO ALLOW FOR LARGER WORD SIZES**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**
- **ALL CERAMIC "HERMETIC" 16 LEAD DUAL IN-LINE AND FLATPAKS**
- **TTL COMPATIBLE**

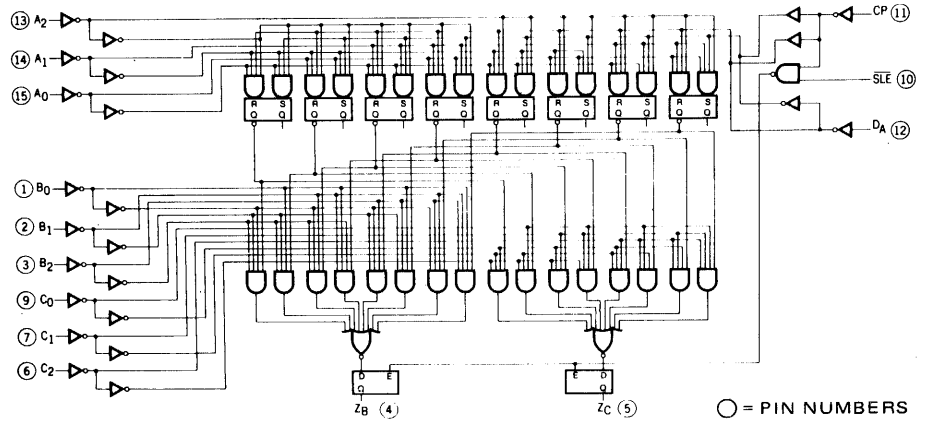
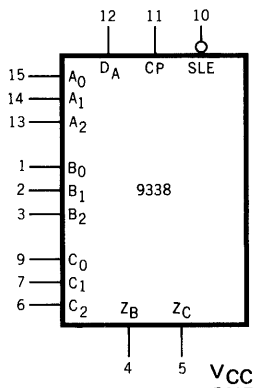
C_0, C_1, C_2	C Read Address Inputs	2/3 U.L.
Z_C	C Output (Note b)	10 U.L.
CP	Clock Pulse Input	2/3 U.L.
$\overline{SLE}$	Slave Enable (Active LOW) Input	2/3 U.L.

NOTES:
a. 1 Unit Load (U.L.) = 40 μA HIGH/1.6 mA LOW.
b. 10 U.L. is the output LOW drive factor and 20 U.L. is the output HIGH drive factor.

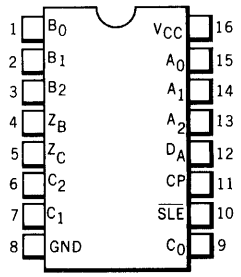
LOGIC DIAGRAM



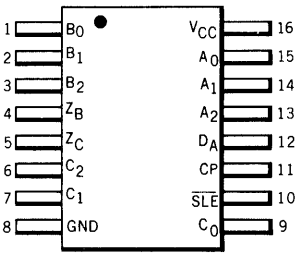
LOGIC SYMBOL



CONNECTION DIAGRAMS
DIP (TOP VIEW)



FLATPAK (TOP VIEW)



FUNCTIONAL DESCRIPTION – The 9338 8-bit multiple port register may be considered as a 1-bit slice of eight high speed working registers. Data may be written into any one of eight storage locations and read out from any two of the eight storage locations simultaneously. Master/slave operation eliminates all race problems associated with simultaneous writing in and reading from the same location.

The timing of this data transfer is similar to that of a standard master/slave flip-flop. While the clock is LOW the slaves are held steady, but the information on the D (data) input is permitted to enter the selected master. The next clock transition from LOW to HIGH locks the masters in their present states making them insensitive to the D input and write address inputs. This rising clock edge also connects each of the two slaves to the selected masters causing their contents to be reflected on the outputs. Outputs change, therefore, following the LOW to HIGH transition of the clock as on almost all Fairchild TTL/MSI devices and TTL flip-flops.

The Slave Enable ($\overline{SLE}$) input may be used to defeat the master/slave operation. If the Slave Enable ($\overline{SLE}$) line is held LOW, the slaves are continuously enabled allowing immediate transfer of information from the selected masters to the outputs.

DEFINITION OF TERMS

DATA SET UP TIME (t_s) — Is defined as the time required for a HIGH (t_s "H") or a LOW (t_s "L") logic level to be present at the data input prior to the clock transition from LOW to HIGH, in order for the master to recognize and store the new data.

t_{CP} "L" (CLOCK LOW TIME REQUIRED TO WRITE) — This parameter is defined as the minimum LOW clock pulse width required to write information into the master.

t_{CP} "H" (CLOCK HIGH TIME REQUIRED TO READ) — This parameter is defined as the minimum HIGH clock pulse width required to store information in the slaves.

WRITE ADDRESS SET-UP TIME $t_s(A)$ — Is the time required for the write address to be present before the HIGH to LOW clock transition so that the correct master is addressed and other masters are not disturbed. When writing data into the 9338, the write address inputs should be stable at $t_s(A)$ before the HIGH to LOW transition of the clock and while the clock is LOW but they may change simultaneously with the LOW to HIGH clock transition.

HOLD TIME (t_h) is defined as the minimum time following the clock transition from LOW to HIGH that the logic level must be maintained at the input in order to insure continued recognition. A negative HOLD TIME indicates that the correct logic level may be released prior to the clock transition from LOW to HIGH and still be recognized.

APPLICATIONS

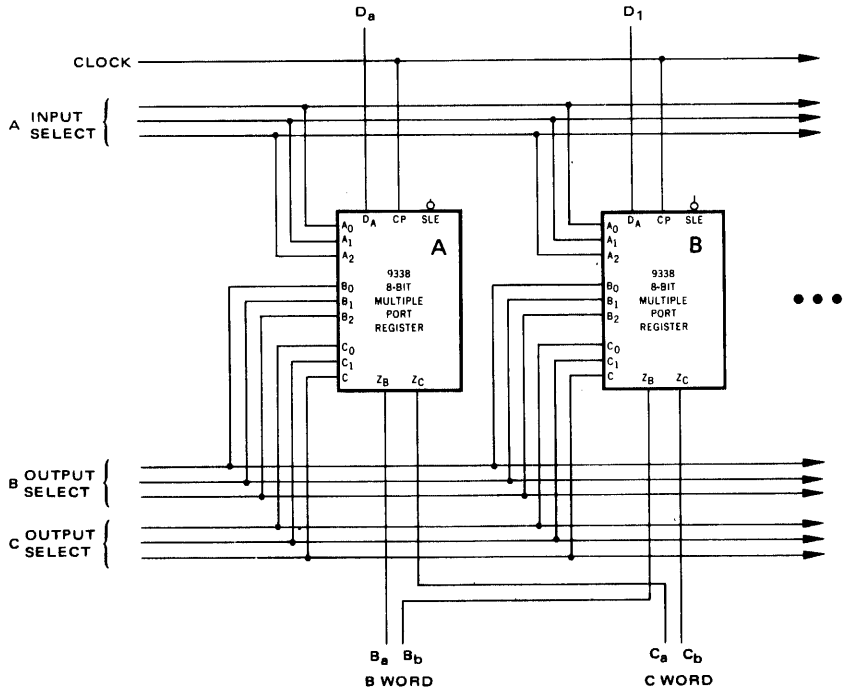

Fig. 9 PARALLEL EXPANSION

One 9338 is needed for each bit of the required word length. The read and write input lines should be connected in common on all of the devices. This register configuration provides two words of n-bits each at one time as is illustrated above, where n devices are connected in parallel.

TTL/MSI 93S39

8-BIT EDGE TRIGGERED MULTIPLE PORT REGISTER

TO BE ANNOUNCED

DESCRIPTION – The TTL/MSI 93S39 is an 8-bit, edge triggered, multiple port register designed with the super high speed Schottky-barrier diode clamp circuit. It is organized as a 1-bit slice of eight storage registers for use as accumulators, data registers, or scratch pad memory. It is primarily intended to be used with an arithmetic logic unit (ALU) such as the 93S41/74S181 to provide very high speed arithmetic operations.

The 93S39 is essentially an 8-bit register having one input data line and three output ports. Data can be written into any one of eight locations, selected by address lines A_0 thru A_2. Because of the master/slave design, the previous data can be read out of that same location simultaneously on output Z_A. In addition data can be read out from any other location on output Z_B, under control of the second output multiplexer, addressed by B_0 thru B_2. Individual multiplexer enable controls to the Z_A and Z_B outputs allow for easy expansion to more than eight registers. A separate Z_0 output is provided which continuously displays the contents of location 0, which can be used as a P register.

The 93S39 features edge triggered inputs on the write enable, data, and write address lines, which respond only to the LOW to HIGH transition of the clock. This insures the longest possible time for propagation of signals through external combinatorial logic, as the stability of the input address, the new data, and the write enable must be controlled only within the set-up time requirements of the rising edge of the clock. The outputs Z_A and Z_B are asynchronous, depending only on the delay of the multiplexer address and enable controls. The output enables are designed to permit OR-tying the outputs for easy expansion to more than eight registers.

- **THE WRITE CONTROLS (WRITE ENABLE, WRITE ADDRESS, AND DATA) ARE EDGE TRIGGERED—RESPONDING ONLY TO THE POSITIVE TRANSITION OF THE CLOCK PULSE**
- **SCHOTTKY-BARRIER DIODE DESIGN FOR SUPER HIGH SPEED OPERATION**
- **ASYCHRONOUS CONTROL OF OUTPUT DATA MULTIPLEXERS**
- **OUTPUT MULTIPLEXER DESIGN PROVIDES FOR EASY REGISTER EXPANSION**
- **CONTINUOUS OUTPUT FROM BIT LOCATION "000" FOR MEMORY ADDRESS REGISTER APPLICATIONS**

TTL/MSI 9340

4-BIT ARITHMETIC LOGIC UNIT WITH CARRY LOOKAHEAD

DESCRIPTION – The 9340 is a TTL/MSI high speed Arithmetic Logic Unit with full on chip carry lookahead circuitry. It can perform the arithmetic operations add or subtract in parallel, or either of six logic functions on two 4-bit binary words. The internal carry lookahead provides either a ripple carry output or carry lookahead outputs. An internal carry input network accepts carry lookahead outputs from up to three other packages producing a 16-bit full carry lookahead ALU without additional gates. Ripple carries can be used between additional blocks of 12 bits to further expand the word length. A low power version of the 9340 is available as the 93L40, dissipating only 110 mW.

- **MULTIFUNCTION CAPABILITY**
  Two Arithmetic Operations – Add, Subtract
  Six Logic Functions – A Ex or B, A and B, Plus Four Others
- **ADD TWO 4-BIT WORDS IN 23 ns TYPICAL**
- **SUBTRACT TWO 4-BIT WORDS IN 28 ns**
- **LOOKAHEAD CARRY INPUT AND OUTPUT NETWORKS ON CHIP**
- **EASILY EXPANDABLE TO LONGER WORD LENGTHS**
- **TYPICAL POWER DISSIPATION OF 425 mW**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**
- **TTL COMPATIBLE**

FUNCTIONAL DESCRIPTION – The 9340 accepts two 4-bit words, A_0, A_1, A_2, A_3 (A_{0-3}) and B_0, B_1, B_2, B_3 (B_{0-3}), and produces a 4-bit output, F_0, F_1, F_2, F_3 (F_{0-3}). The output function is determined by the states on the control lines S_0 and S_1. The inputs and outputs of the 9340 may be considered to be active level LOW or active level HIGH. Logic equivalents for four representations of the 9340 are shown in Figure 1a, b, c, and d.

The add and subtract operations are performed on the entire word, with carries or borrows propagated between bits of different weight. The arithmetic may be performed in 1's complement, 2's complement, or sign-magnitude notation. In the logic modes, carries are inhibited and the device acts like four gates of the type shown in Figure 1.

To achieve high speed operation, the 9340 is designed to be used in a carry lookahead system. Full carry lookahead is used inside the device to propagate carries between bits. Carry lookahead functions over the 4-bit block are available as outputs. These outputs are labeled $\overline{CO/CG}$ (Carry Out/Carry Generate) and $\overline{CP}$ (Carry Propagate) on the logic symbol. The carry in to the device is formed from a set of Carry Generate and Carry Propagate inputs (equation 1) so that three 9340's can be interconnected without any additional gates to form a 12-bit full carry lookahead ALU with a carry in. The pin labeled COE (Carry Out Enable) controls the $\overline{CO/CG}$ output according to equation 2. When COE is HIGH, $\overline{CO/CG}$ becomes a Carry Out which can be used to ripple carries between blocks of 12 bits. The $\overline{CG_1}$ input can be used for a ripple carry input, since this signal is sufficient to produce a carry in.

EQUATION:

(1) $(\overline{CG_1}) + (\overline{CP_1})(\overline{CG_2}) + (\overline{CP_1})(\overline{CP_2})(\overline{CG_3}) = C_{in}$ (internal)

(2) $\overline{CO/CG} = (\overline{CG}) + (\overline{CP})(C_{in})(COE)$

Fig. 1–FUNCTION TABLES FOR LOGIC EQUIVALENTS OF THE 9340

Note that when the input operants are defined as active HIGH, the carry lookahead inputs and outputs are not formally carry generate and carry propagate. Consequently, these pins have been relabeled CX and CY in the active HIGH cases. However, the signals are connected in the same manner as $\overline{CG}$ and $\overline{CP}$.

NOTES:
(1) The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
(2) Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
(3) The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
(4) Typical limits are at V_{CC} = 5.0 V, 25°C, and maximum loading.
(5) Not more than one output should be shorted at a time.

TTL/MSI 9341/54181, 74181
4-BIT ARITHMETIC LOGIC UNIT

DESCRIPTION – The TTL/MSI 9341/54181, 74181 is a 4-bit high speed Arithmetic Logic Unit (ALU) which can perform all the possible 16 logic operations on two variables and a variety of arithmetic operations; the Add and Subtract modes are the most important. The ALU is fully compatible with all members of the Fairchild TTL family.

- **PROVIDES 16 ARITHMETIC OPERATIONS**
  ADD, SUBTRACT, COMPARE, DOUBLE,
  PLUS TWELVE OTHER ARITHMETIC OPERATIONS
- **PROVIDES ALL 16 LOGIC OPERATIONS OF TWO VARIABLES**
  EXCLUSIVE–OR, COMPARE, AND, NAND, OR, NOR, PLUS
  TEN OTHER LOGIC OPERATIONS
- **FULL LOOKAHEAD FOR HIGH SPEED ARITHMETIC OPERATION ON LONG WORDS**
- **INPUT CLAMP DIODES**
- **TTL COMPATIBLE**

8

FUNCTIONAL DESCRIPTION – The TTL/MSI 9341/54181, 74181 is a 4-bit, high speed parallel Arithmetic Logic Unit (ALU). Controlled by the four Function Select Inputs ($S_0 \ldots S_3$) and the Mode Control Input (M), it can perform all the 16 possible logic operations or 16 different arithmetic operations on active HIGH or active LOW operands. The Function Table below lists these operations.

When the Mode Control Input (M) is HIGH, all internal carries are inhibited and the device performs Logic operations on the individual bits as listed. When the Mode Control Input is LOW, the carries are enabled and the device performs Arithmetic operations on the two, 4-bit words. The device incorporates full internal look-ahead carry and provides for either ripple carry between devices using the C_{n+4} output, or for carry look-ahead between packages using the signals P (carry propagate) and G (carry generate). P and G are not affected by carry in. When speed requirements are not stringent, the 9341/54181, 74181 can be used in a simple ripple carry mode by connecting the carry out (C_{n+4}) signal to the carry input (C_n) of the next unit. For high speed operation the 9341/54181, 74181 is used in conjunction with the 9342/54182, 74182 carry look-ahead circuit. One carry look-ahead package is required for each group of four 9341/54181, 74181 devices. Carry look-ahead can be provided at various levels and offers high speed capability over extremely long word lengths.

The A = B output from the 9341/54181, 74181 goes HIGH when all four F outputs are HIGH and can be used to indicate logic equivalence over 4-bits when the unit is in the subtract mode. The A = B output is open collector and can be wire ANDed with other A = B outputs to give a comparison for more than 4-bits. The A = B signal can also be used with the carry out signal to indicate A > B and A < B.

The Function Table lists the Arithmetic operations that are performed without a carry in. An incoming carry adds a one to each operation. Thus Select Code LHHL generates A minus B minus 1 (2's complement notation) without a carry in and generates A minus B when a carry is applied. Because subtraction is actually performed by complementary addition (1's complement), a CARRY OUT means BORROW; thus a carry is generated when there is no underflow and no carry is generated when there is underflow.

As indicated the 9341/54181, 74181 can be used with either active LOW inputs producing active LOW outputs or with active HIGH inputs producing active HIGH outputs. For either case the table lists the operations that are performed to the operands labeled inside the logic symbol.

NOTES:
(1) The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
(2) Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
(3) The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
(4) Note more than one output should be shorted at a time.

TTL/MSI 93S41

4-BIT ARITHMETIC LOGIC UNIT

DESCRIPTION – The TTL/MSI 93S41 is a 4-bit high speed Arithmetic Logic Unit (ALU) which can perform all the possible 16 logic operations on two variables and a variety of arithmetic operations; the Add and Subtract modes are the most important. The ALU is fully compatible with all members of the Fairchild TTL family and incorporates the Schottky TTL process to achieve super high speeds.

- **PROVIDES 16 ARITHMETIC OPERATIONS**
  ADD, SUBTRACT, COMPARE, DOUBLE, PLUS
  TWELVE OTHER ARITHMETIC OPERATIONS
- **PROVIDES ALL 16 LOGIC OPERATIONS OF TWO VARIABLES**
  EXCLUSIVE–OR, COMPARE, AND, NAND, OR, NOR, PLUS
  TEN OTHER LOGIC OPERATIONS
- **FULL LOOKAHEAD FOR HIGH SPEED ARITHMETIC OPERATION ON LONG WORDS**
- **INPUT CLAMP DIODES**
- **TYPICAL ADD TIME FOR 16-BITS IS 19ns**
- **TYPICAL POWER DISSIPATION OF 500mW**

FUNCTIONAL DESCRIPTION – The TTL/MSI 93S41 is a 4-bit super high speed parallel Arithmetic Logic Unit (ALU). Controlled by the four Function Select Inputs ($S_0 \ldots S_3$) and the Mode Control Input (M), it can perform all the 16 possible logic operations or 16 different arithmetic operations on active HIGH or active LOW operands. The Function Table below lists these operations.

When the Mode Control Input (M) is HIGH, all internal carries are inhibited and the device performs Logic operations on the individual bits as listed. When the Mode Control Input is LOW, the carries are enabled and the device performs Arithmetic operations on the two, 4-bit words. The device incorporates full internal look-ahead carry and provides for either ripple carry between devices using the C_{n+4} output, or for carry look-ahead between packages using the signals P (carry propagate) and G (carry generate). P and G are not affected by carry in. When speed requirements are not stringent, the 93S41 can be used in a simple ripple carry mode by connecting the carry out (C_{n+4}) signal to the carry input (C_n) of the next unit. For high speed operation the 93S41 is used in conjunction with the 93S42 carry look-ahead circuit. One carry look-ahead package is required for each group of four 93S41 devices. Carry look-ahead can be provided at various levels and offers high speed capability over extremely long word lengths.

The A = B output from the 93S41 goes HIGH when all four F outputs are HIGH and can be used to indicate logic equivalence over 4-bits when the unit is in the subtract mode. The A = B output is open collector and can be wire ANDed with other A = B outputs to give a comparison for more than 4-bits. The A = B signal can also be used with the carry out signal to indicate A > B and A < B.

The Function Table lists the Arithmetic operations that are performed without a carry in. An incoming carry adds a one to each operation. Thus Select Code LHHL generates A minus B minus 1 (2's complement notation) without a carry in and generates A minus B when a carry is applied. Because subtraction is actually performed by complementary addition (1's complement), a CARRY OUT means BORROW; thus a carry is generated when there is no underflow and no carry is generated when there is underflow.

As indicated the 93S41 can be used with either active LOW inputs producing active LOW outputs or with active HIGH inputs producing active HIGH outputs. For either case the table lists the operations that are performed to the operands labeled inside the logic symbol.

TTL/MSI 9342/54182, 74182
LOOKAHEAD CARRY GENERATOR

DESCRIPTION – The TTL/MSI 9342/54182, 74182 is a high speed Lookahead Carry Generator. It is generally used with the 9341/54181, 74181 4-Bit Arithmetic Logic Unit to provide high speed lookahead over word lengths of more than four bits. The lookahead carry generator is fully compatible with all members of the Fairchild TTL Family.

- **PROVIDES LOOKAHEAD CARRIES ACROSS A GROUP OF FOUR ALU'S**
- **MULTI-LEVEL LOOKAHEAD FOR HIGH SPEED ARITHMETIC OPERATION OVER LONG WORD LENGTHS**
- **INPUT CLAMP DIODES**
- **TTL COMPATIBLE**

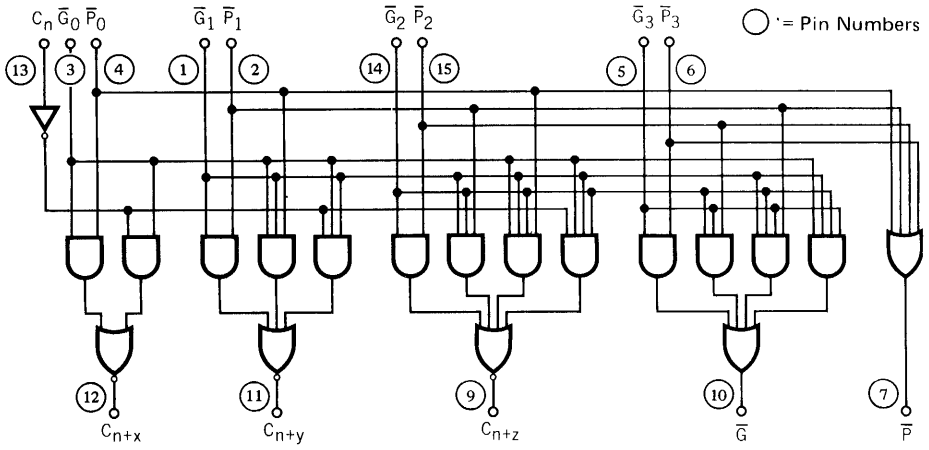
LOGIC DIAGRAM



FUNCTIONAL DESCRIPTION—The TTL/MSI 9342/54182, lookahead carry generator accepts up to four pairs of active LOW Carry Propagate ($\overline{P}_0, \overline{P}_1, \overline{P}_2, \overline{P}_3$) and Carry Generate ($\overline{G}_0, \overline{G}_1, \overline{G}_2, \overline{G}_3$) signals and an active HIGH Carry Input (C_n) and provides anticipated active HIGH carries (C_{n+x}, C_{n+y}, C_{n+z}) across four groups of binary adders. The 9342/54182, 74182 also has active LOW Carry Propagate (P) and Carry Generate ($\overline{G}$) outputs which may be used for further levels of lookahead.
The logic equations provided at the outputs are:

$$C_{n+x} = G_0 + P_0C_n$$
$$C_{n+y} = G_1 + P_1G_0 + P_1P_0C_n$$
$$C_{n+z} = G_2 + P_2G_1 + P_2P_1G_0 + P_2P_1P_0C_n$$
$$\overline{G} = \overline{G_3 + P_3G_2 + P_3P_2G_1 + P_3P_2P_1G_0}$$
$$\overline{P} = \overline{P_3P_2P_1P_0}$$

Also, the 9342/54182, 74182 can be used with binary ALU's in an active LOW or active HIGH input operand mode. The connections to and from the ALU to the lookahead carry generator are identical in both cases.

NOTES:
1. The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
2. Conditions for testing, not shown in the table, are chosen to guarantee operation under "worst case" conditions.
3. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
4. Typical limits are at V_{CC} = 5.0 V, 25°C, and maximum loading.

TTL/MSI 93S42
LOOKAHEAD CARRY GENERATOR

DESCRIPTION — The TTL/MSI 93S42 is a high speed Lookahead Carry Generator. It is generally used with the 93S41 4-Bit Arithmetic Logic Unit to provide super high speed lookahead over word lengths of more than four bits. The lookahead carry generator is fully compatible with all members of the Fairchild TTL Family.

- **TYPICALLY 4 ns DELAY FOR EACH LEVEL OF LOOKAHEAD**
- **PROVIDES LOOKAHEAD CARRIES ACROSS A GROUP OF FOUR ALU'S**
- **MULTI-LEVEL LOOKAHEAD FOR HIGH SPEED ARITHMETIC OPERATION OVER LONG WORD LENGTHS**
- **INPUT CLAMP DIODES**
- **TTL COMPATIBLE**

TTL/MSI 9344

BINARY (4-BIT BY 2-BIT) FULL MULTIPLIER

DESCRIPTION – The TTL/MSI 9344 is a 4-bit by 2-bit Full Multiplier building block. It multiplies two binary numbers and simultaneously adds two other binary numbers to the product. 9344's can be interconnected to form a high speed multiplier array of any size. The device is constructed with TTL compatible inputs and outputs. Inputs are buffered to reduce loading. The device is fully compatible with all members of the Fairchild TTL family.

- **PERFORMS DIRECT MULTIPLICATION**
- **EXPANDS TO ANY SIZE ARRAY WITHOUT ADDITIONAL COMPONENTS**
- **MULTIPLIES AND ADDS SIMULTANEOUSLY**
- **TTL COMPATIBLE**

PIN NAMES

		LOADING

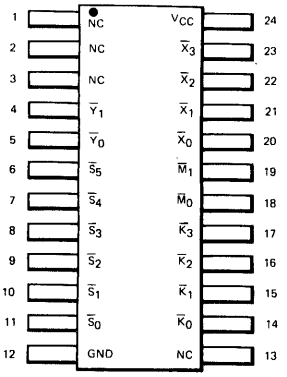
FLATPAK (TOP VIEW)



FUNCTIONAL DESCRIPTION – The 9344 is a binary full multiplier for 4-bit by 2-bit words. It is easily expandable in an array to form a high speed parallel multiplier of any length.

The functional equation is illustrated below:

S(6-bits) = $\overline{X}$(4-bits) times $\overline{Y}$(2-bits) plus $\overline{M}$(2-bits) plus $\overline{K}$(4-bits)

Functionally the 9344 multiplies a 4-bit word ($\overline{X}_0 - \overline{X}_3$) by a two bit word ($\overline{Y}_0 - \overline{Y}_1$), generating eight partial products. Two other words, $\overline{K}_0 - \overline{K}_3$ and $\overline{M}_0 - \overline{M}_1$, are added to these partial products through a lookahead carry adder, generating a 6-bit product/sum.

The function can be described by the following equation (note that "+" means arithmetic addition) :

$$S = 2^0 (\overline{X}_0\overline{Y}_0 + \overline{M}_0 + \overline{K}_0) + 2^1 (\overline{X}_1\overline{Y}_0 + \overline{X}_0\overline{Y}_1 + \overline{M}_1 + \overline{K}_1) + 2^2 (\overline{X}_2\overline{Y}_0 + \overline{X}_1\overline{Y}_1 + \overline{K}_2) + 2^3 (\overline{X}_3\overline{Y}_0 + \overline{X}_2\overline{Y}_1 + \overline{K}_3) + 2^4 (\overline{X}_3\overline{Y}_1).$$

All inputs and outputs are active LOW; X and Y inputs are buffered to present only one TTL unit load.

The device operates only on positive numbers. If two's complement mutliplication is required, then the numbers must be changed to sign-magnitude before multiplication, or else the product must be corrected following multiplication of the two's complement numbers. The correction algorithm depends on whether X or Y or both are negative.

If X is negative:
Subtract Y from most significant half of product.

If Y is negative:
Subtract X from most significant half of product.

If both X and Y are negative:
Add X plus Y to most significant half of product.

The result will be the correct two's complement product.

MULTIPLICATION TIME

NUMBER OF BITS	PACKAGES	TIME (ns)
8 x 8	8	150
12 x 12	18	260
16 x 16	32	350
24 x 24	72	550

TYPICAL MULTIPLICATION ARRAYS

The 9344 can be assembled in an iterative structure to perform multi-bit multiplication. The blocks are interconnected so that partial product sums generated in a particular 9344 are applied, if necessary, to equal weight carry inputs ($\overline{K}_{0,1,2,3}$ or $\overline{M}_{0,1}$) of succeeding stages.

In the iteritive multiplication arrays shown, weighting factors of the carry and sums between 9344's are indicated (i.e., $0 = 2^0$, $1 = 2^1$, $2 = 2^2$, etc.). Labels inside the blocks identify bits multiplied in that block. For instance 0—0 refers to multiplicand bits $B_{0,1,2,3}$ and multiplier bits $A_{0,1}$, while 4—2 would represent multiplicant bits $B_{4,5,6,7}$ and multiplier bits $A_{2,3}$.

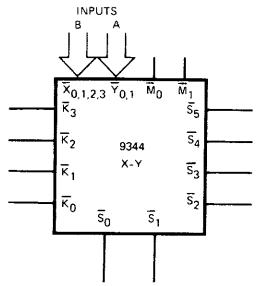
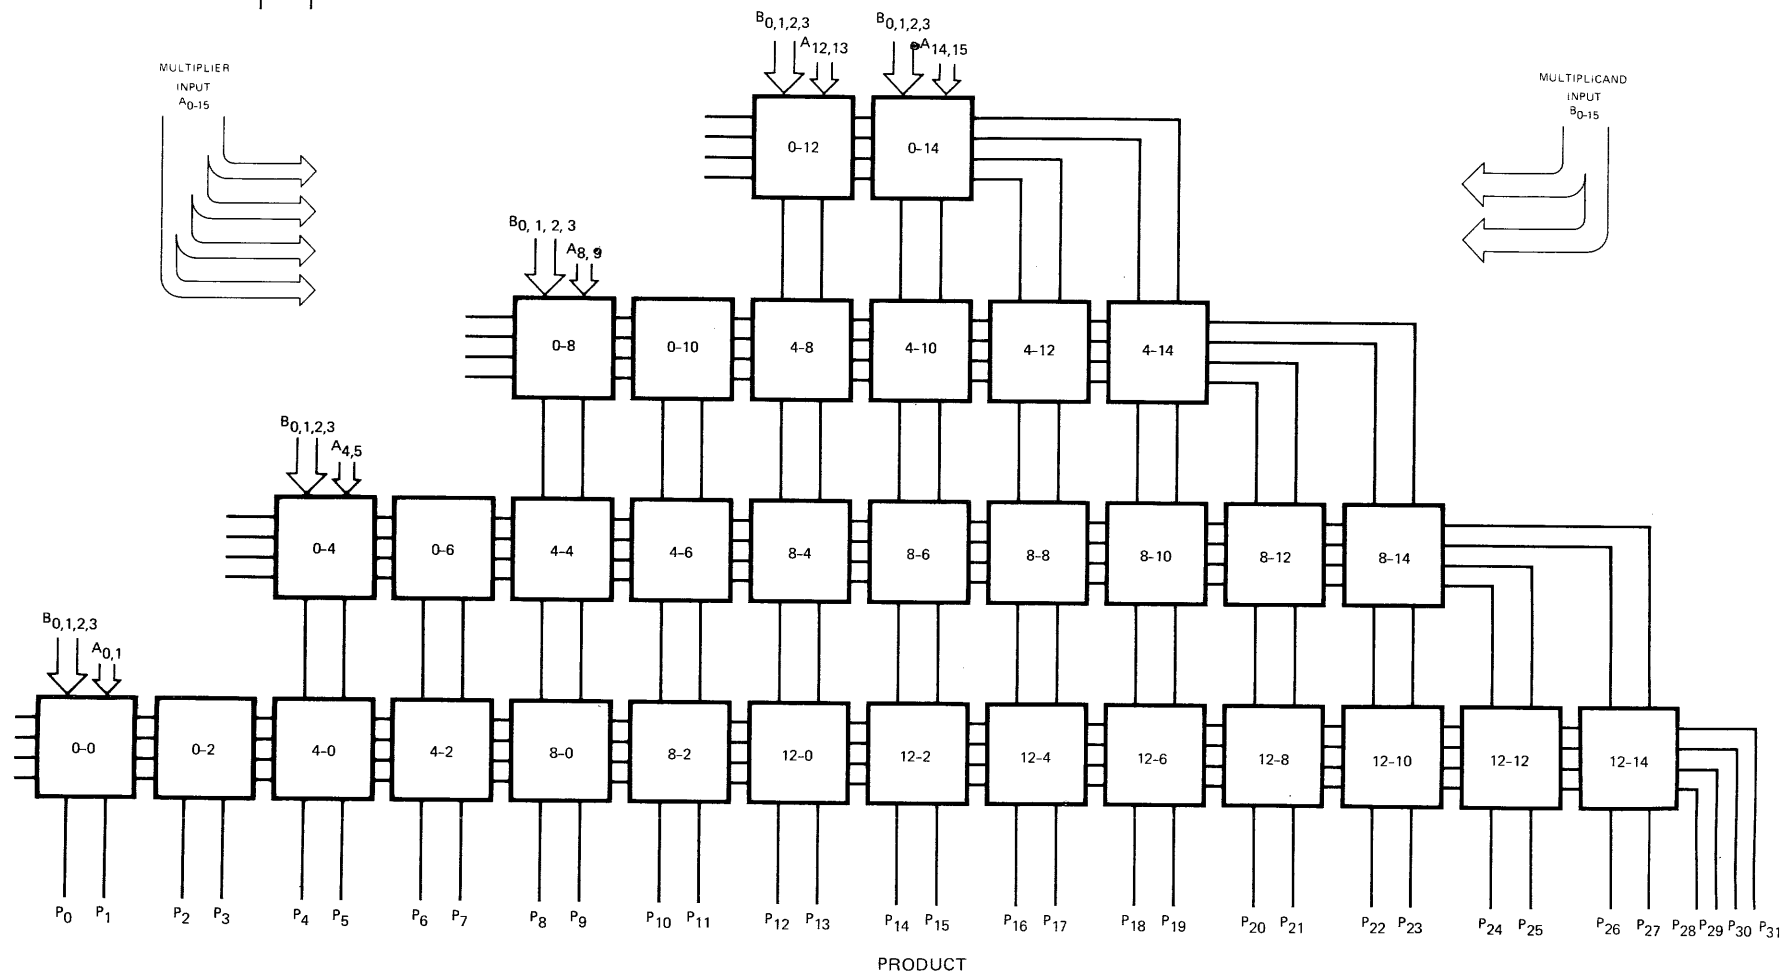
TYPICAL MULTIPLICATION ARRAYS (Cont'd)

16-BIT BY 16-BIT MULTIPLICATION ARRAY



KEY:
X = 4 BIT MULTIPLICAND, INPUT B
Y = 2 BIT MULTIPLIER, INPUT A
ALL INPUTS ACTIVE LOW



Note: Each block represents one 9344. Labels inside the blocks identify bits multiplied in that block. The first number is the 4-bit B input, and the second number is the 2-bit A input. For instance, 12–0 refers to multiplicand bits $B_{12, 13, 14, 15}$ and multiplier bits $A_{0, 1}$.

Fig. 7

TTL/MSI 9345/5445, 7445
93145/54145, 74145
1-OF-10 DECODER/DRIVER

DESCRIPTION — The 9345/5445, 7445 and 93145/54145, 74145 1-of-10 Decoder/Drivers are designed to accept BCD inputs and provide appropriate outputs to drive 10 digit incandescent displays. All outputs remain off for all invalid binary input conditions. These devices are designed for use as indicator/relay drivers or as open-collector logic circuit drivers. Each of the high breakdown output transistors (9345/5445, 7445 = 30 V and 93145/54145, 74145 = 15 V) will sink up to 80 mA of current. Typical power dissipation is 215 mW.

TTL/MSI 9348
12-INPUT PARITY CHECKER/GENERATOR

DESCRIPTION – The TTL/MSI 9348 is a 12-Input Parity Checker/Generator generating odd and even parity outputs. It can be used in high speed error detection applications. The 9348 uses TTL technology for high capacitive drive capability, and provides low impedance in both logic states for good ac noise immunity. All inputs feature diode clamping to reduce negative line transients. This device is compatible with all members of the TTL family of digital integrated circuits.

- **BOTH ODD AND EVEN PARITY OUTPUTS PROVIDED**
- **GENERATES A PARITY BIT FOR UP TO 12 BITS**
- **CHECKS FOR PARITY ON UP TO 12 BITS**
- **EASILY EXPANDABLE**
- **HIGH DRIVE OUTPUT CIRCUITRY**
- **INPUT CLAMP DIODE LIMITS HIGH SPEED TERMINATION EFFECTS**
- **TTL COMPATIBLE**

PIN NAMES

		LOADING (Note a)

8

FUNCTIONAL DESCRIPTION – The MSI 9348 is a 12-input parity generator. It provides odd and even parity for up to 12 data bits. The Even Parity output (PE) will be HIGH if an even number of logic ones are present on the inputs. The Odd Parity output (PO) will be HIGH if an odd number of logic ones are present on the inputs. The logic equations for the outputs are shown below.

$$PO = I_0 \oplus I_1 \oplus I_2 \oplus I_3 \oplus I_4 \oplus I_5 \oplus I_6 \oplus I_7 \oplus I_8 \oplus I_9 \oplus I_{10} \oplus I_{11}$$

$$PE = \overline{I_0 \oplus I_1 \oplus I_2 \oplus I_3 \oplus I_4 \oplus I_5 \oplus I_6 \oplus I_7 \oplus I_8 \oplus I_9 \oplus I_{10} \oplus I_{11}}$$

NOTE: Less through delay is encountered from the I_0, I_1, I_2, and I_3 inputs than I_4 thru I_{11} inputs. Therefore, if some signals are slower than others, the slower signals should be applied to these four inputs for maximum speed.

V_{CD}	Input Clamp Diode Voltage			−1.5	Volts	V_{CC}=MIN., I_{IN}=−12mA, T_A=25°C

NOTES:
(1) The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
(2) Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
(3) The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
(4) Typical limits are at V_{CC} = 5.0 V, 25°C, and maximum loading.
(5) Not more than one output should be shorted at a time.

TTL/MSI 9350
DECADE COUNTER

DESCRIPTION – The TTL/MSI 9350 is a Monolithic Decade Counter. This multifunctional MSI building block is capable of being used as a divide-by-two, divide-by-five or divide-by-ten counter. It is useful in a large number of counting applications in digital computer systems, data handling systems and control systems.

- **FUNCTIONALLY EQUIVALENT TO THE 7490**
- **STANDARD CORNER POWER PINS FOR EASY USE**
- **HIGH SPEED, 18 MHz TYPICAL**
- **TYPICAL POWER DISSIPATION OF 160 mW**
- **TTL COMPATIBLE**
- **ALL CERAMIC, HERMETIC 14-LEAD DUAL IN-LINE PACKAGE**
- **INPUT DIODE CLAMPING**

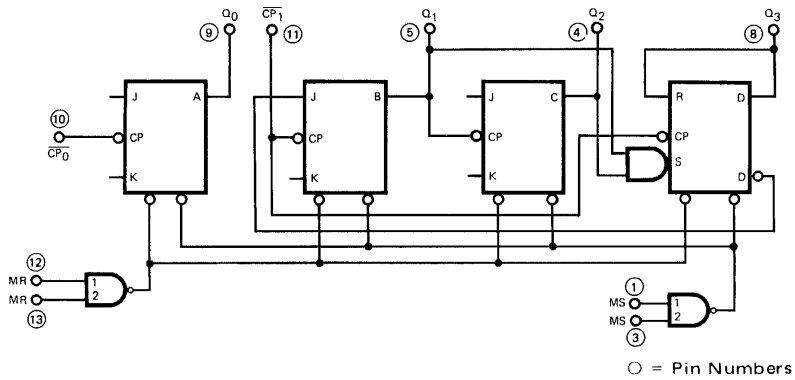
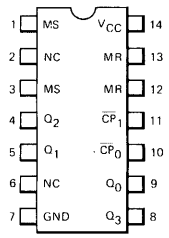
LOGIC DIAGRAM



CONNECTION DIAGRAM
DIP (TOP VIEW)



NC – No internal connection

FUNCTIONAL DESCRIPTION

The 9350 is an up decade counter. It consists of four dual-rank, master-slave flip-flops internally interconnected to provide a dividy-by-two counter and a divide-by-five counter. A gated "AND" Master Reset is provided to inhibit counting and return all outputs to a LOW state. A gated "AND" Master Set is provided which will set the counter to a binary coded decimal count of nine (9), overriding all other count or reset conditions. Since the output from the first flip-flop is not internally connected to the succeeding stages, the device may be operated in three independent count modes:

A. BCD Decade Counter – The $\overline{CP}_1$ input must be externally connected to the Q_0 output. The $\overline{CP}_0$ input receives the incoming count and a BCD count sequence is produced.

B. Symmetrical Divide-By-Ten Counter – The Q_3 output must be externally connected to the $\overline{CP}_0$ input. The input count is then applied to the $\overline{CP}_1$ input and a divide-by-ten square wave is obtained at output Q_0.

C. Divide-By-Two & Divide-By-Five Counter – No external interconnections are required. The first flip-flop is used as a binary element for the divide-by-two function. (CP_0 as the input and Q_0 as the output.) The $\overline{CP}_1$ input is used to obtain binary divide-by-five operation at the Q_1, Q_2, and Q_3 outputs.

NOTE: The 9350 flip-flops change state after the HIGH to LOW transition of the clock.

TTL/MSI 9352/5442, 7442
9353/5443, 7443 • 9354/5444, 7444
FOUR LINE TO TEN LINE DECODER (1-OF-10)

DESCRIPTION — These monolithic Decimal Decoders consist of eight inverters and ten 4-input NAND gates. The inverters are connected in pairs to make BCD input data available for decoding by the NAND gates. Full decoding of valid input logic insures that all outputs remain off for all invalid input conditions.

The TTL/MSI 9352/5442, 7442 BCD-to-decimal; TTL/MSI 9353/5443, 7443 excess 3-to-decimal; and TTL/MSI 9354/5444, 7444 excess 3 gray-to-decimal decoders feature familiar transistor-transistor logic (TTL) circuits with inputs and outputs compatible for use with other TTL and DTL circuits. The dc noise margins are typically 1.0V and power dissipation is typically 140 mW. Full fan out of 10 is available at all outputs.

TTL/MSI 9356
4-BIT BINARY COUNTER

DESCRIPTION – The TTL/MSI 9356 is a monolithic 4-Bit Binary Counter. This device is capable of being used as a divided-by-two, divided-by-eight or a divided-by-sixteen counter. It is useful in a large number of counting applications in digital computer systems, data handling systems and control systems.

- **FUNCTIONALLY EQUIVALENT TO THE 7493**
- **STANDARD CORNER POWER PINS FOR EASY USE**
- **HIGH SPEED, 18 MHz TYPICAL**
- **TYPICAL POWER DISSIPATION OF 160 mW**
- **INPUT CLAMP DIODES LIMIT HIGH SPEED TERMINATION EFFECTS**
- **TTL COMPATIBLE**
- **ALL CERAMIC, HERMETIC 14-LEAD DUAL IN-LINE PACKAGE**

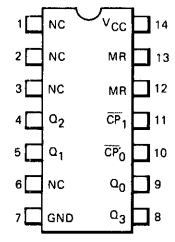
CONNECTION DIAGRAM
DIP (TOP VIEW)



NC – No Internal Connection

FUNCTIONAL DESCRIPTION – The MSI 9356 is an 4-bit up binary counter. It consists of four master-slave flip-flops which are internally interconnected to provide a divide-by-two counter and a divide-by-eight counter. A gated "AND" master reset is provided to inhibit the counting and return all outputs to a LOW state.* Since the output from the first flip-flop is not internally connected to the succeeding flip-flops, the device may be operated in two independent modes:

A. 4-Bit Ripple Counter – The output Q_0 must be externally connected to input $\overline{CP}_1$. The input count pulses are applied to input $\overline{CP}_0$. Simultaneous divisions of 2, 4, 8, and 16 are performed at the Q_0, Q_1, Q_2, and Q_3 outputs as shown in the truth table.

B. 3-Bit Ripple Counter – The input count pulses are applied to input $\overline{CP}_1$. Simultaneous frequency divisions of 2, 4 and 8 are available at the Q_1, Q_2 and Q_3 outputs. Independent use of the first flip-flop is available if the reset function coincides with reset of the 3-bit ripple-through counter.

*(i.e., When both inputs of the "AND" master reset are HIGH outputs Q_{0-3} will be forced LOW, resetting the flip-flops, regardless of all other input conditions.)

NOTE: The 9356 flip-flops change state after the HIGH to LOW transition of the clock.

*X = package type; F for Flatpak, D for Ceramic Dip, P for Plastic Dip. See Packaging Information Section for packages available on this product.

NOTES:
(1) The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
(2) Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
(3) The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating range.
(4) Typical limits are at V_{CC} = 5.0 V, 25°C, and max. loading.
(5) Not more than one output should be shorted at a time.

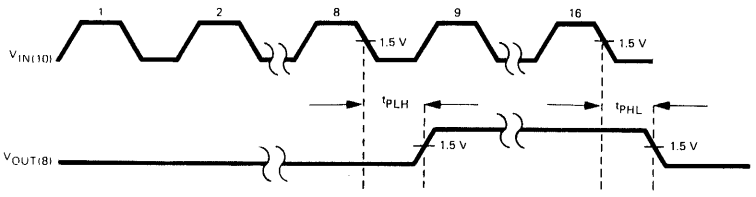
SWITCHING TIME WAVEFORMS



TTL/MSI 9357A/5446, 7446
9357B/5447, 7447
BCD TO 7-SEGMENT DECODER/DRIVER

DESCRIPTION – The 9357A/5446, 7446 and 9357B/5447, 7447 are TTL, BCD to 7-segment Decoder/Drivers consisting of NAND gates, input buffers and seven AND-OR-INVERT gates. They offer active LOW, high sink current outputs for driving indicators directly. Seven NAND gates and one driver are connected in pairs to make BCD data and its complement available to the seven decoding AND-OR-INVERT gates. The remaining NAND gate and three input buffers provide lamp test, blanking input/ripple-blanking output and ripple-blanking input.

The circuits accept 4-bit binary-coded-decimal (BCD) and, depending on the state of the auxiliary inputs, decodes this data to drive a 7-segment display indicator. The relative positive-logic output levels, as well as conditions required at the auxiliary inputs, are shown in the truth tables. Output configurations of the 9357A/5446, 7446; 9357B/5447, 7447 are designed to withstand the relatively high voltages required for 7-segment indicators. The 9357A/5446, 7446 outputs will withstand 30 V and the 9357B/5447, 7447 outputs will withstand 15 V with a maximum reverse current of 250 μA. Indicator segments requiring up to 20 mA of current may be driven directly from the 9357A/5446, 7446 or 9357B/5447, 7447 high performance output transistors. Display patterns for BCD input counts above nine are unique symbols to authenticate input conditions.

The 9357A/5446, 7446; 9357B/5447, 7447 incorporate automatic leading and/or trailing-edge zero-blanking control ($\overline{RBI}$ and $\overline{RBO}$). Lamp test ($\overline{LT}$) of these types may be performed at any time when the $\overline{BI}/\overline{RBO}$ node is a HIGH level. Both contain an overriding blanking input ($\overline{BI}$) which can be used to control the lamp intensity or to inhibit the outputs.

PIN NAMES		LOADING
A, B, C, D	BCD Inputs	1 U.L.
$\overline{RBI}$	Ripple Blanking Input	1 U.L.
$\overline{LT}$	Lamp Test Input	1 U.L.
$\overline{BI}/\overline{RBO}$	Blanking Input or	2.6 U.L.
	Ripple Blanking Output	5 U.L.
$\overline{a}$, to $\overline{g}$	Outputs	12.5 U.L.

$\overline{LT}$	L	X	X	X	X	X	H	L	L	L	L	L	L	L	D

NOTES:

(A) $\overline{BI/RBO}$ is wire-AND logic serving as blanking input (BI) and/or ripple-blanking output ($\overline{RBO}$). The blanking out (BI) must be open or held at a HIGH level when output functions 0 through 15 are desired, and ripple-blanking input ($\overline{RBI}$) must be open or at a HIGH level if blanking of a decimal 0 is not desired. X = input may be HIGH or LOW.

(B) When a LOW level is applied to the blanking input (forced condition) all segment outputs go to a LOW level regardless of the state of any other input condition.

(C) When ripple-blanking input ($\overline{RBI}$) and inputs A, B, C, and D are at LOW level, with the lamp test input at HIGH level, all segment outputs go to a HIGH level and the ripple-blanking output (RBO) goes to a LOW level (response condition).

(D) When the blanking input/ripple-blanking output ($\overline{BI/RBO}$) is open or held at a HIGH level, and a LOW level is applied to lamp test input, all segment outputs go to a LOW level.

TTL/MSI 9358/5448, 7448
9359/5449, 7449
BCD TO 7-SEGMENT DECODER

DESCRIPTION – The 9358/5448, 7448 and 9359/5449, 7449 are TTL, BCD to 7-Segment Decoders consisting of NAND gates, input buffers and seven AND-OR-INVERT gates. The 9358/5448, 7448 offers active HIGH, open-collector outputs for current-sourcing applications to drive logic circuits or discrete, active components. Seven NAND gates and one driver are connected in pairs to make BCD data and its complement available to the seven decoding AND-OR-INVERT gates. The remaining NAND gate and three input buffers provide lamp test, blanking input/ripple-blanking output and ripple-blanking input for the 9358/5448, 7448. Four NAND gates and four input buffers provide BCD data and its complement and a buffer provides blanking input for the 9359/5449, 7449.

The circuits accept 4-bit binary-coded-decimal (BCD) and, depending on the state of the auxiliary inputs, decodes this data to drive other components. The relative positive-logic output levels, as well as conditions required at the auxiliary inputs are shown in the truth tables.

The 9358/5448, 7448 circuit incorporates automatic leading and/or trailing edge zero-blanking control ($\overline{RBI}$ and $\overline{RBO}$). Lamp test ($\overline{LT}$) of these types may be performed at any time when the $\overline{BI}/\overline{RBO}$ node is a HIGH level. They contain an overriding blanking input ($\overline{BI}$) which can be used to control the lamp intensity or to inhibit the outputs.

$\overline{LT}$	L	X	X	X	X	X	H	H	H	H	H	H	H	H	4

NOTES:

(1) $\overline{BI/RBO}$ is wired-AND logic serving as blanking input ($\overline{BI}$) and/or ripple-blanking output ($\overline{RBO}$). The blanking out ($\overline{BI}$) must be open or held at a HIGH level when output functions 0 through 15 are desired, and ripple-blanking input ($\overline{RBI}$) must be open or at a HIGH level if blanking of a decimal 0 is not desired. X=input may be HIGH or LOW.

(2) When a LOW level is applied to the blanking input (forced condition) all segment outputs go to a LOW level, regardless of the state of any other input condition.

(3) When ripple-blanking input ($\overline{RBI}$) and inputs A, B, C, and D are at LOW level, with the lamp test input at HIGH level, all segment outputs go to a HIGH level and the ripple-blanking output ($\overline{RBO}$) goes to a LOW level (response condition).

(4) When the blanking input/ripple-blanking output ($\overline{BI/RBO}$) is open or held at a HIGH level, and a LOW level is applied to lamp-test input, all segment outputs go to a LOW level.

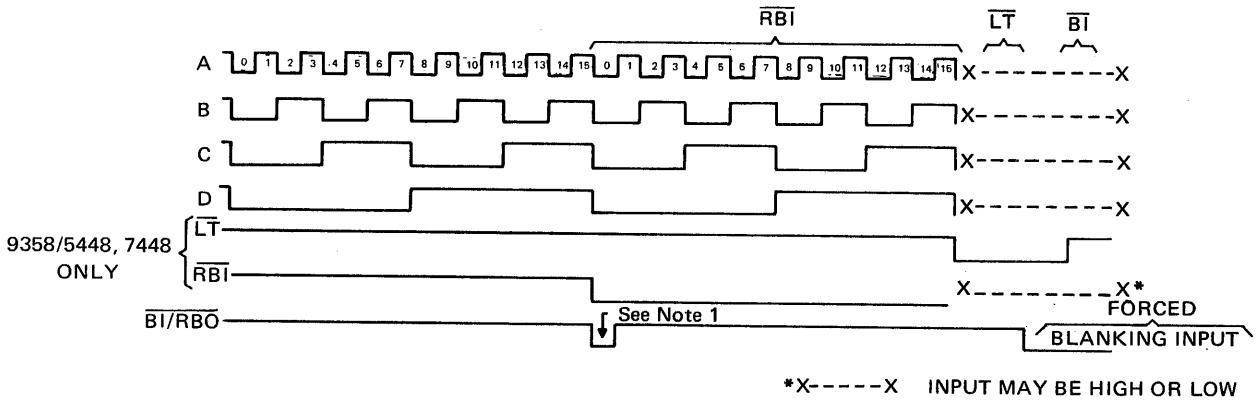
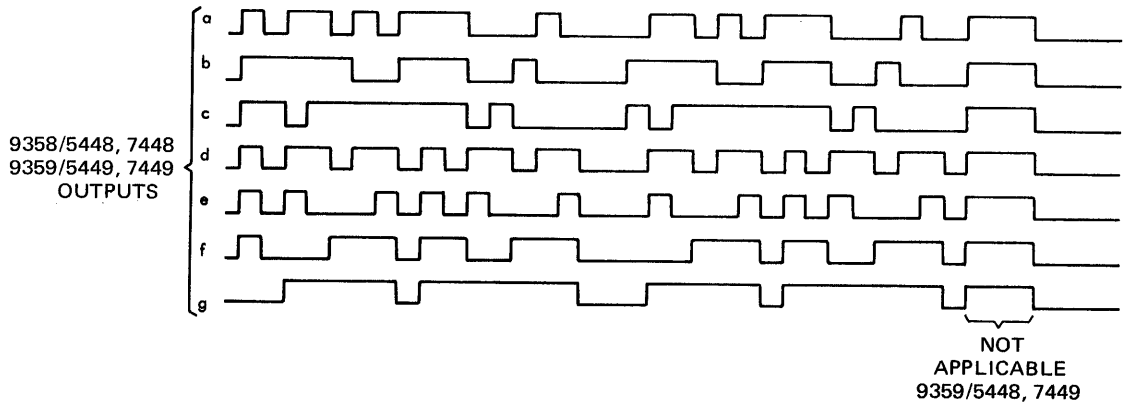
SWITCHING CHARACTERISTICS (Continued)





NOTE:

1. For the 9358/5448, 7448 this LOW level represents the $\overline{RBO}$ response. For the 9359/5449, 7449 a LOW level pulse is applied to the blanking input.

TTL/MSI 9360/54192, 74192
9366/54193, 74193
UP/DOWN DECADE AND BINARY COUNTERS

DESCRIPTION – The TTL/MSI 9360/54192, 74192 is a synchronous Up/Down BCD Decade Counter, and the TTL/MSI 9366/54193, 74193 is a synchronous Up/Down 4-Bit Binary Counter. Both counters have separate up/down clocks, parallel load facility, terminal count outputs for multidecade operation and an asynchronous overriding master reset. The circuits use TTL technology for high speed, and are compatible with the entire Fairchild TTL family.

- **SYNCHRONOUS OPERATION**
- **CASCADING CIRCUITRY INTERNALLY PROVIDED**
- **PARALLEL LOAD FACILITY**
- **ASYNCHRONOUS MASTER RESET**
- **30MHz TYPICAL COUNT FREQUENCY**
- **TYPICAL POWER DISSIPATION OF 300mW**
- **INPUT CLAMP DIODES**
- **ALL CERAMIC "HERMETIC" 16-LEAD DUAL IN-LINE PACKAGE**
- **TTL COMPATIBLE**

8

FUNCTIONAL DESCRIPTION – The 9360/54192, 74192 and 9366/54193, 74193 can be reset, preset and count up or down. These operating modes of the 9360/54192, 74192 and 9366/54193, 74193 are tabulated in Mode Selection table. The operating modes of the 9360/54192, 74192 and 9366/54193, 74193 are identical; the only difference between the devices is the count sequences.

Counting is synchronous, with the outputs changing state after the LOW to HIGH transition of either the Count-Up Clock (CP_U) or Count-Down Clock (CP_D). The direction of counting is determined by which clock input is pulsed while the other clock input is HIGH. (Incorrect counting will occur if both the count-up clock and count-down clock inputs are LOW simultaneously.) Both counters will respond to a clock pulse on either input by changing to the next appropriate state of the count sequence. (The state diagram for the 9360/54192, 74192 shows the regular sequence and in addition shows the sequence of states if a code greater than nine is present in the counter.

Both the 9360/54192, 74192 and the 9366/54193, 74193 have a parallel load (asynchronous) facility which permits the counter to be preset. Whenever the parallel load ($\overline{PL}$) input is LOW, and Master Reset is LOW, the information present on the Parallel Data inputs (P_A, P_B, P_C, P_D) will be loaded into the counters and appear on the outputs independent of the conditions of the clock inputs. When the Parallel Load Input goes HIGH this information is stored in the counters and when the counters are clocked they change to the next appropriate state in the count sequence. The Parallel Data inputs are inhibited when the Parallel Load is HIGH and have no effect on the counters.

The Terminal Count-Up ($\overline{TC}_U$) and Terminal Count-Down ($\overline{TC}_D$) outputs (carry and borrow respectively) allow multidecade counter operations without additional logic. The counters are cascaded by feeding the terminal count-up output to the count-up clock input and terminal count-down clock input of the following counter.

The terminal count-up outputs for the 9360/54192, 74192 and 9366/54193, 74193 are LOW when their count-up clock inputs are LOW and the counters are in state nine and state fifteen respectively. Similarly, the terminal count-down outputs are LOW when their count-down clock inputs are LOW and both counters are in state zero. Thus, when the 9360/54192, 74192 counter is in state nine and the 9366/54193, 74193 counter is in state fifteen and both are counting up, or both counters are in state zero and counting down, a clock pulse will change the counter's state on the rising edge and simultaneously clock the following counter through the appropriate active LOW terminal count output. There are two gate delays per state when these counters are cascaded.

The asynchronous Master Reset input (MR), when HIGH, overrides all input and clears the counters. Master reset overrides parallel load so that when both are activated the counters will be reset. (Obviously, both parallel load and master reset must not be deactivated simultaneously for predictable operation).

9360/54192, 74192 LOGIC EQUATIONS FOR TERMINAL COUNT

$$TC_U = Q_0 \cdot \overline{Q_1} \cdot \overline{Q_2} \cdot Q_3 \cdot \overline{CP_U}$$

$$TC_D = \overline{Q_0} \cdot \overline{Q_1} \cdot \overline{Q_2} \cdot \overline{Q_3} \cdot \overline{CP_D}$$

9366/54193, 74193 LOGIC EQUATIONS FOR TERMINAL COUNT

$$TC_U = Q_0 \cdot Q_1 \cdot Q_2 \cdot Q_3 \cdot \overline{CP_U}$$

$$TC_D = \overline{Q_0} \cdot \overline{Q_1} \cdot \overline{Q_2} \cdot \overline{Q_3} \cdot \overline{CP_D}$$

TTL/MSI 93S62

9-INPUT PARITY CHECKER/GENERATOR

TO BE ANNOUNCED

DESCRIPTION – The TTL/MSI 93S63 is a very high speed 9-input parity checker/generator for use in error detection in data transmission applications. The 93S62 is implemented with Schottky barrier diode clamped TTL technology to insure high speed.

The 93S62 provides odd and even parity for up to nine data bits. The even parity output (PE) will be HIGH is an even number of logic ones are present on the inputs. The odd parity output (PO) will be HIGH if an odd number of logic ones are present. An enable input ($\overline{E}$) is provided which forces both outputs to a LOW level when the input is HIGH.

- **INPUT TO OUTPUT DELAY 16 ns**
- **OUTPUT ENABLE TERMINAL**
- **BOTH ODD AND EVEN PARITY OUTPUTS PROVIDED**
- **GENERATES A PARITY BIT FOR UP TO NINE BITS**
- **CHECKS FOR PARITY ON UP TO NINE BITS**
- **EASILY EXPANDABLE**
- **SCHOTTKY-CLAMPED TTL DESIGN**

PIN NAMES

TTL/MSI 93H72
HIGH SPEED 4-BIT SHIFT REGISTER WITH ENABLE

DESCRIPTION — The 93H72 High Speed MSI 4-Bit Shift Register is a multifunctional sequential logic block which is useful in a wide variety of register applications. It may be used in serial-serial, shift left, shift right, serial-parallel, parallel-serial and parallel-parallel data transfers. The circuit is compatible with all Fairchild 9300 MSI/TTL Integrated circuits.

The 93H72 has three synchronous modes of operation: shift, parallel load and hold (do nothing). The hold capability permits information storage in the register independent of the clock.

- **60 MHz TYPICAL SHIFT FREQUENCY**
- **SYNCHRONOUS PARALLEL ENTRY**
- **DATA HOLD (DO NOTHING) INDEPENDENT OF CLOCK**
- **FULLY SYNCHRONOUS WITH EDGE TRIGGERED TYPE CHARACTERISTICS ON INPUTS (EXCEPT $\overline{MR}$)**
- **ASYNCHRONOUS MASTER RESET**
- **TYPICAL POWER DISSIPATION OF 475 mW**
- **TTL COMPATIBLE**
- **ALL CERAMIC "HERMETIC" 16-LEAD DUAL IN-LINE AND FLAT PACKAGES**
- **INPUT CLAMP DIODES**

PIN NAMES

		LOADING (Note a)
$\overline{E}$	Active LOW Enable Input	2 U.L.
$\overline{PE}$	Active LOW Parallel Enable Input	1 U.L.

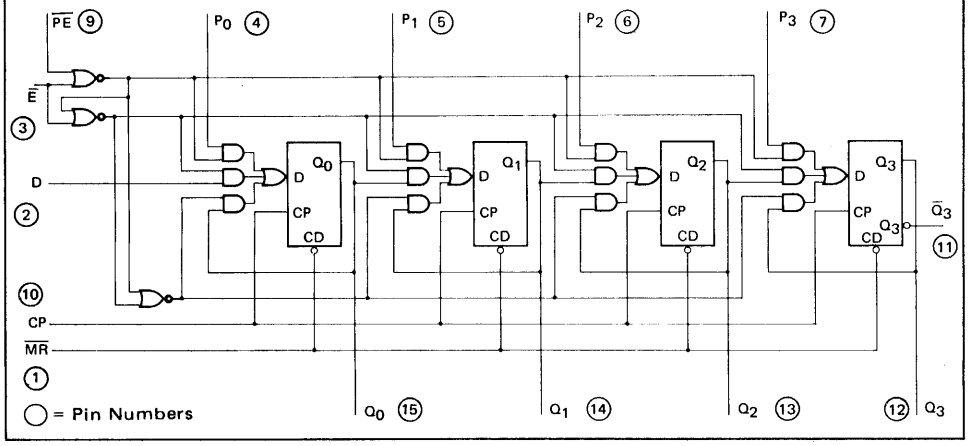
LOGIC DIAGRAM



8

FUNCTIONAL DESCRIPTION – The 93H72 is a 4-bit shift register with three modes of operation: shift, parallel load and hold (do nothing). The register is fully synchronous with any output change occuring after the rising clock edge. The 93H72 features edge triggered type characteristics on all inputs (except $\overline{MR}$) which means there are no restrictions on the activity of these inputs ($\overline{PE}$, $\overline{E}$, P_0, P_1, P_2, P_3, D) for logic operation except for the set up requirements prior to the LOW to HIGH clock transition.

The mode of operation of the 93H72 is determined by the two inputs, parallel enable ($\overline{PE}$) and enable ($\overline{E}$) as shown in Table I. The active LOW enable when HIGH, places the register in the hold mode with the register flip-flops retaining their information. When the enable is activated (LOW) the parallel enable ($\overline{PE}$) determines whether the register operates in a shift or parallel data entry mode.

When the enable is LOW and the parallel enable input is LOW the parallel inputs are selected and will determine the next condition of the register synchronously with the clock as shown in Table II. In this mode the element appears as four common clocked D flip-flops. With $\overline{E}$ LOW and the $\overline{PE}$ input HIGH the device acts as a 4-bit shift register with serial data entry through the D input shown in Table III. In both cases the next state of the flip-flops occurs after the LOW to HIGH transition of the clock input.

The asynchronous active LOW master reset overrides all inputs and clears the register forcing outputs Q_{0-3} LOW and $\overline{Q}_3$ HIGH.

To provide for left shift operation, P_3 is used as the serial data input and Q_0 is the serial data output. The other outputs are tied back to the previous parallel inputs, with Q_3 tied to P_2, Q_2 tied to P_1 and Q_1 tied to P_0.

TABLE I. MODE SELECTION

NOTES:
1. The actual testing procedures used to guarantee the Electrical Characteristics are contained in a detailed Customer Sample Specification. A copy of this specification can be obtained from Fairchild Digital Product Marketing, Mountain View, California.
2. Conditions for testing, not shown in the Table, are chosen to guarantee operation under "worst case" conditions.
3. The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.
4. Typical limits are at V_{CC} = 5.0 V, 25°C and max. loading.
5. Not more than one output should be shorted at a time.

SWITCHING CHARACTERISTICS (T_A = 25°C, V_{CC} = 5.0 V, C_L = 15 pF)

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNITS	CONDITIONS
f_{sr}	Shift Right Frequency	45	60		MHz	
t_{PHL}	Turn On Delay from Positive Clock Edge to Any Output		14.5	21	ns	Fig. 1
t_{PLH}	Turn Off Delay from Positive Clock Edge to Any Output		10	16	ns	Fig. 1
t_{PHL} ($\overline{MR}$)	Delay from Master Reset to Any Output		19	26	ns	Fig. 4
t_s (Data)	Setup Time for Data (D, P_0, P_1, P_2, P_3)	7.0	3.5		ns	Fig. 3
t_s ($\overline{E}$)	Setup Time for Enable, $\overline{E}$ (H or L)	17	9.0		ns	Fig. 2
t_s($\overline{PE}$)	Setup Time for Parallel Enable, $\overline{PE}$	19	10		ns	Fig. 1
t_{rec}($\overline{MR}$)	Recovery Time for $\overline{MR}$	7.0	3.0		ns	Fig. 4
t_{pw} $\overline{MR}$	Required Pulse Width for $\overline{MR}$	19	11		ns	Fig. 4
t_{HOLD} (Data) ($\overline{E}$) or ($\overline{PE}$)	Hold Time for Data, $\overline{E}$, or $\overline{PE}$	0			ns	Fig. 1, 2 and 3

NOTES:

6. SET-UP TIME: t_s is defined as the minimum time required for the logic level to be present at the logic input prior to the clock transition from LOW to HIGH in order for the register to respond.
7. HOLD TIME: t_{HOLD} is defined as the minimum time following the clock transition from LOW to HIGH that the logic level must be maintained to insure continued recognition.
8. RECOVERY TIME FOR $\overline{MR}$: t_{rec} ($\overline{MR}$) is defined as the minimum time required between the end of the reset pulse and the clock transition from LOW to HIGH in order for the flip-flop(s) to respond to the clock.

SWITCHING TIME WAVEFORMS

TTL/MSI 9375/5475, 7475
9377/5477, 7477
4-BIT LATCH

DESCRIPTION – The TTL/MSI 9375/5475, 7475 and 9377/5477, 7477 are latches used as temporary storage for binary information between processing units and input/output or indicator units. Information present at a data (D) input is transferred to the Q output when the clock is HIGH and the Q output will follow the data input as long as the clock remains HIGH. When the clock goes LOW, the information (that was present at the data input at the time the transition occurred) is retained at the Q output until the clock is permitted to go HIGH.

The 9375/5475, 7475 features complementary Q and $\overline{Q}$ output from a 4-bit latch and is available in the 16-lead packages. For higher component density applications the 9377/5477, 7477 4-bit latch is available in the 14-lead package with $\overline{Q}$ outputs omitted.

PIN NAMES		LOADING
D_1, D_2, D_3, D_4	Data Inputs	2 U.L.
$\overline{CP}_{1\text{-}2}$	Clock Input Latches 1 & 2	4 U.L.
$\overline{CP}_{3\text{-}4}$	Clock Input Latches 3 & 4	4 U.L.
Q_1, Q_2, Q_3, Q_4	Latch Outputs	10 U.L.
$\overline{Q}_1, \overline{Q}_2, \overline{Q}_3, \overline{Q}_4$	Complementary Latch Outputs	10 U.L.

Note: 1 Unit Load (U.L.) = 40 μA HIGH/1.6 mA LOW

TRUTH TABLE

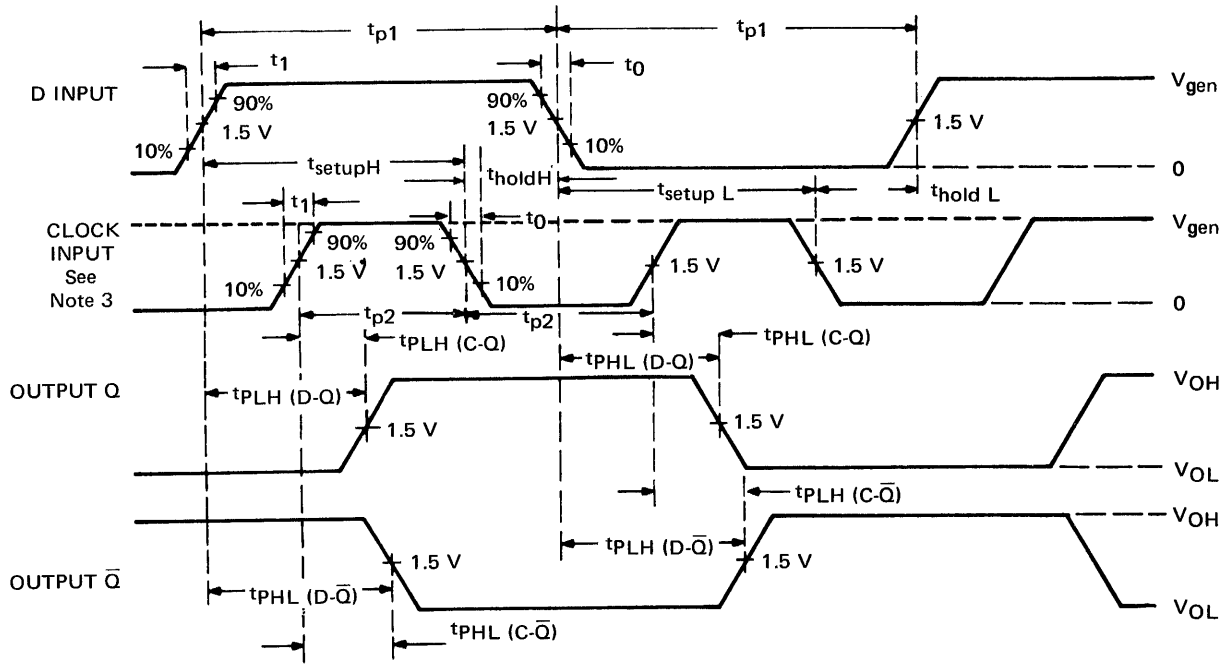
TEST CIRCUIT



VOLTAGE WAVEFORMS

NOTES:
1. The pulse generators have the following characteristics: V_{gen} = 3 V, $t_1 = t_0 \leq 10$ ns, and $Z_{out} \approx 50\Omega$. For pulse generator A t_{p1} = 1 μs and PRR = 500 kHz. For pulse generator B, t_{p2} = 500 ns and PRR = 1 MHz. Positions of D-input and clock-input pulses are varied with respect to each other to verify setup and hold times.
2. Each latch is tested separately.
3. When measuring t_{PLH} (D-Q) and t_{PHL} (D-Q) or t_{PHL} (D-Q) and t_{PLH} (D-$\overline{Q}$) for the 9375/5475, 7475, clock input must be held at high level.

Fig. A SWITCHING TIMES

*Complementary Q outputs are on the 9375/5475, 7475.

TTL/MSI 9380/5480, 7480
GATED FULL ADDER

DESCRIPTION – The TTL/MSI 9380/5480, 7480 is a single-bit, high speed, Binary Full Adder with gated complementary inputs, complementary sum (Σ and $\overline{\Sigma}$) outputs and inverted carry output. It is designed for medium and high speed, multiple-bit, parallel-add/serial-carry applications. The circuit utilizes DTL for the gated inputs and high speed, high fan out TTL for the sum and carry outputs. The circuit is entirely compatible with both DTL and TTL logic families. The implementation of a single-inversion, high speed, Darlington-connected serial-carry circuit minimizes the necessity for extensive "lookahead" and carry-cascading circuits.

PIN NAMES

		LOADING

Fig. A – SWITCHING TIMES

TTL/MSI 9382/5482, 7482
2-BIT FULL ADDER

DESCRIPTION – The TTL/MSI 9382/5482,7482 is a Full Adder which performs the addition of two 2-bit binary numbers. The sum (Σ) outputs are provided for each bit and the resultant carry (C_2) is obtained from the second bit. Designed for medium to high speed, multiple-bit, parallel-add/serial-carry applications, the circuit utilized high speed, high fan out TTL. The implementation of a single-inversion, high speed, Darlington-connected serial-carry circuit within each bit minimizes the necessity for extensive "lookahead" and carry-cascading circuits.

LOGIC SYMBOL

SWITCHING CHARACTERISTICS (T_A = 25°C)

SYMBOL	PARAMETER	LIMITS MIN.	LIMITS TYP.	LIMITS MAX.	UNITS	TEST CONDITIONS
t_{PLH}	Turn Off Delay Input to Output		18	25	ns	V_{CC} = 5.0 V
t_{PHL}	Turn On Delay Input to Output		18	25	ns	

NOTES:
(1) For conditions shown as MIN. or MAX., use the appropriate value specified under recommended operating conditions for the applicable circuit type.
(2) Typical limits are at V_{CC} = 5.0 V, 25°C.
(3) Output sink current is supplied through a resistor to V_{CC}.
(4) A and B are tested separately. When A is 4.5 V, B is 0 V, and vice versa.
(5) A and B are tested separately. When A is 0.4 V, B is 5.25 V, and vice versa.
(6) This test guarantees operation free of input latch-up over the specified operating supply voltage range.

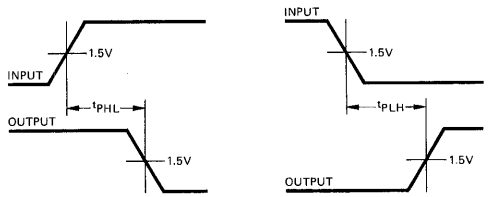
SWITCHING CHARACTERISTICS



8

TTL/MSI 93H87/54H87, 74H87

HIGH SPEED 4-BIT TRUE/COMPLEMENT, ZERO/ONE ELEMENT

DESCRIPTION — The 93H87/54H87, 74H87 will perform four functions; use of the B and C control inputs determine the function performed. A 4-bit binary number (A) can be transferred to the output (Y) in either true or complementary form. In addition the control inputs can also set all outputs to LOW or HIGH independent of the state of the data inputs.

PIN NAMES		LOADING
A_1, A_2, A_3, A_4	Data Inputs	1.0 U.L.
B, C	Control Inputs	1.0 U.L.
Y_1, Y_2, Y_3, Y_4	Outputs	10 U.L.

1 Unit Load (U.L.) = 40 μA HIGH/1.6 mA LOW.

NOTES:
1. The pulse generator has the following characteristics: V_{gen} = 3 V, $t_1 = t_0$ = 7 ns, t_p = 500 ns, PRR = 1 MHz, and $Z_{out} \approx 50\Omega$.
2. Inputs not specified are open.

Fig. A – SWITCHING TIMES

TTL/MSI 9390/5490, 7490
DECADE COUNTER

DESCRIPTION – The TTL/MSI 9390/5490, 7490 is a Decade Counter which consists of four dual rank, master slave flip-flops internally interconnected to provide a divide-by-two counter and a divide-by-five counter. Count inputs are inhibited, and all outputs are returned to logical zero or a binary coded decimal (BCD) count of 9 through gated direct reset lines. The output from flip-flop A is not internally connected to the succeeding stages, therefore the count may be separated into these independent count modes:

A. If used as a binary coded decimal decade counter, the $\overline{CP}_{BD}$ input must be externally connected to the Q_A output. The $\overline{CP}_A$ input receives the incoming count, and a count sequence is obtained in accordance with the BCD count for nine's complement decimal application.

B. If a symmetrical divide-by-ten count is desired for frequency synthesizers or other applications requiring division of a binary count by a power of ten, the Q_D output must be externally connected to the $\overline{CP}_A$ input. The input count is then applied at the $\overline{CP}_{BD}$ input and a divide-by-ten square wave is obtained at output Q_A.

C. For operation as a divide-by-two counter and a divide-by-five counter, no external interconnections are required. Flip-flop A is used as a binary element for the divide-by-two function. The $\overline{CP}_{BD}$ input is used to obtain binary divide-by-five operation at the Q_B, Q_C, and Q_D outputs. In this mode, the two counters operate independently; however, all four flip-flops are reset simultaneously.

PIN NAMES		LOADING
R_0	Reset-Zero Inputs	1 U.L.
R_9	Reset-Nine Inputs	1 U.L.
$\overline{CP}_A$	Clock Input	2 U.L.
$\overline{CP}_{BD}$	Clock Input	4 U.L.
Q_A, Q_B, Q_C, Q_D	Outputs	10 U.L.

1 Unit Load (U.L.) = 40μA HIGH/1.6mA LOW.

TTL/MSI 9391/5491, 7491
8-BIT SHIFT REGISTER

DESCRIPTION – The TTL/MSI 9391/5491, 7491 is a serial-in, serial-out, 8-Bit Shift Register utilizing TTL technology. It is composed of eight RS master/slave flip-flops, input gating, and a clock driver. The register is capable of storing and transferring data at clock rates up to 18 MHz while maintaining a typical noise-immunity level of 1.0V. Power dissipation is typically 175 mW; a full fan out of 10 is available from the outputs.

Single-rail data and input control are gated through inputs A and B and an internal inverter to form the complementary inputs to the first bit of the shift register. Drive for the internal common clock line is provided by an inverting clock driver. Each of the inputs (A, B, and $\overline{CP}$) appear as only one TTL input load.

The clock pulse inverter/driver causes these circuits to shift information to the output on the positive edge of an input clock pulse, thus enabling the shift-register to be fully compatible with other edge-triggered synchronous functions.

TTL/MSI 9392/5492, 7492

DIVIDE-BY-TWELVE COUNTER (DIVIDE-BY-TWO AND DIVIDE-BY-SIX)

DESCRIPTION – The TTL/MSI 9392/5492, 7492 is a 4-Bit Binary Counter consisting of four master slave flip-flops which are internally interconnected to provide a divide-by-two counter and a divide-by-six counter. A grated direct reset line is provided which inhibits the count inputs and simultaneously returns the four flip-flop outputs to a LOW level. As the output from flip-flop A is not internally connected to the succeeding flip-flops, the counter may be operated in two independent modes:

A. When used as a divide-by-twelve counter, output Q_A must be externally connected to input $\overline{CP}_{BC}$. The input count pulses are applied to input $\overline{CP}_A$. Simultaneous divisions of 2, 6 and 12 are performed at the Q_A, Q_C and Q_D outputs as shown in the truth table.

B. When used as a divide-by-six counter, the input count pulses are applied to input $\overline{CP}_{BC}$. Simultaneously, frequency divisions of 3 and 6 are available at the Q_C and Q_D outputs. Independent use of flip-flop A is available if the reset function coincides with reset of the divide-by-six counter.

These circuits are completely compatible with TTL and DTL logic families.

PIN NAMES		LOADING

TTL/MSI 9393/5493, 7493
4-BIT BINARY COUNTER

DESCRIPTION – The TTL/MSI 9393/5493, 7493 is a 4-Bit Binary Counter consisting of four master/slave flip-flops which are internally interconnected to provide a divide-by-two counter and a divide-by-eight counter. A gated direct reset line is provided which inhibits the count inputs and simultaneously returns the four flip-flop outputs to a LOW level. As the output from flip-flop A is not internally connected to the succeeding flip-flops the counter may be operated in two independent modes:

1. When used as a 4-bit ripple-through counter, output Q_A must be externally connected to input $\overline{CP}_B$. The input count pulses are applied to input $\overline{CP}_A$. Simultaneously divisions of 2, 4, 8 and 16 are performed at the Q_A, Q_B, Q_C, and Q_D outputs as shown in the truth table.
2. When used as a 3-bit ripple-through counter, the input count pulses are applied to input $\overline{CP}_B$. Simultaneous frequency divisions of 2, 4, and 8 are available at the Q_B, Q_C, and Q_D outputs. Independent use of flip-flop A is available if the reset function coincides with reset of the 3-bit ripple-through counter.

These circuits are completely compatible with TTL and DTL logic families.

PIN NAMES

		LOADING
R_0	Reset-Zero Input	1 U.L.

TTL/MSI 9394/5494, 7494
4-BIT SHIFT REGISTER

DESCRIPTION – The TTL/MSI 9394/5494, 7494 is composed of four RS master/slave flip-flops, four AND-OR-INVERT gates and four inverter-drivers. Internal interconnections of these functions provide a versatile register which performs right-shift operations as a serial-in, serial-out register or as a dual-source, parallel-to-serial converter. A number of these registers may be connected in series to form an n-bit register.

All flip-flops are simultaneously set to the LOW state by applying a HIGH level voltage to the clear input. This condition may be applied independent of the state of the clock input, but not independent of state of the preset input. Preset input is independent of the clock and clear states.

The flip-flops are simultaneously set to the HIGH state from either of two preset input sources. Preset inputs P_{1A} through P_{1D} are activated during the time that a positive pulse is applied to preset 1 if preset 2 is at a LOW level. When the logic levels at preset 1 and preset 2 are reversed, preset inputs P_{2A} through P_{2D} are active.

Transfer of information to the outputs occurs when the clock input goes from a LOW to a HIGH level. Since the flip-flops are RS master/slave circuits, the proper information must appear at the RS inputs of each flip-flop prior to the rising edge of the clock input waveform. The serial input provides this information for the first flip-flop. The outputs of the subsequent flip-flops provide information for the remaining RS inputs. The clear input, preset 1, and preset 2 must be at a LOW state when clocking occurs.

TTL/MSI 9395/5495, 7495
4-BIT RIGHT-SHIFT, LEFT-SHIFT REGISTER

DESCRIPTION – The TTL/MSI 9395/5495, 7495 Shift Register is composed of four RS master/slave flip-flops, four AND-OR-INVERT gates, one AND-OR gate and six inverters-drivers. Internal interconnections of these functions provide a versatile register which will perform right-shift or left-shift operations dependent upon the logic input level to the mode control. A number of these registers may be connected in series to form an n-bit right-shift or left-shift register. This register can also be used as a parallel-in, parallel-out storage register with gate (mode) control.

When a LOW level is applied to the mode control input, the number 1 AND gates are enabled and the number-2 AND gates are inhibited. In this mode the output of each flip-flop is coupled to the RS inputs of the succeeding flip-flop and right-shift operation is performed by clocking at the clock 1 input. In this mode, serial data is entered at the serial input. Clock 2 and parallel inputs A through D are inhibited by the number 2 AND gates.

When a HIGH level is applied to the mode control input, the number 1 AND gates are inhibited (decoupling the outputs from the succeeding RS inputs to prevent right-shift) and the number 2 AND gates are enabled to allow entry of data through parallel inputs A through D and clock 2. This mode permits parallel loading of the register, or with external interconnection, shift-left operation. In this mode, shift-left can be accomplished by connecting the output of each flip-flop to the parallel input of the previous flip-flop (Q_D to input C, and etc.), and serial data is entered at input D.

Clocking for the shift register is accomplished through the AND-OR gate E which permits separate clock sources to be used for the shift-right and shift-left modes. If both modes can be clocked from the same source, the clock input may be applied commonly to clock 1 and clock 2. Information must be present at the R-S inputs of the master-slave flip-flops prior to clocking. Transfer of information to the output pins occurs when the clock input goes from a HIGH to a LOW level.

TTL/MSI 9396/5496, 7496
5–BIT SHIFT REGISTER

DESCRIPTION – The TTL/MSI 9396/5496, 7496 5-Bit Shift Register consists of five RS master/slave flip-flops connected to perform parallel-to-serial or serial-to-parallel conversion of binary data. Since both inputs and outputs to all flip-flops are accessible, parallel-in/parallel-out or serial-in/serial-out operation may be performed.

All flip-flops are simultaneously set to the LOW state by applying a low level voltage to the clear input. This condition may be applied independent of the state of the clock input.

The flip-flops may be independently set to the HIGH state by applying a high level voltage to both the preset input of the specific flip-flop and the common preset input. The parallel enable input is provided to allow setting each flip-flop independently or setting two or more flip-flops simultaneously. Preset is independent of the state of the clock input or clear input.

Transfer of information to the output pins occurs when the clock input goes from a LOW level to a HIGH level. Since the flip-flops are RS master/slave circuits, the proper information must appear at the RS inputs of each flip-flop prior to the rising edge of the clock input voltage waveform. The serial input provides this information to the first flip-flop, while the outputs of the subsequent flip-flops provide information for the remaining RS inputs. The clear input must be at a HIGH level and the preset input must be at a LOW level when clocking occurs.

PIN NAMES

		LOADING
PL	Parallel Load Input	5 U.L.
P_A, P_B, P_C, P_D, P_E	Parallel Data Inputs	1 U.L.
D_S	Serial Data Input	1 U.L.
CP	Clock Input	1 U.L.
$\overline{C}_L$	Clear Input	1 U.L.
Q_A, Q_B, Q_C, Q_D, Q_E	Parallel Data Outputs	10 U.L.

1 Unit Load (U.L.) = 40 μA HIGH/1.6 mA LOW

TRUTH TABLE

PRESET COMMON	PRESET BIT	$\overline{CLEAR}$	SERIAL INPUT	CLOCK	OUTPUT	
L	X	L	X	X	L	Clear all output to logical "L".
H	H	H	X	X	H	Preset outputs to 1 input
H	L	H	X	X	L	bit configuration.
L	X	H	H	enable	H	Serial input shift right.
L	X	H	L	enable	L	Serial-to-parallel conversion.

NOTES:
(a) After loading data, set clear to "H" and preset to "L" clock to give parallel to serial conversion.
(b) Information transferred on rising edge of clock pulse.

(c) Do not enable preset and clear simultaneously.
Preset – "H" Clear – "L" = undefined output. Dependent upon which enable is removed first.
(d) X Either logical "L" or logical "H".

TTL/MSI 93141/74141
1-OF-10 DECODER/DRIVER (NIXIE)

DESCRIPTION — The 93141/74141 is a BCD-to-Decimal Decoder Driver that is designed to take a 4-bit BCD code input and drive cold-cathode indicator tubes. This decoder utilizes design improvements that minimize switching transients in order to maintain a stable display.

The segments and numeric designations chosen to represent the decimal numbers are shown below. For binary inputs 10 through 15, the outputs are off. These invalid codes can be used in blanking leading or trailing-edge zeros in a display.

The ten high performance, NPN output transistors have a maximum reverse current of 50μA at 55V. Typical power dissipation is 55 mW.

PIN NAMES

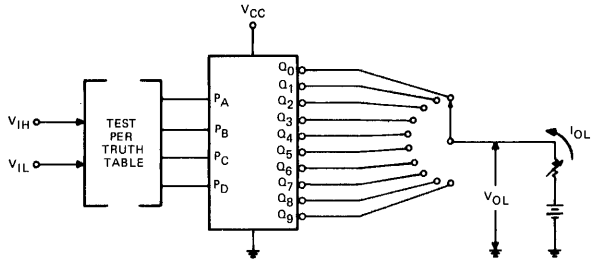
(2) Typical limits are at V_{CC} = 5.0 V, 25°C.
(3) Voltage values are with respect to network ground terminal.
(4) This is the maximum voltage which should be applied to any output when it is in the off state.

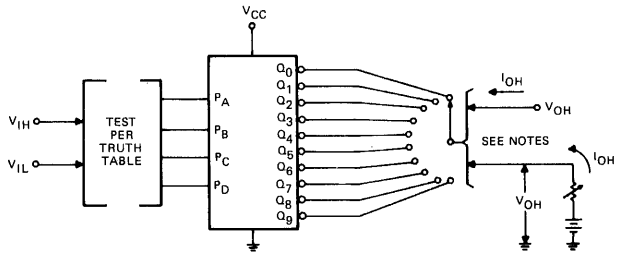
PARAMETER MEASUREMENT INFORMATION

DC TEST CIRCUITS*



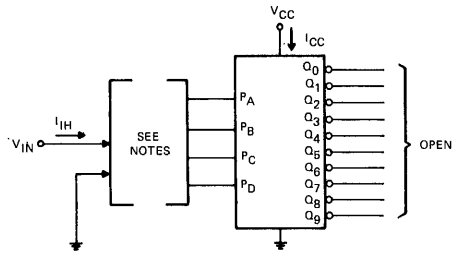
Each output is tested separately.

Fig. 1 V_{IH}, V_{IL}, V_{OL}



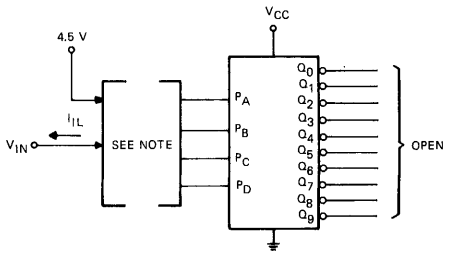
1. Each output is tested separately.
2. V_{OH} is tested at I_{OH} = 0.5 mA and I_{OH} is tested at V_{OH} = 55 V for all inputs counts. I_{OH} is tested also at V_{OH} = 30 V for input counts 10 through 15.

Fig. 2 V_{IH}, V_{IL}, I_{OH}, V_{OH}



1. When testing I_{IH}, each input is tested separately with all other inputs grounded.
2. When testing I_{CC}, all inputs are grounded.

Fig. 3 I_{IH}, I_{CC}



Each input is tested separately, with all other inputs at 4.5 V.

Fig. 4 I_{IL}

*Arrows indicate actual direction of current flow. Current into a terminal is a positive value.

APPLICATIONS

GENERAL – When these decoder/drivers are used in close proximity (on the same circuit board) with standard digital integrated circuits, care should be exercised to ensure that the impedance of the ground bus (including interconnections) is sufficiently low to absorb the normal energy levels resulting from switching the tube elements.

DRIVING INDICATOR TUBES – As shown in Figure 5, the 93141/74141 requires no external components for driving cold-cathode indicator tubes. The versatility here is limited only by the system capability to control the data inputs.

A suggested method for blanking extraneous zeros is shown in Figure 6. Any input count above decimal 9 may be used for blanking. In the following application decimal 12 is used. When the most significant bit (MSB) or the least significant bit (LSB) is decimal 0(0000), that indicator is blanked while decimal 12 (binary 1100) is applied to the 93141/74141 inputs causing all the outputs to be off. If the MSB or LSB is decimal 0 and being blanked, this signal is gated with and blanks the next smaller digit. This scheme is easily expandable to n digits.

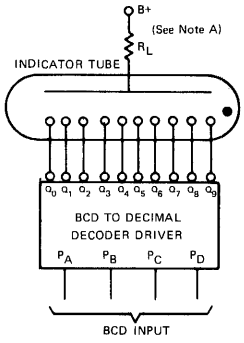


Fig. 5

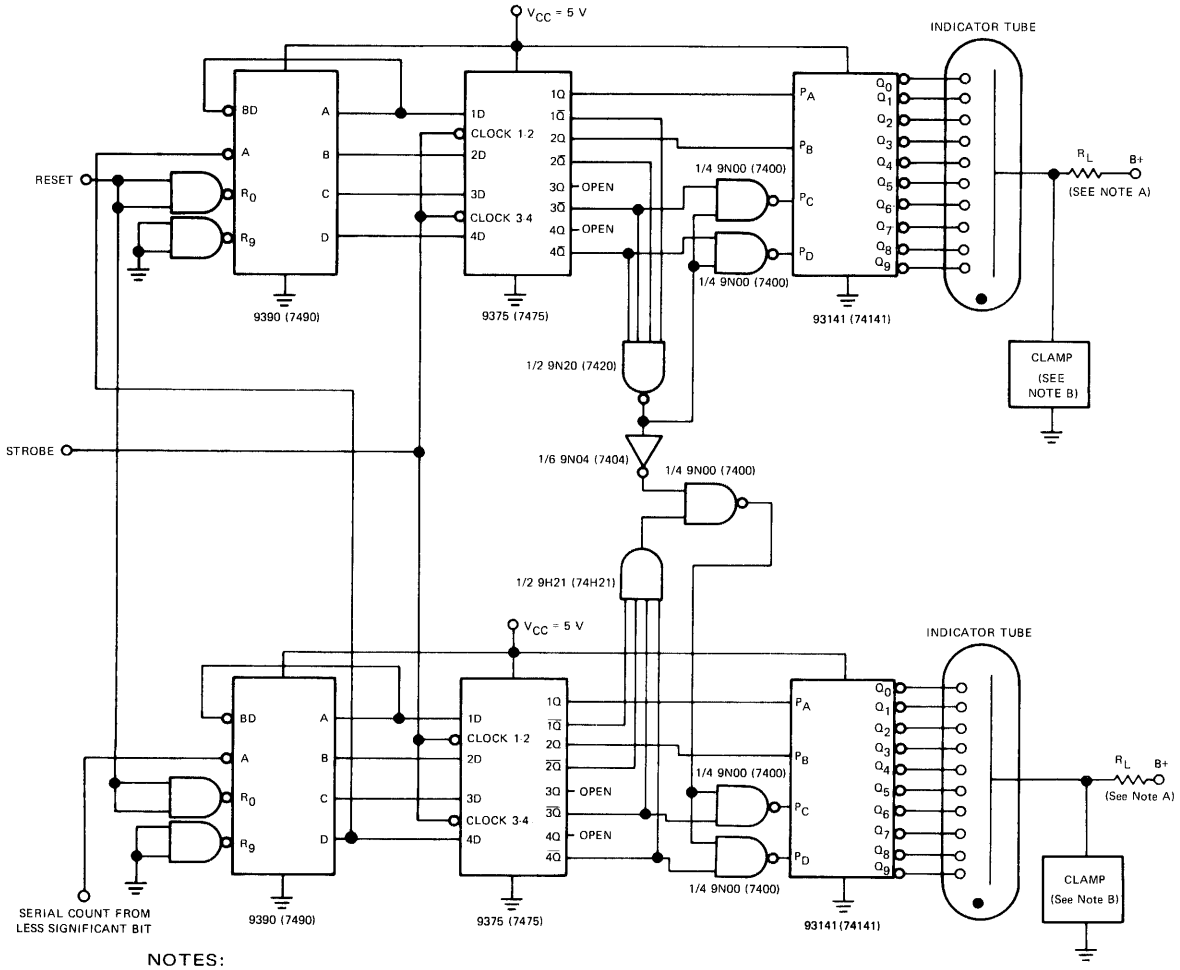

NOTES:

A. Values for B+ and R_L are as specified by the tube manufacturer.

B. Blanking is assured only if the anode of the indicator tube is clamped at 150 volts maximum.

Fig. 6

TTL/MSI 93150/54150, 74150
93151/54151, 74151•93152/54152, 74152
16-INPUT AND 8-INPUT MULTIPLEXER

DESCRIPTION – The 93150/54150, 74150 is a 16-Input Multiplexer which features active LOW strobe and internal select decoding. A HIGH at the strobe input forces the output HIGH regardless of input conditions.

The 93151/54151, 74151 is an 8-Input Multiplexer with active LOW strobe, internal select decoding and complementary outputs.

The 93152/54152, 74152 is an 8-Input Multiplexer with internal select decoding and a single inverted output.

In each of the multiplexers data is routed from a particular input to the output according to the binary code applied to the select inputs.

Typical power dissipations are: 93150/54150, 74150 – 200 mW; 93151/54151, 74151 – 145 mW; 93152/54152, 74152 – 130 mW.

TTL/MSI 93153/54153, 74153
DUAL 4-INPUT DATA SELECTOR/MULTIPLEXER

DESCRIPTION — The 93153/94153, 74153 is a monolithic, high speed, Dual 4-Input Digital Multiplexer. It consists of two multiplexing circuits with separate strobe inputs for each of the two 4-line sections, and with common input select logic. Active pull up outputs ensure high drive and high speed performance with a full fan out of 10 unit loads in the LOW state. Typical power dissipation is 180 mW.

PIN NAMES

		LOADING
1G, 2G, $1C_{0-3}$, $2C_{0-3}$, A, B	Inputs	1 U.L.
1Y, 2Y	Outputs	10 U.L.

TTL/MSI 93164/54164, 74164

8-BIT SERIAL TO PARALLEL CONVERTER

TO BE ANNOUNCED

DESCRIPTION – The 93164/54164, 74164 are 8-Bit Shift Registers with gated serial inputs and an asynchronous clear facility. The gated serial inputs (A and B) permit control over incoming data, as a LOW at either (or both) input(s) inhibits entry of the new data and resets the first flip-flop to the LOW level at the next clock pulse. A HIGH level input enables the other input which will then determine the state of the first flip-flop. Data at the serial inputs may be changed while the clock is HIGH, but only information meeting the setup requirements will be entered. Clocking occurs on the LOW to HIGH level transition of the clock input. All inputs are diode-clamped to minimize transmission-line effects and are buffered to present one TTL load.

PIN NAMES

		LOADING
CP	Clock Pulse Input	1 U.L.
$\overline{C_L}$	Clear Input	1 U.L.

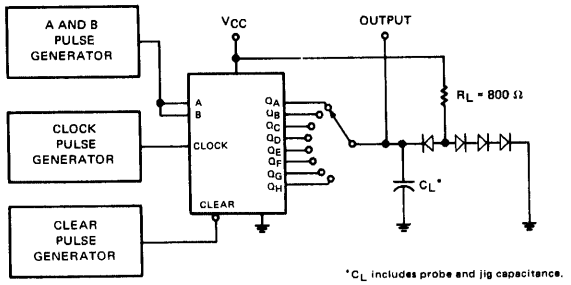
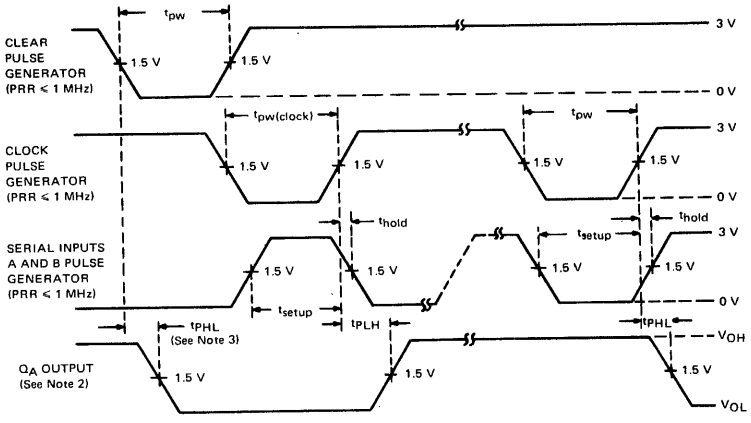
PARAMETER MEASUREMENT INFORMATION

SWITCHING CHARACTERISTICS



TEST CIRCUIT



VOLTAGE WAVEFORMS

NOTES:
1. The pulse generators have the following characteristics: $t_r \leq 10$ns, $t_f \leq 10$ns, duty cycle ≤ 50%, $Z_{OUT} = 50\Omega$.
2. Q_A output is illustrated. Relationship of serial input A and B data to other Q outputs is illustrated in the typical shift sequence.
3. Outputs are set to the HIGH level prior to the measurement of t_{PHL} from the clear input.

Fig. A SWITCHING TIMES

TTL/MSI 93165/54165, 74165
8-BIT PARALLEL TO SERIAL CONVERTER

DESCRIPTION — The 93165/54165, 74165 is an 8-Bit Serial Shift Register which features parallel-in access to each stage, gated clock input, complementary outputs from the last stage and input clamp diodes. Parallel-in access to each stage is made possible by eight individual direct data inputs which are enabled by a LOW level at the shift/load input.

Clocking is accomplished through a 2-input positive-NOR gate, permitting one input to be used as a clock-inhibit function. Holding either of the clock inputs HIGH inhibits clocking, and holding either clock input LOW with the load input HIGH enables the other clock input. The clock-inhibit input should be changed to the HIGH level only while the clock input is HIGH. Parallel loading is inhibited as long as the load input is HIGH. When taken LOW, data at the parallel inputs are loaded directly into the register independently of the state of the clock.

Typical power dissipation is 210 mW and maximum input clock frequency is typically 26 MHz.

PIN NAMES		LOADING

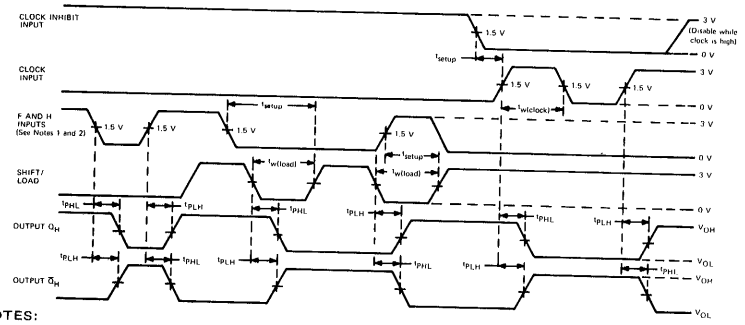
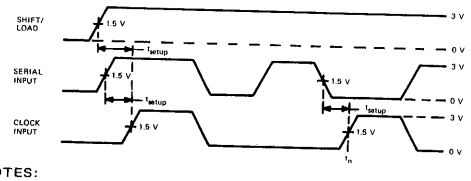
PARAMETER MEASUREMENT INFORMATION

SWITCHING CHARACTERISTICS



NOTES:
1. The remaining six data inputs and the serial input are LOW.
2. Prior to test, HIGH level data is loaded into H input.
3. The input pulse generators have the following characteristics:
   $t_r \leq 10$ ns, $t_f \leq 10$ ns, PRR ≤ 1 MHz, duty cycle ≤ 50%, $Z_{out} \approx 50\ \Omega$. When testing f_{max}, vary clock PRR.

Fig. 1 VOLTAGE WAVEFORMS



NOTES:
1. The eight data inputs and the clock-inhibit input are LOW. Results are monitored at output Q_H at $t_n + 7$.
2. The inputs pulse generators have the following characteristics:
   $t_r \leq 10$ ns, $t_f \leq 10$ ns, PRR ≤ 1 MHz, duty cycle ≤ 50%, $Z_{out} \approx 50\ \Omega$.

TTL/MSI 93176/54176, 74176
93177/54177,74177
BCD DECADE/4-BIT BINARY COUNTER

TO BE ANNOUNCED

DESCRIPTION – The 93176/54176, 74176 is a Decade Counter that can be connected in BCD counting mode, in a divide-by-two and divide-by-five configuration, or in the bi-quinary mode. The 93177/54177, 74177 can be connected as a divide-by-two, eight, or sixteen counter. Both counters feature strobed parallel-entry capability. A LOW at the Data Strobe inputs transfers the data at the parallel inputs to the outputs. Each counter is provided with a reset input, which when LOW resets the outputs to LOW state. The counting operation is performed on the negative going edge of the clock pulse.

TTL/MSI 93178/54178, 74178
93179/54179, 74179
4-BIT SHIFT REGISTERS

TO BE ANNOUNCED

DESCRIPTION — The 93178 and 93179 are 4-Bit Shift Registers with both serial and parallel data entry capability. The 93179 features a direct reset (R_D), and a $\overline{D}_{out}$ line in addition to the available outputs of the 93178. The truth table below indicates the three possible control states: shift right, parallel entry and hold. The clock line is buffered to minimize input clock loading. All changes occur on the negative-going clock transition. Since data transfer is synchronous with the clock, data may be transferred in any serial/parallel input/output relationship.

TTL/MSI 93180/54180, 74180
8-BIT PARITY GENERATOR/CHECKER

DESCRIPTION – The 93180/54180 or 74180 are monolithic, 8-Bit Parity Check/Generators which feature control inputs and even/odd outputs to enhance operation in either odd or even parity applications. Cascading these circuits allows unlimited word length expansion. Typical application would be to generate and check parity on data being transmitted from one register to another. Typical power dissipation is 170 mW.

As with all Fairchild TTL products, all inputs are diode-clamped to minimize transmission-line effects and simplify system design.

PIN NAMES		LOADING
I_0 to I_7	Parity Inputs	1 U.L.
P_O	Odd Parity Input	2 U.L.
P_E	Even Parity Input	2 U.L.
ΣO_O	Sum Odd Outputs	10 U.L.
ΣO_E	Sum Even Outputs	10 U.L.

Note: 1 U.L. = 40 μA HIGH/1.6 mA LOW

TTL/MSI 93190/54190, 74190
93191/54191, 74191
UP/DOWN DECADE AND BINARY COUNTER

DESCRIPTION – The 93190/54190, 74190 and 93191/54191, 74191 are Synchronous Up/Down Counters with enable control presetting facility, single line up/down control, cascading for multi-decade operation and buffered inputs. The 93190/54190, 74190 is a BCD counter, while the 93191/54191, 74191 is a 4-bit binary counter. Synchronous operation is provided by having all flip-flops clocked simultaneously so that the outputs change coincident with each other when input conditions are met. This mode of operation will eliminate the output counting spikes which are normally associated with asynchronous (ripple clock) counters.

A HIGH at the enable input inhibits counting. A LOW at the enable input and a LOW-to-HIGH clock transition triggers the four master/slave flip-flops. The enable input should be changed only when the clock is HIGH. The down/up input determines the direction of the count. When LOW, the count goes up; when HIGH, the count goes down.

These counters are fully programmable. The outputs may be preset to any state by placing a LOW on the load input and entering the desired data at the data inputs. The output will change to agree with the data inputs independently of the state of the clock input. This feature allows the counters to be used as modulo-N dividers by simply modifying the count length with the preset inputs.

Two outputs have been made available to perform the cascading function: ripple clock and maximum/minimum count. The latter output produces a HIGH level output pulse with a duration approximately equal to one complete cycle of the clock when the counter overflows or underflows. The ripple clock output produces a LOW level output pulse equal in width to the LOW level portion of the clock input when an overflow or underflow condition exists. The counters can be easily cascaded by feeding the ripple clock output to the enable input of the succeeding counter if parallel clocking is used, or to the clock input if parallel enabling is used. The maximum/minimum count output can be used to accomplish lookahead for high speed operation.

Power dissipation is typically 325 mW for either the decade or binary version. Maximum input clock frequency is typically 25 MHz and is guaranteed to be at least 20 MHz.

TTL/MSI 93196/54196, 74196
93197/54197, 74197
HIGH SPEED DECADE AND BINARY COUNTER

TO BE ANNOUNCED

DESCRIPTION – The 93196/54196, 74196 and 93197/54197, 74197 High Speed Counters will provide either a divide-by-two and a divide-by-five counter (93196/54196, 74196) or a divide-by-two and a divide-by-eight counter (93197/54197, 74197). The counters are fully presettable to any output state by placing a LOW on the count/load input and entering the desired data at the data inputs. The outputs will change to agree with the data inputs regardless of the state of the clocks.

These counters may also be used as 4-bit latches by using the count/load input as the strobe and entering data at the data inputs. The outputs will directly follow the data inputs when the count/load is LOW, but will remain unchanged when the count/load is HIGH and the clock inputs are inactive.

These high speed counters will accept count frequencies of 0 to 50 MHz at the clock 1 input and 0 to 25 MHz at the clock 2 input. During the count operation, transfer of information to the outputs occurs on the negative-going edge of the clock pulse. These counters feature a direct clear which, when taken LOW, sets all outputs LOW regardless of the states of the clocks.

All inputs are diode-clamped to minimize transmission-line effects and simplify system design. Typical power dissipation is 240 mW.

					−3.2	mA	93197/54197, 74197	
I_{OS}	Output Short Circuit Current (Note 3)		−20		−57	mA	93196/54196, 93197/54197	V_{CC} = MAX.
			−18		−57	mA	93196/74196, 93197/74197	
I_{CC}	Supply Current (Note 5)			48	59	mA	V_{CC} = MAX.	

NOTES:
(1) For conditions shown as MIN. or MAX., use the appropriate value specified under recommended operating conditions for the applicable device type.
(2) Typical limits are at V_{CC} = 5.0V, 25°C.
(3) Not more than one output should be shorted at a time.
(4) Q_A outputs are tested at I_{OL} = 16 mA plus the limit value of I_{IL} for the clock 2 input. This permits driving the clock 2 input while fanning out to 10 Series 54/74 loads.
(5) I_{CC} is measured with all inputs grounded and all outputs open.

TYPICAL COUNT CONFIGURATIONS

93196/54196, 74196

The output of flip-flop A is not internally connected to the succeeding flip-flops; therefore, the count may be operated in three independent modes:

1. When used as a BCD decade counter, the clock 2 input must be externally connected to the Q_A output. The clock 1 input receives the incoming count, and a count sequence is obtained in accordance with the BCD count sequence truth table shown at the right.
2. If a symmetrical divide-by-ten count is desired for any application requiring division of a binary count by a power of ten, the Q_D output must be externally connected to the clock 1 input. The input count is then applied at the clock 2 input and a divide-by-ten square wave is obtained at output Q_A in accordance with the bi-quinary truth table shown at the right.
3. For operation as a divide-by-two counter and a divide-by-five counter, no external interconnections are required. Flip-flop A is used as a binary element for the divide-by-two function. The clock 2 input is used to obtain binary divide-by-five operation at the Q_B, Q_C, and Q_D outputs. In this mode, the two counters operate independently; however, all four flip-flops are loaded and cleared simultaneously.

NOTES:
A. Output Q_A connected to clock 2 input.
B. Output Q_D connected to clock 1 input.

93197/54197, 74197

The output of flip-flop A is not internally connected to the succeeding flip-flops, therefore the counter may be operated in two independent modes:

1. When used as a high speed 4-bit ripple counter, output Q_A must be externally connected to the clock 2 input. The input count pulses are applied to the clock 1 input. Simultaneous divisions by 2, 4, 8 and 16 are performed at the Q_A, Q_B, Q_C, Q_D output as shown in the truth table at the right.
2. When used as a 3-bit ripple counter, the input count pulses are applied to the clock 2 input. Simultaneous frequency divisions by 2, 4 and 8 are available at the Q_B, Q_C, and Q_D outputs. Independent use of flip-flop A is available if the load and clear functions coincide with those of the 3-bit ripple counter.

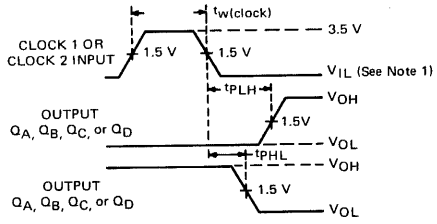
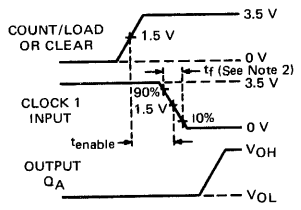
*C_L includes probe and jig capacitance.

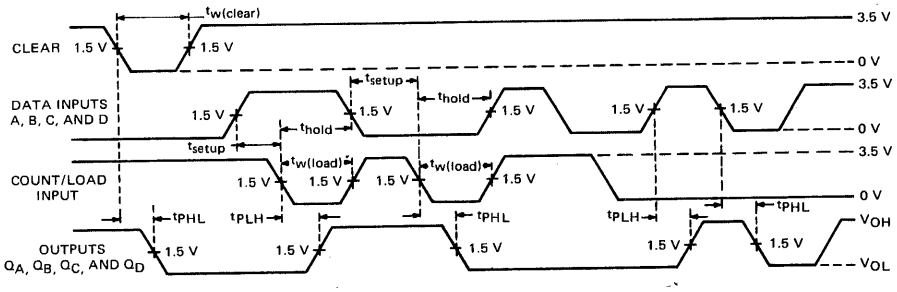
LOAD CIRCUIT



CLOCK-MODE VOLTAGE WAVEFORMS



CLOCK ENABLE TIME VOLTAGE WAVEFORMS



CLEAR AND LOAD VOLTAGE WAVEFORMS

NOTES:
1. The input pulse generator has the following characteristics: for testing f_{max}, V_{IL} = 0.3 ± 0.1 V, duty cycle = 50%, t_r < 5 ns, and t_f < 5 ns; for all other measurements V_{IL} = 0, PRR ≤ 1 MHz, duty cycle ≤ 50%, t_r < 5 ns, and unless otherwise specified, t_f < 5 ns.
2. Fall time of clock 1 is measured with count/load and clear high. When measuring clock enable time, t_f < 5 ns.
3. Unless otherwise specified, Q_A is connected to Clock 2.

Fig. 1

TTL/MSI 93198/54198, 74198

8-BIT SHIFT REGISTER

TO BE ANNOUNCED

DESCRIPTION – The 93198/54198, 74198 are Bidirectional Registers that are designed to incorporate virtually all of the features a system designer may want in a shift register. The 93198/54198, 74198 feature 35 MHz shift frequency, parallel inputs, parallel outputs, right-shift and left-shift serial inputs, operating mode-control inputs and a direct overriding clear line. The register has four distinct modes of operation: (1) parallel (broadside) load, (2) shift right (in the direction Q_A toward Q_H), (3) shift left (in the direction Q_H toward Q_A), (4) inhibit clock (do nothing).

Synchronous parallel loading is accomplished by applying the eight bits of data and taking both mode control inputs, S_0 and S_1, HIGH. The data is loaded into the associated flip-flop and appears at the outputs after the positive transition of the clock input. During loading, serial data flow is inhibited.

Shift right is accomplished synchronously with the rising edge of the clock pulse when S_0 is HIGH and S_1 is LOW. Serial data for this mode is entered at the shift-right data input. When S_0 is LOW and S_1 is HIGH, data shifts left synchronously and new data is entered at the shift-left serial input.

Clocking of the flip-flop is inhibited when both mode control inputs are LOW. The mode controls should be changed only while the clock input is HIGH.

Typical power dissipation is 360 mW and all inputs are diode-clamped.

PIN NAMES		LOADING

VOLTAGE WAVEFORMS

NOTES:
1. The clock pulse has the following characteristics: $t_{w(clock)} \geq 20$ ns and PRR = 1 MHz. The clear pulse has the following characteristics: $t_{w(clear)} \geq 20$ ns and $t_{hold} = 0$ ns. When testing f_{MAX}, vary the clock PRR.
2. A clear pulse is applied prior to each test.
3. Propagation delay times (t_{PLH} and t_{PHL}) are measured at t_n+1. Proper shifting of data is verified at t_n+8 with a functional test.
4. t_n = bit time before clocking transition
   t_n+1 = bit time after one clocking transition
   t_n+8 = bit time after eight clocking transitions

TTL MEMORY 93400 • 93400B • 93401

256-BIT READ/WRITE MEMORY & DECODER/DRIVER

FORMERLY 4100 • 4100B • 4101

DESCRIPTION – The 93400 256-Bit Read/Write Memory and the 93401 Decoder/Driver are components for use in high speed memory systems. The 93400 is a fast 256 x 1 random access read/write memory which is addressed with a partially decoded x-y coincident selection scheme. There are two device grades, with the 93400B having a slower access time than the 93400. The companion decoder and buffer driver, 93401, converts binary addresses into the partially decoded form required by the 93400, and provides sufficient drive to connect to 32 93400's. Both devices are supplied in 16-lead Dual In-Line Packages.

FUNCTIONAL DESCRIPTIONS

The 93400 and 93400B contain 256 bipolar storage cells arranged in a 16 by 16 format. Any one of the 256 cells may be accessed by supplying an address code on the X address inputs and the Y address inputs. Internal decoders decode the X and Y addresses into one of 16 rows and one of 16 columns in the matrix of storage cells. Data may be written into or read out from the cell lying at the intersection of the selected row and column.

The X and Y addresses supplied to the 93400 and 93400B are partially decoded in a "3 of 6" code. Of the six X address lines and the six Y address lines there are always three lines HIGH and three lines LOW. There are 20 such combinations, 16 are decoded by the internal row and column decoders. The four unused combinations of 3 of 6 will not select any row or column. If there are more than three lines HIGH in either the X or Y address, then multiple row or column selection will occur. The sixteen 3 of 6 codes used by the 93400 and 93400B are generated by the 93401 decoder/driver.

Data enters and leaves the memory on a single input/output (I/O) line (pin 7). The I/O line is an open collector output, so many 93400 I/O lines can be connected together in a wired-OR configuration. Input data must be applied to the I/O lines through an open collector gate. Each I/O line requires a pull-up resistor to V_{CC}. The magnitude of the pull-up resistor is determined by the number of 93400 I/O lines tied together. The I/O of a 93400 which is not addressed will be HIGH.

Read/Write selection is determined by the state of pin 9, the active HIGH write enable. When WE is HIGH, the data on the I/O line will be written into the selected address in the 93400. When the Write Enable line is LOW, data will be read out of the addressed location.

The 93401 is a partial decoder and driver for the 93400. It accepts a 4-bit binary code on the address inputs (A_0—A_3) and produces a 3 of 6 code on the six output pins (O_0—O_5). The decoder also features four separate enables, two active HIGH and two active LOW. All four enables must be active before the decoder will produce a 3 of 6 code. Since two of the enables are HIGH and two are LOW, it is possible to route two binary coded lines to four different 93401's to get two additional bits of decoding with no extra packages.

Ordinarily in memory systems, 93400 memory devices will be arranged in a matrix of rows and columns. Each column will store a particular bit and each row of 93400's will be 256 words. A 93401 driver will be used for each row and each column in the matrix. One 93401 can drive up to 32 93400 X or Y address lines. The usual driving scheme is to connect the four LSB's of address to each of the column decoders. The next four bits of address are connected to each of the row decoders. Additional address bits are decoded to the chip selects on the row decoders. Each column decoder drives the Y address lines on up to 32 93400's in a column. Each row decoder drives the address lines on up to 32 93400's in a row.

THE THREE OF SIX CODE

The "3 of 6" code used in the 93400 and produced by the 93401 is a tradeoff between memory chip complexity and pin count. The simplest 256-bit memory chip would be a 16 by 16 matrix of storage cells, with all 16 rows and 16 column select lines brought off chip. The lowest pin count for a 256-bit memory chip would be achieved by fully decoded X and Y select lines reducing the 32 lines of the simple scheme to only 8 lines. However, full binary decoding of the X and Y lines on chip significantly increases to complexity of the memory chip. The 93400 and 93401 are designed to gain the good features of both alternatives. The 16 X and Y lines are decoded into 6 lines each, allowing the memory to fit into a 16-lead package and still keeping the memory chip fairly simple, since the 3 of 6 code does not require a complex decoder. The table on the right below shows the conversion of 4-bit binary to 3 of 6 code by the 93401, and also the internal column or row selected by the 3 of 6 to 1 of 16 decoder inside the 93400.

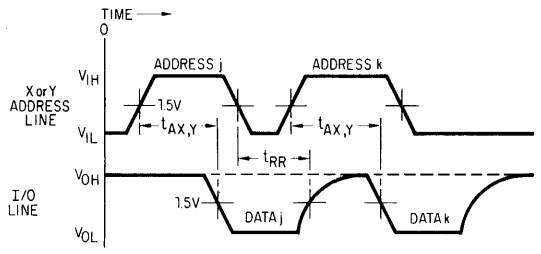
t_{AS}	Address Set Up Time. Time address must be good before end of write pulse during write operation. (See Fig. 3b)	80			80			ns
t_{AP}	Address Pulse Width. Time that address must remain good for write operation. (See Fig. 3b)	100			100			ns
t_{WR}	Write Recovery Time. Time in write-read cycle from end of write pulse to valid output data.			120			120	ns

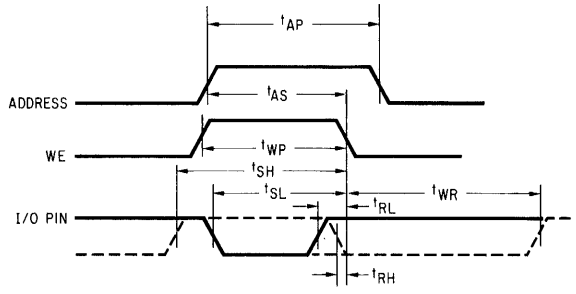
NOTES:
(1) The set up and release times define a window during which devices are responding to the data and/or address. Inputs must remain good at all times in between the set up and release time limits.
(2) Applies for write pulse less than 150 ns.
(3) Applies for write pulse more than 160 ns.

Fig. 1a–93400 TYPICAL READ CYCLE



$t_{AX, Y}$ is the time from a good address to good data on the output. Note that the access time may be overlapped with the recovery time to improve speed on consecutive read operations.

Fig. 1b–93400 WRITE CYCLE



The address must be maintained for 100 ns. The simplest write cycle is achieved by applying the data, then simultaneously raising the address and write pulses for 100 ns. If the write pulse width is less than 100 ns, then the address should come up at about the same time as the write pulse and should be held on after the write pulse. The address should not be applied more than 25 ns before the write pulse, because an early address will cause a read operation to begin disrupting data on the I/O lines (see t_{RR}). For a longer write pulse the address pulse may appear anytime as long as it starts before t_{AS} and lasts at least t_{AP}.

TTL MEMORY 93402

16-BIT ASSOCIATIVE/CONTENT ADDRESSABLE MEMORY

FORMERLY 4102

DESCRIPTION – The 93402 is a high speed 16-Bit Associative Random Access Memory. It is a linear select 4-word by 4-bit array which performs the equality search on all bits in parallel. The 93402 is TTL compatible.

With the bit enable lines ($\overline{E}_0 - \overline{E}_3$) LOW, the outputs ($M_0 - M_3$) go HIGH if associated stored data matches the descriptor bits ($\overline{D}_0 - \overline{D}_3$). If a bit enable line is held HIGH, a match is forced on the corresponding bit in all the words regardless of the state of the descriptor bit ($\overline{D}_0 - \overline{D}_3$). An inverter is connected to the match output M_0 to give its negation $\overline{M}_0$.

A word is addressed by having an active LOW on the appropriate address line ($\overline{A}_0 - \overline{A}_3$). Any number of words may be addressed simultaneously.

Data can be written into the memory through the data inputs ($\overline{D}_0 - \overline{D}_3$) under control of the address inputs and the appropriate bit enable ($\overline{E}_0 - \overline{E}_3$) when the write enable ($\overline{WE}$) is LOW.

Reading can occur either during an equality search or a write operation. If a single word is addressed that word will appear at the data outputs ($\overline{O}_0 - \overline{O}_3$). If multiple addressing is used, the word appearing at the data output is the AND (positive logic) or the OR (negative logic) of the addressed words.

All outputs are uncommitted collectors allowing maximum flexibility in output connection. In many applications such as memory expansion, the outputs of many 93402's can be tied together. In other applications, the wired-OR is not used. In either case an external pull up resistor must be used to attain a HIGH at an output.

LOADING RULES

	HIGH LEVEL (TTL Unit Loads)	LOW LEVEL (TTL Unit Loads)
Address	1.0	1.0
Bit Enable	1.5	1.5
Write Enable	1.5	1.5
Data Input	1.0	1.0
Data Output	Open Collector	6.2
Match Output	Open Collector	6.2

1 Unit Load (U.L.) = 60 μA HIGH/1.6 mA LOW.

The external pull-up resistor R is selected to lie in the range as shown.

$$\frac{5.1}{10 - \text{F.O. } (1.6)} \leq R \leq \frac{2.1}{NL + \text{F.O. } (0.06)}$$

R is in kΩ
N = number of wired-OR outputs
F.O. = number of TTL loads driven
L = Sum of all I_{CEX} of wired-OR outputs

The minimum value of R is limited by output current sinking ability. The maximum value of R is determined by the output and input leakage current (I_{CEX} and I_R) which must be supplied to hold the output at 2.4 V.

F.O.	Maximum number of Wired-OR's

SWITCHING CHARACTERISTICS (T_A = 25°C, V_{CC} = 5.0 V)

SYMBOL	PARAMETER	LIMIT (ns) TYP.	LIMIT (ns) MAX.	LOAD	CONDITIONS C	NOTE
t_{AO-}	Address to Output Turn-On Delay	20	30	10 mA	30 pF	1
t_{AO+}	Address to Output Turn-Off Delay	25	35	10 mA	30 pF	1
t_{DM+}	Descriptor to Output Match Turn-On Delay	25	35	10 mA	30 pF	2
t_{DM-}	Descriptor to Output Match Turn-Off Delay	30	40	10 mA	30 pF	2
t_{WP}	Write Pulse Width Required to Write	33	40	10 mA	30 pF	
t_{WO}	Write Delay	50	80	10 mA	30 pF	
t_s	Maximum Set-up Time on Data Input	33	40	10 mA	30 pF	3
t_r	Release Time (Minimum Set-up Time) on Data Input	0	19	10 mA	30 pF	3

NOTES:
(1) To test t_{AO+} and t_{AO-} a LOW must be stored in the cell under test.
(2) To test t_{DM-} and t_{DM+}, a mismatch must occur in at least one bit of the word under test
(3) Setup and release times are measured with respect to the rising edge of the Write enable. To guarantee writing in the correct data, the data input must be good by t_s and remain good until after t_r.

The typical capacitance of one 93402 output is 7.0 pF.

TTL MEMORY 93403

64-BIT FULLY DECODED READ/WRITE MEMORY

FORMERLY 4103

DESCRIPTION – The 93403 is a high speed 64-Bit Read/Write Memory organized 16 words by four bits. Four address lines are buffered and decoded "on chip" for word selection. The 93403 is made with TTL circuitry and all inputs are equivalent to one TTL load.

OPERATION – When the 93403 receives a LOW at the Chip Select ($\overline{CS}$) input, the binary address (A_0, A_1, A_2 and A_3) is decoded to select one of sixteen 4-bit words. If the Write Enable ($\overline{WE}$) is at a HIGH level, the contents of the selected word are non-destructively read out and the sense amplifier outputs ($\overline{O_0}$, $\overline{O_1}$, $\overline{O_2}$ and $\overline{O_3}$) reflect the state of the stored data in the four bits of the selected word. If the Write Enable is LOW, the data present on the Data Input lines (D_0, D_1, D_2 and D_3) is written into the four bits of the selected word. Note that there is inversion through the device in a read operation.

- **OUTPUT WIRED-OR CAPABILITY**
- **ON CHIP DECODING**
- **NON-DESTRUCTIVE READOUT**
- **CHIP SELECT FOR SYSTEM WORD EXPANSION**
- **TTL COMPATIBLE**

TTL LOADING RULES

	HIGH LEVEL	LOW LEVEL
Address	1 U. L.	1 U. L.
Chip Select	1 U. L.	1 U. L.
Write Enable	1 U. L.	1 U. L.
Data Input	1 U. L.	1 U. L.
Data Output	Open Collector	10 U. L.

1 LOW Level TTL Unit Load (U.L.) = 1.6 mA
1 HIGH Level TTL Unit Load (U.L.) = 60 μA

Uncommitted collector outputs are provided on the 93403 to allow maximum flexibility in output connection. In many applications such as memory expansion, the outputs of many 93403 can be tied together. In other applications the wired-OR is not used. In either case an external pullup resistor of value R_L must be used to provide a HIGH at the output when it is off. Any value of R_L within the range specified below may be used.

$$\frac{5.05}{16 - \text{F.O.}\,(1.6)} \leq R_L \leq \frac{2.1}{N\,(0.1) + \text{F.O.}\,(0.06)}$$

R_L is in kΩ
N = number of wired-OR outputs
F.O. = number of TTL loads driven
V_{CC} = 5.0 V ±10%

The minimum value of R_L is limited by output current sinking ability. The maximum value of R_L is determined by the output and input leakage current (I_{CEX} and I_R) which must be supplied to hold the output at 2.4 V.

TTL MEMORY 93406
1024-BIT READ ONLY MEMORY

DESCRIPTION – The Fairchild 93406 is a 1024-bit Bipolar Read Only Memory organized 256 words by four bits. An 8-bit binary address is used to select the desired word. The four outputs are uncommitted collectors which permit "OR" tying of the outputs for expanding the memory in the word direction. The customer can specify the active level of the 2-input chip select gate. $\overline{CS}_1$ and $\overline{CS}_2$ both will be active LOW unless otherwise specified by the customer. The programmable enable feature allows expansion of the memory to 1024 words without any external gates.

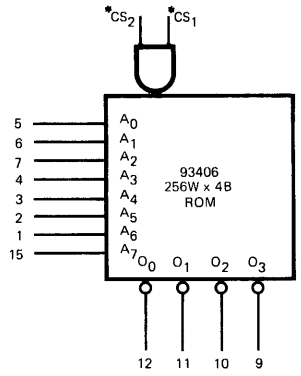
The contents of the memory are mask programmed to the customers specification. The customer can specify the desired ROM code on either the 93406 Coding Form(s) or by punched cards using the 93406 Data Card Format.

- **DTL AND TTL COMPATIBLE**
- **ACCESS TIME – 50 ns MAX**
- **FULLY DECODED – ON CHIP ADDRESS DECODER AND BUFFER**
- **2 CHIP SELECT INPUTS PROVIDING EASY MEMORY EXPANSION**
- **PROGRAMMABLE CHIP SELECTS**
- **OR-TIE CAPABILITY**
- **STANDARD 16-LEAD DUAL IN-LINE PACKAGE**

PIN NAMES

A_0 to A_7	Address Inputs
$\overline{CS}_1$, $\overline{CS}_2$	Chip Select Inputs
$\overline{O}_0$ to $\overline{O}_3$	Data Outputs

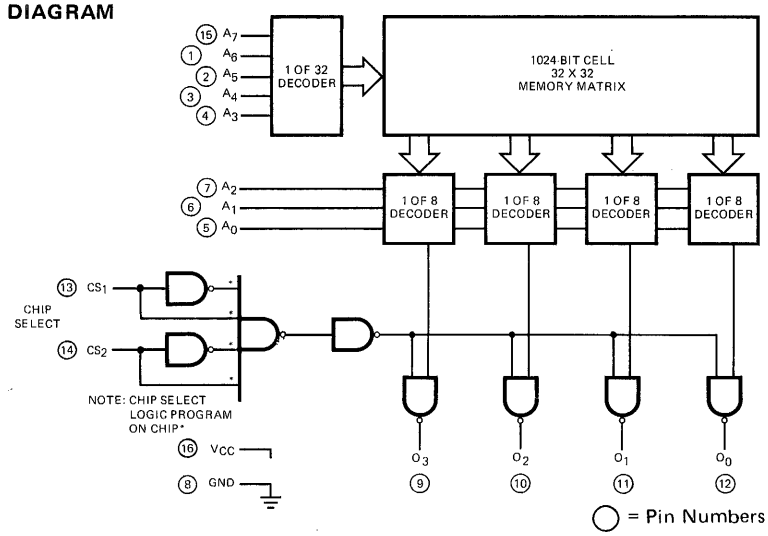
LOGIC SYMBOL



V_{CC} = PIN 16
GND = PIN 8

*Chip selects active level may be programmed per customer requirements. If not specified both CS will be active low.

LOGIC DIAGRAM



◯ = Pin Numbers

*Per customer request. Unless otherwise specified CS_1 and CS_2 will be active low.

9

93406 DATA CARD FORMAT

The most efficient method of ordering the 93406 is to punch the desired truth table on a punched card in the format described below. Fairchild will generate mask and test program data directly from these inputs. This eliminates the chance of error when transcribing inputs from a hand written truth table.

Data should be provided on a deck of 34 standard 80 column cards containing the following information.

CARD NO. 1 – Customer Identification

Column	Content
1	Blank
2–28	Customer Name, Drawing or Specification control number.
29–32	Blank
33–39	FAIRCHILD PART NUMBER. This part number is supplied by the factory through your Fairchild sales representative.
40–64	Blank
65–72	Date
73–80	Blank

CARD NO. 2 – Chip Select Option

Column	Content
1–11	Punch "Chip Select"
12	Blank
13, 14	Punch Charts '00', '01', '10' or '11', depending on the chip select code option. (First bit represents CS_1 input, second bit represents CS_2 input. '0' = LOW, '1' = HIGH.)
15–32	Blank
33–39	Repeat FAIRCHILD PART NUMBER (This is used for positive identification).
40–80	Blank

CARDS NO. 3 through 34 – Truth Table Deck

Each card will contain instructions for the output levels for 8 input words.

Column	Content
1–7	Punch the numerals representing the first and last words on that card (i.e.: 000-007, 008-015, 016-023. . .248-255). Word order is determined by the value of the binary address – A_7 = MSB, A_0 = LSB.
8–9	Blank
10–13	Punch the desired combination of "1's" and "0's" representing the output levels for outputs O_3, O_2, O_1 and O_0 (in that order), for the first word on the card, '0' = LOW, '1' = HIGH.
14	Blank
15–18	Punch the desired combination of "1's" and "0's" representing the output levels for the second word on the card.
19	Blank
20–23	Punch the desired combination of "1's" and "0's" representing the output levels for the third word on the card.
24	Blank
25–28	Punch the desired combination of "1's" and "0's" representing the output levels for the fourth word on the card.
29	Blank
30–33	Punch the desired combination of "1's" and "0's" representing the output levels for the fifth word on the card.
34	Blank

CARDS NO. 3 through 34 – Truth Table Deck (cont'd)

Column	Content
35–38	Punch the desired combination of "1's" and "0's" representing the output levels for the sixth word on the card.
39	Blank
40–43	Punch the desired combination of "1's" and "0's" representing the output levels for the seventh word on the card.
44	Blank
45–48	Punch the desired combination of "1's" and "0's" representing the output levels for the eighth word on the card.
49	Blank
50–51	Repeat chip select code option as in columns 13 and 14 of card number 2.
52–59	Blank
60–66	Repeat FAIRCHILD PART NUMBER (this number is used for positive identificaiton).
67	Blank
68–80	Use optional.

93406 Address Scheme

The 93406 is organized 256 words by 4-bits. The words are numbered 0 through 255 and are addressed using sequential addressing of address inputs A_0 through A_7, with A_0 as the least significant digit.

	INPUTS							
WORD	Pin 15	Pin 1	Pin 2	Pin 3	Pin 4	Pin 7	Pin 6	Pin 5
	A_7	A_6	A_5	A_4	A_3	A_2	A_1	A_0
WORD 0	0	0	0	0	0	0	0	0
WORD 1	0	0	0	0	0	0	0	1

TTL MEMORY 93407 • 93433

16-BIT COINCIDENT SELECT READ/WRITE MEMORY

FORMERLY 5033 • 9033

DESCRIPTION – These devices are Planar* epitaxial integrated 16-bit, bit-oriented, non-destructive readout memory cells, compatible with Fairchild TTL. These memory cells, organized as 16 words by one bit, are designed for high speed scratch-pad memory applications. The 93407 and 93433 are electrically identical, but with different pin configurations. Both devices are available in two fan out options, 40 mA (A) and 20 mA (B) for Industrial/Commercial temperature range.

OPERATION – The memory cell consists of 16 RS flip-flops arranged in an addressable four-by-four matrix. The desired bit location is selected by raising the coincident X-Y address lines to a logic "H" level (>2.1 volts) and holding the non-selected address lines at logic "L" level (<0.7 volts). As many as four locations may be addressed simultaneously without destroying stored information. The stored data and its complement at the addressed bit location may be read at the output terminals. If the addressed bit location contains a "1", the $\overline{S_1}$ output will be LOW and the $\overline{S_0}$ output will be HIGH. If the addressed bit location contains a "0", the $\overline{S_1}$ otuput will be HIGH and the $\overline{S_0}$ output will be LOW.

Writing is accomplished by activating one of the write amplifiers. To write a "1", the desired bit location is addressed and the input of the "write one" (W_1) amplifier is raised to a HIGH level. To write a "0", the input of the "write zero" (W_0) amplifier is raised to a HIGH Level.

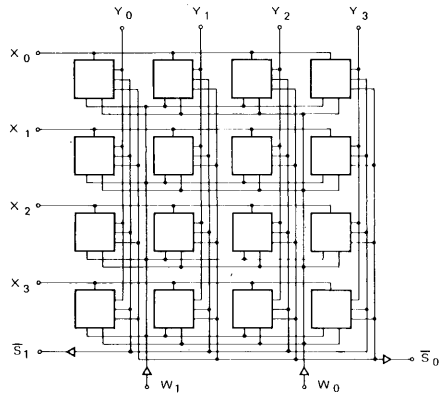
The outputs are open-collector, which may be wired OR for word expansion. (The output transistors are off when none of the bits are selected.) An external resistor should be returned to V_{CC} to pull-up the wired OR outputs.

- **TTL COMPATIBLE**
- **OUTPUT WIRED-OR CAPABILITY**
- **TRUE AND COMPLEMENTARY OUTPUTS ARE PROVIDED**
- **NON DESTRUCTIVE READ OUT**
- **FAN OUT AVAILABLE IN TWO GRADES: A = 40 mA, B = 20 mA FOR INDUSTRIAL/ COMMERCIAL TEMPERATURE RANGE**

ABSOLUTE MAXIMUM RATINGS (above which the useful life may be impaired)

Storage Temperature	−65°C to +150°C
Temperature (Ambient) Under Bias	−55°C to +125°C
V_{CC} Pin Potential to Ground	−0.5 V to +8.0 V
Input Pin Voltage	−1.5 V to +5.5 V
Current Into Output Terminal	100 mA
Output Voltage	−0.5 V to +8.0 V

LOGIC DIAGRAM



X,Y – Address
W – Write Input
S – Sense Output

Each square represents one bit of storage.

APPLICATION:

A memory utilizing these memory cells may have any desired word length. The number of words in the memory is a multiple of four words. The following example of a 64 word memory illustrates how a number of 16-bit memory cells may be used to construct a typical memory.

The 64 word memory as shown in Figure A consists of groups of four memory cells. Each of the groups of four memory cells supplies one bit for each of the 64 words stored in the memory. All bits belonging to one word are stored in the same address location. Therefore, the address of a word in the memory is the address of each bit of the addressed word in the groups of four memory cells. The equal outputs of the four memory cells are tied together so that each group of four memory cells has one HIGH and one LOW level output.

The six memory address lines from an external source are decoded at the first level with two 9301 decoders. The fourth input to each of the two decoders can be used as an enable control input to the 64 word memory. If the address enable is at a LOW logic level, one and only one of the eight outputs, 0 to 7, in the illustration assumes a LOW logic level. If the address enable is at a HIGH logic level, the outputs 0 to 7 of the two decoders assume a HIGH logic level, thus none of the 64 words stored in the memory is addressed. The outputs, 0 to 7, of the two decoders serve as X-and-Y address lines. The output signals of the decoders are connected to driving transistors which provide the necessary current to address the memory cells.

The example given above is only one of the many organizations and is presented as an illustration. Obviously many address decoding schemes may be utilized depending on memory size, driver fan out, decoder fan out, wiring, heat dissipation, etc.

Figures B through D show alternative schemes to enter data into the memory cell.

TTL ISOPLANAR MEMORY 93410 • 93410A

256-BIT FULLY DECODED RANDOM ACCESS MEMORY

DESCRIPTION — The 93410 and 93410A are high speed 256 Bit TTL Random Access Memories with full decoding on chip. Each memory, organized as 256 words x 1 bit, is designed for scratch pad, buffer and distributed main memory applications. Both devices have three chip select lines to simplify their use in larger memory systems. Address input pin locations are specifically chosen to permit maximum packaging density and for ease of PC board layout. An uncommitted collector output is provided to permit "OR-ties" for ease of memory expansion.

The 93410A is a high speed version of the 93410, offering a 35 ns access time.

- **ORGANIZATION - 256 WORDS X 1 BIT**

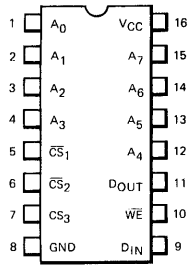
V_{CC} = Pin 16
Gnd = Pin 8

CONNECTION DIAGRAM DIP (TOP VIEW)



FUNCTIONAL DESCRIPTION

The 93410 and 93410A are fully decoded 256-bit Random Access Memories organized 256 words by 1 bit. Bit selection is achieved by means of an 8-bit address, A_0 thru A_7.

Three chip select inputs are provided, two are active LOW ($\overline{CS}_1$ and $\overline{CS}_2$) and the third active HIGH (CS_3) for maximum logic flexibility. This permits memory array expansion up to 2048 words without the need for additional external decoders. For larger memories the fast chip select access time permits the decoding of chip select, CS, from the address without increasing address access time.

The read and write operations are controlled by the state of the active LOW Write Enable $\overline{WE}$ (pin 10). With $\overline{WE}$ held LOW and the chip selected, the data at D_{IN} is written into the addressed location. To read, $\overline{WE}$ is held HIGH and the chip selected. Data in the specified location is presented at D_{OUT} and is non-inverted.

Uncommitted collector outputs are provided to allow maximum flexibility in output connection. In many applications such as memory expansion, the outputs of many 93410s or 93410As can be tied together. In other applications the wired-OR is not used. In either case an external pull up resistor of value R_L must be used to provide a HIGH at the output when it is off. Any value of R_L within the range specified below may be used.

$$\frac{V_{CC}\,(MAX)}{16 - F.O.\,(1.6)} \leqslant R_L \leqslant \frac{V_{CC}\,(MIN) - V_{OH}}{N\,(I_{CEX}) + F.O.\,(0.04)}$$

R_L is in kΩ
N = number of wired-OR outputs tied together
F.O. = number of TTL Unit Loads (U.L.) driven
I_{CEX} = Memory Output Leakage Current in mA
V_{OH} = Required Output HIGH level at Output Node

The minimum value of R_L is limited by output current sinking ability. The maximum value of R_L is determined by the output and input leakage current which must be supplied to hold the output at V_{OH}.

NOTES:

(1) Conditions for testing, not shown in the table, are chosen to guarantee operation under "worst case" conditions.

(2) The specified LIMITS represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature and supply voltage extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.

(3) Typical limits are at V_{CC} = 5.0 V, 25°C, and max. loading.

(4) Guaranteed with transverse airflow exceeding 400 linear F.P.M. and 2 minute warm up.

Typical thermal resistance values of the package are:

θ_{JA} (Junction to Ambient) = 50°C/W (at 400 F.P.M. Airflow)
θ_{JA} (Junction to Ambient) = 90°C/W (Still Air)
θ_{JL} (Junction to Case) = 25°C/W

The −55°C Operating Temperature relates to a −30°C worst case cold Junction Temperature.

(5) The maximum address access time is guaranteed to be the worst case bit in the memory using a pseudo random testing pattern.

TTL ISOPLANAR MEMORY 93415

1024-BIT FULLY DECODED RANDOM ACCESS MEMORY

DESCRIPTION — The 93415 is a 1024-Bit Read/Write Random Access Memory organized 1024 words x 1-bit. It has a typical access time of 60 ns and is designed for buffer and control storage and high performance main memory applications.

The 93415 includes full decoding on the chip, has separate data input and data output lines and an active LOW chip select line.

The device is fully compatible with standard DTL and TTL logic families and has an uncommitted collector output for ease of memory expansion.

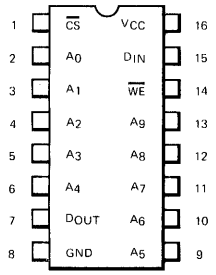
GND = PIN 8

CONNECTION DIAGRAM
DIP (TOP VIEW)



FUNCTIONAL DESCRIPTION – The 93415 is a fully decoded 1024-bit Random Access Memory organized 1024 words by 1-bit. Bit selection is achieved by means of a 10-bit address A_0 to A_9.

One chip select input is provided for memory array expansion with the need for one additional external decoder. For larger memories the fast chip select access time permits the decoding of chip select, $\overline{CS}$, from the address without affecting system performance.

The read and write operations are controlled by the state of the active LOW Write Enable $\overline{WE}$ (pin 14). With $\overline{WE}$ held LOW and the chip selected, the data at D_{IN} is written into the addressed location. To read, $\overline{WE}$ is held HIGH and the chip selected. Data in the specified location is presented at D_{OUT} and is non-inverted.

Uncommitted collector outputs are provided on the 93415 to allow maximum flexibility in output connection. In many applications such as memory expansion, the outputs of many 93415 can be tied together. In other applications the wired-OR is not used. In either case an external pull up resistor of value R_L must be used to provide a HIGH at the output when it is off. Any value of R_L within the range specified below may be used.

$$\frac{V_{CC}\ (min)}{I_{OL} - F.O.\ (1.6)} \leqslant R_L \leqslant \frac{V_{CC}\ (min) - V_{OH}}{N\ (I_{CEX}) + F.O.\ (0.04)}$$

R_L is in kΩ
N = number of wired-OR outputs tied together
F.O. = number of TTL Unit Loads (U.L.) driven
I_{CEX} = Memory Output Leakage Current
V_{OH} = Required Output HIGH Level at Output Node
I_{OL} = Output LOW Current

The minimum value of R_L is limited by output current sinking ability. The maximum value of R_L is determined by the output and input leakage current which must be supplied to hold the output at V_{OH}.

TTL MEMORY 93434

256-BIT READ-ONLY MEMORY

FORMERLY 9034

DESCRIPTION – The Fairchild 93434 is a 256-Bit bipolar TTL Read-Only Memory. The memory is organized as 32 words of eight bits each. The words are selected through five address lines. The eight outputs of the words are uncommitted collectors which may be wired-OR with the outputs of other ROMs. An Enable input is provided for additional decoding flexibility. A HIGH on the Enable input forces all outputs to be HIGH.

The contents of the memory are permanently programmed to customer order. A customer order form is available on request.

TTL MEMORY 93435

64-BIT LINEAR SELECT READ/WRITE MEMORY

FORMERLY 9035

DESCRIPTION – The 93435 is a high speed 64-Bit Read/Write Memory Cell designed for use in high speed scratch pad memories. It is a linear select 16 word by 4-bit array.

The 93435 is available in the hermetically sealed 36-lead ceramic Dual In-Line package and will operate over the temperature range from –55°C to +125°C.

OPERATION – In addition to 16 address inputs, 4 data outputs, and 4 data inputs, the 93435 has a chip select and a write enable. When the chip select is HIGH, a word may be addressed by a HIGH on one of the address inputs. Data is written into the addressed word location only when the write enable is held LOW. While the address is present, the outputs continuously show the contents of the word selected. Readout is non-destructive.

Up to four words may be addressed and read simultaneously with the OR function of each bit appearing at the outputs. Data can be written into two locations simultaneously.

Uncommitted collector outputs are provided on the 93435 to allow maximum flexibility in output connection. In many applications such as memory expansion, the outputs of many 93435's can be tied together. In other applications the wired-OR is not used. In either case an external pullup resistor of value R must be used to provide a HIGH at the output when it is off. Any value of R within the range specified below may be used.

$$\frac{5.1}{10 - \text{F.O. } (1.6)} \leq R \leq \frac{2.1}{N(0.1) + \text{F.O. } (0.06)}$$

R is in kΩ
N = number of wired-OR outputs
F.O. = number of TTL loads driven

The minimum value of R is limited by output current sinking ability. The maximum value of R is determined by the output and input leakage current (I_{CEX} and I_R) which must be supplied to hold the output at 2.4 V.

- **35 ns MAXIMUM ACCESS TIME – 20 ns TYPICAL**
- **CHIP SELECT AND WRITE ENABLES**
- **UNCOMMITTED COLLECTOR OUTPUTS FOR WIRED-OR CAPABILITY**
- **LINEAR SELECT**
- **ON CHIP ADDRESS LINE BUFFERING**
- **TTL COMPATIBLE**

ABSOLUTE MAXIMUM RATINGS

Storage Temperature	–65°C to +150°C
Temperature (Ambient) Under Bias	–55°C to +125°C
V_{CC} Pin Potential to Ground	–0.5 V to +7.0 V
Input Pin Voltage	–0.5 V to +5.5 V
Current into Output Terminal	50 mA
Output Voltage	–0.5 V to +8.0 V

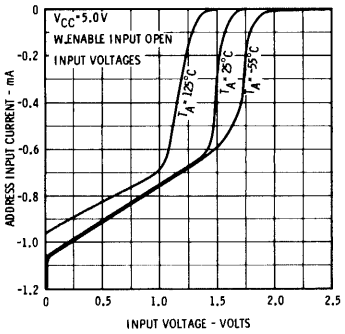
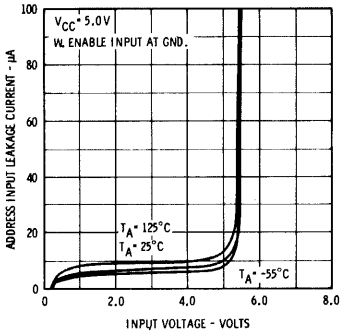
*X = package type; F for Flatpak, D for Ceramic Dip, P for Plastic Dip. See Packaging Information Section for packages available on this product.
NOTE:
(1) I_{FCS} increases by 1.6 mA for each address input held at a logic 1.

TYPICAL ELECTRICAL CHARACTERISTICS

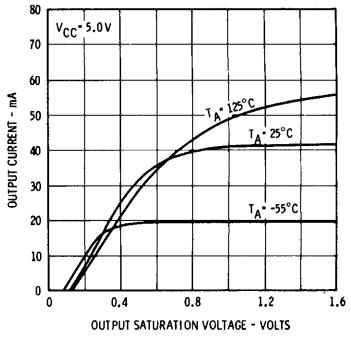
ADDRESS INPUT LOAD CURRENT VERSUS INPUT VOLTAGE



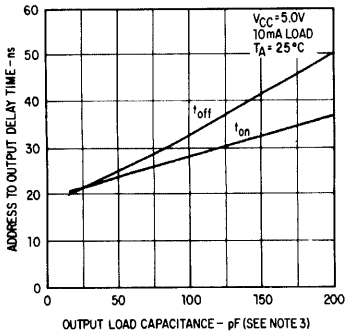
ADDRESS INPUT LEAKAGE CURRENT VERSUS INPUT VOLTAGE



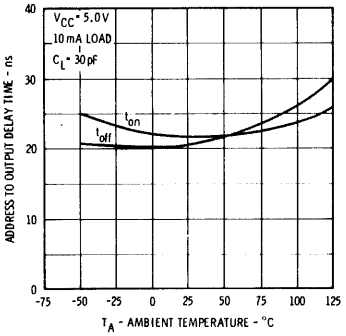
OUTPUT CURRENT VERSUS OUTPUT SATURATION VOLTAGE



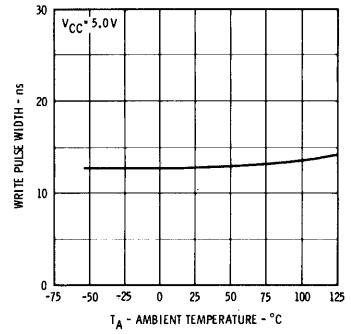
ADDRESS TO OUTPUT DELAY TIME VERSUS OUTPUT LOAD CAPACITANCE



ADDRESS TO OUTPUT DELAY TIME VERSUS TEMPERATURE



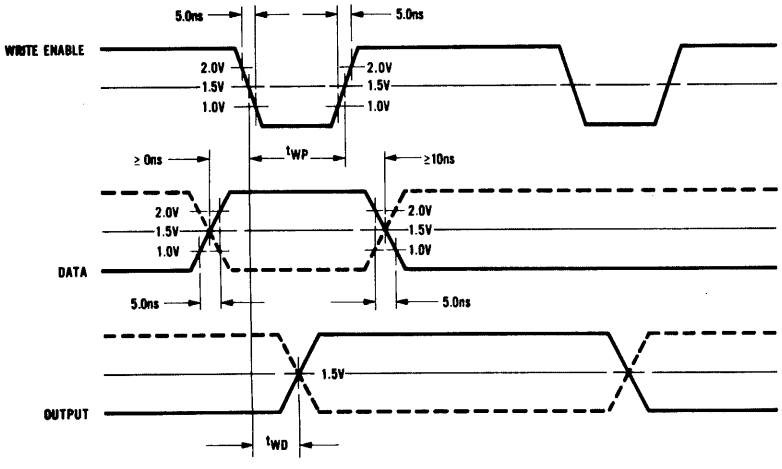
WRITE PULSE WIDTH VERSUS TEMPERATURE

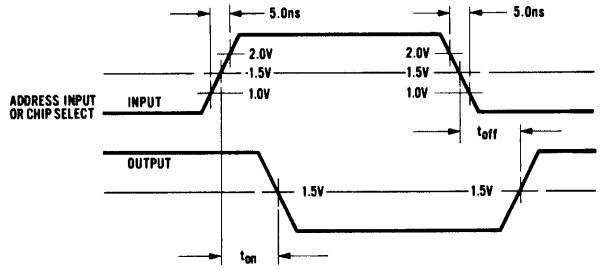


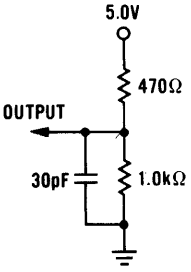
SWITCHING CHARACTERISTICS (T_A = 25°C, V_{CC} = 5.0 V)

SYMBOL	PARAMETER	LIMIT (ns)			CONDITION		
		MIN.	TYP.	MAX.	LOAD	C	NOTE
t_{on}	Address to Output Turn-On Delay	10	22	35	10 mA	30 pF	1
t_{off}	Address to Output Turn-Off Delay	10	20	35	10 mA	30 pF	1
t_{WP}	Write Pulse Width Required to Write	25	15		10 mA	30 pF	2
t_{WD}	Write Delay	10	30	50	10 mA	30 pF	2

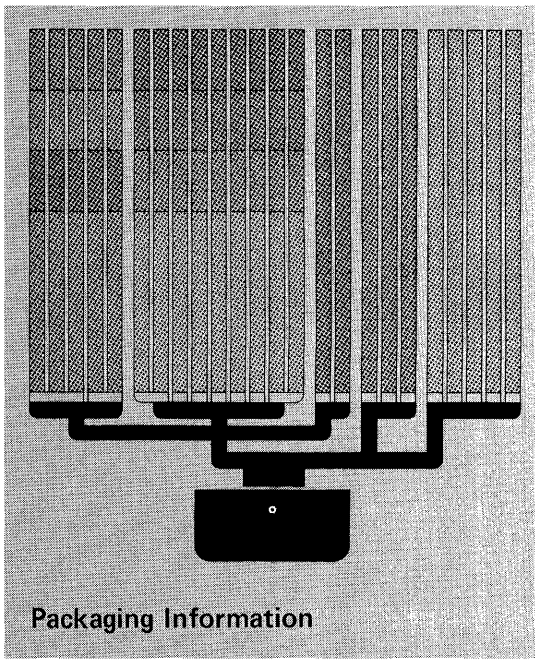
NOTES:
(1) To test t_{on} and t_{off}, a LOW must be stored in the cell under test.
(2) One word is selected during the test.
(3) The typical capacitance of one 93435 output is 7.0 pF.







10 mA TEST LOAD



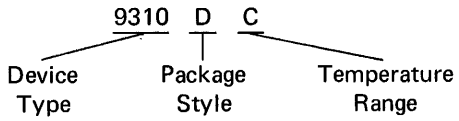
Packaging Information

PACKAGING INFORMATION

Fairchild digital integrated circuits may be ordered using a simplified purchasing code in which the package style is defined as follows:

PACKAGE STYLE

D = Dual In-Line – Ceramic (Hermetic)
P = Dual In-Line – Plastic
F = Flat Package



In order to accommodate varying die sizes (SSI, MSI, etc), numbers of pins (14, 16, 24, etc.), and package outlines, a number of different package forms are required in each of these three categories.

The following lists indicate the specific package dimensions currently used for each device type. The detailed outline corresponding to each package code is shown at the end of this section.

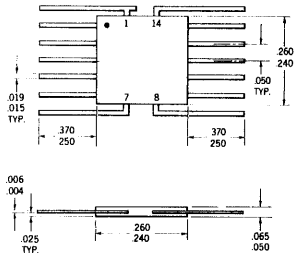
PACKAGE PHYSICAL DIMENSIONS

3B

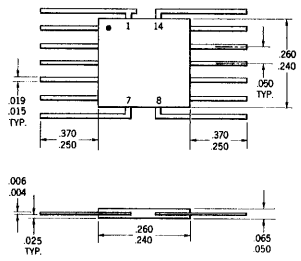
in accordance with JEDEC (TO-86) outline 14 Lead MSI Cerpak



NOTES: All dimensions in inches
Leads are gold-plated kovar
Package weight is 0.26 gram
Lead 1 orientation may be either tab or dot

3I

in accordance with JEDEC (TO-86) outline 14 Lead Cerpak

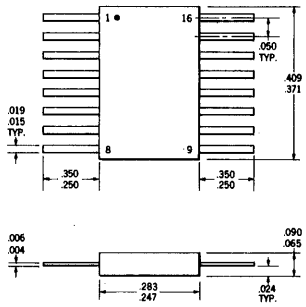


NOTES: All dimensions in inches
Leads are gold-plated kovar
Package weight is 0.26 gram
Lead 1 orientation may be either tab or dot

PACKAGE PHYSICAL DIMENSIONS

4L

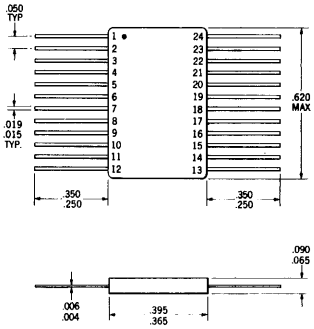
16 Lead Cerpak



NOTES: All dimensions in inches
Leads are gold-plated kovar
Package weight is 0.4 gram

4M

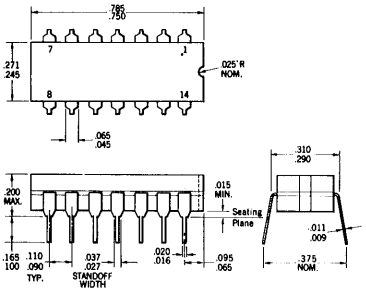
24 Lead BeO Cerpak



NOTES: All dimensions in inches
Leads are gold-plated kovar
Package weight is 0.8 gram

6A

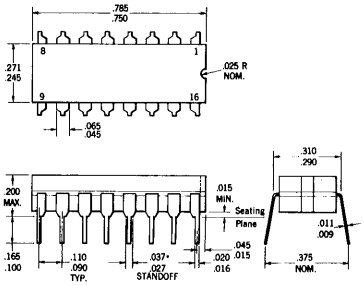
in accordance with JEDEC (TO-116) outline 14 Lead SSI Dual In-line



NOTES: All dimensions in inches
Leads are intended for insertion in hole rows on .300" centers
They are purposely shipped with "positive" misalignment to facilitate insertion
Board-drilling dimensions should equal your practice for .020 inch diameter lead
Leads are tin-plated kovar
Package weight is 2.0 grams

6B

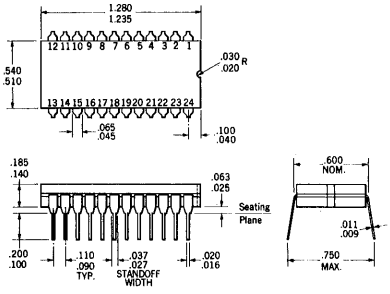
16 Lead SSI Dual In-line



NOTES: All dimensions in inches
Leads are intended for insertion in hole rows on .300" centers
They are purposely shipped with "positive" misalignment to facilitate insertion
Board-drilling dimensions should equal your practice for .020 inch diameter lead
Leads are tin-plated kovar
Package weight is 2.0 grams
*The .037/.027 dimension does not apply to the corner leads

6N

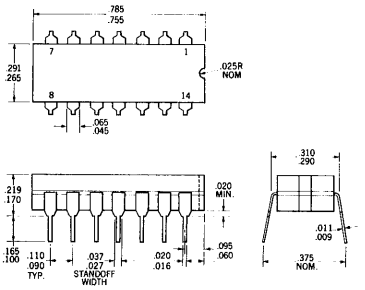
24 Lead MSI Dual In-line



NOTES: All dimensions in inches
Leads are intended for insertion in hole rows on .600" centers
They are purposely shipped with "positive" misalignment to facilitate insertion
Leads are tin-plated kovar
Package weight is 6.5 grams

7A

Similar* to JEDEC (TO-116) outline 14 Lead MSI Dual In-line



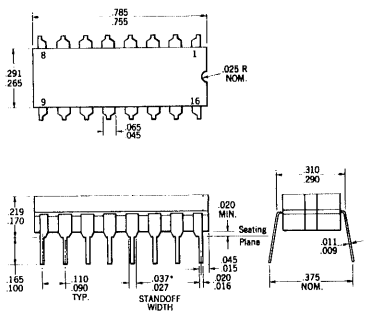
NOTES: All dimensions in inches
Leads are intended for insertion in hole rows on .300" centers
They are purposely shipped with "positive" misalignment to facilitate insertion
Board-drilling dimensions should equal your practice for .020 inch diameter lead
Leads are tin-plated kovar
Package weight is 2.2 grams
*Similar to JEDEC TO-116 except for package width

10

PACKAGE PHYSICAL DIMENSIONS

7B

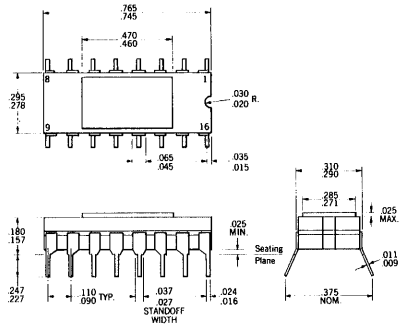
16 Lead MSI Dual In-line



NOTES: All dimensions in inches
Leads are intended for insertion in hole rows on .300" centers
They are purposely shipped with "positive" misalignment to facilitate insertion
Board-drilling dimensions should equal your practice for .020 inch diameter lead
Leads are tin-plated kovar
Package weight is 2.2 grams
*The .037 dimension does not apply to the corner leads

7K

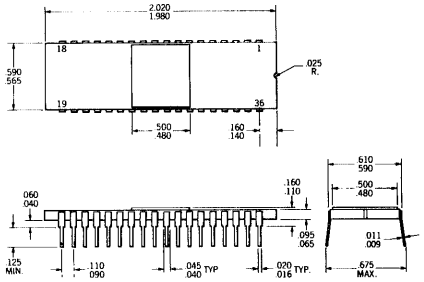
16 Lead Dual In-line (Metal Cap)



NOTES: All dimensions in inches
Leads are intended for insertion in hole rows on .300" centers
They are purposely shipped with "positive" misalignment to facilitate insertion
Board-drilling dimensions should equal your practice for .020 inch diameter lead
Leads are gold-plated kovar
Low temperature seal
Package weight is 1.3 grams

7U

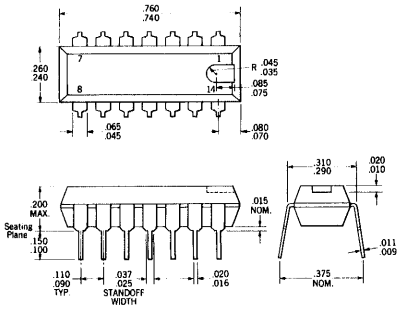
36 Lead Side Brazed Dual In-line



NOTES: All dimensions in inches
Leads are intended for insertion in hole rows on .600" centers
They are purposely shipped with "positive" misalignment to facilitate insertion
Leads are gold-plated kovar
Package weight is 6.2 grams

9A

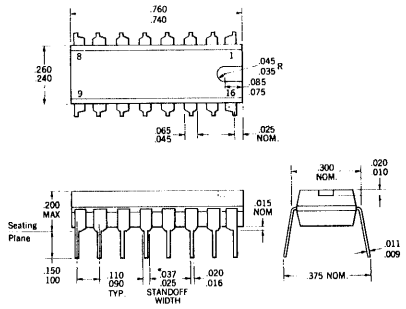
in accordance with JEDEC (TO-116) outline 14 Lead Silicone Dual In-line



NOTES: All dimensions in inches
Leads are intended for insertion in hole rows on .300" centers
They are purposely shipped with "positive" misalignment to facilitate insertion
Board-drilling dimensions should equal your practice for .020 inch diameter lead
Leads are tin-plated kovar
Package weight is 0.9 grams

9B

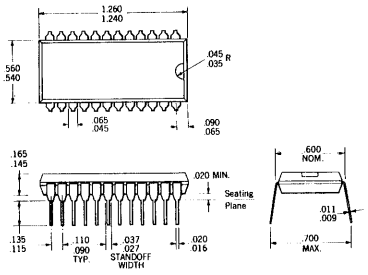
16 Lead Silicone Dual In-line



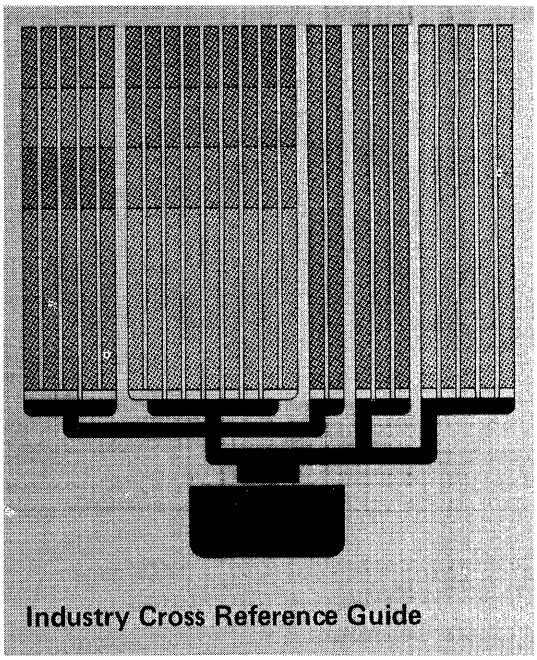
NOTES: All dimensions in inches
Leads are intended for insertion in hole rows on .300" centers
They are purposely shipped with "positive" misalignment to facilitate insertion
Board-drilling dimensions should equal your practice for .020 inch diameter lead
Leads are tin-plated kovar
Package weight is 0.9 grams
*The .0371/.027 dimension does not apply to the corner leads

9N

24 Lead Plastic MSI Dual In-line



NOTES: All dimensions in inches
Leads are intended for insertion in hole rows on .600" centers
They are purposely shipped with "positive" misalignment to facilitate insertion
Leads are tin-plated kovar
Package weight is 2.7 grams



Industry Cross Reference Guide

INDUSTRY TTL CROSS REFERENCE GUIDE

The following charts indicate the recommended Fairchild replacement for the most popular TTL devices in use today.
Two categories of replacement are given.

1. Pin for Pin Replacement

Function and pin configuration are identical, however some small differences in the electrical or mechanical specification or method of test may exist.

2. Functional Equivalent

Device performing similar function, but with different pin outs, or organization.
Exact interchangability in every application is not guaranteed. Before specifying a substitute, the user should compare the most recent data and device parameters from both sources of supply.
Cross reference information is provided for the following manufacturers.

- Advanced Micro Devices
- Computer Microtechnology
- Intel
- ITT
- Motorola
- National
- Philips
- Signetics
- Texas Instruments

AMD – ADVANCED MICRO DEVICES

Other Fairchild Digital Families
And Application Notes

LIST OF OTHER FAIRCHILD DIGITAL PRODUCTS AND APPLICATION NOTES

In addition to TTL, Fairchild also manufactures other digital logic integrated circuit families. Further information on these other products is available on request from:

Fairchild Semiconductor
P.O. BOX 880A
Mountain View, California 94040
Att. Distribution Services

CTL—COMPLEMENTARY TRANSISTOR LOGIC

9952 Series (CTL I)

9030	8-Bit Memory Cell
9952	Dual 2-Input NOR Gate
9953	AND/OR Gate
9954	AND/OR Gate
9955	AND/OR Gate
9956	Dual 2-Input Buffer
9957	Flip-Flop
9964	AND/OR Gate
9965	AND/OR Gate
9966	AND/OR Gate
9967	Flip-Flop
9968	Dual High Speed Latch
9971	AND/OR Gate
9972	AND/OR Gate

9852 Series (CTL II)

9801	Dual Gated Phase Splitter NOR/OR
9806	Hex Inverter NOR/OR
9816	Hex Restorer (Buffer) AND/OR Gate
9820	100 Ω Line Receiver
9821	100 Ω Line Driver
9822	Dual Full Adder/Subtractor
9823	Carry Lookahead Logic for 9822
9824	4-Bit Comparator
9828	Dual JK-D Flip-Flop
9834	Quad Latch (with output gating)
9838	1-of-8 Decoder
9852	Dual 2-Input Inverter NOR/OR
9853	2-2-3-Input AND/OR Gate
9854	Dual 4-Input AND/OR Gate
9855	Single 8-Input AND/OR Gate
9856	Dual 2-Input Restorer (Buffer) AND/OR Gate
9863	9874 (minus 2 kΩ resistors) AND/OR Gate
9864	3-1-3-Input AND/OR Gate
9865	Quad 1-Input AND/OR Gate
9866	Quad 2-Input (one pair or tied) AND/OR Gate
9871	Quad 2-Input (pairs or tied) AND/OR Gate
9872	9866 (minus 2 K Input resistors) AND/OR Gate
9874	3-2-2-2-Input AND/OR Gate
9875	4-3-3-Input AND/OR Gate
9877	Micro Operator
9881	8-Input Multiplexer
9883	8-Input Priority Encoder

DTL—DIODE TRANSISTOR LOGIC

9930 Series

9930	Dual 4-Input Extendable NAND Gate
9932	Quad 2-Input Extendable NAND Buffer Gate
9933	Extender
9935	Extendable Hex Inverter
9936	Hex Inverter
9937	Hex Inverter
9941	Monostable Multivibrator
9944	Quad 2-Input Extendable NAND Buffer Gate (Open Collector)
9945	RS Flip-Flop
9946	Quad 2-Input NAND Gate
9948	RS Flip-Flop
9949	Quad 2-Input NAND Gate
9950	ac Coupled RS Flip-Flop
9951	Monostable Multivibrator
9961	Dual 4-Input Extendable NAND Gate
9962	Triple 3-Input NAND Gate
9963	Triple 3-Input NAND Gate
9135	Hex Inverter (Open Collector)
9157	Quad 2-Input Buffered NAND Gate
9158	Quad 2-Input Power NAND Gate
9093	Dual JK Flip-Flop
9094	Dual JK Flip-Flop
9097	Dual JK Flip-Flop
9099	Dual JK Flip-Flop
9109	High Voltage Hex Inverter
9110	High Voltage Hex Inverter
9111	RS Flip-Flop
9112	High Voltage Hex Inverter

1800 Series

1800	Dual 5-Input NAND Gate
1801	Dual 5-Input NAND Gate
1802	Single 8-Input NAND Gate
1803	Single 8-Input NAND Gate
1804	Single 10-Input NAND Gate
1805	Single 10-Input NAND Gate
1806	Quad 2-Input AND Gate
1807	Quad 2-Input AND Gate
1808	Quad 2-Input OR Gate
1809	Quad 2-Input OR Gate
1810	Quad 2-Input NOR Gate
1811	Quad 2-Input NOR Gate
1812	Quad 2-Input Exclusive OR Gate
1813	Quad Latch
1814	Quad Latch

ECL – EMITTER COUPLED LOGIC

9500 Series

95H00	4-Bit Universal Register
9502	Dual 4-Input OR/NOR Gate (2.4 ns)
95H02	High Speed 9502 (1.6 ns)
9503	Triple 2-Input OR/NOR Gate (2.4 ns)
95H03	High Speed 9503 (1.6 ns)
9504	Quad 2-Input NOR Gate (2.4 ns)
95H04	High Speed 9504 (1.6 ns)
9505	Quad OR/AND Gate
9507	Quad AND/NAND Gate
95H10	Synchronous Decade Counter
95H16	Synchronous Binary Counter
95H22	High Input Z 95H02
95L22	Low Power 9502 (20 mW, 2 ns)
95H23	High Input Z 95H03
95L23	Low Power 9503 (20 mW, 2 ns)
95H24	High Input Z 95H04
95L24	Low Power 9504 (20 mW, 2 ns)
9528	160 MHz "Dual D" Flip-Flop
95H28	220 MHz 9528
95H29	210 MHz JK Flip-Flop
9534	Quad Latch
9538	2 Line/8 Line Decoder
*95H39	8-Bit Multiport Memory
95H41	4-Bit ALU
*95H42	Lookahead Unit for 95H41
95H55	5-Bit Comparator
9578	Quad Exclusive-OR Gate/4-Bit Comparator
9579	Quad 2-Input Multiplexer
9580	Triple 2-Input Multiplexer
9581	8-Input Multiplexer
9582	Multifunction Receiver/Schmitt Trigger
95H84	2-Bit Adder/Subtractor
95H90	250 MHz Prescaler (divide by 10/11)
9595	ECL – TTL Converter
95400	64-Bit RAM – 16X4
95401	16-Bit RAM – 16X1
95410	256-Bit RAM – 256X1

95100 Series

*95101	Dual 2-Wide OR-AND/NAND Gate
95102	Dual OR/NOR Gate
95103	Triple OR/NOR Gate
95104	Quad OR/NOR Gate
*95105	4-Wide OR-AND/NAND Gate
*95106	Dual 3-Input, 3-Output OR Gate
*95108	Quad 1-Input OR/NOR Gate
*95109	Dual 3-Input, 3-Output NOR Gate
95110	Synchronous Decade Counter
95116	Synchronous Hexadecimal Counter
95128	Dual D Flip-Flop
95129	JK Flip-Flop
*95134	Quad Latch
*95138	1-of-8 Decoder
95141	4-Bit ALU/Function Generator
*95178	Quad Exclusive OR
*95179	Quad 2-Input Multiplexer
*95180	Triple 2-Input Multiplexer
*95196	Quad ECL–TTL Level Converter
*95197	Quad TTL–ECL Level Converter

RTL – RESISTOR TRANSISTOR LOGIC

9900 Series

9900	Buffer
9901	Counter Adapter
9902	Flip-Flop
9903	3-Input NOR Gate
9904	Half Adder
9905	Half Shift Register
9906	Half Shift Register
9907	4-Input Gate
9908	Adder
9909	Buffer
9910	Dual Gate
9911	Dual Gate W/Inverter
9912	Half Adder
9913	Type D F/F
9914	Dual 2-Input NOR Gate
9915	Dual 3-Input NOR Gate
9921	Expander
9923	JK Flip-Flop
9926	JK Flip-Flop
9927	Quad Inverter
9974	JK Flip-Flop

CμL (RTL) – COUNTING MICROLOGIC

9958	Decade Counter
9959	4-Bit Latch
9960	Decoder/Driver
9989	Binary Counter

TTL APPLICATIONS NOTE INDEX

The following Applications notes provide further information on many of the devices described in this catalog. New Application notes are prepared often. Check Fairchild Application Index, published quarterly, for the most up to date listing.

APP–161	9300 Shift Register
163	9304 Dual Adder
167	9308 Dual 4-Bit Latch
168	93434 Read Only Memory
170	9311 1-of-16 Decoder
181	9309 and 9312 Multiplexers
182	9328 Dual 8-Bit Shift Register
184	9310/16 Counters
202	Philosophy and Design of MSI
205	Thermal Evaluation of Integrated Circuits
212	Digital Display Systems
219	93400 TTL Random Access Memories for High Speed Applications
220	9334 8-Bit Addressable Latch
294	9338 8-Bit Multiple Port Register
295	9321 Dual 1-of-4 Decoder/Demultiplexer
296	9322 Quad 2-Input Multiplexer
303	9305 Variable Modulo Counter
304	9360/66 Up/Down Counters
305	9348 12-Input Parity Checker/Generator

*To be announced.
