## PREFACE

This data book contains the latest product information for Fujitsu's line of Telecommunications Products. This year's edition includes Piezoelectric Devices and IC Compandors, as well as sustaining products from the previous edition. Please note that the contents of this edition have been reorganized to better categorize products for your ease of use.
In addition to the collection of data sheets, you will find valuable information on ordering and expanded packaging descriptions, both in the Order Information section. One appendix, Design Information, is included as a guideline for selecting and designing Fujitsu prescalers and phase-locked loops for VHF and UHF frequency synthesis.
If you are interested in obtaining other Fujitsu product information, see the publication listing on the following pages for titles and brief descriptions of other Fujitsu product literature. To obtain a copy of any of the documents, contact one of our sales offices.

## FUJITSU PRODUCT PUBLICATIONS

The following is a list of the product publications available from Fujitsu Microelectronics, Inc. Call your nearest FMI Sales Office or Sales Representative to order any document(s) you need. (See the Sales Information section for phone numbers.)

## STANDARD PRODUCTS

| Dynamic RAM Products Data Book | Contains product data sheets for NMOS and CMOS DRAMs, including 1 M and 4 M devices, and MOS application-specific RAMs. |
| :---: | :---: |
| Static RAM Products Data Book | Contains product data sheets for high-speed CMOS and BiCMOS SRAMs, low-power CMOS SRAMs and applicationspecific SRAMs. |
| ECL RAM Products Data Book | Contains product data sheets for ECL and TTL bipolar ECL RAMs, BiCMOS ECL RAMs, and application-specific RAMS including self-timed RAMs (STRAMs). |
| Programmable Memory Products Data Book | Contains product data sheets for programmable ROMs (including registered and wide-temperature range PROMs); CMOS maskprogrammable ROMS, OTP ROMs, erasable PROMs, and EEPROMs; NMOS erasable PROMs and non-volatile RAMs. |
| Memory Card Products Data Book | Contains product data sheets and programming information for 68 -pin JEIDA and PCMCIA standard memory cards and connectors and for 38 -pin memory cards. |
| Power Transistor Products Data Book | Contains product data sheets for RETs, Darlington arrays, and FETs. |
| Linear Products Data Book | Contains product data sheets for audio products, power supply controls, motor drivers, disk drivers, and converters (A/D, D/A, A/D-D/A, and F/N), and other linear products. |
| Linear Products Selector Guide | Presents an overview of linear products. |
| Telecommunication Products Data Book | Contains product data sheets for prescalers and VCOs, PLLs, single-chip PLLs and Prescalers, CODECs, telephone ICs, and cellular telephone ICs, cordless telephone ICs, and piezoelectric devices. |
| Telecommunication Devices Selector Guide | Presents an overview of telecommunication products and piezoelectric devices. |
| Interface and Logic Products Selector Guide | Presents an overview of logic and interface devices. |
| CMOS 4-bit Microcontrollers Data Book, Vol. I | Contains product information, including the development tool for the MB8850 and MB88200 families of 4-bit microcontrollers. |
| CMOS 4-bit Microcontrollers Data Book, Vol. II | Contains product information, including the development tool for the MB88500 family of 4-bit microcontrollers. |
| CMOS 4-bit Microcontrollers Selector Guide | Presents an overview of the MB88500 (high end), MB8850 (midrange), and MB88200 (low end) families of 4 -bit microcontrollers. |
| Master Product Guide | Presents an overview of the entire range of products offered by the Integrated Circuits Division: Standard and ASIC products. |

## FUJITSU PRODUCT PUBLICATIONS (Continued)

## ASIC. PRODUCTS

CMOS Channeled Gate Arrays Data Book and Design Evaluation Guide

CMOS Channelless Gate Arrays Data Book and Design Evaluation Guide

ASIC Products Selector Guide

BiCMOS Gate Arrays Data Book and Design Evaluation Guide

ECL Gate Arrays Data Book and Design Evaluation Guide

Contains product information for UHB Series High Drive CMOS Gate Arrays and CG10 Series High Drive CMOS Gate Arrays.

Contains product information for AU Series CMOS Series Gate Arrays and CG21 Series CMOS Gate Arrays.

Presents an overview of CMOS, BiCMOS, ECL, and GaAs gate arrays and CMOS standard cell products.

Contains product information for BC Series BiCMOS Gate Arrays and BC-H Series BiCMOS Gate Arrays.

Contains product information for ET Series ECL Gate Arrays, H Series ECL Gate Arrays, Ultra-High Performance ECL Gate Arrays, and VH Series ECL Gate Arrays.

## ASIC SOFTWARE

The ASIC Gallery ${ }^{\text {TM }}$ (catalog)
The ASIC Design Environment (catalog)
ViewCAD User's Guide
ViewCAD Installation Guide
CMOS ASIC Reference Manual for
Valid

FAME User's Guide

FAME Reference Manual

Synopsys User's Guide

Discusses the trend in ASICs: migration from using gates as primitives to using LSI and even VLSI macros as design elements.

Provides an overview of the third-party tools that work in concert with Fujitsu's proprietary tools, ViewCAD ${ }^{\text {M }}$, BankCAD ${ }^{\text {M }}$, and FAME. Also included are product profiles explaining how the third-party tools fit within the design framework.

Provides a basic understanding of Fujitsu's proprietary CAD/CAE system, ViewCAD. This book provides information necessary to design, test, simulate, and analyze circuits using Fujitsu's unit cell libraries for AU, UHB, CG10, CG21, and CG31 CMOS technologies.

Explains how to install Fujitsu's proprietary CAD/CAE system, ViewCAD.

Provides a basic understanding of the Valid System on the Sun platform as it interfaces with Fujitsu programs to build circuits using Fujitsu's unit cell libraries for AU and UHB CMOS technologies.

Provides a basic understanding of the Fujitsu ASIC Management Environment (FAME) software as it interfaces with third-party tools (Sun or PC) to build circuits using Fujitsu's unit cell libraries.

Provides installation and directory information for the Fujitsu ASIC Management Environment (FAME) software, which uses third-party tools (Sun or PC) to build circuits using Fujitsu's unit cell libraries.

Provides a basic understanding of the Synopsys ${ }^{(8)}$ system as it interfaces with Fujitsu programs to build circuits using Fujitsu's unit cell libraries.

## Contents and Alphanumeric Product List

## Fujitsu's Telecommunication Products

Introduction ..... vii
Section 1 - Prescalers - At a Glance ..... 1-1
MB467 $\quad 200 \mathrm{MHz}$ Low Power High Frequency Prescaler ..... 1-3
MB501/L $\quad 1.0 / 1.1 \mathrm{GHz}$ Two Modulus Prescaler ..... 1-11
$503 \quad 200 \mathrm{MHz}$ Two Modulus Prescaler ..... 1-11
504/L $\quad 520 \mathrm{MHz}$ Two Modulus Prescaler ..... 1-11
MB501LV $\quad$ 1.1 GHz Low Voltage/Low Power Two Modulus Prescaler ..... 1-23
MB504LV $\quad 520$ GHz Low Voltage/Low Power Two Modulus Prescaler ..... 1-23
MB501SL $\quad$ 1.1 GHz Super Low Power Two Modulus Prescaler ..... 1-33
MB505-16 $\quad 1.6$ GHz Ultra-high Frequency Prescaler ..... 1-43
MB506 $\quad 2.4 \mathrm{GHz}$ Ultra-high Frequency Prescaler ..... 1-47
MB507 1.6 GHz Two Modulus Prescaler ..... 1-51
MB508 $\quad 2.3 \mathrm{GHz}$ Two Modulus Prescaler ..... 1-59
MB509 $\quad$ 1.1 GHz Two Modulus Prescaler with Stand-by Mode ..... 1-67
MB510 $\quad 2.7 \mathrm{GHz}$ Two Modulus Prescaler ..... 1-75
MB511 $\quad 1.0 \mathrm{GHz}$ High-speed Prescaler ..... 1-83
Section 2 - Phase-Locked Loops (PLLs) - At a Glance ..... 2-1
MB87001A $\quad 13 \mathrm{MHz}$ CMOS Serial Input PLL Frequency Synthesizer ..... 2-3
MB87006A $\quad 17 \mathrm{MHz}$ CMOS Serial Input PLL Frequency Synthesizer ..... 2-15
MB87014A CMOS Serial Input PLL Frequency Synthesizer with 180 MHz Prescaler ..... 2-27
MB87076 $\quad 13 \mathrm{MHz}$ CMOS Serial Input PLL Frequency Synthesizer With Power Down Mode ..... 2-37
MB87086A $\quad 15 \mathrm{MHz}$ CMOS Serial Input PLL Frequency Synthesizer ..... 2-51
MB87087 $\quad 17$ MHz CMOS Serial Input PLL Frequency Synthesizer ..... 2-61
MB87090 13 MHz CMOS Serial Input PLL Frequency Synthesizer with Constant Current Output Charge Pump ..... 2-73
Section 3 - Single-Chip PLLs/Prescalers - At a Glance ..... 3-1
MB1501 Serial Input PLL Frequency Synthesizer with 1.1 GHz Prescaler ..... 3-31501H
1501L
MB1502 Low Power Serial Input PLL Synthesizer with 1.1 GHz Prescaler ..... 3-21
MB1503 Serial Input PLL Frequency Synthesizer with 1.1 GHz Prescaler ..... 3-35
MB1504 Serial Input PLL Frequency Synthesizer with 520 MHz Prescaler ..... 3-49
1504H
1504L
MB1505 Serial Input PLL Frequency Synthesizer with 600 MHz Prescaler ..... 3-67
MB1507 Low Power Serial Input PLL Frequency Synthesizer with 2.0 GHz Prescaler ..... 3-79

## Contents and Alphanumeric Product List (Continued)

## Introduction

Introduction
Fujitsu manufactures a wide range of integrated circuits that includes linear products, microprocessors,
telecommunications circuits, ASICs, high-speed ECL logic, power components (consisting of both discrete transistors and transistor arrays), and both static and dynamic RAMs.

The telecommunication product line offers devices for use in a wide range of applications. These telecommunication products are manufactured to meet the high standard of quality and reliability that is found in all Fujitsu products.

## Prescalers

Fujitsu offers a wide range of prescaler devices capable of satisfying the technical requirements of today's applications. Features such as the 200 MHz to 2.7 GHz frequency range, low power consumption, and a multitude of divide ratios are some of the advantages of Fujitsu's prescaler family.

Phase-Locked Loops (PLLs)
The Fujitsu family of PLLs offers a wide range of operating frequencies with low supply currents and voltages to meet design needs. The serial input capability of these devices is an outstanding feature of Fujitsu's PLLs.

## Single-Chip PLLs/Prescalers

Fujitsu is one of only a few semiconductor manufacturers to offer single-chip PLL/Prescaler devices. Fujitsu is the only manufacturer with a BiCMOS version that combines high speed and low power consumption in a single chip. With the increasing emphasis on board space reduction (to improve cost), reliability, and overall product size, these single-chip devices provide solutions for designers.

## Single-Chip VCOs/Prescalers

Fujitsu is the only semiconductor manufacturer with a single-chip VCO/Prescaler family of products. With the increasing emphasis on overall product size reduction and added on-chip functionality, this new family of devices provides the needed design solution.

## Fujitsu's Telecommunication Devices

## Plezoelectric Devices

Fujitsu's lithium tantalate peizoelectric bandpass SAW filters provide sharp roll-off characteristics and excellent stability over temperature in a tiny $5 \mathrm{~mm} \times 5 \mathrm{~mm}$ surface mount package. Standard frequencies are available for AMPS, NTACS, NMT, and ETACS transmit and receive frequencies. This family of devices also includes a series of voltage controlled oscillators.

## Cordiess Telephone Integrated Circuits

Fujitsu's family of cordless telephone ICs offers low power consumption, ideal for application of this type. This family of products consists of minimum-shift keying modems for data transfer applications.

## Telephone Integrated Circuits

Fujitsu offers a complete family of telephone ICs as an application-specific product line. These devices are capable of performing advanced telephone functions such as SLIC, speech transmission/reception, DTMF, on-hook dialing, last number repeat, tone amplification, and companding functions.

Coder/Decoders (CODECs)
The Fujitsu family of CODECs consists of the MB6020 series. All devices conform to CCITT and AT\&T specifications.

Prescalers - At a Glance

| Page | Device | Maximum Frequency | $I_{c c}{ }^{\text {Supply }}$ | $V_{\text {cc }}$ | Divide Ratio | Package Options |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1-3 | MB467 | 200 MHz | 6 mA | 5 V | 10/20 | 8 -pin | Plastic | DIP, FPT |
| 1-11 | MB501 | 1.0 GHz | 30 mA | 5 V | $\begin{aligned} & \text { 64/65, } \\ & \text { 128/129 } \end{aligned}$ | 8 -pin | Plastic | DIP, FPT |

## MB467

LOW POWER PRESCALER

## 200MHz, LOW POWER PRESCALER

The Fujitsu MB467 is a prescaler, which is used in Phase Locked Loop (PLL) frequency synthesizer. The MB467 will divide by 10 when SW pin is high (Vcc level) and by 20 when SW pin is low (open or $1 / 2 \mathrm{~V}$ cc level). The output is an open collector output to drive TTL or CMOS logic circuit.

- Operating Frequency: $200 \mathrm{MHz}_{\mathrm{z}}$ max.
- Low Power Comsumption: 30 mW typ.
- Low Level Input Voltage: $V_{I N} \geq 150 \mathrm{mV} V_{P-p}$
- Wide Operation Temperature: $T_{A}=-30^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
- Power Supply Voltage: $\mathrm{V}_{\mathrm{cc}}=+5 \mathrm{~V} \pm 10 \%$
- Interface

Input: Capacitor coupling due to internal biased input
Output: Open collector output

- Plastic 8-pin Standard Dual-In-Line Package: (Suffix: -P)
- Plastic 8-pin Standard Flat Package: (Suffix: -PF)

his device contains circuity to protect the inputs against However, it is to high static voltages or elichic avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

ABSOLUTE MAXIMUM RATINGS (See NOTE)

| Rating | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| Supply Voltage | $\mathrm{V}_{\mathrm{CC}}$ | -0.5 to +7.0 | V |
| Input Voltage | $\mathrm{V}_{\mathrm{IN}}$ | -0.5 to $\mathrm{V}_{\mathrm{cc}}$ | V |
| Output Current | $\mathrm{I}_{\mathrm{C}}$ | 0 to +5 | mA |
| Junction Temperature | $\mathrm{T}_{\mathrm{J}}$ | +125 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature | $\mathrm{T}_{\mathrm{STG}}$ | -55 to +150 | ${ }^{\circ} \mathrm{C}$ |

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are excoeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

[^0]

## PIN DESCRIPTION

| Pin Number | Symbol |  |
| :---: | :--- | :--- |
| 1 | IN | Function |
| 2 | Input |  |
| 3 | SW | DC Supply Voltage Input |
| 4 | OUT | Output |
| 5 | GND | Ground |
| 6 | CH | Check Input For Outgoing Test. It should be open. |
| 7 | NC | Non Connection Input (See Divide Ratio Table) |
| 8 | $\mathbb{N}$ | Complementary Input |

RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Value |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min | Typ | Max |  |
| Power Supply Voltage | $V_{c c}$ | 4.5 | 5.0 | 5.5 | V |
| Ambient Temperature | $\mathrm{T}_{\wedge}$ | $-30$ |  | +85 | ${ }^{\circ} \mathrm{C}$ |

## MB501/501L/503/504/504L TWO MODULUS PRESCALERS

## TWO MODULUS PRESCALERS

The Fujitsu MB 501/503/504 are two modulus prescalers, which are used in Phase Locked Loop (PLL) frequency synthesizer and will divide the input frequency by the modulus of $64 / 65$ or $128 / 129,16 / 17$ or $32 / 33$, and $32 / 33$ or 64/65 respectively. MB $501 \mathrm{~L} / \mathrm{MB} 504 \mathrm{~L}$ is the low-power version of MB 501/ MB 504; it will perform exactly the same function as MB 501/MB 504 but with much lower power dissipation.

The output is 1.6 V peak to peak on ECL level.

- High Operating Frequency, Low Power Operation.
1.0 GHz at 150 mW typ. (MB 501)
1.1 GHz at 50 mW typ. (MB 501 L )

200 MHz at 40 mW typ. (MB 503)
520 MHz at 50 mW typ. (MB 504)
520 MHz at 25 mW typ. (MB 504L)

- Pulse Swallow Function
- Wide Operation Temperature $\mathrm{T}_{\mathrm{A}}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
- Stable Output Amplitude $\quad V_{\text {OUt }}=1.6 \mathrm{~V}_{\text {P-P }}$
- Complete PLL synthesizer circuit with the Fujitsu MB 87001A, PLL synthesizer IC
- Plastic 8-pin Standard Dual-In-Line Package or space saving Flat Package

ABSOLUTE MAXIMUM RATINGS (See NOTE)

| Rating |  | Value | Unit |
| :--- | :---: | :---: | :---: |
| Supply Voltage | $\mathrm{V}_{\mathrm{CC}}$ | -0.5 to +7.0 | V |
| Input Voltage | $\mathrm{V}_{\mathrm{IN}}$ | -0.5 to $\mathrm{V}_{\mathrm{CC}}$ | V |
| Output Current | $\mathrm{V}_{0}$ | 10 | mA |
| Ambient Temperature | $\mathrm{T}_{\mathrm{A}}$ | -40 to +85 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature | $\mathrm{T}_{\mathrm{STG}}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

Note: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

## MB501/MB501L TIMING CHART (2 MODULUS)

Example: Divide ratio $=64 / 65$

Note: When divide ratio of 65 is selected, positive pulse is applied by one to 33.
The typical set up time is 18 ns (MB501), 16 ns (MB501L) from the MC signal input to the timing of change of prescaler divide ratio.

## MB503 TIMING CHART (2 MODULUS)

Example: Divide ratio = 16/17

Note: When divide ratio of 17 is selected, positive pulse is applied by one to 9 .
The typical set up time is 38 ns from the MC signal input to the timing of change of prescaler divide ratio.

## MB504/MB504LV TIMING CHART (2 MODULUS)

Example: Divide ratio $=32 / 33$

Note: When divide ratio of 33 is selected, positive pulse is applied by one to 17 .
The typical set up time is 20 ns (MB504), 18 ns (MB504L) from the MC signal input to the timing of change of prescaler divide ratio.

## LOW VOLTAGE/LOW POWER TWO MODULUS PRESCALERS

The Fujitsu MB501LV/504LV are low power and low voltage versions of MB501/504 two modulus prescalers used in Phase Locked Loop (PLL) frequency synthesizer and will divide the input frequency by the modulus of $64 / 65$ or 128/129, and $32 / 33$ or 64/65 respectively.
The output level is 1.1 V peak to peak on ECL level.

- Wide Low Voltage Operation 3.0 V typ., +2.7 to 4.5 V
- High Frequency Operation, Low Power Operation ( $\mathrm{V}_{\mathrm{IN}}=-12 \mathrm{dBm}$ min.)
1.1 GHz at 36 mW typ. (MB 501LV)

520 MHz at 18 mW typ. (MB 504LV)

- Pulse Swallow Function
- Wide Operation Temperature

$$
\begin{aligned}
& \mathrm{T}_{\mathrm{A}}=-40^{\circ} \mathrm{C} \text { to }+85^{\circ} \mathrm{C} \\
& \mathrm{~V}_{\text {OUT }}=1.1 \mathrm{~V}_{\mathrm{Dpp}} \text { typ. }
\end{aligned}
$$

- Stable Output Amplitude
- Built-in a termination resistor

Stable output amplitude is obtained up to output load capacitance of 8 pF .

- Complete PLL synthesizer circuit with the Fujitsu MB 87001A, PLL synthesizer IC
- Plastic 8-pin Standard Dual-In-Line Package or space saving Flat Package

MB506
ULTRA HIGH FREQUENCY PRESCALER

## ULTRA HIGH FREQUENCY PRESCALER

The Fujitsu MB506 is a high frequency prescaler used in Phase Locked Loop (PLL) frequency synthesizer and will divide the input frequency by the modulus of 64,128 or 256 . The output level is 1.6 V peak to peak on ECL level.

Its ultra high frequency operation provides wide application range, such as Direct Broadcasting Satellite System, CATV system, UHF Transceiver, etc.

- High Frequency Operation 2.4 GHz max.
- Power Dissipation 90 mW typ.
- Wide Operation Temperature $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
- Stable Output Amplitude $\quad V_{\text {OUT }}=1.6 \mathrm{~V}_{\text {P-P }}$
- Complete PLL synthesizer circuit with the Fujitsu MB 87006A, PLL synthesizer IC
- Plastic 8-pir Standard Dual-In-Line Package or Flat Package

## ABSOLUTE MAXIMUM RATINGS (See NOTE)

Details of "A"----7 part

## TWO MODULUS PRESCALER WITH STAND-BY MODE

The Fujitsu MB509 is a low power two modulus prescaler which enables pulse swallow function. The MB509 is used in Phase Locked Loop (PLL) frequency synthesizer and divides the input frequency by the modulus of 64/65 or 128/129, respectively.
Power consumption is 58 mW typ. at power supply voltage of 5.0 V . The MB509 is equipped with the stand by mode which cuts off the power supply current $l_{\mathrm{cc}}$ under PLL phase lock condition. ( $\mathrm{l}_{\mathrm{cc}}=180 \mu \mathrm{~A}$ under current cut condition) Intermittent operating mode is achieved by using MB509 and MB87076.

- High Speed: $\operatorname{fmax}=1.1 \mathrm{GHz}$ max. $\left(V_{\mathbb{N}}=-4 \mathrm{dBm}\right.$ min. $)$
- Pulse Swallow Function: 64/65, 128/129
- Power Supply Consumption: 58 mW typ.
- Stand-by Current: $180 \mu \mathrm{~A}$ typ.
- Stable Output Amplitude: $\mathrm{V}_{\mathrm{o}}=1.6 \mathrm{~V}_{\mathrm{p}-\mathrm{p}}$ typ.
- Complete PLL synthesizer circuit with the Fujitsu MB87076, PLL frequency synthesizer IC.
- Plastic 8-pin Dual-In-Line Package (Suffix: -P)

Plastic 8-pin Mini Flat Package (Suffix: -PF)

- Built-in a Termination Resistor

Stable output amplitude is obtained up to output load capacitance of 8 pF .

## ABSOLUTE MAXIMUM RATINGS (See NOTE)

| Rating | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{cc}}$ | -0.5 to +7.0 | V |
| Input Voltage | $\mathrm{V}_{\mathrm{IN}}$ | -0.5 to $\mathrm{V}_{\mathrm{cc}}$ | V |
| Output Current | $\mathrm{I} \circ$ | 10 | mA |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated avoid application of any vonage higher
voltages to this high impedance circuit.

## 8-LEAD PLASTIC FLAT PACKAGE (CASE No.: FPT-08P-M01)

## MB511 <br> 1GHz HIGH SPEED PRESCALER

## HIGH SPEED PRESCALER

The Fujitsu MB511 is a 1 GHz high speed prescaler designed for use in PLL (Phase Locked Loop) frequency synthesizer application.

The MB511 consumes low power 23 mA at 5 V up to 1 GHz input frequency due to adoption of Fujitsu advanced bipolar process.

The MB511 will divide by 1,2 , or 8 , respectively and very sensitivity ( -20 dBm min.). So, the MB511 is well suited for electronically tuned TV and CATV applications.

- Wide operating frequency range: $\mathrm{f}_{\text {in }}=50$ to $1000 \mathrm{MHz}\left(\mathrm{V}_{\text {in }}=\right.$ -20 dBm )
- Maximum operating frequency depends upon a divide ratio 1/1: 250MHz max. (Buffer through)
$1 / 2$ : 500 MHz max.
1/8: 1000 MHz max.
- Low supply current: 23mA @5V
- High input sensitivity: -20 dBm min
- Stable output amplitude: $800 \mathrm{mVp}-\mathrm{p}\left(\mathrm{C}_{\mathrm{L}} \leq 5 \mathrm{pF}\right)$
- Wide temperature range: $T_{A}=-40$ to $+85^{\circ} \mathrm{C}$
- Plastic 8-pin dual-in-line package (Suffix: -P)

Plastic 8-pin flat package (Suffix: -PF)
absolute maximum ratings (See note)

| Rating | Symbol | Value | Unit |
| :--- | :--- | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{CC}}$ | -0.5 to 7.0 | V |
| Input Voltage | $\mathrm{V}_{\text {IN }}$ | -0.5 to $\mathrm{V}_{\mathrm{CC}}+0.5$ | V |
| Output Current | $\mathrm{V}_{\mathrm{O}}$ | 10 | mA |
| Storage Temperature | $\mathrm{T}_{\mathrm{STG}}$ | -55 to 125 | ${ }^{\circ} \mathrm{C}$ |

NOTE: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

MB87001A
CMOS PLL FREQUENCY SYNTHESIZER

## CMOS SERIAL INPUT PHASE-LOCKED-LOOP (PLL) FREQUENCY SYNTHESIZER

The Fujitsu MB87001A, fabricated in CMOS technology, is a serial input PLL frequency synthesizer.

The MB87001A contains an inverter for oscillator, a programmable reference divider, a divide factor of programmable reference divider control circuit, a phase detector, a charge pump, a 17-bit shift register, a 17-bit latch, a programmable divider (a binary 7-bit swallow counter, a binary 10-bit programmable counter), and a control generator for an external dual modulus prescaler.

When supplemented with a loop filter and VCO, the MB87001 A contains the necessary circuit to make up PLL frequency synthesizer. Typically, a dual modulus prescaler such as the MB501L can be added, allowing input frequency operation up to 1.1 GHz .

- Single power supply voltage: $V_{D D}=2.7 \mathrm{~V}$ to 5.5 V
- Wide temperature range: $\mathrm{T}_{\mathrm{A}}=-40$ to $85^{\circ} \mathrm{C}$
- 13 MHz typical input capability @5V (fin input)
- On-chip inverter for oscillator
- 8 divide factors for programmable reference divider are selected by $\mathrm{S}_{1}$, $S_{2}$ and $S_{3}$ input (1/8, 1/16, 1/64,
$1 / 128,1 / 256,1 / 512,1 / 1024$, 1/2048)
- Programmable 17-bit divider with input amplifier consisting of: Binary 7-bit swallow counter Binary 10-bit programmable counter
- Two types of phase detector output: On-chip charge pump output Output for external charge pump
- Easy interface to Fujitsu dual modulus prescaler

ABSOLUTE MAXIMUM RATINGS (see NOTE)
( $\mathrm{Vss}_{\text {s }}=0 \mathrm{~V}$ )

| Rating | Symbol | Value | Unit |
| :---: | :---: | :---: | :---: |
| Power Supply Voltage | VDo | $V_{s s}-0.5$ to $V_{\text {ss }}+7.0$ | $V$ |
| Input Voltage | V IN | $V_{S S}-0.5$ to $V_{\text {DD }}+0.5$ | V |
| Output Voltage | Vout | $V_{S S}-0.5$ to $V_{D D}+0.5$ | V |
| Output Current | lout | $\pm 10$ | mA |
| Open-drain Output | Voop | $V_{\text {SS }}-0.5$ to $V_{\text {DD }}+3.0$ | V |
| Operating Temperature | $\mathrm{T}_{\text {A }}$ | -40 to +85 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature | Tstg | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |
| Power Dissipation | PD | 300 | mW |

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static vohages or electric fields. However, is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

## PIN DESCRIPTION (Continued)

## FUNCTIONAL DESCRIPTION

## DIVIDE FACTOR OF PROGRAMMABLE DIVIDER

Serial data of binary code is input to Data pin. These data are loaded into the 17 -bit shift register from MSB. When load enable signal LE is high, the data stored in the 17-bit shift register is transferred to the 17-bit latch
The data (1) to (7) set a divide factor of the binary 7-bit swallow counter and data (8) to (17) set a divide factor of binary 10-bit programmable counter. In other words, serial data is equivalent to the divide factor of programmable divider.

Fig. 2 - BLOCK DIAGRAM OF PROGRAMMABLE DIVIDER

## Binary 7-bit Swallow Counter Data Input

| $(7)$ | (6) | (5) | (4) | (3) | (2) | (1) | Divide <br> Factor A |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Divide factor N: 5 to 1023

## PULSE SWALLOW FUNCTION

[^8]
## TIMING CHART

Clock: Clock signal input for the 17-bit shift register.
Each rising edge of the clock shifts one bit of data into the shift register.
Data : Serial data input for the 17 -bit shift register.
LE : Load enable input.
When LE is high (high active), the data stored in the 17-bit shift register is transferred to the 17 -bit latch.
The 17-bit data is used for setting a divide factor of the programmable divider.

## MB87006A

CMOS PLL FREQUENCY SYNTHESIZER

## CMOS SERIAL INPUT PHASE-LOCKED-LOOP (PLL) FREQUENCY SYNTHESIZER

The Fujitsu MB87006A, fabricated in CMOS technology, is a serial input phase locked loop (PLL) frequency synthesizer.

The MB87006A contains an inverter for oscillator, programmable reference divider (binary 14 -bit programmable reference counter), 14 -bit shift register, 14 -bit latch, phase detector, charge pump, 17 -bit shift register, 17 -bit latch, programmable divider (binary 7 -bit swallow counter, binary 10 -bit programmable counter) and control generator for dual modulus prescaler.
When supplemented with a loop filter and VCO, the MB87006A contains the necessary circuit to make up a PLL frequency synthesizer. Typically, a dual modulus prescaler such as the MB501L can be added, allowing input frequency operation up to 1.1 GHz .

- Wide range power supply voltage: $\mathrm{V}_{\mathrm{CC}}=3.0$ to 6.0 V
- Wide temperature range: $\mathrm{T}_{\mathrm{A}}=-40$ to $85^{\circ} \mathrm{C}$
- 17 MHz typical input capability at 5 V (fin input)
- Programmable divider with input amplifier consisting of: -Binary 7-bit swallow counter -Binary 10-bit programmable counter
- Programmable reference divider with input amplifier consisting of binary 14-bit programmable reference counter
- On-chip inverter for oscillator
- Divide factor of programmable divider and programmable reference divider are set by serial data input. (The last data bit is control bit.)
- Two types of phase detector output: -On-chip charge pump output -Output for external charge pump
- Easy interface with Fujitsu prescalers
- 16-pin standard dual-in-line package (Suffix: -P)
16-pin standard flat package (Suffix: -PF)

## PIN DESCRIPTION

| Pln No, | Symbol | 10 | Description |
| :---: | :---: | :---: | :---: |
| 1 | OSC ${ }_{\text {IN }}$ | 1 | Input pin for crystal oscillator. <br> Input to the inverting amplifier that forms part of the oscillator. <br> This pin receives the oscillator signal as AC coupled when an external oscillator is used. For large amplitude signals (standard CMOS levels) DC coupling may also be used. |
| 2 | OSCout | 0 | Output pin for crystal oscillator. <br> Output of the inverting amplifier. This pin should be open when an external oscillator is used. |
| 3 | fv | 0 | Monitor output of the phase detector. <br> This pin is tied to the programmable divider output. |
| 4 | Vod | - | Power supply voltage input. |
| 5 | Do | 0 | Three-state charge pump output of phase detector. <br> The mode of $D_{0}$ is changed by the combination of programmable reference divider output frequency <br> fr , and programmable divider output frequency fv as listed below: <br> $\mathrm{fr}>\mathrm{fv}$ : $\quad$ Drive mode ( $\mathrm{Do}_{\mathrm{c}}=$ High level ) <br> $\mathrm{fr}=\mathrm{fv}$ : $\quad$ High impedance <br> fr < fv: $\quad$ Sink mode ( $\mathrm{D}_{\mathrm{o}}=$ Low level) |
| 6 | Vss | - | Ground. |
| 7 | LD | 0 | Output of phase detector. It is high level when fr and fv are equal, and when the loop is locked. Otherwise it outputs negative pulse signal. |
| 8 | fin | 1 | Clock input for programmable divider. <br> This input contains internal bias circuit and amplifier. The connection with an external dual-modulus prescaler should be an AC connection. |
| 9 | Clock | 1 | Clock signal input for 17-bit shift register and 14-bit shift register. <br> Each rising edge of the clock shifts one bit of the data into the shift registers. |
| 10 | Data | 1 | Serial data input for programmable divider and programmable reference divider. The last bit of the data is the control bit. Control bit determines which latch is activated. The data stored in the shift register is transferred to the 14-bit latch when the bit is high, and to 17-bit latch when low. |
| 11 | LE | 1 | Load enable input with internal pull up resistor. <br> When this pin is high (active high), the data stored in shift register is transferred to 14-bit latch or 17-bit latch depending on the control bit data. |
| 12 | M | 0 | Control output for an external dual modulus prescaler. <br> The connection to the prescaler should be DC connection. This output level is synchronized with falling edge of fin input signal (pin \#8). <br> Pulse swallow function: <br> e.g. MB501L: $M=$ High: Preset modulus factor 64 or 128 <br> M = Low Preset modulus factor 65 to 129 |

| 13 | $f r$ | 0 | Monitors output of phase detector input. <br> This pin is tied to the programmable reference divider output. |
| 14 | REFout | 0 | Monitor output pin of the reference frequency. <br> This output can be used as system clock for microprocessor, or reference oscillator for another PLL frequency synthesizer. |
| $\begin{aligned} & 15 \\ & 16 \end{aligned}$ | $\begin{aligned} & \phi V \\ & \phi R \end{aligned}$ | $\begin{aligned} & 0 \\ & 0 \end{aligned}$ | Output for external charge pump. <br> The mode of $\phi R$ and $\phi V$ is changed by the combination of programmable reference divider output frequency fr and programmable divider output frequency fv as listed below. |

## FUNCTIONAL DESCRIPTION

## SERIAL DATA INPUT TIMING

* Data for programmable reference divider.

Notes: Data: Serial data input is used for setting divide factor of programmable reference divider and programmable divider.
Data is input from MSB, and last bit data is a control bit.
Control bit is set high when divide factor of programmable reference divider is set. Control bit is set low level when divide factor of programmable divider is set.
Clock: Data is input to internal shift registers by rising edge of the clock.
LE: Load enable input:
When LE is high, the data stored in shift register is transferred to 14-bit latch, or 17-bit latch depending on the control bit setting.

## PULSE SWALLOW FUNCTION

$$
f v c o=[(N \times M)+A] \times f o s c+R(N>A)
$$

fvco : Output frequency of external voltage controlled oscillator (VCO)
N : Preset divide factor of binary 10-bit programmable counter (5 to 1023)
M : Preset modulus factor of external dual modulus prescaler (e.g. 64 in 64/65 mode, 128 in 128/129 mode of an MB501L prescaler)

A : Preset divide factor of binary 7-bit programmable counter (0 to 127, A < N)
fosc : Output frequency of external oscillator
R : Preset divide factor of binary 14-bit pragrammable reference counter (5 to 16383)

## DIVIDE FACTOR OF PROGRAMMABLE REFERENCE DIVIDER

Serial data consists of 14-bit data, which is used for setting divide factor of programmable reference counter, and 1-bit control data. In this case, control bit is set high level.

The data format is shown below.

BINARY 14-BIT REFERENCE COUNTER DATA INPUT

| $(14)$ | (13) | (12) | (11) | (10) | (9) | (8) | $(7)$ | $(6)$ | $(5)$ | $(4)$ | $(3)$ | $(2)$ | (1) | Divide <br> Factor |

[^11]
## DIVIDE FACTOR OF PROGRAMMABLE DIVIDER

Serial data consists of 17-bit data, which is used for setting divide factor of programmable divider, and 1-bit control data. In this case, control bit is set low level. The data (1) to (7) set a divide factor of 7 -bit swallow counter and data (8)to (17) set divide factor of 10-bit programmable counter

The data format is shown below

BINARY 7-BIT SWALLOW COUNTER DATA INPUT

| $(7)$ | (6) | (5) | (4) | (3) | (2) | (1) | Divide <br> Factor <br> $A$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| 0 | 0 | 0 | 0 | 0 | 1 | 0 | 2 |
| 0 | 0 | 0 | 0 | 0 | 1 | 1 | 3 |
| 0 | 0 | 0 | 0 | 1 | 0 | 0 | 4 |
| $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 127 |

Note: Divide factor A: 0 to 127
Depending upon the divide factor set input (SW) of external prescaler, the input data should be as follows. e.g. MB501L ( $+65 / 65$ )prescaler
$\mathrm{SW}=\mathrm{H}(64 / 65)$ : Bit 7 to shift register (7) should be zero.

BINARY 10-BIT PROGRAMMABLE COUNTER DATA INPUT

MB87014A
CMOS PLL Frequency Synthesizer/Prescaler

The Fujitsu MB87014A, fabricated in advanced CMOS technology, is a serial input phase locked loop (PLL) frequency synthesizer with an on-chip 180 MHz dual modulus prescaler.

The MB87014A contains dual modulus prescaler, inverter for oscillator, programmable reference divider, control circuit, phase detectors, charge pump, programmable divider (binary 6 -bit swallow counter and binary 10 -bit programmable counter).
The MB87014A contains the necessary circuit to make up a PLL frequency synthesizer that operates at a speed up to 180 MHz .

- Single power supply voltage: $V_{D D}=4.5 \mathrm{~V}$ to 5.5 V
- Wide temperature range: $\quad \mathrm{T}_{\mathrm{A}}=-30$ to $60^{\circ} \mathrm{C}$
- 180 MHz input capability at 5 V (fin input)
- On-chip inverter for oscillator
- Programmable divider with input amplifier consisting of: Binary 6-bit swallow counter
Binary 10-bit programmable counter
- Programmable reference divider with input amplifier consisting of binary 16 -bit programmable reference counter
- Divide factor of programmable divider and programmable reference divider are set by serial data input. (The last data bit is a control bit.)
- Three types of phase detector outputs:
- On-chip charge pump output for active LPF
- On-chip charge pump output for passive LPF
- Output for external charge pump
- 16 -pin standard dual-in-line package (Suffix: -P)

16-pin standard flat package (Suffix: -PF)

- Pulse swallow function
$\left.\begin{array}{ll}\quad f_{\text {vco }}=[(N \times M)+A] \times\left(F_{\text {osc }}+R\right)(N>A) \\ \text { (Output frequency of external voltage controlled oscillator (VCO) }\end{array}\right)$

## FUNCTIONAL DESCRIPTIONS

dIVIDE FACTOR OF DIVIDER

Binary code serial data is input to data pin. On rising edge of clock, one bit of data shifts into the shift register. Input data consists of 16 -bit data and 1-bit control data. The control data determines which latch is activated. When control is high, 16-bit latch is selected; when low, 6 -bit latch and 10 -bit latch are selected.

The serial data is input to 16 -bit shift registers and 1-bit control register. When load enable is high, the data from the shift register is latched into the programmable reference divider (binary 16-bit programmable reference counter) or programmable divider (binary 6-bit swallow counter and binary 10-bit programmable counter) depending upon a control bit setting.

STAND-BY MODE
When zero data of 16 -bit serial data is input, the MB87014 goes to stand-by mode. During stand-by mode, an internal circuit stops operation and $f_{\text {in }}$ and OSC $_{\text {in }}$ are forced to high level. Thus, a low supply current is achieved. Stand-by down mode is released when data other than low is input.
SERIAL DATA INPUT TIMING

Notes: Data: Serial data input is used for setting divide factor of programmable reference divider or programmable divider Data is input from MSB and last bit data is control bit.
Control bit is high level when divide factor of programmable reference divider is set. Control bit is set low level when divide factor of programmable divider is set.
Clock: Clock input for 16 -bit shift registers and control register. Data is input into internal shift registers by rising edge of the clock.
LE: Load enable input:
When LE is high, the data from shift register is latched into programmable reference divider or programmable divider depending upon the control bit setting.

## CMOS PLL FREQUENCY SYNTHESIZER

## CMOS SERIAL INPUT PHASE-LOCKED-LOOP (PLL) <br> FREQUENCY SYNTHESIZER WITH POWER DOWN MODE

The Fujitsu MB87076, fabricated in CMOS technology, is a serial input PLL frequency synthesizer that features a power down mode.

The MB87076 contains an inverter for Oscillator, 14-bit Shift Register, 18-bit Shift Register, 1-bit Control Register, 14 -bit Latch, 18-bit Latch, Programmable Divider (Binary 11-bit Programmable Counter and Binary 7-bit Swallow Counter), Programmable Reference Divider (Binary 14-bit Programmable Reference Counter), Phase Detector, Charge Pump, Control Generator for Two Modulus Prescaler, and Power Down Circuit.

The MB87076 selects either operation mode or power down mode, depending on PS input signal level. When device begins operation, phase $f_{t}$ and $f_{v}$ are synchronized.

- Single Power Supply Voltage: $\mathrm{V}_{\mathrm{DD}}=2.7$ to 5.5 V
- Wide Temperature Range: $T_{A}=-40$ to $85^{\circ} \mathrm{C}$
- Low Power Supply Current: 3 mA typ, ( $100 \mu \mathrm{~A}$ in power down mode)
- On-chip Inverter for Oscillator
- Programmable Reference Divider with Input Amplifier Programmable Divider with Input Amplifier
- 2 Types of Phase Detector Output

## FUNCTIONAL DESCRIPTION

## SERIAL DATA INPUT FOR PROGRAMMABLE DIVIDER

Binary serial data is input to Data pin. Each rising edge of clock shifts one bit of the data into the shift registers and control register. Input data consists of 18 -bit data and 1-bit of control bit data. In this case, control bit is set at low level. $\mathrm{S}_{1}$ to $\mathrm{S}_{7}$ is used for setting the divide ratio of 7 -bit swallow counter and $S_{8}$ to $S_{18}$ is used for setting the divide ratio of 11 bit programmable counter.

The data format is shown below.

## 7-bit Swallow Counter Data Input

Note: Divide factor less than 8 is prohibited. Divide factor: 8 to 16383

Fig. 2 - SERIAL DATA INPUT TIMING

Fig. 3 - PHASE DETECTOR WAVEFORM

Note: LD is set at High level when $\mathrm{f}_{\mathrm{r}} \neq \mathrm{f}_{\mathrm{v}}$. (Unclock condition) LD is set at Low level when $f_{r}=f_{v}$. (Lock condition)

## POWER DOWN OPERATION DESCRIPTION

The MB87076 has power down function which selects operation mode or power down mode depending on PS input signal level.
When PS is set at low level, power down mode is selected. During power down mode, internal dividers stop operation. Thus, very low power supply consumption is achieved and LC pin is set at Low level.

Then the PS level goes High with the frequency of VCO as almost the same value as that under the condition of phase lock, the following sequence is taken.

1) Programmable divider starts operation
2) $f_{p}$ is output with some delay
3) Programmable reference divider starts operation when it receives $f_{p}$.
4) $f_{t}$ is output
5) LC is forced to set at High level (Normal operation mode is selected)

When the $f_{f}$ outputs immediately after the $f_{p}$ outputs, and goes into the phase detector, the phase lock condition is obtained just after the first clock. When PS is set at Low level again, internal dividers stop operation. Then internal condition is reset.

## MB87086A

CMOS PLL Frequency Synthesizer/Prescaler
The Fujitsu MB87086A, fabricated in advanced CMOS technology, is a serial input phase locked loop (PLL) frequency synthesizer. The MB87086A contains an inverterfor oscillator, programmable reference divider (binary 16-bit programmable reference counter), programmable divider (binary 10-bit programmable counter), phase detector, charge pump.

The MB87086A contains the necessary circuit to make up a PLL frequency synthesizer that operates at a speed up to 95 MHz .

- Single power supply voltage: $\mathrm{V}_{\mathrm{DD}}=4.5 \mathrm{~V}$ to 5.5 V
- Wide temperature range: $\mathrm{T}_{\mathrm{A}}=-30$ to $60^{\circ} \mathrm{C}$
- On-chip inverter for oscillator
- Divide factor of programmable divider and programmable reference divider are set by serial data input. (The last data bit is a control bit).
- Three types of phase detector outputs:
-On-chip charge pump output for active LPF
-On-chip charge pump output for passive LPF
-Output for external charge pump
- 16-pin standard dual-in-line package (Suffix: $-P$ )

16-pin standard flat package (Suffix: -PF)

- 95 MHz input capability at 5 V (fin input)
- fin, Clock, Data input circuits involve schmitt circuit
- The divide factor is selected according to the following equation:
$f_{\mathrm{yco}}=\mathrm{N} \times \mathrm{f}_{\mathrm{osc}}+\mathrm{R}$
$\mathrm{f}_{\mathrm{vco}} \quad$ :Output frequency of external voltage controlled oscillator (VCO)
$\mathrm{N} \quad$ :Preset divide factor of programmable divider (5 to 1023)
M :Preset modulus factor of internal dual modulus prescaler (64/65)
fosc :Output frequency of the external oscillator
R Preset divide factor of binary programmable reference divider ( 5 to 65535)

## ABSOLUTE MAXIMUM RATINGS

| Parameter | Symbol | Ratings | Unit |
| :--- | :---: | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{DD}}$ | $\mathrm{V}_{\mathrm{SS}}-0.3$ to $\mathrm{V}_{\mathrm{SS}}+7.0$ | V |
| Input Voltage | $\mathrm{V}_{\mathrm{IN}}$ | $\mathrm{V}_{\mathrm{SS}}-0.3$ to $\mathrm{V}_{\mathrm{DD}}+0.3$ | V |
| Output Voltage | $\mathrm{V}_{\text {OUT }}$ | $\mathrm{V}_{\mathrm{SS}}-0.3$ to $\mathrm{V}_{\mathrm{DD}}+0.3$ | V |
| Output Current | $\mathrm{I}_{\text {OUT }}$ | $\pm 10$ | mA |
| Operating Ambient <br> Temperature | $\mathrm{T}_{\mathrm{A}}$ | -30 to +80 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature | $\mathrm{T}_{\mathrm{STG}}$ | -40 to +125 | ${ }^{\circ} \mathrm{C}$ |
| Power Dissipation | $\mathrm{P}_{\mathrm{D}}$ | 300 | mW |

Note: Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operation sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

[^17]

Pin Assignment

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it
is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

## PIN DESCRIPTION

| Pin No. | Symbol | 1/O | Description |
| :---: | :---: | :---: | :---: |
| 1 | OSC ${ }_{\text {in }}$ | 1 | Input pin for crystal oscillator. <br> Input to the inverting amplifier that forms part of the oscillator. This pin receives the oscillator signal as AC coupled when an extemal oscillator is used, but for large amplitude signals (standard CMOS levels) DC coupling may also be used. |
| 2 | OSCour | 0 | Output pin for crystal oscillator. <br> Output of the inverting amplifier. This pin should be connected to open when an external oscillator is used. |
| 3 | fv | 0 | Monitor pin for the phase detector input. <br> This pin is tied to the programmable divider output. |
| 4 | V ${ }_{\text {D }}$ | - | Power supply voltage input. |
| 5 | Dop | 0 | Output pin for low pass filter (Passive type). <br> The mode of $\mathrm{D}_{\mathrm{p}}$ is changed by the combination of programmable reference divider output frequency fr , and programmable divider output frequency fv as listed below: <br> fr > fv: Drive mode (Dop - High level) <br> $\mathrm{fr}=\mathrm{fv}: \quad$ High-impedance <br> $\mathrm{fr}<\mathrm{fv}$ : $\quad$ Sink mode (Dop = Low level) |
| 6 | $V_{\text {ss }}$ | - | Ground. |
| 7 | LD | 0 | Output of phase detector. It is high level when $f r$ and $f v$ are coherent, and when the loop is locked. Otherwise it outputs low pulse signal. |
| 8 | fin | 1 | Frequency input to programmable divider from VCO or prescaler output. (This input has an internal feed back resistor.) |
| 9 | Clock | 1 | Clock signal input for shift registers. <br> Each rising edge of the clock makes one bit of the data shift into the shift registers. |
| 10 | Data | 1 | Serial data input for shift registers. <br> The last bit of the data is the control bit. The control data determines which latch is activated. |
| 11 | LE | 1 | Load enable input. <br> When this pin is high level, the data stored in the shift registers is transferred to 16-bit latch, or 10-bit latch depending on the control bit setting. |
| 12 | DoA | 0 | Output pin for low pass filter (Active type). <br> The mode of $D_{O A}$ is changed by the combination of programmable reference divider output frequency fr , and programmable divider output frequency fy as listed below: <br> $f r>f v: \quad$ Drive mode (Don - Low level) <br> $\mathrm{fr}=\mathrm{ft}_{\mathrm{v}}: \quad$ High-impedance <br> $\mathrm{fr}<\mathrm{fv}$ : $\quad$ Sink mode (DoA $=$ High level) |
| 13 | $f r$ | 0 | Monitor pin for the phase detector input. <br> This pin is tied to the programmable reference divider output. |

## FUNCTIONAL DESCRIPTIONS

## DIVIDE FACTOR OF PROGRAMMABLE REFERENCE DIVIDER

Binary code serial data is input to data pin. Each rising edge of clock makes one bit of the data shift into the shift registers and control register. Input data consists of 16-bit or 10-bit data and 1-bit of control bit data. The 16-bit data is used for setting the divide factor of programmable reference divider. The 10-bit data is used for setting the divide factor of programmable divider.

The last bit of the data stored in control register is a control bit. Control data determines which latch is activated. When this bit is at high level, 16 -bit latch is selected; when this is at low level, 10 -bit latch is selected.

The data format is shown below.

When LE is high level and control bit is high level, the data stored in 16 -bit shift register is transferred to 16 -bit latch. When LE is high level and control bit is at low level, the data stored in 10-bit shift register is transferred to 10-bit latch.

SERIAL DATA INPUT TIMING

Notes:
 Data input for programmable reference divider.
( ) Data input for programmable divider.
Data Serial data input is used for setting divide factor of programmable reference divider or programmable divider. Data is input from MSB and last bit data is control bit.
Control bit is set at high level when divide factor of programmable reference divider is set. Control bit is set at low level when divide factor of programmable divider is set.

Clock Clock input for 10-bit shift register, 16-bit shift register and control register. Data is input into internal shift registers by rising edge of the clock.

LE Load enable input:
When LE is high level, the data stored in shift registers is transferred to 16 -bit latch, or 10 -bit latch depending on the control bit setting.

RECOMMENDED OPERATING CONDITIONS

## MB87087

CMOS PLL FREQUENCY SYNTHESIZER

## CMOS SERIAL INPUT PHASE-LOCKED-LOOP (PLL) FREQUENCY SYNTHESIZER

The Fujitsu MB87087, fabricated in CMOS technology, is a serial input phase locked loop (PLL) frequency synthesizer.

The MB87087 contains an inverter for oscillator, programmable reference divider (binary 14-bit programmable reference counter), 14-bit shift register, 14 -bit latch, phase detector, charge pump, 17-bit shift register, 17-bit latch, programmable divider (binary 7 -bit swallow counter, binary 10 -bit programmable counter) and control generator for dual modulus prescaler.
When supplemented with a loop filter and VCO, the MB87087 contains the necessary circuit to make up a PLL frequency synthesizer. Typically, a dual modulus prescaler such as the MB501L can be added, allowing input frequency operation up to 1.1 GHz .

- Wide range power supply voltage:
$V_{C C}=3.0$ to 6.0 V
- Wide temperature range:
$\mathrm{T}_{\mathrm{A}}=-40$ to $85^{\circ} \mathrm{C}$
- $\quad 17 \mathrm{MHz}$ typical input capability at 5 V (fin input)
- Programmable divider with input amplifier consisting of:
-Binary 7-bit swallow counter
-Binary 10-bit programmable counter
- Programmable reference divider with input amplifier consisting of binary 14-bit programmable reference counter
- On-chip inverter for oscillator
- Divide factor of programmable divider and programmable reference divider are set by serial data input. (The last data bit is control bit.)
- Two types of phase detector output: -On-chip charge pump output -Output for external charge pump
- Easy interface with Fujitsu prescalers
- 16-pin standard dual-in-line package (MB87087P)
16-pin standard flat package (MB87087PF)

## FUNCTIONAL DESCRIPTION

## SERIAL DATA INPUT TIMING

Notes: Data: Serial data input is used for setting divide factor of programmable reference divider and programmable divider. Data is input from MSB, and last bit data is a control bit.
Control bit is set high when divide factor of programmable reference divider is set. Control bit is set low level when divide factor of programmable divider is set.
Clock: Data is input to internal shift registers by rising edge of the clock.
LE: Load enable input:
When LE is high, the data stored in shift register is transferred to 14-bit latch, or 17-bit latch depending on the control bit setting.

## PULSE SWALLOW FUNCTION

$$
f v c o=[(N \times M)+A] \times f o s c \div R(N>A)
$$

fvco : Output frequency of external voltage controlled oscillator (VCO)
N : Preset divide factor of binary 10-bit programmable counter (5 to 1023)
M : Preset modulus factor of external dual modulus prescaler (e.g. 64 in 64/65 mode, 128 in 128/129 mode of an MB501L prescaler)

A : Preset divide factor of binary 7-bit programmable counter (0 to 127, A < N)
fosc : Output frequency of external oscillator
R : Preset divide factor of binary 14-bit programmable reference counter (5 to 16383)

DIVIDE FACTOR OF PROGRAMMABLE REFERENCE DIVIDER
Serial data consists of 14-bit data, which is used for setting divide factor of programmable reference counter, and 1-bit control data. In this case, control bit is set high level.

The data format is shown below.

BINARY 14-BIT REFERENCE COUNTER DATA INPUT

| (14) | (13) | (12) | (11) | (10) | (9) | (8) | (7) | (6) | (5) | (4) | (3) | (2) | (1) | Divide <br> Factor |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 16383 |

Note: Divide factor less than 5 is prohibited. Divide factor: 5 to 16383

## DIVIDE FACTOR OF PROGRAMMABLE DIVIDER

Serial data consists of 17-bit data, which is used for setting divide factor of programmable divider, and 1-bit control data. In this case, control bit is set low level. The data (1) to (7) set a divide factor of 7 -bit swallow counter and data (8) to (17) set divide factor of 10-bit programmable counter.

The data format is shown below.

BINARY 7-BIT SWALLOW COUNTER DATA INPUT

| $(7)$ | (6) | (5) | (4) | (3) | (2) | (1) | Divide <br> Factor <br> $A$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| 0 | 0 | 0 | 0 | 0 | 1 | 0 | 2 |
| 0 | 0 | 0 | 0 | 0 | 1 | 1 | 3 |
| 0 | 0 | 0 | 0 | 1 | 0 | 0 | 4 |
| $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | . |
| 0 | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | . |
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 127 |

Note: Divide factor A: 0 to 127 Depending upon the divide factor set input (SW) of external prescaler, the input data should be as follows. e.g. MB501L ( $+65 / 65$ )prescaler $S W=H(64 / 65)$ : Bit 7 to shift register (7) should be zero.

BINARY 10-BIT PROGRAMMABLE COUNTER DATA INPUT

| $(17)$ | 16 | $(15)$ | $(14)$ | $(13)$ | 12 | $(11)$ | $(10$ | 9 | $(8)$ | Divide <br> Factor <br> $N$ |

## MB87090

## CMOS PLL FREQUENCY SYNTHESIZER

## CMOS SERIAL INPUT PHASE-LOCKED-LOOP (PLL) FREQUENCY SYNTHESIZER WITH CONSTANT CURRENT OUTPUT CHARGE PUMP

The Fujitsu MB87090, fabricated in CMOS technology, is a serial input PLL frequency synthesizer with constant current output charge pump.
The MB87090 contains an inverter for oscillator, programmable reference divider, divide factor of programmable reference divider control circuit, phase detector, constant current output charge pump, 17 -bit shift register, 17 -bit latch, programmable divider (binary 7 -bit swallow counter, binary 10-bit programmable counter), and a control generator for an external dual modulus prescaler.
When supplemented with a loop filter and VCO, the MB87090 contains the necessary circuit to make up a PLL frequency synthesizer.
Unique to this device is a constant current output charge pump. This allows improved modulation characteristics, tracking and noise performance compared to earlier devices.

- Constant current output charge pump. Magnitude of current controlled by external resistor: 0 to 4 mA .
- 13 MHz input capability @5V (fin input)
- Single power supply voltage: $V_{0 D}=2.7 \mathrm{~V}$ to 5.5 V
- Wide temperature range: $T_{A}=-40$ to $85^{\circ} \mathrm{C}$
- On-chip inverter for oscillator
- Eight divide factors for programmable reference divider are selected by external input $S_{1}, S_{2}$, and $S_{3}(1 / 8,1 / 16,1 / 64,1 / 128,1 / 256,1 / 512,1 / 1024,1 / 2048)$
- Programmable 17-bit divider with input amplifier consisting of:

Binary 7-bit swallow counter
Binary 10-bit programmable counter

- Easy interface to Fujitsu dual modulus prescalers.
- 16-pin standard dual-in-line package (Suffix: -P)

16-pin standard flat package (Suffix: -PF)

ABSOLUTE MAXIMUM RATINGS (See NOTE)

| Rating | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| Power Supply Voltage | $V_{D D}$ | $V_{S S}-0.5$ to $V_{S S}+7.0$ | V |
| Input Voltage | $V_{I N}$ | $V_{S S}-0.5$ to $V_{D D}+0.5$ | V |
| Output Voltage | $V_{\text {OuT }}$ | $\mathrm{V}_{S S}-0.5$ to $V_{D D}+0.5$ | V |
| Output Current | louT | $\pm 10$ | mA |
| Operating Temperature | $\mathrm{T}_{A}$ | -40 to +85 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature | $\mathrm{T}_{S T G}$ | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |
| Power Dissipation | $\mathrm{P}_{\mathrm{D}}$ | 300 | mW |

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PIN ASSIGNMENT

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

Fig. 1 - MB87090 BLOCK DIAGRAM

## PIN DESCRIPTION

| Pin No. | Symbol | 1/0 | Description |
| :---: | :---: | :---: | :---: |
| 1 | $V_{\text {Do }}$ | - | Power supply voltage input. |
| 2 | Clock | 1 | Clock signal input for 17-bit shift register. <br> Each rising edge of the clock shitts one bit of the data into the shift register. |
| 3 | Data | 1 | Serial data input for 17 -bit shift register. <br> This data is used for setting the divide factor of programmable divider. |
| 4 | LE | 1 | Load enable input. <br> When this pin is high level (high active), the data stored in the 17 -bit shift register is transferred to the 17-bit latch. |
| 5 | fin | 1 | Input for programmable divider from VCO or prescaler output. <br> This input involves bias circuit and amplifier. The connection with external dual modulus prescaler should be an AC connection. |
| 6 | M | 0 | Control output for external dual modulus prescaler. <br> The connection to the prescaler should be DC connection. This output level is synchronized with falling edge of fin input signal (pin \#5). <br> Pulse Swallow Function: <br> MB501L $M=$ High: Preset modulus factor 64 or 128 <br> $M=$ Low: Preset modulus factor 65 or 129 |
| 7 | LD | 0 | Output of phase detector. It is high level when $f_{r}$ and $f_{p}$ are equal, and then the loop is locked. Otherwise it outputs negative pulse signal. |
| 8 | D。 | 0 | Three-state charge pump output of the phase detector. <br> The mode of $D_{o}$ is changed by the combination of programmable reference divider output frequency <br> $f_{r}$ and programmable divider output frequency $f_{p}$ as listed below: <br> $f_{f}>f_{p}$ : Drive mode <br> ( $\mathrm{Do}_{\mathrm{o}}=$ High level) <br> $f_{t}=f_{p}$ : High-impedance mode <br> $f_{f}<f_{p}$ : Sink mode <br> ( $\mathrm{D}_{\mathrm{o}}=$ Low level) |
| 9 | RC | 1 | The value of external resistor connected to this pin determines the magnitude of the current delivered by the charge pump. See graph on page 10. |
| 10 | $f$ | 0 | This pin is tied to programmable reference divider output. |
| $\begin{aligned} & 11 \\ & 12 \\ & 13 \end{aligned}$ | $\begin{aligned} & S_{1} \\ & S_{2} \\ & S_{3} \end{aligned}$ | 1 | Control input for programmable reference divider. The combination of these inputs provides divide factor to programmable reference divider. See following page. |
| 14 | OSCout | $\bigcirc$ | Pin for crystal oscillator. <br> Output of the inverting amplifier. This pin should be open when an external oscillator is used. |
| 15 | $\mathrm{OSC}_{1 \times}$ | 1 | Pin for crystal oscillator. <br> Input to the inverting amplifier that forms part of the oscillator. This pin receives the oscillator signal as AC coupled when an external oscillator is used. <br> For large amplitude signals (standard CMOS levels) DC coupling may also be used. |
| 16 | $\mathrm{V}_{\text {ss }}$ | - | Ground |

## FUNCTIONAL DESCRIPTION

DIVIDE FACTOR OF PROGRAMMABLE REFERENCE DIVIDER

Divide factor of programmable reference divider is set depending on input dignal $S_{1}$ to $S_{3}$.

|  | $\frac{1}{8}$ | $\frac{1}{16}$ | $\frac{1}{64}$ | $\frac{1}{128}$ | $\frac{1}{256}$ | $\frac{1}{512}$ | $\frac{1}{1024}$ | $\frac{1}{2048}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $S_{n}$ | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |
| $S_{1}$ | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 |
| $S_{2}$ | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |

## DIVIDE FACTOR OF PROGRAMMABLE DIVIDER

Serial data of binary code is input to Data pin. These data are loaded into the 17 -bit shift register from MSB. When load enable signal LE is high, the data stored in the 17-bit shift register is transferred to the 17-bit latch.
The data (1) to (7) set a divide factor of the binary 7 -bit swallow counter and data (8) to 17 set a divide factor of binary 10 -bit programmable counter. In other words, serial data is equivalent to the divide factor of programmable divider.

Fig. 2 - BLOCK DIAGRAM OF PROGRAMMABLE DIVIDER

Binary 7-bit Swallow Counter Data Input

| $(7)$ | $(6)$ | $(5)$ | $(4)$ | $(3)$ | $(2)$ | $(1)$ | Divide <br> Factor $A$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| 0 | 0 | 0 | 0 | 0 | 1 | 0 | 2 |
| 0 | 0 | 0 | 0 | 0 | 1 | 1 | 3 |
| 0 | 0 | 0 | 0 | 1 | 0 | 0 | 4 |
| $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 127 |

Note: Divide factor A: 0 to 127
Depending upon the divide factor set input (SW) of external prescaler, the input data should be as follows.
Example MB501L
$\mathrm{SW}=\mathrm{H}(64 / 65)$ : Bit 7 of shift register (7) should be zero.

Binary 10-bit Programmable Counter Data Input

| $(17)$ | $(16)$ | $(15)$ | $(14)$ | $(13)$ | $(12)$ | $(1)$ | $(10$ | $(9)$ | $(8)$ | Divide <br> Factor $N$ |

| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 5 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 6 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 7 |
| $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1023 |

Note: Divide factor less than 5 is prohibited.
Divide factor N: 5 to 1023

## PULSE SWALLOW FUNCTION

$$
f_{v c o}=[(N \times M)+A] \times \text { fosc }+R \quad(N>A)
$$

fvco: Output frequency of external voltage controlled oscillator (VCO)
N : Preset divide factor of binary 10-bit programmable counter (5 to 1023)
M : Preset modulus factor of external dual modulus prescaler (e.g. 64 in $64 / 65$ mode, 128 in 128/129 mode of an MB501L prescaler)
A : Preset divide factor of binary 7 -bit swallow counter ( 0 to 127)
fosc: Output frequency of the external oscillator
R : Preset divide factor of programmable reference divider ( $8,16,64,128,256,512,1024,2048$ )

## CONSTANT CURRENT OUTPUT CHARGE PUMP

The MB87090 adopts constant current output charge pump. The output current of charge pump is controlled by an external resistor shown in Fig. 3.

Fig. 3 - EXTERNAL RESISTOR CONNECTION EXAMPLE

Clock: Clock signal input for the 17-bit shift register.
Each rising edge of the clock shifts one bit of data into the shift register.
Data : Serial data for the 17-bit shift register is input.
LE : Load enable input.
When LE is high (high active), the data stored in the 17-bit shift register is transferred to the 17-bit latch.
The 17 -bit data is used for setting a divide factor of the programmable divider.

## RECOMMENDED OPERATING CONDITIONS

( V ss $=0 \mathrm{~V}$ )

| Parameter | Symbol | Value |  |  | Unit |
| :--- | :---: | :---: | :---: | :---: | :---: |

## MB1501/MB1501H/MB1501L SERIAL INPUT PLL FREQUENCY SYNTHESIZER

## SERIAL INPUT PLL FREQUENCY SYNTHESIZER WITH 1.1GHz PRESCALER

The Fujitsu MB1501/MB1501H/MB1501L, utilizing BI-CMOS technology, is a single chip serial input PLL frequency synthesizer with pulse-swallow function.
The MB1501 series contain a 1.1 GHz two modulus prescaler that can select either 64/65 or 128/129 divide ratio; control signal generator; 16-bit shift register; 15 -bit latch; programmable reference divider (binary 14 -bit programmable reference counter); 1 -bit switch counter; phase comparator with phase inverse function; charge pump; crystal oscillator; 19-bit shift register; 18 -bit latch; programmable divider (binary 7 -bit swallow counter and binary 11-bit programmable counter).
The MB1501 operates on a low supply voltage ( 3 V typ) and consumes low power ( 45 mW at 1.1 GHz ).

## MB1501 Product Line

|  | $V_{\mathrm{P}}$ <br> Voltage | $V_{\text {oop }}$ <br> Voltage | Lock up <br> time | $D_{\circ}$ <br> Output <br> Width | High-level <br> Output <br> Current | Low-level <br> Output <br> Current |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| MB1501 | 8 V max | 8.5 V max | Middle speed | Middle | Middle | Middle |
| MB1501H | $10 \mathrm{~V} \max$ | 10.0 V max | High speed | Low | High | Low |
| MB1501L | $8 \mathrm{~V} \max$ | 8.5 V max | Low speed | High | Low | High |

- High operating frequency: $f_{\mathbb{N} \max }=1.1 \mathrm{GHz}\left(\mathrm{V}_{\mathbb{N} \operatorname{miN}}=0.20 \mathrm{~V}_{\text {p.p }}\right)$
- On-chip prescaler
- Low power supply voltage: 2.7 V to $5.5 \mathrm{~V}(3.0 \mathrm{~V}$ typ)
- Low power supply consumption: 45 mW (3.0V, 1.1 GHz operation)
- Serial input 18 -bit programmable divider consisting of:
- Binary 7-bit swallow counter (Divide ratio: 0 to 127)
- Binary 11 -bit programmable counter (Divide ratio: 16 to 2047)
- Serial input 15 -bit programmable reference divider consisting of:
- Binary 14-bit programmable reference counter (Divide ratio: 8 to 16383)
- 1-bit switch counter (SW) Sets divide ratio of prescaler
- 2types of phase detector output
- On-chip charge pump (Bipolar type)
- Output for external charge pump
- Wide operating temperature: $\mathrm{T}_{\mathrm{A}}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$

ABSOLUTE MAXIMUM RATINGS (see NOTE)

| Rating | Symbol | Condition | Value | Unit |
| :---: | :---: | :---: | :---: | :---: |
| Power Supply Voltage | $V_{c c}$ |  | -0.5 to +7.0 | V |
|  | $\mathrm{V}_{\text {PH }}$ | MB1501H | $V_{c c}$ to 12.0 | V |
|  | $\mathrm{V}_{\mathrm{P}}, \mathrm{V}_{\mathrm{PL}}$ | MB1501/1501L | $V_{\text {cc }}$ to 10.0 |  |
| Output Voltage | $V_{\text {our }}$ |  | -0.5 to $\mathrm{V}_{c c}+0.5$ | V |
| Open-drain Output | $V_{\text {OOPH }}$ | MB1501H | -0.5 to 11.0 | V |
|  | $\mathrm{V}_{\text {OOP, }} \mathrm{V}_{\text {OOPL }}$ | MB1501/1501L | -0.5 to 9.0 |  |
| Output Current | lour |  | $\pm 10$ | mA |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ |  | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. How. ever, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

> NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PIN DESCRIPTIONS

| Pin No. | Pin Name | 1/0 | Descriptions |
| :---: | :---: | :---: | :---: |
| $\begin{aligned} & 1 \\ & 2 \end{aligned}$ | $\begin{aligned} & \text { OSC }_{\text {IN }} \\ & \text { OSC }_{\text {out }} \end{aligned}$ | $\begin{aligned} & 1 \\ & 0 \end{aligned}$ | Oscillator input. <br> Oscillator output. <br> A crystal is placed between $\mathrm{OSC}_{\mathbb{N}}$ and $\mathrm{OSC}_{\text {our }}$. |
| 3 | $V_{p}$ | - | Power supply input for charge pump. |
| 4 | $V_{c c}$ | - | Power supply voltage input. |
| 5 | D | 0 | Charge pump output. <br> Phase characteristic can be inversed depending upon FC input. |
| 6 | GND | - | Ground. |
| 7 | LD | 0 | Phase comparator output. <br> This pin outputs high when the phase is locked. While the phase difference of $f_{1}$ and $f_{p}$ exists, the output level goes low. |
| 8 | $\mathrm{f}_{\mathrm{n}}$ | 1 | Prescaler input. <br> The connection with an external VCO should be an AC connection. |
| 9 | Clock | 1 | Clock input for 19 -bit shift register and 16 -bit shift register. Each rising edge of the clock shifts one bit of data into the shift registers. |
| 10 | Data | 1 | Serial data of binary code input. <br> The last bit of the data is a control bit. The last data bit specifies which latch is activated. When the last bit is high level and LE is high-level, data is transferred to 15-bit latch. When the last bit is low level and LE is high level, data is transferred to 18 -bit latch. |
| 11 | LE | 1 | Load enable input (with internal pull up resistor). <br> When LE is high level (or open), data stored in the shift register is transferred to latch depending on the control data. |
| 12 | FC | 0 | Phase selecting input of phase comparator (with internal pull up resistor). When FC is low level, charge pump and phase detector characteristics can be inversed. |
| 13 | $\mathrm{f}_{1}$ | 0 | Monitor pin of phase comparator input. It is the same as programmable reference divider output. |
| 14 | $\mathrm{f}_{\mathrm{p}}$ | 0 | Monitor pin of phase comparator input. It is the same as programmable divider output. |
| $\begin{aligned} & 15 \\ & 16 \end{aligned}$ | $\begin{aligned} & \varnothing P \\ & \varnothing R \end{aligned}$ | $\begin{aligned} & 0 \\ & 0 \end{aligned}$ | Outputs for external charge pump. Phase characteristics can be inversed depending on FC input. $\varnothing \mathrm{P}$ pin is an N -channel open-drain output. |

## FUNCTIONAL DESCRIPTIONS

## SERIAL DATA INPUT

Serial data input is input using Data pin, Clock pin and LE pin, The 15 -bit programmable reference divider and 18 -bit programmable divider are controlled respectively.

On rising edge of the clock shifts one bit of the data into the internal shift registers.
When load enable (LE) is high level (or open), data stored in shift resisters is transferred to 15 -bit latch or 18 -bit latch depending upon the control bit level.

Control data " H " ; Data is transferred into 15 -bit latch.
Control data "L" ; Data is transferred into 18 -bit latch.

## PROGRAMMABLE REFERENCE DIVIDER

Programmable reference divider consists of 16 -bit shift register, 15 -bit latch and 14 -bit reference counter. Serial 16 -bit data format is shown below.

SW: Divide ratio of prescaler setting bit.
SW="H": 64
$S W=" L "!128$
$\mathrm{S}_{1}$ to $\mathrm{S}_{14}$ : Divide ratio of programmable reference counter setting bits (8 to 16383)
C : Control bit (Control bit is set to high.)

## FUNCTIONAL DESCRIPTIONS

## PROGRAMMABLE DIVIDER

Programmable divider consists of 19 -bit shift register, 18 -bit latch, 7 -bit swallow counter and 11 -bit programmable counter. Serial 19-bit data format is shown below.

© 7-BIT SWALLOW COUNTER DIVIDE RATIO
(0) 11-BIT PROGRAMMABLE COUNTER DIVIDE RATIO

| Divide <br> ratio <br> A | S <br> 7 | S <br> 6 | S <br> 5 | S <br> 4 | S <br> 3 | S <br> 2 | S <br> 1 |

| 2047 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Divide ratio less than 16 is prohibited.
Divide ratio N : 16 to 2047
$S_{8}$ to $S_{18}$ : Divide ratio of programmable counter setting bits (16 to 2047)
$S_{1}$ to $S_{7}$ : Divide ratio of swallow counter setting bits ( 0 to 127)
C : Control bit (Control bit is set to low.)
Dara is input from MSB data.

On the rising edge of the clock shifts one bit of the data into the shift registers.
Parenthsis data is used for setting the divide ratio of the programmable reference divider.

## PHASE CHARACTERISTICS

VCO CHARACTERISTICS
FC pin (pin 12) is provided to inverse the phase comparator characteristics. The characteristics of internal charge pump output ( $\mathrm{D}_{\circ}$ ), phase detector outputs ( $\varnothing \mathrm{R}, \varnothing \mathrm{P}$ ) can be inversed depending upon FC input data. Outputs are shown below.

|  | $F C=H$ (or open) |  |  | $F C=L$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $D_{\circ}$ | $\varnothing R$ | $\varnothing P$ | $D_{\circ}$ | $\varnothing R$ | $\otimes P$ |  |
| $f_{r}>f_{p}$ | $H$ | $L$ | $L$ | $L$ | $H$ | $Z$ |  |
| $f_{r}<f_{p}$ | $L$ | $H$ | $Z$ | $H$ | $L$ | $L$ |  |
| $f_{r}=f_{p}$ | $Z$ | $L$ | $Z$ | $Z$ | $L$ | $Z$ |  |

Note: $\mathrm{Z}=$ (High impedance)
Depending upon VCO characteristics, FC pin should be set accordingly:
When VCO characteristics are like(1), FC should be set high or open circuit;
When VCO characteristics are like(2), FC should be set Low.

## RECOMMENDED OPERATING CONDITIONS

## Serial Input PLL Frequency Synthesizer

The Fujitsu MB1502 fabricated in Bi-CMOS technology, is a single chip serial input PLL synthesizer with pulse-swallow function.

The MB1502 contains the following: analog switch to speed up lock up time, control signal generator, 16 -bit shift register, 15 -bit latch, programmable reference divider (binary 14-bit programmable reference counter), 1 -bit switch counter, phase comparator with phase conversion function, charge pump, crystal oscillator, 19-bit shift register, 18 -bit latch, programmable divider (binary 7 -bit swallow counter and binary 11-bit programmable counter) and a 1.1 GHz two modulus prescaler that can select either a 64/65 or 128/129 divide ratio.

It operates supply voltage of 5 V typ. and achieves very low power supply current of 8 mA typ. realized through the use of Fujitsu Advanced Process Technology.

- High operating frequency: $\mathrm{f}_{\mathbb{N} \operatorname{mAX}}=1.1 \mathrm{GHz}\left(\mathrm{V}_{\mathbb{I} \max }=-10 \mathrm{dBm}\right)$
- Pulse swallow function: 64/65 or 128/129
- Low supply current: $I_{c c}=8 \mathrm{~mA}$ typ.
- Serial input 18 -bit programmable divider consisting of:
- Binary 7-bit swallow counter: 0 to 127
- Binary 11-bit programmable counter: 16 to 2047
- Serial input 15 -bit programmable reference divider consisting of: - Binary 14-bit programmable reference counter: 8 to 16383 - 1-bit switch counter (SW) sets divide ratio of prescaler
- On-chip analog switch achieves fast lock up time
- Two types of phase detector output: - On-chip charge pump (Bipolar type)
- Output for external charge pump
- Wide operating temperature: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
- 16-pin Plastic DIP Package (Suffix: -P) 16-pin Plastic Flat Package (Suffix: -PF)

## ABSOLUTE MAXIMUM RATINGS

| Parameter | Symbol | Ratings | Unit |
| :--- | :---: | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{CC}}$ | -0.5 to +7.0 | V |
|  | $\mathrm{~V}_{\mathrm{P}}$ | $\mathrm{V}_{\mathrm{CC}}$ to 10.0 | V |
| Output Voltage | $\mathrm{V}_{\text {OUT }}$ | -0.5 to $\mathrm{V}_{\mathrm{CC}}+0.5$ | V |
| Open-drain Voltage | $\mathrm{V}_{\text {OOP }}$ | -0.5 to 0.8 | V |
| Output Current | $\mathrm{I}_{\text {OUT }}$ | $\pm 10$ | mA |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

Note: Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operation sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

## PIN DESCRIPTION

| Pln No. | Pin Name | 1/O | Description |
| :---: | :---: | :---: | :---: |
| $\begin{aligned} & 1 \\ & 2 \end{aligned}$ | $\begin{aligned} & \text { OSC }_{\text {N }} \\ & \text { OSC }_{\text {out }} \end{aligned}$ | $1$ | Oscillator input. <br> Oscillator output. <br> A crystal is placed between OSC $_{1 N}$ and OSC $_{\text {our }}$. |
| 3 | $V_{p}$ | - | Power supply input for charge pump and analog switch. |
| 4 | $V_{c c}$ | - | Power supply voltage input. |
| 5 | D。 | 0 | Charge pump output. <br> The characteristics of charge pump are reversed depending upon FC input. |
| 6 | GND | - | Ground. |
| 7 | LD | 0 | Phase comparator output. <br> Normally this pin outputs high level. While the phase difference of $f_{f}$ and $f_{p}$ exists, this pin outputs low level. |
| 8 | $\mathrm{f}_{\mathrm{N}}$ | 1 | Prescaler input. <br> The connection with an external VCO should be AC connection. |
| 9 | Clock | 1 | Clock input for 19 -bit shift register and 16 -bit shift register. Each rising edge of the clock shifts one bit of data into the shift register, |
| 10 | Data | 1 | Binary serial data input. <br> The last bit of the data is a control bit which specified destination of shift registers. When this bit is high level and LE is high level, the data stored in shift register is transferred to 15 -bit latch. When this bit is low level and LE is high level, the data is transferred to 18 -bit latch. |
| 11 | LE | 1 | Load enable input (with internal pull up resistor). <br> When LE is high or open, the data stored in shift register is transferred into latch depending upon the control bit. At the time, internal charge pump output to be connected to BISW pin because internal analog switch becomes ON state. |
| 12 | FC | 1 | Phase select input of phase comparator (with internal pull up resistor). <br> When FC is low level, the characteristics of charge pump, phase comparator is reversed. <br> FC input signal is also used to control $f_{\text {out }}$ pin (test pin) output level, $f_{r}$ or $f_{p}$. |
| 13 | BISW | 0 | Analog switch output. <br> Usually BISW pin is set high-impedance state. When internal analog switch is ON (LE pin is high level), this pin outputs internal charge pump state. |
| 14 | $\mathrm{f}_{\text {out }}$ | 0 | Monitor pin of phase comparator input. <br> $f_{\text {out }}$ pin outputs either programmable reference divider output ( $f_{r}$ ) or programmable divider output ( $f_{p}$ ) depending upon FC pin input level. <br> $\mathrm{FC}=\mathrm{H}$ : It is the same as f , output level. <br> FC=L: It is the same as $f_{p}$ output level. |

## FUNCTIONAL DESCRIPTIONS

## SERIAL DATA INPUT

Serial data input is achieved by three inputs, such as Data pin, Clock pin and LE pin. Serial data input controls 15 -bit programmable reference divider and 18 -bit programmable divider, respectively.
Binary serial data is input to Data pin.
On rising edge of clock shifts one bit of serial data into the internal shift registers and when load enable pin is high level or open, stored data is transferred into latch depending upon the control bit.
Control data " H " data is transferred into 15 -bit latch.
Control data "L" data is transferred into 18 -bit latch.

## PROGRAMMABLE REFERENCE DIVIDER

Programmable reference divider consists of 16 -bit shift register, 15 -bit latch and 14-bit reference counter. Serial 16 -bit data format is shown below.

## 14-BIT PROGRAMMABLE REFERENCE COUNTER DIVIDE RATIO

| Divide <br> Ratio <br> R | S <br> 14 | S <br> 13 | S <br> 12 | S | S |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 11 | S | S | S | S | S | S | S | S | S | S |  |  |  |  |

NOTES: Divide ratio less than 16 is prohibited. Divide ratio: 16 to 2047
S1 to S7: Swallow counter divide ratio setting bit. (0 to 127)
S8 to S18: Programmable counter divide ratio setting bit. (16 to 2047) C: Control bit (sets as low level).
Data is input from MSB side.

## PULSE SWALLOW FUNCTION

[^21]
## SERIAL DATA INPUT TIMING

NOTES: The data noted in parentheses is used for setting the divide ratio.
On rising edge of clock, one bit of data shifts into the shift register.
NOTES: Parenthesis data is used for setting divide ratio of programmable reference divider.
On rising edge of clock shifts one bit of data in the shift register.

## PHASE CHARACTERISTICS

VCO CHARACTERISTICS
FC pin is provided to change phase characteristics of phase comparator. Characteristics of internal charge pump output level ( $\mathrm{D}_{\mathrm{o}}$ ), phase comparator output level ( ${ }_{\varnothing} R,{ }_{e} P$ ) are reversed depending upon FC pin input level. Also, monitor pin ( $f_{\text {ouv }}$ ) output level of phase comparator is controlled by FC pin input level. The relationship between outputs ( $D_{\phi 1}, \phi_{R}, \phi^{P}$ ) and FC input level is shown below.

|  | $\mathrm{FC}=\mathrm{H}$ or open |  |  |  | $\mathrm{FC}=\mathrm{L}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | D | ${ }_{0} \mathrm{R}$ | ${ }_{¢} \mathbf{P}$ | $\mathrm{f}_{\text {out }}$ | D | ${ }_{9} \mathrm{R}$ | ${ }_{\text {® }}{ }^{\text {P }}$ | $\mathrm{f}_{\text {out }}$ |
| $f_{1}>\mathrm{f}_{\mathrm{p}}$ | H | L | L | (f) | L | H | Z | $\left(f_{p}\right)$ |
| $f_{1} \ll_{p}$ | L | H | Z | (f) | H | L | L | $\left(f_{p}\right)$ |
| $f_{1}=f_{p}$ | Z | L | Z | $\left(f_{1}\right)$ | Z | L | Z | $\left(f_{p}\right)$ |

Note: $\quad Z=$ (High impedance)
Depending upon VCO characteristics, FC pin should be set accordingly:
When VCO characteristics are like (1), FC should be set High or open circuit; When VCO characteristics are like (2), FC should be set Low.

NOTES: Phase difference detection range: $-2 \pi$ to $+2 \pi$ Spike appearance depends on charge pump characteristics. Also, the spike is output in order to diminish dead band. When $f_{f}>f_{p}$ or $f_{1}<f_{p}$, spike might not appear depending upon charge pump characteristics.

## ANALOG SWITCH

ON/OFF of analog switch is controlled by LE input signal. When the analog switch is ON, internal charge pump output ( $D_{0}$ ) is connected to BISW pin. When the analog switch is OFF, BISW pin is set to high-impedance state.
$\mathrm{LE}=\mathrm{H}$ (Changing the divide ratio of internal prescaler) : Analog switch=ON
LE=L (Normal operating mode)
: Analog switch=OFF
LPF time constant is decreased in order to insert a analog switch between LPF1 and LPF2 when channel of PLL is changing.
Thus, lock up time is decreased, that is, fast lock up time is achieved.

## RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Value |  |  | Unit |
| :--- | :---: | :---: | :---: | :---: | :---: |

## PACKAGE DIMENSIONS

16-LEAD PLASTIC DUAL IN-LINE PACKAGE
(Case No.: DIP-16P-M04)

## MB1503 <br> Serial Input PLL Frequency Synthesizer

The Fujitsu MB1503 is a serial input phase-locked loop (PLL) frequency synthesizer with a pulse-swallow function. A stand-by mode is provided to limit power consumption during intermittent operation.
The MB1503 is configured with a 1.1 GHz dual-modulus prescaler with a 128/129 divide ratio, control signal generator, 16 -bit shift register, 15 -bit latch, programmable reference divider (binary 14 -bit programmable reference counter), 1 -bit switch counter, phase comparator with phase conversion function, charge pump, crystal oscillator, 19-bit shift register, 18-bit latch, programmable divider (binary 7 -bit swallow counter and binary 11-bit programmable counter), analog switches, and intermittent operation control circuit that selects the operating or stand-by mode depending on the power-save control input state (PS).
The MB1503 operates from a single +5 V supply. Fujitsu's advanced technology achieves an Icc of 8 mA , typical. The stand-by mode current consumption is just $100 \mu \mathrm{~A}$.

- High operating frequency: $\mathrm{f}_{\mathrm{N}}=1.1 \mathrm{GHz}\left(\mathrm{V}_{\mathbb{I}}=-10 \mathrm{dBm}\right)$
- Pulse-swallow function: high-speed dual-modulus prescaler with 128/129 divide ratio
- Low supply current: $I_{C C}=8 \mathrm{~mA}$ typ. at 5 V
- Power-saving stand-by mode: $100 \mu \mathrm{~A}$
- Serial input, 18-bit programmable reference divider consisting of: Binary 7-bit swallow counter: 0 to 127 Binary 11-bit programmable counter: 0 to 2,047
- Serial input, 15 -bit programmable reference divider consisting of binary 15 -bit programmable reference counter: 8 to 16,383 1-bit switch counter sets prescaler divide ratio
- On-chip analog switch for fast lock-up
- On-chip charge pump
- Wide operating temperature range: -40 to $+85^{\circ} \mathrm{C}$
- Plastic 16-pin dual inline package (Suffix:-P) Plastic 16 -pin small outline package (Suffix:-PF)

## ABSOLUTE MAXIMUM RATINGS

| Parameter | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| Supply Voltage | $\mathrm{V}_{\mathrm{CC}}$ | -0.5 to 7.0 | V |
|  | $\mathrm{~V}_{\mathrm{P}}$ | $\mathrm{V}_{\mathrm{CC}} \leq \mathrm{V}_{\mathrm{P}} \leq 10.0$ | V |
|  | $\mathrm{V}_{\text {OUT }}$ | -0.5 to $\mathrm{V}_{\mathrm{CC}}+0.5$ | V |
| Output Current | $\mathrm{I}_{\text {OUT }}$ | $\pm 10$ | mA |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

Note: Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operation sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## FUNCTION DESCRIPTIONS

## Pulse swallow function

The divide ratio can be calculated using the following equation:
$f_{v c o}=[(M \times N)+A] \times f_{o s c}+R \quad(A<N)$
$f_{\text {vco }}$ : Output frequency of external voltage controlled oscillator (VCO)
N : Preset divide ratio of binary 11 -bit programmable counter (16 to 2,047 )
A : Preset divide ratio of binary 7-bit swallow counter ( $0 \leq A \leq 127$ )
$f_{\text {osc }}$ : Output frequency of the reference frequency oscillator
$R$ : Preset divide ratio of binary 14 -bit programmable reference counter ( 8 to 16,383 )
M : Preset divide ratio of modulus prescaler (128)

## Serial data input

Serial data is input using the Data, Clock, and LE pins. Serial data controls the 15-bit programmable reference divider and 18 -bit programmable divider separately.
Binary serial data is input to the Data pin.
One bit of data is shifted into the internal shift registers on the rising edge of the clock. When the load enable pin is high or open, stored data is latched depending on the control data as follows:

| Control data | Destination of serial data |
| :---: | :--- |
| H | 15 bit latch |
| L | 18 bit latch |

(a) Programmable reference divider ratio

The programmable reference divider consists of a 15 -bit latch and a 14 -bit reference counter. The serial 16 -bit data format is shown below:

## MB1503

- 14-bit programmable reference counter divide ratio

| Divide ratio n | $14$ | $\stackrel{5}{13}$ | \% 12 | ¢ 11 | S | S. | ¢ 8 | $\stackrel{5}{7}$ | S | 5 | S | S. | S. | S |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

| 16383 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

(Divide ratio $=8$ to 16,383 )
Notes: 1. Divide ratios less than 8 are prohibited.
2. SW: This bit selects the divide ratio of the prescaler SW Low: 128 or 129
(SW must be always be low.)
3. $S 1$ to S 14 : These bits select the divide ratio of the programmable reference counter ( 8 to 16,383 ).
4. C: Control bit: Set high.
5. Input data MSB first.
(b) Programmable divider divide ratio

The programmable divider consists of a 19 -bit shift register, an 18 -bit latch, a 7 -bit swallow counter, and an 11-bit programmable counter. The serial 19-bit data format is shown below:

- 7-bit swallow counter divide ratio

| Divide | $\mathbf{S}$ | $\mathbf{S}$ | $\mathbf{S}$ | $\mathbf{S}$ | $\mathbf{S}$ | $\mathbf{S}$ | $\mathbf{S}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ratio | 7 | 6 | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | 2 | 1 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ |
| 127 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

(Divide ratio $=0$ to 127)

- 11-bit programmable counter divide ratio

| Divide ratio N | $18$ | $\mathrm{S}$ | $16$ | $\frac{5}{15}$ | S | 13. | 12 | 11 | 5 | 9 | S |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 16 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| 17 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |
| - | - | - | - | - | - | - | - | - | - | $\bullet$ |  |
| 2047 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

(Divide ratio $=16$ to 2,047 )

Notes: 1. Divide ratios less than 16 are prohibited for 11-bit programmable counter.
2. S 1 to S7: These bits select the divide ratio of swallow counter ( 0 to 127).
3. S 8 to S 18 : These bits select the divide ratio of programmable counter ( 16 to 2,047 ).
4. C: Control bit: (Set low)
5. Input data MSB first.

## Serial data input timing

- $t_{1}(\geq 1 \mu \mathrm{~s})$ : Data setup time $\quad \mathrm{t}_{2}(\geq 1 \mu \mathrm{~s})$ : Data hold time $\mathrm{t}_{3}(\geq 1 \mu \mathrm{~s})$ : Clock pulse width $\mathrm{t}_{4}(\geq 1 \mu \mathrm{~s})$ : LE setup time to the rising edge of last clock

*1: Bits enclosed in parentheses are used when the divide ratio of the programmable reference divider is selected.
Note: One bit of data is shifted into the shift register on the rising edge of the clock.

## Intermittent operation

Intermittent operation limits power consumption by shutting down or starting the internal circuits according to its necessity. If device operation resumes uncontrolled, the error signal output from the phase comparator may exceed the limit due to an undefined phase relationship between the reference frequency ( $f_{R}$ ) and the comparison frequency ( $f_{p}$ ) and frequency lock is lost.
To prevent this, an intermittent operation control circuit is provided to decrease the variation in the locking frequency by forcibly correcting phase of both frequencies to limit the error signal output. This is done by the PS control circuit. If PS is set high, the circuit enters the operating mode. If PS is set low, operation stops and the device enters the stand-by mode. Each mode is explained below:

- Operating mode (PS = High)

All circuits are operating, and PLL operation is normal.

- Stand-by mode (PS = Low level) Circuits that do not affect operation are power-down to limit current consumption. The current in the power save state is typically $100 \mu \mathrm{~A}$. At this time, the levels of $D_{0}$ and LD are the same as when the PLL is locked. Since $D_{0}$ is placed in the high-impedance state and the input voltage of the voltage controlled oscillator (VCO) is set to the voltage in the operating mode (when locked) by the time constant of the low-pass filter, the frequency output from the VCO ( ivco ) is kept at the locking frequency.

The operating and stand-by modes alternate repeatedly. This intermittent operation limits the error signal by forcibly correcting the phase of the reference and comparison frequencies to limit power consumption.
The device must be set in the stand-by mode ( $\mathrm{PS}=\mathrm{low}$ ) when it is powered up.

## Relationship between the FC input and phase characteristics

The FC pin changes the phase characteristics of the phase comparator. The internal charge pump output level ( $D_{0}$ ) is reversed, depending on the FC pin input level. The relationship between the FC input level and $D_{o}$ is shown below:

| W, ¢, , , , , , \% | FC. High or open: | FC=Low |
| :---: | :---: | :---: |
| $\mathrm{f}_{\mathrm{R}}>\mathrm{f}_{\mathrm{P}}$ | H | L |
| $f_{R}<f_{p}$ | L | H |
| $\mathrm{f}_{\mathrm{R}}=\mathrm{f}_{\mathrm{P}}$ | Z (*1) | Z (*1) |

## *1: High impedance

When designing a synthesizer, the FC pin setting depends on the VCO characteristics.
$*:$ When the VCO characteristics are similar to
(1), set FC high or open.
*: When the VCO characteristics are similar to
(2), set FC low.

Phase comparator output waveform (FC = High)

Notes: 1. Phase difference detection range: $-2 \pi$ to $+2 \pi$
2. Spike appearance depends on the charge pump characteristics. Also, the spike is output to diminish dead band.
3. When $f_{R}>f_{P}$ or $f_{R}<f_{P}$, spike might not appear depending on the charge pump characteristics.
4. LD is low when the phase difference is two or more. LD is high when the phase difference is two or less for three or more cycles (when $\mathrm{f}_{\text {oscin }}=12.8 \mathrm{MHz}, \mathrm{tw}=625$ to $1,250 \mathrm{~ns}$ ).

## Analog switch

The LE signal turns the analog switch on or off. When the analog switch is turned on, the charge pump output ( $\mathrm{D}_{\mathrm{o}}$ ) is output through the BiSW pin. When it is turned off, the BiSW pin is in the high-impedance state.

When $\mathrm{LE}=$ high (when the divide ratio of the internal divider is changed): Analog switch $=0$ n
When LE = low (normal operating mode): Analog switch = off
The LPF time constant can be decreased by inserting an analog switch between LPF1 and LPF2. This decreases the lock-up time when the PLL channel is changed.

## RECOMMENDED OPERATING CONDITIONS

| Parametar | Symbol |  |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | < M Min | ¢, Typ | Q Max, |  |
| Supply voltage | $\mathrm{V}_{\mathrm{cc}}$ | 4.5 | 5.0 | 5.5 | V |
|  | $V_{p}$ | $V_{c c} \leq V_{p} \leq 8.0$ |  |  | V |
| Input voltage | V | GND | - | $\mathrm{V}_{\mathrm{cc}}$ | V |

Notes: To protect against damage by electrostatic discharge, note the following handling precautions:

- Store and transport devices in conductive containers.
- Use properly grounded workstations, tools, and equipment.
- Turn off power before inserting or removing this device from a socket
- Protect leads of the device using conductive sheet when handling PC boards on which devices are mounted.

 SERIAL INPUT PLL FREQUENCY SYNTHESIZER
## SERIAL INPUT PLL FREQUENCY SYNTHESIZER WITH 520MHz PRESCALER

The Fujitsu MB1504/MB1504H/MB1504L, utilizing BI-CMOS technology, is a single chip serial input PLL frequency synthesizer with pulse-swallow function.

The MB1504 series contain a 520 MHz two modulus prescaler that can select either $32 / 33$ or 64/65 divide ratio; control signal generator; 16-bit shift register; 15-bit latch; programmable reference divider (binary 14-bit programmable reference counter); 1-bit switch counter; phase comparator with phase inverse function; charge pump; crystal oscillator; 19-bit shift register; 18-bit latch; programmable divider (binary 7-bit swallow counter and binary 11-bit programmable counter).
The MB1504 operates on a low supply voltage ( 3 V typ) and consumes low power ( 30 mW at 520 MHz ).
MB1504 Product Line

|  | $V_{p}$ Voltage | $V_{\text {cop }}$ Voltage | Lock up time | Do Output <br> Widht | High-level <br> Output Current | Low-level <br> Output Current |
| :--- | :--- | :--- | :--- | :--- | :--- | :---: |
| MB1504 | 8 V max | 8.5 V max | Middle speed | Middle | Middle | Middle |
| M81504H | 10V max | 10.0 V max | High speed | Low | High | Low |
| MB1504L | 8 V max | 8.5 V max | Low speed | High | Low | High |

- High operating frequency: $f_{\text {IN MAX }}=520 \mathrm{MH}_{Z}\left(\mathrm{~V}_{\text {IN MIN }}=0.20 \mathrm{~V}_{\text {P.P }}\right)$
- On-chip prescaler
- Low power supply voltage: 2.7 V to 5.5 V (3.0V typ)
- Low power supply consumption: $30 \mathrm{~mW}(3.0 \mathrm{~V}, 520 \mathrm{MHz}$ operation)
- Serial input 18 -bit programmable divider consisting of: - Binary 7-bit swallow counter (Divide ratio: 0 to 127) - Binary 11-bit programmable counter (Divide ratio: 16 to 2047)
- Serial input 15-bit programmable reference divider consisting of: - Binary 14-bit programmable reference counter (Divide ratio: 8 to 16383) - 1-bit switch counter (SW) Sets divide ratio of prescaler
- 2types of phase detector output
- On-chip charge pump (Bipolar type)
- Output for external charge pump
- Wide operating temperature: $T_{A}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$

ABSOLUTE MAXIMUM RATINGS (see NOTE)

| Rating | Symbol | Condition | Value | Unit |
| :---: | :---: | :---: | :---: | :---: |
| Power Supply Voltage | $V_{c c}$ |  | -0.5 to +7.0 | V |
|  | $\mathrm{V}_{\text {PH }}$ | MB1504H | $V_{\text {cc }}$ to 12.0 | V |
|  | $V_{p}, V_{p l}$ | MB1504/1504L | $V_{c c}$ to 10.0 |  |
| Output Voltage | $V_{\text {OUt }}$ |  | -0.5 to $V_{c c}+0.5$ | V |

## FUNCTIONAL DESCRIPTIONS

## SERIAL DATA INPUT

Serial data input is input using Data pin, Clock pin and LE pin, The 15-bit programmable reference divider and 18-bit programmable divider are controlled respectively.

On rising edge of the clock shifts one bit of the data into the internal shift registers.
When load enable (LE) is high level (or open), data stored in shift resisters is transferred to 15-bit latch or 18-bit latch depending upon the control bit level.

Control data " H " ; Data is transferred into 15 -bit latch.
Control data "L" ; Data is transferred into 18 -bit latch.

## PROGRAMMABLE REFERENCE DIVIDER

Programmable reference divider consists of 16 -bit shift register, 15 -bit latch and 14-bit reference counter. Serial 16-bit data format is shown below.

SW: Divide ratio of prescaler setting bit.
$S W={ }^{*} H^{\prime \prime}: 32$
$S W={ }^{*} L^{n}: 64$
$S_{1}$ to $S_{14}$ : Divide ratio of programmable reference counter setting bits (8 to 16383)
C : Control bit (Control bit is set to high.)

## FUNCTIONAL DESCRIPTIONS

## PROGRAMMABLE DIVIDER

Programmable divider consists of 19-bit shift register, 18 -bit latch, 7 -bit swallow counter and 11-bit programmable counter. Serial 19-bit data format is shown below.

$\mathrm{S}_{8}$ to $\mathrm{S}_{18}$ : Divide ratio of programmable counter setting bits ( 16 to 2047)
$S_{1}$ to $S_{7}$ : Divide ratio of swallow counter setting bits (0 to 127)
C: Control bit (Control bit is set to low.)
Dara is input from MSB data.

MB1504
MB1504H
MB1504L

On the rising edge of the clock shifts one bit of the data into the shift registers.
Parenthsis data is used for setting the divide ratio of the programmable reference divider.

## PHASE CHARACTERISTICS

VCO CHARACTERISTICS
FC pin (pin 12) is provided to inverse the phase comparator characteristics. The characteristics of internal charge pump output ( $D_{0}$ ), phase detector outputs ( $\varnothing \mathrm{R}, \varnothing \mathrm{P}$ ) can be inversed depending upon FC input data. Outputs are shown below.

|  | $F C=H$ (or open) |  |  | $F C=L$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $D_{\circ}$ | $\varnothing R$ | $\varnothing P$ | $D_{0}$ | $\varnothing R$ | $\varnothing P$ |
| $f_{1}>f_{p}$ | $H$ | $L$ | $L$ | $L$ | $H$ | $Z$ |
| $f_{1}<f_{p}$ | $L$ | $H$ | $Z$ | $H$ | $L$ | $L$ |
| $f_{1}=f_{p}$ | $Z$ | $L$ | $Z$ | $Z$ | $L$ | $Z$ |

Note: $\quad Z=($ High impedance)
Depending upon VCO characteristics, FC pin should be set accordingly:
When VCO characteristics are like (1) FC should be set high or open circuit; When VCO characteristics are like (2). FC should be set Low.

## RECOMMENDED OPERATING CONDITIONS

## SERIAL INPUT PLL FREQUENCY SYNTHESIZER

## LOW POWER SERIAL INPUT PLL SYNTHESIZER WITH 600 MHz PRESCALER

The Fujitsu MB1505, utilizing BI-CMOS technology, is a single chip serial input PLL synthesizer with pulse-swallow function.
The MB1505 contains a $600 \mathrm{MH}_{\mathrm{z}}$ two modulus prescaler that can select of either $32 / 33$ or 64/65 divide ratio, control signal generator, 16 -bit shift register, 15 -bit latch, programmable reference divider (binary 14 -bit programmable reference counter), 1 -bit switch counter, phase comparator with phase conversion function, charge pump, crystal oscillator, 19 -bit shift register, 18 -bit latch, programmable divider (binary 7 -bit swallow counter and binary 11 -bit programmable counter) and analog switch to speed up lock up time.
It operates supply voltage of 5 V typ. and achieves very low supply current of 6 mA typ. realized through the use of Fujitsu Advanced Process Technology.

- High operating frequency: $\mathfrak{f}_{\mathbb{N} \operatorname{MAX}}=600 \mathrm{MH}_{\mathrm{Z}}\left(\mathrm{V}_{\mathrm{IN} \text { miN }}=-4 \mathrm{dBm}\right)$
- Pulse swallow function: $32 / 33$ or 64/65
- Low supply current: $\mathrm{I}_{\mathrm{cc}}=6 \mathrm{~mA}$ typ.
- Serial input 18 -bit programmable divider consisting of:
- Binary 7 -bit swallow counter: 0 to 63
- Binary 11-bit programmable counter: 16 to 2047
- Serial input 15 -bit programmable reference divider consisting of:
- Binary 14-bit programmable reference counter: 8 to 16383
- 1-bit switch counter (SW) sets divide ratio of prescaler
- On-chip analog switch achieves fast lock up time
- 2types of phase detector output
- On-chip charge pump (Bipolar type)
- Output for external charge pump
- Wide operating temperature: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
- 16-pin Plastic DIP Package (Suffix : -P) 16 -pin Plastic Flat Package (Suffix:-PF)

## ABSOLUTE MAXIMUM RATINGS (See NOTE)

| Rating | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{Cc}}$ | -0.5 to +7.0 | V |
|  | $\mathrm{~V}_{\mathrm{p}}$ | $\mathrm{V}_{\mathrm{Cc}}$ to 10.0 | V |
| Output Voltage | $\mathrm{V}_{\text {out }}$ | -0.5 to $\mathrm{V}_{\mathrm{cc}}+0.5$ | V |
| Open-drain Voltage | $\mathrm{V}_{\text {oop }}$ | -0.5 to 0.8 | V |
| Output Current | $\mathrm{I}_{\text {out }}$ | $\pm 10$ | mA |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

[^24]

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

## PIN DESCRIPTION

| Pin No. | Pin Name | I/O | Description |
| :---: | :---: | :---: | :---: |

| 3 | $V_{\text {P }}$ | - | Power supply input for charge pump and analog switch. |
| 4 | $V_{c c}$ | - | Power supply voltage input. |
| 5 | D。 | 0 | Charge pump output. <br> The characteristics of charge pump is reversed depending upon FC input. |
| 6 | GND | - | Ground. |
| 7 | LD | 0 | Phase comparator output. <br> Normally this pin outputs high level. While the phase difference of $f_{\mathrm{t}}$ and $\mathrm{f}_{\mathrm{p}}$ exists, this pin outputs low level. |
| 8 | $f_{\text {IN }}$ | 1 | Prescaler input. <br> The connection with an external VCO should be AC connection. |
| 9 | Clock | 1 | Clock input for 19 -bit shift register and 16 -bit shift register. On rising edge of the clock shifts one bit of data into the shift registers. |
| 10 | Data | 1 | Binary serial data input. <br> The last bit of the data is a control bit which specified destination of shift registers. When this bit is high level and LE is high level, the data stored in shift register is transferred to 15 -bit latch. When this bit is low level and LE is high level, the data is transferred to 18 -bit latch. |
| 11 | LE | 1 | Load enable input (with internal pull up resistor). <br> When LE is high or open, the data stored in shift register is transferred into latch depending upon the control bit. At the time, internal charge pump output to be connected to BISW pin because internal analog switch becomes ON state. |
| 12 | FC | 1 | Phse select input of phase comparator (with internal pull up resistor). <br> When FC is low level, the characteristics of charge pump, phase comparator is reversed. <br> FC input signal is also used to control $f_{\text {out }}$ pin (test pin) output level, $f_{t}$ or $f_{p}$. |
| 13 | BISW | 0 | Analog switch output. <br> Usually BISW pin is set high-impedance state. When internal analog switch is ON (LE pin is high level), this pin outputs internal charge pump state. |
| 14 | $f_{\text {out }}$ | 0 | Minitor pin of phase comparator input. <br> $\mathrm{f}_{\text {out }}$ pin outputs either programmable reference divider output ( $\mathrm{f}_{\mathrm{r}}$ ) or programmable divider output ( $f_{p}$ ) depending upon FC pin input level. <br> $\mathrm{FC}=\mathrm{H}$ : It is the same as $\mathrm{f}_{\text {, output level. }}$ <br> FC=L: It is the same as $f_{p}$ output level. |
| $\begin{aligned} & 15 \\ & 16 \end{aligned}$ | $\begin{aligned} & \varnothing P \\ & \varnothing R \end{aligned}$ | $\begin{aligned} & 0 \\ & 0 \end{aligned}$ | Outputs for external charge pump. <br> The characteristics are reversed according to FC input. <br> $\varnothing \mathrm{P}$ pin is N -channel open drain output. |

## FUNCTIONAL DESCRIPTIONS

## SERIAL DATA INPUT

Serial data input is achieved by three inputs, such as Data pin, Clock pin and LE pin. Serial data input controls 15-bit programmable reference divider and 18-bit programmable divider, respectively.
Binary serial data is input to Data pin.
On rising edge of clock shifts one bit of serial data into the internal shift registers and when load enable pin is high level or open, stored data is transferred into latch depending upon the control bit.
Control data " H " data is transferred into 15 -bit latch.
Control data " $L$ " data is transferred into 18 -bit latch.

## PROGRAMMABLE REFERENCE DIVIDER

Programmable reference divider consists of 16 -bit shift register, 15 -bit latch and 14 -bit reference counter. Serial 16 -bit data format is shown below.

$\omega$ Divide ratio of programmable reference counter setting bit

14-BIT PROGRAMMABLE REFERENCE COUNTER DIVIDE RATIO

| Divide <br> Ratio <br> R | S <br> 14 | S <br> 13 | S |  |  |  |  |  |  |  |  |  |  |  |

| 2047 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

NOTES: Divide ratio less than 16 is prohibited.
Divide ratio: 16 to 2047
S1 to S7: Swallow counter divide ratio setting bit. (0 to 63)
S8 to S18: Programmable counter divide ratio setting bit. (16 to 2047)
C: Control bit (sets as low level).
Data is input from MSB side.

## PULSE SWALLOW FUNCTION

$f_{v c o}=[(P \times N)+A] \times f_{o s c}+R$
$f_{\mathrm{vco}}$ : Output frequency of external voltage controlled oscillator (VCO)
N : Preset divide ratio of binary 11 -bit programmable counter (16 to 2047)
A: Preset divide ratio of binary 7 -bit swallow counter ( $0 \leq A \leq 63, A<N$ )
$f_{\text {osc }}$ : Output frequency of the external reference frequency oscillator
R: Preset divide ratio of binary 14 -bit programmable reference counter ( 8 to 16383)
P: Preset modulus of external dual modulus prescaler (32 or 64)

NOTES: Parenthesis data is used for setting divide ratio of programmable reference divider. On rising edge of clock shifts one bit of data in the shift register.

## PHASE CHARACTERISTICS

VCO CHARACTERISTICS
FC pin is provided to change phase characteristics of phase comparator. Characteristics of internal charge pump output level ( $\mathrm{D}_{0}$ ), phase comparator output level ( $\approx \mathrm{R}, \mathrm{\otimes P}$ ) are reversed depending upon FC pin input level. Also, monitor pin (foul) output level of phase comparator is controlled by FC pin input level. The relation between

|  | FC=H or open |  |  |  |  | FC $=L$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $D_{0}$ | $\otimes R$ | $\otimes P$ | $f_{\text {out }}$ | $D_{o}$ | $\otimes R$ | $\otimes P$ | $f_{\text {out }}$ |  |  |
|  | $H$ | $L$ | $L$ | $\left(f_{1}\right)$ | $L$ | $H$ | $Z$ | $\left(f_{p}\right)$ |  |  |
| $f_{1}<f_{p}$ | $L$ | $H$ | $Z$ | $\left(f_{r}\right)$ | $H$ | $L$ | $L$ | $\left(f_{p}\right)$ |  |  |
| $f_{1}=f_{p}$ | $Z$ | $L$ | $Z$ | $\left(f_{r}\right)$ | $Z$ | $L$ | $Z$ | $\left(f_{p}\right)$ |  |  |

Note: $\quad Z=($ High impedance)
Depending upon VCO characteristics, FC pin should be set accordingly:
When VCO characteristics are like (1), FC should be set High or open circuit;
When VCO characteristics are like (2), FC should be set Low.

3

NOTES: Phase difference detection range: $-2 \pi$ to $+2 \pi$
Spike appearance depends on charge pump characteristics. Also, the spike is output in order to diminish dead band. When $f_{r}>f_{p}$ or $f_{t}<f_{p}$, spike might not appear depending upon charge pump characteristics.

## ANALOG SWITCH

ON/OFF of analog switch is controlled by LE input signal. When the analog switch is ON, internal charge pump output ( $D_{0}$ ) to be connected to BISW pin. When the analog switch is OFF, BISW pin is set to high-impedance state.
$\mathrm{LE}=\mathrm{H}$ (Changing the divide ratio of internal prescaler): Analog switch=ON
$L E=L$ (Normal operating mode)
: Analog switch=OFF
LPF time constant is decreased in order to insert a analog switch between LPF1 and LPF2 when channel of PLL is changing. Thus, lock up time is decreased, that is, fast lock up time is achieved.

## RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Value |  |  | Unit |
| :--- | :---: | :---: | :---: | :---: | :---: |

## MB1507

SERIAL INPUT PLL FREQUENCY SYNTHESIZER

## SERIAL INPUT PLL FREQUENCY SYNTHESIZER WITH 2.0GHz PRESCALER

The Fujitsu MB1507 is a single chip serial input PLL frequency synthesizer designed for BS tuner and cellular telephone applications.
It contains a $2.0 \mathrm{GH}_{\mathrm{z}}$ dual modulus prescaler which enables pulse swallow function, and an analog switch to speed up lock up time.
It operates supply voltage of 5.0 V typ. and dissipates 18 mA typ. of current realized through the use of Fujitsu's unique U-ESBIC Bi-CMOS technology.

- High operating frequency: $f_{\mathrm{IN}_{\operatorname{mx}}}=2.0 \mathrm{GH}_{Z}\left(\mathrm{~V}_{\mathbb{I N} \text { MIN }}=-4 \mathrm{dBm}\right)$
- Pulse swallow function: 128/129 or 256/257
- Low supply current: $I_{c c}=18 \mathrm{~mA}$ typ.
- Serial input 19-bit programmable divider consisting of:
- Binary 8-bit swallow counter: 0 to 255
- Binary 11-bit programmable counter: 16 to 2047
- Serial input 15 -bit programmable reference divider consisting of: - Binary 14-bit programmable reference counter: 8 to 16383 o 1-bit switch counter (SW) sets divide ration of prescaler
- On-chip analog switch achieves fast lock up time
- Two types of phase detector output - On-chip charge pump (Bipolar type) - Output for external charge pump
- Wide operating temperature: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
- 16-pin Plastic Flat Package (Suffix: -PF)

## ABSOLUTE MAXIMUM RATINGS (see NOTE)

| Rating | Symbol | Value | Unit |
| :--- | :--- | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{cc}}$ | -0.5 to +7.0 | V |
|  | $\mathrm{~V}_{\mathrm{p}}$ | $\mathrm{V}_{\mathrm{cc}}$ to 10.0 | V |
| Output Voltage | $\mathrm{V}_{\text {out }}$ | -0.5 to $\mathrm{V}_{\mathrm{cc}}+0.5$ | V |
| Open-drain Voltage | $\mathrm{V}_{\text {oop }}$ | -0.5 to 8.0 | V |
| Output Current | $\mathrm{l}_{\text {OuT }}$ | +10 | mA |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. How ever, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

[^25]

## PIN DESCRIPTION

| Pin No. | Pin Name | IV | Description |
| :---: | :---: | :---: | :---: |
| $\begin{aligned} & 1 \\ & 2 \end{aligned}$ | $\begin{aligned} & \text { OSC }_{\mathbf{N}} \\ & \text { OSC }_{\text {out }} \end{aligned}$ | $\begin{aligned} & 1 \\ & 0 \end{aligned}$ | Oscillator input. <br> Oscillator output. <br> A crystal is placed between $\mathrm{OSC}_{\text {IN }}$ and $\mathrm{OSC}_{\text {our. }}$. |
| 3 | $V_{\text {P }}$ | - | Power supply input for charge pump and analog switch. |
| 4 | $\mathrm{V}_{\mathrm{cc}}$ | - | Power supply voltage input. |
| 5 | Do | 0 | Charge pump output. <br> The characteristics of charge pump are reversed depending upon FC input. |
| 6 | GND | - | Ground. |
| 7 | LD | 0 | Phase comparator output. <br> Normally the output level is high level. While the phase difference of $f_{r}$ and $f_{p}$ exists, the output becomes low level. |
| 8 | $\mathrm{f}_{\mathrm{N}}$ | 1 | Prescaler input. <br> The connection with VCO should be AC connection. |
| 9 | Clock | 1 | Clock input for 20 -bit shift register and 16 -bit shift register. <br> Each rising edge of the clock shifts one bit of data into shift registers |
| 10 | Data | 1 | Binary serial data input. <br> The last bit of the data is a control bit which specified destination of shift registers. When this bit is high level and LE is high level, the data stored in shift register is transferred to 15 -bit latch. When this bit is low level and LE is high level, the data is transferred to 19-bit latch. |
| 11 | LE | 1 | Load enable input (with pull up resistor). <br> When LE is high or open, the data stored in shift register is transferred into latch depending upon the control bit. At the time, internal charge pump output to be connected to BISW pin because internal analog switch becomes $O N$ state. |
| 12 | FC | 1 | Phase select input of phase comparator (with pull up resistor). <br> When FC is low level, the characteristics of charge pump, phase comparator are reversed. <br> FC pin input signal controls $f_{\text {out }}$ pin (test pin) output level, $f_{f}$ or $f_{p}$. |
| 13 | BISW | 0 | Analog switch output. <br> Usually BISW pin is set at high-impedance state. When internal analog switch in ON (LE pin is set at high level), this pin outputs internal charge pump output. |
| 14 | fout | 0 | Monitor pin of phase comparator input. <br> $\mathrm{f}_{\text {out }}$ pin outputs programmable reference divider output ( $\mathrm{f}_{\mathrm{r}}$ ) or programmable divider output ( $\mathrm{f}_{\mathrm{p}}$ ) depending upon FC pin input level. <br> $\mathrm{FC}=\mathrm{H}$ : It is the same as $\mathrm{f}_{\mathrm{f}}$ output level. <br> $F C=L$ : It is the same as $f_{p}$ output level. |
| $\begin{aligned} & 15 \\ & 16 \end{aligned}$ | ${ }_{6}$ $\oplus R$ | $\begin{aligned} & 0 \\ & 0 \end{aligned}$ | Outputs for external charge pump. <br> The characteristics are reversed according to FC input. थP pin is N -channel open drain output. |

## FUNCTIONAL DESCRIPTIONS

## SERIAL DATA INPUT

Serial data input is achieved by three inputs, such as Data pin, Clock pin and LE pin. Serial data input controls 15 -bit programmable reference divider and 19-bit programmable divider, respectively.
Binary serial data is input to Data pin.
Each rising edge of the clock shifts one bit of serial data into the internal shift registers and when load enable pin is high level or open, stored data is transferred into latch depending upon the control bit.
Control data "H" data is transferred into 15 -bit latch.
Control data "L" data is transferred into 19-bit latch.

## THE DIVIDE RATIO SETTING

## $f_{v c o}=[(M \times N)+A] \times f_{o s c}+R$

$f_{\text {vco: }}$ Output frequency of external voltage controlled oscillator (VCO)
M: Preset modulus of external dual modulus prescaler (128 or 256)
N: Preset divide ratio of binary 11-bit programmable counter (16 to 2047)
A: Preset divide ratio of binary 8 -bit swallow counter ( $0 \leq A \leq 255, A<N$ )
fosc: Output frequency of the external reference frequency oscillator
R: Preset divide ratio of binary 14 -bit programmable reference counter ( 8 to 16383)

## PROGRAMMABLE REFERENCE DIVIDER

Programmable reference divider consists of 16 -bit shift register, 15 -bit latch and 14-bit reference counter. Serial 16-bit data format is shown below.

## 14-BIT PROGRAMMABLE REFERENCE COUNTER DIVIDE RATIO

| 2047 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

NOTES: Divide ratio less than 16 is prohibited.
Divide ratio: 16 to 2047
S1 to S8: Swallow counter divide ratio setting bit. (0 to 255)
S9 to S19: Programmable counter divide ratio setting bit. (16 to 2047)
C: Control bit (sets to low level).
Data is input from MSB side.

## SERIAL DATA INPUT TIMING

$t_{1}, t_{2}, t_{3}, t_{4}, t_{s} \geq 1 \mu s$

NOTES: The data noted in parenthesis is used for setting divide ratio of programmable reference divider. On rising edge of clock, one bit of data shifts into the shift register.

## PHASE CHARACTERISTICS

VCO POLARITY
FC pin is provided to change phase polarity of phase comparator. Characteristics of internal charge pump output level ( $\mathrm{D}_{0}$ ), phase comparator output level ( $\varnothing \mathrm{R}, \varnothing \mathrm{P}$ ) are reversed depending upon FC pin input level. Also, monitor pin ( $\mathrm{f}_{\text {out }}$ ) output level of phase comparator is controlled by FC pin input level.

|  | $F C=H$ or open |  |  |  | $F C=L$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $D_{0}$ | $\varnothing R$ | $\varnothing P$ | $f_{\text {out }}$ | $D_{0}$ | $\varnothing R$ | $\varnothing P$ | $f_{\text {out }}$ |  |
|  | $H$ | $L$ | $L$ | $\left(f_{r}\right)$ | $L$ | $H$ | $Z$ | $\left(f_{p}\right)$ |  |
| $f_{r}=f_{p}$ | $Z$ | $L$ | $Z$ | $\left(f_{r}\right)$ | $Z$ | $L$ | $Z$ | $\left(f_{p}\right)$ |  |
| $f_{r}<f_{p}$ | $L$ | $H$ | $Z$ | $\left(f_{r}\right)$ | $H$ | $L$ | $L$ | $\left(f_{p}\right)$ |  |

Note: $\quad \mathrm{Z}=$ (High impedance)

Depending upon VCO polarity, FC pin should be set accordingly:
When VCO polarity are like (1) , FC should be set High or open circuit; When VCO polarity are like (2). FC should be set Low.

PHASE DETECTOR OUTPUT WAVEFORM (FC=High)

NOTES: Phase difference detection range: $-2 \pi$ to $+2 \pi$
Spike appearance depends on charge pump characteristics. Also, the spike is output in order to diminish dead band. When $f_{t}>f_{p}$ or $f_{t}<f_{p}$, spike might not appear depending upon charge pump characteristics.

## ANALOG SWITCH

ON/OFF of analog switch is controlled by LE input signal. When the analog switch is ON, internal charge pump output ( $\mathrm{D}_{0}$ ) is connected to BISW pin. When the analog switch is OFF, BI-SW pin is set to high-impedance state.

| LE | Analog Switch |
| :--- | :---: |
| $H$ (Changing the divide ratio of internal prescaler) | ON |
| $L$ (Normal operating mode) | OFF |

When an analog switch is inserted between LP1 and LP2, faster lock up time is achieved to reduce LPF time constant during PLL channel switching.

## RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Value |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min | Typ | Max |  |
| Power Supply Voltage | $V_{c c}$ | 4.5 | 5.0 | 5.5 | V |
|  | $V_{p}$ | $V_{c c}$ | - | 8.0 | V |
| Input Voltage | $V_{1}$ | GND | - | $\mathrm{V}_{\mathrm{cc}}$ | V |
| Operating Temperature | $T_{\text {A }}$ | -40 | - | 85 | ${ }^{\circ} \mathrm{C}$ |

## HANDLING PRECAUTIONS

- This device should be transported and stored in anti-static containers.
- This is a static-sensitive device; take proper anti-ESD precautions. Ensure that personnel and equipment are properly grounded. Cover workbenches with grounded conductive mats.
- Always turn the power supply off before inserting or removing the device from its socket.
- Protect leads with a conductive sheet when handling or transporting PC boards with devices.

SERIAL INPUT PLL FREQUENCY SYNTHESIZER

## SERIAL INPUT PLL FREQUENCY SYNTHESIZER ON CHIP 2.5GHz PRESCALER

The Fujitsu MB1508 on chip 2.5 GHz dual modulus prescaler is a serial input PLL (Phase Locked Loop) frequency synthesizer with pulse swallow function. It is well suited for BS tuner, CATV system, and TV tuner applications.

It operates supply voltage of 5.0 V typ. and dissipates 16 mA typ. of current realized through the use of Fujitsu's unique U-ESBIC Bi-CMOS technology.

- Power supply voltage: $\mathrm{V}_{c c}=4.5$ to 5.5 V
- High operating frequency: $\mathrm{f}_{\mathrm{n}}=2.5 \mathrm{GHz}\left(\mathrm{V}_{\mathrm{n}}=-4 \mathrm{dBm}\right)$
- 2.5 GHz dual modulus prescaler: $\mathrm{P}=256 / 272,512 / 528$
- Low power supply current: $\mathrm{Icc}=16 \mathrm{~mA}$ typ.
- Programmable reference divider consisting of: Binary 2-bit programmable reference counter ( $R=256,512,1024,2048$ )
- Programmable divider consisting of:

Binary 5 -bit swallow counter ( $A=0$ to 31)
Binary 12-bit programmable counter ( $\mathrm{N}=32$ to 4095)

- Wide operating temperature: $T_{A}=-40$ to $+85^{\circ} \mathrm{C}$
- Plastic 20 -pin flat package (Suffix: -PF)

ABSOLUTE MAXIMUM RATINGS (see NOTE)

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circutry to protect the inputs against damage due to high static voltages or electric fiekds. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

[^26]

## PIN DESCRIPTIONS

| Pin No. | Pin Name | vo | Descriptions |
| :---: | :---: | :---: | :---: |
| 1 | FC | 1 | Phase select input pin of the phase detector. This pin involves an internal pull up resistor. When this pin is low, characteristics of the charge pump and phase detector can be reversed. This input also selects fout pin output level, either fr or $\mathfrak{f p}$. See Functional Description section, Phase Detector Characteristics. |
| 2 | LE | 1 | Load enable input pin. This pin involves a schmitt trigger circuit. When this pin is high, the data stored in the shift register is transferred into the latch. |
| 3 | Data | 1 | Serial data of binary code input pin. This pin involves a schmitt trigger circuit. |
| 4 | Clock | 1 | Clock input pin of the 24-bit shift register. This pin involves a schmitt trigger circuit. Each rising edge of the clock shifts one bit of data into the shift register. |
| 5 | $\mathrm{V}_{\mathrm{cc}}$ | - | PLL power supply voltage input pin. |
| 6 7 | $\begin{aligned} & \mathrm{OSC}_{\mathrm{IN}} \\ & \text { OSCout } \end{aligned}$ | $!$ | Oscillator input pin. <br> Oscillator output pin. <br> A crystal is connected between OSC $_{\text {in }}$ pin and OSCout pin. |
| 8 | GND1 | - | PLL ground pin. |
| $\begin{aligned} & 9 \\ & 10 \end{aligned}$ | $\begin{aligned} & D_{0} \\ & D_{02} \end{aligned}$ | $\begin{aligned} & \mathrm{O} \\ & \mathrm{O} \end{aligned}$ | Charge pump output pins. <br> Phase characteristics can be reversed depending upon FC pin input level. |
| $\begin{aligned} & 11 \\ & 12 \\ & 13 \\ & 14 \end{aligned}$ | $\begin{aligned} & \mathrm{BC4} \\ & \mathrm{BC} 3 \\ & \mathrm{BC2} \\ & \mathrm{BC1} \end{aligned}$ | $\begin{aligned} & 0 \\ & 0 \\ & 0 \end{aligned}$ | Band switching output pins. (Open-collector output) Output is controlled by a band bit data, individually. $\mathrm{BCX}-\mathrm{bit}=\mathrm{H}: \mathrm{BCX}$ output transistor is ON . $B C X$-bit $=\mathrm{L}$ : $B C X$ output transistor is OFF. $(X=1 \text { to } 4)$ |
| 15 | $\overline{f_{i n}}$ | 1 | Complementary input pin of $\mathrm{f}_{\mathrm{n}}$. Please connect to GND through a capacitor. |
| 16 | GND2 | - | Prescaler ground pin. |
| 17 | $\mathrm{fin}^{\text {n }}$ | 1 | Prescaler input pin, This signal is AC coupled. |
| 18 | $V_{\text {cc2 }}$ | - | Prescaler power supply voltage input pin. |
| 19 | fout | 0 | Monitor pin of the phase detector input. <br> fout pin outputs either of the programmable reference divider output frequency fr or programmable divider output frequency fp depending upon the FC pin input level. |
| 20 | LD | 0 | Phase detector output pin. <br> Normally this pin outputs high. While the phase difference between fr and $f p$ exists, this pin outputs low. |

## FUNCTIONAL DESCRIPTIONS

## divide ratio setting

Divide ratio can be set using the following equation:
$f_{v c o}=\{(P \times N)+(16 \times A)\} \times f_{\text {ose }}+R$
fyco: Output frequency of an external voltage controlled oscillator (VCO)
P: Preset divide ratio of an internal dual modulus prescaler (256 or 512)
N: Preset divide ratio of binary 12-bit programmable counter ( 32 to 4095)
A: Preset divide ratio of binary 5 -bit swallow counter ( 0 to 31)
fosc: Reference oscillator frequency
R: Preset divide ratio of reference counter $(256,512,1024,2048)$

## SERIAL DATA I NPUT

Each rising edge of the clock shifts one bit of data into the shift register.
When the load enable is high, the data stored in the shift register is transferred to the latch.
The data format of 24 bits is shown below.

$$
\longrightarrow \text { Data Input Flow }
$$

5-bit swallow counter divide ratio (A1 to A5)

| Divide ratio <br> A | $\mathbf{A}$ | A | A | A | A |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 5 | 4 | 3 | 2 | 1 |  |
| 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 0 | 0 | 0 | 0 | 1 |
| 2 | 0 | 0 | 0 | 1 | 0 |
| $:$ | $:$ | $:$ | $:$ | $:$ | $:$ |
| 31 | 1 | 1 | 1 | 1 | 1 |

12-bit programmable counter divide ratio ( N 1 to N 12 )

| Divide ratio | $N$ | $N$ | $N$ | $N$ | $N$ | $N$ | $N$ | $N$ | $N$ | $N$ | $N$ | $N$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |
| 32 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| 33 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 |
| 34 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 0 |
| $:$ | $:$ | $:$ | $:$ | $:$ | $:$ | $:$ | $:$ | $:$ | $:$ | $:$ | $:$ | $:$ |
| 4095 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

## FUNCTIONAL DESCRIPTIONS

Reference counter divide ratio (R1 to R2)

| Divide ratio <br> $R$ | $R$ | $R$ |
| :---: | :---: | :---: |
| 2 | 1 |  |
| 256 | 0 | 0 |
| 512 | 0 | 1 |
| 1024 | 1 | 0 |
| 2048 | 1 | 1 |

## Prescaler divide ratio (SW)

When divide ratio of prescaler setting bit is high, divide ratio of $256 / 272$ is selected When divide ratio of prescaler setting bit is low, divide ratio of $512 / 528$ is selected.

Band Switch Setting (BC1 to BC4)
When band switch setting bit is high, output is ON.
When band switch setting bit is low, output is OFF.

## SERIAL DATA INPUT TIMING

Note: Each rising edge of the clock shifts one bit of data into the shift register.
When LE is high, the data stored in the shift register is transferred into the latch.

## PHASE DETECTOR CHARACTERISTICS

FC pin selects the phase of the phase detector. Phase characteristics (charge pump output) can be reversed depending upon the FC pin. input level. Monitor pin (fout) output level is selected by the FC pin input level as well.

|  |  | $\mathrm{FC}=\mathrm{H}$ (or open) |  | $F C=L$ |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{D}_{01}, \mathrm{D}_{\infty}$ | fout | $D_{01}, D_{02}$ | fout |
| $f r>f p$ | H | Outputs programmable reference divider output frequency fr. | L | Outputs programmable divider output frequency fp. |
| $\mathrm{fr}=\mathrm{fp}$ | Z |  | Z |  |
| $\mathrm{fr}<\mathrm{fp}$ | L |  | H |  |

## Note:

Z: High-impedance
Depending upon the VCO polarity, FC pin should be set accordingly.

When VCO polarity is like 1 ,
FC should be set high or open.
When VCO polarity is like 2 ,
FC should be set low.

PHASE DETECTOR WAVEFORM

$$
\mathrm{fr}>\mathrm{fp} \quad \mathrm{fr}=\mathrm{fp} \quad \mathrm{fr}<\mathrm{fp} \quad \mathrm{fr}<\mathrm{fp} \quad \mathrm{fr}<\mathrm{fp}
$$

Note: Phase difference detection range : $-2 \pi$ to $+2 \pi$
Spike shape depends on the charge pump characteristics.
The spike is output to diminish the dead band.

## TEST CIRCUIT (FOR PRESCALER INPUT SENSITIVITY)

## RECOMMENDED OPERATING CONDITIONS

| Parameler | Symbol | Value |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min | Typ | Max |  |
| Power Supply Voltage | Vcc | 4.5 | 5.0 | 5.5 | V |
| Input Voltage | $V_{1}$ | GND | - | V cc | V |
| Operating Temperature | $\mathrm{T}_{\text {A }}$ | -40 | - | +85 | ${ }^{\circ} \mathrm{C}$ |

## HANDLING PRECAUTIONS

- This device should be transported and stored in anti-static containers.
- This is a static-sensitive device; take proper anti-ESD precautions. Ensure that personnel and equipment are properly grounded. Cover workbenches with grounded conductive mats.
- Always turn the power supply off before inserting or removing the device from its socket.
- Protect leads with a conductive sheet when handling or transporting PC boards with devices.

ELECTRICAL CHARACTERISTICS

Note1: $f_{i n}=2.5 \mathrm{GHz}, \mathrm{OSC}_{\mathbb{1}}=4.0 \mathrm{MHz}, \mathrm{V}_{c c}=5.0 \mathrm{~V}$. Input pins are grounded and output pins are open.
Note2: AC coupling. Minimum operating frequency is measured with a capacitor 1000 pF .

## MB1508 APPLICATION CIRCUIT

$C_{1}, C_{2}$ : depends on the crystal oscillator.
FC : with internal pull up resistor.

MB1509

## DUAL SERIAL INPUT PLL FREQUENCY SYNTHESIZER

## DUAL SERIAL INPUT PLL FREQUENCY SYNTHESIZER WITH 400MHz PRESCALER

The Fujitsu MB1509 is a 400 MHz dual serial input PLL (Phase Locked Loop) frequency sizer synthesizer designed for cordless telephone application.

The MB1509 has two PLL circuits on a single chip: one for transmit and the other for reception. Separate power supply pins are provided for the transmit and reception PLL circuits. Transmit PLL contains a low sensitivity charge pump for ease of modulation and reception PLL contains a high sensitivity charge pump for faster lock up time.

The MB1509 incorporates two 400 MHz dual modulus prescalers to enable implemention of a pulse swallow function.

It operates supply voltage of 3.0 V typ. and dissipates 8 mA typ. of current realized through the use of Fujitsu's unique U-ESBIC Bi-CMOS technology.

- High operating frequency: fin $=400 \mathrm{MHz}$
- Low power supply voltage: $\mathrm{V}_{\mathrm{cc}}=2.7$ to 5.5 V
- Low power supply current: $\mathrm{Icc}=8 \mathrm{~mA}$ typ, @3V.
- Wide operating temperature: $\mathrm{T}_{\mathrm{A}}=-40$ to $85^{\circ} \mathrm{C}$
- Two charge pumps

Low sensitivity charge pump for transmit
High sensitivity charge pump for reception

- Plastic 20 -pin dual in line package (Suffix: -P) Plastic 20 -pin flat package (Suffix: -PF)

ABSOLUTE MAXIMUM RATINGS (see NOTE)

| Rating | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{cc}}$ | -0.5 to 7.0 |  |
|  | $\mathrm{~V}_{\mathrm{p}}$ | $\mathrm{V}_{\mathrm{cc}}$ to 10.0 |  |
| Output Voltage | $\mathrm{V}_{\text {out }}$ | -0.5 to $\mathrm{V}_{\mathrm{cc}}+0.5$ | V |
| Output Current | lout | $\pm 10$ | mA |
| Storage Temperature | TsTG | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

## BLOCK DESCRIPTIONS

## TRANSMIT/RECEPTION BLOCK

- 20-bit latch
- Programmable divider consisting of:

Binary 7-bit swallow counter (Divide ratio: 0 to 127)
Binary 11-bit programmable counter (Divide ratio: 16 to 2047)

- Phase detector with phase polarity change function
- 400 MHz dual modulus prescaler (Divide ratio: $32 / 33,64 / 65$ )
- Charge pump

## COMMON BLOCK

- 23-bit shift register
- Programmable divider consisting of:

Reference counter (Divide ratio: 512, 1024)
(Divide frequency $=25 \mathrm{kHz}, 12.5 \mathrm{kHz}$ (Crystal oscillator frequency $=12.8 \mathrm{MHz}$ )

- Crystal oscillator
- fp monitor output selector
- Latch selector
- Schmitt circuits
- Analog switches

PIN DESCRIPTIONS

## PIN DESCRIPTIONS (Continued)

| Pin No. | Pin Name | $1 / 0$ | Descriptions |
| :---: | :---: | :---: | :---: |
| 16 | Vcc2 | - | Power supply voltage input pin for reception section, programmable reference divider, shift register, and crystal oscillator. <br> When power is OFF, latched data of reception section and reference counter is cancelled. |
| 17 | $\mathrm{fin}_{2}$ | 1 | Prescaler input pin of reception section. The connection with VCO should be AC connection. |
| 18 | LE | 1 | Load enable input pin. This pin involves a schmitt trigger circuit. When this pin is high, the data stored in the shift register is transferred into the latch depending on a control data. <br> At this moment, charge pump output signal is output from BS pin since internal analog swith becomes ON. |
| 19 | Data | 1 | Serial data input pin of 23 -bit shift register. This pin involves a schmitt trigger circuit. The stored data in the shift register is transferred to either transmit section or reception section depending upon a control data. |
| 20 | Clock | 1 | Clock input pin of 23 -bit shift register. This pin involves a schmitt trigger circuit. Each rising edge of the clock shifts one bit of data into the shift register. |

## FUNCTIONAL DESCRIPTIONS

The divide ratio can be calculated using the following equation:
$f_{\text {vco }}=\{(M \times N)+A\} \times f$ fosc $\div R(A<N)$
fyco: Output frequency of external voltage controlled oscillator (VCO)
M: Preset divide ratio of dual modulus prescaler (32 or 64)
$\mathrm{N}: \quad$ Preset divide ratio of binary 11-bit programmable counter (16 to 2047)
A: Preset divide ratio of binary 7 -bit swallow counter ( $0 \leq A \leq 127$ )
$f_{\text {osc: }}$ Reference oscillator frequency
R: Preset divide ratio of reference counter (512 or 1024)

## FUNCTIONAL DESCRIPTIONS

serial data input
Serial data is input using three pins: Data pin, Clock pin, and LE pin. Programmable divider of transmit section and programmable divider of reception section are controlled individually.
Serial data of binary data is input into Data pin.
Each rising edge of the clock shifts one bit of serial data into the shift register. When load enable signal is high, the data stored in thegister is shift register is transferred to either the latch of the transmit section or the latch of the reception section, depending upon the control bit data setting.

| Control data | Destination of serial data |
| :---: | :--- |
| H | Latch of transmit section |
| L | Latch of reception section |

## SHIFT REGISTER CONFIGURATION

Control bit

N1 to N11 : Divide ratio of the programmable counter setting bit (16 to 2047)
A1 to A7 : Divide ratio of the swallow counter setting bit (0 to 127)
FC : Phase control bit of the phase detector
PRE $\quad$ : Divide ratio of the prescaler setting bit ( $32 / 33$ or $64 / 65$ )
FP : Output of the programmable divider control bit (fp1 or fp2)
REF : Divide ratio of the reference counter setting bit (512 to 1024)
CNT : Control bit
SERIAL DATA INPUT TIMING

Each rising edge of the clock shifts one bit of data into the shift register.

| $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| 127 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Note: Divide ratio $(A)$ range $=0$ to 127

PRE : DIVIDE RATIO (P) OF THE PRESCALER SETTING BIT
$H=32 / 33$
$L=64 / 65$
REF : DIVIDE RATIO (R) OF THE REFERENCE COUNTER SETTING BIT
$\mathrm{H}=512(\mathrm{fr}=25.0 \mathrm{kHz})$
$\mathrm{L}=1024(\mathrm{fr}=12.5 \mathrm{kHz})$
FP : OUTPUT OF THE PROGRAMMABLE DIVIDER SETTING BIT
$H=f p$ pin (15 pin) outputs programmable divider output frequency ( fp 1 ) of transmit section.
$L=f p$ pin (15 pin) outputs programmable divider output frequency (fp2) of reception section.
FC : PHASE CONTROL BIT OF THE PHASE DETECTOR
Output of charge pump is selected by FC pin.

|  | $F C=H$ | $F C=L$ |
| :--- | :---: | :---: |
| $f r>f p$ | $H$ | $L$ |
| $f r=f p$ | $Z$ | $Z$ |
| $f r<f p$ | $L$ | $H$ |
| Vco Polarity | $(1)$ | (2) |

Note: Z = High-impedance
Depending upon the VCO polarity, FC bit should be set.

## MB1509

## PHASE DETECTOR OUTPUT WAVEFORM

Note: - Phase difference detection range $=-2 \pi$ to $+2 \pi$

- LD output becomes low when phase difference is tw or more.

LD output becomes high when phase difference less than $t_{w}$ is reperated 3 times or more.
(e. g. $\mathrm{t}_{\mathrm{w}}=625$ to 1250 ns, foscin $=12.8 \mathrm{MHz}$ )

- Spike apperance depends on the charge pump characteristics. The spike is output to diminish the dead band.
- When $\mathrm{fr}>\mathrm{fp}$ or fr < fp , spike might not generate depending upon the VCO characteristics.

## ANALOG SWITCH

ON/OFF of the analog switch is controlled by the combination of the control data and LE signal. When the analog switch is ON, BS1, BS2 pin output the charge pump output ( $\mathrm{D}_{01}, \mathrm{D}_{02}$ ). When analog switch is OFF, BS pin is set to high impedance.

|  | Control data $=H$ <br> Divide ratio of transmit section is set |  | Control data $=L$ <br> Divide ratio of reception section is set |  |
| :--- | :---: | :---: | :---: | :---: |
|  | $L E=H$ | $L E=L$ | $L E=H$ | $L E=L$ |
|  | ON | OFF | OFF | OFF |
|  | OFF | OFF | ON | OFF |

When an analog switch is inserted between LP1 and LP2, faster lock up time is achieved to reduce LPF time constant during PLL channel switching.

RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Value |  |  | Unit | Note |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min | Typ | Max |  |  |
| Power Supply Voltage | V cc | 2.7 | 3.0 | 5.5 | V | $V_{C C 1}=V_{C C 2}$ |
|  | $V_{P}$ | $V_{C c}$ | - | 8.0 | V |  |
| Input Voltage | $V_{\text {IN }}$ | GND | - | Vcc | V |  |
| Operating Temperature | TA | -40 | - | +85 | ${ }^{\circ} \mathrm{C}$ |  |

## HANDLING PRECAUTIONS

- This device should be transported and stored in anti-static containers.
- This is a static-sensitive device; take proper anti-ESD precautions. Ensure that personnel and equipment are properly grounded. Coverworkbenches with grounded conductive mats.
- Always turn the power supply off before inserting or removing the device from its socket.
- Protect leads with a conductive sheet when handling or transporting PC boards with devices.

## APPLICATION EXAMPLE

## PACKAGE DIMENSIONS

## PACKAGE DIMENSIONS (Continued)

## MB1511

## SERIAL INPUT PLL FREQUENCY SYNTHESIZER

## SERIAL INPUT PLL FREQUENCY SYNTHESIZER WITH 1.1 GHz PRESCALER

The Fujitsu MB1511 is a single chip serial input PLL frequency synthesizer designed for VHF tuner and cellular telephone applications.
It contains a $1.1 \mathrm{GH}_{\mathrm{z}}$ dual modulus prescaler which enables pulse swallow function, and an analog switch to speed up lock up time.
It operates supply voltage of 3.0 V typ. and dissipates 7 mA typ. of current realized through the use of Fujitsu's unique U-ESBIC Bi-CMOS technology.
The MB1511 is housed in SSOP package, this enables high integration.

- Low power supply voltage: $\mathrm{V}_{\mathrm{cc}}=2.7$ to 5.5 V
- High operating frequency: $f_{\mathbb{N} \text { max }}=1.1 \mathrm{GH}_{\mathrm{z}}\left(\mathrm{V}_{\mathbb{N}}\right.$ min $\left.=-10 \mathrm{dBm}\right)$
- Pulse swallow function: 64/65 or 128/129
- Low supply current: $\mathrm{I}_{\mathrm{cc}}=7 \mathrm{~mA}$ typ.
- Serial input 18 -bit programmable divider consisting of: - Binary 7-bit swallow counter: 0 to 127
- Binary 11-bit programmable counter: 16 to 2047
- Serial input 15 -bit programmable reference divider consisting of: - Binary 14-bit programmable reference counter: 8 to 16383 - 1-bit switch counter (SW) sets divide ratio of prescaler
- On-chip analog switch achieves fast lock up time
- 2types of phase detector output
- On-chip charge pump (Bipolar type)
- Output for external charge pump
- Wide operating temperature: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
- 20-pin Plastic Shrink Small Outline Package (Suffix: - PFV)

ABSOLUTE MAXIMUM RATINGS (See NOTE)

| Rating | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{Cc}}$ | -0.5 to +7.0 | V |
|  | $\mathrm{~V}_{\mathrm{p}}$ | $\mathrm{V}_{\mathrm{Cc}}$ to 10.0 | V |
| Output Voltage | $\mathrm{V}_{\text {out }}$ | -0.5 to $\mathrm{V}_{\mathrm{cc}}+0.5$ | V |
| Open-drain Voltage | $\mathrm{V}_{\text {oop }}$ | -0.5 to 0.8 | V |
| Output Current | $\mathrm{I}_{\text {out }}$ | $\pm 10$ | mA |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circuitry to protect the inputs against damage due to high staric voliages or electric fields. How ever, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

[^30]

## PIN DESCRIPTION

| Pin No. | Pin Name | I/O | Description |
| :---: | :---: | :---: | :---: |

## FUNCTIONAL DESCRIPTIONS

## SERIAL DATA INPUT

Serial data input is achieved by three inputs, such as Data pin, Clock pin and LE pin. Serial data input controls 15-bit programmable reference divider and 18 -bit programmable divider, respectively.
Binary serial data is input to Data pin.
On rising edge of clock shifts one bit of serial data into the internal shift registers and when load enable pin is high level or open, stored data is transferred into latch depending upon the control bit.
Control data " H " data is transferred into 15 -bit latch.
Control data " L " data is transferred into 18 -bit latch.

## PROGRAMMABLE REFERENCE DIVIDER

Programmable reference divider consists of 16 -bit shift register, 15 -bit latch and 14 -bit reference counter. Serial 16 -bit data format is shown below.

## 14-BIT PROGRAMMABLE REFERENCE COUNTER DIVIDE RATIO

| Divide <br> Ratio <br> R | S <br> 14 | S <br> 13 | S <br> 12 | S | 11 | S | S | S | S | S | S | S | S | S |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 2047 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

NOTES: Divide ratio less than 16 is prohibited.
Divide ratio: 16 to 2047
S1 to S7: Swallow counter divide ratio setting bit. (0 to 127)
S8 to S18: Programmable counter divide ratio setting bit. (16 to 2047)
C: Control bit (sets as low level).
Data is input from MSB side.

## PULSE SWALLOW FUNCTION

The divide ratio is set using the following equation.
$\left.f_{v c o}=[\mathrm{M} \times \mathrm{N})+\mathrm{A}\right] \times \mathrm{f}_{\mathrm{osc}}+\mathrm{R}$
$\mathrm{f}_{\mathrm{vco}}$ : Output frequency of external voltage controlled oscillator (VCO)
M: Preset modulus of external dual modulus prescaler (64 or 128)
N: Preset divide ratio of binary 11-bit programmable counter (16 to 2047)
A: Preset divide ratio of binary 7 -bit swallow counter ( $0 \leq A \leq 127, A<N$ )
fosc: Output frequency of the external reference frequency oscillator
R: Preset divide ratio of binary 14-bit programmable reference counter (8 to16383)

## SERIAL DATA INPUT TIMING

NOTES: Parenthesis data is used for setting divide ratio of programmable reference divider. On rising edge of clock shifts one bit of data in the shift register.

## PHASE CHARACTERISTICS

VCO CHARACTERISTICS
FC pin is provided to change phase characteristics of phase comparator. Characteristics of internal charge pump output level ( $\mathrm{D}_{\mathrm{o}}$ ), phase comparator output level ( $\varnothing \mathrm{R}, \varnothing \mathrm{P}$ ) are reversed depending upon FC pin input level. Also, monitor pin (fout) output level of phase comparator is controlled by FC pin input level. The relation between outputs ( $\mathrm{D}_{\mathrm{O}}, \otimes \mathrm{R}, \otimes \mathrm{P}$ ) and FC input level are shown below.

|  | FC=H or open |  |  |  | FC=L |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | D | $\otimes$ R | ${ }_{\Delta P}$ | $\mathrm{f}_{\text {out }}$ | D | өR | ${ }_{6} \mathbf{P}$ | $\mathrm{f}_{\text {out }}$ |
| $\mathrm{f}_{\mathrm{r}}>\mathrm{f}_{\mathrm{p}}$ | H | L | L | (fi) | L | H | Z | $\left(f_{p}\right)$ |
| $f_{f}<f_{p}$ | L | H | Z | (f.) | H | L | L | $\left(f_{p}\right)$ |
| $f_{\text {r }}=\mathrm{f}_{\mathrm{p}}$ | Z | L | Z | (f.) | Z | L | Z | $\left(f_{p}\right)$ |

Note: $\quad Z=($ High impedance)
Depending upon VCO characteristics, FC pin should be set accordingly:
When VCO characteristics are like (1), FC should be set High or open circuit; When VCO characteristics are like (2), FC should be set Low.

NOTES: Phase difference detection range: $-2 \pi$ to $+2 \pi$ Spike appearance depends on charge pump characteristics. Also, the spike is output in order to diminish dead band. When $f_{r}>f_{p}$ or $f_{t}<f_{p}$, spike might not appear depending upon charge pump characteristics.

## ANALOG SWITCH

ON/OFF of analog switch is controlled by LE input signal. When the analog switch is ON , internal charge pump output ( $\mathrm{D}_{0}$ ) is connected to BISW pin. When the analog switch is OFF, BISW pin is set to high-impedance state.

| LE | Analog Switch |
| :--- | :---: |
| H (Changing the divide ratio of intermal prescaler) | ON |
| L (Normal operating mode) | OFF |

When an analog switch is inserted between LP1 and LP2, faster lock up times is achieved to reduce LPF time constant during PLL channal switching.

## RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Value |  |  | Unit |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  |  | Min | Typ | Max |  |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{cc}}$ | 2.7 | 3.0 | 5.5 | V |
|  | $\mathrm{~V}_{\mathrm{P}}$ | $\mathrm{V}_{\mathrm{cc}}$ |  | 8.0 | V |
|  | $\mathrm{V}_{\mathrm{C}}$ | GND | - | $\mathrm{V}_{\mathrm{cc}}$ | V |
| Operating Temperature | $\mathrm{T}_{\mathrm{A}}$ | -40 | - | 85 | ${ }^{\circ} \mathrm{C}$ |

## HANDLING PRECAUTIONS

- This device should be transported and stored in anti-static containers.
- This is static-sensitive device; take proper anti-ESD precautions. Ensure that personnel and equipment are properly grounded. Cover workbenches with grounded conductive mats.
- Always turn the power supply off befer inserting or removing the device from its socket.
- Protect leads with a conductive sheet when handing or transporting PC boards with devices.

## ELECTRICAL CHARACTERISTICS

| Parameter |  | Symbol | Condition | Value |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min |  | Typ | Max |  |
| Power Supply Current |  |  | $I_{\text {cc }}$ | Note 1 |  | 7.0 |  | mA |
| Operating Frequency | $\mathrm{f}_{\text {in }}$ | $\mathrm{f}_{\mathrm{n}}$ | Note 2 | 10 |  | 1100 | MHz |
|  | $\mathrm{OSC}_{\text {in }}$ | fosc |  |  | 12 | 20 | MHz |
| Input Sensitivity | $\mathrm{f}_{\mathrm{n} 1}$ | Vf ${ }_{\text {inf }}$ | $\mathrm{V}_{\mathrm{cc}}=4.0$ to 5.5 V | -4 |  | 6 | dBm |
|  | $\mathrm{f}_{\text {in2 }}$ | $\mathrm{Vt}_{\text {in2 }}$ | $V_{c c}=2.7$ to 4.0 V | -10 |  | 6 |  |
|  | $\mathrm{OSC}_{\text {IN }}$ | Vosc |  | 0.5 |  |  | $V_{\text {Pp }}$ |
| High-level Input Voltage | Except $\mathrm{fin}_{\mathrm{n}}$ and $\mathrm{OSC}_{\mathrm{N}}$ | $\mathrm{V}_{\text {IH }}$ |  | $\mathrm{V}_{\mathrm{cc}} \times 0.7$ |  |  | V |
| Low-level Input Voltage |  | $\mathrm{V}_{1}$ |  |  |  | $\mathrm{V}_{\mathrm{cc}} \times 0.3$ | V |
| High-level Input Current | Data Clock | $I_{1 H}$ |  |  | 1.0 |  | $\mu \mathrm{A}$ |
| Low-level Input Current |  | IL |  |  | -1.0 |  | $\mu \mathrm{A}$ |
| Input Current | $\mathrm{OSC}_{\text {IN }}$ | losc |  |  | $\pm 50$ |  | $\mu \mathrm{A}$ |
|  | LE, FC | $\mathrm{l}_{\text {LE }}$ |  |  | -60 |  | $\mu \mathrm{A}$ |
| High-level Output Current | Except $D_{0}$ and $\mathrm{OSC}_{\text {out }}$ | $\mathrm{V}_{\mathrm{OH}}$ | $V_{c c}=3 \mathrm{~V}$ | 2.2 |  |  | V |
| Low-level Output Current |  | VoL |  |  |  | 0.4 | V |
| N -channel Open Drain Cutoff Current | $D_{0}, \varnothing \mathrm{P}$ | loff | $V_{c c} \leq V_{p} \leq 8 \mathrm{~V}$ |  |  | 1.1 | $\mu \mathrm{A}$ |
| Output Current | Except $D_{0}$ and $\mathrm{OSC}_{\text {out }}$ | $\mathrm{IOH}_{\mathrm{H}}$ |  | -1.0 |  |  | mA |
|  |  | 102 |  | 1.0 |  |  | mA |
| Analog Switch On Resistance |  | $\mathrm{R}_{\text {on }}$ |  |  | 50 |  | $\Omega$ |

NOTE 1: $f_{\mathrm{in}}=1.1 \mathrm{GHz}, \mathrm{OSC}_{\mathbb{I}_{\mathbb{N}}}=12 \mathrm{MHz}, \mathrm{V}_{\mathrm{cc}}=3 \mathrm{~V}$. Inputs are grounded and outputs are open.
NOTE 2: AC coupling. Minimum operating frequency is measured when a capacitor 1000 pF .

## MB1511

## TEST CIRCUIT

TYPICAL APPLICATION EXAMPLE

## MB1511

## PACKAGE DIMENSIONS

## LOW POWER SERIAL INPUT PLL SYNTHESIZER WITH 1.1GHz PRESCALER

The Fujitsu MB1512, utilizing BI-CMOS technology, is a single chip serial input PLL synthesizer with pulse-swallow function.
The MB1512 contains a $1.1 \mathrm{GH}_{\mathrm{z}}$ two modulus prescaler that can select of either $64 / 65$ or $128 / 129$ divide ratio, control signal generator, 16 -bit shift register, 15 -bit latch, programmable reference divider (binary 14 -bit programmable reference counter), 1-bit switch counter, phase comparator with phase conversion function, charge pump, crystal oscillator, 19-bit shift register, 18 -bit latch, programmable divider (binary 7 -bit swallow counter and binary 11 -bit programmable counter) and analog switch to speed up lock up time.
It operates supply voltage of 5 V typ. and achieves very low supply current of 8 mA typ. realized through the use of Fujitsu Advanced Process Technology.

- High operating frequency: $\mathrm{f}_{\mathbb{N} \max }=1.1 \mathrm{GH}_{Z}\left(\mathrm{~V}_{\mathbb{N} \operatorname{MN}}=-10 \mathrm{dBm}\right)$
- Pulse swallow function: $64 / 65$ or 128/129
- Power supply voltage: $\mathrm{V}_{\mathrm{cc}}=4.5$ to 5.5 V
- Low supply current: $I_{c c}=8 \mathrm{~mA}$ typ.
- Serial input 18 -bit programmable divider consisting of: - Binary 7-bit swallow counter: 0 to 127
- Binary 11-bit programmable counter: 16 to 2047
- Serial input 15 -bit programmable reference divider consisting of: - Binary 14-bit programmable reference counter: 8 to 16383 - 1-bit switch counter (SW) sets divide ratio of prescaler
- On-chip analog switch achieves fast lock up time
- 2types of phase detector output - On-chip charge pump (Bipolar type)
- Output for external charge pump
- Wide operating temperature: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
- 20-pin Plastic Shrink Small Outline Package

ABSOLUTE MAXIMUM RATINGS (See NOTE)

| Rating | Symbol | Value | Unit |
| :--- | :--- | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{cc}}$ | -0.5 to +7.0 | V |
|  | $\mathrm{~V}_{\mathrm{p}}$ | $\mathrm{V}_{\mathrm{cc}}$ to 10.0 | V |
| Output Voltage | $\mathrm{V}_{\text {OUT }}$ | -0.5 to $\mathrm{V}_{\mathrm{cc}}+0.5$ | V |
| Open-drain Voltage | $\mathrm{V}_{\text {cop }}$ | -0.5 to 0.8 | V |
| Output Current | $\mathrm{I}_{\text {out }}$ | $\pm 10$ | mA |
| Storage Temperature | $\mathrm{T}_{\mathrm{STG}}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. How ever, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

NOTES: Divide ratio less than 16 is prohibited.
Divide ratio: 16 to 2047
S1 to S7: Swallow counter divide ratio setting bit. ( 0 to 127)
S8 to S18: Programmable counter divide ratio setting bit. (16 to 2047)
C: Control bit (sets as low level).
Data is input from MSB side.

## PULSE SWALLOW FUNCTION

$f_{\mathrm{vco}}=[(\mathrm{PxN})+\mathrm{A}] \times \mathrm{ff}_{\mathrm{osc}}+\mathrm{R}$
$\mathrm{f}_{\mathrm{vco}}$ : Output frequency of external voltage controlled oscillator (VCO)
N: Preset divide ratio of binary 11-bit programmable counter (16 to 2047)
A: Preset divide ratio of binary 7 -bit swallow counter ( $0 \leq A \leq 127, A<N$ )
$\mathrm{f}_{\mathrm{osc}}$ : Output frequency of the external reference frequency oscillator
R: Preset divide ratio of binary 14-bit programmable reference counter (8 to16383)
P: Preset modulus of external dual modulus prescaler (64 or 128)

NOTES: Parenthesis data is used for setting divide ratio of programmable reference divider. On rising edge of clock shifts one bit of data in the shitt register.

## PHASE CHARACTERISTICS

VCO CHARACTERISTICS
FC pin is provided to change phase characteristics of phase comparator. Characteristics of internal charge pump output level ( $\mathrm{D}_{\mathrm{o}}$ ), phase comparator output level ( ${ }_{\varnothing} R$, ${ }_{\varnothing} \mathrm{P}$ ) are reversed depending upon FC pin input level. Also, monitor pin ( $f_{\text {out }}$ ) output level of phase comparator is controlled by FC pin input level. The relation between outputs ( $\mathrm{D}_{0},{ }_{\varnothing} \mathrm{R},{ }_{\varnothing} \mathrm{P}$ ) and FC input level are shown below.

|  | $\mathrm{FC}=\mathrm{H}$ or open |  |  |  | $\mathrm{FC}=\mathrm{L}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | D | ${ }_{8} \mathrm{R}$ | ${ }_{9}{ }^{\text {P }}$ | $\mathrm{f}_{\text {out }}$ | D | ${ }_{9} \mathrm{R}$ | ${ }_{8} \mathrm{P}$ | $\mathrm{f}_{\text {out }}$ |
| $\mathrm{f}_{1} \mathrm{f}_{\mathrm{p}}$ | H | L | L | (f.) | L | H | Z | $\left(f_{p}\right)$ |
| $f_{1}<f_{p}$ | L | H | Z | (f.) | H | L | L | $\left(f_{p}\right)$ |
| $f_{1}=f_{p}$ | Z | L | Z | $\left(\mathrm{f}_{\mathrm{t}}\right.$ ) | Z | L | Z | $\left(f_{p}\right)$ |

Note: $\quad Z=($ High impedance)
Depending upon VCO characteristics, FC pin should be set accordingly:
When VCO characteristics are like (1), FC should be set High or open circuit;
When VCO characteristics are like (2), FC should be set Low.

3

NOTES: Phase difference detection range: $-2 \pi$ to $+2 \pi$
Spike appearance depends on charge pump characteristics. Also, the spike is output in order to diminish dead band. When $f_{t}>f_{p}$ or $f_{t}<f_{p}$, spike might not appear depending upon charge pump characteristics.

## ANALOG SWITCH

ON/OFF of analog switch is controlled by LE input signal. When the analog switch is ON, internal charge pump output ( $\mathrm{D}_{\mathrm{o}}$ ) to be connected to BISW pin. When the analog switch is OFF, BISW pin is set to high-impedance state.
$\mathrm{LE}=\mathrm{H}$ (Changing the divide ratio of internal prescaler) : Analog switch=ON
$\mathrm{LE}=\mathrm{L}$ (Normal operating mode)
: Analog switch=OFF
LPF time constant is decreased in order to insert a analog switch between LPF1 and LPF2 when channel of PLL is changing. Thus, lock up time is decreased, that is, fast lock up time is achieved.

RECOMMENDED OPERATING CONDITIONS

## TYPICAL APPLICATION EXAMPLE

## PACKAGE DIMENSIONS

## MB1513

Serial Input PLL Frequency Synthesizer

The Fujitsu MB1513 is a serial input phase-locked loop (PLL) frequency synthesizer with a pulse-swallow function. A stand-by mode is provided to limit power consumption during intermittent operation.
The MB1513 is configured with a 1.1 GHz dual-modulus prescaler with a $128 / 129$ divide ratio, control signal generator, 16 -bit shift register, 15 -bit latch, programmable reference divider (binary 14-bit programmable reference counter), 1-bit switch counter, phase comparator with phase conversion function, charge pump, crystal oscillator, 19-bit shift register, 18 -bit latch, programmable divider (binary 7-bit swallow counter and binary 11-bit programmable counter), analog switches, and intermittentoperation control circuit that selects the operating or stand-by mode depending on the power-save control input state (PS).
The MB1513 operates from a single +5 V supply. Fujitsu's advanced technology achieves an $\mathrm{I}_{\mathrm{cc}}$ of 8 mA , typical. The stand-by mode current consumption is just $100 \mu \mathrm{~A}$.

- High operating frequency: $\mathrm{f}_{\mathrm{N}}=1.1 \mathrm{GHz}\left(\mathrm{V}_{\mathrm{IN}}=-10 \mathrm{dBm}\right)$
- Pulse-swallow function: high-speed dual-modulus prescaler with 128/129 divide ratio
- Low supply current: $I_{\mathrm{CC}}=8 \mathrm{~mA}$ typ. at 5 V
- Power-saving stand-by mode: $100 \mu \mathrm{~A}$ typ.
- Serial input, 18 -bit programmable divider consisting of: Binary 7-bit swallow counter: 0 to 127
Binary 11-bit programmable counter: 16 to 2,047
- Serial input, 15-bit programmable reference divider consisting of binary 14 -bit programmable reference counter: 8 to 16,383 1-bit switch counter sets prescaler divide ratio
- On-chip analog switch for fast lock-up
- On-chip charge pump minimizes system component count
- Wide operating temperature range: -40 to $+85^{\circ} \mathrm{C}$
- Plastic 20-pin shrink small outline package (Suffix: PFV)

## ABSOLUTE MAXIMUM RATINGS

| Parameter | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| Supply Voltage | $\mathrm{V}_{\mathrm{CC}}$ | -0.5 to +7.0 | V |
|  | $\mathrm{~V}_{\mathrm{P}}$ | $\mathrm{V}_{\mathrm{CC}} \leq \mathrm{V}_{\mathrm{P}} \leq 10.0$ | V |
|  | $\mathrm{V}_{\text {OUT }}$ | -0.5 to $\mathrm{V}_{\mathrm{CC}}+0.5$ | V |
| Output Current | $\mathrm{l}_{\text {OUT }}$ | $\pm 10$ | mA |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

Note: Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operation sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circuitry to protect the inputs against darnage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

## FUNCTION DESCRIPTIONS

## Pulse swallow function

The divide ratio can be calculated using the following equation:
$f_{v c o}=[(M \times N)+A] \times f_{o s c}+R \quad(A<N)$
$f_{\text {vco }}$ : Output frequency of external voltage controlled oscillator (VCO)
N : Preset divide ratio of binary 11-bit programmable counter (16 to 2,047)
A : Preset divide ratio of binary 7 -bit swallow counter ( $0 \leq A \leq 127$ )
$f_{\text {osc }}$ : Output frequency of the reference frequency oscillator
R : Preset divide ratio of binary 14 -bit programmable reference counter ( 8 to 16,383 )
M : Preset divide ratio of prescaler (128)

## Serial data input

Serial data is input using the Data, Clock, and LE pins. Serial data controls the 15 -bit programmable reference divider and 18 -bit programmable divider separately.
Binary serial data is input to the Data pin.
One bit of data is shifted into the internal shift registers on the rising edge of the clock. When the load enable pin is high or open, stored data is latched, depending on the control as follows:

| Control data | Destination of serial data |
| :---: | :--- |
| H | 15 bit latch |
| L | 18 bit latch |

(a) Programmable reference divider ratio

The programmable reference divider consists of a 15-bit latch and a 14 -bit reference counter. The 16 -bit serial data format is shown below:

- 14 -bit programmable reference counter divide ratio

| Divide ratio R | $\frac{5}{14}$ | $\begin{aligned} & 5 \\ & 13 \end{aligned}$ | 5 | S | S 10 | S | 8 | 5 | 5 | 5 | S | 5 | S | S |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| 9 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |
| - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| 16383 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

(Divide ratio $=8$ to 16,383 )
Notes: 1. Divide ratios less than 8 are prohibited.
2. SW: This bit selects the divide ratio of the prescaler SW Low: 128 or 129
(SW must be always be low.)
3. S1 to S14: These bits select the divide ratio of the programmable reference counter ( 8 to 16,383 ).
4. C: Control bit: Set high.
5. Input data MSB first.
(b) Programmable divider divide ratio

The programmable divider consists of a 19 -bit shift register, an 18 -bit latch, a 7 -bit swallow counter, and an 11-bit programmable counter. The 19 -bit serial data format is shown below:

## MB1513

- 7-bit swallow counter divide ratio

| Divide ratio A | $\stackrel{s i}{\psi}$ | 5 | 5 | $\frac{5}{4}$ | S | S | 5 1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| - | - | - | - | - | - | - | - |
| 127 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

(Divide ratio $=0$ to 127)

- 11-bit programmable counter divide ratio

| Divide ratio N | $18$ | S. 17. | S. | S. | 5 14 | 13 | S. | S 11 | 5 | S. | 5 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 16 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| 17 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |
| - | - | - | - | - | - | - | - | - | - | - | - |
| 2047 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

(Divide ratio $=16$ to 2,047 )

Notes: 1. Divide ratios less than 16 are prohibited for 11-bit programmable counter.
2. S 1 to S7: These bits select the divide ratio of swallow counter ( 0 to 127).
3. S8 to S18: These bits select the divide ratio of programmable counter (16 to 2,047 ).
4. C: Control bit: (Set low)
5. Input data MSB first.

## Serial data input timing

- $t_{1}(\geq 1 \mu \mathrm{~s})$ : Data setup time $\quad t_{2}(\geq 1 \mu \mathrm{~s})$ : Data hold time $t_{3}(\geq 1 \mu \mathrm{~s})$ : Clock pulse width
$t_{4}(\geq 1 \mu \mathrm{~s})$ : LE setup time to the rising edge of last clock
$\mathrm{t}_{5}(\geq 1 \mu \mathrm{~s})$ : LE pulse width

*1: Bits enclosed in parentheses are used when the divide ratio of the programmable reference divider is selected.
Note: One bit of data is shifted into the shift register on the rising edge of the clock.

## Intermittent operation

Intermittent operation limits power consumption by shutting down or starting the internal circuits according to its necessity. If device operation resumes uncontrolled, the error signal output from the phase comparator may exceed the limit due to an undefined phase relationship between the reference frequency ( $f_{R}$ ) and the comparison frequency ( $f_{p}$ ) and frequency lock is lost.
To prevent this, an intermittent operation control circuit is provided to decrease the variation in the locking frequency by forcibly correcting phase of both frequencies to limit the error signal output. This is done by the PS control circuit. If PS is set high, the circuit enters the operating mode. If PS is set low, operation stops and the device enters the stand-by mode. Each mode is explained below:

- Operating mode (PS = High)

All circuits are operating, and PLL operation is normal.

- Stand-by mode (PS = Low)

Circuits that do not affect operation are powered-down to save power.
The current in the power save state is typically $100 \mu \mathrm{~A}$.
At this time, the levels of $D_{0}$ and LD are the same as when the PLL is locked.
Since $D_{0}$ is placed in the high-impedance state and the input voltage of the voltage-controlled oscillator (VCO) is set to the voltage in the operating mode (when locked) by the time constant of the low-pass filter, the frequency output from the VCO (f vco) is kept at the locking frequency.

The operating and stand-by modes alternate repeatedly. This intermittent operation limits the error signal by forcibly correcting the phase of the reference and comparison frequencies to limit power consumption.
The device must be set in the stand-by mode ( $\mathrm{PS}=\mathrm{low}$ ) when it is powered up.

## Relationship between FC input and phase characteristics

The FC pin controls the phase characteristics of the phase comparator. The internal charge pump output level ( $\mathrm{D}_{0}$ ) is reversed depending on the FC pin input level. The relationship between the FC input level and $D_{o}$ is shown below:

|  | \% FC = High or open \% | ¢ FC=Low |
| :---: | :---: | :---: |
| $\mathrm{f}_{\mathrm{R}}>\mathrm{f}_{\mathrm{P}}$ | H | L |
| $\mathrm{f}_{\mathrm{R}}<\mathrm{f}_{\mathrm{P}}$ | L | H |
| $f_{\text {R }}=\mathrm{f}_{\mathrm{P}}$ | Z (*1) | Z(*1) |

## *1: High impedance

When designing a synthesizer, the FC pin setting depends on the VCO characteristics.
*: When the VCO characteristics are similar to (1), set FC high or open.
*: When the VCO characteristics are similar to (2) set FC low.

## MB1513

Phase comparator output waveform (FC= High)

Notes: 1. Phase difference detection range: $-2 \pi$ to $+2 \pi$
2. Spike appearance depends on the charge pump characteristics. The spike is output to diminish dead band.
3. When $f_{R}>f_{p}$ or $f_{R}<f_{p}$, spike might not appear, depending on the charge pump characteristics.
4. LD is low when the phase difference is two or more. LD is high when the phase difference is two or less for three or more continuous cycles (when $\mathrm{f}_{\mathrm{oscin}}=12.8 \mathrm{MHz}, \mathrm{tw}=625$ to $1,250 \mathrm{~ns}$ ).

## Analog switch

The LE signal turns the analog switch on or off. When the analog switch is turned on, the charge pump output ( $\mathrm{D}_{0}$ ) is output through the BiSW pin. When it is turned off, the BiSW pin is in the high-impedance state.

When $\mathrm{LE}=$ high (when the divide ratio of the internal divider is changed): Analog switch $=0$ n
When LE = low (normal operating mode): Analog switch = off
The LPF time constant can be decreased by inserting an analog switch between LPF1 and LPF2. This decreases the lock-up time when the PLL channel is changed.

## RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol |  | .. Value, थ., | Max | Unit\% |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Supply voltage | $\mathrm{V}_{\mathrm{cc}}$ | 4.5 | 5.0 | 5.5 | V |
|  | $V_{p}$ | $\mathrm{V}_{\mathrm{cc}} \leq \mathrm{V}_{\mathrm{p}} \leq 8.0$ |  |  | V |
| Input voltage | V | GND | - | $V_{c c}$ | V |
| Operating temperature | $\mathrm{T}_{\text {A }}$ | -40 | - | +85 | ${ }^{\circ} \mathrm{C}$ |

Notes: To protect against damage by electrostatic discharge, note the following handling precautions:

- Store and transport devices in conductive containers.
- Use properly grounded workstations, tools, and equipment.
- Turn off power before inserting or removing this device from a socket.
- When handling PC boards on which devices are mounted, protect leads of the device using conductive sheet.

ELECTRICAL CHARACTERISTICS

## TEST CIRCUIT

 (FOR MEASURING PRESCALER INPUT SENSITIVITY)

## APPLICATION EXAMPLE

## PACKAGE DIMENSIONS

## MB1518

SERIAL INPUT PLL FREQUENCY SYNTHESIZER

## SERIAL INPUT PLL FREQUENCY SYNTHESIZER ON CHIP 2.5GHz PRESCALER

The Fujitsu MB1518 on chip 2.5 GHz dual modulus prescaler is a serial input PLL (Phase Locked Loop) frequency synthesizer with pulse swallow function. It is well suited for BS tuner, CATV system applications.

It operates supply voltage of 5.0 V typ. and dissipates 16 mA typ. of current realized through the use of Fujitsu's unique U-ESBIC Bi-CMOS technology.

- Power supply voltage: $\mathrm{V}_{c c}=4.5$ to 5.5 V
- High operating frequency: $\mathrm{f}_{\mathrm{n}}=2.5 \mathrm{GHz}\left(\mathrm{V}_{\mathrm{in}}=-4 \mathrm{dBm}\right)$
- 2.5 GHz dual modulus prescaler: $\mathrm{P}=512 / 528$
- Low power supply current: $\mathrm{Icc}=16 \mathrm{~mA}$ typ.
- Programmable reference divider : $\mathrm{R}=512$
- Programmable divider consisting of:

Binary 5 -bit swallow counter ( $\mathrm{A}=0$ to 31 )
Binary 9-bit programmable counter ( $\mathrm{N}=32$ to 511)

- Wide operating temperature: $T_{A}=-40$ to $+85^{\circ} \mathrm{C}$
- Plastic 16 -pin flat package (Suffix: -PF)

## ABSOLUTE MAXIMUM RATINGS (see NOTE)

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

 damage due to high static vohages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

## PIN DESCRIPTIONS

$\left.\begin{array}{|c|l|l|l|l|}\hline \text { Pin No. } & \text { Pin Name }\end{array}\right)$

## FUNCTIONAL DESCRIPTIONS

divide ratio setting
Divide ratio can be set using the following equation:
$f_{\text {veo }}=\{(P \times N)+(16 \times A)\} \times f_{\text {osc }}+R$
fvoo: Output frequency of an external voltage controlled oscillator (VCO)
P: Preset divide ratio of an internal dual modulus prescaler (512)
N: Preset divide ratio of binary 9-bit programmable counter ( 32 to 511 )
A: Preset divide ratio of binary 5 -bit swallow counter ( 0 to 31)
fosc: Reference oscillator frequency
R: Preset divide ratio of reference counter (512)

## SERIAL DATA I NPUT

On rising edge of the clock shifts one bit of the data into the shift register.
When the load enable is high, the data stored in the shift register is transferred to the latch.
14 bit of serial data formit is shown below.

5-bit swallow counter divide ratio (A1 to A5)

| Divide ratio <br> A | A | A | A | A | A |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 0 | 0 | 0 | 0 | 1 |
| 2 | 0 | 0 | 0 | 1 | 0 |
| $:$ | $:$ | $:$ | $:$ | $:$ | $:$ |
| 31 | 1 | 1 | 1 | 1 | 1 |

9-bit programmable counter divide ratio ( N 1 to N 9 )

| Divide ratio | N | N | N | N | N | N | N | N | N |

## SERIAL DATA INPUT TIMING

Note: On rising edge of the clock shifts one bit of the data into the shift register. When LE is high, the data stored the shift register is transferred into the latch.

## PHASE DETECTOR CHARACTERISTICS

FC pin selects the phase of the phase detector. Phase characteristics (chage pump output) can be reversed depending upon the FC pin input level. Monitor pin (fout) output level is selected by the FC pin input level as well.

|  | FC = H (or open) |  | FC = L |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $D_{01}, D_{02}$ | fout | $\mathrm{D}_{01}, \mathrm{D}_{0}$ | fout |
| $\mathrm{fr}>\mathrm{fp}$ | H | Outputs programmable reference divider output frequency fr. | L | Outputs programmable divider output frequency fp . |
| $\mathrm{fr}=\mathrm{fp}$ | Z |  | Z |  |
| $\mathrm{fr}<\mathrm{tp}$ | L |  | H |  |

Note:
Z: High-impedance
Depending upon the VCO polarity, FC pin should be set accordingly.

When VCO polarity is like 1 , FC should be set high or open. When VCO polarity is like 2 , FC should be set low.

## PHASE DETECTOR WAVEFORM

Note: Phase difference detection range : $-2 \pi$ to $+2 \pi$
Spike shape depends on the charge pump characteristics.
The spike is output to diminish the dead band.

## TEST CIRCUIT (FOR PRESCALER INPUT SENSITIVITY)

## RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Min | Value | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Power Supply Voltage | $V_{c c}$ | 4.5 | 5.0 | 5.5 | V |
| Input Voltage | $V_{1}$ | GND | - | Vcc | V |
| Operating Temperature | $\mathrm{T}_{\mathrm{A}}$ | -40 | - | +85 | ${ }^{\circ} \mathrm{C}$ |

## HANDLING PRECAUTIONS

- This device should be transported and stored in anti-static containers.
- This is a static-sensitive device; take proper anti-ESD precautions. Ensure that personnel and equipment are properly grounded. Cover workbenches with grounded conductive mats.
- Always turn the power supply off before inserting or removing the device from its socket.
- Protect leads with a conductive sheet when handling or transporting PC boards with devices.

## ELECTRICAL CHARACTERISTICS

[^33]
## MB1518 APPLICATION CIRCUIT

## MB1518

## PACKAGE DIMENSIONS

MB1519
DUAL SERIAL INPUT PLL FREQUENCY SYNTHESIZER

## DUAL SERIAL INPUT PLL FREQUENCY SYNTHESIZER WITH 600MHz PRESCALER

The Fujitsu MB1519 is a 600 MHz dual serial input PLL (Phase Locked) frequency synthesizer designed for cellular telephone and cordless telephone applications.

The MB1519 has two PLL circuits on a single chip: one for transmit and the other for reception. Separate power supply pins are provided for the transmit and reception PLL circuits. Transmit PLL contains a low sensitivity charge pump for ease of modulation and reception PLL contains a high sensitivity charge pump for faster lock up time.

600 MHz dual modulus prescalers are on chip and enables a pulse swallow function.
It operates supply voltage of 3.0 V typ. and dissipates 11 mA typ. of current realized through the use of Fuilitsu's unique U-ESBIC Bi-CMOS technology.

- High operating frequency: $\mathrm{fin}=600 \mathrm{MHz}$
- Low power supply voltage: $V_{c c}=2.7$ to 5.5 V
- Low power supply current: Icc = 11mA typ, @3V.
- Wide operating temperature: $T_{A}=-40$ to $85^{\circ} \mathrm{C}$
- Two charge pumps

Low sensitivity charge pump for transmit
High sensitivity charge pump for reception

- Plastic 20-pin dual in line package (Suffix: -P) Plastic 20-pin flat package (Suffix: -PF)

## ABSOLUTE MAXIMUM RATINGS (see NOTE)

| Rating | Symbol | Value | Unit |
| :---: | :---: | :---: | :---: |
| Power Supply Voltage | V cc | -0.5 to 7.0 | V |
|  | $V_{p}$ | Vcc to 10.0 |  |
| Output Voltage | Vout | -0.5 to $\mathrm{V}_{\text {cc }}+0.5$ | V |
| Output Current | lout | $\pm 10$ | mA |
| Storage Temperature | Tstg | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

## NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

## BLOCK DESCRIPTIONS

## TRANSMIT/RECEPTION BLOCK

- 20-bit latch
- Programmable divider consisting of: Binary 7-bit swallow counter (Divide ratio: 0 to 127)
Binary 11-bit programmable counter (Divide ratio: 16 to 2047)
- Phase detector with phase polarity change function
- 600 MHz dual modulus prescaler (Divide ratio: $64 / 65$ )
- Charge pump

## COMMON BLOCK

- 23-bit shift register
- Programmable divider consisting of:

Reference counter (Divide ratio: 512, 1024)
(Divide frequency $=25 \mathrm{kHz}, 12.5 \mathrm{kHz}$ (Crystal oscillator frequency $=12.8 \mathrm{MHz}$ )

- Crystal oscillator
- ip monitor output selector
- Latch selector
- Schmitt circuits
- Analog switches

## PIN DESCRIPTIONS

## PIN DESCRIPTIONS (Continued)

## FUNCTIONAL DESCRIPTIONS

The divide ratio can be calculated using the following equation:
$f_{v c o}=\{(M \times N)+A\} \times f_{o s c} \div R \quad(A<N)$
fvco: Output frequency of external voltage controlled ocillator (VCO)
M: Preset divide ratio of dual modulus prescaler (64)
N: Preset divide ratio of binary 11-bit programmable counter (16 to 2047)
A: Preset divide ratio of binary 7 -bit swallow counter ( $0 \leq A \leq 127$ )
fosc: Reference oscillator frequency
R: Preset divide ratio of reference counter (512 or 1024)

## FUNCTIONAL DESCRIPTIONS

## SERIAL DATA INPUT

Serial data is input using three pins, Data pin, Clock pin, and LE pin. Programmable divider of transmit section and programmable divider of reception section are controlled individually.
Serial data of binary data is input into Data pin.
On rising edge of clock shifts one bit of serial data into the shift register. When load enable signal is high, the data stored in the shift register is transferred to either the latch of transmit section or the latch of reception section depending upon the control bit data setting

| Control data | Destination of serial data |
| :---: | :--- |
| $H$ | Latch of transmit section |
| L | Latch of reception section |

SHIFT REGISTER CONFIGURATION

N1 to N11 : Divide ratio of the programmable counter setting bit (16 to 2047)
A1 to A7 : Divide ratio of the swallow counter setting bit ( 0 to 127)
FC : Phase control bit of the phase detector
DMY : Dummy bit (sets to low)
FP : Output of the programmable divider control bit ( fp 1 or fp 2 )
REF : Divide ratio of the reference counter setting bit (512 to 1024)
CNT : Control bit

## SERIAL DATA INPUT TIMING

On rising edge of the clock shifts one bit of the data into the shift register.

| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ | $\cdot$ |
| 127 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Note: Divide ratio (A) range $=0$ to 127

DMY : DUMMY BIT INPUT
This bit is set to low in operation.
REF : DIVIDE RATIO (R) OF THE REFERENCE COUNTER SETTING BIT $H=512(\mathrm{fr}=25.0 \mathrm{kHz})$
$\mathrm{L}=1024(\mathrm{fr}=12.5 \mathrm{kHz}$ )
FP : OUTPUT OF THE PROGRAMMABLE DIVIDER SETTING BIT
$H=f p$ pin ( 15 pin ) outputs programmable divider output frequency ( fp 1 ) of transmit section. $L=f p$ pin ( 15 pin ) outputs programmable divider output frequency ( fp 2 ) of reception section.

FC : PHASE CONTROL BIT OF THE PHASE DETECTOR Output of charge pump is selected by FC pin.

|  | $F C=H$ | $F C=L$ |
| :--- | :---: | :---: |
| $\mathrm{fr}>\mathrm{fp}$ | $H$ | $L$ |
| $\mathrm{fr}=\mathrm{fp}$ | $Z$ | $Z$ |
| $\mathrm{fr}<\mathrm{fp}$ | L | $H$ |
| VCO Polarity | $(1)$ | $(2)$ |

Note: $Z=$ High-impedance
Depending upon the VCO poratity, FC bit should be set.

Vco Output | Frequency |
| :---: |
| VCO input Voltage $\longrightarrow$ (2) |

## PHASE DETECTOR OUTPUT WAVEFORM

Note: - Phase difference detection range $=-2 \pi$ to $+2 \pi$

- LD output becomes low when phase difference is tw or more.

LD output becomes high when phase difference less than tw is reperated 3 times or more.
(e. g. $\mathrm{tw}=625$ to 1250 ns , foscin $=12.8 \mathrm{MHz}$ )

- Spike apperance depends on the charge pump characteristics. The spike is output to diminish the dead band.
- When $\mathrm{fr}>\mathrm{fp}$ or $\mathrm{fr}<\mathrm{fp}$, spike might not generate depending up the VCO characteristics.

## ANALOG SWITCH

ON/OFF of the analog switch is controlled by the combination of the control data and LE signal. When the analog switch is ON, BS1, BS2 pin output the charge pump output ( $\mathrm{D}_{01}, \mathrm{D}_{02}$ ). When analog switch is OFF, BS pin is set to high impedance.

|  | Control data $=H$ <br> Divide ratio of transmit section is set |  | Control data $=L$ <br> Divide ratio of reception section is set |  |
| :--- | :---: | :---: | :---: | :---: |
|  | $L E=H$ | $L E=L$ | $L E=H$ | $L E=L$ |
| Analog switch of transmit section | ON | OFF | OFF | OFF |
| Analog switch of reception section | OFF | OFF | ON | OFF |

When a analog switch is inserted between LP1 and LP2, faster lock up time is achieved to reduce LPF time constant during PLL channel switching.

## RECOMMENDED OPERATING CONDITIONS

## HANDLING PRECAUTIONS

- This device should be transported and stored in anti-static containers.
- This is a static-sensitive device; take proper anti-ESD precautions. Ensure that personnel and equipment are properly grounded. Cover workbenches with grounded conductive mats.
- Always turn the power supply off before inserting or removing the device from its socket.
- Protect leads with a conductive sheet when handling or transporting PC boards with devices.

## ELECTRICAL CHARACTERISTICS

Single-Chip VCOs/Prescalers - At a Glance

| Page | Device | Maximum <br> Frequency | Divide Ratio |  | $V_{c c}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4-3 | MB551 | 1 GHz | 128 or 129 | 16 mA | 5 V (typ) |
| NOTE: | The MB551 is available in an 8-pin Plastic FPT package. |  |  |  |  |

MB551

## 1 GHz Dual Modulus Prescaler

The Fujitsu MB551 is a dual modulus prescaler with low supply current and a VCO (voltage controlled oscillator). It is used in a frequency synthesizer in the 1 GHz region.

The MB551 contains a Colpitts oscillator with a grounded base capacitor, an open-collector output buffer amplifier, a prescaler interface circuit, and a dual modulus prescaler that can select divide ratios of 128 or 129.

The VCO oscillator section can be constructed with external components such as a capacitor, dieletric oscillator (resonator), and variable capacitor.

The on-chip VCO and prescaler are connected on internal control circuit. Thus, the influence caused by carrier to noise by deviation of prescaler input load is suppressed.

The MB551 operates on a supply voltage of 5 V typical and has a 16 mA supply current typical.

- Oscillator frequency: 1 GHz max.
- Low supply current: $\mathrm{l}_{\mathrm{cc}}=16 \mathrm{~mA}$ typ.
- Oscillator output voltage: 0 dBm typ.
- Carrier to noise ratio:

70 dB typ. $(\Delta \mathrm{f}=50 \mathrm{kHz}$,
$B W=15 \mathrm{kHz}$
65 dB typ. $(\Delta \mathrm{f}=25 \mathrm{kHz}$, $B W=15 \mathrm{kHz}$

- Pulse swallow method: Divide ratio of 128 or 129
- Prescaler output contains termination circuit: V1 $=1.6 \mathrm{Vp}-\mathrm{p}$ typ.
- Signal to noise ratio: 45 dB typ. (BW = 0.3 to $3 \mathrm{kHz}, 3 \mathrm{kHz}$ Dev, 1 kHz tone)
- Stable oscillator output
- Supply voltage dependence: $\pm 200 \mathrm{kHz} / \mathrm{V}$ typ.
- Frequency stability: $35 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ (Referenced to $25^{\circ} \mathrm{C}$ )
- Load regulation: $\pm 2 \mathrm{MHz}$ VSWR $=2$ typ.
- Plastic 8-pin flat package: Suffix -PF

ABSOLUTE MAXIMUM RATINGS

| Parameter | Symbol | Ratings | Unit |
| :---: | :---: | :---: | :---: |
| Supply Voltage | $V_{C C}$ | -0.5 to +7.0 | V |
| Oscillator Transistor Base, Emitter Input Voltage | $\begin{aligned} & V_{B} \\ & V_{E} \end{aligned}$ | DC voltage is not input from outside. |  |
| Input Voltage for MC and OUT (3, 4 pins) | $V_{P 1}$ | -0.5 to $\mathrm{V}_{\mathrm{cc}}+0.5$ | V |
| Input Voltage for fivoo and C $(1,6$ pins $)$ | $\mathrm{V}_{\mathrm{P} 2}$ | $\mathrm{V}_{\mathrm{CC}} \leq \mathrm{V}_{\mathrm{P} 2}<+7.0$ | V |
| Input Current | $\mathrm{I}_{\mathrm{p}}$ | $\pm 10$ | mA |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

Note: Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operation sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Piezoelectric Devices - At a Glance

| Page | Device | Description | Frequency <br> Range | Package <br> Option |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $5-3$ | F5CB Series | SAW-Bandpass Filter | $700-1000 \mathrm{MHz}$ | 8-pin | LCC |
| $5-17$ | M2 Series | VCO (D100) | $4-30 \mathrm{MHz}$ | 14-pin | DIP |
| $5-25$ | M2 Series | VCO (D300) | $4-30 \mathrm{MHz}$ | 16-pin | SIP |
| $5-35$ | M3 Series | VCO (D001) | $50-300 \mathrm{MHz}$ | 16-pin | DIP |
| $5-39$ | M3 Series | VCO (D101) | $50-300 \mathrm{MHz}$ | 14-pin | DIP | 

## F5CB Series <br> Piezoelectric Filters

## SAW-BPF, 700 MHz to 1000 MHz

The F5 series are wide bandpass filters for use in the 700 MHz to 1000 MHz range. The F5 series uses a single lithium tantalate piezoelectric crystal $\left(\mathrm{LiTaO}_{3}\right)$ that has a high electromechanical coupling coefficient. The $\mathrm{LiTaO}_{3}$ also provides wide bandwidths and exceptional stability. Fujitsu's exclusive mounting technique makes the F5 series very compact and surface mountable. The F5 is suitable for use in handheld phones.

- Considerably smaller and lighter than the ceramic filter (volume and weight are reduced by $1 / 30$ )
- Surface mount package (SMT)
- Wide variety of bandwidths
- Low insertion loss
- High power rating: 0.2 W guaranteed
- 8-pad ceramic package (LCC)

## ABSOLUTE MAXIMUM RATINGS

| Parameter | Symbol | Ratings | Unit |
| :--- | :--- | :---: | :---: |
| Operating Temperature | $\mathrm{T}_{\mathrm{a}}$ | -30 to 70 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ | -40 to 100 | ${ }^{\circ} \mathrm{C}$ |
| Maximum Input Level | $\mathrm{P}_{\text {IN }}$ | 200 | mW |
| Frequency Range |  | 700 to 1000 | MHz |

## RECOMMENDED OPERATING CONDITIONS

## 3. Tape Dimension

The M2 series (D100) voltage controlled oscillators (VCO) operate in the frequency range of 4 to 30 MHz .
The M2 series VCOs use a single $\mathrm{LiTaO}_{3}$ (lithium tantalate) piezoelectric crystal with a high electromechanical coupling coefficient for stable and wide variable frequency width.

- Wider variable frequency width than quartz crystals: $\pm 0.2 \%$ or more
- High stability ( 100 times more stable than LC configuration)
- Excellent carrier noise ratio
- Hermetically sealed in a metal case for high reliability in severe environmental conditions
- Compatible with 14 -pin DIP IC packages

## ABSOLUTE MAXIMUM RATINGS

| Parameter | Symbol | Ratings | Unit |
| :--- | :---: | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{CC}}$ | -0.5 to 7.0 | V |
| Input Control Voltage | $\mathrm{V}_{\mathbb{I}}$ | -0.5 to 10 | V |
| Output Voltage | $\mathrm{V}_{\mathrm{OUT}}$ | -0.5 to $\mathrm{V}_{\mathrm{CC}}+0.5$ | V |
| Output Current | $\mathrm{l}_{\text {OUT }}$ | $\pm 25$ | mA |
| Operating Temperature | $\mathrm{T}_{\mathrm{a}}$ | -30 to +85 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ | -40 to +100 | ${ }^{\circ} \mathrm{C}$ |
| Oscillation Frequency Range |  | 4 to 30 | MHz |

## RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Ratings | Unit |
| :--- | :---: | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{CC}}$ | 4.75 to 5.25 | V |
| Input Control Voltage | $\mathrm{V}_{\mathbb{I}}$ | 0.5 to 5.0 | V |
| Operating Temperature | $\mathrm{T}_{\mathrm{a}}$ | -30 to +85 | ${ }^{\circ} \mathrm{C}$ |

Note: Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operation sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

| (Bottom View) |  |  |
| :---: | :---: | :---: |
|  | $1$ $\bigcirc 14$ | 70 80 |
| Terminal No. | Terminal Name | Description |
| 1 | $\mathrm{V}_{\text {IN } 1}$ | Control Voltage Input Terminal |
| 7 | GND | Grounding Terminal |
| 8 | $V_{\text {OUT }}$ | Oscillation Output Terminal |
| 14 | $\mathrm{V}_{\mathrm{cc}}$ | Power Supply Terminal |

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

## M2 Series (D300) Piezoelectric Device (Voltage Controlled Oscillator)

The M2 series (D300) voltage controlled oscillators (VCO) operate in the frequency range of 4 to 30 MHz . The M 2 series VCOs use a single $\mathrm{LiTaO}_{3}$ (lithium tantalate) piezoelectric crystal with a high electromechanical coupling coefficient for stable and wide variable frequency width.
This module incorporates three VCOs for the three sampling frequencies used in digital audio equipment ( $32,44.1$, and 48 kHz ). The frequencies are selected by external signals.

- Clock replay in response to three sampling frequencies (32, 44.1 and 48 kHz ), is contained in one module
- Wider variable frequency width than in quartz crystals: $\pm 0.1 \%$ or more
- Excellent stability for signal noise reproduced by high quality' of the lithium tantalate
- 100 times more stable than VCOs of LC and TTL-IC configuration
- Three sampling frequencies controlled at CMOS logic level
- SIP packaged for high-density mounting of devices
- Compatible with the Electronic Industry Association of Japan (EIAJ) digital //O Standard Type II (consumer digital audio equipment), Level (high-resolution mode) and Level II (standard resolution mode)

ABSOLUTE MAXIMUM RATINGS

| Parameter | Symbol | Ratings | Unit |
| :--- | :--- | :--- | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{CC}}$ | -0.5 to 7.0 | V |
| Input Control Voltage | $\mathrm{V}_{\text {IN }}$ | -0.5 to 10 | V |
| Output Voltage | $\mathrm{V}_{\text {OUT }}$ | -0.5 to $\mathrm{V}_{\mathrm{CC}}+0.5$ | V |
| Output Current | $\mathrm{I}_{\text {OUT }}$ | $\pm 25$ | mA |
| Operating Temperature | $\mathrm{T}_{\mathrm{a}}$ | -30 to +85 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ | -40 to +100 | ${ }^{\circ} \mathrm{C}$ |

Negative value of current means that the current flows from the device.

## RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Ratings | Unit |
| :--- | :--- | :--- | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{CC}}$ | 4.75 to 5.25 | V |
| Input Control Voltage | $\mathrm{V}_{\mathrm{IN}}$ | 0.5 to 5.0 | V |
| Operating Temperature | $\mathrm{T}_{\mathrm{a}}$ | -20 to +70 | ${ }^{\circ} \mathrm{C}$ |

Note: Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operation sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

[^39]

1 The GND terminal and the $V_{c c}$ terminals are not connected inside the module. So be sure to route them on the PC board.
2 The F1 and FO bits switch the oscillation frequencies. The F1 and FO bits are equivalent to bits 25 and 24 of the EIAJ Digital I/O Standard.

[^40]
## STANDARD COMBINATION OF FREQUENCIES

## MARKING

DIMENSIONS

DATA SHEET

## M3 Series (D001) Piezoelectric Device (Voltage Controlled Oscillator)

The M3 series voltage controlled oscillators (VCO) operate in the frequency range of 50 to 300 MHz . The M 3 series VCOs use a single $\mathrm{LiTaO}_{3}$ (lithium tantalate) piezoelectric crystal with a high electromechanical coupling coefficient and a SAW resonator that has an origInal configuration. The M3 series VCOs oscillate directly in the VHF band up to 300 MHz , and have a wide variable frequency width and high temperature stability.

- Direct oscillation at high frequencies: 50 to 300 MHz
- Wide variable frequency width: $800 \mathrm{ppm} / \mathrm{V}$ minimum ( 0.5 to 4.5 V )
- Superb temperature characteristics: Within $\pm 200 \mathrm{ppm}\left(0\right.$ to $\left.60^{\circ} \mathrm{C}\right)$
- High-precision oscillation frequency, ready for use without adjustment
- High reliability due to hermetically sealed package
- High carrier noise ratio: -90 dB or less ( 12.5 kHz detuning, 8 kHz band)
- Compact size: Compatible with 16-pin DIP IC packages
- Frequency offset by built-in offset terminal
- Three types of standard frequencies available

## ABSOLUTE MAXIMUM RATINGS

| Parameter | Symbol | Ratings | Unit |
| :--- | :--- | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{CC}}$ | -0.5 to 7.0 | V |

## PACKAGE DIMENSIONS

DATA SHEET

## M3 Series (D101) <br> Piezoelectric Device

## Modulator, 50 MHz to 300 MHz

These piezoelectric modulators feature direct oscillators ( 50 MHz to 300 MHz ). The piezoelectric modulator uses a lithium tantalate piezoelectric single crystal $\left(\mathrm{LiTaO}_{3}\right)$ with a high electromechanical coupling coefficient. The piezoelectric modulator employs an exclusive SAW resonator. The piezoelectric modulator can be used in direct modulation applications needing high modulation sensitivity and a high signal-to-noise ratio in the VHF band (up to 300 MHz ).

- High frequency direct modulation:

50 to 300 MHz

- High modulation sensitivity:
$800 \mathrm{ppm} / \mathrm{V}$ min. ( 0.5 to 4.5 V )
- Excellent modulation distortion ratio: 40 dB max. ( 1 kHz to 1.75 kHz dev .)
- Excellent signal noise ratio: -50 dB max.
- Excellent temperature characteristic: $\pm 200 \mathrm{ppm} \max .\left(-20\right.$ to $\left.70^{\circ}\right)$
- Highly reliable hermetically sealed package
- Compatible with 14-pin DIP IC packages

## MB86460A

MODEM WITH INTERNAL VOICE-BAND FILTERS

## CMOS MODEM CIRCUIT WITH INTERNAL VOICE-BAND

 FILTERS FOR CORDLESS TELEPHONESThe MB86460 MSK (Minimum Shift Keying) modem IC contains a 1200-band MSK modem and voice-band filters.
The voice-band filter consists of transmit and receive bandpass filters, pre-emphasis/de-emphasis, and splatter filters arranged in an SCF configuration. In addition, a limiter circuit is included.
The MB86460 operates at low voltage ( 3.0 to 5.5 V ) and is suitable for cordless telephone applications.

- On-chip voice-band filters and 1200-band MSK modem
- Low supply voltage requirements ( 3.0 to 5.5 V )
- Wide operating temperature range ( $\mathrm{T}_{\mathrm{A}}=-20^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$ )
- Standby function for low power consumption
- MSK frame detection
- Frame synchronization selectable
- Full-duplex MSK modem
- Transmit/receive muting
- Externally adjustable receive and transmit gain
- Externally adjustable limiter level
- Carrier/interference detection circuit
- The on-chip oscillator operates with 3.6864 or 3.456 MHz crystal (selectable).
- The on-chip serial interface reduces the number of signal lines
- CMOS I/O interface

## PIN DESCRIPTION

| $\cdots$ | Erino. | Pinames |  |
| :---: | :---: | :---: | :---: |
| Power supply pins | 19 | $V_{\text {DDA }}$ | Analog supply voltage ( 3.0 to 5.5 V ). |
|  | 40 | DG | Digital ground |
|  | 41 | AG | Analog ground |
|  | 43 | $V_{\text {DDD }}$ | Digital supply voltage ( 3.0 V to 5.5 V ). $\mathrm{V}_{\text {DDD }}=\mathrm{V}_{\text {DDA }}$ is recommended. |
| Input pins | 2 | COMPout | Input from external compressor |
|  | 5 | $\mathrm{AF}_{\text {IN1 }}$ | Inverting input of the input transmit amplifier The transmit input amplifier gain is adjusted by two external resistors, R1 and R2. R1 is connected to this pin and R2 connected between this pin and pin 4 (AFiñ). |
|  | 7 | $1 / 2 \mathrm{~V}_{\text {din }}$ | Input to the $1 / 2 V_{D D}$ generator. A $1 \mu \mathrm{~F}$ bypass capacitor is usually connected from this pin to analog ground (pin 41) |
|  | 10 | DEM ${ }_{1}$ | Inverting input of the receive input amplifier <br> The receiver input amplifier gain is adjusted by two external resistors, R3 and R4. R3 is connected to this pin and R4 is connected between this pin and pin 11 (DEM 2 ). |
|  | 13 | EXPout | Input from external expander |
|  | 15 | RAMPis | Inverting input of the receive summing amplifier |
|  | 21 | DET ${ }_{\text {IN }}$ | Reference voltage input to the tone detector. With this pin open, the reference voltage level is $1 / 100 \mathrm{~V}_{\mathrm{DD}}$. |
|  | 23 | $\overline{T E S T}$ | Input for pattern check mode selection <br> When TEST is low, an internal pattern is loaded into the shift register on the rising edge of DCK. When TEST is high, data at DIN is loaded into the shift register ans data in the shift register is shifted out to Dout on the rising edge of DCK. This pin is pulled by up a high resistance. |
|  | 24 | F/M | Mode selection input. <br> When $F / \bar{M}$ is low, the mode selection pattern is set and checked. When $F / \bar{M}$ is high, the frame synchronization pattern is set and checked. |
|  | 26 | DSTB | Input serial signal strobe. An input serial signal is validated on the rising edge of DSTB. |
|  | 27 | DCK | Input serial signal clock. Serial data at $D_{\text {w }}$ is read in on the rising edge of DCK. (When TEST is high) |
|  | 28 | $\mathrm{D}_{\text {IN }}$ | Input for serial signals from the microprocessor |
|  | 29 | FCL | Frame detection latch clear input. When FCL is low, FDout goes low. This pin is pulled up by a high resistance. FCL is pulled low to pull FDout low after the frame synchronization pattern is set. |
|  | 33 | SD | MSK modem data input |
|  | 35 | SEND | Mutes transmit data to the MSK modem. A high on the SEND line enables data transmission. |
|  | 36 | RST | Reset input. A low on RST resets all circuits. This pin is pulled up by a high resistance. |

| \% \% \% , | Pin No. | Pin name. | Function |
| :---: | :---: | :---: | :---: |
| Input pins | 37 | $\mathrm{OSC}_{\text {IN }}$ | Internal oscillator inputs. <br> A 3.6864 or 3.456 MHz crystal is connected between $\mathrm{OSC}_{\mathbb{I N}}$ and OSC $_{\text {our. }}$ |
|  | 38 | OSCour |  |
|  | 45 | LIM | Limiter level adjustment input. The limiter level is set to $0.05 \mathrm{~V}_{\mathrm{DD}}(\mathrm{V})$ when this pin is left open. |
|  | 47 | SAMPin | Inverting input of the transmit summing amplifier |
| Input pin | 8 | $\mathrm{CC}_{4}$ | For demodulator external coupling capacitor. A $0.1 \mu \mathrm{~F}$ capacitor is connected between $\mathrm{CC}_{3}$ and $\mathrm{CC}_{4}$. |
| Output pin | 9 | $\mathrm{CC}_{3}$ |  |
| Output pin | 17 | $\mathrm{CC}_{1}$ | For tone detector input external coupling capacitor. A $0.1 \mu \mathrm{~F}$ capacitor is connected between $\mathrm{CC}_{1}$ and $\mathrm{CC}_{2}$. |
| Input pin | 18 | $\mathrm{CC}_{2}$ |  |
| Output pins | 1 | EMPout | Pre-emphasis output |
|  | 3 | COMP ${ }_{1}$ | Output to external compressor |
|  | 4 | $\mathrm{AF}_{\text {IN2 }}$ | Output of input transmit amplifier. The transmit input gain is adjusted with external registors connected to this pin and pin 5 (AFini). |
|  | 6 | 1/2 VDDour | Output of the $1 / 2 \mathrm{~V}_{D D}$ reference. Internal circuit operation is referenced to the voltage on this pin. |
|  | 11 | DEM ${ }_{2}$ | Output of receive input amplifier. The receive input amplifier gain is adjusted with external resistors connected to this pin and pin 10 (DEM ${ }^{1}$ ). |
|  | 12 | EXPIN | Output to external expander |
|  | 14 | AFour | Output to external expander or de-emphasis |
|  | 16 | RAMPout | Output of receive summing amplifier |
|  | 20 | Cout | Output of tone detector. An external $0.1 \mu \mathrm{~F}$ capacitor is connected from this pin to ground complete the internal primary LPF configuration. |
|  | 22 | DETout | Tone detector output. DET out is high when the input to the tone detector (rms value) exceeds the reference voltage. |
|  | 25 | Dout | Pattern check setting output <br> When TEST is high, the rising edge of DCK triggers output of the pattern. |
|  | 30 | FDout | Frame detection circuit output. FDout goes high when a signal matching the frame synchronization pattern is output from RD after a reset. |
|  | 31 | RCK | MSK modem receive clock output. RD data is output on the rising edge of RCK. |
|  | 32 | RD | MSK modem receive data output |
|  | 34 | SCK | MSK modem transmit clock output. SD data is read in on the rising edge of SCK. |
|  | 39 | TDout | Test digital output |
|  | 42 | MOD | Transmit output |
|  | 44 | LIMout | Limiter output |
|  | 46 | SAMP ${ }_{\text {out }}$ | Output of the transmit summing amplifier |
|  | 48 | Sour | MSK modulated signal output |

## CIRCUIT FUNCTIONS

The MB86460 consists of the transmit filters, receive filters, MSK modulator, MSK demodulator, digital circuits, and tone detector.

## 1. Transmit filters

The input amplifier AMP1 controls the gain of the transmitted VF signal. Gain is adjusted with external resistors R1 and R2. The input signal is then band-limited to 3.7 kHz or less by the transmit filter LPF1. The signal is then output at CMPin to an external compressor. We recommend forming an RC filter using external resistor R1, and external capacitor C 1 .
The compressor output signal is input to filter HPF2 at CMPour for $6 \mathrm{~dB} / \mathrm{cctave}$ pre-emphasis. The pre-emphasis filter can be bypassed externally.
The pre-emphasis filter output is brought out at EMPour to the external summing network of summing amplifier AMP2, where the signal is summed with the MSK modulating signal. The signal then enters the limiter. The limiter level can be adjusted externally at the LIM pin.
The output of the limiter is then band-limited to 3 kHz by splatter filter LPF2 and output at the MOD pin. the transmitted VF signal can be muted externally.

## 2. Receive filters

Input amplifier AMP3 controls the gain of the received VF signal. Gain is adjusted by external resistors R3 and R4. The input signal is then band-limited to 0.23 kHz to 3.4 kHz by receive filters LPF4 and HPF3. The signal then enters filter LPF5, where the $6 \mathrm{~dB} / \mathrm{octave}$ pre-emphasis is removed. The de-emphasis filter can be bypassed externally.
The output of the de-emphasis filter is brought out to the EXPIN pin to an external expander. The expander output is then input to summing amplifier AMP4, where the signal is summed with tone, DTMF, or other signal. The signal is then output at RAMPour. The receive VF signal can be muted externally.

## 3. MSK modulator

In the MSK modulator, a $1200-\mathrm{Hz}$ (data 1 ) or $1800-\mathrm{Hz}$ (data 0 ) sine-wave signal is generated for data input to pin SD in synchronization with transmit clock SCK. The MSK modulator signal then passes through pin Sour and enters summing amplifier AMP2, where the signal is summed with the transmit VF signal.

## 4. MSK demodulator

The received MSK signal passes through receive input amplifier AMP3. The signal then enters BPF1, where frequencies other than 1200 and 1800 Hz are eliminated. The signal passes through waveform-shaping circuit 1 and is A/D converted. The signal then enters the delay detector, where data is regenerated. The noise components in the regenerated data are filtered out by LPF3 and then the signal enters waveform-shaping 2 , where $A / D$ conversion is done again.
The digital phase-locked loop (DPLL) circuit recovers receive clock RCK from the regenerated data signal and outputs the regenerated data at the RD pin.
The MB86460 has a built-in frame-detection function for reducing microprocessor load. When the regenerated data output from pin RD matches the frame synchronization pattern, FDour goes high. The frame synchronization pattern can be set externally.

## 5. Digital circuits

The digital circuits consist of the timing generator and serial interface. The timing generator generates basic clocks for the MSK modulator and demodulator, transmit filters, and receive filters, and consists of a $3.6864-\mathrm{MHz}$ crystal and an on-chip oscillator and divider circuits.
The signal interface is used to set the standby mode, the bypass mode, and the frame synchronization pattern, and to enable or and disable the transmit/receive mute function. These operations are microprocessor-controllable through serial signal lines $\mathrm{Din}_{\mathrm{i}}, \mathrm{DCK}$, DSTB, and $\bar{F} \bar{M}$.

## 6. Tone detector

The tone detector is used for interference or carrier detection during demodulation. The tone detector full-wave-rectifies the output of the receive LPF or demodulator BPF, smoothes the signal, and compares it with the reference to check for interference or carrier presence.

## FUNCTION DESCRIPTIONS

Note: During reset, mode M4 is set.

## MB86460A

## FUNCTION DESCRIPTIONS

- Mute mode
(D4, D3)

- Pre-emphasis/de-emphasis bypass mode
(D6, D5)

- Compander bypass mode
(D7)

- Tone detector mode
(D8)

- Crystal oscillator mode
(D9)

Note: The internal dividing ratio depends on the frequency of the crystal.

- Test mode
(D15 to D10)

Note: In no-test (normal operation) mode, set D12 and D13 to 0.

## FUNCTION DESCRIPTIONS

## 4. Setting the frame synchronization pattern

The frame synchronization pattern is set via the serial interface pins. (16 bits)
For strobe, use DSTB and set $F / M$ to high.
Data input timing ( $\overline{T E S T}$ is high, $\overline{\mathrm{F}} \overline{\mathrm{M}}$ is high)

## ABSOLUTE MAXIMUM RATINGS (See NOTE)

| Parameter | Symbol | ¢ $\quad$ Pin name | Minimum | Typical | Maximum | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Supply voltage | $V_{\text {D }}$ | $V_{\text {DD }}$ | GND-0.3 | - | 7 | V |
| Input voltage | $\mathrm{V}_{\mathrm{IN}}$ | All input pins | GND-0.3 | - | $V_{D D}+0.3$ | $\checkmark$ |
| Output voltage | Vout | All output pins | GND-0.3 | - | $\mathrm{V}_{\mathrm{DO}}+0.3$ | V |
| Output current | lout | All output pins | -10 | - | 10 | mA |
| Storage temperature | $T_{\text {aso }}$ |  | -40 | - | 125 | ${ }^{\circ} \mathrm{C}$ |

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol, | Pln name | Minlmum | Typlaal | Maximum | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 48-LEAD PLASTIC FLAT PACKAGE <br> (Case No. : FPT-48-M02)

## 1200 BPS MSK (Minimum Shift Keying) MODEM

The MB87002 is a 1200 -bps CMOS minimum shift keying (MSK) single-chip modem for multichannel access (MCA) and radio communication application. Its operation at low supply voltages and low power consumption is especially suitable for portable application.

- Data rate: $1200-\mathrm{bps}$
- Low power consumption ( 20 mW with 5 V power supply)
- Low supply voltage operation: 3.0 to 5.5 V ( 5 V typical)
- On-chip crystal oscillator: 3.6864 MHz
- Switched-capacitor filter (SCF)
- Selectable timing regenerator pull-in characteristic (within 15 bits for high-speed, and within 25 bits for low-speed operation)
- Low external component count
- TTL compatible inputs and outputs

PLASTIC PACKAGE (DIP-16P-M03)

PLASTIC PACKAGE (FPT-16P-M03)

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fieids. However, it is advised that normal precautions be taken to avoid apolication of any voltage higher than maximum rated voltages to this high impedance circuit.

[^44]PIN DESCRIPTIONS

| Pin $\mathrm{No}_{\text {; }}$ | Symbol | 110 | Functional descriptions |
| :---: | :---: | :---: | :---: |
| 1 | R/TC | 1 | Transmit-receive clock output control. When pulled high, the 1.2 kHz transmit clock is output from the CLOCK pin and DATAOUT becomes low. When pulled low, the 1.2 kHz receive clock is output from the CLOCK pin. |
| 2 | CLOCK | 0 | Transmit-receive clock output pin. When R/TC pin is pulled high, 1.2 kHz transmit clock is output. When R/TC pin is pulled low, the 1.2 kHz receive clock is output. |
| 3 | OSC1 | 1 | Pin for external crystal ( 3.6864 MHz ) connection. |
| 4 | OSC2 | 0 | Pin for external crystal ( 3.6864 MHz ) connection. |
| 5 | DATAOUT | 0 | Regenerated data output signal. |
| 6 | MSKOUT | 0 | Modulated signal output pin. $\mathrm{V}_{\text {Do }} / 2$ is output when the RESET pin is pulled low. |
| 7 | BPFIN | 1 | Demodulated signal input to the receive band-pass filter (BPF). |
| 8 | GND | - | Ground |
| 9 | $1 / 2 \mathrm{~V}_{\text {D }}$ | 0 | $\mathrm{V}_{\text {od }}$ /2 reference voltage output |
| 10 | TEST | 1 | Test function control signal input. In the normal mode, this pin is pulled high or left open. In the test mode, it is pulled low. In the test mode, the BPF IN pin directly accepts Waveform Shaping I and receive LPF input signals, and the DATA IN pin directly accepts Waveform Shaping II input signals. In this mode, the delay detection circuit signal is output from BPFOUT and the receive LPF signal is output from MSKOUT. |
| 11 | DPLLC | 1 | DPLL pull-in time control signal input. When pulled low, high-speed operation is selected. When pulled high, low-speed operation is selected. |
| 12 | BPFOUT | 0 | Receive BPF output pin. |
| 13 | RESET | 1 | Device reset signal input. A low on this pin resets all circuits. Pulled high or left open to enable device operation. |
| 14 | SEND | 1 | Data transmit enable. With the reset high or open, transmit signals are output when this pin is pulled low to high. |
| 15 | DATAIN | 1 | Transmit data input to the receive BPF. |
| 16 | $\mathrm{V}_{\text {D }}$ | - | Supply voltage pin ( +3.0 to +5.5 V ). |

## MB87002 BLOCK DIAGRAM

## FUNCTIONAL DESCRIPTION

The timing generating section generates the clock signals required by the modulator and demodulator. The basic clock is generated by an internal oscillator and external crystal ( 3.6864 MHz ).
Modulator uses a programmable DAC with a 6 bit resistor string. The MSKOUT output is 1200 Hz for input 1 and 1800 Hz for input 0 synchronized with transmit clock. Before the transmit signal is output, a fixed level of $1 / 2 \mathrm{~V}_{00}$ is output by pulling the SEND pin low. The demodulator is composed of a band-pass filter (BPF), a delay detection circuit, a low-pass filter (LPF), and a digital phase-locked loop (DPLL). The BPF removes noise components from the $1,200 \mathrm{~Hz}$ and $1,800 \mathrm{~Hz}$ receive signals from the BPFIN pin and consists of a 10 th-order Chebyshev switched-capacitor filter (SCF). The delay detection circuit, after conversion of the BPF output from analog to digital in the waveform shaping circuit, regenerates data by delay detection. The noise components in the regenerated data are removed by the LPF. The LPF is a third-order Butterworth filter and removes noise components of 800 Hz or higher. The DPLL extracts the receive clock from the regenerated data. The regenerated data is output from the DATAOUT pin synchronized with the receive clock. The DPLL has a tendency to degrade the bit error rate when the pull-in time is shortened. This IC allows users to choose between two pull-in times. When the DPLLC pin is pulled low, the high-speed mode is selected. When pulled high, the low-speed mode is selected.
The on-chip $1 / 2 V_{D D}$ circuit supplies the reference voltage required by BPF, LPF, and waveform shaping circuits and reduces external circuitry and component count.

NOTE: Devices consisting of mixed analog and digital signal processing circuits are usually difficult to test. The MB87002 incorporates a test circuit which simplifies independent testing of the BPF, delay detection circuit, LPF and DPLL.

## TIMING CHART

Modulator timing chart (TEST pin = High or Open)

NOTE:1. SEND pin is pulled high after low-to-high transition of the RESET pin.
2. DATAIN signal is read at the rising edge of the CLOCK.
3. When SEND pin changes from low to high, the CLOCK pin is pulled high once. Then 1.2 kHz clock is output.
4. When $R / T C$ pin is pulled high, DATAOUT pin outputs low.
5. When power is first applied, RESET pin must be set to low to reset all circuits before use.

Demodulator timing chart (TEST pin $=$ High or Open)

NOTE:1. DATAOUT is output synchronized with the rising edge of the CLOCK.
2. When demodulator section is used, SEND pin must be set to high or low. When SEND pin is set to low, MSKOUT is fixed to $1 / 2 V_{\text {Do }}$.
3. When power is first applied, RESET pin must be set to low to reset all circuits before use.

## MB3120

COMPANDOR IC

## COMPANDOR IC

The Fujitsu MB3120 is a compandor IC to expand dynamic range at transmission/reception systems and to improve the tone quality by means of restricting noise.

Two functions are loaded on one IC, the one is the compressor which has the $2 / 1$ ratio of input/output ratio by logarithm, and the expandor which has the $1 / 2$ ratio of input/output ratio by logarithm.

The MB3120 is encapsulated in a small package. This enables high density mounting.

The MB3120 is well suitable for a mobile radio system like as cellular radio, MCA and handy telephone set.

- Wide power supply voltage range (3.2V to 10.0 V )
- Low power supply current
- On-chip both compressor and expandor
- Wide dynamic range
- Less external elements

## ABSOLUTE MAXIMUM RATINGS (See NOTE)

| Rating | Symbol | Value | Unit |
| :--- | :--- | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{CC}}$ | 12 | V |
| Mute Control Voltage | $\mathrm{V}_{\text {MUTE }}$ | $5^{*}$ | V |
| Inhibit Control Voltage | $\mathrm{V}_{\text {INH }}$ | $5^{*}$ | V |
| Power Dissipation | $\mathrm{P}_{\mathrm{D}}$ | 560 | mW |
| Operating Temperature | $\mathrm{T}_{\mathrm{A}}$ | -20 to +75 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

*: This value takes $\mathrm{V}_{\mathrm{cc}}$ when $\mathrm{V}_{\mathrm{Cc}}$ is less than 5 V .
NOTE: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## BLOCK DESCRIPTIONS

$C_{1} \quad: C_{1}$ determines the low cut off frequency of compressor section.
$\mathrm{fc}=\frac{1}{2 \pi R \cdot C_{1}}$
$R$ is on chip feed back resistor ( $10 \mathrm{k} \Omega$ typ.)
$C_{2}, C_{8}, C_{9}$ : Input coupling condenser
$C_{3}, C_{7} \quad: \quad$ Smooth capacitor of full wave rectifier. Atack time and recovery time are determined by $C_{3}$ and $C_{7}$.
Time constant $T_{C}$ can be calculated.
$T_{C}(\mathrm{~ms}) \fallingdotseq 10 \times \mathrm{C}_{3}(\mu \mathrm{~F})$
$\mathrm{C}_{4}, \mathrm{C}_{10} \quad:$ Output coupling condenser
$\mathrm{C}_{5}, \mathrm{C}_{6} \quad$ : Coupling condenser for internal feed back of compressor section.
$C_{11} \quad: \quad$ Ripple filter condenser
RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Value |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |

## PACKAGE DIMENSIONS

## 16-LEAD PLASTIC FLAT PACKAGE

(CASE No.: FPT-16P-M04)

## PACKAGE DIMENSIONS (Continued)

The Fujitsu MB3121 is a highly functional compandor IC with on-chip support circuitry that includes a microphone amplifier, input amplifier, and a splatter filter amplifier. It also features low operating voltage and low power consumption.

The MB3121 is designed to improve the sound quality in transceiver systems by increasing the dynamic range of the voice signal and suppressing noise. This device incorporates a signal compression circuit having an input/output compression ratio of $1 / 2^{*} \log (/ / O)$ and an expandor circuit with an input/output expansion ratio of $2^{*} \log (1 / O)$.

The MB3121 is the ideal choice for application in portable/mobile equipment such as car phones and cordless telephones.

- Low voltage operation: 1.8 to 7 V
- Compressor and expandor circuitry
- Adjustable voltage gain (0 to 40 dB )
- Limiter circuit
- Amplifier circuit for use with a splatter filter
- Data input and output pins
- Output signal muting function
- INHIBIT function that sets the compression and expansion ratio to 1:1
- STANDBY mode
- 28 -pin plastic SOP

## RECOMMENDED OPERATING CONDITIONS

| Parameter | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| Supply Voltage | $\mathrm{V}_{\mathrm{cc}}$ | 1.8 to 7 (Typical $=3$ ) | V |
| Operating Temperature | $\mathrm{T}_{\mathrm{a}}$ | -20 to +75 | ${ }^{\circ} \mathrm{C}$ |

Note: Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operation sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## 28-Lead Plastic Flat Package (Case No.:FPT-28P-M01)

## MB4513

## TELEPHONE IC

## TELEPHONE IC

## (SPEECH NETWORK, TONE RINGER, FILTER)

The Fujitsu MB4513 has an on-chip speech network circuit, filter circuit, and toneringer circuit. The MB4513 is intended to be used with dialer IC's (MB87003/4, MB87007A/8A, MB87029) to produce a telephone which can be connected to a rotary dial line or push button line.

- On-chip speech network circuit, filter circuit and tone ringer circuit
- Uses a ceramic piezoelectronic transmitter and receiver
- Reception amplifier adopts BTL (Balanced Transformer Less) circuit
- Three selections of tone by the external switches
- Connectable to pulse or DTMF lines

## ABSOLUTE MAXIMUM RATINGS (see NOTE)

| Parameter |  | Symbol | Value | Unit |
| :--- | :--- | :---: | :---: | :---: |
| Speech | Supply Voltage | $\mathrm{V}_{\mathrm{L}}$ | 20 | V |
|  | Supply Current | $\mathrm{I}_{\mathrm{L}}$ | 150 | mA |
|  | Supply Voltage | $\mathrm{V}_{\text {TR }}$ | 20 | V |
|  | Supply current | 1 TR | 7 | mA |
| Operating Ambient Temperature | $\mathrm{T}_{\mathrm{A}}$ | -30 to 60 | ${ }^{\circ} \mathrm{C}$ |  |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ | -55 to 125 | ${ }^{\circ} \mathrm{C}$ |  |

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit

## MB4518

TELECOMMUNICATION CIRCUIT

The MB4518 provides many of the major speech circuit functions of the telephone handset. Additional features include a level expander circuit to minimize ambient acoustic noise interference and an on-chip amplifier with speaker-drive capability.
Combined with general-purpose dialer and tone-ringer ICs, the MB4518 provides all of the basic handset functions.
The MB4518 easily interfaces with microprocessors designed for telephone handset control to provide microprocessor-controlled speaker level, transmitter muting, and side-tone level adjustments. The sidetone level adjustment circuit detects loop current levels and switches between two balance networks for proper sidetone level.

- On-chip power amplifier drives an $8 \Omega$ speaker
- Transmit level expander
- Simple receive level boost
- Balanced transmitter input for improved noise rejection
- Drives low-impedance receiver (dynamic receiver)
- Switchable balance network for optimum side-tone level
- Loop-current monitoring automatic gain control (automatic pad function)
- Low loop current drain ( $\mathrm{L} \div 5 \mathrm{~mA}$ )
- Superior branching properties
- Gain and frequency characteristics adjustable by external resistor and capacitor.
- Simple telephone microcomputer interface
- Available in 28 -pin shrink dip and flat packages

## ABSOLUTE MAXIMUM RATINGS (See NOTE)

$\left(T_{A}=+25^{\circ} \mathrm{C}\right)$

| \. F $_{\text {Hating }}$ | Symbol |  | Unit: |
| :---: | :---: | :---: | :---: |
| Supply voltage | $V_{L}$ | 18 | V |
| Supply current | IL | 120 | mA |
| Operating temperature range | Top | -30 to +60 | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature range | Tstg | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PIN FUNCTIONS

| Pin No. | Symbol | 10. | , \%) M, Description |
| :---: | :---: | :---: | :---: |
| 1 | GND | - | Chip ground. <br> Connected to the (-) side of an external diode bridge connected to the subscriber loop. |
| 2 | $\mathrm{V}_{\text {cc }}$ | - | Power supply pin. <br> Supplies power to the chip circuits. Coupled from the loop (AC-grounded) by an external capacitor. |
| 3 | RPI | 1 | Receive preamplifier input. Connected to the receive input through an external coupling capacitor. |
| 4 | RPO | 0 | Receive preamplifier output. <br> The receive preamplifier gain and frequency compensation are externally adjusted with a resistor and capacitor connected between this pin and the RPI pin. |
| 5 | VREF | - | Reference voltage pin. <br> Connected to the internal reference voltage and AC-grounded through an external capacitor. |
| 6 | PADC | - | Pad insertion control. <br> Start-up current for the pad insertion control is adjusted by connecting an external resistor to this pin. |
| 7 | RGU | 1 | Simple receive gain control. <br> Grounding this pin increases the receive preamplifier gain by about 6 dB . Normally left open. |
| 8 | RBO | $\bigcirc$ | Receive buffer output. <br> Connected to the RI and SPI pins through external coupling capacitors. |
| 9 | SPSW | 1 | Speaker defeat switch. <br> When this pin is open, the speaker is connected; when grounded, the speaker is disconnected. |
| 10 | RI | 1 | Receive main amplifier input. <br> The receive signal is coupled to this pin from the RBO pin by an external capacitor. |
| 11 | RO | 0 | Receive main amplifier output. <br> Connected to a low-impedance receiver by an external coupling capacitor. <br> Some receivers may require a shunt capacitor to prevent oscillation. |
| 12 | SPREF | - | Speaker circuit reference voltage pin. <br> Reference voltage pin for the speaker and receive output circuit. AC-grounded through an external capacitor. |
| 13 | VSP | - | Speaker amplifier power supply pin. <br> The speaker amplifier receives power from this pin. <br> The speaker power supply can be coupled at this point by an external capacitors. |
| 14 | SPO | 0 | Speaker output. <br> Connected to an $8 \Omega$ speaker through an external capacitor. <br> Some applications may require a speaker shunt capacitor to prevent oscillation. |

| PinNo. | Symbol: | 110 |  |
| :---: | :---: | :---: | :---: |
| 15 | SPGND | - | Speaker amplifier ground. <br> This pin must be connected to the circuit network ground. |
| 16 | SPI | 1 | Speaker amplifier input. <br> Connected to the RBO pin through an external capacitor and resistor for adjustment of speaker amplifier gain and frequency compensation. |
| 17 | SPH | - | Speaker circuit power control. <br> The speaker power supply circuit is connected to the speaker amplifier input (VSP) through an external network which can be adjusted to control chip power consumption. |
| 18 | VL | I | Line input. <br> Connected to the (+) side of an external diode bridge connected to the subscriber loop. |
| 19 | TOE | 0 | Transmit main amplifier output. Connected to the emitter of the transmit transistor. |
| 20 | MFIN | 1 | DTMF signal input. <br> Connected to the base of the transmit output transistor. The input impedance is about $24 \mathrm{k} \Omega$. During voice transmission this pin must be open. |
| $\begin{aligned} & 21, \\ & 22 \end{aligned}$ | BN1, BN2 | - | Balance network pins. <br> Used for connection of external balance networks. <br> BN1: Short loop, BN2: Long loop |
| 23 | BNC | - | Balance network switching control. <br> An external resistor is connected between this pin and $\mathrm{V}_{\mathrm{cc}}$ or ground to adjust the BN1 and BN2 switching current. |
| 24 | EXR | - | Level expander reference voltage pin. <br> Reference voltage pin for the control of the level expander. Connecting an external capacitor holds the positive peak voltage level. |
| 25 | EXC | - | Level expander control. <br> Control pin for the level expander. <br> Connecting an external capacitor holds the negative peak voltage level. When grounded, this pin disables the expander function. |
| 26 | MUTE | - | Muting. <br> Grounding this pin suppresses output to the loop. <br> During communication this pin must be left open. |
| $\begin{aligned} & 27, \\ & 28 \end{aligned}$ | $\begin{aligned} & \mathrm{T} 11, \\ & \mathrm{~T} 12 \end{aligned}$ | 1 | Transmit preamplifier input. Connected to the transmitter through external coupling capacitors. The input is balanced. TI1 is the noninverting input and TI2 is the inverting input. |

## TEST CIRCUITS

- Test circuit

- DC characteristics test circuit

IL : Current source (AC impedance $\geq 60 \mathrm{k} \Omega, 1 \mathrm{kHz}, 30 \mathrm{~mA}$ )
(V) : DC voltmeter

- Balance network switching $\mathrm{I}_{\mathrm{FN}}$ : When IL increases from 30 mA to 70 mA IL (mA) for which VBN2 increases from 1.5 V to 3.5 V or more
$\mathrm{I}_{\mathrm{NF}}$ : When IL decreases from 70 mA to 30 mA
IL (mA) for which VBN1 decreases from 3.5 V to 1.5 V or less
Note: The tolerance of the load impedance for each pin shall be $\pm 1 \%$. (All test circuits)
- Transmission characteristics test circuit

Abstracted from the electrical characteristics circuit
$\sim$ : Oscillator (Output impedance and DC resistance $\leq 4 \Omega$ at 1 kHz )
IL : Current source (AC impedance $\geq 60 \mathrm{k} \Omega, 1 \mathrm{kHz}, 30 \mathrm{~mA}$ )
(V) : AC voltmeter

Transmit circuit gain: $\mathrm{G}_{\mathrm{Tv}}(\mathrm{dB})=20$ Log V3/V1 (oscillator 1)
$\mathrm{G}_{\text {mFV }}(\mathrm{dB})=20$ Log V3/V2 (oscillator 2)

- Dynamic range : The distortion attenuation with the output signal level fixed is at least 20 dB .
- Residual noise : Measure the transmit output signal level with no transmit input signal.

## MB4518

## - Receive characteristics test circuit

$\approx$ : Oscillator (Output impedance and DC resistance $\leq 4 \Omega, f=1 \mathrm{kHz}$ )
IL : Current source (AC impedance $\geq 60 \mathrm{k} \Omega, 1 \mathrm{kHz}, 30 \mathrm{~mA}$ )
(V) : AC voltmeter

Receive circuit gain: $\quad G_{\text {gv }}(d B)=20 \log$ V4N3

- Gain boost : Measure the V3 AC signal level boost when SW1 is closed.
- Dynamic range : The distortion attenuation with the output signal level fixed is at least 20 dB .
- Speaker characteristics test circuit

$\sim$ : Oscillator (Output impedance and DC resistance $\leq 4 \Omega, f=1 \mathrm{kHz}$ )
IL : Current source (AC impedance $\geq 60 \mathrm{k} \Omega, 1 \mathrm{kHz}, 30 \mathrm{~mA}$ )
(V) : AC voltmeter

Speaker system gain: Gsv $(\mathrm{dB})=20 \log \mathrm{~V} 5 \mathrm{~N} 3$ (SW2 open)

- Dynamic range : The distortion attenuation with the output signal level fixed is at least 20 dB .

## - Test circuit components

| Reference Designation | Component | Values | Remarks |

## TYPICAL CHARACTERISTIC CURVES

GTV (dB)

## PACKAGE DIMENSIONS

## PACKAGE DIMENSIONS

## MB4752A

Subscriber Line Interface IC

The Fujitsu MB4752A is designed for PBX (Private Branch Exchange), and has battery feed, supervision, and 4-wire-to-2-wire conversion functions.
The battery feed mode can be set to a $200 \times 2$ or $440 \times 2$ constant feed resistor by using the terminal connection.
The subscriber line interface circuit is used for digital PBX and CO. This device can be used worldwide to achieve high longitudinal balance with 4W-to-2W gain and characteristics by adjusting the external resistor.

- $440 \Omega \times 2 / 200 \Omega \times 2$ feeding resistance
- Loop detection function
- Line fault protection
- Hybrid function (4-wire to 2-wire conversion function)
- Ring trip comparator

Balancing impedance is selected by external parts

- Digital output terminal has open-collector output with a pull up resistor
- 28-pad LCC package: (Suffix: -TV)

## ABSOLUTE MAXIMUM RATINGS

| Rating | Symbol | Value | Unit | Note |
| :---: | :---: | :---: | :---: | :---: |
| Power Supply Voltage | $V_{B B}$ | -60 to +0.5 | V | Referenced to GND |
|  | $V_{C C}$ | -0.5 to +7 | V | Referenced to E |
|  | $V_{\text {EE }}$ | -7 to +0.5 | V |  |
|  | $V_{\text {EG }}$ | -7.5 to +0.5 | V | Referenced to GND |

## PIN DESCRIPTION

| Pin No. | Symbol | Description |
| :---: | :---: | :---: |
| 1 | NC | No Connection |
| 2 | CA | High-impedance capacitor pin. A capacitor is connected between this terminal and CB terminal. AC impedance of Battey Feed circuit is made up to high impedance by this external capacitor. |
| 3 | A | $440 \Omega$ battery feed for line A |
| 4 | $A^{1}$ | $200 \Omega$ battery feed for line $A$ |
| 5 | NB | Base drive output for the NPN power transistor |
| 6 | NE | Emitter current sensing input for the NPN power transistor |
| 7 | $V_{B B}$ | Most negative voltage supply, -48 V |
| 8 | RTPA | Ring-trip input for line A |
| 9 | NC | No Connection |
| 10 | ZT | 4 W to 2 W transformation impedance |
| 11 | $V_{0}$ | 4 W to 2 W gain setting resistor input |
| 12 | $\mathrm{R}_{1}$ | 4 W to 2 W gain setting resistor input |
| 13 | $V_{\text {EE }}$ | Negative voltage supply, -5 V |
| 14 | 4W | 4-wire input |
| 15 | E | Ground |
| 16 | NC | No Connection |
| 17 | SCNA | SCN detecting output for line A |
| 18 | SCNB | SCN detecting output for line B |
| 19 | $V_{C C}$ | Positive voltage supply, +5 V |
| 20 | NC | No Connection |
| 21 | RTPB | Ring trip input for line B |
| 22 | Z | Compensation capacitor input |
| 23 | G | Ground |
| 24 | PE | Emitter current sensing input for the PNP power transistor |
| 25 | PB | Base drive output for the PNP power transistor |
| 26 | $B^{1}$ | $200 \Omega$ battery feed for line B |
| 27 | B | $440 \Omega$ battery feed for line B |
| 28 | CB | High-impedance capacitor pin. A capacitor is connected between this terminal and CB terminal. AC impedance of Battery Feed circuit is made up to high impedance by this external capacitor. |

## FUNCTIONAL DESCRIPTION

## Battery Feed

By selecting connection $\mathrm{A}, \mathrm{B}$ or $\mathrm{A}^{1}, \mathrm{~B}^{1}$, balanced feeding resistance of $440 \Omega$ for PBX or $200 \Omega$ for CO application is selected.

## Loop Detection

The digital signal output indicates the handset condition as off the hook, both the SCNA and SCNB terminals simultaneously, by detecting the current that is generated when the handset is off the hook.

## Line Fault Protection

Line fault protection outputs the signals when line A or B is short circuited to SCNA and SCNB, respectively.
When excess current flows, arrester provides system protection, and DC feeding resistance becomes six times as large as the normal value. As a result, current decreases.

## Hybrid (Four-to-two wire conversion)

As for the communication channel, the telephone switching system has a four-wire line internally, and the telephone set system has a two-wire line. This device also has a built-in four-wire to two-wire converter. The two-wire to four-wire converter contains external common industrial operational amplifier.

## Ring Trip Comparator

It is necessary for the electrical telephone switching system to detect that the receiver is on the hook during a calling signal.
Ring trip detection is performed by connecting external low pass filter to the input RTPA or RTPB terminal. The output signal is superimposed on the trip supervise SCA when the handset is on the hook.

RECOMMENDED OPERATING CONDITIONS

| Parameter |  | Symbol | Condition | Unit | Note |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Power Supply Voltage |  | $V_{B B}$ | $-48 \pm 5$ | V | Referenced to GND |
|  |  | $\mathrm{V}_{\mathrm{CC}}$ | $5.0 \pm 0.25$ | V | Referenced to E |
|  |  | $\mathrm{V}_{\mathrm{EE}}$ | $-5.0 \pm 0.25$ | V |  |
|  |  | $V_{\text {EG }}$ | -0.5 to +0.5 | V | Referenced to GND |
| 2 W | $440 \Omega$ Feeding Loop Resistor | $\mathrm{R}_{\mathrm{L}}$ | 0 to 1200 | $\Omega$ | Line resistor + terminal resistor |
|  | $200 \Omega$ Feeding Loop Resistor | $\mathrm{R}_{\mathrm{L}}$ | 0 to 1900 | $\Omega$ |  |
|  | Low Frequency Inductive Current | $I_{\text {AC }}$ | 0 to 6.4 | mArms | Single line current $f=50 / 60 \mathrm{~Hz}$ |
| 4 W | Input Offset Voltage | $\mathrm{V}_{\text {RCS }}$ | -0.2 to 0.2 | V |  |
|  | Input Voltage | $\mathrm{S}_{4 \mathrm{~W}}$ | 7.0 | dBm |  |
| Operating Temperature |  | Top | 5 to 70 | ${ }^{\circ} \mathrm{C}$ |  |

## MB87007A/MB87008A DTMF Pulse Dialer

The Fujitsu MB87007A/MB87008A is a Dual Tone Multifrequency (DTMF) pulse dialer for pushbutton telephone sets. It uses the Si-Gate CMOS process and is suitable for both DTMF and PULSE modes. The MB87007AMB87008A can be switched from a PULSE mode to a DTMF mode by a mode selection entry or by an input from the keyboard. It has a 26-digit redial memory that permits the coexistence of PULSE and DTMF modes and enables mixed redialing in both PULSE and DTMF modes by a signal key entry.

- Pulse 10 pps, 20 pps, or DTMF operation that is selected by the mode switch pin (MODEIN)
- On-chip 26 digits of redial memory (up to 25 digits can be written into the memory)
- MB87007A has a make ratio of $39 \%$ and MB87008A has a make ratio of $33 \%$
- LDT function is provided (switching from PULSE mode to DTMF mode by key entry)
- Beep tone for input confirmation can be output (for all effective key entry independently PULSE/DTMF modes)
- Mixed redialing of both PULSE and DTMF modes is possible
- Redial inhibit function is included for redial memory overflow
- PAUSE function is provided and pause accumulation is possible
- FLASH function is provided (ONHOOK mode is selected by keyboard input)
- Crystal or ceramic oscillator ( 3.579545 MHz ) can be used
- Pause release function is provided (two or more consecutive pauses can be released)
- Operating voltages: PULSE mode: 2.0 V to 6.0 V DTMF mode: 2.5 V to 6.0 V ( $\mathrm{TA}=-30$ to $60^{\circ} \mathrm{C}$ )

## ABSOLUTE MAXIMUM RATINGS

| Rating | Symbol | Pin Name | Value | Unit |
| :--- | :---: | :---: | :---: | :---: |
| Power Supply Voltage | $\mathrm{V}_{\mathrm{DD}}$ | $\mathrm{V}_{\mathrm{DD}}$ | GND -0.3 to 7.0 | V |
| Input Voltage | VI | All inputs | GND -0.3 to $\mathrm{V}_{\mathrm{DD}}+0.3$ | V |
| Ouput Voltage | VO | All outputs | GND -0.3 to $\mathrm{V}_{\mathrm{DD}}+0.3$ | V |
| Storage Temperature | $\mathrm{T}_{\text {STG }}$ |  | -55 to +150 | ${ }^{\circ} \mathrm{C}$ |

Note: Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operation sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Figure 1. MB87007A/MB87008A Block Diagram

## PIN DESCRIPTIONS

| $1 / 0$ | Pin No. |  | Symbol | Description |
| :---: | :---: | :---: | :---: | :---: |
|  | DIP | FPT |  |  |
| Power Supply | 1 | 1 | $V_{D D}$ | Power supply voltages: Pulse mode 2.0 V to 6.0 V DTMF mode 2.5 V to 6.0 V Memory Retention mode 2.0 V min. |
|  | 10 | 12 | GND | Ground |
| Input | 2 3 4 5 17 16 15 14 | 2 3 4 5 23 22 21 20 | $\begin{aligned} & \text { COL才 } \\ & \text { COL2 } \\ & \text { COL3 } \\ & \text { COL4 } \\ & \text { ROW才 } \\ & \text { ROW2 } \\ & \text { ROW3 } \\ & \text { ROW4 } \end{aligned}$ | Uses key entries from 2 of 7 or 2 of 8 keyboard with common GND. This IC is available with a single contact from A type key board and electronic input (Low entry). <br> Key input debouncing time is 23 ms typ. for both PULSE and DTMF modes. Key input release guard time is 23 ms typ. for both PULSE and DTMF modes. Key entry is accepted in PULSE/DTMF mode only when a single key (one key on the keyboard) is pressed longer than the debouncing time. If two or more keys are pressed, they are not accepted unless they are released one-by-one and the last key is held closed longer than the debouncing time, after all other keys are released. <br> Key entry is accepted in DTMF mode only when either a single key (dual-tone key) is pressed, or two or more keys in the same COL or ROW (single-tone keys) are pressed longer than the debouncing time. If even one key is pressed in COL4, the single-tone keys are ineffective. When multiple single-tone keys are pressed, if they are released one-by-one, and the last key is held closed longer than the debouncing time (after all other keys are released), the key is effective as the dual-tone key. <br> Hereafter, key entries are described with the premise that keys are held closed longer than the debouncing time. <br> Pauses between key entries in PULSE and DTMF modes must be 50 ms or more. However, up to 50 ms is necessary from key entry to output start for a single-tone output. <br> Key switch contact resistance up to $5 \mathrm{k} \Omega$ is allowable. |
|  | 6 | 8 | MODEIN | This pin selects the pulse $10 \mathrm{pps}, 20 \mathrm{pps}$ and DTMF mode. |
|  |  |  |  | Mode Setting |
|  |  |  |  | $*$   <br> PULSE mode 10 pps Open (1 M $\Omega$ or more) |
|  |  |  |  | PULSE mode 20 pps $\mathrm{V}_{\mathrm{DD}}$ <br>    |
|  |  |  |  | DTMF mode ${ }_{\text {L }}$ GND |
|  |  |  |  | When mode switching is requested by MODEIN during PULSE or TONE transmission, the request will not be accepted. <br> The request is accepted by key entry after data entry transmission is completed. In ONHOOK mode, MODEIN is set to a high impedance state. |

PIN DESCRIPTIONS

| I/O | Pin No. |  | Symbol | Description |
| :---: | :---: | :---: | :---: | :---: |
|  | DIP | FPT |  |  |
| Input | 12 | 15 | HKS | Hook switch input pin. |
|  |  |  |  | ONHOOK Mode ${ }^{\text {O }}$ Open or $\mathrm{V}_{\mathrm{DD}}$ |
|  |  |  |  | OFFHOOK Mode ${ }^{\text {GND }}$ |
|  |  |  |  | Output is inhibited in ONHOOK mode and PULSEOUT, DTMF/BEEPOUT, MUTE, and MODEOUT are set at a high impedance state. <br> Allkey entries are set to HZ and the on-chip operational amplifier and oscillator ( $\mathrm{OSCIN}=\mathrm{L}, \mathrm{OSCOUT}=\mathrm{L}$ ) become power down states. <br> This pin is pulled up by a high resistance internally. <br> The input level is in the CMOS level. |
|  |  |  |  |  |
|  |  |  |  |  |
|  | 8 | 10 | OSCIN | Oscillator input pin. <br> This pin is pulled up by a high resistance in ONHOOK mode. |
| Output | 9 | 11 | OSCOUT | Oscillator output pin. <br> This pin is pulled down by a high resistance in ONHOOK mode. |
|  | 7 | 9 | MODEOUT | The output level is in the CMOS level and set to a high impedance state in ONHOOK mode. <br> Low level is output in the PULSE mode and high level is output in the DTMF mode, including the LDT function. <br> MODEOUT blinks on and off at a frequency of 2.5 Hz typ., if there is no pause before and after mode switching in redial function. <br> Independent of PULSE/DTMF modes, the beep tone is output at the BEEPOUT when the FLASH key is pressed. The MODEOUT pin is output low level during the beep tone output. High impedance of 0.6 second typ. is output following the beep tone output. The key acceptance state (OFFHOOK mode) is now entered. |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  | 11 | 13 | MUTE | N -channel open drain output. <br> The following are MUTE pin HZ conditions during PULSE/DTMF modes. <br> 1. There is no key entry. <br> 2. When the FLASH key is pressed, HZ of 0.6 typ. second is output after the beep tone is output. <br> 3. During pause output state. (However, when a key is pressed, MUTE is low level while beep tone is being output.) <br> 4. During MODEOUT blinking. <br> After key entries become effective in the PULSE or DTMF modes, the output level is low during the beep tone transmission, pulse transmission in accordance with effective key entries, and DTMF output transmission. |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  | 13 | 16 | PULSEOUT | N -channel open drain output. <br> High impedance (HZ) is set in ONHOOK or DTMF modes. <br> In PULSE mode, this pin is set low for pulse brakes, according to numerical key entries. <br> When the FLASH key is pressed in either the PULSE or DTMF mode, a low level is output for 600 milliseconds typ. after the beep tone is sent (even during a PULSE/DTMF send). The key acceptance state (OFFHOOK state) then returns. The make ratio for PULSE output is $39 \%$ for MB87007A and $33 \%$ for MB87008A. |

## PIN DESCRIPTIONS

| 1/0 | Pin No. |  | Symbol | Description |
| :---: | :---: | :---: | :---: | :---: |
|  | DIP | FPT |  |  |
|  | 18 | 24 | DTMF/ BEEPOUT | The DTMF/BEEPOUT pin is a bipolar emitter follower that can drive a $100 \Omega$ load between pin and GND. <br> In the DTMF mode (exclude COL4) when a single key (numeric, ${ }^{\star}$ or ©) is pressed, a dual tone is output. <br> Pressing two or more keys in the same ROW or COL on the keyboard outputs the signal tone in the ROW or COL. <br> However, if a key in COL4 is pressed, DUAL TONE or single tone in the ROW or COL is not output (see Electrical Characteristics). <br> If the FLASH key is pressed during DTMF sending, the beep tone is output at BEEPOUT and subsequent DTMF tones are not output. The ONHOOK mode is entered for 600 milliseconds typ. after which, MODEIN and key entries are placed in the acceptance state (OFFHOOK mode). <br> Beep tone (key entry confirmation tone) is output in PULSE mode. The 41 ms typ. beep tone ( 1 kHz square wave) is output when the following keys are pressed. <br> 1. Numerical key entry. <br> 2. First LDT key entry (subsequent LDT key entries are ineffective). <br> 3. Pause key entries: ${ }^{*}$ or key. (However, if the first key after OFFHOOK is the PAUSE key, the key entry is ineffective or not accepted.) <br> 4. Redial key entries: \#or RED)* key. (They are effective only when the redial key is the first key after OFFHOOK.) <br> 5. PAUSE release key entries: $\overbrace{}^{*}$, or RED key. (They are accepted only during redialing and effective only when MODEOUT is blinking or at a pause time during redialing.) <br> 6. FLASH key entry: $F$ key. (For FLASH key entry, the beep tone is output in PULSE and DTMF modes.) <br> When two or more keys are pressed simultaneously, that is, double or multiple key entries, the key entries are ineffective and the beep tone is not output. If DTMF mode tone request is received during a beep tone transmission, the beep tone is terminated even though the duration is 41 ms or shorter and DTMF tone is output. <br> DUAL TONE output time conditions are as follows: <br> 1. 80 ms typ. for redial output. <br> 2. 80 ms typ. when the key entry time is within 130 ms typ. and more than the debouncing time. <br> 3. DUAL TONE output is stopped at once if a key is pressed over 130 ms typ. and released. <br> 4. Signal tone is output from the end of debouncing time until the key is released. <br> 5. When a beep or DTMF tone is not being output, this pin is placed in a high impedance state. |

## FUNCTIONAL DESCRIPTIONS

## Ordinal Dialing

In the OFFHOOK mode, PULSE/DTMF signals are output according to the key input, regardless of number of key input figures. For the PULSE mode, any number of digital entries withkeys 0 to 9 . Forthe DTMF mode, any number of digital entries with keys 0 to $9, \pi$ and \#.

Upto 26 digits can be stored in the redial memory. In the PULSE mode, a redial digit is counted for any numeric, pause, and LDT entry. In the DTMF mode, a redial digit is counted for any numeric, $\star^{*}$, $\#$, and $(P$ entry.

In both the PULSE and DTMF modes, one digit is counted as mode information when MODEIN is used for mode switching. After OFFHOOK, the first numeric entry is counted as mode digit. In the PULSE mode the numeric key is counted as a mode digit. In the DTMF mode, a numeric key, *) and \# entry is counted as a mode digit. In either the OFFHOOK or PULSE modes, the mode-information digit is written into the redial memory.

## Redialing Function

The redial memory is read out to execute the redialing operation when a redial key is the first key pressed in OFFHOOK state. In the PULSE mode, the redial keys are \# and \#. In the DTMF mode, only the RED key is accepted for redial.

When 27 or more digits are written into the redial memory, PULSE or DTMF signals that correspond to the key entries are output, but the redialing operation is ineffective because of memory overflow. At this time, even if the first key pressed after the state change from ONHOOK to OFFHOOK is the redial key, the entry is not accepted and the beep tone is not output in either mode of operation.

After OFFHOOK, if a numeric or LDT key is the first entry in PULSE mode, or the first entry in the DTMF mode is a numeric, ©]. (\#) or a single-tone key entry (excluding COL4), the redial memory is cleared and data is written into memory according to key entry information.

## Mixed Redialing

Mixed redialing is executed when the mode is changed from the PULSE to DTMF mode (done by pressing the LDT key), or when MODE is changed during key entries.

If, at redialing, there is a pause before or after mode switching (including LDT), PULSE/DTMF is sent and PULSE/DTMF signals are transmitted after the pause. To redial when there is no pause before or after mode switching (including LDT), all operations must cease after mode switching and a HALT state is enabled. MODEOUT blinks (indicates that mode switching has no automatic pause) and prompts a pause release.

The pause release keys in PULSE mode are ${ }^{\star}$, RED , and the $P$ key. In the DTMF mode, the RED and the $P$ keys are used for pause release. PULSE and DTMF signals can now be sent by key entry. The FLASH key, is the only other acceptable entry.

During redial output, the F key is the only key entry accepted. The pause release key is only accepted when MODEOUT is blinking or during a pause at redialing.

## Mode Switching

During PULSE or TONE transmissions, mode switching by MODEIN is not permitted; after transmission is complete, MODEIN can be used for mode switching.

When PULSE or DTMF modes are switched by MODEIN, one digit is stored into redial memory as mode information. After OFFHOOK, if the first key entry is numeric in the PULSE mode, or a numeric ${ }^{*}$ or $\#$ in the DTMF mode, the mode-information digit is written into redial memory.

In the PULSE mode, after the LDT key is accepted only one time, the DTMF mode is selected (regardless of MODEIN pin switching). The LDT key is not accepted in the DTMF mode. The MODEIN pin switching enables the desired mode of operation to be selected.

## Line Dial Tone (LDT) Function

If the LDT key is pressed in the PULSE mode, the DTMF mode is selected and DTMF tones can be output. In PULSE mode, only the first LDT key is accepted after key acceptance state (OFFHOOK mode) is entered. Once the LDT key is accepted, the following LDT key entries are ignored.
When the LDT key is used to enter the DTMF mode, all keys (excluding COL4 keys) provide dual-tone and single-tone outputs. (Note: If even one COL4 key is pressed, neither dual nor single tones are output.) The mode after that is not switched. If mode switching by LDT from memory is done during redialing, key entries after redialing are executed in DTMF mode regardless of the MODEIN state and the data is written into the redial memory. However, for effective keys (not the redial key) after ONHOOK changes to OFFHOOK, memory is reset and written in the current mode.

## Pause Function

A pause state can be entered by pause key entry.
In the PULSE mode, a pause is introduced by pressing the $\#$ or $P$ keys; in the DTMF mode (including LDT) only the $P$ key is effective. If a pause key is the first key pressed after changing from ONHOOK to OFFHOOK, the entry is not accepted. One pause key entry introduces a pause state that is typically 4 seconds; contiguous pause (NX 4 seconds) can be executed by making consecutive key entries. The pause can be reduced by entering $\mathbb{P}$ or RED during a redialing pause time.

In the PULSE mode, the ${ }^{\star}$ key is used as a pause release key. Multiple pauses can be sent up to 500 times faster by entering a pause release key, that is, NX4 seconds becomes NX800 milliseconds.

## Flash Function

Keyboard entries enable ONHOOK mode. Only the $F$ key is used as a FLASH key in both PULSE and DTMF modes (including LDT). When the (F) key is pressed, the ONHOOK mode is entered for 600 milliseconds (typical), atter beeptone is sent. During thistime, the key entry pin is not accepted. MODEIN, MUTE, MODEOUT, and DTMF/BEEPOUT pins are placed in the high-impedance state and the PULSEOUT pin is set low level. After 600 milliseconds (typical), the return of OFFHOOK is automatic and key entries can again be accepted.

## Test (High-speed Mode)

A test mode circuit is built into the IC. In the ONHOOK state, pins OSCIN and OSCOUT are pulled down by a high resistance. To activate the test mode, tie the OSCIN high and apply clock signal to OSCOUT. The internal circuit operates up to 128 times faster than normal operation.

Figure 1. Keyboard Configuration

Figure 2. Reference Circuit

Note: Key input capacitance (2 to 5, 14 to 17 pins) : 500 pF .
When electronic input is used, there is no need for connecting a capacitance with key input pins.

## PACKAGE DIMENSIONS

MB87009
Dual Tone Multi-Frequency/Pulse Dialer

The Fujitsu MB 87009 is an IC for pushbutton telephone sets using Si gate CMOS process and can be used for both DTMF and PULSE modes.

The MB 87009 can be switched from PULSE mode to DTMF mode by mode selection entry or by input from the keyboard.

The MB 87009 contains a 26 -digit redial memory, permitting coexistence of PULSE and DTMF modes, enabling mixed redialing in both PULSE and DTMF modes by a single key entry.

- Pulsed 10 pps, 20 pps, or DTMF operation can be selected by the mode switch pin (MODEC).
- 26-digit redial memory is built in (up to 25 digits can actually be written in the memory).
- Selectable make ratio by MA/BR: $39 \%$ or $33 \%$.
- LDT function is provided (key entry enables switching from PULSE mode to DTMF mode).
- Beep tone for input confirmation can be output (for all effective key entry independently of PULSE/DEMF mode.
- Redial inhibit function is included for redial memory overflow.
- Mixed redialing of both PULSE and DTMF modes is possible.
- PAUSE function is provided and pause accumulation is possible.
- FLASH function is provided (ONHOOK mode is entered by keyboard entry).
- Crystal or ceramic oscillator ( 3.579545 MHz ) can be used.
- PAUSE release function is provided (two or more consecutive pauses can be released).
- Operating voltage $\left(-30^{\circ} \mathrm{C}\right.$ to $\left.60^{\circ} \mathrm{C}\right)$

PULSE mode : 2.0 to 6.0 V
DTMF mode : 2.5 to 6.0 V

## ABSOLUTE RATINGS

| Rating | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| Power voltage | $\mathrm{V}_{\text {DD }}$ | GND-0.3 to 7.0 | V |
| Input voltage | $\mathrm{V}_{\text {IN }}$ | GND-0.3 to $\mathrm{V}_{\text {DD }}+0.3$ | V |
| Output voltage | $\mathrm{V}_{\text {OUT }}$ | GND-0.3 to $\mathrm{V}_{\text {DO }}+0.3$ | V |
| Storage temperature | $\mathrm{T}_{\text {STG }}$ | -55 to 150 | ${ }^{\circ} \mathrm{C}$ |

NOTE: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

[^51]

## EXPLANATION OF THE BLOCK DIAGRAM

Setting the HKSW pin from " H " to " L " changes the mode from ONHOOK to OFFHOOK, activating the 3.579545 MHz oscillator and entering a key entry accepting state.
MODEC pin entry in OFFHOOK mode enables selection of PULSE mode 10 pps or 20 pps or DTMF mode. In PULSE mode, DTMF mode can be set by pressing the LDT key.

The keyboard logic circuit discriminates key entry information on $\overline{\mathrm{ROW} 1}$ to $\overline{\mathrm{ROW} 4}$ and $\overline{\mathrm{COL}}$ to $\overline{\mathrm{COL4}}$ pins, and transmits key information to the control logic circuit after a time interval for debouncing, for effective key entry.
The control logic circuit controls the memory circuit, beep tone generator, pulse output generator, and DTMF output
generator according to key entry information.
The memory circuit contains a 26 -digit redial memory. Onetouch redialing is possible after mode and key entry information is stored.

Independently of PULSE/DTMF mode, the beep tone generator operates to output beep tone to the BEEPOUT pin for all effective key entries.

The pulse output generator detects the memory output when the PULSE mode is selected, and outputs to the POUT pin as many PULSE signals "L" as the number depending on effec-
tive memory data in PULSE mode.
The make rate is $39 \%$ when $M A / B R$ is " H ", and $33 \%$ when "L."

When the DTMF mode is selected, the DTMF output generator outputs DTMF tones from the DTMF OUT pin according to effective memory data output. Row and column program counters and DA converter generate row and column sine wave signals, which are added by the analog adder to generate DTMF tones.

## PIN DESCRIPTION

## PIN DESCRIPTION (Cont'd)

| Pin No. | Pin name | 1/0 | Description |
| :---: | :---: | :---: | :---: |
| 7 | MODEC |  | - Switch to select Pulse $10 \mathrm{pps}, 20 \mathrm{pps}$, or DTMF operation. <br> The table below shows mode settings. <br> - When mode switching is requested by MODEC during pulse or tone transmission, the request will not be accepted. The request is accepted by key entry after data transmission. <br> - In ONHOOK mode, a high impedance $(\mathrm{HZ})$ is set. |
| 14 | HKSW | Input pin | - Hook switch entry <br> - Output inhibit state is entered in ONHOOK mode and POUT, DTMFOUT, BEEPOUT, MUTE, and MODEO are set to HZ . All key entries are set to HZ and the built-in operational amplifier and oscillator ( $\mathrm{X} 1=$ " L ", $\mathrm{X} 2=$ " L ") enter power down states in ONHOOK mode. <br> - This pin is pulled up by a high resistance in the IC. <br> - The input level is CMOS levet. |
| 9 | X1 |  | - Resonator input pin. <br> - Pulled down to "L" by a high resistance in ONHOOK mode. <br> - Both crystal and ceramic resonators are available ( 3.579545 MHz ). |
| 10 | X2 | Output pin | - Resonator output pin. <br> - Pulled down to "L" by a high resistance in ONHOOK mode. <br> - Both crystal and ceramic resonators are availble ( 3.579545 MHz ). |
| 8 | MODEO |  | - CMOS output pin which is set to HZ in ONHOOK mode. <br> - Outputs " $L$ " level in PULSE mode, and " $H$ " level in DTMF mode (including the LDT function). <br> - Blinks MODEO on and off at a frequency of 2.5 Hz typ. if there is no pause before and after mode switching in redialing function. |

## MB87009

## PIN DESCRIPTION (Cont'd)

| Pin No. | Pin name | 1/0 | Description |
| :---: | :---: | :---: | :---: |
| 8 | MODEO | Output pin | - Independently of PULSE/DTMF mode, the beep tone is output at the BEEPOUT when the FLASH key is pressed. HZ of 0.6 second typ. is output after the beep tone is output. After that, key acceptance state (OFFHOOK mode) is entered. |
| 12 | $\overline{\text { MUTE }}$ |  | - NCH open drain output pin. <br> - The following are MUTE pin HZ conditions in PULSE and DTMF modes. <br> (1) When there is no key entry. <br> (2) After the beep tone is output when the FLASH key is pressed ( 0.6 s typ.) <br> (3) During pause state <br> However, MUTE is " $L$ " while the beep tone is output. <br> (4) During MODEO blinking. <br> - After key entries become effective in PULSE and DTMF modes, the pin level is "L" during output of the beep tone, pulses, or DTMF according to effective key entries. |
| 13 | BEEPOUT |  | - CMOS Three-State Output. High-Impedance when the beep tone is not output. <br> - Independently of PULSE/DTMF mode, the beep for input confirmation is output for all effective key entry. <br> - BEEPTONE is output in 41 ms typ. at 1 kHz in rectangler pulse. |
| 15 | $\overline{\text { POUT }}$ |  | - NCH open drain output pin. <br> - HZ in ONHOOK and DTMF modes. <br> - In PULSE mode, this pin is "L" for pulse breaks according to numerical key entries. <br> - In PULSE and DTMF modes, when the FLASH key is pressed, "L" level is output for 0.6 second typ. after the beep tone is sent even during PULSE/ DTMF sending, and a key acceptance state (OFFHOOK mode) returns. |
| 20 | DTMF OUT |  | - Bipolar type NPN emitter-follower pin. It can drive a load of $100 \Omega$ (between pin and GND). <br> - When an ordinary single key is entered in DTMF mode, DUAL TONE of numerical, 㘠, and 囲 keys is output ( $\overline{\mathrm{COL}} 4$ column is not allowed). Pressing two or more keys in the same $\overline{\text { ROW }}$ or $\overline{\mathrm{COL}}$ on the keyboard outputs the single tone in the $\overline{\mathrm{ROW}}$ or $\overline{\mathrm{COL}}$. However, if a key in $\overline{\mathrm{COL}}$ is pressed, DUAL TONE or single tone in the $\overline{\text { ROW }}$ or $\overline{\mathrm{COL}}$ is not output. <br> - See Section 8.4 for single tone output frequencies. |

## PIN DESCRIPTION（Cont＇d）

| Pin <br> No． | Pin name | 1／0 | Description |
| :---: | :---: | :---: | :---: |
| 20 | DTMF OUT | Output pin | －In the FLASH key is pressed during DTMF sending，the beep tone is output at BEEPOUT and subsequent DTMF tones are not output．After beep tone output，nearly ONHOOK mode of 0.6 second typ．is entered，and then，key acceptance state（OFFHOOK mode）is entered． <br> －DUAL TONE output time conditions： <br> 1） 80 ms TYP for redial output． <br> 2） 80 ms TYP when the key entry time is within 130 ms typ．more than the debouncing time． <br> 3）DUAL TONE output stops being generated at once if a key is pressed over 130 ms TYP and released． <br> 4）Single tone is output from the end of debouncing time until the key is released． <br> － HZ when the DTMF tone is not output． |

## OPERATION AND FUNCTION USE CONDI－ TIONS

## Ordinary dialing

Dialing is done by entering numerical keys（ 1 to 0 keys）in PULSE mode and numerical，$\#$ ，and 囲 keys in DTMF mode regardless of the number of digits of key input in OFFHOOK，PULSE，or DTMF signals according to the key input are output．
The redial memory is 26 digits．A digit is counted for numerical，pause，and LDT keys in PULSE mode and for numerical，田，囲，and $\mathbb{P}$ keys in DTMF mode．
One digit is counted as mode information for mode switch． ing by MODEC for both PULSE and DTMF modes．The first key after OFFHOOK is counted as one digit as mode information for numerical keys in PULSE mode and numerical，\＃，and \＃keys in DTMF mode，and is written into the redial memory．

## Redial function

The redial memory is read to execute redialing only if the redial key is the first key pressed in OFFHOOK state．
The redial key，＊，and RED keys are used in PULSE mode and only the RED key in DTMF mode．
When 27 or more digits are written into the redial memory， PULSE or DTMF signals corresponding to the key entries are output，but the redialing operation is ineffective because of memory overflow．At this time，even if the first key pressed after the state changes from ONHOOK to OFF－ HOOK is the redial key，the redial key is not accepted and
the beep tone is not output regardless of PULSE or DTMF mode．
If a numerical or LDT key is the first key entry in PULSE mode after OFFHOOK or a numerical，$\circledast, ~ \#$, or single－ tone key（excluding COL4）in DTMF mode，the memory is reset and data is written into the redial memory according to key entry information．

## Mix redial function

If the mode is changed from PULSE to DTMF mode by pressing the LDT key，or MODEC is switched during key entries，mix redialing is executed．
If there is a pause before or after mode switching（including the LDT function）at redialing，PULSE／DTMF is sent and DTMF／PULSE signals are sent after the pause．However，for redialing in which there is no pause before or after mode switching（including the LDT function），the operation stops immediately after mode switching and a HALT state is entered．MODEO blinks to indicate that the mode switching has no auto pause，prompting pause release．The pause re－ lease key at this time is $*$ ，RED，and $P$ keys in PULSE mode，and RED and $\square$ keys in DTMF mode．By key entry， the operation sending subsequent PULSE／DTMF signals is returned．Key entries other than the above are not accepted， except the $\mathbb{F}$ key．
Key entries are not accepted during redial output，except the F and pause release keys（only when MODEO is blinking or during a pause at redialing）．

## Mode switching

When mode switching is requested by MODEC during pulse or tone transmission, the request will not be accepted. The request becomes acceptable after data transmission.
One digit is used as mode information in both PULSE and DTMF modes when the mode is switched by MODEC. If the first key entry is a numerical in PULSE mode after OFF. HOOK or a numerical, $\#, ~$ 囲 in DTMF mode, mode information is written into redial memory.
In PULSE mode, the LDT key is accepted only once. After that, DTMF mode is fixed regardless of MODEC pin switching.
In DTMF mode, the LDT key is not accepted. MODEC pin switching enables the desired mode to be selected.

## LDT function

If the LDTTkey is pressed in PULSE mode, the mode changes to DTMF mode in which DTMF tones can be sent. "In PULSE mode, only first LDT key is accepted after key acceptance state (OFFHOOK mode) is entered. Once LDT key is accepted, the following LDT key entries are ignored.

When DTMF mode is entered by the LDT key, dual tones of keys, excepting $\overline{\mathrm{COL4}}$ and single tones, can be output. 〈If even one COL4 key is pressed, dual and single tones on the $\overline{\text { ROW }}$ or $\overline{\mathrm{COL}}$ are not sent.) The mode after that is not switched. If mode switching by LDT from memory is done during redialing, key entries after redialing are executed in DTMF mode regardless of the MODEC state and the data is additionally written into the redial memory. However, for effective keys other than the redial key after ONHOOK changes to OFFHOOK memory is reset and written in the current mode.

PAUSE function
A pause state can be entered by pause key entry.

In PULSE mode, both $\circledast$ and $\cap$ keys can be used as the pause key. In DTMF mode (including the LDT function), only the $\begin{aligned} & \text { key is used. }\end{aligned}$

If the pause key is the first key pressed after ONHOOK changes to OFFHOOK, the key is not accepted.

One pause key entry can make a 4.0 second typ. pause state. $\mathrm{N} \times 4.0$ second typ. pauses can be made by multiple consecutive pause key entries.
Pause duration can be reduced by entering $\square$ and RED keys during redialing pause time. In PULSE mode, the * key can also be used as a pause release key.

When multiple consecutive pauses are written, the consecutive pauses are all sent fast by entering a pause release key. ( $\mathrm{N} \times 4.0$ second typ. pause time becomes $\mathrm{N} \times 8.0 \mathrm{~ms}$ pause time because the pauses are sent at a speed up to 500 times as fast.)

## FLASH function

Keyboard entries enable ONHOOK mode. Only the F key is used as a FLASH key in both PULSE and DTMF modes (including the LDT function). When the $\boldsymbol{F}$ key is pressed, ONHOOK mode is entered for 0.6 second TYP after the beep tone is sent. The key entry pin, MODEC, MUTE, DTMFOUT, and BEEPOUT during the time become HZ and the $\overline{\text { POUT pin outputs level "L". OFFHOOK mode returns after }}$ 0.6 second typ., and key entries can be accepted.

## TEST MODE (High speed mode) function

TEST. MODE circuit is built into the chip. At ONHOOK, X1 and X 2 are pulled down by high resistances. By making the X1 pin " H " and entering a clock from the X2 pin, TEST MODE is enabled to operate internal circuits up to 128 times as fast.

## KEYBOARD CONFIGURATION

An example of a single contact type keyboard is shown below.

Timing chart 1-B (When there is a pause before LDT in PULSE mode) Key entries in Timing chart 1-A are written as memory data.

NOTE: $M A / B R=$ " $H$ " for make rate $39 \%$ and " $L$ " for $33 \%$.

Timing chart 2-A (When there is no pause before or after LDT in PULSE mode)

Timing chart 2-B (When there is no pause before or after LDT in PULSE mode.) Key entries in Timing chart 2-A are written as memory data.

## Timing chart 3-A (in DTMF mode)

вefeovt "म"
NOTE: MA/BR = "H" for make rate $39 \%$ and " L " for $33 \%$.

Timing chart 3-B (in DTMF mode)
Key entries in Timing chart 3-A are written as memory data.

PACKAGE DIMENSIONS (Suffix: P)

## PACKAGE DIMENSIONS (Suffix: PF)

Circuit diagrams utilizing Fujitsu products are included as a means of illustrating typical semiconductor applications; consequently, complete information sufficient for construction purposes is not necessarily given. The information has been carefully checked and is believed to be entirely reliable. However, no responsibility is assumed for inaccuracies. Furthermore, such information does not convey to the purchaser of the semiconductor devices described herein any license under the patent rights of Fujitsu Limited or others. Fujitsu Limited reserves the right to change device specifications.

## MB87017B

DTMF RECEIVER

## DUAL TONE MULTI FREQUENCY RECEIVER

The MB87017B is a one chip DTMF receiver with an input amplifier gain adjuster and low power consumption, integrating filter and decoder circuits. The MB87017B can select either automatic guard time setting mode or adjustable external guard time setting mode.
This circuit consists of SCFs (Switched Capacitor Filters) and decoders which convert 16 types of DTMF tone pairs into hexadecimal four-bit codes.

- All DTMF receiver functions are integrated on one chip.
- Low power consumption
- Built-in input amplifier gain adjustment circuit
- Selectable automatic or adjustable external guard time setting modes

## ABSOLUTE MAXIMUM RATINGS (See NOTE)

| Ratings | Symbol | Value | Unit |
| :---: | :---: | :---: | :---: |
| Supply Voltage | $V_{D D}$ | +6.0 | V |
| Analog Input Voltage | $V_{\text {AIN }}$ | -0.3 to $V_{D D}+0.3$ | V |
| Digital Input Voltage | $V_{\text {DIN }}$ | -0.3 to $V_{D D}+0.3$ | V |
| Operating Temperature | $T_{A}$ | 0 to +70 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature | $\mathrm{T}_{\text {stg }}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |

NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## FUNCTIONAL DESCRIPTIONS

## FILTER

The filters consist of 3 sixth-order SCFs. The dial tone removal filter (including the 60 Hz filter) output is connected to the individual hysteresis comparators through the low group and high group filters.
In the figure below, the solid line shows the characteristics of the low group filter while the broken line shows the characteristics of the high group filter. At a frequency of 770 Hz , it is assumed that 0 dB are lost. Therefore, this point is used for reference.

## DECODER

## 1. Digital Frequency-detecting Circuit

The DF (Detect Frequency) pin goes to "High" when the detector circuit acknowledges the output signals from the two comparators as valid DTMF signal frequencies in the digital frequency detecting block.

## 2. Guard Time Setting Circuit

Automatic or adjustable external guard time setting modes are provided. Guard time has two types: GTP (Guard Time Present) and GTA (Guard Time Absent).

### 2.1 Automatic Guard Time Setting Circuit

When GT pin is clamped to $\mathrm{V}_{\mathrm{DD}}$, automatic guard time setting circuit is selected; $\mathrm{t}_{\mathrm{GTP}}$ and $\mathrm{t}_{\mathrm{trA}}$ are set to 20 milliseconds. The output signal from the filters may be acknowledged as a DTMF signal if:
(1) A signal with valid DTMF frequency lasts more than 40 milliseconds. This signal is decoded into a DTMF signal. These pulses correspond to the input signal enable period and disable period for alternative current characteristics.
(2) A period of more than 40 milliseconds exists between DTMF signals $n$ and ( $n+1$ ). If this is not the case the DTMF signal $(n+1)$ is disabled.
These pulses correspond to the inter-digit pauses for acceptance and rejection for alternative current characteristics.

In (1), it takes the DS (Detect Signal) pin GTP to acknowledge that the input signal is a DTMF signal after DF switches to "High". The DS pin switches to "High" when the input signal is acknowledged as a DTMF signal.
In (2, it takes the DS pin GTA to disable DTMF signal $n$ after DF switches to "Low". The DS pin switches to "Low" when the signal is disabled. (See Page 10 for the timing chart.)
$t_{S D A}>t_{G T P}+t_{P D F}$
$t_{I D A}>t_{A D F}+t_{G T A}$

### 2.2 Adjustable External Guard Time Setting Circuit

The simplified adjustable external guard time setting circuit shown below enables any guard time present (GTP) or guard time absent (GTA) setting.
The guard time is adjusted by selecting external register R when the external capacitor is $0.1 \mu \mathrm{~F}$.

2.3 Automatic Guard-time/Adjustable External Guard-time Setting Mode Selection Circuit

- Adjustable external guard time setting mode Adjustable external guard time setting mode (GT pin is set low) is selected on the rising edge of the detected frequency (DF).
- Automatic guard time setting mode

The automatic guard time setting mode (GT pin is set high) is selected the power-on reset signal and on the rising edges of the DF.

### 2.4 Power-on Reset Circuit

The power-on reset circuit generates a reset signal to initialize the automatic guard time or adjustable guard time setting circuit when power is applied.
The power-on reset circuit specifications and timing diagram are shown below.

| Parametar | Symbol | Minlmum | Tysical | Maximun | Unl! | Finuts |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Power supply rise time Power supply fall time | $\begin{aligned} & t_{1} \\ & t_{1} \end{aligned}$ | 0.1 | - | 50 | ms | Power-on reset operation conditions |
| Power-off time | $\mathrm{torl}^{\text {f }}$ | 100 | - | - | ms |  |

## FUNCTIONAL DESCRIPTIONS

- Power-on reset timing diagram

NOTE: If the values of power supply rise time, fall time, and power off time shown in the table are not satisfied, the power-on reset signal will not be generated and the automatic guard time setting circuit may not recover from malfunction (receive disabled).
The adjustable external guard time setting circuit will not enter malfunction even if the power-on reset signal is not generated.
Therefore, if power supply conditions disable the power-on reset circuit, the adjustable external guard setting circuit can be used.

## OUTPUT CIRCUIT

When the signal detector pin (DS) switches to "High", a received tone pair is stored in the output circuit register. The output latch status may be output on the output bus by setting the three state control input (TOE) to "High".

|  | Avo Input |  | Input | Output |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## SAMPLE DIFFERENCE INPUT CONFIGURATION

The MB87017B uses a difference input amplifier and provides for a bias power source ( $V_{\text {reF }}$ ) to apply a bias voltage to the input signal. This also allows a pin to connect a gain adjustment resistor to the amplifier output.

MB87017B

TIMING CHART

## PACKAGE DIMENSIONS

## MB87029

DTMF Pulse Dialer
The Fujitsu MB87029 is a Dual Tone Multifrequency (DTMF) pulse dialer that is designed for pushbutton telephone sets and uses the Si-Gate CMOS process.
The MB87029 is used in both DTMF and PULSE modes and can be switched from PULSE mode to DTMF mode by a mode selection entry or by input from the keyboard. The MB87029 contains a 26 -digit redial memory that permits the coexistence of PULSE and DTMF modes, enabling mixed redialing in both PULSE and DTMF modes by a signal key entry.

- Pulse $10 \mathrm{pps}, 20 \mathrm{pps}$, or DTMF operation can be selected by the mode switch pin (MODEIN)
- On-chip 26 digits of redial memory (up to 25 digits can actually be written in the memory)
- Selectable make ratio by MA/BR: 39\% or 33\%
- Line Dial Tone (LDT) function is provided (switching from PULSE mode to DTMF mode by key entry)
- Output of a beep tone for input confirmation (for all effective key entry independently PULSE/DTMF modes)
- Redial inhibit function is included for redial memory overflow
- Mixed redialing of both PULSE and DTMF modes
- PAUSE function is provided and pause accumulation is possible
- Single-tone output is enabled by SCNT pin
- FLASH function is provided (ONHOOK mode is selected by keyboard input)
- FLASH output time, 0.1 second or 0.6 second, is selected by FCNT pin
- Crystal or ceramic oscillator ( 3.579545 MHz ) can be used
- Pause release function is provided (two or more consecutive pauses can be released)
- Operating voltages: PULSE mode: 2.0 V to 6.0 V DTMF mode: 2.5 V to 6.0 V (TA $=-30$ to $60^{\circ} \mathrm{C}$ )

## ABSOLUTE MAXIMUM RATINGS

| Rating | Symbol | Pin Name | Value | Unit |
| :--- | :---: | :---: | :---: | :---: |
| Positive Supply Voltage | $\mathrm{V}_{\mathrm{DD}}$ | $\mathrm{V}_{\mathrm{DD}}$ | $\mathrm{GND}-0.3$ to 7.0 | V |
| Input Voltage | VI | All inputs | GND -0.3 to $\mathrm{V}_{\mathrm{DD}}+0.3$ | V |
| Ouput Voltage | VO | All outputs | GND -0.3 to $\mathrm{V}_{\mathrm{DD}}+0.3$ | V |
| Storage Temperature | $\mathrm{T}_{\mathrm{STG}}$ |  | -55 to +150 | ${ }^{\circ} \mathrm{C}$ | Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

(C) 1991 by FUJITSU LIMITED and Fujitsu Microelectronics, Inc.

## PIN DESCRIPTIONS

| VO | Pin No. |  | Symbol | Description |
| :---: | :---: | :---: | :---: | :---: |
|  | DIP | FPT |  |  |
| Power Supply | 1 | 1 | $\mathrm{V}_{\mathrm{D}}$ | $\begin{array}{ll}\text { Power supply voltages: } & \text { Pulse mode } 2.0 \mathrm{~V} \text { to } 6.0 \mathrm{~V} \\ & \text { DTMF mode } 2.5 \mathrm{~V} \text { to } 6.0 \mathrm{~V} \\ & \text { Memory Retention mode } 2.0 \mathrm{~V} \text { min. }\end{array}$ |
|  | 11 | 12 | GND | Ground |
| Input | 2 3 4 5 21 20 19 18 | $\begin{array}{r} 2 \\ 3 \\ 5 \\ 6 \\ 23 \\ 22 \\ 21 \\ 20 \end{array}$ | $\begin{aligned} & \text { COL才 } \\ & \text { COL2 } \\ & \text { COL3 } \\ & \text { COL4 } \\ & \text { ROW1 } \\ & \text { ROW2 } \\ & \text { ROW3 } \\ & \text { ROW4 } \end{aligned}$ | Uses key entries from 2 of 7 or 2 of 8 keyboards with common GND. This IC is available with a single contact from A type keyboard and electronic input (Low entry). <br> Key input debouncing time is 23 ms typ. for both PULSE and DTMF modes. Key input release guard time is 23 ms typ. for both PULSE and DTMF modes. Key entry is accepted in PULSE/DTMF modes only when a single key (one key on the keyboard) is pressed longer than the debouncing time. If two or more keys are pressed, they are not accepted unless they are released one-by-one and the last key is held closed longer than the debouncing time, after all other keys are released. <br> Key entry is accepted in DTMF mode only when either a single key (dual-tone key) is pressed or two or more keys in the same COLor ROW (single-tone keys) are pressed longer than the debouncing time. If one key in COL4 is pressed, the single-tone keys are ineffective. If multiple single-tone keys are pressed, and the last key is held closed longer than the debouncing time, after all other keys are released, the key is effective as the dual-tone key. <br> Hereafter, key entries are described with the premise that keys are held closed longer than the debouncing time. <br> Pauses between key entries in PULSE and DTMF modes must be 50 ms or more. However, up to 50 ms is necessary from key entry to output start for single-tone outputs. <br> Key switch contact resistance up to $5 \mathrm{k} \Omega$ is allowable. |
|  | 6 | 7 | MA/BR | This pin selects the make rate. <br> Make ratio switching by MA/BR is inhibited during PULSE/DTMF transmission. The input level is in the CMOS level. |
|  | 6 | 7 | MODEIN | This pin selects the pulse mode, $10 \mathrm{pps}, 20 \mathrm{pps}$, or the DTMF mode. <br> Mode switching is not accepted by MODEIN. After data transmission is completed, mode switching is honored by key entry. <br> In the ONHOOK mode, this pin is set to a high impedance state. |

## PIN DESCRIPTIONS

| VO | Pin No. |  | Symbol | Description |
| :---: | :---: | :---: | :---: | :---: |
|  | DIP | FPT |  |  |
| Output | 12 | 13 | MUTE | N -channel open drain output. <br> In both PULSE and DTMF modes, the MUTE pin is in a high impedance state for the following conditions: <br> 1. There is no key entry. <br> 2. After the beep tone is output and the FLASH key is pressed, HZ is output for 0.6 second (typical). <br> 3. During pause output state. (However, when key is pressed, MUTE is low level while beep tone is being output.) <br> 4. During MODEOUT blinking. <br> Afterkey entries become effective in the PULSE or DTMF modes, the MUTE pin is low during output of the beep tone, pulse output (according to numeric key entry), and output of DTMF. |
|  | 13 | 14 | BEEPOUT | The output is in CMOS level and the pin is set to a high impedance state unless beep tone is output. <br> In PULSE/DTMF modes, the beep tone is output according to effective key entries. <br> Beep tone is output in 41 ms typ. at 1 kHz in rectangular pulse. |
|  | 13 | 14 | PULSEOUT | N -channel open drain output. <br> This pin is in a high impedance state in the ONHOOK mode or DTMF mode. In PULSE mode, this pin is at lowfor brakes (according to numerical key entries). When the FLASH key is pressed in the PULSE or DTMF mode, a low level is output for 600 ms typ. after the beep tone is sent (even during a PULSE/DTMF send). The key acceptance state (OFFHOOK mode) then returns. |
|  | 22 | 24 | DTMFOUT | This DTMFOUT output pin is a bipolar follower that can drive a $100 \Omega$ load between pin and GND. <br> When a single key (numerical, \# or \#) is pressed in the DTMF modes, dual tone is output. <br> Pressing two or morekeys in the same ROW or COLon the keyboard outputs the signal tone in the ROW or COL. <br> If a key in COL4 is pressed, then the DUAL TONE or single tone in the ROW or COL is not output. (Please see Electrical Characteristics.) <br> If the FLASH key is pressed during DTMF sending, the beep tone is output at BEEPOUT and subsequent DTMF tones are not output. The ONHOOK mode is entered for 600 ms typ. after the key acceptance state (OFFHOOK mode) is entered. <br> DUAL TONE output time conditions are as follows: <br> 1. 80 ms typ. for redial output <br> 2. 80 ms typ. when the key entry time is within 130 ms typ. and more than the debouncing time <br> 3. DUAL TONE output is stopped at once if a key is pressed longer than 130 ms typ. and released. <br> 4. Signal tone is output from the end of debouncing time until the key is released. This pin is set to a high impedance state unless DTMF tone is output. |

## FUNCTIONAL DESCRIPTIONS

## Ordinal Dialing

In OFFHOOK mode, PULSE/DTMF signals are output according to the key input, regardless of the number of key input figures. For the PULSE mode, any number of digital entries with keys 0 to 9 . For the DTMF mode, any number of digital entries with keys 0 to $9, \pi_{\text {, and }}$ (\#)

Up to 26 digits can be stored in the redial memory. In the PULSE mode, a redial digit is counted for any numeric, pause, and LDT entry. In the DTMF mode, a redial digit is counted for any numeric, ${ }^{*}$, \#, and $P$ entry.

In both the PULSE and DTMF modes, one digit is counted as mode information when MODEIN is used for mode switching. After OFFHOOK, the first numeric entry is counted as a mode digit. In the PULSE mode the numeric key is counted as a mode digit. In the DTMF mode, a numeric key, *) and \# entry is counted as a mode digit. In either OFFHOOK or PULSE modes, the mode-information digit is written into the redial memory.

## Redialing Function

The redial memory is read out to execute the redialing operation when a redial key is the first key pressed in OFFHOOK state. In the PULSE mode, the redial keys are \# and *. In the DTMF mode, only the RED key is accepted for redial.

When 27 or more digits are written into the redial memory, PULSE or DTMF signals that correspond to the key entries are output, but the redialing operation is ineffective because of memory overflow. At this time, even if the first key pressed after the state change from ONHOOK to OFFHOOK is the redial key, the entry is not accepted and the beep tone is not output in either mode of operation.

After OFFHOOK, if a numeric or LDTkey is the first entry in PULSE mode, or the first entry in the DTMF mode is a numeric, *. © or a single-tone key entry (excluding COL4), the redial memory is cleared and data is written into memory according to key entry information.

## Mixed Redialing

Mixed redialing is executed when the mode is changed from the PULSE to DTMF mode (done by pressing the LDT key), or when MODE is changed during key entries.
If, at redialing, there is a pause before or after mode switching (including LDT), PULSE/DTMF is sent and PULSE/DTMF signals are transmitted after the pause. To redial when there is no pause before or after mode switching (including LDT), all operations must cease after mode switching and a HALT state is enabled. MODEOUT blinks (indicates that mode switching has no automatic pause) and prompts a pause release.

The pause release keys in PULSE mode are *, RED, and the $P$ key. Inthe DTMF mode, the RED and the $P$ keys are used for pause release. PULSE and DTMF signals can now be sent by key entry. The FLASH key is the only other acceptable entry.

During redial output, the Eey is the only key entry accepted. The pause release key is only accepted when MODEOUT is blinking or during a pause at redialing.

## Mode Switching

During PULSE or TONE transmissions, mode switching by MODEIN is not permitted; after transmission is complete, MODEIN can be used for mode switching.
When PULSE or DTMF modes are switched by MODEIN, one digit is stored into redial memory as mode information. After OFFHOOK, if the first key entry is numeric in the PULSE mode, or a numeric $*$ or $\#$ in the DTMF mode, the mode-information digit is written into redial memory.

In the PULSE mode, after the LDT key is accepted only one time, the DTMF mode is selected (regardless of MODEIN pin switching). The LDT key is not accepted in the DTMF mode. The MODEIN pin switching enables the desired mode of operation to be selected.

## Line Dial Tone (LDT) Function

If the LDT key is pressed in the PULSE mode, the DTMF mode is selected and DTMF tones can be output. In PULSE mode, only the first LDT key is accepted after key acceptance state (OFFHOOK mode) is entered. Once LDT key is accepted, the following LDT key entries are ignored.

When the LDT key is used to enter the DTMF mode, all keys (excluding COL4 keys) provide dual-tone and single-tone outputs. (Note: If even one COL4 key is pressed, neither dual nor single tones are output.) The mode after that is not switched. If mode switching by LDT from memory is done during redialing, key entries after redialing are executed in DTMF mode regardless of the MODEIN state and the data is written into the redial memory. However, for effective keys (not the redial key) after ONHOOK changes to OFFHOOK, memory is reset and written in the current mode.

## Pause Function

A pause state can be entered by pause key entry.
In the PULSE mode, a pause is introduced by pressing the \# or $P$ keys; in the DTMF mode (including LDT) only the $(P$ key is effective. If a pause key is the first key pressed after changing from ONHOOK to OFFHOOK, the entry is not accepted.
One pause key entry introduces a pause state that is typically 4 seconds; contiguous pause ( $\mathrm{N} \times 4$ seconds) can be executed by making consecutive key entries. The pause can be reduced by entering $P$ or RED during a redialing pause time.

In the PULSE mode, the ** key is used as a pause release key. Multiple pauses can be sent up to 500 times faster by entering a pause release key, that is, $N \times 4$ seconds becomes $N \times 800$ milliseconds.

## Flash Function

Keyboard entries enable ONHOOK mode. Only the F key is used as a FLASH key in both PULSE and DTMF modes (including LDT). When the Fey is pressed, the ONHOOK mode is entered for 600 milliseconds (typical) after beep tone is sent. During this time, the key entry pin is not accepted. MODEIN, MUTE, MODEOUT, and DTMF/BEEPOUT pins are placed in the high-impedance state and the PULSEOUT pin is set low level. After 600 milliseconds (typical), the return of OFFHOOK is automatic and key entries can again be accepted.

## Test (High-speed Mode)

A test mode circuit is built into the IC. In the ONHOOK state, pins OSCIN and OSCOUT are pulled down by a high resistance. To activate the test mode, tie the OSCIN high and apply clock signal to OSCOUT. The internal circuit operates up to 128 times faster than normal operation.

## PACKAGE DIMENSIONS

## DUAL TONE MULTI FREQUENCY RECEIVER

The MB87057 is a one chip DTMF receiver with an input amplifier gain adjuster and low power consumption, integrating filter and decoder circuits. The MB87057 can automatically set guard times.
This circuit consists of SCFs (Switched Capacitor Filters) and decoders which convert 16 types of DTMF tone pairs into hexadecimal four-bit codes.

- All DTMF receiver functions are integrated on one chip.
- Low power consumption
- Built-in input amplifier gain adjustment circuit
- Automatic guard time setup

## FUNCTIONAL DESCRIPTIONS

## 1. FILTER

The filters consist of 3 sixth-order SCFs. The dial tone removal filter (including the 60 Hz filter). Output is connected to the individual hysteresis comparators through the low group and high group filters.
In the figure below, the solid line shows the characteristics of the low group filter while the broken line shows the characteristics of the high group filter. At a frequency of 770 Hz , it is assumed that 0 dB are lost. Therefore, this point is used for reference.

## 2. DECODER

### 2.1 Digital Frequency-detecting Circuit

The DF (Detect Frequency) pin goes to "High" when the detector circuit acknowledges the output signals from the two comparators as valid DTMF signal frequencies in the digital frequency detecting block.

### 2.2 Guard Time Setup Circuit

The automatic setup mode is provided for guard time setup. Guard time has two types: GTP (Guard Time Present) and GTA (Guard Time Absent).

### 2.2.1 Automatic guard-time setup circuit

The automatic guard time setup circuit sets both $\mathrm{t}_{\text {GTP }}$ and tata to 20 ms . The output signal from the filters may be acknowledged as a DTMF signal if:
(1) A signal with valid DTMF frequency lasts more than 40 ms . This signal is decoded into a DTMF signal. These pulses correspond to the input signal enable period and disable period for alternative current characteristics.
(2) A period of more than 40 ms exists between DTMF signals $n$ and ( $n+1$ ). If this is not the case the DTMF signal ( $n+$ 1 ) is disabled.
These pulses correspond to the inter-digit pauses for acceptance and rejection for alternative current characteristics.

In (1), it takes the DS (Detect Signal) pin GTP to acknowledge that the input signal is a DTMF signal after DF switches to "High". The DS pin switches to "High" when the input signal is acknowledged as a DTMF signal.
In (2), it takes the DS pin GTA to disable DTMF signal n after DF switches to "Low". The DS pin switches to "Low" when the signal is disabled. (See Page 8 for the timing chart.)

\end{aligned}
$$

## FUNCTIONAL DESCRIPTIONS

## 3. OUTPUT CIRCUIT

When the signal detector pin (DS) switches to "High", a received tone pair is stored in the output circuit register. The output latch status may be output on the output bus by setting the three state control input (TOE) to "High".

## 4. SAMPLE DIFFERENCE INPUT CONFIGURATION

The MB87057 uses a difference input amplifier and provides for a bias power source $\left(V_{\text {REF }}\right)$ to apply a bias voltage to the input signal. This also allows a pin to connect a gain adjustment resistor to the amplifier output.

MB87057

## MB6021/6022 PCM CODEC

The Fujitsu CMOS BD6020 series consists of both $\mu$-law and A-law single-chip codec/filter ICs for either synchronous-only or sync/async operation. These monolithic, single-channel, voice-frequency codecs incorporate both transmit and receive circuitries that are used for PCM (pulse coded modulation) systems.

- Transmit high-pass and low-pass filters
- Receive low-pass filter with SinX/X Correction
- Anti-aliasing filter
- Conforms to CCITT and AT\&T specifications
- Synchronous and asynchronous operation: MB6021, MB6022
- Serial data rates of 64 kHz to 3.152 MHz
- PLL circuits as internal clock generator
- Internal voltage reference
- Internal auto-zero circuit
- TTL compatible digital interface
- Input gain adjust amplifier
- Pin selectable on-chip analog loopback
- $\mu$-law: MB6021

A-law: MB6022

- Package: 16-pin ceramic DIP package (Suffix: -CZ)

Note: Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operation sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, h is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

[^53]
## BLOCK DIAGRAM

## FUNCTIONAL DESCRIPTION

The transmit section in the upper-half of the block diagram is composed of an input gain amplifier, an anti-aliasing filter (ANTI-ALIAS), a band-pass filter (COS, LPT, and HPF), and a compressing coder (CODER). An auto-zero circuit (AZ) is also included in this section. The receive section (lower half) is composed of an expanding decoder (DECODER) and a low-pass filter (LPF).

## TRANSMIT SECTION

Analog signals are input to an operational amplifier to provide gain adjustment. This amplifier is followed by a 2nd order analog anti-aliasing filter (ANTI-ALIAS). This filter provides attenuation of 40 dB (typical) at the 256 kHz effective clock frequency of the following switched capacitor cosine filter (COS). From the cosine filter, the signals enter a 5 th order low-pass (LPF) clocked at 128 kHz , followed by a 3rd order high-pass filter (HPF) clocked at 128 kHz . The resulting band-pass characteristics meet both the D3/D4 specification and the CCIT G. 712 recommendation. The output of the high-pass filter is then sampled by the coder (CODEC) at 8 kHz . This coder transforms the analog signals into 8-bit words using compressing law. The encoded PCM data is then output serially from the OUTPUTREGISTER at a frequency determined by the external clock, 64 kHz to 3.152 MHz . An auto-zerocircuit (AZ) is utilized for DC offset correction.

## RECEIVE SECTION

This filter smooths the decoded signals and corrects for $\operatorname{Sin} X / X$ attenuation caused by the 8 kHz sample and hold operation. The decoder (DECODER) reconstructs the analog signals from the PCM data using expanding law. The decoder is followed by a 5th order low pass filter (LPF). This filter smooths the decoded signals and corrects them for the $\operatorname{Sin} \mathrm{X} / \mathrm{X}$ attenuation due to the 8 kHz sampling and holding operation.

## INTERNAL CLOCK

Two independent phase locked loops (PLL) generate internal clocks for the transmit and receive sections from the respective synchronization clocks (XSYNC and RSYNC).

## ANALOG LOOPBACK MODE

The analog loopback mode allows all decoding and coding functions to be exercised without using the analog input (AIN) and analog output (AOUT). In this mode, a digital input signal is decoded and internally routed to the transmit filters.

Theoutput is available from the digital output (DOUT). The analog output (AOUT) is forced to the analog ground (AG) level. The analog loopback mode is selected by connecting the $\mathrm{PD} / \mathrm{L}$ input to the negative supply voltage (-VS).

## POWER DOWN MODE

Two power down modes are provided. The transmit and receive sections independently go into power down operation in the absense of the respective synchronization clock (XSYNC and RSYNC). If the external power down input (PD/L) is connected to a TTL low level, both the transmit and receive section are powered down regardless of the synchronization clocks. During power down operation, AOUT is forced to the level of AG, and DOUT goes into a high-impedance state.

## TEST MODE

The VREF/T pin is connected to-VS, test mode allows independent evaluation of the coder and decoder. In this mode, AIN is internally connected to the input of the coder and its output is available on the DOUT pin. Also, the output of the decoder is made available on pin AOUT.

MB6021 MB6022

## PIN DESCRIPTION

| MB6021, MB6022 |  | Description |
| :---: | :---: | :---: |
| Pin Name | Pin No. |  |
| AIN | 1 | Analog Input. This is an input pin for analog signals to be filtered and coded. |
| $\begin{aligned} & \text { GA1 } \\ & \text { GA2 } \end{aligned}$ | $\begin{aligned} & 2 \\ & 3 \end{aligned}$ | Gain Adjust 1 <br> Gain Adjust 2 <br> These pins are provided for adjusting the gain of transmit section. GA1 and GA2 are the inverting input and output of the amplifier, respectively. GA2 can drive a load impedance of 10 to $20 \mathrm{k} \Omega$ and 50 pF or less. |
| AG | 4 | Analog Ground. All analog signals are referenced to this pin. |
| AOUT | 5 | Analog Output. This pin outputs the decoded and filtered analog signals. It can drive a load impedance of $3 \mathrm{k} \Omega$ or greater, and 100 pF or less. This output is forced to $A G$ level in the analog loopback mode and power down mode. |
| VREF/T | 6 | Reference Voltage Supply/Test. This pin is provided for the supply of an external voltage reference, for the selection of an internal reference, or for the selection of test mode. If VREF/T is greater than 2 V , the external voltage reference is selected. In this mode, a 2.5 V reference is recommended. If this pin is at the TTL low level or left open, the internal reference ( 2.5 V ) is selected. If this pin is connected to -VS, the test mode with the internal reference results. In this mode, AIN is internally connected to the input of the coder and its output is available on the DOUT pin. <br> Also, the output of the decoder is directly available on the AOUT pin. |
| +VS | 7 | Positive Voltage Supply, $+5 \mathrm{~V} \pm 5 \%$. |
| DIN | 8 | Digital Input. This is a TTL compatible input to the decoder and accepts an eight-bit data word into the shift register on the falling edge of RCLK. |
| RCLK | 9 | Receive Clock. This TTL compatible input defines the bit rate on the receive PCM highway. The device can operate with clock rates of 64 kHz to 3.152 MHz . The digital PCM codes are accepted on the falling edge of the clock. |
| XCLK | 10 | Transmit Clock. This TTL compatible input defines the bit rate on the transmit PCM highway. The device can operate with bit rates of 64 kHz to 3.152 MHz . The digital PCM codes are shifted out of the digital output (DOUT) pin on the rising edge of the XCLK. |
| RSYNC | 11 | Receive Synchronization Clock. This TTL compatible input defines the beginning of the receive timeslot on the receive PCM highway. It must be synchronized with RCLK. The clock rate is typically 8 kHz and its duration can be equal to or more than one RCLK cycle. |
| XSYNC | 12 | Transmit Synchronization Clock. This TTL compatible input defines the beginning of the transmit timeslot on the transmit PCM highway. It must be synchronized with XCLK. The clock rate is typically 8 kHz and its duration can be equal to or more than one XCLK cycle. |
| DG | 13 | Digital Ground. All digital signals are reference to this pin. |
| PD/L | 14 | Power Down/Analog Loopback. This three level input is provided for the selection of power down mode or analog loopback mode. If this pin is at the TLL high level, the normal operation is selected. If this pin is at the TTL low level, the device is powered down regardless of the synchronization clocks. <br> If this pin is connected to -VS, the analog loopback mode is selected. In this mode, the output of the receive filter in internally connected to the input of the transmit filter and AOUT is forced to AG level. |
| DOUT | 15 | Digital Output. This is a TTL compatible open-drain output. A pull-up resistor greater than $0.5 \mathrm{k} \Omega$ must be connected to +VS. PCM digital codes are shifted out of the device on the rising edges of XCLK in a serial format. This output goes into high-impedance state when eight bits are shifted out of the output shift register. |
| -vs | 16 | Positive Voltage Supply, $-5 \mathrm{~V} \pm 5 \%$. |

## Quality Control at Fujitsu

## Built-in Quality and Reliability

Fujitsu's integrated circuits work. The reason they work is Fujitsu's single-minded approach to built-in quality and reliability, and its dedication to providing components and systems that meet exacting requirements allowing no room for failure.

Fujitsu's philosophy is to build quality and reliability into every step of the manufacturing process. Each design and process is scrutinized by individuals and teams of professionals dedicated to perfection.

The quest for perfection does not end when the product leaves the Fujitsu factory. It extends to the customer's factory as well, where integrated circuits are subsystems of the customer's final product. Fujitsu emphasizes meticulous interaction between the individuals who design, manufacture, evaluate, sell, and use its products.

Quality control for all Fujitsu products is an integrated process that crosses all lines of the manufacturing cycle. The quality control process begins with inspection of all incoming raw materials and ends with shipping and reliability tests following final test of the finished product. Prior to warehousing, Fujitsu products have been subjected to the scrutiny of man, machine, and technology, and are ready to serve the customer in the designated application.

# Ordering Information - At a Glance 

Page Title
10-3 IC Packages, Inserted Types
10-4 IC Packages, Surface Mounted Types
10-6 Part Number System

## IC Packages

This section on Fujitsu packages is arranged as follows:

1. Package technology: inserted or surface mount types.
2. Package types within the technology.
3. Package type illustration and description with (a) package width(s) and (b) lead pitch (when applicable).
4. Package material.
5. Package ordering code. This code appears as a suffix to the product part number. See Part Number System in this section.

For the most up-to-date device and packaging information, including available packages and exact ordering code, please contact your nearest Fujitsu Sales Office, Sales Representative, or Distributor. (See the Sales Information section of this book.)

## Inserted Packages

Inserted Packages (Continued)

| Package Type |  | Description | Package Material | Fujitsu Ordering Code (Suffix) |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Zig-zag In-line Package <br> Package width: 100 mil Lead pitch:50 mil 100 mil (modules) | Plastic | PSZ |
| ZIP |  |  |  |  |

## Surface Mount Packages

| Package Type |  | Description | Package Material | Fujitsu Ordering Code (Suffix) |
| :---: | :---: | :---: | :---: | :---: |
| FPT |  | Flat (Disk Button type) Package | Ceramic | CF |
|  |  |  |  |  |
| LCC | (ays) | Leadless Chip Carrier Lead pitch: $40,50 \mathrm{mil}$ | Ceramic with Frit seal | TV |
|  |  |  | Ceramic with metal seal | CV |
| PLCC |  | (Plastic) Leaded Chip Carrier Lead pitch: 50 mil | Plastic | PD or PV |
|  |  |  |  |  |
| QFP |  | Quad Flat Package Lead pitch: 0.65, 0.80, $1.00 \mathrm{~mm} ; 0.50 \mathrm{~mm}$ for straight leads | Plastic | PFQ |
|  |  |  | Ceramic | CFQ |
| SQFP |  | Shrink Quad Flat Package Lead pitch: 0.50 mm | Plastic | PFQV or PFV |
|  |  |  |  |  |
| TQFP |  | Thin Quad Flat Package (Thin profile) Lead pitch: 0.50 mm | Plastic | PFT |
|  |  |  |  |  |
| SOJ | (\%) | Small Outline Package with J-leads <br> Lead pitch: 50 mil | Plastic | PJ |
|  |  |  | Ceramic | CJ |
|  |  |  |  |  |

## Part Number System

## Standard Products Part Number

Found on most Standard Products: Memory, Analog, Logic, Telecommunications, Microprocessor, and Special Controller Products

## 8-Pin SMT Piezoelectric SAW Filter

## Examples:

Memory Product, MB81C1001A-60 PFTN
MB Fujitsu
81C1001 DRAM Device
A Die Revision
60 Access Speed (60 ns)
L Low Power Feature
PFTN Plastic SOP (Package) with normal leads

Telecommunications Product, MB87086AP
MB
Fujitsu
87086 PLL Device
A Die Revision
P Plastic DIP (Package)

Analog Product, MB3731PS
MB Fujitsu
3731 Audio Power Amplifier PS Plastic SIP (Package)

Controller Product, MB8876AC
MB Fujitsu
8876 Floppy Disk Controller
A Die Revision
C Ceramic DIP (Package) with metal seal

## Introduction to Fujitsu

## Fujitsu Limited (Japan)

Fujitsu Limited was founded as a telecommunications equipment manufacturer in 1935, and today is not only one of Japan's leading telecommunications companies, but also one of the world's largest computer manufacturers.

This leadership has resulted, at least in part, from the superb quality of the company's semiconductors and electronic components. Manufactured by the company's Electronics Devices Operations Group, these vital electronic devices also contribute to the high reliability and performance of products made by many other manufacturers around the world.

Today, Fujitsu is one of the world's top manufacturers of semiconductors and electronic components. In Japan, Fujitsu's R\&D laboratories for semiconductor and electronic components are situated in Kawasaki and Mie, and manufacturing works are located in Iwate, Aizu, Wakamatsu and Suzaka. Fujitsu also has six affiliated manufacturing works in the country. Overseas facilities in the U.S, Europe, and Asia also help to meet the growing global demand for Fujitsu semiconductors and electronic components.
Fujitsu enforces strict quality control at all stages of production, from materials selection through manufacturing to final testing. As a result, Fujitsu's electronic devices are known for their extremely high reliability and excellent cost-to-performance ratio.

Fujitsu manufactures a full line of semiconductors and electronic components to meet the diverse applications of a wide variety of customers. Backed by Fujitsu's extensive R\&D commitment equal to over 10 percent of annual sales, Fujitsu's electronic devices stay on the cutting edge of electronics technology.

## Introduction to Fujitsu

## Fujitsu Microelectronics, Inc. (U.S.A.)

Fujitsu Microelectronics, Inc. (FMI), with headquarters in San Jose, California, was established in 1979 as a wholly-owned Fujitsu Limited subsidiary for the marketing, sales, and distribution of Fujitsu integrated circuit and component products. Since 1979, FMI has grown to four marketing divisions and two manufacturing divisions. FMI offers a complete array of components including semiconductor products for its customers throughout North and South America.

The Advanced Products Division (APD) is responsible for designing and selling a full line of SPARC processors, peripheral chips, and the EtherStar ${ }^{\text {TM }}$ LAN controller that it designed. The EtherStar LAN controller is the first VLSI device to integrate both StarLAN ${ }^{\text {TM }}$ and Ethernet ${ }^{\circledR}$ protocols into one device. The core of APD's EtherStar chip was the result of a cooperative venture with Ungermann-Bass.

The Microwave and Optoelectronics Division (MOD) markets GaAs FETs and FET power amplifiers, lightwave and microwave devices, optical devices, emitters, and SI transistors.

The Electronic Components Division (ECD) markets connectors, keyboards, thermal printers, plasma displays, and relays.

The largest FMI marketing division is the Integrated Circuits Division (ICD) which markets the following standard devices, components, and ASICs.

| Memory Products | BiCMOS SRAMs |
| :--- | :--- |
|  | Bipolar PROMs |
|  | CMOS Masked ROMs |
|  | CMOS SRAMs |
|  | DRAMs |
|  | ECL RAMs |
|  | EEPROMs |
|  | EPROMs |
|  | NOVRAMs |
|  | STRAMs (self-timed RAMs) |
| Memory Module Products | DRAM modules |
| Memory Card Products | Memory Cards: |
|  | EPROM, Flash, OTPROM, and SRAM |
|  | Controller |
|  | Design kits |
|  | Programming adaptors |
| Telecommunication Products | CODECs |
|  | Modems |
|  | Piezoelectric devices |
|  | PLLs |
|  | Prescalers |
|  | Telephone ICs |
|  | VCOs |

## Introduction to Fujitsu

## Introduction to Fujitsu

Design and customer support for ASIC products are available throughout the country and at FMI Sales Offices located in Atlanta, Boston, Chicago, Dallas, Denver, Irvine, Minneapolis, Portland, and San Jose,

FMI's manufacturing divisions are in San Diego, California and Gresham, Oregon. The San Diego Manufacturing Division (SMD) assembles and tests memory devices. The Gresham Manufacturing Division (GMD) began manufacturing in 1988. GMD fabricates wafers, and produces ASIC products and DRAM memories.

## Introduction to Fujitsu

## Fujitsu Electronic Devices Europe:

Fujitsu Mikroelektronik GmbH (FMG), West Germany
Fujitsu Microelectronics Limited (FML), U.K.
Fujitsu Microelectronics Italla S.R.L (FMIL), Italy
Fujitsu Microelectronics Ireland, Ltd. (FME), Ireland
Fujitsu Mikroelektronik GmbH (FMG) was established in June 1980 in Frankfurt, West Germany, as Fujitsu's European headquarters and is a totally owned subsidiary of Fujitsu Limited, Tokyo. Fujitsu Microelectronics Limited (FML) is a sister company based in Maidenhead, England and dedicated to serving the U.K., Ireland, and Scandanavia. Fujitsu Microelectronics Italia (FMIL) is based in Milan, Italy and serves Italy, Spain, Portugal, and the rest of Southern Europe. Together, FMG, FML, and FMIL supply the European market with a full range of semiconductors and electronic components. Sales offices are located in Munich, Frankfurt, Stuttgart, Paris, Eindhoven, Milan, Maidenhead, and Stockholm.

Fujitsu Microelectronics Ireland, Ltd. (FME) was established in 1980, in Dublin, Ireland, as Fujitsu's European Assembly Center for integrated circuits. FME produces DRAMs, EPROMs, and other LSI memory products.

Fujitsu has two European VLSI design centers, both in the U.K. The Manchester Design Center, in operation since 1983, is equipped with two mainframe computers and is linked by satellite to production plants in Japan and the U.S. Staffed with a team of experienced engineers, the center is involved in the design of VLSI standard products, SuperMacros, CAD tools and ASICs. A second design center was set up in London in 1990 for designing telecommunication ICs. Additionally, Fujitsu offers a network of 17 ASIC design centers in eight European countries.

Fujitsu has further demonstrated its commitment to the European market by commencing construction of a full wafer fabrication plant in Durham in the North of England. The new plant is due to start production of 4 megabyte DRAMs and ASICs in 1991.

## Introduction to Fujitsu

| Memory Products | DRAMs <br> SRAMs <br> EPROMs <br> EEPROMs <br> Mask ROMs <br> Bipolar PROMs <br> Video RAMs <br> ECL RAMs <br> Memory modules <br> Memory cards |

## Introduction to Fujitsu

## Fujltsu Microelectronics Asia PTE Ltd. (Singapore)

Fujitsu Microelectronics Asia PTE Ltd. (FMAP) opened in August 1986, in Hong Kong, as a wholly-owned Fujitsu subsidiary for sales of electronic devices to the Asian, Australian, and Southwest Pacific markets. In 1990, FMAP moved to a new location in Singapore.
FMAP offers memory, ASIC, microprocessor, and telecommunication products along with Fujitsu's wide range of electronic components.

12-3 Application Note. Prescalers and PLLs: Fujitsu Prescalers and Phase-Locked Loops for VHF and UHF Frequency Synthesis. A Tutorial with Selection Guides

## Prescalers and PLLs

# Fujitsu Prescalers and Phase-Locked Loops for VHF and UHF Frequency Synthesis 

A Tutorial with Selection Guides

Fujitsu Microelectronics, Inc.
Field Applications Engineering

#### Abstract

This Application Note includes a broad introduction to the relevant high frequency synthesis theory and its application areas, a description of prescaler and phase-locked loop (PLL) components, and guidelines for selecting and designing with Fujitsu's extensive selection of prescaler and PLL IC products.

## Contents

Introduction ..... 13-9
PLL Tuning Systems ..... 13-9
What is a PLL? ..... 13-11
Frequency Synthesis With PLLs and Prescalers ..... 13-12
The Pulse Swallow Method ..... 13-13
Stand-alone PLLs and Integrated PLLs ..... 13-14

## Introduction

Phase-locked loops (PLLs) and prescalers are used for synthesizing and controlling frequencies in a multitude of high frequency systems. These systems range from radio and television broadcasting, cellular phones, computer local area networks (LANs), and measurement instrumentation to satellite and microwave systems.
Dedicated PLL integrated circuits (ICs) are manufactured in CMOS technology and typically operate in the $20-30 \mathrm{MHz}$ range (maximum). Prescalers manufactured in bipolar ECL or GaAs technologies are considered interface ICs that allow the relatively slower PLLs to accurately control and select frequencies well into the microwave range ( $>1 \mathrm{GHz}$ ).

Fujitsu manufactures a broad range of high frequency telecommunication ICs that includes prescalers, PLLs, integrated PLLs, as well as microcontrollers with onboard PLL and prescaler circuits.

## PLL Tuning Systems

Tuning of telecommunication senders and receivers is, by far, the largest application area for today's PLLs and prescalers. High frequency PLLs have largely replaced older methods such as direct tuning an RC or LC oscillator to the desired local oscillator frequency.

At the expense of a quantized (instead of a continuous frequency) resolution, PLLs and the so-called digital tuning circuits into which they are incorporated provide a cheaper, faster, more compact and reliable solution to tuning circuitry. The fact that PLLs only allow selection of frequencies in discrete steps, rather than over a continuous range, is not a concern because the available frequencies (for airwaves, long distance telephone cables, satellites, microwave links, ISDN etc.) are heavily regulated and limited to preassigned channel frequencies.
The frequency position and spacing between channels depends on the physical carrier medium and the program material involved. For example, U.S. airwaves regulations of the Federal Communications Commission (FCC) specify that:

AM radio must be broadcast at $530,540,550$ to 1610 , or 1620 kHz
FM radio must be broadcast at $87.9,88.1$ to $107.7,107.9 \mathrm{MHz}$
TV (channels 2-69) must be broadcast at $55.25,61.25,67.25,77.25,83.25$ to $795.25,801.25 \mathrm{MHz}$.
These frequencies represent the center frequencies of each channel. The spacing of 10 KHz between assigned AM channels, 200 kHz between assigned FM channels, and 6 MHz between assigned TV channels reflects the progressively higher bandwidths necessary for FM and TV.
Other regulated frequencies worth mentioning within the VHF ( $30-300 \mathrm{MHz}$ ) and UHF ( $300 \mathrm{MHz}-3$ GHz ) bands include: $46 / 49 \mathrm{MHz}$ for cordless telephones, $800-900 \mathrm{MHz}$ for cellular phones (also known as land mobile radio services), $0.1-1.5 \mathrm{GHz}$ for cable TV and $>2 \mathrm{GHz}$ for emerging Digital TV standards and Integrated Services Digital Network (ISDN). Fujitsu prescalers and PLL ICs are appropriate for most of these applications.

Figure 1 shows a superheterodyne FM broadcast receiver and some of the involved spectra and frequencies. For an example, let us examine the steps involved in tuning to the FM station at 88.1 MHz .

Figure 1. A Typical Heterodyne FM Receiver Tuned to the $88.1 \mathbf{M H z}$ Signal
The antenna is exposed to a multitude of transmission frequencies. In order to retrieve the desired signal, several stages of amplification and progressive selective filtration must be applied. In FM broadcasting each radio station is allowed to use up to 150 kHz around the assigned center frequency. Since the spacing between the assigned channels is 200 kHz , this leaves a $50-\mathrm{kHz}$ wide isolation gap between the stations to avoid a spectral overlap. Thus, a $150-\mathrm{kHz}$ wide filter can be used in the final stage to isolate the desired station from all the others. Accurate tuning of such a narrow filter over the $20-\mathrm{MHz}$ wide FM frequency range is not an easy task. To achieve accurate tuning, the filter is kept at a constant frequency, the so-called Intermediate Frequency (IF), and the desired radio signal is shifted in frequency to fall exactly within the filter passband. 10.7 MHz is the broadly used value for IF in commercial FM tuners.

The antenna signal is converted to a lower frequency by mixing (or heterodyning) with an appropriately chosen local oscillator frequency $f_{l o c}$. A PLL is employed for synthesizing floc. In order to place the desired radio station (originally located at $f_{\text {in }}$ ) exactly at the center of the IF bandpass filter, the PLL frequency $f_{l o c}$ must be set so that IF $=f_{l o c}-f_{\text {in }}$. In other words, to tune to the 88.1 MHz signal, a $f_{l o c}$ of $88.1+10.7$ $\mathrm{MHz}=98.8 \mathrm{MHz}$ is necessary. Tuning to another signal is accomplished by selecting a different $f_{\text {loc }}$.
An appropriate FM demodulator working at the IF provides the final restoration of the original signal.
On the sender side (see Figure 2) the sequence is reversed: a modulated IF signal is mixed with the local frequency oscillator up to the appropriate channel-frequency and broadcast.

Figure 2. A Typical Heterodyne (Audio) Sender
Near-ideal PSK, PM, or FM demodulators can be implemented with PLLs as well as local oscillators.

## What is a PLL?

A PLL is a control loop consisting of a phase detector (PD), low pass filter (LPF), voltage controlled oscillator (VCO), program counter(s), and, as necessary, single- or dual-modulus prescalers. (See Figure 3.)

Figure 3. A Basic PLL Configuration
The output of the PD is a voltage indicating the phase difference between its two inputs.
The LPF smooths the PD output and determines the dynamic performance of the loop. The dynamic performance includes general servo loop issues, such as the capture and lock ranges, the noise suppression bandwidth and the transient response.
When the loop is out of lock, the PD voltage changes the frequency of the VCO in a direction that reduces the phase difference between the input signal and the local oscillator signal. When the loop is locked, the signals at both inputs are in phase and have the same frequency.

Generally speaking, the output of the VCO is considered the desired PLL output. It should be mentioned, however, that in some instances (such as when a PLL is used as an FM de-modulator), the filtered output of the PD, rather than the output of the VCO, can be viewed as the system output.
The bandwidth of the low-pass loop filter is crucial to the dynamic- and noise-filtering performance of the loop. The two performance requirements are conflicting, since faster lock-up times require wider LP filters while better noise characteristics are achieved with narrower filters. Therefore, a reasonable compromise has to be met for each application.

Narrow filter bandwidths provide long-loop averaging times and are useful in applications where a noisy, intermittent, or varying reference source must be cleaned up.
For example, in digital LANs, a PLL is used to regenerate a local clock rate from frame synchronization bits, which appear intermittently on most asynchronous communications networks.
In a similar way, the "flywheel synchronizers" for vertical ardi horizontal scan in today's TV receivers, are operated using PLL circuits. In both cases the "slow" lowpass filter maintains a relatively constant VCO frequency between occurrences of synchronization patterns on the input.

In frequency synthesis applications, the reference frequency source will typically be a high quality, relatively noise-free, crystal oscillator. The loop filter can be extensively wide to provide for fast switching times without compromising noise performance.

A novel approach to PLL design is to electronically bypass the loop filter during the bulk of a frequency switching period and then to activate it back into the loop for final lock-in.
As previously mentioned, the loop filter is the single most important factor in determining the dynamic performance of the servo loop. A thorough theoretical treatment of servo loop analysis is beyond the scope of this publication. References 1 through 4 listed in the back of this note are recommended for more in-depth information.

## Frequency Synthesis With PLLs and Prescalers

Figure 4 shows a simple frequency-synthesizing configuration employing a PLL and a single program counter.

Figure 4. Frequency Synthesis with a Programmable Counter
When the loop is in lock, the two input frequencies of the PD are equal, hence:

$$
f_{r e f}=f_{o} / N \Leftrightarrow f_{o}=N \cdot f_{r e f}
$$

A reprogramming of " $N$ " by +1 or -1 will result in selection of a new output frequency with channel separation of $f_{\text {ref. }}$.
The scheme of Figure 4, although attractive in its simplicity, is only applicable to output frequencies below 40 MHz , since higher VCO frequencies will exceed the program counter's toggling rate.
Figure 5 shows a widely used remedy to the high frequency problem: a $1 / M$ prescaler is inserted in the feedback loop as a buffer between the VCO and the program counter. This lowers the program counter's input frequency to $f_{\text {out }} / M$ instead of $f_{\text {out }}$.

Figure 5. Prescaler Accommodating for a Slow Program Counter
Figure 5 also shows a reference frequency divider, $1 / R$, inserted in the reference frequency path to allow more flexibility in output frequency programming. Without the reference frequency divider, the presence
of the prescaler would result in broadening the channel separation to $M \bullet f_{\text {ref }}$. A resolution of $f_{\text {ref }}$ is maintained by setting $R$ equal to $M$.
In many cases, the scheme of Figure 5 is a satisfactory solution, with one drawback. Compared to Figure 4, the operational frequency of the phase detector is lowered by the prescaling factor $M$. A lowered PD frequency necessitates use of a narrower low-pass filter to suppress spurious output signals from the phase detector at the comparison frequency and its harmonics. Especially in very high frequency synthesizers, where the divide ratio of the prescaler becomes substantial, the loop's lock-in and switching speed characteristics will be severely degraded as a result of narrowing the lowpass filter.

## The Pulse Swallow Method

The widely used "multi-modulus division", also known as pulse swallowing (see Figure 6), offers a solution to previously mentioned problems. This method employs two programmable counters and a dual modulus prescaler inside the loop. (For simplicity the reference frequency divider is not shown.)

Figure 6. Pulse Swallow

## A description of the pulse swallow method is as follows:

$N$ must be larger than $A(N>A)$. The dual modulus prescaler is initially set to divide by $M+1$. After " $A$ " pulses out of the prescaler, the swallow counter is full and changes the prescaler modulus to $M$. After additional ( $N-A$ ) pulses out of the prescaler, the program counter changes the prescaler modulus back to $M+1$, restarts the swallow counter and the cycle repeats.

In this way each cycle of the $1 / N$ counter is a result of:

$$
A \bullet(M+1)+(N-A) \cdot M=N \bullet M+A
$$

$$
\text { cycles of the } f_{\text {pit }} \text {. }
$$

In other words:

$$
f_{\text {out }}=(N \cdot M+A) \cdot f_{\text {ref }}
$$

Since $M$ is multiplied by $N$, but not $A$, the frequency will change by $f_{\text {ref }}$ when $A$ is changed by 1 . In this way both the channel separation and the PD frequencies are maintained at $f_{\text {ref }}$ to provide for an uncompromised loop performance.
As previously mentioned, more complex variations of the multi-modulus theme include: $N / N+Z$ prescalers (as in MB508 with 128/130, 256/258 and 512/514) and quad-modulus schemes involving multiple swallow counters and special prescalers.

## Stand-alone PLLs and Integrated PLLs

Figure 7 shows a general purpose high frequency synthesizer and the functional blocks. These blocks are: the PD, the reference counter, the A and the N counters and modulus control logic. The MB87014, manufactured entirely in CMOS, includes an onboard 180 MHz prescaler.

Figure 7. System Blocks
Advances in recent years in CMOS and BiCMOS (combined ECL and CMOS on one chip) have allowed integration of gigahertz prescalers on the same chip as the PLL. The architecture of these integrated PLL BiCMOS devices is illustrated in Figure 8.

Figure 8. Fujitsu's Integrated PLL ICs

Before discussing the blocks on the PLL chip, let us briefly mention the circuits not found on it. As stated earlier, the low-pass filter must yield a good compromise between accommodating the desired noise and switching characteristics on one side and removing spurious components from the phase detector output on the other side. A charge pump output (see Figure 14) from the PLL is provided in most cases, allowing direct connection of an external passive RC filter. The charge pump output is simply a very high impedance output ( $Z_{\text {out }} \geq 400 k \Omega$ ) well suited to drive high- $Q$ resonant circuits found in the VCO. Optionally, an unbuffered PD output is often also made available for connection of custom external active filter configurations. Typical filter bandwidths for frequency synthesis are $1-10 \mathrm{kHz}$.

The prescaler and the VCO are the only two devices actually operating at the high output frequency $f_{\text {out }}$.
The VCO is frequently custom made for a specific application. Some popular oscillator types, in order of decreasing phase and frequency-stability, but increasing frequency coverage and linearity, are as follows:

- PLL IC with an on-chip inverter/buffer for an external reference frequency oscillator
- Voltage controlled crystal oscillator with varactor diode (also known as VCXO)
- LC oscillator with a varactor diode
- RC multivibrator

A list of crystal oscillator and VCXO manufacturers can be found in reference 11.

*Dual Device

## Selecting a PLL

The specifications to consider when selecting a PLL are as follows:

## Width of the counters

The most significant feature of the various PLL devices (since operating speed is practically the same for all), is the width of their counters. In general, the width (in bits) of the reference counter determines the frequency resolution ( $\Delta f_{\text {channel }}=f_{\text {ref }} / R$ ) obtainable from the system. The width of the programmable counter, ( $1 / N$ ) (see Figure 7) and the swallow counter ( $1 / A$ ) determine the number of channels that can be covered. Fujitsu devices are available with up to 18 -bit wide combined program and swallow counters, and 16 -bit wide reference counters.

## Selecting the $N$ and $A$ counters

It is easily observed from the dual-modulus equation $\left[f_{\text {out }}=(N \bullet M+A) \bullet \Delta f_{\text {channel }}\right]$ that $A$ need not assume values higher than the prescaler modulus $M$, since setting $A$ equal to $M+X$ is equivalent to setting $A$ equal to $X$ and increasing $N$ by 1 . Hence, all possible channels can be covered in a dual modulus configuration if the programmable swallow counter number $(A)$ is allowed to assume all values from 0 to $M-1$, where $M$ is the modulus of the $M / M+1$ prescaler:

$$
\bullet 0 \leq A \leq M-1
$$

Under all circumstances the condition $\mathrm{N} \geq \mathrm{A}$ must be satisfied:

$$
-N_{\min }=A_{\max }=M-1
$$

To select the right PLL counters for your application, supply the information that is requested in the following guide.

## PLL Counter Selection Guide

1. Identify maximum and minimum output frequency desired, $f_{\text {out }}, \max$ and $f_{\text {out }}, \min$.
2. Select a $M / M+1$ prescaler, so that $f_{\text {out, } \max } / M$ can be accommodated by the PLL ( $<20 \mathrm{MHz}$ typically).
3. Identify desired channel spacing(s), $\Delta f_{\text {channel }}$ -
4. Let $A=0$, then $N_{\text {min }}=f_{\text {out }, \min } / \Delta f_{\text {channel }}$ and $N_{\max }=f_{\text {out }, \max } / \Delta f_{\text {channel }}$.
5. Verify that $N_{\min } \geq M-1$; if not, select a bigger prescaling modulus and go back to step 3 .
6. Select an $N$ program counter with enough bit-width to accommodate the value of $N_{\max }$.
7. Select an $A$ swallow counter with enough bit-width to accommodate the value $M-1$; set all higher bits to 0 .
8. Select the reference frequency divider ( $R$ ) and a crystal reference frequency so that $f_{\text {ref }} / R=\Delta f_{\text {channel }}$.

## A Practical Example: Selecting the PLL IC for an FM Receiver

We are going to select the appropriate PLL IC and prescaler for the local oscillator of the superheterodyne FM receiver shown earlier in Figure 1. In order to receive an FM station at $f_{i n}$, the local oscillator must be set to $f_{\text {loc }}=f_{\text {in }}+10.7 \mathrm{MHz}$. For receiving all FM stations, $f_{l o c}$ has to be selectable between 98.6 MHz and 118.6 MHz in 0.2 MHz steps; that is 101 positions in total.

To select a PLL for our example FM Receiver, we used the PLL Selection Guide, supplied the required information (see Example), and selected the appropriate PLL.

## Example

1. $f_{\text {out }, \max }=118.6 \mathrm{MHz} f_{\text {out }}=98.6 \mathrm{MHz}$
2. Choose the MB503 prescaler $(M=16)$
$f_{\text {out }, \max } / \mathrm{M}=7.4 \mathrm{MHz}<20 \mathrm{MHz}$
3. $\Delta f_{\text {channel }}=0.2 \mathrm{MHz}$
4. $N_{\text {min }}=f_{\text {out }, \text { min }} / \Delta f_{\text {channel }}=493$
$N_{\max }=f_{\text {out }, \max } / \Delta f_{\text {channel }}=593$
5. $N_{\max }>16$, OK
6. $N_{\max }$ of 593 requires a 10 -bit wide N -counter

- A 4-bit wide (swallow) counter
- Either an MB87001A or an MB87006A
- Choose MB87001A

8. Choose an fref of 3.2 MHz and set the R-counter to 16 to yield $\Delta f_{\text {channel }}=0.2 \mathrm{MHz}$

## Programming of the counters

In order to preserve board space, all Fujitsu PLLs have serially programmable counters. The divisor values are fed through a serial pin to a shift register and latched-in with a control pulse. This allows 16-pin packaging to be used for all devices.
Set-up and switching times of the counters and modulus control logic
These delays are important and can become a limiting factor, especially when operating in pulse swallow mode. When the circuit has counted down so that the $N$ program counter is full, the whole counter system is reset. The reset function must be completed within the next cycle of the $M / M+1$ prescaler or,

$$
t_{\text {reset }}<M / f_{\text {out }, \max }
$$

Where $t_{\text {reset }}$ equals the sum of propagation delays through the $A$ and $N$ counters, (the required modulus set-up time of the prescaler and release time of the modulus control logic).

## Positive or negative edge triggering of counters

As previously mentioned, when the modulus of a dual-modulus prescaler is changed from 64 to 65 , one half-cycle of the output (output low) will be extended to 33 input cycles. The other half-cycle will remain unchanged at 32 input cycles.
Therefore, modulus set-up time of the prescaler will be expressed relative to an edge of the affected halfcycle (in this case the negative-going edge). If the program counters and the modulus control logic are triggered on an opposite edge, valuable set-up time margin will be lost. (See Figures 11 and 12).
When necessary, insertion of a fast inverter between the prescaler and the program counter may provide some timing relief.

Figure 11. PLL Program Counter Triggered by Opposite Edge

Figure 12. PLL Program Counter Triggered by Same Edge

## Phase detector

There are some differences between analog and digital phase detectors.
An analog phase detector works on a so-called integrating multiplier principle (Gilbert Cell multiplier is one example) and reflects not only timing differences, but also (if the signals are not purely sinusoidal or square) differences in the shape of the input signals. Analog phase detectors can offer superior signal-tonoise ( $\mathrm{S} / \mathrm{N}$ ) ratios and can react almost instantaneously to minute changes in input waveforms. However, they are relatively complex and lend themselves poorly to high speed CMOS integration.
The digital phase-frequency detector is a simple and extremely fast sequential circuit (4 flip-flops). The circuit detects only positive-going threshold crossings and indicates which of the two inputs is ahead of the other one. It is not dependent on the shape of the signals. The digital phase-frequency detector is in all Fujitsu PLLs.

## Charge pump

The single-ended output from the phase detector is called the internal charge pump. The three-state charge pump output goes high when $f_{r e f}>f_{v c o}$, low when $f_{r e f}<f_{v c o}$ and high-impedance state when $f_{r e f}=f_{v c o}$. This output can be connected directly to an active or passive external filter. The MB87014 provides an inverted charge pump output as well.

The charge pump output is derived from two flip-flops out of the phase detector, $\phi \mathrm{r}$ and $\phi \mathrm{v}$. In the case of MB87006A, MB87014 and the MB87086 ${ }^{1}$ when the loop is unlocked, the appropriate output terminal, $\phi$ or $\phi \mathrm{v}$, pulls low to indicate which of the two inputs $f_{\text {ref }}$ or $f_{\mathrm{vco}}$ is at a higher frequency.
The signals $\phi \mathrm{r}$ and $\phi \mathrm{v}$ would normally be considered an intermediate result; however, they are also made accessible on two output terminals allowing construction of an external charge pump.
A charge pump combines the two digital outputs ( $\phi \mathrm{r}$ and $\phi \mathrm{v}$ ) into one output. (See Figure 13.) The external configuration shown here also directly implements the lowpass filter. Note that due to different polarity assignments, this configuration is not appropriate for MB87001A, 87073, 87076, and the integrated PLLs. Also note that often a large resistor is inserted following the op-amp output to increase the output impedance.

Figure 13. Active Low Pass Filter
A fast external charge pump implementation appropriate for the MB87001A, 87073, 87076 PLLs, ICs, and an integrated PLL is shown in Figure 14. The $\phi r$ and $\phi v$ outputs on these devices are of the open-drain type. (The rest of the PLL family provides push-pull outputs for $\phi r$ and $\phi v$.)
${ }^{1}$ Note that the remaining Fujitsu PLLICs(MB87001A, 87073, and 87076), as well as the single-chip PLL/Prescaler family (MB1500), have a different phase detector design and a different truth table for $\phi \mathrm{r}$ and $\phi \mathrm{v}$ :

|  | $\phi r$ | $\phi \mathrm{v}$ |  |
| :--- | :--- | :--- | :--- |
| $f_{\mathrm{r}}>f_{\mathrm{V}}$ | $:$ | Low | Low |
| $f_{\mathrm{r}}=f_{\mathrm{V}}$ | $:$ | Low | High-Impedance |
| $f_{\mathrm{r}}<f_{\mathrm{V}}$ | $:$ | High | High-Impedance |

The $\phi$-outputs of these devices are open drain.
An external charge pump allows use of faster transistors or op-amps (higher slew rates) and may offer improvement in lock-in performance.

Figure 14. External Charge Pump Example

## Charge pump waveforms and $\phi r$ and $\phi v$

As previously mentioned, in the case of MB87006A, 87014 and 87086 (see footnote ${ }^{1}$ on the preceeding page), when the loop is unlocked, the appropriate output terminal, $\phi \mathrm{r}$ or $\phi \mathrm{v}$, pulls low to indicate which of the two inputs $f_{r e f}$ or $f_{v c o}$ is at a higher frequency. This active terminal, $\phi \mathrm{r}$ or $\phi \mathrm{v}$, will not stay at a steady low but will occasionally toggle to a high state. Basically, its output provides a pulse-width modulated representation of the frequency difference between the inputs.

When the loop is in lock, $\phi r$ and $\phi v$ will both be in the "high" state. However, synchronously with the phase comparison frequency, a short spurious negative pulse will occur at both outputs.

The same pulse anomalies will also appear on the output from the internal charge pump. One of the tasks of the loop lowpass filter is to remove all spurious signals (pulses) from the PD output. The loop filter bandwidth must, therefore, always be below the phase comparison frequency. Conversely the phase comparison frequency should be kept as high as possible.

## 4-bit Microcontrollers with PLLs

Fujitsu also offers a family of 4-bit microcontrollers, the MB88560 family with an on-chip PLL.The MB88560 family consists of two 4-bit CMOS microcomputers: the MB88561 with a liquid crystal display (LCD) controller/driver and the MB88562 with a vacuum fluorescent display (VFD) driver. Both devices contain 21 I/O lines, an 8-bit timer/counter, an A/D converter with 6-bit resolution, display drivers, and a PLL with prescalers suitable for all broadcast and shortwave frequencies. Each device has independent AM (up to 32 MHz ) and FM (up to 120 MHz ) inputs. Up to 4 K by 8 -bit ROM space and 256 K by 4 -bit static RAM space is available on-chip.

Both chips allow extremely compact designs of car radios, personal stereos, personal communication equipment, etc.
A two-part MB88560 design guide and a demo board are both available from Fujitsu.

## What is a Prescaler?

A prescaler is an integrated circuit that divides the frequency of an incoming signal by an integer $M$ (see Figure15). The divisor, $M$, is called the Modulus.

Internally, a prescaler is a specialized ripple counter, which counts incoming pulses and performs one output cycle for every $M$ received input cycle. If $M$ is an even number the output is toggled following every $M / 2$ input pulse. For $M$ odd, one of the toggles is delayed an extra input cycle (e.g., 6 input pulses for output high and 5 input pulses for output low for $M=11$ ).

Figure15. Frequency Division
There are distinct differences between prescalers and general purpose divide-by-N counters. We will refer to the latter as program counters and substitute the letter N when referring to them for the remainder of this text.

Prescalers are comparatively simple devices. They contain a minimal amount of logic (less than approximately 100 gates) and offer a few, well chosen modulus numbers. This streamlined architecture allows implementation in the fastest bipolar and GaAs technologies without excessive power consumption or expense. For example, the MB510 dual modulus prescaler from Fujitsu offers a choice of four divide ratios
(128, 144, 256 and 272). Manufactured in $0.8 \mu \mathrm{~m}$ bipolar technology, this 8 -pin device is ECL compatible, accepts input frequencies up to 2.7 GHz , and dissipates only 0.05 watts of power.
Program counters, on the other hand, contain a fair amount of programming and decoding logic in order to allow a wide selection of $N$ (any value of $N$ between 0 and $2 q^{-1}$ is made selectable using a $q$-bit wide program input). The relatively high internal gate count generally limits program counters to TTL or CMOS technology with toggling speeds of less than 40 MHz .
The important point to be made is that there is no need to make program counters faster, or prescalers more programmable. The distinction between the two types of devices is intentional. Once the frequency is brought down sufficiently by a prescaler, sophisticated frequency manipulation is performed with CMOS program counters and a PLL. Prescalers are generally classified as either single or dual modulus.
Dual modulus prescalers
Dual modulus prescalers allow a very rapid transition from a divide-by- $M$ mode to a divide-by- $M+1$ mode (e.g., from 64 to 65); hence, they are often also called $M / M+1$ prescalers ( $64 / 65$ ). In conjunction with PLLs and the pulse swallow method (discussed on page 14), dual modulus prescalers allow finer frequency resolution than single modulus prescalers.

Single modulus prescalers
Single modulus prescalers are fixed, or semi-fixed dividers that only divide by a fixed number $M$. A semifixed single modulus prescaler allows a choice of more than one modulus (e.g., 32, 64 and 128), but is not necessarily optimized for fast switching between moduluses, and the modulus choices are not spaced one apart.
Less common varieties of prescalers include:

- $M / M+Z$ (where $Z \neq 1$ ) dual modulus prescalers
- Four modulus prescalers
- Decimal single modulus prescalers

Figure 16 shows Fujitsu's bipolar prescaler ICs.

Figure 16. Selection Guide to the Fujitsu Bipolar Prescaler Family

## Microwave Prescalers

Microwave prescalers manufactured in GaAs technology are available from specialized vendors, including Fujitsu. The microwave prescalers have frequencies above 3 GHz (microwave range) and toggle speeds of up to 10 GHz . The cost of GaAs parts, however, is considered high when compared to ECL bipolar parts.

## Stand-alone Prescaler Application

Prescalers can be used as stand-alone components without a PLL.
A stand-alone application does not involve feedback of signals around the prescaler. The most common stand-alone application for a prescaler is in digital clock distribution networks, where a prescaler simply reduces an incoming clock rate and distributes it to slower analog or digital circuitry. (See Figure17.)

Figure 17. A Stand-alone Application of a Prescaler: Clock Rate Reduction
Prescalers offer several advantages as stand-alone elements. For example, consider an application that requires a high quality $1-\mathrm{MHz}$ reference signal. For this application, a straightforward, high quality $1-\mathrm{MHz}$ crystal oscillator might seem the most obvious choice; however, the highest quality will be
achieved with a higher frequency reference signal ( 10 MHz ) followed by a prescaler ( $1 / 10$ ). This application is preferred because of the following reasons:

- Crystal resonators with higher oscillation frequency tend to have smaller dimensions, shorter oscillation stabilization times and narrower characteristic variations.
- A prescaler will clean up the incoming high frequency signal in two ways:
- It will totally remove variations in the amplitude noise (amplitude envelope of the incoming signal), since its output amplitude is independent of the input.
- It will reduce the phase noise (jitter of zero-crossings) of the incoming signal by approximately a factor of $M$ since its output only switches synchronously with one out of every $M / 2$ input pulses.

The above reasons apply up to a certain point, or as long as the prescaling factor is moderate. The frequency of the crystal should not be increased to the point where RF shielding or board layout has to be changed. Increasingly small dimensions or the price of the crystal can also become a problem.
Numerous digital LSI ICs take advantage of the beneficial properties of prescaling; e.g., they have onboard prescalers that allow a direct connection of high frequency crystal clocks to slower internal logic. For example, Fujitsu's line of 4-bit microprocessors offers a built-in, divide-by-2 prescaler as a recommended option. This option allows the user to drive the $2-\mathrm{MHz}$ internal logic with a $4-\mathrm{MHz}$ crystal rather than a $2-\mathrm{MHz}$ crystal. With this option, the $4-\mathrm{MHz}$ crystal clock will turn on and be fully operational (as well as recover from any external disturbances) in half the time required for a $2-\mathrm{MHz}$ crystal.

## Selecting the Right Prescaler

To select the appropriate prescaler, first determine the necessary modulus choices and input toggling speeds.

## Toggling speed

One should be aware that a 1-GHz ( $f_{\text {in,max }}$ typically) prescaler does not abruptly stop functioning when fed frequencies above 1 GHz . The $1-\mathrm{GHz}$ prescaler will typically require higher input levels to trigger, and it may deliver a smaller output swing, but typically it will function up to a $20-50$ percent higher frequency. See Figure 18.
These characteristics are important, since frequency switching in a PLL is normally accompanied by a fair amount of overshoot. A VCO intended to stabilize at 1 GHz may reach, for example, 1.4 GHz before settling down. It is important that the loop (including the prescaler) remains functional during that period. Charts like Figure 18 can be helpful in verifying such cases.

Figure 18. Input Signal Amplitude Versus Input Frequency for MB509 Dual Modulus Prescaler
Prescalers with higher frequency ratings will typically be associated with higher power dissipation and higher switching noise. For example, measurements of gallium arsenide dividers suggest noise performances 20 to 30 dB worse than for ECL dividers (reference 10).

Also note that the input coupling capacitance of a prescaler will limit the lowest useful frequency.

## Termination resistor internal/external

All Fujitsu prescalers, except MB501LV, MB504LV, MB501SL, MB509, and MB510 have an open emitter output. Typically a $2.2 \mathrm{k} \Omega$ resistor to ground for a load capacitance of 12 pF is recommended. By choosing a smaller or a larger external resistor, the prescaler's output can be tailored to drive higher or lower loads, respectively.

The prescalers with on-chip termination can drive output load capacitances of up to 8 pF undistorted. A shunt resistance can be added for driving larger loads.

In some situations it is desirable to "overdesign" the termination resistor. The limited current driving ability will tend to smooth the output signal, thus reducing its harmonic content and switching noise induced into supply lines.
Stability of $V_{\text {out }}$
One of the purposes of prescaling is to eliminate amplitude modulation from the output of the VCO.
Therefore, it is absolutely mandatory that the output high and low are stable and guaranteed over a wide range of $\mathrm{V}_{\mathrm{in}}, \mathrm{V}_{\mathrm{cc}}$ and temperature.

## Flexibility of the input voltage

A prescaler should be able to toggle properly with relatively widely varying input voltage levels (anywhere between 0.15 to 2 Vp -p for the Fujitsu MB 504), while maintaining a constant output level.

## ECL level

For most Fujitsu prescalers the maximum allowable input voltage swing is 2 Vp -p. This means that a typical TTL voltage swing of 3 V will overload the prescaler, whereas ECL voltage levels can be accommodated without problems. The outputs of the prescaler are ECL compatible, too.
The statement "The outputs are 1.6 V peak on ECL level" found on the data sheet for MB501, 503, 504 etc. means that Fujitsu prescalers do not require negative supply voltages. In this sense they are not "true" ECL devices.

## Flexibility of $V_{c c}$

A wide operational range of Vcc is essential ( 2.7 V to $4.5 \mathrm{~V}, 3.0 \mathrm{~V}$ typical for MB501LV), if a prescaler is to be used in a battery-powered system. Most Fujitsu prescalers, except the low voltage (LV-suffix) types which operate from a 3 V supply, operate from a single 5 V supply. The integrated PLLs, MB1501 and MB1504, however, operate from a 3 V supply (a higher supply voltage between $\mathrm{V}_{\mathrm{cc}}$ and 8 V is required for the charge pump circuit).

## Modulus set-up time

The time from application of appropriate voltage to the modulus select pin to appearance of the correctly prescaled waveform at the output is $10-50 \mathrm{~ns}$. As previously discussed in the PLL section, fast modulus set-up times are necessary for correct implementation of the pulse swallow method.

## Input impedance and reactance

Excessive reactance may affect performance of the VCO and require buffer circuitry between it and the prescaler. For very high frequencies ( $>500 \mathrm{MHz}$ ), the input impedance should be given on a Smith chart. The nominal input impedance of Fujitsu's high frequency prescalers is $50 \Omega$.

## Smith chart

Signals on a printed circuit board travel at approximately $2 / 3$ the speed of light. This means that at frequencies above 500 MHz , the signal wavelengths become less than 0.4 m and comparable in size to the board itself. At this point, circuit board traces start acting as transmission lines; i.e., the RMS voltage level will vary along the trace unless impedances of the termination and the trace are matched.

A Smith chart is a graphical impedance representation widely used in transmission theory. It is a tool allowing an easy assessment of impedance mismatch.
The chart consists of two sets of circles: the constant resistance circles (see Figure 19) and the constant reactance circles (see Figure 20). The values of these circles are normalized to the characteristic impedance of the system by dividing the actual value of resistance or reactance by the characteristic impedance, for example, in a $50 \Omega$ system, a resistance of 100 W is normalized to a value of 2.0.
A further series of circles may be plotted on the chart; these are the circles of constant voltage standing wave ratio (VSWR) and represent the degree of mismatch in the system. The VSWR is the ratio of the device impedance to the characteristic impedance. It is always expressed as a ratio greater than 1 (a $25 \Omega$ device in a $50 \Omega$ system gives rise to a 2:1 VSWR). See Figure 21.

## Packaging

All Fujitsu prescalers are available in 8-pin DIP or surface mountable 8-pin plastic flat packages. Space saving and better stray capacitance performance are obtained with surface mounting.
CMOS PLLs and BiCMOS integrated PLLs are available in 16-pin DIP and Flatpacks.

Figure 19. Smith Chart Constant Resistance

Figure 20. Smith Chart Constant Reactance

Figure 21. Input Impedance of Fujitsu's MB501L Dual Modulus Prescaler as a Function of Frequency Shown on a Smith Chart

## Signal propagation delay through the prescaler

Although a signal delay through the prescaler will affect the lock-in times of the loop, the prescaler is, in this respect, of little importance relative to the loop lowpass filter. Extensive phase shifts between the input and the output of the prescaler may, however, affect the PLL stability.
High capacitive loading will typically be the main cause for delays. This situation can be remedied by decreasing the output termination resistor value, thereby improving drive performance.
Self-oscillation problems can be caused by poor grounding, lack of decoupling, or cross-talk due to board layout. Fujitsu prescalers are guaranteed to be non-oscillatory under most conditions.

## Balanced inputs

The ability to drive balanced inputs can be beneficial at high frequencies. All Fujitsu prescalers offer complementary inputs. The prescaler outputs, however, are single ended as they are intended to drive singleended PLL inputs.

## Output duty cycles

The output duty cycle should be 50 percent when the modulus is an even number (such as three input clock periods high and three input clock periods low for division with modulus 6). Division by an odd number should cause minimal deviation from 50 percent duty cycle (such as four input clocks high and three input clocks low for division with modulus 7). Rise and fall times are, of course, load dependent and deviations from idealized waveforms will occur. Also, clearly specify which of the output half-cycles (output low or output high) is the one that is extended in the $M+1$ mode of a dual modulus prescaler.
Power dissipation
Thanks to a proprietary, "third generation," $0.8 \mu \mathrm{~m}$ emitter self-align and polysilicon electrode and resistor (ESPER) manufacturing technology, Fujitsu can offer bipolar prescalers with the most beneficial frequency rating/power dissipation ratio available. See Table 3.

Table 3. Fujitsu Prescalers

| P/N | $\mathrm{F}_{\text {IN }}$ (MAX) | $\mathrm{V}_{\text {IN }}$ (MIN) | Divide Ratio | $\mathrm{I}_{\mathrm{cc}}$ (TYP) | Supply Voltage | Package |

Glossary

| CATV | Cable Television. |
| :--- | :--- |
| CB RADIO | Citizen Band Radio. The frequency bands allocated for short-distance personal or <br> business radio communication. Present USA bands are 26.965 to 17.405 kHz, |
| 72 to 76 MHz, and 462.550 to 467.425 MHz. |  |

## FUJITSU LIMITED

Marunouchi Headquarters
6－1，Marunouchi 1－chome
Chiyoda－ku，Tokyo 100，Japan
Tel：（03）216－3211
Telex：781－22833
FAX：（03）213－7174

[^8]:    $f_{v c o}=[(N \times M)+A] \times f r$
    fvco : Output frequency of external voltage controlled oscillator (VCO)
    N : Preset divide factor of binary 10-bit programmable counter (5 to 1023)
    M : Preset modulus factor of external dual modulus prescaler (e.g. 64 in $64 / 65$ mode, 128 in 128/129 mode of an MB501L prescaler)
    A : Preset divide factor of binary 7 -bit swallow counter ( 0 to 127)
    fr : Output frequency of the programmable reference divider

[^9]:    NOTE: Permanent device damage may occur if the above Absolute Maximum Ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

[^10]:    This device contains circuitry to protect the inputs against damage due to high static voltages of electric fields. However it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

[^11]:    Note: Divide factor less than 5 is prohibited. Divide factor: 5 to 16383

[^12]:    Note: Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as detailed in the operation sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

[^13]:    This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, in is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.
