# Hewlett-Packard: A Leader in Components

---

## A Brief Sketch

For over 25 years, Hewlett-Packard's Components Group has developed reliable, high performance optoelectronic and microwave components. Recognized for technological advances, setting world standards, and providing high-quality products, the Components Group has become a leader in the markets it serves, such as the computer, telecommunication, automotive and military/aerospace markets.

The products of the Components Group are vertically integrated, from the growing of LED crystals, to the development of the various on-board integrated circuits, to package design. Vertical integration ensures that HP quality is maintained throughout product development and manufacturing.

Over 5000 employees are dedicated to HP Components, including a worldwide sales force. Manufacturing facilities are located in Malaysia and Singapore with factory and marketing support in San Jose, California. Marketing operations are also located in Germany, Singapore, and Japan.

Each field sales office is staffed with engineers trained to provide technical assistance. An extensive communications network links field with factory to assure that each customer can quickly obtain the information and help needed.

## Quality and Reliability

Quality and reliability are very important concepts to Hewlett-Packard in maintaining the commitment to product performance.

At Hewlett-Packard, quality is integral to product development, manufacturing, and final introduction. "Parts per million" (PPM), as a measure of quality, is used in HP's definition of product assurance. And HP's commitment to quality means that there is a continuous process of improvement and tightening of quality standards. Manufacturing quality circles and quality testing programs are important ingredients in HP products.

Reliability testing is also required for the introduction of new HP components. Lifespan calculations in "mean-time-between-failure" (MTBF) terms are published and available as reliability data sheets. HP's stringent reliability testing assures long component lifetimes and consistent product performance.

---

# About This Catalog

---

To help you choose and design with Hewlett-Packard optoelectronic components, this catalog includes detailed specifications for HP component products. The catalog is divided into nine sections:

1. Motion Sensing and Encoder Products
2. LED Light Bars and Bar Graph Arrays
3. LED Lamps
4. LED Displays
5. Fiber Optics
6. Optocouplers
7. Electrophotographic Products
8. Applications
9. Appendix

## How to Find the Right Information

- The Table of Contents (p. iii) helps you to locate the product sections as well as the selection guides for each of the product sections.
- An alphanumeric index (p. iv) lists every component represented in this catalog.
- Selection guides at the beginning of each of the seven product sections, contain basic product specifications which allows you to quickly select products most suitable for your application.

Following the product sections is a complete listing of application bulletins and notes which are frequently useful as design aids. The final section is an appendix containing HP sales, service, and authorized distributor locations.

---

## How to Order

To order any component in this catalog or additional applications information, call the HP office nearest you and ask for a Components representative. A complete listing of the U.S. sales offices is on page 9-7; offices located outside of the U.S. are listed on page 9-8.

A world-wide listing of HP authorized distributors is on page 9-3. These distributors can offer off-the-shelf delivery for most HP components.

If you need technical assistance, please call our Customer Information Center at 1-800-752-0900.

## Motion Sensing and Control

Hewlett-Packard's growing family of motion sensing and control products developed as an extension of our emitter/detector systems capabilities. Motion sensing products include optical shaft encoders and optical encoder modules for closed-loop servo applications, and rotary pulse generators for manual input applications. HP's optical products provide a digital link converting mechanical shaft rotation into TTL logic level signals. HP's motion control ICs complement the optical products and greatly simplify the design of digital motion control systems.

Our HEDS-9000, HEDS-9100, HEDS-9200, and HEDS-9700 series optical encoder modules provide sophisticated motion detection at a low price, making them ideal for high volume applications such as printer, plotters, and industrial automation equipment. The HEDS-9000 and HEDS-9100 are now available in three channel versions, the HEDS-9040 and 9140, which provide a third channel index pulse in

addition to the standard two channel outputs. The HEDS-9200 series linear encoder module uses the same emitter/detector technology as the HEDS-9000 to sense linear position. The HEDS-9700 comes in a super small, wave solderable package with a variety of mounting options.

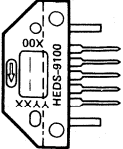

The HEDS-5500 and HEDS-5600 series are complete, quick assembly, low cost optical shaft encoders. No adhesives or last minute adjustments are necessary for assembly. In addition, the HEDS-5540 and HEDS-5640 provide a third channel index pulse for home position sensing. The HEDS-5500 and 5600 series encoders offer a complete solution in industrial, medical, and office automation equipment.

Hewlett-Packard's new HRPG series of low cost miniature rotary pulse generators (RPGs) use reflective optics technology for superior reliability and consistent rotational feel for more than 1 million revolutions. The HRPG is ideal for front panel applications such as test and measurement equipment, medical equipment,

CAD/CAM systems, and audio/video equipment. The HRPG is available in a variety of configurations including smooth or detented turning, multiple terminations and mounting options, and a wide selection of shaft configurations.

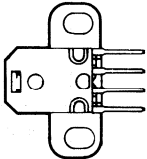

To complement the motion sensing products, HP has released two motion control IC families. The HCTL-1100 CMOS general purpose motion control IC performs all of the time-intensive tasks of digital motion control. The HCTL-1100 controls position or velocity while using an incremental encoder for feedback information. The HCTL-1100 is also available in a surface mount package. The HCTL-2000, HCTL-2016, and HCTL-2020 Quadrature Decoder/Counter ICs provide a one chip, easy to implement solution to interfacing the quadrature output of an encoder or RPG to a microprocessor. These CMOS ICs include a quadrature decoder, a 12 or 16 bit up/down counter, and an 8 bit bus interface. In addition, the HCTL-2020 has cascade output signals as well as quadrature decoder output signals.

# Two Channel Optical Incremental Encoder Module

## Technical Data

### Features

- High Performance
- High Resolution
- Low Cost
- Easy to Mount
- No Signal Adjustment Required
- Insensitive to Radial and Axial Play
- Small Size
- -40°C to 100°C Operating Temperature
- Two Channel Quadrature Output
- TTL Compatible
- Single 5 V Supply

### Package Dimensions

TYPICAL DIMENSIONS IN  
MILLIMETERS AND (INCHES)

### HEDS-9000 HEDS-9100

are accessed through five 0.025 inch square pins located on 0.1 inch centers.

### Description

The HEDS-9000 and HEDS-9100 series are high performance, low cost, optical incremental encoder modules. When used with a codewheel, these modules detect rotary position. The modules consist of a lensed LED source and a detector IC enclosed in a small C-shaped plastic package. Due to a highly collimated light source and a unique photo-detector array, the modules are extremely tolerant to mounting misalignment.

The two channel digital outputs and the single 5 V supply input

Standard resolutions for the HEDS-9000 are 500 CPR and 1000 CPR for use with a HEDS-

6100 codewheel or equivalent. For the HEDS-9100, standard resolutions between 96 CPR and 512 CPR are available for use with a HEDS-5120 codewheel or equivalent.

### Applications

The HEDS-9000 and 9100 provide sophisticated motion detection at a low cost, making them ideal for high volume applications. Typical applications include printers, plotters, tape drives, and factory automation equipment.

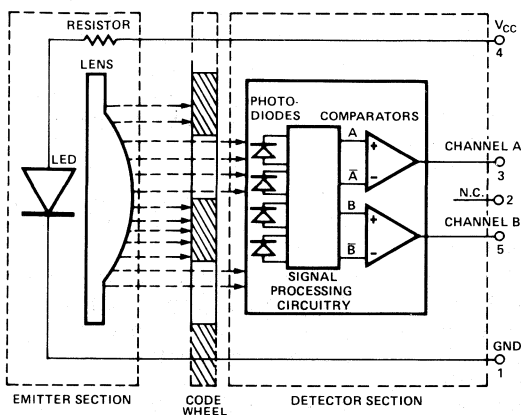

### Theory of Operation

The HEDS-9000 and 9100 are C-shaped emitter/detector modules. Coupled with a codewheel, they translate the rotary motion of a shaft into a two-channel digital output.

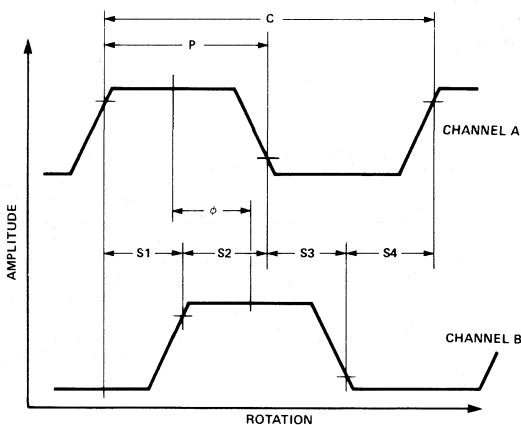

As seen in the block diagram, each module contains a single Light Emitting Diode (LED) as its light source. The light is collimated into a parallel beam by means of a single polycarbonate lens located directly over the LED. Opposite the emitter is the integrated detector circuit. This IC consists of multiple sets of photodetectors and the signal processing circuitry necessary to produce the digital waveforms.

The codewheel rotates between the emitter and detector, causing the light beam to be interrupted by the pattern of spaces and bars on the codewheel. The photodiodes which detect these interruptions are arranged in a pattern that corresponds to the radius and design of the codewheel. These detectors are also spaced such that a light period on one pair of detectors corresponds to a dark period on the

### Block Diagram

### Output Waveforms

adjacent pair of detectors. The photodiode outputs are then fed through the signal processing circuitry resulting in A,  $\bar{A}$ , B, and  $\bar{B}$ . Two comparators receive these signals and produce the final outputs for channels A and B. Due to this integrated phasing technique, the digital output of channel A is in quadrature with that of channel B (90 degrees out of phase).

### Definitions

*Count (N)* = The number of bar and window pairs or counts per revolution (CPR) of the codewheel.

$$1 \text{ Shaft Rotation} = 360 \text{ mechanical degrees} = N \text{ cycles}$$

$$1 \text{ cycle (c)} = 360 \text{ electrical degrees (}^\circ\text{)} = 1 \text{ bar and window pair}$$

**Pulse Width (P):** The number of electrical degrees that an output is high during 1 cycle. This value is nominally 180°e or 1/2 cycle.

**Pulse Width Error ( $\Delta P$ ):** The deviation, in electrical degrees, of the pulse width from its ideal value of 180°e.

**State Width (S):** The number of electrical degrees between a transition in the output of channel A and the neighboring transition in the output of channel B. There are 4 states per cycle, each nominally 90°e.

**State Width Error ( $\Delta S$ ):** The deviation, in electrical degrees, of each state width from its ideal value of 90°e.

### Absolute Maximum Ratings

Storage Temperature, $T_s$ .....	-40°C to 100°C
Operating Temperature, $T_A$ .....	-40°C to 100°C
Supply Voltage, $V_{CC}$ .....	-0.5 V to 7 V
Output Voltage, $V_O$ .....	-0.5 V to $V_{CC}$
Output Current per Channel, $I_O$ .....	-1.0 mA to 5 mA

**Phase ( $\phi$ ):** The number of electrical degrees between the center of the high state of channel A and the center of the high state of channel B. This value is nominally 90°e for quadrature output.

**Phase Error ( $\Delta\phi$ ):** The deviation of the phase from its ideal value of 90°e.

**Direction of Rotation:** When the codewheel rotates in the

direction of the arrow on top of the module, channel A will lead channel B. If the codewheel rotates in the opposite direction, channel B will lead channel A.

**Optical Radius ( $R_{Op}$ ):** The distance from the codewheel's center of rotation to the optical center (O.C.) of the encoder module.

### Recommended Operating Conditions

Parameter	Symbol	Min.	Typ.	Max.	Units	Notes
Temperature	T	-40		100	°C	
Supply Voltage	$V_{CC}$	4.5		5.5	Volts	Ripple < 100 mV <sub>pp</sub>

**HEWLETT  
PACKARD**

# LINEAR OPTICAL INCREMENTAL ENCODER MODULE

**HEDS-9200  
SERIES**

## Features

- HIGH PERFORMANCE
- HIGH RESOLUTION
- LOW COST
- EASY TO MOUNT
- NO SIGNAL ADJUSTMENT REQUIRED
- INSENSITIVE TO MECHANICAL DISTURBANCES
- SMALL SIZE
- -40°C TO 100°C OPERATING TEMPERATURE
- TWO CHANNEL QUADRATURE OUTPUT
- TTL COMPATIBLE
- SINGLE 5 V SUPPLY

## Description

The HEDS-9200 series is a high performance, low cost, optical incremental encoder module. When operated in conjunction with a codestrip, this module detects linear position. The module consists of a lensed LED source and a detector IC enclosed in a small C-shaped plastic package. Due to a highly collimated light source and a unique photo-detector array, the module is extremely tolerant to mounting misalignment.

The two channel digital outputs and the single 5 V supply input are accessed through four 0.025 inch square pins located on 0.1 inch centers.

## Package Dimensions

Note: Codestrip not included with HEDS-9200.

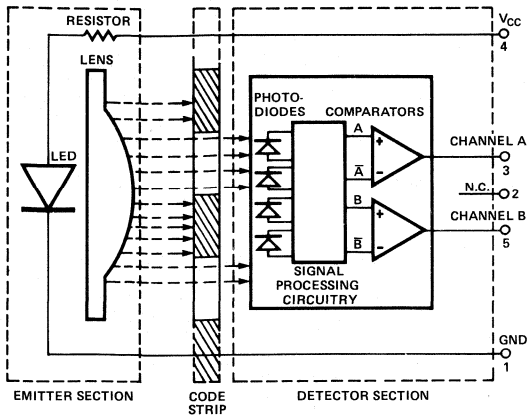

Five standard resolutions between 4.72 counts per mm (120 counts per inch) and 7.87 counts per mm (200 counts per inch) are available. Consult local Hewlett-Packard sales representatives for other resolutions ranging from 1.5 to 7.87 counts per mm (40 to 200 counts per inch).

## Applications

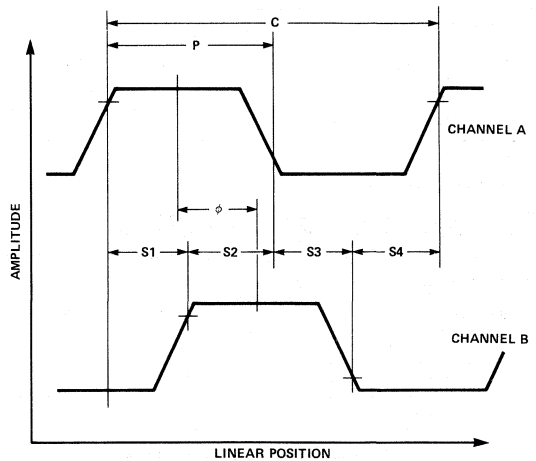

The HEDS-9200 provides sophisticated motion detection at a low cost, making it ideal for high volume applications. Typical applications include printers, plotters, tape drives, and factory automation equipment.

**ESD WARNING: NORMAL HANDLING PRECAUTIONS SHOULD BE TAKEN TO AVOID STATIC DISCHARGE.**

## Block Diagram

## Output Waveforms

## Theory of Operation

The HEDS-9200 is a C-shaped emitter/detector module. Coupled with a codestrip it translates linear motion into a two-channel digital output.

As seen in the block diagram, the module contains a single Light Emitting Diode (LED) as its light source. The light is collimated into a parallel beam by means of a single polycarbonate lens located directly over the LED. Opposite the emitter is the integrated detector circuit. This IC consists of multiple sets of photodetectors and the signal processing circuitry necessary to produce the digital waveforms.

The codestrip moves between the emitter and detector, causing the light beam to be interrupted by the pattern of spaces and bars on the codestrip. The photodiodes which detect these interruptions are arranged in a pattern that corresponds to the count density of the codestrip. These detectors are also spaced such that a light period on one pair of detectors corresponds to a dark period on the adjacent pair of detectors. The photodiode outputs are then fed through the signal processing circuitry resulting in A,  $\bar{A}$ , B and  $\bar{B}$ . Two comparators receive these signals and produce the final outputs for channels A and B. Due to this integrated phasing technique, the digital output of channel A is in quadrature with that of channel B (90 degrees out of phase).

## Definitions

**Count density (D):** The number of bar and window pairs per unit length of the codestrip.

**Pitch (1/D):** The unit length per count.

**Electrical degree ( $^{\circ}e$ ):** Pitch/360, The dimension of one bar and window pair divided by 360.

**1 cycle (C):** 360 electrical degrees, 1 bar and window pair.

**Pulse Width (P):** The number of electrical degrees that an output is high during 1 cycle. This value is nominally  $180^{\circ}e$  or  $1/2$  cycle.

**Pulse Width Error ( $\Delta P$ ):** The deviation, in electrical degrees, of the pulse width from its ideal value of  $180^{\circ}e$ .

**State Width (S):** The number of electrical degrees between a transition in the output of channel A and the neighboring transition in the output of channel B. There are 4 states per cycle, each nominally  $90^{\circ}e$ .

**State Width Error ( $\Delta S$ ):** The deviation, in electrical degrees, of each state width from its ideal value of  $90^{\circ}e$ .

**Phase ( $\phi$ ):** The number of electrical degrees between the center of the high state of channel A and the center of the high state of channel B. This value is nominally  $90^{\circ}e$  for quadrature output.

**Phase Error ( $\Delta\phi$ ):** The deviation of the phase from its ideal value of  $90^{\circ}e$ .

**Direction of Movement:** When the codestrip moves, relative to the module, in the direction of the arrow on top of the module, channel A will lead channel B. If the codestrip moves in the opposite direction, channel B will lead channel A.

## Absolute Maximum Ratings

# Three Channel Optical Incremental Encoder Modules

## Technical Data

### HEDS-9040 HEDS-9140

#### Features

- Two Channel Quadrature Output with Index Pulse
- Resolution Up to 1024 Counts Per Revolution
- Low Cost
- Easy to Mount
- No Signal Adjustment Required
- Small Size
- -40°C to 100°C Operating Temperature
- TTL Compatible
- Single 5 V Supply

#### Description

The HEDS-9040 and HEDS-9140 series are three channel optical incremental encoder modules. When used with a codewheel, these low cost modules detect rotary position. Each module consists of a lensed LED source and a detector IC enclosed in a small plastic package. Due to a highly collimated light source and a unique photodetector array, these modules provide the same

high performance found in the HEDS-9000/9100 two channel encoder family.

#### Package Dimensions

ESD WARNING; NORMAL HANDLING PRECAUTIONS SHOULD BE TAKEN TO AVOID STATIC DISCHARGE.

The HEDS-9040 and 9140 have two channel quadrature outputs plus a third channel index output. This index output is a 90 electrical degree high true index pulse which is generated once for each full rotation of the codewheel.

The HEDS-9040 is designed for use with a HEDS-6140 code-wheel which has an optical radius of 23.36 mm (0.920 inch). The HEDS-9140 is designed for use with a HEDS-5140 code-wheel which has an optical radius of 11.00 mm (0.433 inch).

The quadrature signals and the index pulse are accessed through five 0.025 inch square pins located on 0.1 inch centers.

Standard resolutions between 256 and 1024 counts per revolution are available. Consult local Hewlett-Packard sales representatives for other resolutions.

### Applications

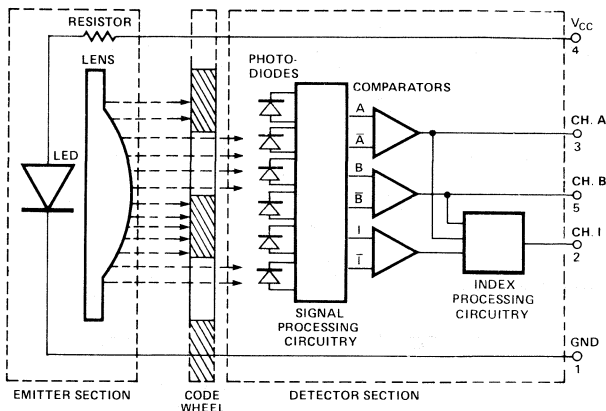

The HEDS-9040 and 9140 provide sophisticated motion control detection at a low cost, making them ideal for high volume applications. Typical applications include printers, plotters, tape drives, and industrial and factory automation equipment.

### Theory of Operation

The HEDS-9040 and 9140 are emitter/detector modules. Coupled with a codewheel, these modules translate the rotary motion of a shaft into a three-channel digital output.

As seen in the block diagram, the modules contain a single

### Block Diagram

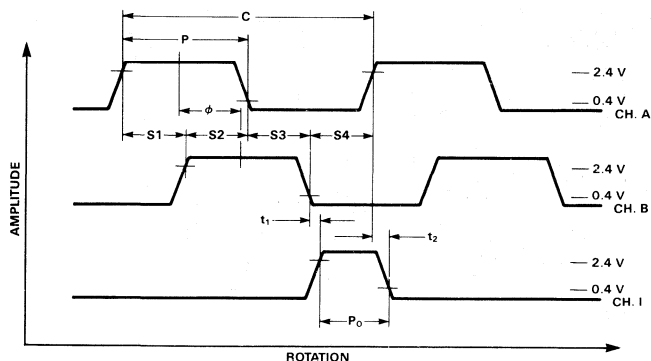

Light Emitting Diode (LED) as its light source. The light is collimated into a parallel beam by means of a single polycarbonate lens located directly over the LED. Opposite the emitter is the integrated detector circuit. This IC consists of multiple sets of photodetectors and the signal processing circuitry necessary to produce the digital waveforms.

The codewheel rotates between the emitter and detector, causing the light beam to be interrupted by the pattern of spaces and bars on the codewheel. The photodiodes which detect these interruptions are arranged in a pattern that corresponds to the radius and design of the codewheel. These detectors are also spaced such that a light period on one pair of detectors corresponds to a dark period on the adjacent pair of detectors. The photodiode outputs are then fed through the signal processing circuitry resulting in A,  $\bar{A}$ , B,  $\bar{B}$ , I and  $\bar{I}$ . Comparators receive these signals and

produce the final outputs for channels A and B. Due to this integrated phasing technique, the digital output of channel A is in quadrature with that of channel B (90 degrees out of phase).

The output of the comparator for I and  $\bar{I}$  is sent to the index processing circuitry along with the outputs of channels A and B. The final output of channel I is an index pulse  $P_0$  which is generated once for each full rotation of the codewheel. This output  $P_0$  is a one state width (nominally 90 electrical degrees), high true index pulse which is coincident with the low states of channels A and B.

## Output Waveforms

### Definitions

**Count (N):** The number of bar and window pairs or counts per revolution (CPR) of the codewheel.

**One Cycle (C):** 360 electrical degrees ( $^{\circ}e$ ), 1 bar and window pair.

**One Shaft Rotation:** 360 mechanical degrees, N cycles.

**Position Error ( $\Delta\Theta$ ):** The normalized angular difference between the actual shaft position and the position indicated by the encoder cycle count.

**Cycle Error ( $\Delta C$ ):** An indication of cycle uniformity. The differ-

ence between an observed shaft angle which gives rise to one electrical cycle, and the nominal angular increment of  $1/N$  of a revolution.

**Pulse Width (P):** The number of electrical degrees that an output is high during 1 cycle. This value is nominally  $180^{\circ}e$  or  $1/2$  cycle.

**Pulse Width Error ( $\Delta P$ ):** The deviation, in electrical degrees, of the pulse width from its ideal value of  $180^{\circ}e$ .

**State Width (S):** The number of electrical degrees between a transition in the output of channel A and the neighboring transition in the output of

channel B. There are 4 states per cycle, each nominally  $90^{\circ}e$ .

**State Width Error ( $\Delta S$ ):** The deviation, in electrical degrees, of each state width from its ideal value of  $90^{\circ}e$ .

**Phase ( $\phi$ ):** The number of electrical degrees between the center of the high state of channel A and the center of the high state of channel B. This value is nominally  $90^{\circ}e$  for quadrature output.

**Phase Error ( $\Delta\phi$ ):** The deviation of the phase from its ideal value of  $90^{\circ}e$ .

**Direction of Rotation:** When the codewheel rotates in the direction of the arrow on top of the module, channel A will lead channel B. If the codewheel rotates in the opposite direction, channel B will lead channel A.

**Optical Radius ( $R_{OP}$ ):** The distance from the codewheel's center of rotation to the optical center (O.C.) of the encoder module.

**Index Pulse Width ( $P_0$ ):** The number of electrical degrees that an index is high during one full shaft rotation. This value is nominally  $90^{\circ}e$  or  $1/4$  cycle.

## Absolute Maximum Ratings

## Mechanical Characteristics

Part No.	Parameter	Dimension	Tolerance	Units
HEDS-6140 23.36 mm optical radius codewheel	Codewheel Available to Fit These Standard Shaft Diameters	4 6 8	+0.000 -0.015	mm
		3/16 1/4 5/16 3/8 1/2 5/8	+0.000 -0.0007	in
	Moment of Inertia	7.7 (110 x 10 <sup>-6</sup> )		g-cm <sup>2</sup> (oz-in-s <sup>2</sup> )
	HEDS-5140 11.00 mm optical radius codewheel	Codewheel Available to Fit These Standard Shaft Diameters	2 3 4 5 6 8	+0.000 -0.015
5/32 1/8 3/16 1/4			+0.000 -0.0007	in
Moment of Inertia		0.6 (8.0 x 10 <sup>-6</sup> )		g-cm <sup>2</sup> (oz-in-s <sup>2</sup> )

Note: The tolerance requirements are on the mating shaft, not on the codewheel.

## Electrical Interface

To insure reliable encoding performance, the HEDS-9040 and 9140 three channel encoder modules require 2.7 kΩ (±10%) pull-up resistors on output pins 2, 3, and 5 (Channels I, A and B) as shown in Figure 1. These pull-up resistors should be located as close to the encoder module as possible (within 4 feet). Each of the three encoder module outputs can drive a single TTL load in this configuration.

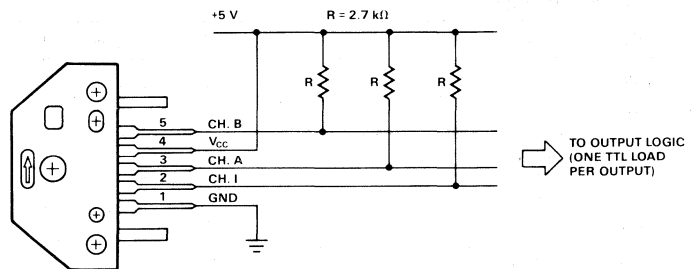

Figure 1. Pull-up Resistors on HEDS-9X40 Encoder Module Outputs.

## Mounting Considerations

Figure 2 shows a mounting tolerance requirement for proper operation of the HEDS-9040 and HEDS-9140. The Aligning Recess Centers must be located within a tolerance circle of 0.005 in. radius from the nominal locations. This tolerance must be maintained whether the module is mounted with side A as the mounting plane using aligning pins (see Figure 5), or mounted with Side B as the mounting plane using an alignment tool (see Figures 3 and 4).

Figure 2. HEDS-9X40 Mounting Tolerance.

## Mounting with an Alignment Tool

The HEDS-8905 and HEDS-8906 alignment tools are recommended for mounting the modules with Side B as the mounting plane. The HEDS-8905 is used to mount the HEDS-9140, and the HEDS-8906 is used to mount the HEDS-9040. These tools fix the module position using the codewheel hub as a reference. They will not work if Side A is used as the mounting plane.

The following assembly procedure uses the HEDS-8905/8906 alignment tool to mount a HEDS-9140/9040 module and a HEDS-5140/6140 codewheel:

### Instructions:

1. Place codewheel on shaft.
2. Set codewheel height: (a) place alignment tool on motor base (pins facing up) flush up

against the motor shaft as shown in Figure 3. (b) Push codewheel down against alignment tool. The codewheel is now at the proper height. (c) Tighten codewheel setscrew and remove alignment tool.

Some motors have a boss around the shaft that extends above the mounting plane. In this case, the alignment tool cannot be used as a gage block to set the codewheel height as described in 2(a), (b), and (c).

*If boss is above mounting plane:* Slide module onto motor base, adjusting height of codewheel so that it sits approximately in the middle of module slot. Lightly tighten setscrew. The codewheel height will be more precisely set in step 5.

3. Insert mounting screws through module and thread into the motor base. Do not tighten screws.

4. Slide alignment tool over codewheel hub and onto module as shown in Figure 4. The pins of the alignment tool should fit snugly inside the alignment recesses of the module.

*If boss is above mounting plane:* The pins of the tool may not mate properly because the codewheel is too high on the shaft. Loosen codewheel setscrew and lower codewheel slightly. Retighten setscrew lightly and attempt this step again.

5. While holding alignment tool in place, tighten screws down to secure module.

*If boss is above mounting plane:* Push codewheel up flush against alignment tool to set codewheel height. Tighten codewheel setscrew.

6. Remove alignment tool.

Figure 3. Alignment Tool is Used to Set Height of Codewheel.

NOTE 1: THIS DIMENSION IS FROM THE MOUNTING PLANE TO THE NON-HUB SIDE OF THE CODEWHEEL.

Figure 4. Alignment Tool is Placed over Shaft and onto Codewheel Hub. Alignment Tool Pins Mate with Aligning Recesses on Module.

## Mounting with Aligning Pins

The HEDS-9040 and HEDS-9140 can also be mounted using aligning pins on the motor base.

(Hewlett-Packard does not provide aligning pins.) For this configuration, Side A *must* be used as the mounting plane. The aligning recess centers

must be located within the 0.005 in. Radius Tolerance Circle as explained in "Mounting Considerations." Figure 5 shows the necessary dimensions.

## Technical Data

### HEDS-9700 Series

#### Features

- Small Size
- Low Cost
- Multiple Mounting Options
- Wide Resolution Range
- Linear and Rotary Options Available
- No Signal Adjustment Required
- Insensitive to Radial and Axial Play
- -40°C to +85°C Operating Temperature

- Two Channel Quadrature Output
- TTL Compatible
- Single 5V Supply
- Wave Solderable

#### Description

The HEDS-9700 series is a high performance, low cost, optical incremental encoder module. When operated in conjunction with either a codewheel or codestrip, this module detects rotary or linear position. The

#### Package Dimensions

Mounting Option #50 - Standard

Contact Factory for Detailed Package Dimensions

**ESD WARNING; NORMAL HANDLING PRECAUTIONS SHOULD BE TAKEN TO AVOID STATIC DISCHARGE.**

module consists of a lensed LED source and a detector IC enclosed in a small C-shaped plastic package. Due to a highly collimated light source and a unique photodetector array, the module is extremely tolerant to mounting misalignment.

The two channel digital outputs and 5V supply input are accessed through four solder-plated leads located on 2.54 mm (0.1 inch) centers.

The standard HEDS-9700 is designed for use with an 11 mm optical radius codewheel, or linear codestrip. Other options are available. Please contact factory for more information.

### Applications

The HEDS-9700 provides sophisticated motion detection at a low cost, making closed-loop control very cost-competitive! Typical

### Block Diagram

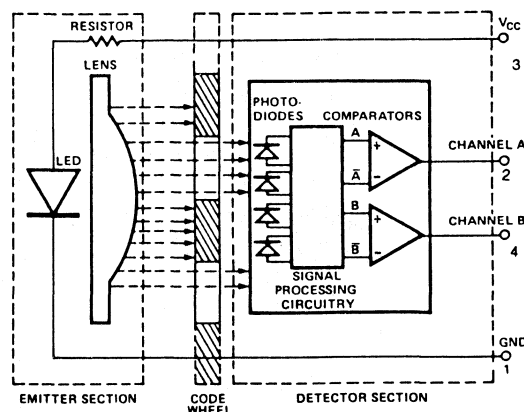

applications include printers, plotters, copiers, and office automation equipment.

### Theory of Operation

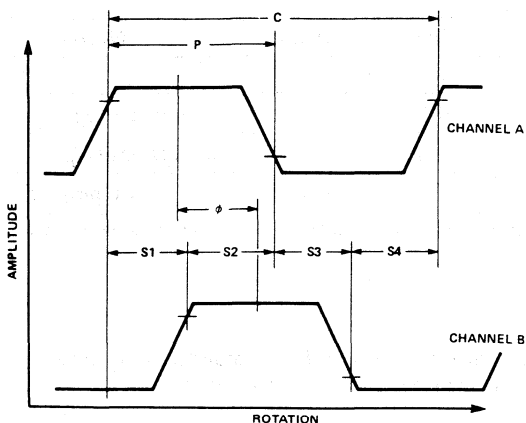

The HEDS-9700 is a C-shaped emitter/detector module. Coupled with a codewheel, it translates rotary motion into a two-channel digital output. Coupled with a codestrip, it translates linear motion into a digital output.

As seen in the block diagram, the module contains a single Light Emitting Diode (LED) as its light source. The light is collimated into a parallel beam by means of a single lens located directly over the LED. Opposite the emitter is the integrated detector circuit. This IC consists of multiple sets of photodetectors and the signal processing circuitry necessary to produce the digital waveforms.

The codewheel/codestrip moves between the emitter and detector, causing the light beam to be interrupted by the pattern of spaces and bars on the codewheel/codestrip. The photodiodes which detect these interruptions are arranged in a pattern that corresponds to the radius and count density of the codewheel/codestrip. These detectors are also spaced such that a light period on one pair of detectors corresponds to a dark period on the adjacent pair of detectors. The photodiode outputs are fed through the signal processing circuitry. Two comparators receive these signals and produce the final outputs for channels A and B. Due to this integrated phasing technique, the digital output of channel A is in quadrature with channel B (90 degrees out of phase).

## Output Waveforms

### Definitions

Count (N) = The number of bar and window pairs or counts per revolution (CPR) of the codewheel, or the number of lines per inch of the codestrip (LPI).

- 1 Shaft Rotation = 360 mechanical degrees = N cycles
- 1 cycle (c) = 360 electrical degrees (°e) = 1 bar and window pair

Pulse Width (P): The number of electrical degrees that an output is high during one cycle. This value is nominally 180°e or 1/2 cycle.

Pulse Width Error (ΔP): The deviation, in electrical degrees, of the pulse width from its ideal value of 180°e.

State Width (S): The number of electrical degrees between a transition in the output of

channel A and the neighboring transition in the output of channel B. There are 4 states per cycle, each nominally 90°e.

State Width Error (ΔS): The deviation, in electrical degrees, of each state width from its ideal value of 90°e.

Phase (φ): The number of electrical degrees between the center of the high state of channel A and the center of the high state of channel B. This value is nominally 90°e for quadrature output.

Phase Error (Δφ): The deviation of the phase from its ideal value of 90°e.

Direction of Rotation: When the codewheel rotates counterclockwise, as viewed looking down on the module (so the marking is visible), channel A will lead channel B. If the codewheel rotates in the opposite direction, channel B will lead channel A.

Optical Radius (Rop): The distance from the codewheel's center of rotation to the optical center (O.C.) of the encoder module.

# Quick Assembly Two and Three Channel Optical Encoders

## Technical Data

**HEDS-5500/5540**  
**HEDS-5600/5640**

### Features

- **Two Channel Quadrature Output with Optional Index Pulse**
- **Quick and Easy Assembly**
- **No Signal Adjustment Required**
- **External Mounting Ears Available**
- **Low Cost**
- **Resolutions Up to 512 Counts Per Revolution**
- **Small Size**
- **-40°C to 100°C Operating Temperature**
- **TTL Compatible**
- **Single 5 V Supply**

### Description

The HEDS-5500/5540 and 5600/5640 are high performance, low cost, two and three channel optical incremental encoders. These encoders emphasize high reliability, high resolution, and easy assembly.

Each encoder contains a lensed LED source, an integrated circuit with detectors and output

circuitry, and a codewheel which rotates between the emitter and detector IC. The outputs of the HEDS-5500 and 5600 are two square waves in quadrature. The HEDS-5540 and 5640 also have a third channel index output in addition to the two channel quadrature. This index output is a 90 electrical degree, high true index pulse which is generated once for each full rotation of the codewheel.

These encoders may be quickly and easily mounted to a motor. For larger diameter motors, the HEDS-5600/5640 feature external mounting ears.

The quadrature signals and the index pulse are accessed through five 0.025 inch square pins located on 0.1 inch centers.

Standard resolutions between 96 and 512 counts per revolution are presently available. Consult local Hewlett-Packard sales representatives for other resolutions.

### Applications

The HEDS-5500, 5540, 5600, and 5640 provide motion detection at a low cost, making them ideal for high volume applications. Typical applications include printers, plotters, tape drives, positioning tables, and automatic handlers.

ESD WARNING; NORMAL HANDLING PRECAUTIONS SHOULD BE TAKEN TO AVOID STATIC DISCHARGE.

# Package Dimensions

## HEDS-5500/5540

\*Note: For the HEDS-5500, Pin #2 is a No Connect. For the HEDS-5540, Pin #2 is CH. I, the index output.

## HEDS-5600/5640

\*Note: For the HEDS-5600, Pin #2 is a No Connect. For the HEDS-5640, Pin #2 is CH. I, the index output.

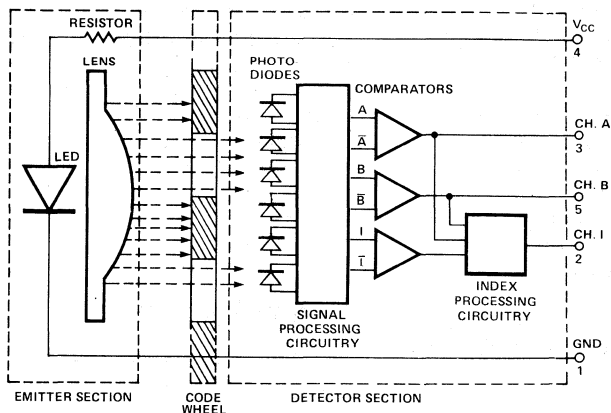

## Theory of Operation

The HEDS-5500, 5540, 5600, and 5640 translate the rotary motion of a shaft into either a two- or a three-channel digital output.

As seen in the block diagram, these encoders contain a single Light Emitting Diode (LED) as its light source. The light is collimated into a parallel beam by means of a single polycarbonate lens located directly over the LED. Opposite the emitter is the integrated detector circuit. This IC consists of multiple sets of photodetectors and the signal processing circuitry necessary to produce the digital waveforms.

The codewheel rotates between the emitter and detector, causing the light beam to be interrupted by the pattern of spaces and bars on the codewheel. The photodiodes which detect these interruptions are arranged in a pattern that corresponds to the radius and design of the codewheel. These detectors are also spaced such that a light period on one pair of detectors corresponds to a dark period on the adjacent pair of detectors. The photodiode outputs are then fed through the signal processing circuitry resulting in A,  $\bar{A}$ , B and  $\bar{B}$  (also I and  $\bar{I}$  in the HEDS-5540 and 5640). Comparators receive these signals and produce the final outputs for channels A and B. Due to this integrated phasing technique, the digital output of channel A is in quadrature with that of channel B (90 degrees out of phase).

## Block Diagram

NOTE: CIRCUITRY FOR CH. I IS ONLY IN HEDS-5540 AND 5640 THREE CHANNEL ENCODERS.

In the HEDS-5540 and 5640, the output of the comparator for I and  $\bar{I}$  is sent to the index processing circuitry along with the outputs of channels A and B. The final output of channel I is an index pulse  $P_0$  which is generated once for each full rotation of the codewheel. This output  $P_0$  is a one state width (nominally 90 electrical degrees), high true index pulse which is coincident with the low states of channels A and B.

## Definitions

**Count (N):** The number of bar and window pairs or counts per revolution (CPR) of the codewheel.

**One Cycle (C):** 360 electrical degrees ( $^\circ$ ), 1 bar and window pair.

**One Shaft Rotation:** 360 mechanical degrees, N cycles.

**Position Error ( $\Delta\theta$ ):** The normalized angular difference between the actual shaft position and the position indicated by the encoder cycle count.

**Cycle Error ( $\Delta C$ ):** An indication of cycle uniformity. The difference between an observed shaft angle which gives rise to one electrical cycle, and the nominal angular increment of  $1/N$  of a revolution.

**Pulse Width (P):** The number of electrical degrees that an output is high during 1 cycle. This value is nominally  $180^\circ$  or  $1/2$  cycle.

**Pulse Width Error ( $\Delta P$ ):** The deviation, in electrical degrees, of the pulse width from its ideal value of  $180^\circ$ .

**State Width (S):** The number of electrical degrees between a transition in the output of channel A and the neighboring transition in the output of channel B. There are 4 states per cycle, each nominally  $90^\circ$ .

**State Width Error ( $\Delta S$ ):** The deviation, in electrical degrees, of each state width from its ideal value of 90°e.

**Phase ( $\phi$ ):** The number of electrical degrees between the center of the high state of channel A and the center of the high state of channel B. This value is nominally 90°e for quadrature output.

**Phase Error ( $\Delta\phi$ ):** The deviation of the phase from its ideal value of 90°e.

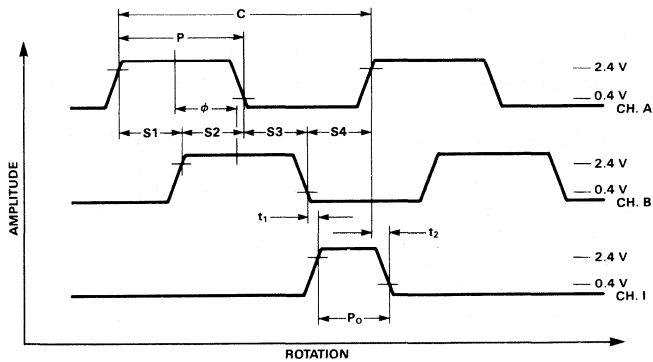

**Direction of Rotation:** When the codewheel rotates in the counterclockwise direction (as viewed from the encoder end of the motor), channel A will lead channel B. If the codewheel rotates in the clockwise direction, channel B will lead channel A.

**Index Pulse Width ( $P_o$ ):** The number of electrical degrees that an index output is high during one full shaft rotation. This value is nominally 90°e or 1/4 cycle.

### Notes:

- These are tolerances required of the user.
- The HEDS-55X5 and 56X5 provide an 8.9 mm (0.35 inch) diameter hole through the housing for longer motor shafts. See Ordering Information.
- The HEDS-5540 and 5640 must be aligned using the aligning pins as specified in Figure 3, or using the alignment tool as shown in "Encoder Mounting and Assembly". See also "Mounting Considerations."
- The recommended mounting screw torque for 2 screw and external ear mounting is 1.0 kg-cm (0.88 in-lbs). The recommended mounting screw torque for 3 screw mounting is 0.50 kg-cm (0.43 in-lbs).

## Electrical Interface

To insure reliable encoding performance, the HEDS-5540 and 5640 three channel encoders require 2.7 kΩ (±10%) pull-up resistors on output pins 2, 3, and 5 (Channels I, A, and B) as shown in Figure 1. These

pull-up resistors should be located as close to the encoder as possible (within 4 feet). Each of the three encoder outputs can drive a single TTL load in this configuration.

normally require pull-up resistors. However, pull-up resistors on output pins 3 and 5 (Channels A and B) are recommended to improve rise times.

The HEDS-5500 and 5600 two channel encoders do not

Figure 1. Pull-up Resistors on HEDS-5X40 Encoder Outputs.

## Mounting Considerations

The HEDS-5540 and 5640 three channel encoders must be aligned using the aligning pins as specified in Figure 3, or using the HEDS-8910 Alignment Tool as shown in Encoder Mounting and Assembly.

The use of aligning pins or alignment tool is recommended but not required to mount the HEDS-5500 and 5600. If these

two channel encoders are attached to a motor with the screw sizes and mounting tolerances specified in the mechanical characteristics section without any additional mounting bosses, the encoder output errors will be within the maximums specified in the encoding characteristics section.

The HEDS-5500 and 5540 can be mounted to a motor using either the two screw or three

screw mounting option as shown in Figure 2. The optional aligning pins shown in Figure 3 can be used with either mounting option.

The HEDS-5600 and 5640 have external mounting ears which may be used for mounting to larger motor base plates. Figure 4 shows the necessary mounting holes with optional aligning pins and motor boss.

Figure 2. Mounting Holes.

Figure 3. Optional Mounting Aids.

Figure 4. Mounting with External Ears.

## Encoder Mounting and Assembly

**1. For HEDS-5500 and 5600:** Mount encoder base plate onto motor. Tighten screws. Go on to step 2.

**1a. For HEDS-5540 and 5640:** Slip alignment tool onto motor shaft. With alignment tool in place, mount encoder baseplate onto motor as shown above. Tighten screws. Remove alignment tool.

**2. Snap encoder body onto base plate locking all 4 snaps.**

**3a. Push the hex wrench into the body of the encoder to ensure that it is properly seated into the code wheel hub set screws. Then apply a downward force on the end of the hex wrench. This sets the code wheel gap by levering the code wheel hub to its upper position.**

**3b. While continuing to apply a downward force, rotate the hex wrench in the clockwise direction until the hub set screw is tight against the motor shaft. The hub set screw attaches the code wheel to the motor's shaft.**

**3c. Remove the hex wrench by pulling it straight out of the encoder body.**

**4. Use the center screwdriver slot, or either of the two side slots, to rotate the encoder cap dot clockwise from the one dot position to the two dot position. Do not rotate the encoder cap counterclockwise beyond the one dot position.**

**The encoder is ready for use!**

# Miniature Panel Mount Optical Encoder

## Technical Data

### Features

- **Miniature Size**
- **Smooth Turning and Detented Options**
- **Multiple Mounting Bracket Options**
- **Uses Optical Reflective Technology**
- **Quadrature Digital Output**
- **Small Footprint for Versatile Mounting**
- **TTL Compatible**

### Description

The HRPG series is a family of miniature panel mount optical encoders, also known as Rotary Pulse Generators (RPG) and digital potentiometers. The HRPG is designed to be mounted on a front panel and used as a rotary, data-entry device. The HRPG is very flexible for numerous applications due to the many configuration options available. These options include detents or smooth, multiple terminations, versatile mounting capabilities, and different shaft configurations.

The HRPG uses optical reflective technology providing accuracy and reliability to the encoder. An LED emits a beam of light onto the specular codewheel surface. When the light strikes the surface, it projects the image of the codewheel back on the photo-detector, causing the output to change. The entire detector circuit is on one IC, thus the part is less sensitive to temperature and other environmental variations.

### Applications

Typical applications for the Rotary Pulse Generator include front panel instruments, audio/visual boards, and other devices requiring digital output from a turning knob.

# PANEL MOUNT OPTICAL ENCODER

**HEDS-5700  
SERIES**

MOTION SENSING AND CONTROL

## Features

- AVAILABLE WITH OR WITHOUT STATIC DRAG FOR MANUAL OR MECHANIZED OPERATION
- HIGH RESOLUTION - UP TO 512 CPR
- LONG ROTATIONAL LIFE, >1 MILLION REVS
- -20 TO 85 °C OPERATING TEMPERATURE RANGE
- TTL QUADRATURE OUTPUT
- SINGLE 5V SUPPLY
- AVAILABLE WITH COLOR CODED LEADS

## Description

The HEDS-5700 series is a family of low cost, high performance, optical incremental encoders with mounted shafts and bushings. The HEDS-5700 is available with tactile feedback for hand operated panel mount applications, or with a free spinning shaft for applications requiring a pre-assembled encoder for position sensing.

The encoder contains a collimated LED light source and special detector circuit which allows for high resolution, excellent encoding performance, long rotational life, and increased reliability. The unit outputs two digital waveforms which are 90 degrees out of phase to provide position and direction information.

The HEDS-5700 is quickly and easily mounted to a front panel using the threaded bushing, or it can be directly coupled to a motor shaft (or gear train) for position sensing applications.

## Applications

The HEDS-5700 with the static drag option is best suited for applications requiring digital information from a manually operated knob. Typical front panel applications include instruments, CAD/CAM systems, and audio/video control boards.

The HEDS-5700 without static drag (free spinning) is best suited for low speed, mechanized operations. Typical applications are copiers, X-Y tables, and assembly line equipment.

SOFTWARE

## Description

The HCTL-2000, 2016, 2020 are CMOS ICs that perform the quadrature decoder, counter, and bus interface function. The HCTL-20XX family is designed to improve system performance in digital closed loop motion control systems and digital data input systems. It does this by shifting time intensive quadrature decoder functions to a cost effective hardware solution. The entire HCTL-20XX family consists of a 4x quadrature decoder, a binary up/down state counter, and an 8-bit bus interface. The use of Schmitt-triggered CMOS inputs and input noise filters allows reliable operation in noisy environments. The HCTL-2000 contains a 12-bit counter. The HCTL-2016 and 2020 contain a 16-bit counter. The HCTL-2020 also contains quadrature decoder output signals and cascade signals for use with many standard counter ICs. The HCTL-20XX family provides LSTTL compatible tri-state output buffers. Operation is specified for a temperature range from -40 to +85°C at clock frequencies up to 14 MHz.

## Applications

- INTERFACE QUADRATURE INCREMENTAL ENCODERS TO MICROPROCESSORS
- INTERFACE DIGITAL POTENTIOMETERS TO DIGITAL DATA INPUT BUSES

# Functional Pin Description

**Table 4. Functional Pin Descriptions**

Symbol	Pin 2000/2016	Pin 2020	Description						
V <sub>DD</sub>	16	20	Power Supply						
V <sub>SS</sub>	8	10	Ground						
CLK	2	2	CLK is a Schmitt-trigger input for the external clock signal.						
CHA CHB	7 6	9 8	CHA and CHB are Schmitt-trigger inputs which accept the outputs from a quadrature encoded source, such as incremental optical shaft encoder. Two channels, A and B, nominally 90 degrees out of phase, are required.						
RST	5	7	This active low Schmitt-trigger input clears the internal position counter and the position latch. It also resets the inhibit logic. RST is asynchronous with respect to any other input signals.						
$\overline{OE}$	4	4	This CMOS active low input enables the tri-state output buffers. The $\overline{OE}$ and SEL inputs are sampled by the internal inhibit logic on the falling edge of the clock to control the loading of the internal position data latch.						
SEL	3	3	This CMOS input directly controls which data byte from the position latch is enabled into the 8-bit tri-state output buffer. As in $\overline{OE}$ above, SEL also controls the internal inhibit logic. <table border="1" style="margin: 10px auto;"> <thead> <tr> <th>SEL</th> <th>BYTE SELECTED</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>High</td> </tr> <tr> <td>1</td> <td>Low</td> </tr> </tbody> </table>	SEL	BYTE SELECTED	0	High	1	Low
SEL	BYTE SELECTED								
0	High								
1	Low								
CNT <sub>DCCR</sub>		16	A pulse is presented on this LSTTL-compatible output when the quadrature decoder has detected a state transition.						
U/ $\overline{D}$		5	This LSTTL-compatible output allows the user to determine whether the IC is counting up or down and is intended to be used with the CNT <sub>DCCR</sub> and CNT <sub>CAS</sub> outputs. The proper signal U (high level) or $\overline{D}$ (low level) will be present before the rising edge of the CNT <sub>DCCR</sub> and CNT <sub>CAS</sub> outputs.						
CNT <sub>CAS</sub>		15	A pulse is presented on this LSTTL-compatible output when the HCTL-2020 internal counter overflows or underflows. The rising edge on this waveform may be used to trigger an external counter.						
D0	1	1	These LSTTL-compatible tri-state outputs form an 8-bit output port through which the contents of the 12/16-bit position latch may be read in 2 sequential bytes. The high byte, containing bits 8-15, is read first (on the HCTL-2000, the most significant 4 bits of this byte are set to 0 internally). The lower byte, bits 0-7, is read second.						
D1	15	19							
D2	14	18							
D3	13	17							
D4	12	14							
D5	11	13							
D6	10	12							
D7	9	11							
NC		6	Not connected — this pin should be left floating.						

# Switching Characteristics

**Table 5. Switching Characteristics** Min/Max specifications at  $V_{DD} = 5.0 \pm 5\%$ ,  $T_A = -40$  to  $+85^\circ\text{C}$

Symbol Description			Min.	Max.	Units
1	$t_{CLK}$	Clock period	70		ns
2	$t_{CHH}$	Pulse width, clock high	28		ns
3	$t_{CD}^{[1]}$	Delay time, rising edge of clock to valid, updated count information on D0-7		65	ns
4	$t_{ODE}$	Delay time, $\overline{OE}$ fall to valid data		65	ns
5	$t_{ODZ}$	Delay time, $\overline{OE}$ rise to Hi-Z state on D0-7		40	ns
6	$t_{SDV}$	Delay time, SEL valid to stable, selected data byte (delay to High Byte = delay to Low Byte)		65	ns
7	$t_{CLH}$	Pulse width, clock low	28		ns
8	$t_{SS}^{[2]}$	Setup time, SEL before clock fall	20		ns
9	$t_{OS}^{[2]}$	Setup time, $\overline{OE}$ before clock fall	20		ns
10	$t_{SH}^{[2]}$	Hold time, SEL after clock fall	0		ns
11	$t_{OH}^{[2]}$	Hold time, $\overline{OE}$ after clock fall	0		ns
12	$t_{RST}$	Pulse width, $\overline{RST}$ low	28		ns
13	$t_{DCD}$	Hold time, last position count stable on D0-7 after clock rise	10		ns
14	$t_{DSD}$	Hold time, last data byte stable after next SEL state change	5		ns
15	$t_{DOD}$	Hold time, data byte stable after $\overline{OE}$ rise	5		ns
16	$t_{UDD}$	Delay time, $U/\overline{D}$ valid after clock rise		45	ns
17	$t_{CHD}$	Delay time, $CNT_{DCDR}$ or $CNT_{CAS}$ high after clock rise		45	ns
18	$t_{CLD}$	Delay time, $CNT_{DCDR}$ or $CNT_{CAS}$ low after clock fall		45	ns
19	$t_{UDH}$	Hold time, $U/\overline{D}$ stable after clock rise	10		ns
20	$t_{UDCS}$	Setup time, $U/\overline{D}$ valid before $CNT_{DCDR}$ or $CNT_{CAS}$ rise	$t_{CLK}-45$		ns
21	$t_{UDCH}$	Hold time, $U/\overline{D}$ stable after $CNT_{DCDR}$ or $CNT_{CAS}$ rise	$t_{CLK}-45$		ns

**Notes:**

- $t_{CD}$  specification and waveform assume latch not inhibited.
- $t_{SS}$ ,  $t_{OS}$ ,  $t_{SH}$ ,  $t_{OH}$  only pertain to proper operation of the inhibit logic. In other cases, such as 8 bit read operations, these setup and hold times do not need to be observed.

# Operation

A block diagram of the HCTL-20XX family is shown in Figure 6. The operation of each major function is described in the following sections.

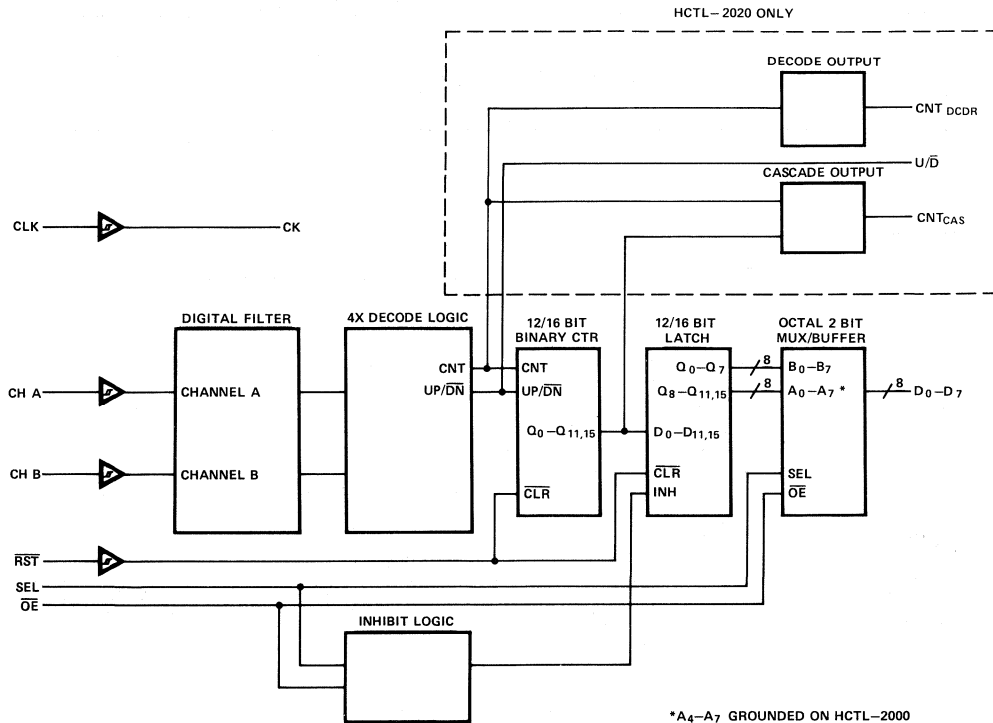

Figure 6. Simplified Logic Diagram

## DIGITAL NOISE FILTER

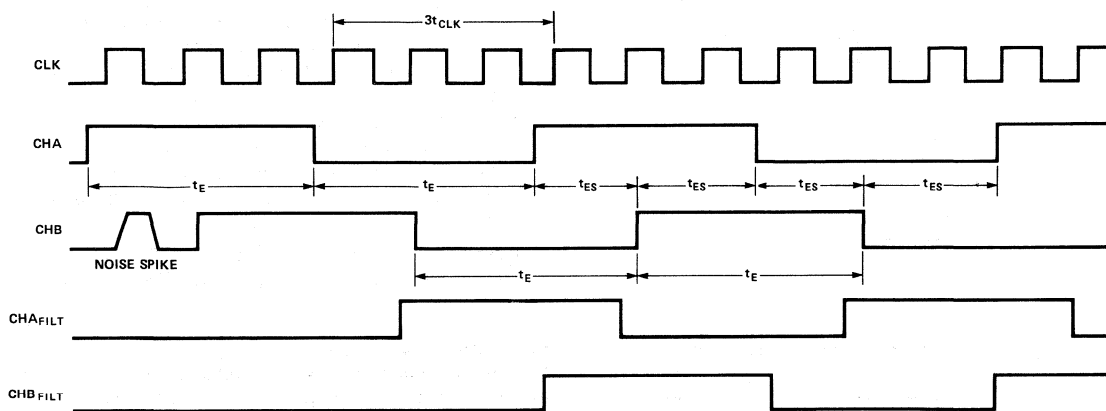

The digital noise filter section is responsible for rejecting noise on the incoming quadrature signals. The input section uses two techniques to implement improved noise rejection. Schmitt-trigger inputs and a three-clock-cycle delay filter combine to reject low level noise and large, short duration noise spikes that typically occur in motor system applications. Both common mode and differential mode noise are rejected. The user benefits from these techniques by improved integrity of the data in the counter. False counts triggered by noise are avoided.

Figure 7 shows the simplified schematic of the input section. The signals are first passed through a Schmitt trigger buffer to address the problem of input signals with slow

rise times and low level noise (approximately  $< 1$  V). The cleaned up signals are then passed to a four-bit delay filter. The signals on each channel are sampled on rising clock edges. A time history of the signals is stored in the four-bit shift register. Any change on the input is tested for a stable level being present for three consecutive rising clock edges. Therefore, the filtered output waveforms can change only after an input level has the same value for three consecutive rising clock edges. Refer to Figure 8 which shows the timing diagram. The result of this circuitry is that short noise spikes between rising clock edges are ignored and pulses shorter than two clock periods are rejected.

**Figure 7. Simplified Digital Noise Filter Logic**

**Figure 8. Signal Propagation Through Digital Noise Filter**

**QUADRATURE DECODER**

The quadrature decoder decodes the incoming filtered signals into count information. This circuitry multiplies the resolution of the input signals by a factor of four (4X decoding). When using an encoder for motion sensing, the user benefits from the increased resolution by being able to provide better system control.

The quadrature decoder samples the outputs of the CHA and CHB filters. Based on the past binary state of the two signals and the present state, it outputs a count signal and a direction signal to the internal position counter. In the case of the HCTL-2020, the signals also go to external pins 5 and 16 respectively.

Figure 9 shows the quadrature states and the valid state transitions. Channel A leading channel B results in counting up. Channel B leading channel A results in counting

down. Illegal state transitions, caused by faulty encoders or noise severe enough to pass through the filter, will produce an erroneous count.

**DESIGN CONSIDERATIONS**

The designer should be aware that the operation of the digital filter places a timing constraint on the relationship between incoming quadrature signals and the external clock. Figure 8 shows the timing waveform with an incremental encoder input. Since an input has to be stable for three rising clock edges, the encoder pulse width ( $t_E$  - low or high), has to be greater than three clock periods ( $3t_{CLK}$ ). This guarantees that the asynchronous input will be stable during three consecutive rising clock edges. A realistic design also has to take into account finite rise times of the waveforms, asymmetry of the waveforms, and noise. In the presence of large amounts of noise,  $t_E$  should be much

greater than  $3t_{CLK}$  to allow for the interruption of the consecutive level sampling by the three-bit delay filter. It should be noted that a change on the inputs that is qualified by the filter will internally propagate in a maximum of seven clock periods.

The quadrature decoder circuitry imposes a second timing constraint between the external clock and the input signals. There must be at least one clock period between consecutive quadrature states. As shown in Figure 9, a quadrature state is defined by consecutive edges on both channels. Therefore,  $t_{ES}$  (encoder state period)  $>$   $t_{CLK}$ . The designer must account for deviations from the nominal 90 degree phasing of input signals to guarantee that  $t_{ES} >$   $t_{CLK}$ .

## POSITION COUNTER

This section consists of a 12-bit (HCTL-2000) or 16-bit (HCTL-2016/2020) binary up/down counter which counts on rising clock edges as explained in the Quadrature Decoder Section. All 12 or 16 bits of data are passed to the position data latch. The system can use this count data in several ways:

- System total range is  $\leq$  12 or 16 bits, so the count represents "absolute" position.
- The system is cyclic with  $\leq$  12 or 16 bits of count per cycle.  $\overline{RST}$  is used to reset the counter every cycle and the system uses the data to interpolate within the cycle.
- System count is  $>$  8, 12 or 16 bits, so the count data is used as a relative or incremental position input for a system software computation of absolute position. In this case counter rollover occurs. In order to prevent loss of position information, the processor must read the outputs of the IC before the count increments one-half of the maximum count capability (i.e. 127, 2047, or 32,767 quadrature counts). Two's-complement arithmetic is normally used to compute position from these periodic position updates. Three modes can be used:
  - The IC can be put in 8-bit mode by tying the SEL line high, thus simplifying IC interface. The outputs must then be read at least once every 127 quadrature counts.
  - The HCTL-2000 can be used in 12-bit mode and sampled at least once every 2047 quadrature counts.
  - The HCTL-2016 or 2020 can be used in 16-bit mode and sampled at least once every 32,767 quadrature counts.
- The system count is  $>$  16 bits so the HCTL-2020 can be cascaded with other standard counter IC's to give absolute position.

## POSITION DATA LATCH

The position data latch is a 12/16-bit latch which captures the position counter output data on each rising clock edge, except when its inputs are disabled by the inhibit logic section during two-byte read operations. The output data is passed to the bus interface section. When active, a signal from the inhibit logic section prevents new data from being captured by the latch, keeping the data stable while successive reads are made through the bus section. The latch is automatically reenabled at the end of these reads. The latch is cleared to 0 asynchronously by the  $\overline{RST}$  signal.

**INHIBIT LOGIC**

The Inhibit Logic Section samples the  $\overline{OE}$  and SEL signals on the falling edge of the clock and, in response to certain conditions (see Figure 10 below), inhibits the position data latch. The  $\overline{RST}$  signal asynchronously clears the inhibit logic, enabling the latch. A simplified logic diagram of the inhibit circuitry is illustrated in Figure 11.

STEP	SEL	$\overline{OE}$	CLK	INHIBIT SIGNAL	ACTION
1	L	L	$\downarrow$	1	SET INHIBIT; READ HIGH BYTE
2	H	L	$\downarrow$	1	READ LOW BYTE; STARTS RESET
3	X	H	$\downarrow$	0	COMPLETES INHIBIT LOGIC RESET

Figure 10. Two Byte Read Sequence

**BUS INTERFACE**

The bus interface section consists of a 16 to 8 line multiplexer and an 8-bit, three-state output buffer. The multiplexer allows independent access to the low and high bytes of the position data latch. The SEL and  $\overline{OE}$  signals determine which byte is output and whether or not the output bus is in the high-Z state. In the case of the HCTL-2000 the data latch is only 12 bits wide and the upper four bits of the high byte are internally set to zero.

**QUADRATURE DECODER OUTPUT (HCTL-2020 ONLY)**

The quadrature decoder output section consists of count and up/down outputs derived from the 4X decode logic of the HCTL-2020. When the decoder has detected a count, a pulse, one-half clock cycle long, will be output on the  $CNT_{DCDR}$  pin. This output will occur during the clock cycle in which the internal counter is updated. The  $U/\overline{D}$  pin will be set to the proper voltage level one clock cycle before the rising edge of the  $CNT_{DCDR}$  pulse, and held one clock cycle after the rising edge of the  $CNT_{DCDR}$  pulse. These outputs are not affected by the inhibit logic. See Figures 5 and 12 for detailed timing.

**CASCADE OUTPUT (HCTL-2020 ONLY)**

The cascade output also consists of count and up/down outputs. When the HCTL-2020 internal counter overflows or underflows, a pulse, one-half clock cycle long, will be output on the  $CNT_{CAS}$  pin. This output will occur during the clock cycle in which the internal counter is updated. The  $U/\overline{D}$  pin will be set to the proper voltage level one clock cycle before the rising edge of the  $CNT_{CAS}$  pulse, and held one clock cycle after the rising edge of the  $CNT_{CAS}$  pulse. These outputs are not affected by the inhibit logic. See Figures 5 and 12 for detailed timing.

Figure 11. Simplified Inhibit Logic

\*CHA<sub>FILT</sub> and CHB<sub>FILT</sub> are the outputs of the digital noise filter (see figures 7 and 8).

Figure 12. Decode and Cascade Output Diagram

#### CASCADE CONSIDERATIONS (HCTL-2020 ONLY)

The HCTL-2020's cascading system allows for position reads of more than two bytes. These reads can be accomplished by latching all of the bytes and then reading the bytes sequentially over the 8-bit bus. Care must be taken to latch all of the bytes such that they represent the count as it actually is, despite propagation delays through the counters.

A good understanding of the mechanics of count propagation is important in designing a proper interface. Consider the sequence of events for a read cycle that starts as the HCTL-2020's internal counter rolls over. On the rising clock edge, count data is updated in the internal counter, rolling it over. A count-cascade pulse (CNT<sub>CAS</sub>) will be generated with some delay after the rising clock edge ( $t_{CHD}$ ). There will be additional propagation delays through the external counters and registers. Meanwhile, with  $\overline{OE}$  and SEL low to start the read, this new count on the HCTL-2020 will be latched in on the falling clock edge of this cycle. If the external registers are latched too soon, before the CNT<sub>CAS</sub> pulse has toggled the external counters and registers, a major count error will occur.

Valid data can be ensured by latching the external counter data on the first rising clock edge following the falling edge on which the internal count on the HCTL-2020 is latched (provided that all the delays are less than one clock cycle). This will ensure that a cascade pulse that occurs during the clock cycle when the read begins has adequate time to propagate. This also guarantees that a cascade pulse occurring on the clock cycle after the read is initiated will not be erroneously latched.

For example, suppose the HCTL-2020 count is at FFFFH and an external counter is at F0H, with the count going up. A count occurring in the HCTL-2020 will cause the counter to roll over and a cascade pulse will be generated. A read starting on this clock cycle will show 0000H from the HCTL-2020. The external counter should read F1H, but if the host latches the count before the cascade signal propagates through, the external counter will still read F0H.

# General Interfacing

The 12-bit (HCTL-2000) or 16-bit (HCTL-2016/2020) latch and inhibit logic allows access to 12 or 16 bits of count with an 8-bit bus. When only 8-bits of count are required, a simple 8-bit (1-byte) mode is available by holding SEL high continuously. This disables the inhibit logic.  $\overline{OE}$  provides control of the tri-state bus, and read timing is shown in Figures 2 and 3.

For proper operation of the inhibit logic during a two-byte read,  $\overline{OE}$  and SEL must be synchronous with CLK due to the falling edge sampling of  $\overline{OE}$  and SEL.

The internal inhibit logic on the HCTL-20XX family inhibits the transfer of data from the counter to the position data latch during the time that the latch outputs are being read. The inhibit logic allows the microprocessor to first read the high order 4 or 8 bits from the latch and then read the low order 8 bits from the latch. Meanwhile, the counter can continue to keep track of the quadrature states from the CHA and CHB input signals.

Figure 11 shows the simplified inhibit logic circuit. The operation of the circuitry is illustrated in the read timing shown in Figure 13.

\* $\overline{OE}$  can consist of two short low pulses, as well as one long pulse, and still satisfy the inhibit logic sequence. During the time that  $\overline{OE}$  is high, the data lines are tri-stated.

Figure 13. Typical Interface Timing

## ACTIONS

1. On the rising edge of the clock, counter data is transferred to the position data latch, provided the inhibit signal is low.
2. When  $\overline{OE}$  goes low, the outputs of the multiplexer are enabled onto the data lines. If SEL is low, then the high order data bytes are enabled onto the data lines. If SEL is high, then the low order data bytes are enabled onto the data lines.
3. When the IC detects a low on  $\overline{OE}$  and SEL during a falling clock edge, the internal inhibit signal is activated. This blocks new data from being transferred from the counter to the position data latch.

4. When SEL goes high, the data outputs change from the high byte to the low byte.
5. The first of two reset conditions for the inhibit logic is met when the IC detects a logic high on SEL and a logic low on  $\overline{OE}$  during a falling clock edge.
6. When  $\overline{OE}$  goes high, the data lines change to a high impedance state.
7. The IC detects a logic high on  $\overline{OE}$  during a falling clock edge. This satisfies the second reset condition for the inhibit logic.

# Interfacing the HCTL-2020 to a Motorola 6802/8 and Cascading the Counter for 24 Bits

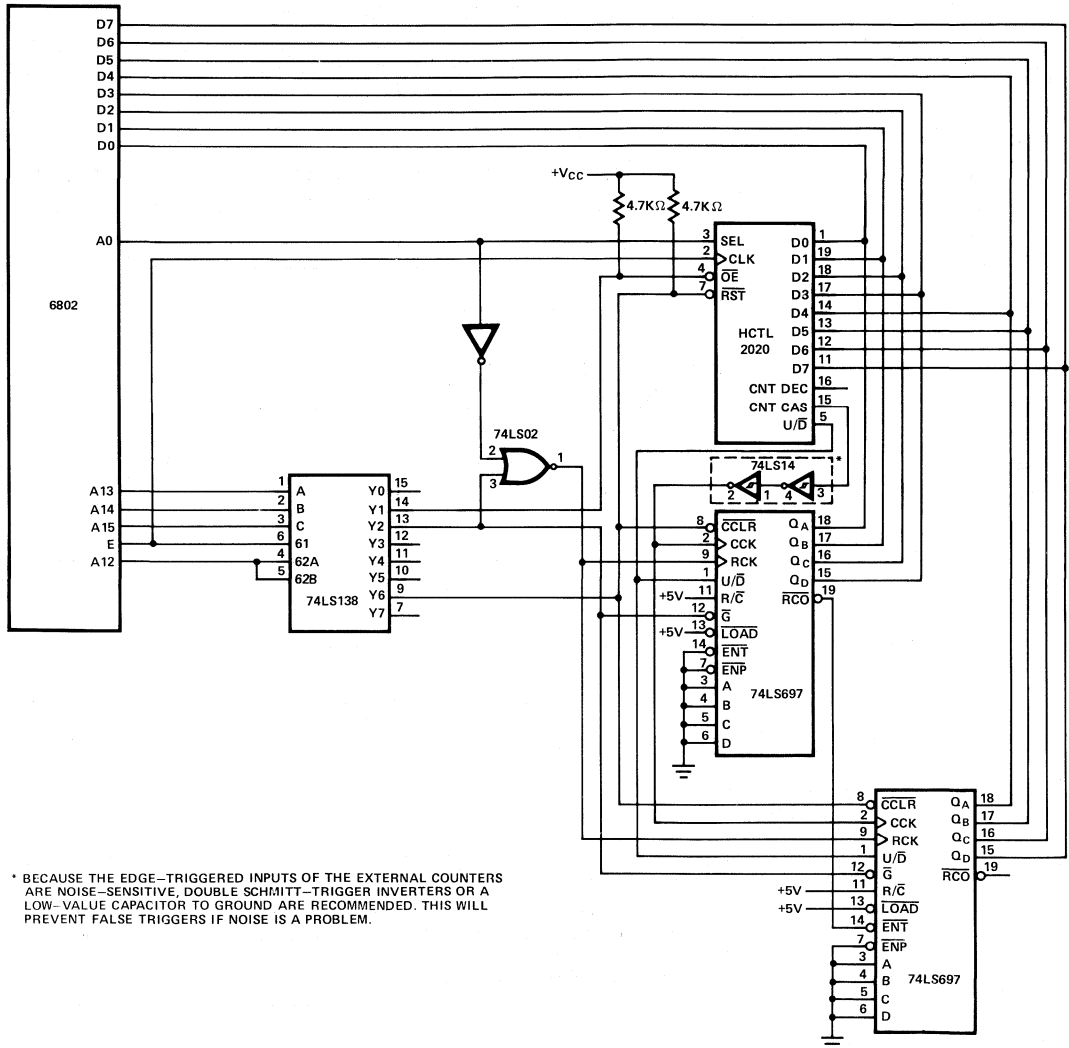

Figure 14. A Circuit to Interface to the 6802/8

In this circuit an interface to a Motorola 6802/8 and a cascading scheme for a 24-bit counter are shown. This circuit provides a minimum part count by: 1) using two 74LS697 Up/Down counters with output registers and tri-state outputs and 2) using a Motorola 6802/8 LDX instruction which stores 16 bits of data into the index registers in two consecutive clock cycles.

The HCTL-2020  $\overline{OE}$  and the 74LS697  $\overline{G}$  lines are decoded from Address lines A15-A13. This results in counter data being enabled onto the bus whenever an external memory access is made to locations 4XXX or 2XXX. Address line A12 and processor clock E enable the 74LS138. The processor clock E is also used to clock the HCTL-2020. Address A0 is connected directly to the SEL pin on the HCTL-2020. This line selects the low or high byte of data from the HCTL-2020.

Cascading is accomplished by connecting the  $CNT_{CAS}$  output on the HCTL-2020 with the counter clock (CCK) input on both 74LS697's. The  $U/\overline{D}$  pin on the HCTL-2020 and the  $U/\overline{D}$  pin on both 74LS697's are also directly connected for easy expansion. The  $\overline{RCO}$  of the first 4-bit 74LS697 is connected to the  $\overline{ENT}$  pin of the second 74LS697. This enables the second counter only when there is a  $\overline{RCO}$  signal on the first counter.

This configuration allows the 6802 to read both data bytes with a single double-byte fetch instruction (LDX 2XX0). This instruction is a five cycle instruction which reads external memory location 2XX0 and stores the high order byte into the high byte of the index register. Memory location 2XX1 is next read and stored in the low order byte

of the index register. The high byte of counter data is clocked into the 74LS697 registers when SEL is high and  $\overline{OE}$  goes low. This upper byte can be read at any time by pulling the 74LS697  $\overline{G}$  low when reading address 4XXX. Figure 15 shows memory addresses and gives an example of reading the HCTL-2020. Figure 16 shows the interface timing for the circuit.

Address	Function
CXXX	Reset Counters
4XXX	Enable High Byte on Data Lines
2XX0	Enable Low Byte on Data Lines
2XX1	Enable Mid Byte on Data Lines

Read Example	
LDX 2000	Loads mid byte and then low byte into memory locations 0100 and 0101
STX 0100	
LDAA 4000	Loads the high byte into memory location 0102
STAA 0102	

**Figure 15. Memory Addresses and Read Example**

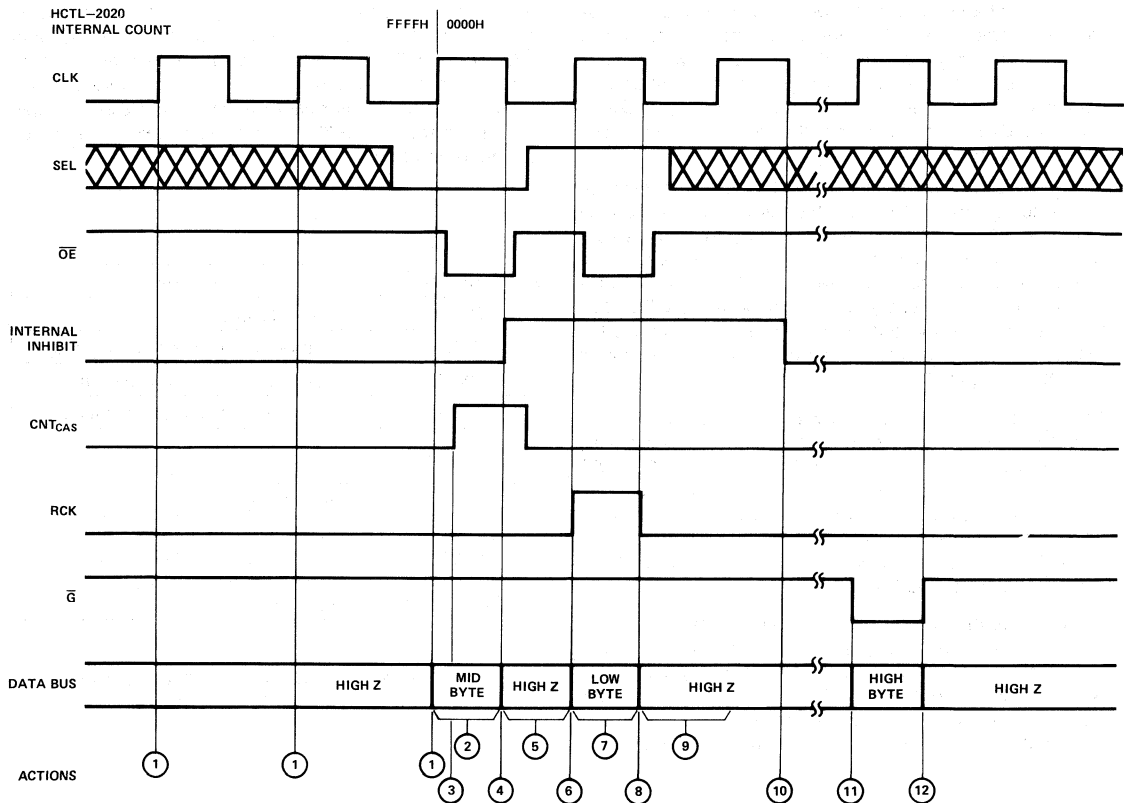

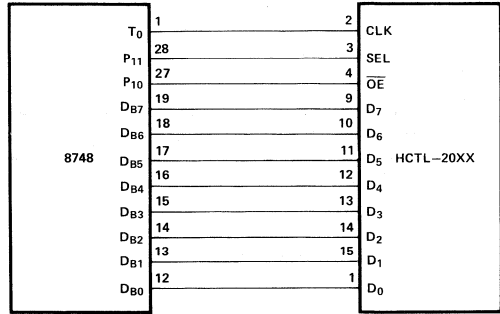

Figure 16. Interface Timing for the 6802/8

### ACTIONS

1. The microprocessor clock output is E. If the internal HCTL-2020 inhibit is not active, new data is transferred from the internal counter to the position data latch.
2. An even address output from the 6802 causes SEL to go low. When E goes high, the address decoder output for the HCTL-2020  $\overline{OE}$  signal goes low. This causes the HCTL-2020 to output the middle byte of the system counter (high byte of the HCTL-2020 counter).
3. In this case, the HCTL-2020 counter has overflowed and there is an output on the  $CNT_{CAS}$  line. This pulse is counted by the 74LS697 but not loaded into the output register of the 74LS697 at this time.
4. The 6802 reads the data bus on the falling edge of E, storing the high order 2020 data byte (middle system byte) into the high byte of the index register. The chip detects that  $\overline{OE}$  and SEL are low on the falling edge of E and activates the internal inhibit signal. The position data latch is inhibited and data cannot be transferred from the internal counter to the latch.
5. When E goes low, the address decoder output is disabled and  $\overline{OE}$  goes high. The 6802 increments the address, causing SEL to go high. The position data latch is still inhibited.
6. When SEL is high and  $\overline{OE}$  is low the 74LS697 register clock (RCK) goes high. The rising edge of RCK loads the 74LS697 count into the 74LS697 register. Delaying the RCK signal until the second  $\overline{OE}$  allows for delays on the  $CNT_{CAS}$  signal.
7. The address decoder is enabled after E goes high. The  $\overline{OE}$  line goes low and the low data byte is enabled onto the bus.
8. The 6802 reads the data bus on the falling edge of E, storing the low order data byte into the low byte of the index register. The HCTL-2020 detects that  $\overline{OE}$  is low and SEL is high on the falling edge of E, thus meeting the first inhibit reset condition.
9. When E goes low, the address decoder is disabled, causing  $\overline{OE}$  to go high and the data lines to go to the high impedance state. The 6802 continues its instruction execution, and the state of SEL is indeterminate.
10. The HCTL-2020 detects  $\overline{OE}$  is high on the next falling edge of E. This satisfies the second inhibit reset condition and the inhibit signal is reset.
11. When E goes high, a new address causes the  $\overline{G}$  line on the 74LS697 to go low and enables the high byte onto the data bus.
12. When E goes low, the high byte is read into the 6802. The data bus returns to tri-state.

# Interfacing the HCTL-20XX to an Intel 8748

The circuit shown in Figure 17 shows the connections between an HCTL-20XX and an 8748. Data lines D0-D7 are connected to the 8748 bus port. Bits 0 and 1 of port 1 are used to control the SEL and  $\overline{OE}$  inputs of the HCTL-20XX respectively. T0 is used to provide a clock signal to the HCTL-20XX. The frequency of T0 is the crystal frequency divided by 3. T0 must be enabled by executing the ENT0 CLK instruction after each system reset, but prior to the first encoder position change. An 8748 program which interfaces to the circuit in Figure 17 is given in Figure 18. The resulting interface timing is shown in Figure 19.

\* NOTE: PIN NUMBERS ARE DIFFERENT FOR THE HCTL-2020

Figure 17. An HCTL-20XX-to-Intel 8748 Interface

LOC	Object Code	Source Statements	Comments
000	99 00	ANL P1, 00H	Enable output and higher order bits
002	08	INS A, BUS	Load higher order bits into ACC
003	A8	MOVE R0 A	Move data to register 0
004	89 03	ORL P1, 01H	Change data from high order to low order bits
006	08	INS A, BUS	Load order bits into AC
008	A9	MOV R1, A	Move data to register 1
009	89 03	ORL P1, 03H	Disable outputs
00B	93	RETR	Return

Figure 18. A Typical Program for Reading HCTL-20XX with an 8748

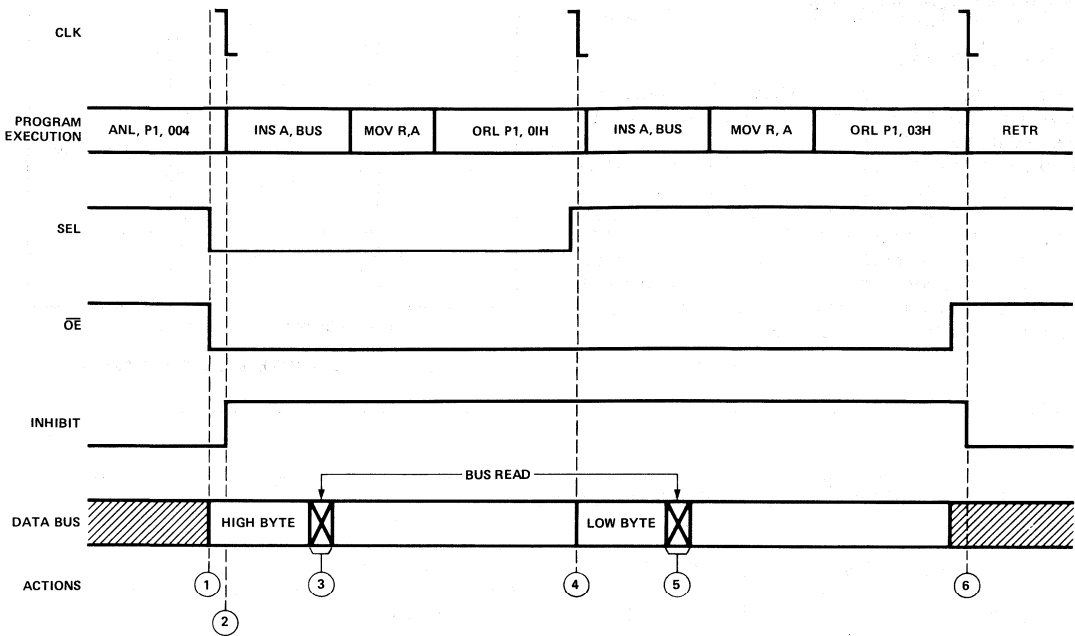

Figure 19. 8748 READ Cycle from Figure 18.

#### ACTIONS

1. ANL P1, 00H has just been executed. The output of bits 0 and 1 of Port 1 cause SEL and  $\overline{OE}$  to be logic low. The data lines output the higher order byte.
2. The HCTL-20XX detects that  $\overline{OE}$  and SEL are low on the next falling edge of the CLK and asserts the internal inhibit signal. Data can be read without regard for the phase of the CLK.
3. INS A, BUS has just been executed. Data is read into the 8748.
4. ORL PORT 1, 01H has just been executed. The program sets SEL high and leaves  $\overline{OE}$  low by writing the correct values to port 1. The HCTL-20XX detects  $\overline{OE}$  is low and SEL is high on the next falling edge of the CLK, and thus the first inhibit reset condition is met.
5. INS A, BUS has just been executed. Lower order data bits are read into the 8748.
6. ORL P1, 03H has just been executed. The HCTL-20XX detects  $\overline{OE}$  high on the next falling edge of CLK. The program sets  $\overline{OE}$  and SEL high by writing the correct values to port 1. This causes the data lines to be tristated. This satisfies the second inhibit and reset condition. On the next rising CLK edge new data is transferred from the counter to the position data latch.

# General Purpose Motion Control IC

## Technical Data

### Features

- Low Power CMOS
- PDIP and PLCC Versions Available
- Enhanced Version of the HCTL-1000
- DC, DC Brushless, and Step Motor Control
- Position and Velocity Control
- Programmable Digital Filter and Commutator
- 8-Bit Parallel, and PWM Motor Command Ports
- TTL Compatible
- SYNC Pin for Coordinating Multiple HCTL-1100 ICs
- 100 kHz to 2 MHz Operation
- Encoder Input Port

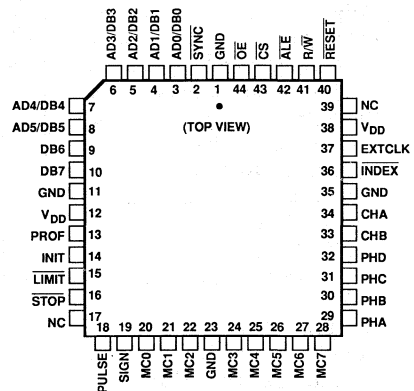

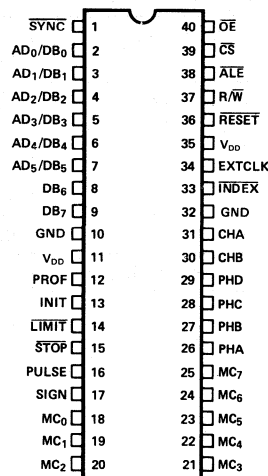

### Description

The HCTL-1100 series is a high performance, general purpose motion control IC, fabricated in HP CMOS technology. It frees the host processor for other tasks by performing all the time-intensive functions of digital motion control. The programmability of all control parameters provides maximum flexibility and quick design of

### HCTL-1100 Series

control systems with a minimum number of components. In addition to the HCTL-1100, the complete control system consists of a host processor to specify commands, an amplifier, and a motor with an incremental encoder (such as the HP HEDS-5XXX, -6XXX, -9XXX series). No analog compensation or velocity feedback is necessary.

## Theory of Operation

The HCTL-1100 is a general purpose motor controller which provides position and velocity control for DC, brushless and stepper motors. The internal block diagram of the HCTL-1100 is shown in Figure 1. The HCTL-1100 receives its input commands from a host processor and position feedback from an incremental encoder with quadrature output. An 8-bit bi-directional multiplexed address/data bus interfaces the HCTL-1100 to the host

processor. The encoder feedback is decoded into quadrature counts and a 24-bit counter keeps track of position. The HCTL-1100 executes any one of four control algorithms selected by the user. The four control modes are:

- Position Control
- Proportional Velocity Control
- Trapezoidal Profile Control for point to point moves
- Integral Velocity Control with continuous velocity profiling using linear acceleration

The resident Position Profile Generator calculates the necessary profiles for Trapezoidal Profile Control and Integral Velocity Control. The HCTL-1100 compares the desired position (or velocity) to the actual position (or velocity) to compute compensated motor commands using a programmable digital filter D(z). The motor command is externally available at the Motor Command port as an 8-bit byte and at the PWM port as a Pulse Width Modulated (PWM) signal.

The HCTL-1100 has the capability of providing electronic commutation for DC brushless and stepper motors. Using the encoder position information, the motor phases are enabled in the correct sequence. The commutator is fully programmable to encompass most motor/encoder combinations. In addition, phase overlap and phase advance can be programmed to improve torque ripple and high speed performance. The HCTL-1100 contains a number of flags including two externally available flags, Profile and Initialization, which allow the user to see or check the status of the controller. It also has two emergency inputs, Limit and Stop, which allow operation of the HCTL-1100 to be interrupted under emergency conditions.

The HCTL-1100 controller is a digitally sampled data system. While information from the host processor is accepted asynchronously with respect to the control functions, the motor command is computed on a discrete sample time basis. The sample timer is programmable.

\*General formula for determining AC characteristics for other clock frequencies (clk), between 100 kHz and 2 MHz.

## HCTL-1100 I/O Timing Diagrams

Input logic level values are the TTL Logic levels  $V_{IL} = 0.8\text{ V}$  and  $V_{IH} = 2.0\text{ V}$ . Output logic levels are  $V_{OL} = 0.4\text{ V}$  and  $V_{OH} = 2.4\text{ V}$ .

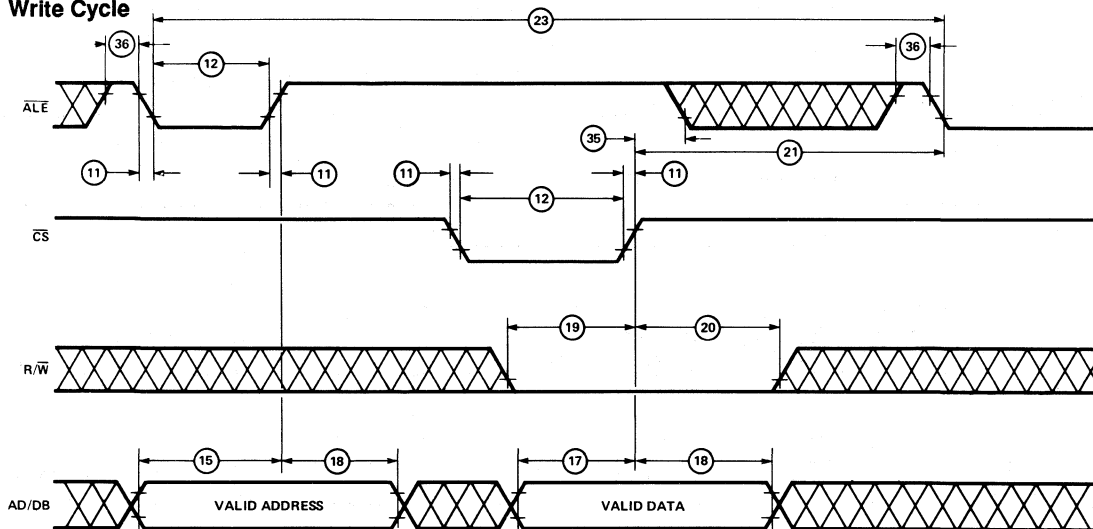

## HCTL-1100 I/O Timing Diagrams

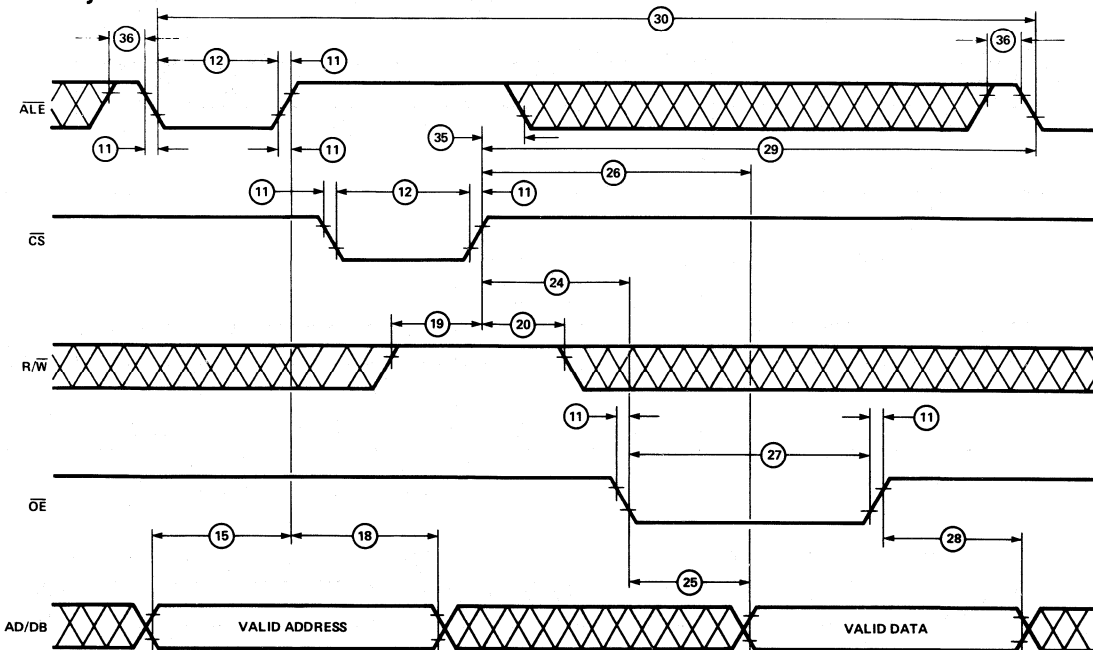

There are three different timing configurations which can be used to give the user flexibility to interface the HCTL-1100 to most microprocessors. See the I/O interface section for more details.

## Pin Descriptions and Functions

### Input/Output Pins

Symbol	Pin Number		Description
	PDIP	PLCC	
AD0/DB0- AD5/DB5	2-7	3-8	Address/Data Bus – Lower 6 bits of 8-bit I/O port which are multiplexed between address and data.
DB6, DB7	8, 9	9, 10	Data bus – Upper 2 bits of 8-bit I/O port used for data only.

### Input Signals

Symbol	Pin Number		Description
	PDIP	PLCC	
CHA/CHB	31, 30	34, 33	Channel A, B – Input pins for position feedback from an incremental shaft encoder. Two channels, A and B, 90 degrees out of phase are required.
$\overline{\text{Index}}$	33	36	Index Pulse – Input from the reference or index pulse of an incremental encoder. <b>Used only in conjunction with the Commutator.</b> Either a low or high true signal can be used with the Index pin. See Timing Diagrams and Encoder Interface section for more detail.
$\overline{\text{R/W}}$	37	41	Read/Write – Determines direction of data exchange for the I/O port.
$\overline{\text{ALE}}$	38	42	Address Latch Enable – Enables lower 6 bits of external data bus into internal address latch.
$\overline{\text{CS}}$	39	43	Chip Select – Performs I/O operation dependent on status of $\overline{\text{R/W}}$ line. For a Write, the external bus data is written into the internal addressed location. For Read, data is read from an internal location into an internal output latch.
$\overline{\text{OE}}$	40	44	Output Enable – Enables the data in the internal output latch onto the external data bus to complete a Read operation.
$\overline{\text{Limit}}$	14	15	Limit Switch – An internal flag which when externally set, triggers an unconditional branch to the Initialization/Idle mode before the next control sample is executed. Motor Command is set to zero. Status of the Limit flag is monitored in the Status register.
$\overline{\text{Stop}}$	15	16	Stop Flag – An internal flag that is externally set. When flag is set during Integral Velocity Control mode, the Motor Command is decelerated to a stop.
$\overline{\text{Reset}}$	36	40	Reset – A hard reset of internal circuitry and a branch to Reset mode.
ExtClk	34	37	External Clock
$V_{\text{DD}}$	11, 35	12, 38	Voltage Supply – Both $V_{\text{DD}}$ pins must be connected to a 5.0 volt supply.
GND	10, 32	1, 11, 23, 35	Circuit Ground
$\overline{\text{SYNC}}$	1	2	Used to synchronize multiple HCTL-1100 sample timers.
NC	–	17, 39	Not connected. These pins should be left floating.

## Output Pins

Symbol	Pin Number		Description
	PDIP	PLCC	
MC0-MC7	18-25	20-22, 24-28	Motor Command Port – 8-bit output port which contains the digital motor command adjusted for easy bipolar DAC interfacing. MC7 is the most significant bit (MSB).
Pulse	16	18	Pulse – Pulse width modulated signal whose duty cycle is proportional to the Motor Command magnitude. The frequency of the signal is External Clock/100 and pulse width is resolved into 100 external clocks.
Sign	17	19	Sign – Gives the sign/direction of the pulse signal.
PHA-PHD	26-29	29-32	Phase A, B, C, D – Phase Enable outputs of the Commutator.
Prof	12	13	Profile Flag – Status flag which indicates that the controller is executing a profiled position move in the Trapezoidal Profile Control mode.
Init	13	14	Initialization/Idle Flag – Status flag which indicates that the controller is in the Initialization/Idle mode.

## Pin Functionality

### SYNC Pin

The SYNC pin is used to synchronize two or more ICs. It is only valid in the INIT/IDLE mode (see Operating the HCTL-1100). When this pin is pulled low, the internal sample timer is cleared and held to zero. When the level on the pin is returned to high, the internal sample timer instantly starts counting down from the programmed value.

Connecting all SYNC pins together in the system and pulsing the SYNC signal from the host processor will synchronize all controllers.

### Limit Pin

This emergency-flag input is used to disable the control modes of the HCTL-1100. A low level on this input pin causes the internal Limit flag to be set. If this pin is NOT used, it must be pulled up to  $V_{DD}$ . If it is not connected, the pin could float low, and possibly trigger a false emergency condition.

The Limit flag, when set in any control mode, causes the HCTL-1100 to go into the Initialization/Idle mode, clearing the Motor Command and causing an immediate motor shutdown. When the Limit flag is set, none of the three control mode flags (F0, F3, or F5) are cleared as the HCTL-1100 enters the Initialization/Idle mode. The user should be aware that these flags are still set before commanding the HCTL-1100 to re-enter one of the four control modes from Initialization/Idle mode.

In general, the user should clear all control mode flags after the limit pin has been pulled low, then proceed.

### Stop Pin

The Stop flag affects the HCTL-1100 only in the Integral Velocity Mode.

When a low level is present on this emergency-flag input, the internal stop flag is set. If this pin is NOT used, it must be pulled up to  $V_{DD}$ . If it is not

connected, the pin could float low, and possibly trigger a false emergency condition.

When the STOP flag is set, the system will come to a decelerated stop and stay in this mode with a command velocity of zero until the Stop flag is cleared and a new command velocity is specified.

### Notes on Limit and Stop Flags

Stop and Limit flags are set by a low level input at their respective pins. The flags can only be cleared when the input to the corresponding pin goes high, signifying that the emergency condition has been corrected, AND a write to the Status register (R07H) is executed. That is, after the emergency pin has been set and cleared, the flag also must be cleared by writing to R07H. Any word that is written to R07H after the emergency pin is set and cleared will clear the emergency flag. The lower four bits of that word will also reconfigure the Status register.

### **Encoder Input Pins (CHA, CHB, INDEX)**

The HCTL-1100 accepts TTL compatible outputs from 2 and 3 channel incremental encoders such as the HEDS-5XXX, 6XXX, and 9XXX series encoders. Channels A and B are internally decoded into quadrature counts which increment or decrement the 24-bit position counter. For example, a 500-count encoder is decoded into 2000 quadrature counts per revolution. The position counter will be incremented when Channel B leads Channel A. The Index channel is used only for the Commutator and its function is to serve as a reference point for the internal Ring Counter.

The HCTL-1100 employs an internal 3-bit state delay filter to remove any noise spikes from the encoder inputs to the HCTL-1100. This 3-bit state delay filter requires the encoder inputs to remain stable for three consecutive clock rising edges for an encoder pulse to be considered valid by the HCTL-1100's actual position counter (i.e., an encoder pulse must remain at a logic level high or low for three consecutive clock rising edges for the HCTL-1100's actual position counter to be incremented or decremented.) The designer should therefore generally avoid creating the encoder pulses of less than 3 clock cycles.

The index signal of an encoder is used in conjunction with the Commutator. It resets the internal ring counter which keeps track of the rotor position so that no cumulative errors are generated.

The  $\overline{\text{Index}}$  pin of the HCTL-1100 also has a 3-bit filter on its input. The  $\overline{\text{Index}}$  pin is *active low and level transition sensitive*. It detects a valid high-to-low transition and qualifies the low input level through the 3-bit filter. At this point, the Index signal is internally detected by the commutator logic. This type of configuration allows an Index or  $\overline{\text{Index}}$  signal to be used to generate the reference mark for commutator operation as long as the AC specifications for the Index signal are met.

### **Motor Command Port (MC0-MC7)**

The 8-bit Motor Command port consists of register R08H whose data goes directly to external pins MC0-MC7. MC7 is the most significant bit. R08H can be read and written to, however, it should be written to only during the Initialization/Idle mode. During any of the four Control modes, the controller writes the motor command into R08H.

This topic is further discussed in the "Register Section" under "Motor Command Register R08H".

### **Pulse Width Modulation (PWM) Output Port (Pulse, Sign)**

The PWM port consists of the Pulse and Sign pins. The PWM port outputs the motor command as a pulse width modulated signal with the correct polarity. This topic is further discussed in the "Register Section" under "PWM Motor Command Register R09H".

### **Trapezoid Profile Pin (Prof)**

The Trapezoid Profile Pin is internally connected to software flag bit 4 in the Status Register. This flag is also represented by bit 0 in the Flag Register (R00H). See the "Register Section" for more information. Both the Pin and the Flag indicate the status of a trapezoid profile move. When the HCTL-1100 begins a trapezoid move, this flag is set by the controller (a high level appears on the pin), indicating the move is in progress. When the HCTL-1100 finishes the move, this flag is cleared by the controller.

Note that the instant the flag is cleared may not be the same instant the motor stops. The flag indicates the completion of the command profile, not the actual profile. If the motor is stalled during the move, or cannot physically keep up with the move, the flag will be cleared before the move is finished.

### **INIT/IDLE Pin (INIT)**

This pin indicates that the HCTL-1100 is in the INIT/IDLE mode, waiting to begin control. This pin is internally connected to the software flag bit 5 in the Status Register R07H. This flag is also represented by bit 1 in the Flag Register (R00H) (See the "Register Section" for more information).

### **Commutator Pins (PHA-PHD)**

These pins are connected only when using the commutator of the HCTL-1100 to drive a brushless motor or step motor. The four pins can be programmed to energize each winding on a multiphase motor.

## Operation of the HCTL-1100

### Registers

The HCTL-1100 operation is controlled by a bank of 64 8-bit registers, 35 of which are user

accessible. These registers contain command and configuration information necessary to properly run the controller chip. The 35 user-accessible registers are listed in Tables 1 and 2. The register number is also the address. A

functional block diagram of the HCTL-1100 which shows the role of the user-accessible registers is also included in Figure 3. The other 29 registers are used by the internal CPU as scratch registers and should not be accessed by the user.

**Notes:**

1. Consult appropriate section for data format and use.
2. Upper 4 bits are read only.
3. Writing to R0EH (LSB) latches all 24 bits.
4. Reading R14H (LSB) latches data in R12H and R13H.
5. Writing to R13H clears Actual Position Counter to zero.
6. The scalar data is limited to positive numbers (00H to 7FH).
7. The commutator registers (R18H, R1CH, R1FH) have further limits which are discussed in the Commutator section of this data sheet.
8. Writing to R17H (R23D) latches all 24 bits (only in INIT/IDLE mode).

## Register Descriptions – General Control, Output, Filter, and Commutator

### Flag Register (R00H)

The Flag register contains flags F0 through F5. This register is a read/write register. Each flag is set and cleared by writing an 8-bit data word to R00H. When writing to R00H, the upper four bits are ignored by the HCTL-1100, bits 0,1,2 specify the flag address, and bit 3 specifies whether to set (bit=1) or clear (bit=0) the addressed flag.

### Flag Descriptions

**F0–Trapezoidal Profile Flag** – set by the user to execute Trapezoidal Profile Control. The flag is reset by the controller when the move is completed. The status of F0 can be monitored at the Profile pin and in Status register R07H bit 4.

**F1–Initialization/Idle Flag** – set/cleared by the HCTL-1100 to indicate execution of the Initialization/Idle mode. The status of F1 can be monitored at the Initialization/Idle pin and in bit 5 of the Status register (R07H). The user should not attempt to set or clear F1.

**F2–Unipolar Flag** – set/cleared by the user to specify Bipolar (clear) or Unipolar (set) mode for the Motor Command port.

**F3–Proportional Velocity Control Flag** – set by the user to specify Proportional Velocity control.

**F4–Hold Commutator flag** – set/cleared by the user or automatically by the Align mode. When set, this flag inhibits the internal commutator counters to

allow open loop stepping of a motor by using the commutator. (See "Offset register" description in the "Commutator section.")

**F5–Integral Velocity Control** – set by the user to specify Integral Velocity Control. Also set and cleared by the HCTL-1100 during execution of the Trapezoidal Profile mode. This is transparent to the user except when the Limit flag is set (see "Emergency Flags" section).

### Writing to the Flag Register

When writing to the flag register, only the lower four bits are used. Bit 3 indicates whether to set or clear a certain flag, and bits 0,1,and 2 indicate the desired flag. The following table shows the bit map of the Flag register:

Bit Number	Function
7-4	Don't Care
3	1 = set 0 = clear
2	AD2
1	AD1
0	AD0

The following table outlines the possible writes to the Flag Register:

Flag	SET	CLEAR
F0	08H	00H
F1	-	-
F2	0AH	02H
F3	0BH	03H
F4	0CH	04H
F5	0DH	05H

### Reading the Flag Register

Reading register R00H returns the status of the flags in bits 0 to 5. For example, if bit 0 is set (logic 1), then flag F0 is set. If bit 4 is set, then flag F4 is set. If

bits 0 and 5 are set, then both flags F0 and F5 are set.

The following table outlines the Flag Register Read:

Bit Number	Flag (1 = set) (0 = clear)
8-6	Don't Care
5	F5
4	F4
3	F3
2	F2
1	F1
0	F0

### Notes:

1. A soft reset (writing 00H to R05H) will not reset the flags in the flag register. A hard reset (RESET pin low) is required to reset all the flags. The flags can also be reset by writing the proper word to the Flag register as explained above.
2. While in Trapezoid Profile Mode, Flag F0 will be set, and Flag F5 may be set. F5 is used for internal purposes. Both flags will be cleared at the end of the profile.

### Program Counter Register (R05H)

The Program Counter, which is a write-only register, executes the preprogrammed functions of the controller. The program counter is used along with the control flags F0, F3, and F5 in the Flag register (R00H) to change control modes. The user can write any of the following four commands to the Program Counter.

Value written to R05H	Action
00H	Software Reset
01H	Enter Init/Idle Mode
02H	Enter Align Mode (only from INIT/IDLE Mode)
03H	Enter Control Mode (only from INIT/IDLE Mode)

These Commands are discussed in more detail in the "Operating Modes" section.

### Status Register (R07H)

The Status register indicates the status of the HCTL-1100. Each bit decodes into one signal. All 8 bits are user readable and are decoded as shown below. Only the lower 4 bits can be written to by the user to configure the HCTL-1100. To set or clear any of the lower 4 bits, the user writes an 8-bit word to R07H. The upper 4 bits are ignored. Each of the lower 4 bits directly sets/clears the corresponding bit of the Status register as shown below. For example, writing XXXX0101 to R07H sets the PWM Sign

Reversal Inhibit, sets the Commutator Phase Configuration to "3 Phase", and sets the Commutator Count Configuration to "full".

### Motor Command Register (R08H)

The 8-bit Motor Command Port consists of register R08H. The register is connected to external pins MC0-MC7. MC7 is the most significant bit. R08H can be read and written to; however, it should be written to only in the Initialization/Idle mode. During any of the four control modes, the HCTL-1100 writes values to register R08H.

The Motor Command Port operates in two modes, bipolar

and unipolar, when under control of internal software. Bipolar mode allows the full range of values in R08H (-128D to +127D). The data written to the Motor Command Port by the control algorithms is the internally computed 2's-complement motor command with an 80H offset added. This allows direct interfacing to a DAC. Connecting the Motor Command Port to a DAC, Bipolar mode allows the full voltage swing (positive and negative).

Unipolar mode functions such that with the same DAC circuit, the motor command output is restricted to positive values (80H to FFH) when in a control mode. Unipolar mode is used with multi-phase motors when the commutator controls the direction of movement. (If needed, the Sign pin could be used to indicate direction). In Unipolar mode, the user can still write a negative value to R08H in INIT/IDLE mode.

Unipolar mode or Bipolar mode is programmed by setting or clearing flag F2 in the Flag Register R00H.

Internally, the HCTL-1100 operates on data of 24, 16 and 8-bit lengths to produce the 8-bit motor command, available externally. Many times the computed motor command will be greater than 8 bits. At this point, the motor command is saturated by the controller. The saturated value output by the controller is not the full scale value 00H (00D), or FFH

**Table 3. Status Register**

Status Bit	Function
0	PWM Sign Reversal Inhibit 0 = off 1 = on
1	Commutator Phase Configuration 0 = 3 phase 1 = 4 phase
2	Commutator Count Configuration 0 = quadrature 1 = full
3	Should always be set to 0
4	Trapezoidal Profile Flag F0 1 = in Profile Control
5	Initialization/Idle Flag F1 1 = in Initialization/Idle Mode
6	Stop Flag 0 = set (Stop triggered) 1 = cleared (no Stop)
7	Limit Flag 0 = set (Limit triggered) 1 = cleared (no Limit)

(255D). The saturated value is adjusted to 0FH (15D) (negative saturation) and F0H (240D) (positive saturation). Saturation levels for the Motor Command port are in Figure 4.

**PWM Motor Command Register (R09H)**

The PWM port outputs the motor command as a pulse width modulated signal with the correct sign of polarity. The PWM port consists of the Pulse and Sign pins and R09H.

The PWM signal at the Pulse pin has a frequency of External Clock/100 and the duty cycle is resolved into the 100 clocks. (For example, a 2 MHz clock gives a 20 KHz PWM frequency).

The Sign pin gives the polarity of the command. Low output on Sign pin is positive polarity.

The 2's-complement contents of R09H determine the duty cycle and polarity of the PWM

command. For example, D8H (-40D) gives a 40% duty cycle signal at the Pulse pin and forces the Sign pin high. Data outside the 64H (+100D) to 9CH (-100D) linear range gives 100% duty cycle. R09H can be read and written to. However, the user should only write to R09H when the controller is in the Initialization/Idle mode. Figure 5 shows the PWM output versus the internal motor command.

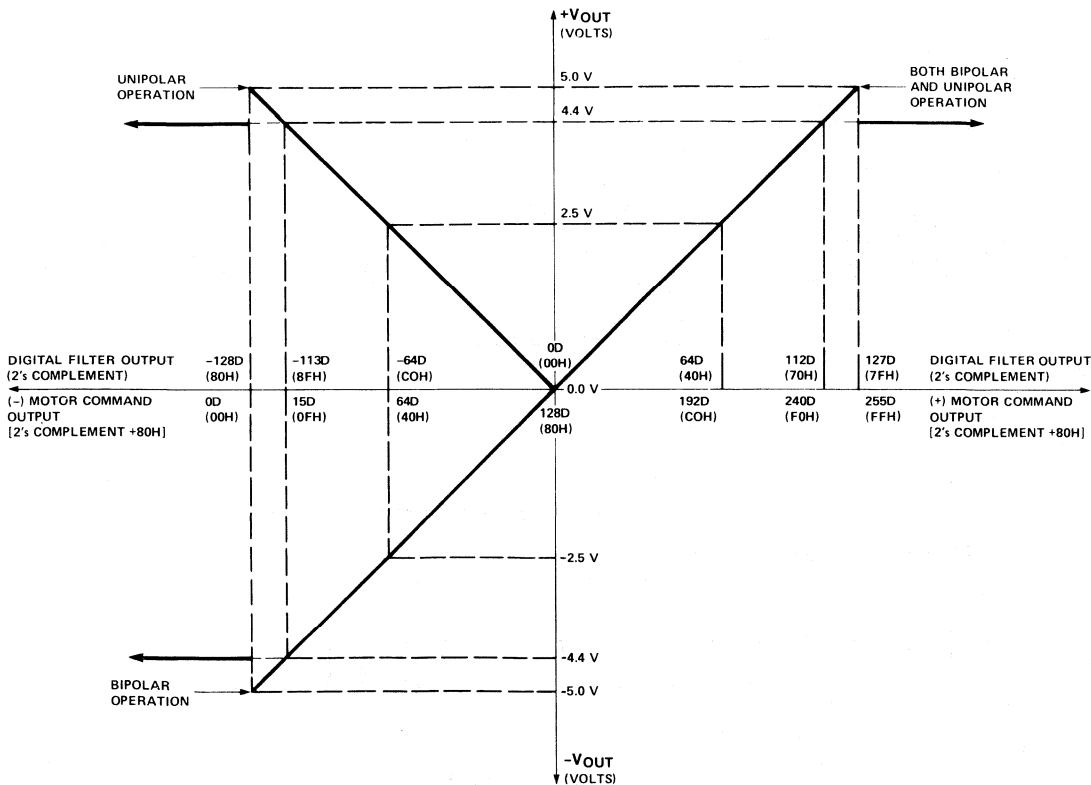

Figure 4. Motor Command Port Output

When any Control mode is being executed, the unadjusted internal 2's-complement motor command is written to R09H. Because of the hardware limit on the linear range (64H to 9CH,  $\pm 100D$ ), the PWM port saturates sooner than the 8-bit Motor Command port (00H to FFH,  $+127D$  to  $-128D$ ). When the internal motor command saturates above 8 bits, the PWM port is saturated to the full  $\pm 100\%$  duty cycle level. Figure 5

shows the actual values inside the PWM port. Note that the Unipolar flag, F2, does *not* affect the PWM port.

For commutation of brushless motors with the PWM port, only use the Pulse pin from the PWM port as the commutator already contains sign information. (See Figure 9.)

The PWM port has an option that can be used with H-bridge

type amplifiers. The option is Sign Reversal Inhibit, which inhibits the Pulse output for one PWM period after a sign polarity reversal. This allows one pair of transistors to turn off before others are turned on and thereby avoids a short across the power supply. Bit 0 in the Status register (R07H) controls the Sign Reversal Inhibit option. Figure 6 shows the output of the PWM port when Bit 0 is set.

Figure 5. PWM Port Output

Figure 6. Sign Reversal Inhibit

### Actual Position Registers

Read, Clear: R12H,R13H,R14H  
Preset : R15H,R16H,R17H

The Actual Position Register is accessed by two sets of registers in the HCTL-1100. When reading the Actual Position from the HCTL-1100, the host processor will read Registers R12H(MSB), R13H, and R14H(LSB). When presetting the Actual Position Register, the processor will write to Registers R15H(MSB), R16H, and R17H(LSB).

When reading the Actual Position registers, the order should be R14H, R13H, R12H. These registers are latched, such that, when reading Register R14H, all three bytes will be latched so that count data does not change while reading three separate bytes.

When presetting the Actual Position Register, write to R15H and R16H first. When R17H is written to, all three bytes are simultaneously loaded into the Actual Position Register.

Note that presetting the Actual Position Registers is only allowed while the HCTL-1100 is in INIT/IDLE mode.

The Actual Position Registers can be simultaneously cleared at any time by writing any value to R13H.

### Digital Filter Registers

Zero (A) R20H  
Pole (B) R21H  
Gain (K) R22H

All control modes use some part of the programmable digital filter D(z) to compensate for closed loop system stability. The compensation D(z) has the form:

$$D(z) = \frac{K \left( z - \frac{A}{256} \right)}{4 \left( z + \frac{B}{256} \right)} \quad [1]$$

where:

- z = the digital domain operator
- K = digital filter gain (R22H)
- A = digital filter zero (R20H)
- B = digital filter pole (R21H)

The compensation is a first-order lead filter which in combination with the Sample Timer T (ROFH) affects the dynamic step response and stability of the control system. The Sample Timer, T, determines the rate at which the control algorithm gets executed. All parameters, A, B, K, and T, are 8-bit scalars that can be changed by the user any time.

As shown in equations [2] and [3], the digital filter uses previously sampled data to calculate D(z). This old internally sampled data is cleared when the Initialization/Idle mode is executed.

In Position Control, Integral Velocity Control, and Trapezoidal Profile Control the digital filter is implemented in the time domain as shown below:

$$MC_n = (K/4)(X_n) - \frac{[(A/256)(K/4)(X_{n-1}) + (B/256)(MC_{n-1})]}{1} \quad [2]$$

where:

- n = current sample time
- n-1 = previous sample time
- MC<sub>n</sub> = Motor Command Output at n
- MC<sub>n-1</sub> = Motor Command Output at n-1
- X<sub>n</sub> = (Command Position – Actual Position) at n
- X<sub>n-1</sub> = (Command Position – Actual Position) at n-1

In Proportional Velocity control the digital compensation filter is implemented in the time domain as:

$$MC_n = (K/4)(Y_n) \quad [3]$$

where:

- Y<sub>n</sub> = (Command Velocity – Actual Velocity) at n

For more information on system sampling times, bandwidth, and stability, please consult Hewlett-Packard Application Note 1032, *Design of the HCTL-1000's Digital Filter Parameters by the Combination Method.*

### Sample Timer Register (R0FH)

The contents of this register set the sampling period of the HCTL-1100. The sampling period is:

$$t = 16(T+1)(1/\text{frequency of the external clock}) \quad [4]$$

where:

T = contents of register R0FH

The Sample Timer has a limit on the minimum allowable sample time depending on the control mode being executed. The limits are given in Table 4 below.

The minimum value limits are to make sure the internal programs have enough time to complete proper execution.

The maximum value of T (R0FH) is FFH (255D). With a 2 MHz clock, the sample time can vary from 64  $\mu$ sec to 2048  $\mu$ sec. With a 1 MHz clock, the sample time can vary from 128  $\mu$ sec to 4096  $\mu$ sec.

Digital closed-loop systems with slow sampling times have lower stability and a lower bandwidth than similar systems with faster sampling times. To keep the system stability and bandwidth as high as possible the HCTL-1100 should typically be

programmed with the fastest sampling time possible. This rule of thumb must be balanced by the needs of the velocity range to be controlled. Velocities are specified to the HCTL-1100 in terms of quadrature encoder counts per sample time. The faster the sampling time, the higher the slowest possible speed.

### Hardware Description

The Sample Timer consists of a buffer and a decrement counter. Each time the counter reaches 00H, the Sampler Timer Value T (value written to R0FH) is loaded from the buffer into the counter, which immediately begins to decrement from T.

### Writing to the Sample Timer Register

Data written to R0FH will be latched into the internal buffer and used by the counter after it completes the present sample time cycle by decrementing to 00H. The next sample time will use the newly written data.

### Reading the Sample Timer Register

Reading R0FH gives the values directly from the decrementing counter. Therefore, the data read from R0FH will have a value anywhere between T and 00H, depending where in the sample time cycle the counter is.

### Example –

1. On reset, the value of the timer is pre-set to 40H.
2. Reading R0FH shows  
3EH . . . 2BH . . . 08H . . .  
3CH . . .

### Synchronizing Multiple Axes

Synchronizing multiple axes with HCTL-1100s can be achieved by using the SYNC pin as explained in the Pin Discussion section. Some users may not only want to synchronize several HCTL-1100s but also follow custom profiles for each axis. To do this, the user may need to write a new command position or command velocity during each sample time for the duration of the profile. In this case, data written to the HCTL-1100 has to be coordinated with the Sample Timer. This is so that only one command position or velocity is received during any one sample period, and that it is written at the proper time within a sample period.

At the beginning of each sample period, the HCTL-1100 is performing calculations and executions. New command positions and velocities should not be written to the HCTL-1100 during this time. If they are, the calculations may be thrown off and cause unpredictable control.

The user can read the Sample Timer Register to avoid writing too early during a sample period. Since the Sample Timer Register continuously counts down from its programmed value, the user can check if enough time has passed in the sample period to insure the completion of the internal calculations. The length of time needed by the HCTL-1100 to do

Table 4.

Control Mode	R0FH Contents Minimum Limit
Position Control	07H(07D)
Proportional Velocity Control	07H(07D)
Trapezoidal Profile Control	0FH(15D)
Integral Velocity Control	0FH(15D)

its calculations is given by the Minimum Limits of R0FH (Sample Timer Register) as shown in Table 4. For Position Control Mode, the user should wait for the Sample Timer to count down 07H from its programmed value before writing the next command position or velocity. If the programmed sample timer value is 39H, wait until the Sample Timer Register reads 32H. Writing between 32H and 00H will make the command information available for the next sample period.

### Commutator

Status Register	(R07H)
Commutator Ring	(R18H)
X Register	(R1AH)
Y Phase Overlap	(R1BH)
Offset	(R1CH)
Max. Phase Advance	(R1FH)
Velocity Timer	(R19H)

The commutator is a digital state machine that is configured by the user to properly select the phase sequence for electronic commutation of multiphase motors. The Commutator is designed to work with 2, 3, and 4-phase motors of various winding configurations and with various encoder counts. Along with providing the correct phase enable sequence, the Commutator provides programmable phase overlap, phase advance, and phase offset.

Phase overlap is used for better torque ripple control. It can also be used to generate unique state sequences which can be further decoded externally to drive more complex amplifiers and motors.

Phase advance allows the user to compensate for the frequency characteristics of the motor/amplifier combination. By advancing the phase enable command (in position), the delay in reaction of the motor/amplifier combination can be offset and higher performance can be achieved.

Phase offset is used to adjust the alignment of the commutator output with the motor torque curves. By correctly aligning the HCTL-1100's commutator output with the motor's torque curves, maximum motor output torque can be achieved.

The inputs to the Commutator are the three encoder signals, Channel A, Channel B, and Index, and the configuration data stored in registers.

The Commutator uses both channels and the index pulse of an incremental encoder. The index pulse of the encoder must be physically aligned to a known torque curve location because it is used as the reference point of the rotor position with respect to the Commutator phase enables.

The index pulse should be permanently aligned during motor encoder assembly to the last motor phase. This is done by energizing the last phase of the motor during assembly and permanently attaching the encoder codewheel to the motor shaft such that the index pulse is active as shown in Figures 7 and 8. Fine tuning of alignment for commutation purposes is done electronically by the Offset register (R1CH) once the complete control system is set up.

Figure 7. Index Pulse Alignment to Motor Torque Curves.

Each time an index pulse occurs, the internal commutator ring counter is reset to 0. The ring counter keeps track of the current position of the rotor based on the encoder feedback. When the ring counter is reset to 0, the Commutator is reset to its origin (last phase going low, Phase A going high) as shown in Figure 10.

The output of the Commutator is available as PHA, PHB, PHC,

and PHD. The HCTL-1100's commutator acts as the electrical equivalent of the mechanical brushes in a motor. Therefore, the outputs of the commutator provide only proper phase sequencing for bidirectional operation. The magnitude information is provided to the motor via the Motor Command and PWM ports. The outputs of the commutator must be combined with the outputs of one of the

motor ports to provide proper DC brushless and stepper motor control. Figure 9 shows an example of circuitry which uses the outputs of the commutator with the Pulse output of the PWM port to control a DC brushless or stepper motor. A similar procedure could be used to combine the commutator outputs PHA-PHD with a linear amplifier interface output (Figure 16) to create a linear amplifier system.

Figure 8. Codewheel Index Pulse Alignment.

OFFSET	0	0	2	2
ADVANCE	0	0	0	1

ENCODER: 90 COUNTS/REVOLUTION  
INDEX PULSE OCCURS AT THE ORIGIN

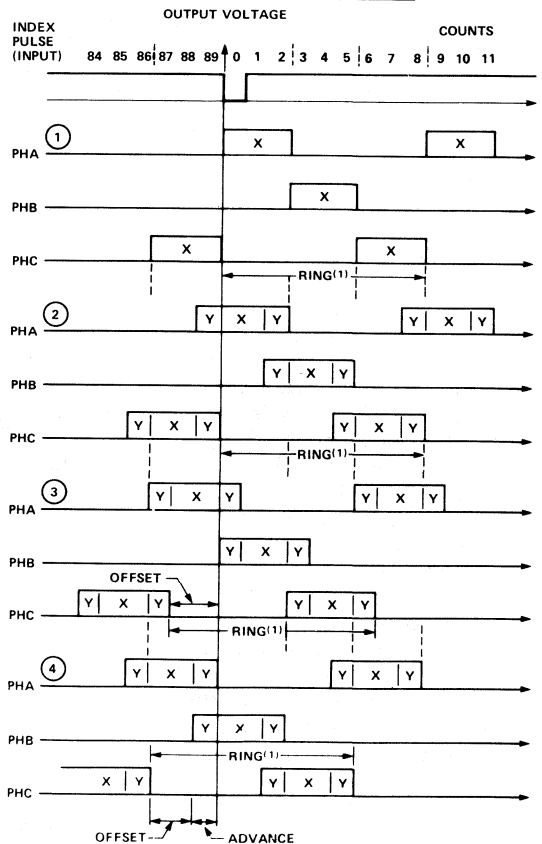

Figure 10. Commutator Configuration.

The Commutator is programmed by the data in the following registers. Figure 10 shows an example of the relationship between all the parameters.

**Status Register (R07H)**

Bit #1- 0 = 3-phase configuration, PHA, PHB, and PHC are active outputs.

1 = 4-phase configuration, PHA – PHD are active outputs.

Bit #2- 0 = Rotor position measured in quadrature counts (4x decoding).

1 = Rotor position measured in full counts (1 count = 1 codewheel bar and space.)

Bit #2 only affects the commutator's counting method. This includes the Ring register (R18H), the X and Y registers (R1AH & R1BH), the Offset register (R1CH), the Velocity Timer register (R19H), and the Maximum Advance register (R1FH).

Quadrature counts (4x decoding) are always used by the HCTL-1100 as a basis for position, velocity, and acceleration control.

**Ring Register (R18H)**

The Ring register is defined as 1 electrical cycle of the commutator which corresponds to 1 torque cycle of the motor. The Ring register is scalar and determines the length of the commutation cycle measured in full or quadrature counts as set by bit #2 in the Status register (R07H). The value of the ring must be limited to the range of 0 to 7FH.

**X Register (R1AH)**

This register contains scalar data which sets the interval during which only one phase is active.

**Y Register (R1BH)**

This register contains scalar data which set the interval during which two sequential phases are both active. Y is phase overlap. X and Y must be specified such that:

$$X + Y = \text{Ring}/(\# \text{ of phases}) \quad [5]$$

These three parameters define the basic electrical commutation cycle.

**Offset Register (R1CH)**

The Offset register contains two's-complement data which determines the relative start of the commutation cycle with respect to the index pulse. Since the index pulse must be physically referenced to the rotor, offset performs fine alignment between the electrical and mechanical torque cycles.

The Hold Commutator flag (F4) in the Status register (R07H) is used to decouple the internal commutator counters from the encoder input. Flag (F4) can be used in conjunction with the Offset register to allow the user to advance the commutator phases open loop. This technique may be used to create a custom commutator alignment procedure. For example, in Figure 10, case 1, for a three-phase motor where the ring = 9, X = 3, and Y = 0, the phases can be made to advance open loop by setting the Hold Commutator flag (F4) in the Flag register (R07H). When the values 0, 1, or 2 are written to the Offset register, phase A will be

enabled. When the values 3, 4 or 5 are written to the Offset register, phase B will be enabled. And, when the values 6, 7, or 8 are written to the Offset register, phase C will be enabled. No values larger than the value programmed into the Ring register should be programmed into the Offset register.

**Phase Advance Registers (R19H, R1FH)**

The Velocity Timer register and Maximum Advance register linearly increment the phase advance according to the measured speed for rotation up to a set maximum.

The Velocity Timer register (R19H) contains scalar data which determines the amount of phase advance at a given velocity. The phase advance is interpreted in the units set for the Ring counter by bit #2 in R07H. The velocity is measured in revolutions per second.

$$\text{Advance} = N_r v \Delta t \quad [6]$$

$$\text{where: } \Delta t = \frac{16 (R19H + 1)}{f \text{ external clk}} \quad [7]$$

$N_r$  = full encoder counts/revolution.  
 $v$  = velocity (revolutions/second)

The Maximum Advance register (R1FH) contains scalar data which sets the upper limit for phase advance regardless of rotor speed.

Figure 11 shows the relationship between the Phase Advance registers. Note: If the phase advance feature is not used, set both R19H and R1FH to 0.

## Commutator Constraints and Use

When choosing a three-channel encoder to use with a DC brushless or stepper motor, the user should keep in mind that the number of quadrature encoder counts (4x the number of slots in the encoder's codewheel) must be an integer multiple (1x, 2x, 3x, 4x, 5x, etc.) of the number of pole pairs in the DC brushless motor or steps in a stepper motor. To take full advantage of the commutator's overlap feature, the number of quadrature counts should be at least 3 times the number of pole pairs in the DC brushless motor or steps in the stepper motor. For example, a 1.8°, (200 step/revolution) stepper motor should employ at least a 150

slot codewheel = 600 quadrature counts/revolution = 3 x 200 steps/revolution).

There are several numerical constraints the user should be aware of to use the Commutator.

The parameters of Ring, X, Y, and Max Advance must be positive numbers (00H to 7FH). Additionally, the following equation must be satisfied:

$$(-128D) 80H \leq 3/2 \text{ Ring} + \text{Offset} \pm \text{Max Advance} \leq 7FH (127D) \quad [8]$$

In order to utilize the greatest flexibility of the Commutator, it must be realized that the Commutator works on a circular ring counter principle, whose range is defined by the Ring

Figure 11. Phase Advance vs. Motor Velocity.

register (R18H). This means that for a ring of 96 counts and a needed offset of 10 counts, numerically the Offset register can be programmed as 0AH (10D) or AAH (-86D), the latter satisfying Equation 8.

If bit #2 in the Status register is set to allow the commutator to count in full counts, a higher resolution codewheel may be chosen for precise motor control without violating the commutator constraints equation (Equation 8).

Example: Suppose you want to commutate a 3-phase 15 deg/step Variable Reluctance Motor attached to a 192 count encoder.

1. Select 3-phase and quadrature mode for commutator by writing 0 to R07H.
2. With a 3-phase 15 degree/step Variable Reluctance motor the torque cycle repeats every 45 degrees or 8 times/revolution.
3. Ring register
 
$$\frac{(4)(192) \text{ counts/revolution}}{8/\text{revolution}}$$

$$= 96 \text{ quadrature counts}$$

$$= 1 \text{ commutation cycle}$$
4. By measuring the motor torque curve in both directions, it is determined that an offset of 3 mechanical degrees, and a phase overlap of 2 mechanical degrees is needed.

$$\text{Offset} = 3^\circ \frac{(4)(192)}{360^\circ}$$

$$\cong 6 \text{ quadrature counts}$$

To create the 3 mechanical degree offset, the Offset

register (R1CH) could be programmed with either A6H (-90D) or 06H (+06D). However, because 06H (+06D) would violate the commutator constraints Equation 8, A6H (-90D) is used.

$$Y = \text{overlap} = \frac{(2^\circ)(4)(192)}{360^\circ} \cong 4$$

$$X + Y = 96/3$$

$$\text{Therefore, } X = 28$$

$$Y = 4$$

For the purposes of this example, the Velocity Timer and Maximum Advance are set to 0.

### Operation Flowchart

The HCTL-1100 executes any one of three setup routines or four control modes selected by the user. The three setup routines include:

- Reset
- Initialization/Idle
- Align.

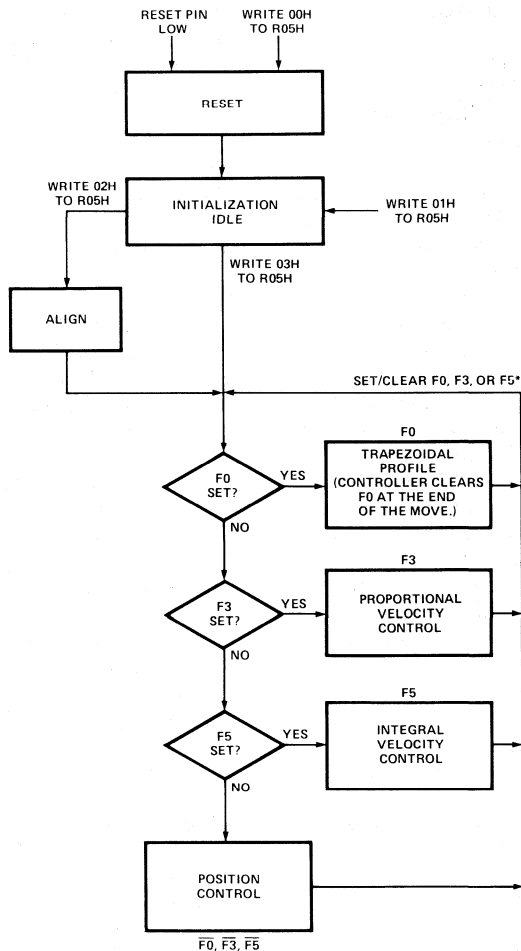

The four control modes available to the user include:

- Position Control
- Proportional Velocity Control
- Trapezoidal Profile Control
- Integral Velocity Control

The HCTL-1100 switches from one mode to another as a result of one of the following three mechanisms:

1. The user writes to the Program Counter.
2. The user sets/clears flags F0, F3, or F5 by writing to the Flag register (R00H).
3. The controller switches automatically when certain initial conditions are provided by the user.

This section describes the function of each setup routine and

\*Only one flag should be set at a time.

Figure 12. Operation Flowchart.

control mode and the initial conditions which must be provided by the user to switch from one mode to another. Figure 12

shows a flowchart of the setup routines and control modes, and shows the commands required to switch from one mode to another.

## Setup Modes

### Hard Reset

Executed by:

- Pulling the RESET pin low (required at power up)

When a hard reset is executed (RESET pin goes low), the following conditions occur:

- All output signal pins are held low except Sign, Data bus, and Motor Command.
- All flags (F0 to F5) are cleared.
- The Pulse pin of the PWM port is set low while the Reset pin is held low. After the Reset pin is released (goes high) the Pulse pin goes high for one cycle of the external clock driving the HCTL-1100. The Pulse pin then returns to a low output.
- The Motor Command port (R08H) is preset to 80H (128D).
- The Commutator logic is cleared.
- The I/O control logic is cleared.
- A soft reset is automatically executed.

### Soft Reset

Executed by:

- Writing 00H to R05H, or
- Automatically called after a hard reset

When a soft reset is executed, the following conditions occur:

- The digital filter parameters are preset to  
A (R20H) = E5H (229D)  
B (R21H) = K (R22H) = 40H (64D)
- The Sample Timer (R0FH) is preset to 40H (64D).
- The Status register (R07H) is cleared.
- The Actual Position Counters (R12H, R13H, R14H) are cleared to 0.

From Reset mode, the HCTL-1100 goes automatically to Initialization/Idle mode.

### Initialization/Idle

Executed by:

- Writing 01H to R05H, or
- Automatically executed after a hard reset, soft reset, or
- Limit pin goes low.

The Initialization/Idle mode is entered either automatically from Reset, by writing 01H to the Program Counter (R05H) under any conditions, or pulling the Limit pin low.

In the Initialization/Idle mode, the following occur:

- The Initialization/Idle flag (F1) is set.
- The PWM port R09H is set to 00H (zero command).
- The Motor Command port (R08H) is set to 80H (128D) (zero command).
- Previously sampled data stored in the digital filter is cleared.

It is at this point that the user should pre-program all the necessary registers needed to execute the desired control mode. The HCTL-1100 stays in this mode (idling) until a new mode command is given.

### Align

Executed by:

- Writing 02H to R05H

The Align mode is executed only when using the commutator feature of the HCTL-1100. This mode automatically aligns multiphase motors to the HCTL-1100's internal Commutator.

The Align mode can be entered only from the Initialization/Idle mode by writing 02H to the Program Counter register (R05H).

Before attempting to enter the Align mode, the user should clear all control mode flags and set both the Command Position registers (R0CH, R0DH, and R0EH) and the Actual Position registers (R12H, R13H, and R14H) to zero. After the Align mode has been executed, the HCTL-1100 will automatically enter the Position Control mode and go to position zero. By following this procedure, the largest movement in the Align mode will be one torque cycle of the motor.

The Align mode assumes: the encoder index pulse has been physically aligned to the last motor phase during encoder/motor assembly, the Commutator parameters have been correctly preprogrammed (see the section called Commutator for details), and a hard reset has been executed while the motor is stationary.

The Align mode first disables the Commutator and with open loop control enables the first phase (PHA) and then the last phase (PHC or PHD) to orient the motor on the last phase torque detent. Each phase is energized for 2048 system sampling periods (t). For proper operation, the motor must come to a complete stop during the last phase enable. At this point the Commutator is enabled and commutation is closed loop.

The HCTL-1100 then automatically switches from the Align mode to Position Control mode.

### Control Modes

Control flags F0, F3, and F5 in the Flag register (R00H) determine which control mode is executed. Only one control flag can be set at a time. After one of

these control flags is set, the control modes are entered either automatically from Align or from the Initialization/Idle mode by writing 03H to the Program Counter (R05H).

### Position Control Mode

Flags: F0 Cleared  
F3 Cleared  
F5 Cleared

Registers Used:

Register	Function
R00H R00D	Flag Register
R12H R18D	Read Actual Position MSB
R13H R19D	Read Actual Position
R14H R20D	Read Actual Position LSB
R0CH R12D	Command Position MSB
R0DH R13D	Command Position
R0EH R14D	Command Position LSB

Position Control performs point-to-point position moves with no velocity profiling. The user specifies a 24-bit position command, which the controller compares to the 24-bit actual

position. The position error is calculated, the full digital lead compensation is applied and the motor command is output.

The controller will remain position-locked at a destination until a new position command is given.

The actual and command position data is 24-bit two's-complement data stored in six 8-bit registers. Position is measured in encoder quadrature counts.

The command position resides in R0CH (MSB), R0DH, R0EH (LSB). Writing to R0EH latches all 24 bits at once for the control algorithm. Therefore, the command position is written in the sequence R0CH, R0DH and R0EH. The command registers can be read in any desired order.

The actual position resides in R12H (MSB), R13H, and R14H (LSB). Reading R14H latches the upper two bytes into an internal buffer. Therefore, Actual Position registers are

read in the order of R14H, R13H, and R12H for correct instantaneous position data.

The largest position move possible in Position Control mode is 7FFFFFFH (8,388,607D) quadrature encoder counts.

### Proportional Velocity Mode

Flags: F0 Cleared  
F3 Set  
F5 Cleared

Registers Used:

Register	Function
R00H R00D	Flag Register
R23H R35D	Command Velocity LSB
R24H R36D	Command Velocity MSB
R34H R52D	Actual Velocity LSB
R35H R53D	Actual Velocity MSB

Proportional Velocity Control performs control of motor speed using only the gain factor, K, for compensation. The dynamic pole and zero lead compensation are not used. (See the "Digital Filter" section of this data sheet.)

### Example Code to Program Position Moves

```
{ Begin }
  Hard Reset { HCTL-1100 goes into INIT/IDLE Mode }

  Initialize Filter, Timer, Command Position Registers

  Write 03H to Register R05H
  { HCTL-1100 is now in Position Mode }

  Write Desired Command Position to Command Position Registers
  { Controller Moves to new position }

  Continue writing in new Command Positions
{ end }
```

The command and actual velocity are 16-bit two's-complement words.

The command velocity resides in registers R24H (MSB) and R23H (LSB). These registers are unlatched which means that the command velocity will change to a new velocity as soon as the value in either R23H or R24H is changed. The registers can be read or written to in any order.

The units of velocity are quadrature counts/sample time. To convert from rpm to quadrature counts/sample time, use the formula shown below:

$$V_q = (V_r)(N)(t)(0.01667/\text{rpm-sec}) \quad [9]$$

Where:

$V_q$  = velocity in quadrature counts/sample time

$V_r$  = velocity in rpm

$N$  = 4 times the number of slots in the codewheel (i.e., quadrature counts).

$t$  = The HCTL-1100 sample time in seconds. (See the section on the HCTL-1100's Sample Timer register).

Because the Command Velocity registers (R24H and R23H) are internally interpreted by the HCTL-1100 as 12 bits of integer and 4 bits of fraction, the host processor must multiply the desired command velocity (in quadrature counts/sample time) by 16 before programming it into the HCTL-1100's Command Velocity registers.

The actual velocity is computed only in this algorithm and stored in scratch registers R35H (MSB) and R34H (LSB). There is no fractional component in the actual velocity registers and they can be read in any order.

The controller tracks the command velocity continuously until new mode command is given. The system behavior after a new velocity command is governed only by the system dynamics until a steady state velocity is reached.

### Integral Velocity Mode

Flags: F0 Cleared  
F3 Cleared  
F5 Set to begin move

Registers Used:

Register	Function
R00H R00D	Flag Register
R26H R38D	Acceleration LSB
R27H R39D	Acceleration MSB
R3CH R60D	Command Velocity

Integral Velocity Control performs continuous velocity profiling which is specified by a command velocity and command acceleration. Figure 13 shows the capability of this control algorithm.

The user can change velocity and acceleration any time to continuously profile velocity in time. Once the specified velocity is reached, the HCTL-1100 will maintain that velocity until a new command is specified. Changes between actual velocities occur at the presently specified linear acceleration.

The command velocity is an 8-bit two's-complement word

### Example Code for Programming Proportional Velocity Mode

```
{ Begin }
  Hard Reset { HCTL-1100 goes into INIT/IDLE Mode }

  Initialize Filter, Timer, Command Position Registers

  Write 03H to Register R05H
    { HCTL-1100 is now in Position Mode }

  Write Desired Command Velocity (if needed)

  Set Flag F3 {Proportional Velocity Move Begins}

  { System ramps to Command Velocity }

  Continue writing new Command Velocities
{end}
```

stored in R3CH. The units of velocity are quadrature counts/sample time.

The conversion from rpm to quadrature counts/sample time is shown in equation 9. The Command Velocity register (R3CH) contains only integer data and has no fractional component.

While the overall range of the velocity command is 8 bits, two's-complement, the difference between any two sequential commands cannot be greater than 7 bits in magnitude (i.e., 127 decimal). For example, when the HCTL-1100 is executing a command velocity of 40H (+64D), the next velocity command must fall in the range of 7FH (+127D), the maximum command range, C1H (-63D), the largest allowed difference.

The command acceleration is a 16-bit scalar word stored in R27H and R26H. The upper byte (R27H) is the integer part and the lower byte (R26H) is the fractional part provided for resolution. The integer part has

a range of 00H to 7FH. The contents of R26H are internally divided by 256 to produce the fractional resolution.

The units of acceleration are quadrature counts/sample time squared.

To convert from rpm/sec to quadrature counts/[sample time]<sup>2</sup>, use the formula shown below:

$$Aq = (Ar)(N)(t^2)(0.01667/rpm\text{-sec}) \quad [10]$$

Where:

Aq = Acceleration in quadrature counts/[sample time]<sup>2</sup>

Ar = Acceleration in rpm/sec

N = 4 times the number of slots in the codewheel (i.e., quadrature counts)

t = The HCTL-1100 sample time in seconds. (See the section on the HCTL-1100's Sample Timer register).

Because the Command Acceleration registers (R27H and R26H) are internally interpreted by the HCTL-1100 as 8 bits of integer and 8 bits of fraction, the host processor must multiply the desired command acceleration (in quadrature counts/[sample time]<sup>2</sup>) by 256 before programming it into the HCTL-1100's Command Acceleration registers.

Internally, the controller performs velocity profiling through position control.

Each sample time, the internal profile generator uses the information which the user has programmed into the Command Velocity register (R3CH) and the Command Acceleration registers (R27H and R26H) to determine the value which will be automatically loaded into the Command Position registers (R0CH, R0DH, and R0EH). After the new command position has been generated, the difference between the value in the Actual Position registers (R12-R13H, and R14H) and the new value in the Command Position registers is calculated as the new position error. This new position error is used by the full digital compensation filter to compute a new motor command output by this sample time. The register block in Figure 3 further shows how the internal profile generator works in Integral Velocity mode. In control theory terms, integral compensation has been added and therefore, this system has zero steady-state error.

Figure 13. Integral Velocity Modes.

Although Integral Velocity Control mode has the advantage over Proportional Velocity mode of zero steady state velocity error, its disadvantage is that the closed loop stability is more difficult to achieve. In Integral Velocity Control mode the system is actually a position control system and therefore the complete dynamic compensation D(z) is used.

If the external Stop flag F6 is set during this mode signalling an emergency situation, the controller automatically decelerates to zero velocity at the presently specified acceleration factor and stays in this condition until the flag is cleared. The user then can specify new velocity profiling data.

### Trapezoid Profile Mode

Flags: F0 Set to begin move  
F3 Cleared  
F5 Cleared

Registers Used:

Register	Function
R00H R00D	Flag Register
R07H R07D	Status Register
R12H R18D	Read Actual Position MSB
R13H R19D	Read Actual Position
R14H R20D	Read Actual Position LSB
R29H R41D	Final Position LSB
R2AH R42D	Final Position MSB
R2BH R43D	Final Position MSB
R26H R38D	Acceleration LSB
R27H R39D	Acceleration MSB
R28H R40D	Maximum Velocity

Trapezoid Profile Control performs point-to-point position moves and profiles the velocity trajectory to a trapezoid or triangle. The user specifies only the desired final position, acceleration and maximum velocity. The controller computes the necessary profile to conform to the command data. If maximum velocity is reached before the distance halfway point, the profile will be trapezoidal, otherwise the profile will be triangular. Figure 14 shows the possible trajectories with Trapezoidal Profile Control.

The command data for Trapezoidal Profile Control mode consists of a final position, a command acceleration, and a

### Example Code for Programming Integral Velocity Mode

```
(Begin)
  Hard Reset {HCTL-1100 goes into INIT/IDLE Mode}

  Initialize Filter, Timer, Command Position Registers

  Write 03H to Register R05H
    {HCTL-1100 is now in Position Mode}

  Write Desired Acceleration (if needed)

  Write Desired Maximum Velocity (if needed)

  Set Flag F5 {Integral Velocity Move Begins}

  {System ramps to Maximum Velocity}

  Continue writing new Accelerations and Velocities
{ end }
```

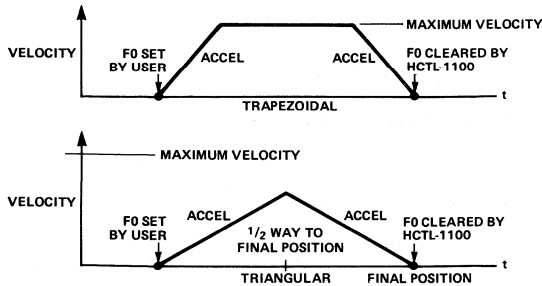

Figure 14. Trapezoidal Profile Mode.

maximum velocity. The 24-bit, two's-complement final position is written to registers R2BH, (MSB), R2AH, and R29H (LSB). The 16-bit command acceleration resides in registers R27H (MSB) and R26H (LSB). The command acceleration has the same integer and fraction format as discussed in the Integral Velocity Control mode section. The 7-bit maximum velocity is a scalar value with the range of 00H to 7FH (0D to 127D). The maximum velocity has the units of quadrature counts per sample time, and resides in register R28H. The command data registers may be read or written to in any order.

The internal profile generator produces a position profile using the present Command Position (R0CH-R0EH) as the starting point and the Final Position (R2BH-R29H) as the end point.

Once the desired data is entered, the user sets flag F0 in the Flag register (R00H) to commence motion (if the HCTL-1100 is already in Position Control mode).

When the profile generator sends the last position command to the Command Position registers to complete the trapezoidal move, the controller clears flag F0. The HCTL-1100 then automatically goes to Position Control mode with the final position of the trapezoidal move as the command position.

When the HCTL-1100 clears flag F0 it does NOT indicate that the motor and encoder are at the final position NOR that the motor and encoder have stopped. The flag indicates that the command profile has finished. The motor and encoder's true position can only be determined by reading the Actual Position registers. The only way to determine if the motor and encoder have stopped is to read the Actual Position registers at successive intervals.

The status of the Profile flag can be monitored both in the Status register (R07) and at the external Profile pin at any time. While the Profile flag is high NO new command data should be sent to the controller.

Each sample time, the internal profile generator uses the information which the user has programmed into the Maximum Velocity register (R28H), the Command Acceleration registers (R27H and R26H), and the Final Position registers (R2BH, R2AH, and R29H) to determine the value which will be automatically loaded into the Command Position registers (R0EH, R0DH, and R0CH). After the new command position has been generated, the difference between the value in the Actual Position registers (R12H, R13H, and R14H) and the new value in the Command Position registers is calculated as the new position error. This new position error is used by the full digital compensation filter to compute a new motor command output for the sample time. (The register block diagram in Figure 3 further shows how the internal profile generator works in Trapezoidal Profile mode.)

### Example Code for Programming Trapezoid Moves

```
{ Begin }
  Hard Reset { HCTL-1100 goes into INIT/IDLE Mode }

  Initialize Filter, Timer, Command Position Registers

  Write 03H to Register R05H
    { HCTL-1100 is now in Position Mode }

  { Profile #1}

  Write Desired Acceleration

  Write Desired Maximum Velocity

  Write Final Position

  Set Flag F0 {Trapezoid Move Begins, PROF pin goes high}

  Poll PROF pin until it goes low (Move is complete)

  { Profile #2}

  Write Desired Acceleration

  Write Desired Maximum Velocity

  Write Final Position

  Set Flag F0 {Trapezoid Move Begins, PROF pin goes high}

  Poll PROF pin until it goes low (Move is complete)

  { Repeat }
  .
  .
  .
  .
{ end }
```

### Applications of the HCTL-1100

#### Interfacing the HCTL-1100 to Host Processors

The HCTL-1100 looks to the host microprocessor like a bank of 8-bit registers to which the host processor can read and

write (i.e., the host processor treats the HCTL-1100 like RAM). The data in these registers controls the operation of the HCTL-1100. The host processor communicates to the HCTL-1100 over a bidirectional multiplexed 8-bit data bus. The

four I/O control lines.  $\overline{\text{ALE}}$ ,  $\overline{\text{CS}}$ ,  $\overline{\text{OE}}$ , and  $\overline{\text{R/W}}$  execute the data transfers (see Figure 15).

There are three different timing configurations which can be used to give the user greater flexibility to interface the

HCTL-1100 to most microprocessors (see Timing diagrams). They are differentiated from one another by the arrangement of the  $\overline{\text{ALE}}$  signal with respect to the  $\overline{\text{CS}}$  signal. The three timing configurations are listed below.

1.  $\overline{\text{ALE}}$ ,  $\overline{\text{CS}}$  non-overlapped
2.  $\overline{\text{ALE}}$ ,  $\overline{\text{CS}}$  overlapped
3.  $\overline{\text{ALE}}$  within  $\overline{\text{CS}}$

Any I/O operation starts by asserting the  $\overline{\text{ALE}}$  signal which starts sampling the external bus into an internal address latch. Rising  $\overline{\text{ALE}}$  or falling  $\overline{\text{CS}}$  during  $\overline{\text{ALE}}$  stops the sampling into the address latch.

$\overline{\text{CS}}$  low after rising  $\overline{\text{ALE}}$  samples the external bus into the data latch. Rising  $\overline{\text{CS}}$  stops the sampling into the data latch, and starts the internal synchronous process.

In the case of a write, the data in the data latch is written into the addressed location. In the case of a read, the addressed location is written into an internal output latch.  $\overline{\text{OE}}$  low enables the internal output latch onto the external bus. The  $\overline{\text{OE}}$  signal and the internal output latch allow the I/O port to be flexible and avoid bus conflicts during read operations.

It is important that the host microprocessor does not attempt to perform too many I/O operations in a single sample time of the HCTL-1100. Each I/O operation interrupts the execution of the HCTL-1100's internal code for 1 clock cycle. Although extra clock cycles have been allotted in each sample time for I/O operations, the number of extra cycles is

reduced as the value programmed into the Sample Timer register (R0FH) is reduced.

Table 5 shows the maximum number of I/O operations allowed under the given conditions.

The number of external clock cycles available for I/O operations in any of the four control modes can be increased by increasing the value in the Sample Timer register (R0FH).

For every unit increase in the Sample Timer register (R0FH) above the minimums shown in Table 5 the user may perform 16 additional I/O operations per sample time.

### Interfacing the HCTL-1100 to Amplifiers and Motors

The Motor Command port is the ideal interface to an 8-bit DAC, configured for bipolar output. The data written to the 8-bit Motor Command port by the control algorithms is the internally computed 2's-

complement motor command with an 80H offset added. This allows direct interfacing to a DAC. Figure 16 shows a typical DAC interface to the HCTL-1100. An inexpensive DAC, such as MC1408 or equivalent, has its digital inputs directly connected to the Motor Command port. The DAC produces an output current which is converted to a voltage by an operational amplifier.  $R_o$  and  $R_g$  control the analog offset and gain. The circuit is easily adjusted for +5 V to -5 V operation by first writing 80H to R08H and adjusting  $R_o$  for 0 V output. Then FFH is written to R08H and  $R_g$  is adjusted until the output is 5 V. Note that 00H in R08H corresponds to -5 V out.

Figure 17 shows an example of how to interface the HCTL-1100 to an H-bridge amplifier. An H-bridge amplifier allows bipolar motor operation with a unipolar power supply. The Sign Reversal Inhibit feature prevents all transistors from being on at the same time when the direction of motion is reversed.

**Table 5. Maximum Number of I/O Allowed**

Sample Timer Register Value	Operating Mode	Maximum Number of I/O Operations Allowed per Sample
07H (07D)	Position Control or Prop. Vel. Control	5
0FH (15D)	Position Control or Prop. Vel. Control	133
	Trapezoidal Prof. or Integral Vel. Control	6

# Light Bars and Bar Graph Arrays

---

LED Light Bars are Hewlett-Packard's innovative solution to fixed message annunciation. The large, uniformly illuminated light emitting surface may be used for backlighting legends or simple indicators. Four distinct colors are offered: AlGaAs red, high efficiency red, yellow, and high performance green with two bicolor combinations. The AlGaAs Red Light Bars provide exceptional brightness at very low drive currents for those applications where portability and battery backup are important considerations. Each of the eight X-Y stackable package styles offers one, two, or four light emitting surfaces. Along with this family of stackable light bars, HP also provides a single chip light bar for high brightness indication of small areas. Panel Mounts are also available for all devices.

In addition to light bars, HP offers effective analog message annunciation with the 10-element LED Bar Graph Arrays. These bar graph arrays eliminate the matching and alignment problems commonly associated with arrays of discrete LED indicators. Each device offers easy to handle packages that are compatible with standard DIP sockets. The 10-element Bar Graph Array is available in standard red, AlGaAs red, high efficiency red, yellow, and high performance green. The multicolor 10-element arrays have high efficiency red, yellow, and green LEDs in one package. The package is X-Y stackable, with a unique interlock allowing easy end-to-end alignment.

### Features

- Large Bright, Uniform Light Emitting Areas
- Choice of Colors
- Categorized for Light Output
- Yellow and Green Categorized for Dominant Wavelength
- Excellent ON-OFF Contrast
- X-Y Stackable
- Flush Mountable
- Can be Used with Panel and Legend Mounts
- Light Emitting Surface Suitable for Legend Attachment per Application Note 1012
- HLCP-X100 Series Designed for Low Current Operation
- Bicolor Devices Available

### Applications

- Business Machine Message Annunciators
- Telecommunications Indicators
- Front Panel Process Status Indicators
- PC Board Identifiers
- Bar Graphs

### Description

The HLCP-X100 and HLMP-2XXX series light bars are rectangular light sources designed for a variety of applications where a large bright source of light is required. These light bars are configured in single-in-line and dual-in-line packages that contain either single or segmented light emitting areas. The AlGaAs Red HLCP-X100 series LEDs use double heterojunction AlGaAs on a GaAs substrate. The HER HLMP-2300/2400 and Yellow HLMP-2400/2700 series LEDs have their p-n junctions diffused into a GaAsP epitaxial layer on a GaP substrate. The Green HLMP-2500/2800 series LEDs use a liquid phase GaP epitaxial layer on a GaP substrate. The bicolor HLMP-2900 series use a combination of HER/Yellow or HER/Green LEDs.

## Selection Guide

Light Bar Part Number				Size of Light Emitting Areas	Number of Light Emitting Areas	Package Outline		Corresponding Panel and Legend Mount Part No. HLMP-

### Notes:

1. These devices are categorized for luminous intensity. The intensity category is designated by a letter code on the side of the package.
2. The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and is the single wavelength which defines the color of the device. Yellow and Green devices are categorized for dominant wavelength with the color bin designated by a number code on the side of the package.
3. This is an HER/Yellow bicolor light bar. HER electrical/optical characteristics are shown in the HER table. Yellow electrical/optical characteristics are shown in the Yellow table.
4. This is an HER/Green bicolor light bar. HER electrical/optical characteristics are shown in the HER table. Green electrical/optical characteristics are shown in the Green table.
5. Does not apply to HLMP-2950 or HLMP-2965.

For a detailed explanation on the use of data sheet information and recommended soldering procedures, see Application Notes 1005, 1027, and 1031.

## Electrical

These light bars are composed of two, four, or eight light emitting diodes, with the light from each LED optically scattered to form an evenly illuminated light emitting surface.

The anode and cathode of each LED is brought out by separate pins. This universal pinout arrangement allows the LEDs to be connected in three possible configurations: parallel, series, or series parallel. The typical forward voltage values can be scaled from Figures 4 and 9. These values should be used to calculate the current limiting resistor value and typical power consumption. Expected maximum  $V_f$  values for driver circuit design and maximum power dissipation, may be

calculated using the following  $V_{f,MAX}$  models:

AlGaAs Red HLCP-X100 series

$$V_{f,MAX} = 1.8 V + I_{Peak} (20\Omega)$$

For:  $I_{Peak} \leq 20 \text{ mA}$

$$V_{f,MAX} = 2.0 V + I_{Peak} (10\Omega)$$

For:  $20 \text{ mA} \leq I_{Peak} \leq 45 \text{ mA}$

HER (HDSP-2300/2600/2900),  
Yellow (HDSP-2400/2700/2900)  
and Green (HDSP-2500/2800/  
2900) series

$$V_{f,MAX} = 1.6 + I_{Peak} (50\Omega)$$

For:  $5 \text{ mA} \leq I_{Peak} \leq 20 \text{ mA}$

$$V_{f,MAX} = 1.8 + I_{Peak} (40\Omega)$$

For:  $I_{Peak} \geq 20 \text{ mA}$

The maximum power dissipation can be calculated for any pulsed or DC drive condition. For DC operation, the maximum power dissipation is the product of the maximum

forward voltage and the maximum forward current. For pulsed operation, the maximum power dissipation is the product of the maximum forward voltage at the peak forward current times the maximum average forward current. Maximum allowable power dissipation for any given ambient temperature and thermal resistance ( $R\theta_{j-A}$ ) can be determined by using Figure 2 or 7. The solid line in Figure 2 or 7 ( $R\theta_{j-A}$  of 600/538 C/W) represents a typical thermal resistance of a device socketed in a printed circuit board. The dashed lines represent achievable thermal resistances that can be obtained through improved thermal design. Once the maximum allowable power dissipation is determined, the maximum pulsed or DC forward current can be calculated.

## Optical

Size of Light Emitting Area	Surface Area	
	Sq. Metres	Sq. Feet
8.89 mm x 8.89 mm	$67.74 \times 10^{-6}$	$729.16 \times 10^{-6}$
8.89 mm x 3.81 mm	$33.87 \times 10^{-6}$	$364.58 \times 10^{-6}$
8.89 mm x 19.05 mm	$135.48 \times 10^{-6}$	$1458.32 \times 10^{-6}$
3.81 mm x 19.05 mm	$72.85 \times 10^{-6}$	$781.25 \times 10^{-6}$

The radiation pattern for these light bar devices is approximately Lambertian. The luminous sterance may be calculated using one of the two following formulas:

$$L_v \text{ (cd/m}^2\text{)} = \frac{I_v \text{ (cd)}}{A \text{ (m}^2\text{)}}$$

$$L_v \text{ (footlamberts)} = \frac{\pi I_v \text{ (cd)}}{A \text{ (ft}^2\text{)}}$$

Refresh rates of 1 kHz or faster provide the most efficient operation resulting in the maximum possible time average luminous intensity.

The time average luminous intensity may be calculated using the relative efficiency characteristic of Figure 3 or 8,  $\eta I_{PEAK}$ , and adjusted for operating ambient temperature. The time average luminous intensity at  $T_A = 25^\circ\text{C}$  is calculated as follows:

$$I_{v, TIME AVG} = \left[ \frac{I_{AVG}}{I_{TEST}} \right] (\eta I_{PEAK}) (I_v \text{ Data Sheet})$$

where:

$$I_{TEST} = 3 \text{ mA for AlGaAs Red (HLMP-X000 series)}$$

$$20 \text{ mA for HER, Yellow and Green (HLMP-2XXX series)}$$

Example:

For HLMP-2735 series

$$\eta I_{PEAK} = 1.18 \text{ at } I_{PEAK} = 48 \text{ mA}$$

$$I_{v, TIME AVG} = \left[ \frac{12 \text{ mA}}{20 \text{ mA}} \right] (1.18) (35 \text{ mcd})$$

$$= 25 \text{ mcd}$$

The time average luminous intensity may be adjusted for operating ambient temperature by the following exponential equation:

$$I_v(T_A) = I_v(25^\circ\text{C})e^{[K(T_A - 25^\circ\text{C})]}$$

Color	K
AlGaAs Red	-0.0095/°C
HER	-0.0131/°C
Yellow	-0.0112/°C
Green	-0.0104/°C

Example:

$$I_v(80^\circ\text{C}) = (25 \text{ mcd})e^{[-0.0112(80-25)]}$$

$$= 14 \text{ mcd.}$$

## Mechanical

These light bar devices may be operated in ambient temperatures above +60°C without derating when installed in a PC board configuration that provides a thermal resistance pin to ambient value less than 280°C/W/LED. See Figure 2 or 7 to determine the maximum allowed thermal resistance for the PC board,  $R\theta_{PC-A}$ , which will permit nonderated operation in a given ambient temperature.

To optimize device optical performance, specially developed plastics are used which restrict the solvents that may be used for cleaning. It is recommended that only mixtures of Freon (F113) and alcohol be used for vapor cleaning processes, with

an immersion time in the vapors of less than two (2) minutes maximum. Some suggested vapor cleaning solvents are Freon TE, Genesolv DES, Arklone A or K. A 60°C (140°F) water cleaning process may also be used, which includes a neutralizer rinse (3% ammonia solution or equivalent), a surfactant rinse (1% detergent solution or equivalent), a hot water rinse and a thorough air dry. Room temperature cleaning may be accomplished with Freon T-E35 or T-P35, Ethanol, Isopropanol or water with a mild detergent.

For further information on soldering LEDs please refer to Application Note 1027.

LIGHT BARS AND BAR  
GRAPH ARRAYS

### Features

- FLAT RECTANGULAR LIGHT EMITTING SURFACE
- CHOICE OF 4 BRIGHT COLORS
- EXCELLENT ON/OFF CONTRAST
- IDEAL AS FLUSH MOUNTED PANEL INDICATORS
- LONG LIFE: SOLID STATE RELIABILITY
- SOLDER COATED LEADS

### Description

The HLMP-T200/-T300/-T400/-T500 light bars are rectangular light sources designed for a variety of applications where this shape and a high sterance are desired. These light bars consist of a rectangular plastic case around an epoxy encapsulated LED lamp. The encapsulant is tinted to match the color of the emitted light. The flat top surface is exceptionally uniform in light emission and the plastic case eliminates light leakage from the sides of the device.

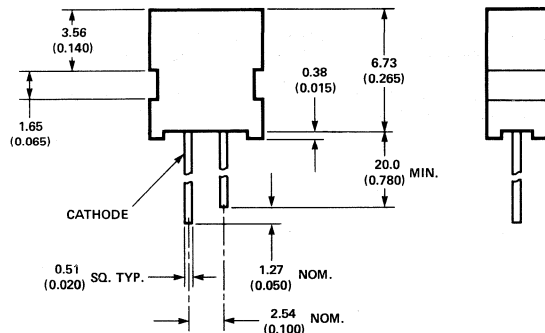

### Applications

- BAR GRAPHS
- FRONT PANEL STATUS INDICATORS
- TELECOMMUNICATIONS INDICATORS
- PUSH BUTTON ILLUMINATION
- PC BOARD IDENTIFIERS
- BUSINESS MACHINE MESSAGE ANNUNCIATORS

### Package Dimensions

NOTES:  
 1. DIMENSIONS ARE IN MILLIMETRES (INCHES).

$\eta_V$	Luminous Efficacy	High Efficiency Red Orange Yellow Green		145 262 500 595		$\frac{\text{lumens}}{\text{Watt}}$	See Note 3

## Notes:

- $\theta/2$  is the off-axis angle at which the luminous intensity is half the axial luminous intensity.
- The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and represents the single wavelength which defines the color of the device.
- Radiant intensity,  $I_e$ , in watts/steradian, may be found from the equation  $I_e = I_V/\eta_V$ , where  $I_V$  is the luminous intensity in candelas and  $\eta_V$  is the luminous efficacy in lumens/watt.

Lead Soldering Temperature [1.6 mm (0.063 in.) below seating plane]	260° C for 3 seconds			

## Notes:

- See Figure 5 to establish pulsed operating conditions.
- For Red, Orange, and Green derate linearly from 50° C at 0.5 mA/°C. For Yellow derate linearly from 50° C at 0.34 mA/°C.
- For Red, Orange, and Green derate power linearly from 25° C at 1.6 mW/°C. For Yellow derate power linearly from 50° C at 1.6 mW/°C.
- The transient peak current is the maximum non-recurring peak current that can be applied to the device without damaging the LED die and wirebond. It is not recommended that the device be operated at peak currents beyond the peak forward current listed in the Absolute Maximum Ratings.

## Electrical

The typical forward voltage values, scaled from Figure 2, should be used for calculating the current limiting resistor values and typical power dissipation. Expected maximum V<sub>F</sub> values for the purpose of driver circuit design and maximum power dissipation may be calculated using the following V<sub>F</sub> models:

$$V_F = 1.8V + I_{PEAK}(40\Omega)$$

$$\text{For } I_{PEAK} \geq 20 \text{ mA}$$

$$V_F = 1.6V + I_{DC}(50\Omega)$$

$$\text{For } 5 \text{ mA} \leq I_{DC} \leq 20 \text{ mA}$$

## Optical

The radiation pattern for these light bar devices is approximately Lambertian. The luminous sterance may be calculated using one of the two following formulas:

$$L_V (\text{cd/m}^2) = \frac{l_V (\text{cd})}{A (\text{m}^2)}$$

$$L_V (\text{footlamberts}) = \frac{\pi l_V (\text{cd})}{A (\text{ft}^2)}$$

$$\begin{aligned} \text{Size of light emitting area (A)} &= 3.18 \text{ mm} \times 5.72 \text{ mm} \\ &= 18.19 \times 10^{-6} \text{ m}^2 \\ &= 195.8 \times 10^{-6} \text{ ft}^2 \end{aligned}$$

## Mechanical

These light bar devices may be operated in ambient temperatures above +50° C without derating when installed in a PC board configuration that provides a thermal resistance (junction to ambient) value less than 625° C/W.

To optimize device optical performance, specially developed plastics are used which restrict the solvents that may be used for cleaning. It is recommended that only mixtures of Freon (F113) and alcohol be used for vapor cleaning processes, with an immersion time in the vapors of less than two (2) minutes maximum. Some suggested vapor cleaning solvents are Freon TE, Genesolv DI-15 or DE-15, Arklone A or K. A 60° C (140° F) water cleaning process may also be used, which includes a neutralizer rinse (3% ammonia solution or equivalent), a surfactant rinse (1% detergent solution or equivalent), a hot water rinse and a thorough air dry. Room temperature cleaning may be accomplished with Freon T-E35 or T-P35, Ethanol, Isopropanol or water with a mild detergent.

# 10-Element Bar Graph Array

## Technical Data

**HDSP-4820**  
**HLCP-J100**  
**HDSP-4830**  
**HDSP-4840**  
**HDSP-4850**  
**HDSP-4832**  
**HDSP-4836**

### Features

- Custom Multicolor Array Capability
- Matched LEDs for Uniform Appearance
- End Stackable
- Package Interlock Ensures Correct Alignment
- Low Profile Package
- Rugged Construction
- Large, Easily Recognizable Segments
- High ON-OFF Contrast, Segment to Segment
- Wide Viewing Angle
- Categorized for Luminous Intensity
- HDSP-4832/4836/4840/4850 Categorized for Dominant Wavelength
- HLCP-J100 Operates at Low Current  
Typical Intensity of 1.0 mcd at 1 mA Drive Current

### Applications

- Industrial Controls
- Instrumentation
- Office Equipment
- Computer Peripherals
- Consumer Products

### Description

These 10-element LED arrays are designed to display information in easily recognizable bar graph form. The packages are end stackable and therefore capable of displaying long strings of information. Use of these bar graph arrays eliminates the alignment, intensity, and color matching problems associated with discrete LEDs. The HDSP-4820/4830/4840/4850 and HLCP-J100 each contain LEDs of one color. The HDSP-4832/4836 are multicolor arrays with High Efficiency Red, Yellow, and High Performance Green LEDs in a single package.

**CUSTOM MULTICOLOR ARRAYS ARE AVAILABLE WITH MINIMUM DELIVERY REQUIREMENTS. CONTACT YOUR LOCAL DISTRIBUTOR OR HP SALES OFFICE FOR DETAILS.**

## Absolute Maximum Ratings<sup>[7]</sup>

Parameter	Red HDSP-4820	AlGaAs Red HLCP-J100	HER HDSP-4830	Yellow HDSP-4840	Green HDSP-4850
Average Power Dissipation per LED ( $T_A = 25^\circ\text{C}$ )	63 mW	37 mW	87 mW	50 mW	105 mW
Peak Forward Current per LED	150 mA <sup>[1]</sup>	45 mA <sup>[2]</sup>	90 mA <sup>[3]</sup>	60 mA <sup>[3]</sup>	90 mA <sup>[3]</sup>
DC Forward Current per LED	30 mA <sup>[4]</sup>	15 mA <sup>[4]</sup>	30 mA <sup>[5]</sup>	20 mA <sup>[5]</sup>	30 mA <sup>[5]</sup>
Operating Temperature Range	$-40^\circ\text{C}$ to $+85^\circ\text{C}$	$-20^\circ\text{C}$ to $+100^\circ\text{C}$	$-40^\circ\text{C}$ to $+85^\circ\text{C}$		$-20^\circ\text{C}$ to $+85^\circ\text{C}$
Storage Temperature Range	$-40^\circ\text{C}$ to $+85^\circ\text{C}$	$-55^\circ\text{C}$ to $+100^\circ\text{C}$	$-40^\circ\text{C}$ to $+85^\circ\text{C}$		
Reverse Voltage per LED	3.0 V	5.0 V	3.0 V		
Lead Soldering Temperature (1.59 mm (1/16 inch) below seating plane) <sup>[6]</sup>	260°C for 3 seconds <sup>[8]</sup>				

### Notes:

- See Figure 1 to establish pulsed operating conditions. Maximum pulse width is 1.5 ms.
- See Figure 2 to establish pulsed operating conditions. Maximum pulse width is 1.5 ms.
- See Figure 8 to establish pulsed operating conditions. Maximum pulse width is 2 ms.
- Derate maximum DC current for Red above  $T_A = 62^\circ\text{C}$  at 0.79 mA/ $^\circ\text{C}$ , and AlGaAs Red above  $T_A = 91^\circ\text{C}$  at 0.8 mA/ $^\circ\text{C}$ . See Figure 3.
- Derate maximum DC current for HER above  $T_A = 48^\circ\text{C}$  at 0.58 mA/ $^\circ\text{C}$ , Yellow above  $T_A = 70^\circ\text{C}$  at 0.66 mA/ $^\circ\text{C}$ , and Green above  $T_A = 37^\circ\text{C}$  at 0.48 mA/ $^\circ\text{C}$ . See Figure 9.
- Clean only in water, isopropanol, ethanol, Freon TF or TE (or equivalent), or Genesolve DI-15 (or equivalent).
- Absolute maximum ratings for HER, Yellow, and Green elements of the multicolor arrays are identical to the HDSP-4830/4840/4850 maximum ratings.
- Maximum component side temperature is 140°C during solder process.

Temperature Coefficient $V_F$ per LED	$\Delta V_F / ^\circ\text{C}$			-2.0		mV/ $^\circ\text{C}$
Thermal Resistance LED Junction-to-Pin	$R\theta_{\text{J-PIN}}$			300		$^\circ\text{C/W/LED}$

## High-Efficiency Red HDSP-4830

Parameter	Symbol	Test Conditions	Min.	Typ.	Max.	Units
Luminous Intensity per LED (Unit Average) <sup>(1,4)</sup>	$I_V$	$I_F = 10 \text{ mA}$	900	3500		$\mu\text{cd}$
Peak Wavelength	$\lambda_{\text{PEAK}}$			635		nm
Dominant Wavelength <sup>(2)</sup>	$\lambda_d$			626		nm
Forward Voltage per LED	$V_F$	$I_F = 20 \text{ mA}$		2.1	2.5	V
Reverse Voltage per LED <sup>(5)</sup>	$V_R$	$I_R = 100 \mu\text{A}$	3	30		V
Temperature Coefficient $V_F$ per LED	$\Delta V_F / ^\circ\text{C}$			-2.0		$\text{mV}/^\circ\text{C}$
Thermal Resistance LED Junction-to-Pin	$R\theta_{\text{J,PN}}$			300		$^\circ\text{C}/\text{W}/\text{LED}$

## Yellow HDSP-4840

Parameter	Symbol	Test Conditions	Min.	Typ.	Max.	Units
Luminous Intensity per LED (Unit Average) <sup>(1,4)</sup>	$I_V$	$I_F = 10 \text{ mA}$	600	1900		$\mu\text{cd}$
Peak Wavelength	$\lambda_{\text{PEAK}}$			583		nm
Dominant Wavelength <sup>(2,3)</sup>	$\lambda_d$		581	585	592	nm
Forward Voltage per LED	$V_F$	$I_F = 20 \text{ mA}$		2.2	2.5	V
Reverse Voltage per LED <sup>(5)</sup>	$V_R$	$I_R = 100 \mu\text{A}$	3	40		V
Temperature Coefficient $V_F$ per LED	$\Delta V_F / ^\circ\text{C}$			-2.0		$\text{mV}/^\circ\text{C}$
Thermal Resistance LED Junction-to-Pin	$R\theta_{\text{J,PN}}$			300		$^\circ\text{C}/\text{W}/\text{LED}$

## Green HDSP-4850

Parameter	Symbol	Test Conditions	Min.	Typ.	Max.	Units
Luminous Intensity per LED (Unit Average) <sup>(1,4)</sup>	$I_V$	$I_F = 10 \text{ mA}$	600	1900		$\mu\text{cd}$
Peak Wavelength	$\lambda_{\text{PEAK}}$			566		nm
Dominant Wavelength <sup>(2,3)</sup>	$\lambda_d$			571	577	nm
Forward Voltage per LED	$V_F$	$I_F = 10 \text{ mA}$		2.1	2.5	V
Reverse Voltage per LED <sup>(5)</sup>	$V_R$	$I_R = 100 \mu\text{A}$	3	50		V
Temperature Coefficient $V_F$ per LED	$\Delta V_F / ^\circ\text{C}$			-2.0		$\text{mV}/^\circ\text{C}$
Thermal Resistance LED Junction-to-Pin	$R\theta_{\text{J,PN}}$			300		$^\circ\text{C}/\text{W}/\text{LED}$

### Notes:

1. The bar graph arrays are categorized for luminous intensity. The category is designated by a letter located on the side of the package.
2. The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and is that single wavelength which defines the color of the device.
3. The HDSP-4832/-4836/-4840/-4850 bar graph arrays are categorized by dominant wavelength with the category designated by a number adjacent to the intensity category letter. Only the yellow elements of the HDSP-4832/-4836 are categorized for color.
4. Electrical/optical characteristics of the High-Efficiency Red elements of the HDSP-4832/-4836 are identical to the HDSP-4830 characteristics. Characteristics of Yellow elements of the HDSP-4832/-4836 are identical to the HDSP-4840. Characteristics of Green elements of the HDSP-4832/-4836 are identical to the HDSP-4850.
5. Reverse voltage per LED should be limited to 3.0 V max. for the HDSP-4820/4830/4840/4850/4832/4836 and 5.0 V max. for the HLCP-J100.

## Electrical/Optical

These versatile bar graph arrays are composed of ten light emitting diodes. The light from each LED is optically stretched to form individual elements.

The Red (HDSP-4820) bar graph array LEDs use a p-n junction diffused into a GaAsP epitaxial layer on a GaAs substrate. The AlGaAs Red (HLCP-J100) bar graph array LEDs use double heterojunction AlGaAs on a GaAs substrate. HER (HDSP-4830) and Yellow (HDSP-4840) bar graph array LEDs use a GaAsP epitaxial layer on a GaP substrate. Green (HDSP-4850) bar graph array LEDs use liquid phase GaP epitaxial layer on a GaP substrate. The multicolor bar graph arrays (HDSP-4832/4836) have HER, Yellow, and Green LEDs in one package.

These displays are designed for strobed operation. The typical forward voltage values can be scaled from Figures 5 and 11. These values should be used to calculate the current limiting resistor value and typical power consumption. Expected maximum  $V_F$  values for driver circuit design and maximum power dissipation may be calculated using the following  $V_{F,MAX}$  models:

Standard Red HDSP-4820 series

$$V_{F,MAX} = 1.8 \text{ V} + I_{Peak} (10 \Omega)$$

For:  $I_{Peak} \geq 5 \text{ mA}$

AlGaAs Red HDSP-J100 series

$$V_{F,MAX} = 1.8 \text{ V} + I_{Peak} (20 \Omega)$$

For:  $I_{Peak} \leq 20 \text{ mA}$

$$V_{F,MAX} = 2.0 \text{ V} + I_{Peak} (10 \Omega)$$

For:  $I_{Peak} \geq 20 \text{ mA}$

HER (HDSP-4830) and Yellow (HDSP-4840) series

$$V_{F,MAX} = 1.6 + I_{Peak} (45 \Omega)$$

For:  $5 \text{ mA} \leq I_{Peak} \leq 20 \text{ mA}$

$$V_{F,MAX} = 1.75 + I_{Peak} (38 \Omega)$$

For:  $I_{Peak} \geq 20 \text{ mA}$

Green (HDSP-4850) series

$$V_{F,MAX} = 2.0 + I_{Peak} (50 \Omega)$$

For:  $I_{Peak} > 5 \text{ mA}$

Figures 4 and 10 allow the designer to calculate the luminous intensity at different peak and average currents. The following equation calculates intensity at different peak and average currents:

$$I_V,AVG = (I_{F,AVG}/I_{F,AVG} \text{ DATA SHEET})(\eta_{Peak})(I_V \text{ DATA SHEET})$$

Where:

- $I_V,AVG$  is the calculated time averaged luminous intensity resulting from  $I_{F,AVG}$ .
- $I_{F,AVG}$  is the desired time averaged LED current.
- $I_{F,AVG} \text{ DATA SHEET}$  is the data sheet test current for  $I_V \text{ DATA SHEET}$ .
- $\eta_{Peak}$  is the relative efficiency at the peak current, scaled from Figure 4 or 10.
- $I_V \text{ DATA SHEET}$  is the data sheet luminous intensity, resulting from  $I_{F,AVG} \text{ DATA SHEET}$ .

For example, what is the luminous intensity of an HDSP-4830 driven at 50 mA peak 1/5 duty factor?

$$I_{F,AVG} = (50 \text{ mA})(0.2) = 10 \text{ mA}$$

$$I_{F,AVG} \text{ DATA SHEET} = 10 \text{ mA}$$

$$\eta_{Peak} = 1.3$$

$$I_V \text{ DATA SHEET} = 3500 \mu\text{cd}$$

Therefore

$$I_V,AVG = (10 \text{ mA}/10 \text{ mA})(1.3)(3500 \mu\text{cd}) = 4550 \mu\text{cd}$$

# PANEL AND LEGEND MOUNTS FOR LED LIGHT BARS

HLMP-2598  
HLMP-2599  
HLMP-2898  
HLMP-2899

## Features

- FIRMLY MOUNTS LIGHT BARS IN PANELS
- HOLDS LEGENDS FOR FRONT PANEL OR PC BOARD APPLICATIONS<sup>[1]</sup>
- ONE PIECE, SNAP-IN ASSEMBLY
- MATTE BLACK BEZEL DESIGN ENHANCES PANEL APPEARANCE
- FOUR SIZES AVAILABLE
- MAY BE INSTALLED IN A WIDE RANGE OF PANEL THICKNESSES
- PANEL HOLE EASILY PUNCHED OR MILLED

## Description

This series of black plastic bezel mounts is designed to install Hewlett-Packard Light Bars in instrument panels ranging in thickness from 1.52 mm (0.060 inch) to 3.18 mm

(0.125 inch). A space has been provided for holding a 0.13 mm (0.005 inch) film legend over the light emitting surface of the light bar module.

## Selection Guide

Panel and Legend Mount Part No. HLMP-	Corresponding Light Bar Module Part No.		Panel Hole Installation Dimensions <sup>[2]</sup>	Package Outline	
	HLCP-	HLMP-			
2598	B100	2350, 2450, 2550	7.62 mm (0.300 inch) x 22.86 mm (0.900 inch)		B
2599	A100	2300, 2400, 2500	7.62 mm (0.300 inch) x 12.70 mm (0.500 inch)		A
2898	D100 C100	2600, 2700, 2800 2655, 2755, 2855 2950, 2965, 2980	12.70 mm (0.500 inch) x 12.70 mm (0.500 inch)		C
2899	E100 F100 G100 H100	2620, 2720, 2820 2635, 2735, 2835 2670, 2770, 2870 2685, 2785, 2885	12.70 mm (0.500 inch) x 22.86 mm (0.900 inch)		D

**Notes:**

1. Application Note 1012 addresses legend fabrication options.
2. Allowed hole tolerance: +0.00 mm, -0.13 mm (+0.000 inch, -0.005 inch). Permitted radius: 1.60 mm (0.063 inch).

# Package Dimensions

NOTES: 1. DIMENSIONS IN MILLIMETRES (INCHES)  
2. UNTOLERANCED DIMENSIONS ARE FOR REFERENCE ONLY.

## Mounting Instructions

1. Mill<sup>[3]</sup> or punch a hole in the panel. Deburr, but do not chamfer, the edges of the hole.
2. Place the front of the mount against a solid, flat surface. A film legend with outside dimensions equal to the outside dimensions of the light bar may be placed in the mount or on the light bar light emitting surface. Press the light bar into the mount until the tabs snap over the back of the light bar<sup>[4]</sup>. When inserting the HLMP-2898, align the notched sides of the light bar with the mount sides which do not have the tabs. (See Figure 1)
3. Applying even pressure to the top of the mount, press the entire assembly into the hole from the front of the panel<sup>[5]</sup>. (See Figure 2)

NOTE: For thinner panels, the mount may be pressed into the panel first, then the light bar may be pressed into the mount from the back side of the panel.

### Notes:

3. A 3.18 mm (0.125 inch) diameter mill may be used.
4. Repetitive insertion of the light bar into mount may cause damage to the mount.
5. Repetitive insertion of the mount into the panel will degrade the retention force of the mount.

## Suggested Punch Sources

Hole punches may be ordered from one of the following sources:

Danly Machine Corporation  
Punchrite Division  
15400 Brookpark Road  
Cleveland, OH 44135  
(216) 267-1444

Ring Division  
The Producto Machine Company  
Jamestown, NY 14701  
(800) 828-2216

Porter Precision Products Company  
12522 Lakeland Road  
Santa Fe Springs, CA 90670  
(213) 946-1531

Di-Acro Division  
Houdaille Industries  
800 Jefferson Street  
Lake City, MN 55041  
(612) 345-4571

---

## Solid State Lamps

---

From General to Special Purpose Lamps, Hewlett-Packard continues to grow its LED lamp product offering. This year, HP expanded the AS AlGaAs product family with the introduction of new rectangular, T1, T-1 3/4, and subminiature lamps.

HP always strives to supply products with greater performance each year. To this effect, HP has introduced a new series of transparent substrate AlGaAs products, including the world's brightest LED, the HLMP-8150.

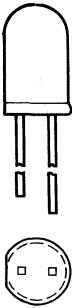

New packages are always an area of growth and importance to designers and Hewlett-Packard. Now, applications that require a high brightness light source can be addressed with HP's high power LED family. These LEDs have a superior optical performance due to the high tech package design. In addition, these parts are capable of being driven by higher currents than traditional LEDs and this results in more light output. Finally, designers will have a high reliability alternative to applications which traditionally required the brightness supplied by incandescent bulbs.

### Low Current DH AlGaAs Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-D150	AlGaAs Red (637 nm)	T-1 3/4	Tinted Diffused	3.0 mcd @ 1 mA	65°	1.6 V @ 1 mA	3-42
	HLMP-D155			Untinted Nondiffused	10.0 mcd @ 1 mA	24°		

**Bold Type – New Product**

### Low Current DH AlGaAs Lamps (Continued)

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-K150	AlGaAs Red (637 nm)	T-1	Tinted Diffused	2.0 mcd @ 1 mA	60°	1.6 V @ 1 mA	3-42
	HLMP-K155			Untinted Nondiffused	3.0 mcd @ 1 mA	45°		
	HLMP-Q150		Subminiature	Tinted Diffused	1.8 mcd @ 1 mA	70°	1.6 V @ 1 mA	3-91
	HLMP-Q155			Untinted Nondiffused	4.0 mcd @ 1.0 mA	28°		

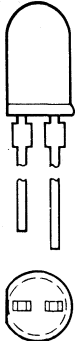

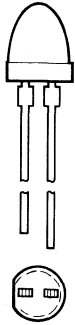

### Very High Intensity AlGaAs Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-4100	AlGaAs Red (637 nm)	T-1 3/4	Untinted Nondiffused	750.0 mcd @ 20 mA	8°	1.8 V @ 20 mA	3-46
	HLMP-4101				1000.0 mcd @ 20 mA			

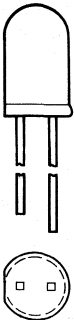

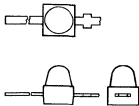

**Bold Type – New Product**

SOLID STATE LAMPS

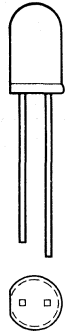

## Ultrabright Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-3750	High Efficiency Red (626 nm)	T-1 3/4	Untinted Non-diffused	125.0 mcd @ 20 mA	24°	2.2 V @ 20 mA	3-50
	HLMP-3850	Yellow (585 nm)			140.0 mcd @ 20 mA		2.2 V @ 20 mA	
	HLMP-3950	Green (569 nm)			120.0 mcd @ 20 mA		2.3 V @ 20 mA	
	HLMP-3390	High Efficiency Red (626 nm)	T-1 3/4 Low Profile	Untinted Non-diffused	55.0 mcd @ 20 mA	32°	2.2 V @ 20 mA	
	HLMP-3490	Yellow (585 nm)					2.2 V @ 20 mA	
	HLMP-3590	Green (569 nm)					2.3 V @ 20 mA	
	HLMP-1340	High Efficiency Red (626 nm)	T-1	Untinted Non-diffused	45.0 mcd @ 20 mA	45°	2.2 V @ 20 mA	
	HLMP-1440	Yellow (585 nm)					2.2 V @ 20 mA	
	HLMP-1540	Green (569 nm)					2.3 V @ 20 mA	

## Low Current Lamps

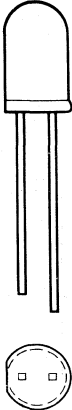

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-4700	High Efficiency Red (626 nm)	T-1 3/4	Tinted Diffused	2.0 mcd @ 2 mA	50°	1.8 V @ 2 mA	3-54
	HLMP-4719	Yellow (585 nm)			1.8 mcd @ 2 mA		1.9 V @ 2 mA	
	HLMP-4740	Green (569 nm)			1.8 mcd @ 2 mA		1.8 V @ 2 mA	
	HLMP-1700	High Efficiency Red (626 nm)	T-1	Tinted Diffused	1.8 mcd @ 2 mA	50°	1.8 V @ 2 mA	
	HLMP-1719	Yellow (585 nm)			1.6 mcd @ 2 mA		1.9 V @ 2 mA	
	HLMP-1790	Green (569 nm)			1.6 mcd @ 2 mA		1.8 V @ 2 mA	
	HLMP-7000	High Efficiency Red (626 nm)	Subminiature	Tinted Diffused	0.8 mcd @ 2 mA	90°	1.8 V @ 2 mA	3-91
	HLMP-7019	Yellow (585 nm)			0.6 mcd @ 2 mA		1.9 V @ 2 mA	
	HLMP-7040	Green (569 nm)			0.6 mcd @ 2 mA		1.8 V @ 2 mA	

### High Intensity T-1 3/4 Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-3315	High Efficiency Red (626 nm)	T-1 3/4	Tinted Nondiffused	40.0 mcd @ 10 mA	35°	2.2 V @ 10 mA	3-58
	HLMP-3316				60.0 mcd @ 10 mA			
	HLMP-3415	Yellow (585 nm)			40.0 mcd @ 10 mA		2.2 V @ 10 mA	
	HLMP-3416				50.0 mcd @ 10 mA			
	HLMP-3517	Green (569 nm)			50.0 mcd @ 10 mA	24°	2.3 V @ 10 mA	
	HLMP-3519				70.0 mcd @ 10 mA			

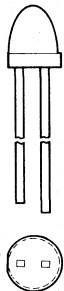

### Diffused (Wide Angle) T-1 3/4 Lamps

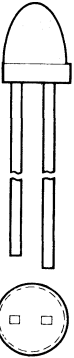

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.		
Package Outline Drawing	Part No.	Color	Package	Lens						
	HLMP-3300	High Efficiency Red (626 nm)	T-1 3/4		3.5 mcd @ 10 mA	60°	2.2 V @ 10 mA	3-62		
	HLMP-3301				7.0 mcd @ 10 mA					
	HLMP-3762				12.0 mcd @ 10 mA					
	HLMP-D400	Orange (602 nm)			3.5 mcd @ 10 mA				60°	2.2 V @ 10 mA
	HLMP-D401				7.0 mcd @ 10 mA					
	HLMP-3400	Yellow (585 nm)			4.0 mcd @ 10 mA					
	HLMP-3401				8.0 mcd @ 10 mA					
	HLMP-3862				12.0 mcd @ 10 mA					
	HLMP-3502	Green (569 nm)			2.4 mcd @ 10 mA	60°	2.3 V @ 10 mA			
	HLMP-3507				5.2 mcd @ 10 mA					
	HLMP-3962				11.0 mcd @ 10 mA					

SOLID STATE LAMPS

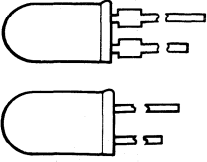

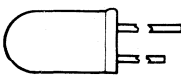

### High Intensity T-1 3/4 Low Profile Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.	
Package Outline Drawing	Part No.	Color	Package	Lens					
	HLMP-3365	High Efficiency Red (626 nm)	T-1 3/4 Low Profile	Tinted Non-Diffused	10.0 mcd @ 10 mA	45°	2.2 V @ 10 mA	3-66	
	HLMP-3366				18.0 mcd @ 10 mA				
	HLMP-3465	Yellow (585 nm)			12.0 mcd @ 10 mA				2.2 V @ 10 mA
	HLMP-3466				18.0 mcd @ 10 mA				
	HLMP-3567	Green (569 nm)			7.0 mcd @ 10 mA	40°	2.3 V @ 10 mA		
	HLMP-3568				15.0 mcd @ 10 mA				

### Diffused (Wide Angle) T-1 3/4 Low Profile Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-3200	Red (640 nm)	T-1 3/4 Low Profile	Tinted Diffused	2.0 mcd @ 20 mA	60°	1.6 V @ 20 mA	3-66
	HLMP-3201				4.0 mcd @ 20 mA			
	HLMP-3350	High Efficiency Red (626 nm)			3.5 mcd @ 10 mA	50°	2.2 V @ 10 mA	
	HLMP-3351				7.0 mcd @ 10 mA			
	HLMP-3450	Yellow (585 nm)			4.0 mcd @ 10 mA	2.2 V @ 10 mA		
	HLMP-3451				10.0 mcd @ 10 mA			
	HLMP-3553	Green (569 nm)			3.2 mcd @ 10 mA	2.3 V @ 10 mA		
	HLMP-3554				10.0 mcd @ 10 mA			

### Standard Red T-1 3/4 Lamps

Device		Description			Typical Luminous Intensity	2 $\theta$ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-3000	Red (648 nm)	T-1 3/4	Tinted Diffused	2.0 mcd @ 20 mA	60°	1.6 V @ 20 mA	3-71
	HLMP-3001				4.0 mcd @ 20 mA			
	HLMP-3002				2.0 mcd @ 20 mA			
	HLMP-3003				4.0 mcd @ 20 mA			
	HLMP-3050			Tinted Non-Diffused	2.5 mcd @ 20 mA	24°		

SOLID STATE LAMPS

### T-1 3/4 Mounting Hardware

Device		Description	Page No.
Package Outline Drawing	Part No.		
	HLMP-0103	Mounting Clip and Ring for T-1 3/4 Lamps	3-128

### T-1 High Intensity Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-1320	High Efficiency Red (626 nm)	T-1	Untinted Nondiffused	12.0 mcd @ 10 mA	45°	2.2 V @ 10 mA	3-73
	HLMP-1321			Tinted Nondiffused				
	HLMP-1420	Yellow (585 nm)		Untinted Nondiffused	12.0 mcd @ 10 mA		2.2 V @ 10 mA	
	HLMP-1421			Tinted Nondiffused				
	HLMP-1520	Green (569 nm)		Untinted Nondiffused	12.0 mcd @ 10 mA		2.3 V @ 10 mA	
	HLMP-1521			Tinted Nondiffused				

### T-1 Diffused (Wide Angle) Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-1300	High Efficiency Red (626 nm)	T-1	Tinted Diffused	5.0 mcd @ 10 mA	60°	2.2 V @ 10 mA	3-77
	HLMP-1301				5.5 mcd @ 10 mA			
	HLMP-1302				7.0 mcd @ 10 mA			
	HLMP-1385				10.0 mcd @ 10 mA			
	HLMP-K400	Orange (602 nm)			4.0 mcd @ 10 mA		2.2 V @ 10 mA	
	HLMP-K401				5.0 mcd @ 10 mA			
	HLMP-K402				6.5 mcd @ 10 mA			

### T-1 Diffused (Wide Angle) Lamps (Continued)

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-1400	Yellow (585 nm)	T-1	Tinted Diffused	5.0 mcd @ 10 mA	60°	2.2 V @ 10 mA	3-77
	HLMP-1401				6.0 mcd @ 10 mA			
	HLMP-1402				7.0 mcd @ 10 mA			
	HLMP-1485				10.0 mcd @ 10 mA			
	HLMP-1503	Green (569 nm)			5.0 mcd @ 10 mA		2.3 V @ 10 mA	
	HLMP-1523				7.0 mcd @ 10 mA			
	HLMP-1585				8.5 mcd @ 10 mA			

SOLID STATE LAMPS

### T-1 Standard Red Lamps

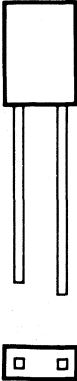

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-1000	Red (648 nm)	T-1	Tinted Diffused	1.0 mcd @ 20 mA	60°	1.6 V @ 20 mA	3-81
	HLMP-1002				2.5 mcd @ 20 mA			
	HLMP-1080			Untinted Diffused	1.5 mcd @ 20 mA			
	HLMP-1071	Untinted Non-Diffused	2.0 mcd @ 20 mA	45°	1.6 V @ 20 mA			
	HLMP-1200	T-1 Low Profile	Untinted Non-Diffused	1.0 mcd @ 20 mA	55°	1.6 V @ 20mA		
	HLMP-1201			2.5 mcd @ 20 mA				

### T-1 Low Profile Diffused Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-1350	High Efficiency Red (626 nm)	T-1 Low Profile	Tinted Diffused	2.0 mcd @ 10 mA	55°	2.2 V @ 10 mA	*
	HLMP-1450	Yellow (585 nm)					2.2 V @ 10 mA	
	HLMP-1550	Green (569 nm)					2.3 V @ 10 mA

## Rectangular Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	<b>HLMP-R100</b>	DH AlGaAs Red (637 nm)	Rectangular	Tinted Diffused	7.5 mcd @ 20 mA	100°	1.8 V @ 20 mA	3-83
	HLMP-0300	High Efficiency Red (626 nm)			2.5 mcd @ 20 mA		2.2 V @ 20 mA	
	HLMP-0301				5.0 mcd @ 20 mA			
	HLMP-0400	Yellow (585 nm)			2.5 mcd @ 20 mA		2.2 V @ 20 mA	
	HLMP-0401				5.0 mcd @ 20 mA			
	HLMP-0503	Green (569 nm)			2.5 mcd @ 20 mA		2.3 V @ 20 mA	
	HLMP-0504				5.0 mcd @ 20 mA			

**Bold Type – New Product**

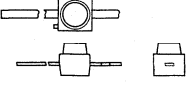

## 2 mm x 5 mm Rectangular Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	<b>HLMP-S100</b>	DH AlGaAs Red (637 nm)	2 mm x 5 mm Rectangular	Tinted Diffused	7.5 mcd @ 20 mA	110°	1.8 V @ 20 mA	3-87
	HLMP-S200	High Efficiency Red (626 nm)			3.5 mcd @ 20 mA		2.2 V @ 20 mA	
	HLMP-S201				4.8 mcd @ 20 mA			
	HLMP-S400	Orange (602 nm)			3.5 mcd @ 20 mA		2.2 V @ 20 mA	
	HLMP-S401				4.8 mcd @ 20 mA			
	HLMP-S300	Yellow (585 nm)			2.1 mcd @ 20 mA		2.2 V @ 20 mA	
	HLMP-S301				3.5 mcd @ 20 mA			
	HLMP-S500	Green (569 nm)			4.0 mcd @ 20 mA		2.3 V @ 20 mA	
	HLMP-S501				5.8 mcd @ 20 mA			

**Bold Type – New Product**

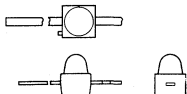

## Subminiature Flat Top Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	<b>HLMP-P005</b>	Standard Red (640 nm)	Flat Top Subminiature	Untinted Non-diffused	2.5 mcd @ 10 mA	125°	1.6 V @ 10 mA	3-91
	<b>HLMP-P105</b>	DH AlGaAs Red (637 nm)			45.0 mcd @ 20 mA		1.8 V @ 20 mA	
	<b>HLMP-P205</b>	High Efficiency Red (626 nm)			5.0 mcd @ 10 mA		1.8 V @ 10 mA	
	<b>HLMP-P405</b>	Orange (602 nm)			4.0 mcd @ 10 mA		1.9 V @ 10 mA	
	<b>HLMP-P305</b>	Yellow (585 nm)			4.0 mcd @ 10 mA		2.0 V @ 10 mA	
	<b>HLMP-P505</b>	Green (569 nm)			5.0 mcd @ 10 mA		2.0 V @ 10 mA	

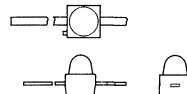

**Bold Type** – New Product

SOLID STATE LAMPS

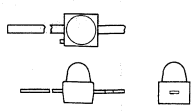

### Subminiature Diffused Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-6000	Standard Red (640 nm)	Subminiature	Tinted Diffused	1.2 mcd @ 10 mA	90°	1.6 V @ 10 mA	3-91
	HLMP-6001						1.6 V @ 10 mA	
	HLMP-Q101	DH AlGaAs Red (637 nm)					1.8 V @ 20 mA	
	HLMP-6300	High Efficiency Red (626 nm)					1.8 V @ 10 mA	
	HLMP-Q400	Orange (602 nm)					1.9 V @ 10 mA	
	HLMP-6400	Yellow (585 nm)					2.0 V @ 10 mA	
	HLMP-6500	Green (569 nm)					2.0 V @ 10 mA	

### Subminiature Nondiffused Lamps

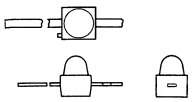

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-Q105	DH AlGaAs Red (637 nm)	Subminiature	Untinted Non-diffused	55.0 mcd @ 20 mA	28°	1.8 V @ 20 mA	3-91
	HLMP-6305	High Efficiency Red (626 nm)					1.8 V @ 10 mA	
	HLMP-6405	Yellow (585 nm)					2.0 V @ 10 mA	
	HLMP-6505	Green (569 nm)					2.0 V @ 10 mA	

### Subminiature Low Current Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Voltage	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-Q150	DH AlGaAs Red (637 nm)	Subminiature	Tinted Diffused	1.8 mcd @ 1.0 mA	90°	1.6 V @ 1.0 mA	3-91
	<b>HLMP-Q155</b>			Untinted Nondiffused	4.0 mcd @ 1.0 mA	28°		
	HLMP-7000	High Efficiency Red (626 nm)		Tinted Diffused	0.8 mcd @ 2.0 mA	90°	1.8 V @ 10.0 mA	
	HLMP-7019	Yellow (585 nm)		0.6 mcd @ 2.0 mA	2.0 V @ 10.0 mA			
	HLMP-7040	Green		0.6 mcd	2.0 V @			

**Bold Type – New Product**

### Subminiature Resistor Lamps

Device		Description			Typical Luminous Intensity	2θ 1/2	Typical Forward Current	Page No.
Package Outline Drawing	Part No.	Color	Package	Lens				
	HLMP-6600	High Efficiency Red (626 nm)	Subminiature Resistor	Tinted Diffused	5.0 mcd @ 5.0 V	90°	9.6 mA @ 5.0 V	3-91
	HLMP-6620			2.0 mcd @ 5.0 V	3.5 mA @ 5.0 V			
	HLMP-6700	Yellow (585 nm)		5.0 mcd @ 5.0 V	9.6 mA @ 5.0 V			
	HLMP-6720			2.0 mcd @ 5.0 V	3.5 mA @ 5.0 V			
	HLMP-6800	Green (569 nm)		5.0 mcd @ 5.0 V	9.6 mA @ 5.0 V			
	HLMP-6820			2.0 mcd @ 5.0 V	3.5 mA @ 5.0 V

# High Power T - 4 (13.3 mm) TS AlGaAs Red Lamp

## Technical Data

**HLMP-8150 15 Candela**

### Features

- 15 Candelas at 20 mA
- Outstanding LED Material Efficiency
- High Light Output Over a Wide Range of Drive Currents
- 4° Viewing Angle
- Low Forward Voltage
- Low Power Dissipation
- CMOS/MOS Compatible
- Red Color

### Applications

- Emitter for Emitter/Detector Applications
- Power Signaling
- Bright Ambient Lighting Conditions
- Bar Code Readers
- Replacement for a Low Power Laser

### Description

This untinted, nondiffused solid state lamp utilizes a highly optimized LED material, transparent substrate aluminum gallium arsenide, TS AlGaAs. This material has outstanding light output efficiency over a wide range of currents, and has superior high current capability to most other LED materials. The

lamp design utilizes advanced optical methods to enable extremely high peak intensity and a very narrow viewing angle. The LED color is red at a dominant wavelength of 637 nm.

### Package Dimensions

- Notes:**
1. All dimensions are in millimetres (inches).
  2. The leads are mild steel, solder dipped.
  3. An epoxy meniscus may extend about 1 mm (0.040 ") down the leads.

### Axial Luminous Intensity and Viewing Angle at $T_A = 25^\circ\text{C}$

Minimum Intensity (cd) @ 20 mA	Typical Intensity (cd) @ 20 mA	Maximum Intensity (cd) @ 20 mA	Typical Radiant Intensity (mW/sr) @ 20 mA	$2\theta_{1/2}^{(1)}$ (degrees)
8.0	15.0	36.0	176	4.0

Note. 1.  $\theta_{1/2}$  is the off axis angle from optical centerline where the luminous intensity is 1/2 the on-axis value.

### Absolute Maximum Ratings at $T_A = 25^\circ\text{C}$

Peak Forward Current <sup>(1,2)</sup> .....	300 mA
Average Forward Current (@ $I_{PEAK}=300\text{ mA}$ ) <sup>(2)</sup> .....	15 mA
DC Forward Current <sup>(3)</sup> .....	50 mA
Power Dissipation .....	130 mW
Reverse Voltage ( $I_R=100\ \mu\text{A}$ ) .....	8 V
Transient Forward Current (10 $\mu\text{s}$ Pulse) <sup>(4)</sup> .....	500 mA
Operating Temperature Range .....	-55 to +100°C
Storage Temperature Range .....	-55 to +100°C
Lead Soldering Temperature	
[1.6 mm (0.063 in.) from body] .....	260°C for 5 seconds

**Notes:**

- Maximum  $I_{PEAK}$  at  $f = 1\text{ kHz}$ ,  $DF = 5\%$ .
- Refer to Figure 6 to establish pulsed operating conditions.
- Derate linearly as shown in Figure 5.
- The transient peak current is the maximum non-recurring peak current the device can withstand without damaging the LED die and wire bonds. It is not recommended that the device be operated at peak currents above the Absolute Maximum Peak Forward Current.

### Electrical/Optical Characteristics at $T_A = 25^\circ\text{C}$

Description	Symbol	Min	Typ	Max	Units	Test Condition
Forward Voltage	$V_F$		1.85	2.4	V	$I_F = 20\text{ mA}$
Reverse Voltage	$V_R$	8.0	20.0		V	$I_R = 100\ \mu\text{A}$
Peak Wavelength	$\lambda_{PEAK}$		650		nm	
Dominant Wavelength <sup>(1)</sup>	$\lambda_d$		637		nm	
Spectral Line Halfwidth	$\Delta\lambda_{1/2}$		22		nm	
Speed of Response	$\tau_s$		45		ns	Exponential Time Constant, $e^{-t/\tau_s}$
Capacitance	C		20		pF	$V_F = 0$ , $f = 1\text{ MHz}$
Thermal Resistance	$R\theta_{J-PIN}$		220		°C/W	Junction-to-Anode Lead
Luminous Efficacy <sup>(2)</sup>	$\eta_v$		85		lm/W	

**Notes:**

- The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and represents the color of the device.
- The radiant intensity,  $I_e$ , in watts per steradian, may be found from the equation  $I_e = I_v / \eta_v$ , where  $I_v$  is the luminous intensity in candelas and  $\eta_v$  is luminous efficacy in lumens/watt.
- The approximate total luminous flux output within a cone angle of  $2\theta$  about the optical axis may be obtained from the following formula:  

$$\phi_v(2\theta) = [\phi_v(\theta) / I_v(0)] I_v;$$
 Where:  $\phi_v(\theta) / I_v(0)$  is obtained from Figure 7.

**Notes:**

- The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and represents the color of the device.
- The radiant intensity,  $I_e$ , in watts per steradian, may be found from the equation  $I_e = I_v/\eta_v$ , where  $I_v$  is the luminous intensity in candelas and  $\eta_v$  is luminous efficacy in lumens/watt.

# DOUBLE HETEROJUNCTION AlGaAs VERY HIGH INTENSITY RED LED LAMPS T-1 3/4 (5 mm) HLMP-4100,-4101

## Features

- 1000 mcd AT 20 mA
- **VERY HIGH INTENSITY AT LOW DRIVE CURRENTS**
- **NARROW VIEWING ANGLE**
- **OUTSTANDING MATERIAL EFFICIENCY**
- **LOW FORWARD VOLTAGE**
- **CMOS/MOS COMPATIBLE**
- **TTL COMPATIBLE**
- **DEEP RED COLOR**

## Applications

- **BRIGHT AMBIENT LIGHTING CONDITIONS**
- **EMITTER/DETECTOR AND SIGNALING APPLICATIONS**
- **GENERAL USE**

## Description

These solid state LED lamps utilize newly developed double heterojunction (DH) AlGaAs/GaAs material technology. This LED material has outstanding light output efficiency over a wide range of drive currents. The lamp package has a tapered lens, designed to concentrate the luminous flux into a narrow radiation pattern to achieve a very high intensity. The LED color is deep red at the dominant wavelength of 637 nanometres. These lamps may be DC or pulse driven to achieve desired light output.

## Package Dimensions

## Luminous Intensity @ 25°C

P/N HLMP-	Package Description	I <sub>v</sub> (mcd) @ 20 mA DC		2θ 1/2 Note 1. Degrees
		Min.	Typ.	
4100	T-1 3/4 Red Untinted, Non-diffused	500	750	8
4101		700	1000	

**Note:**

1. θ1/2 is the angle from optical centerline where the luminous intensity is 1/2 the optical centerline value.

## Absolute Maximum Ratings at T<sub>A</sub> = 25°C

Parameter	Maximum Rating	Units
Peak Forward Current <sup>[1, 2]</sup>	300	mA
Average Forward Current <sup>[2]</sup>	20	mA
DC Current <sup>[3]</sup>	30	mA
Power Dissipation	87	mW
Reverse Voltage (I <sub>R</sub> = 100 μA)	5	V
Transient Forward Current (10 μs Pulse) <sup>[4]</sup>	500	mA
Operating Temperature Range	-20 to +100	°C
Storage Temperature Range	-55 to +100	°C
Lead Soldering Temperature [1.6 mm (0.063 in.) from body]	260°C for 5 seconds	

**Notes:**

1. Maximum I<sub>PEAK</sub> at f = 1 kHz, DF = 6.7%.
2. Refer to Figure 6 to establish pulsed operating conditions.
3. Derate linearly as shown in Figure 5.
4. The transient peak current is the maximum non-recurring peak current the device can withstand without damaging the LED die and wire bonds. It is not recommended that the device be operated at peak currents beyond the Absolute Maximum Peak Forward Current.

## Electrical/Optical Characteristics at T<sub>A</sub> = 25°C

Symbol	Description	Min.	Typ.	Max.	Unit	Test Condition
V <sub>F</sub>	Forward Voltage		1.8	2.2	V	20 mA
V <sub>R</sub>	Reverse Breakdown Voltage	5.0	15.0		V	I <sub>R</sub> = 100 μA
λ <sub>PEAK</sub>	Peak Wavelength		645		nm	Measurement at peak
λ <sub>d</sub>	Dominant Wavelength		637		nm	Note 1
Δλ 1/2	Spectral Line Halfwidth		20		nm	
τ <sub>S</sub>	Speed of Response		30		ns	Exponential Time Constant, e <sup>-t/s</sup>
C	Capacitance		30		pF	V <sub>F</sub> = 0, f = 1 MHz
θ <sub>JC</sub>	Thermal Resistance		220		°C/W	Junction to Cathode Lead
η <sub>V</sub>	Luminous Efficacy		80		lm/W	Note 2

**Notes:**

1. The dominant wavelength, λ<sub>d</sub>, is derived from the CIE chromaticity diagram and represents the color of the device.
2. The radiant intensity, I<sub>e</sub>, in watts per steradian, may be found from the equation I<sub>e</sub> = I<sub>v</sub>/η<sub>V</sub>, where I<sub>v</sub> is the luminous intensity in candelas and η<sub>V</sub> is luminous efficacy in lumens/watt.
3. The approximate total luminous flux output within a cone angle of 2θ about the optical axis, φ<sub>V</sub>(2θ), may be obtained from the following formula:  

$$\phi_V(2\theta) = [\phi_V(\theta)/I_V(0)]I_V$$
 Where: φ<sub>V</sub>(θ)/I<sub>V</sub>(0) is obtained from Figure 7.

## ULTRA-BRIGHT LED LAMPS

T-1 3/4 HLMP-3750,-3850,-3950  
T-1 3/4 LOW PROFILE HLMP-3390,-3490,-3590  
T-1 HLMP-1340,-1440,-1540

### Features

- IMPROVED BRIGHTNESS
- IMPROVED COLOR PERFORMANCE
- AVAILABLE IN POPULAR T-1 and T-1 3/4 PACKAGES
- NEW STURDY LEADS
- IC COMPATIBLE/LOW CURRENT CAPABILITY
- RELIABLE AND RUGGED
- CHOICE OF 3 BRIGHT COLORS  
High Efficiency Red  
High Brightness Yellow  
High Performance Green

### Description

These clear, non-diffused lamps out perform conventional LED lamps. By utilizing new higher intensity material, we achieve superior product performance.

The HLMP-3750/-3390/-1340 Series Lamps are Gallium Arsenide Phosphide on Gallium Phosphide red light emitting diodes. The HLMP-3850/-3490/-1440 Series are Gallium Arsenide Phosphide on Gallium Phosphide yellow light emitting diodes. The HLMP-3950/-3590/-1540 Series lamps are Gallium Phosphide green light emitting diodes.

### Applications

- LIGHTED SWITCHES
- BACKLIGHTING FRONT PANELS
- LIGHT PIPE SOURCES
- KEYBOARD INDICATORS

### Axial Luminous Intensity and Viewing Angle @ 25°C

Part Number HLMP-	Package Description	Color	I <sub>v</sub> (mcd) @ 20 mA DC		2θ 1/2 Note 1.	Package Outline
			Min.	Typ.		
3750	T-1 3/4	HER	80	125	24°	A
3850		Yellow	80	140	24°	A
3950		Green	80	120	24°	A
3390	T-1 3/4 Low Profile	HER	35	55	32°	B
3490		Yellow	35	55	32°	B
3590		Green	35	55	32°	B
1340	T-1	HER	24	45	45°	C
1440		Yellow	24	45	45°	C
1540		Green	24	45	45°	C

**NOTE:**

1. θ1/2 is the typical off-axis angle at which the luminous intensity is half the axial luminous intensity.

# Package Dimensions

**PACKAGE OUTLINE "A"**  
HLMP-3750, 3850, 3950

**PACKAGE OUTLINE "B"**  
HLMP-3390, 3490, 3590

**PACKAGE OUTLINE "C"**  
HLMP-1340, 1440, 1540

**NOTES:**

1. All dimensions are in millimeters (inches).
2. An epoxy meniscus may extend about 1 mm (0.40") down the leads.

## Absolute Maximum Ratings at $T_A = 25^\circ\text{C}$

Parameter	Red	Yellow	Green	Units
Peak Forward Current	90	60	90	mA
Average Forward Current <sup>[1]</sup>	25	20	25	mA
DC Current <sup>[2]</sup>	30	20	30	mA
Power Dissipation <sup>[3]</sup>	135	85	135	mW
Transient Forward Current <sup>[4]</sup> (10 $\mu\text{sec}$ pulse)	500	500	500	mA
Reverse Voltage ( $I_R = 100 \mu\text{A}$ )	5	5	5	V
Operating Temperature Range	-55 to +100	-55 to +100	-20 to +100	$^\circ\text{C}$
Storage Temperature Range			-55 to +100	
Lead Soldering Temperature [1.6 mm (0.063 in.) from body]	260 $^\circ\text{C}$ for 5 seconds			

**NOTES:**

1. See Figure 2 to establish pulsed operating conditions.
2. For Red and Green series derate linearly from 50 $^\circ\text{C}$  at 0.5 mA/ $^\circ\text{C}$ . For Yellow series derate linearly from 50 $^\circ\text{C}$  at 0.2 mA/ $^\circ\text{C}$ .
3. For Red and Green series derate power linearly from 25 $^\circ\text{C}$  at 1.8 mW/ $^\circ\text{C}$ . For Yellow series derate power linearly from 50 $^\circ\text{C}$  at 1.6 mW/ $^\circ\text{C}$ .
4. The transient peak current is the maximum non-recurring peak current that can be applied to the device without damaging the LED die and wirebond. It is not recommended that the device be operated at peak currents beyond the peak forward current listed in the Absolute Maximum Ratings.

SOLID STATE LAMPS

# Electrical/Optical Characteristics at $T_A = 25^\circ\text{C}$

## T-1 3/4 (5 mm) HIGH INTENSITY SOLID STATE LAMPS

HIGH EFFICIENCY RED • HLMP-331X SERIES

YELLOW • HLMP-341X SERIES

HIGH PERFORMANCE GREEN • HLMP-351X SERIES

### Features

- HIGH INTENSITY
- CHOICE OF 3 BRIGHT COLORS  
High Efficiency Red  
Yellow  
High Performance Green
- POPULAR T-1 3/4 DIAMETER PACKAGE
- SELECTED MINIMUM INTENSITIES
- NARROW VIEWING ANGLE
- GENERAL PURPOSE LEADS
- RELIABLE AND RUGGED
- AVAILABLE ON TAPE AND REEL

### Package Dimensions

### Description

This family of T-1 3/4 lamps is specially designed for applications requiring higher on-axis intensity than is achievable with a standard lamp. The light generated is focused to a narrow beam to achieve this effect.

Part Number HLMP-	Description	Minimum Intensity (mcd) at 10 mA	Color (Material)
3315	Illuminator/Point Source	12	High Efficiency Red (GaAsP on GaP)
3316	Illuminator/High Brightness	20	
3415	Illuminator/Point Source	10	Yellow (GaAsP on GaP)
3416	Illuminator/High Brightness	20	
3517	Illuminator/Point Source	6.7	Green (GaP)
3519	Illuminator/High Brightness	10.6	

NOTES:  
1. ALL DIMENSIONS ARE IN MILLIMETRES (INCHES).  
2. AN EPOXY MENISCUS MAY EXTEND ABOUT 1mm (.040") DOWN THE LEADS.

## Electrical Characteristics at $T_A = 25^\circ\text{C}$

Symbol	Description	Device HLMP-	Min.	Typ.	Max.	Units	Test Conditions
$I_V$	Luminous Intensity	3315	12.0	40.0		mcd	$I_F = 10\text{ mA}$ (Figure 3)
		3316	20.0	60.0

$\eta_V$	Luminous Efficacy	331X		145		lumens Watt	See Note 3
		341X		500			
		351X		595			

- NOTES:**
- $\theta_{1/2}$  is the off-axis angle at which the luminous intensity is half the axial luminous intensity.
  - The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and represents the single wavelength which defines the color of the device.
  - Radiant intensity,  $I_e$ , in watts/steradian, may be found from the equation  $I_e = I_V/\eta_V$ , where  $I_V$  is the luminous intensity in candelas and  $\eta_V$  is the luminous efficacy in lumens/watt.

## Absolute Maximum Ratings at $T_A = 25^\circ\text{C}$

Parameter	331X Series	341X Series	351X Series	Units
Peak Forward Current	90	60	90	mA
Average Forward Current <sup>1)</sup>	25	20	25	mA
DC Current <sup>2)</sup>	30	20	30	mA
Power Dissipation <sup>3)</sup>	135	85	135	mW
Reverse Voltage ( $I_R = 100\ \mu\text{A}$ )	5	5	5	V
Transient Forward Current <sup>4)</sup> (10 $\mu\text{sec}$ Pulse)	500	500	500	mA
Operating Temperature Range	-55 to +100	-55 to +100	-20 to +100	$^\circ\text{C}$
Storage Temperature Range			-55 to +100	
Lead Soldering Temperature [1.6 mm (0.063 in.) from body]	260 $^\circ\text{C}$ for 5 seconds			

**NOTES:**

1. See Figure 5 (Red), 10 (Yellow), or 15 (Green) to establish pulsed operating conditions.
2. For Red and Green series derate linearly from 50°C at 0.5 mA/°C. For Yellow series derate linearly from 50°C at 0.2 mA/°C.
3. For Red and Green series derate power linearly from 25°C at 1.8 mW/°C. For Yellow series derate power linearly from 50°C at 1.6 mW/°C.
4. The transient peak current is the maximum non-recurring peak current that can be applied to the device without damaging the LED die and wirebond. It is not recommended that the device be operated at peak currents beyond the peak forward current listed in the Absolute Maximum Ratings.

HIGH EFFICIENCY RED ● HLMP-3300 SERIES  
ORANGE ● HLMP-D400 SERIES  
YELLOW ● HLMP-3400 SERIES  
HIGH PERFORMANCE GREEN ● HLMP-3500 SERIES

### Features

- HIGH INTENSITY
- CHOICE OF 4 BRIGHT COLORS  
High Efficiency Red  
Orange  
Yellow  
High Performance Green
- POPULAR T-1 $\frac{3}{4}$  DIAMETER PACKAGE
- SELECTED MINIMUM INTENSITIES
- WIDE VIEWING ANGLE
- GENERAL PURPOSE LEADS
- RELIABLE AND RUGGED
- AVAILABLE ON TAPE AND REEL

### Description

This family of T-1 $\frac{3}{4}$  lamps is widely used in general purpose indicator applications. Diffusants, tints, and optical design are balanced to yield superior light output and wide viewing angles. Several intensity choices are available in each color for increased design flexibility.

### Package Dimensions

NOTES:  
1. ALL DIMENSIONS ARE IN MILLIMETRES (INCHES).  
2. AN EPOXY MENISCUS MAY EXTEND ABOUT 1mm (.040") DOWN THE LEADS.

Part Number HLMP-	Application	Minimum Intensity (mcd) at 10mA	Color (Material)
3300	General Purpose	2.1	High Efficiency Red (GaAsP on GaP)
3301	High Ambient	4.0	
3762	Premium Lamp	8.0	
D400	General Purpose	2.1	Orange (GaAsP on GaP)
D401	High Ambient	4.0	
3400	General Purpose	2.2	Yellow (GaAsP on GaP)
3401	High Ambient	4.0	
3862	Premium Lamp	8.0	
3502	General Purpose	1.6	Green (GaP) 565 nm
3507	High Ambient	4.2	
3962	Premium Lamp	8.0

$\eta_V$	Luminous Efficacy	High Efficiency Red Orange Yellow Green		145 380 500 595		$\frac{\text{lumens}}{\text{Watt}}$	See Note 3

## NOTES:

- $\theta_{1/2}$  is the off-axis angle at which the luminous intensity is half the axial luminous intensity.
- The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and represents the single wavelength which defines the color of the device.
- Radiant intensity,  $I_e$ , in watts/steradian, may be found from the equation  $I_e = I_V/\eta_V$ , where  $I_V$  is the luminous intensity in candelas and  $\eta_V$  is the luminous efficacy in lumens/watt.

# Absolute Maximum Ratings at $T_A = 25^\circ\text{C}$

Parameter	HER/Orange	Yellow	Green	Units
Peak Forward Current	90	60	90	mA
Average Forward Current <sup>[1]</sup>	25	20	25	mA
DC Current <sup>[2]</sup>	30	20	30	mA
Power Dissipation <sup>[3]</sup>	135	85	135	mW
Reverse Voltage ( $I_R = 100 \mu\text{A}$ )	5	5	5	V
Transient Forward Current <sup>[4]</sup> (10 $\mu\text{sec}$ Pulse)	500	500	500	mA
Operating Temperature Range	-55 to +100	-55 to +100	-20 to +100	$^\circ\text{C}$
Storage Temperature Range			-55 to +100	
Lead Soldering Temperature [1.6 mm (0.063 in.) from body]	260 $^\circ\text{C}$ for 5 seconds			

## NOTES:

- See Figure 5 (Red/Orange), 10 (Yellow) or 15 (Green) to establish pulsed operating conditions.
- For Red, Orange, and Green series derate linearly from 50 $^\circ\text{C}$  at 0.5 mA/ $^\circ\text{C}$ . For Yellow series derate linearly from 50 $^\circ\text{C}$  at 0.2 mA/ $^\circ\text{C}$ . For Red, Orange, and Green series derate power linearly from 25 $^\circ\text{C}$  at 1.8 mW/ $^\circ\text{C}$ . For Yellow series derate power linearly from 50 $^\circ\text{C}$  at 1.6 mW/ $^\circ\text{C}$ .
- The transient peak current is the maximum non-recurring peak current that can be applied to the device without damaging the LED die and wirebond. It is not recommended that the device be operated at peak currents beyond the peak forward current listed in the Absolute Maximum Ratings.

## Description

The HLMP-3200 Series are Gallium Arsenide Phosphide Red Light Emitting Diodes with a red diffused lens.

The HLMP-3350 Series are Gallium Arsenide Phosphide on Gallium Phosphide High Efficiency Red Light Emitting Diodes.

The HLMP-3450 Series are Gallium Arsenide Phosphide on Gallium Phosphide Yellow Light Emitting Diodes.

The HLMP-3550 Series are Gallium Phosphide Green Light Emitting Diodes.

The Low Profile T-1 $\frac{3}{4}$  package provides space savings and is excellent for backlighting applications.

SOLID STATE LAMPS

## Features

- LOW COST, BROAD APPLICATIONS
- LONG LIFE, SOLID STATE RELIABILITY
- LOW POWER REQUIREMENTS: 20 mA @ 1.6V
- HIGH LIGHT OUTPUT:  
2.0 mcd Typical for HLMP-3000  
4.0 mcd Typical for HLMP-3001
- WIDE AND NARROW VIEWING ANGLE TYPES
- RED DIFFUSED AND NON-DIFFUSED VERSIONS

## Description

The HLMP-3000 series lamps are Gallium Arsenide Phosphide light emitting diodes intended for High Volume/ Low Cost applications such as indicators for appliances, smoke detectors, automobile instrument panels and many other commercial uses.

The HLMP-3000/-3001/-3002/-3003 have red diffused lenses where as the HLMP-3050 has a red non-diffused lens. These lamps can be panel mounted using mounting clip HLMP-0103. The HLMP-3000/-3001 lamps have .025" leads and the HLMP-3002/-3003/-3050 have .018" leads.

### NOTES:

1. The transient peak current is the maximum non-recurring peak current that can be applied to the device without damaging the LED die and wirebond. It is not recommended that the device be operated at peak currents beyond the peak forward current listed in the Absolute Maximum Ratings.

## Absolute Maximum Ratings at T<sub>A</sub> = 25° C

Parameter	3000 Series	Units
Power Dissipation	100	mW
DC Forward Current (Derate linearly from 50° C at 0.2 mA/° C)	50	mA
Average Forward Current	50	mA
Peak Operating Forward Current	1000	mA
Reverse Voltage (I <sub>R</sub> = 100 μA)	5	V
Transient Forward Current <sup>1)</sup> (10 μsec Pulse)	2000	mA
Operating and Storage Temperature Range	-55° C to +100° C	
Lead Solder Temperature (1.6 mm [0.063 inch] below package base)	260° C for 5 seconds

### Package Dimensions

### Description

This family of T-1 lamps is specially designed for applications requiring higher on-axis intensity than is achievable with a standard lamp. The light generated is focused to a narrow beam to achieve this effect.

Part Number HLMP-	Description	Minimum Intensity (mcd) at 10 mA	Color (Material)
1320	Untinted Non-Diffused	8.6	High Efficiency Red (GaAsP on GaP)
1321	Tinted Non-Diffused	8.6	
1420	Untinted Non-Diffused	9.2	Yellow (GaAsP on GaP)

$\eta_V$	Luminous Efficacy	132X 142X 152X		145 500 595		$\frac{\text{lumens}}{\text{Watt}}$	See Note 3

### Notes:

- $\theta_{1/2}$  is the off-axis angle at which the luminous intensity is half the axial luminous intensity.
- The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and represents the single wavelength which defines the color of the device.

- Radiant intensity,  $I_e$ , in watts/steradian, may be found from the equation  $I_e = I_V/\eta_V$ , where  $I_V$  is the luminous intensity in candelas and  $\eta_V$  is the luminous efficacy in lumens/watt.

## Absolute Maximum Ratings at $T_A = 25^\circ\text{C}$

Parameter	Red	Yellow	Green	Units
Peak Forward Current	90	60	90	mA
Average Forward Current <sup>[1]</sup>	25	20	25	mA
DC Current <sup>[2]</sup>	30	20	30	mA
Power Dissipation <sup>[3]</sup>	135	85	135	mW
Reverse Voltage ( $I_R = 100\ \mu\text{A}$ )	5	5	5	V
Transient Forward Current <sup>[4]</sup> (10 $\mu\text{sec}$ Pulse)	500	500	500	mA
Operating Temperature Range	-55 to +100	-55 to +100	-20 to +100	$^\circ\text{C}$
Storage Temperature Range			-55 to +100	
Lead Soldering Temperature [1.6 mm (0.063 in.) from body]	260 $^\circ\text{C}$ for 5 seconds			

**NOTES:**

1. See Figure 5 (Red), 10 (Yellow), or 15 (Green) to establish pulsed operating conditions.
2. For Red and Green series derate linearly from 50°C at 0.5 mA/°C. For Yellow series derate linearly from 50°C at 0.2 mA/°C.
3. For Red and Green series derate power linearly from 25°C at 1.8 mW/°C. For Yellow series derate power linearly from 50°C at 1.6 mW/°C.
4. The transient peak current is the maximum non-recurring peak current that can be applied to the device without damaging the LED die and wirebond. It is not recommended that the device be operated at peak currents beyond the peak forward current listed in the Absolute Maximum Ratings.

## T-1 (3mm) DIFFUSED SOLID STATE LAMPS

HIGH EFFICIENCY RED ● HLMP-1300 SERIES  
ORANGE ● HLMP-K400 SERIES  
YELLOW ● HLMP-1400 SERIES  
HIGH PERFORMANCE GREEN ● HLMP-1500 SERIES

### Features

- HIGH INTENSITY
- CHOICE OF 4 BRIGHT COLORS  
High Efficiency Red  
Orange  
Yellow  
High Performance Green
- POPULAR T-1 DIAMETER PACKAGE
- SELECTED MINIMUM INTENSITIES
- WIDE VIEWING ANGLE
- GENERAL PURPOSE LEADS
- RELIABLE AND RUGGED
- AVAILABLE ON TAPE AND REEL

### Description

This family of T-1 lamps is widely used in general purpose indicator applications. Diffusants, tints, and optical design are balanced to yield superior light output and wide viewing angles. Several intensity choices are available in each color for increased design flexibility.

### Package Dimensions

NOTES:  
1. ALL DIMENSIONS ARE IN MILLIMETRES (INCHES).  
2. AN EPOXY MENISCUS MAY EXTEND ABOUT 1mm (0.040") DOWN THE LEADS.

## Description

The HLMP-1000 is a series of Gallium Arsenide Phosphide Light Emitting Diodes designed for applications where space is at a premium, such as in high density arrays.

The HLMP-1000 series is available in three lens configurations.

HLMP-1000 — Red Diffused lens provides excellent on-off contrast ratio, high axial luminous intensity, and wide viewing angle.

HLMP-1080 — Same as HLMP-1000, but untinted diffused to mask red color in the "off" condition.

HLMP-1071/-1201 — Untinted non-diffused plastic lens provides a point source. Useful when illuminating external lens, annunciators, or photo-detectors.

## Technical Data

**HLMP-R100**  
**HLMP-0300/0301**  
**HLMP-0400/0401**  
**HLMP-0503/0504**

### Features

- **Rectangular Light Emitting Surface**
- **Flat High Sterance Emitting Surface**
- **Stackable on 2.54 mm (0.100 inch) Centers**
- **Ideal as Flush Mounted Panel Indicators**
- **Ideal for Backlighting Legends**
- **Long Life: Solid State Reliability**
- **Choice of 4 Bright Colors**
  - DH AS AlGaAs Red
  - High Efficiency Red
  - Yellow
  - High Performance Green
- **IC Compatible/Low Current Requirements**

The HLMP-R100 uses a double heterojunction (DH) absorbing substrate (AS) aluminum gallium arsenide (AlGaAs) red LED chip in a light red epoxy package. This combination produces outstanding light output over a wide range of drive currents.

The HLMP-0300 and -0301 have a high efficiency red GaAsP on GaP LED chip in a light red epoxy package.

The HLMP-0400 and -0401 provide a yellow GaAsP on GaP LED chip in a yellow epoxy package.

The HLMP-0503 and -0504 provide a green GaP LED chip in a green epoxy package.

### Description

The HLMP-R100, -030X, -040X, -050X are solid state lamps encapsulated in a radial lead rectangular epoxy package. They utilize a tinted, diffused epoxy to provide high on-off contrast and a flat high intensity emitting surface. Borderless package design allows creation of uninterrupted light emitting areas.

### Package Dimensions

#### NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETRES (INCHES).
2. AN EPOXY MENISCUS MAY EXTEND ABOUT 1 mm (0.040") DOWN THE LEADS.
3. THERE IS A MAXIMUM 1° TAPER FROM BASE TO TOP OF LAMP.

SOLID STATE LAMPS

### Axial Luminous Intensity

Color	Part Number	$I_v$ (mcd) @ 20 mA DC

SOLID STATE LAMPS

### Features

- Rectangular Light Emitting Surface
- Excellent for Flush Mounting on Panels
- Choice of Five Bright Colors
- Long Life: Solid State Reliability
- Excellent Uniformity of Light Output

### Description

The HLMP-S100, -S200, -S300, -S400, -S500 are epoxy encapsulated lamps in rectangular packages which are easily stacked in arrays or used for discrete front panel indicators. Contrast and light uniformity are enhanced by a special epoxy diffusion and tinting process.

The HLMP-S100 uses double heterojunction (DH) absorbing substrate (AS) aluminum gallium arsenide (AlGaAs) LEDs to produce outstanding light output over a wide range of drive currents.

### Package Dimensions

- NOTES:
1. ALL DIMENSIONS ARE IN MILLIMETRES (INCHES).
  2. AN EPOXY MENISCUS MAY EXTEND ABOUT 1 mm (0.040") DOWN THE LEADS.
  3. THERE IS A MAXIMUM 1° TAPER FROM BASE TO THE TOP OF LAMP.

1.  $\theta_{1/2}$  is the off-axis angle at which the luminous intensity is half the axial luminous intensity.
2. The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and represents the single wavelength which defines the color of the device.
3. Radiant intensity,  $I_r$ , in watts/steradian, may be found from the equation  $I_r = I_V/\eta_V$ , where  $I_V$  is the luminous intensity in candelas and  $\eta_V$  is the luminous efficacy in lumens/watt.

### Absolute Maximum Ratings at $T_A = 25^\circ\text{C}$

Parameter	AlGaAs Red	High Efficiency Red/Orange	Yellow	Green	Units
Peak Forward Current	300	90	60	90	mA
Average Forward Current <sup>[1]</sup>	20	25	20	25	mA
DC Current <sup>[2]</sup>	30	30	20	30	mA
Power Dissipation	87	135	85	135	mW
Transient Forward Current <sup>[3]</sup> (10 $\mu\text{sec}$ Pulse)	500				mA
Operating Temperature Range	-20 to +100	-55 to +100	-55 to +100	-20 to +100	$^\circ\text{C}$
Storage Temperature Range	-55 to +100			-55 to +100	
Lead Soldering Temperature [1.6 mm (0.063 in.) below seating plane]	260 $^\circ\text{C}$ for 5 seconds				

**Notes:**

- See Figure 5 to establish pulsed operating conditions.
- For AlGaAs Red, Red, Orange, and Green series derate linearly from 50 $^\circ\text{C}$  at 0.5 mA/ $^\circ\text{C}$ . For Yellow series derate linearly from 50 $^\circ\text{C}$  at 0.34 mA/ $^\circ\text{C}$ .
- The transient peak current is the maximum non-recurring peak current that can be applied to the device without damaging the LED die and wire bond. It is not recommended that the device be operated at peak currents beyond the peak forward current listed in the Absolute Maximum Ratings.

SOLID STATE LAMPS

### Features

- **Subminiature Flat Top Package**  
Ideal for Backlighting and Light Piping Applications
- **Subminiature Dome Package**  
Diffused Dome for Wide Viewing Angle  
Nondiffused Dome for High Brightness
- **Arrays**
- **TTL and LSTTL Compatible 5 Volt Resistor Lamps**
- **Available in Six Colors**
- **Ideal for Space Limited Applications**
- **Axial Leads**
- **Available with Lead Configurations for Surface Mount and Through Hole PC Board Mounting**

### Description

#### Flat Top Package

The HLMP-PXXX Series flat top lamps use an untinted, non-diffused, truncated lens to provide a wide radiation pattern that is necessary for use in backlighting applications. The flat top lamps are also ideal for use as emitters in light pipe applications.

#### Dome Packages

The HLMP-6XXX Series dome lamps for use as indicators use a tinted, diffused lens to provide a wide viewing angle with a high on-off contrast ratio. High brightness lamps use an untinted, nondiffused lens to provide a high luminous intensity within a narrow radiation pattern.

#### Arrays

The HLMP-66XX Series subminiature lamp arrays are available in lengths of 3 to 8 elements per array. The luminous intensity is matched within an array to assure a 2.1 to 1.0 ratio.

#### Resistor Lamps

The HLMP-6XXX Series 5 volt subminiature lamps with built in current limiting resistors are for use in applications where space is at a premium.

#### Lead Configurations

All of these devices are made by encapsulating LED chips on axial lead frames to form molded epoxy subminiature lamp packages. A variety of package configuration options is available. These include special sur-

face mount lead configurations, gull wing, yoke lead or Z-bend. Right angle lead bends at 2.54 mm (0.100 inch) and 5.08 mm (0.200 inch) center spacing are available for through hole mounting.

**Device Selection Guide**

**Package Configuration Options**

Option Code	Package Configuration Description				Package Outline Drawing
011	Gull Wing Lead, Tape and Reel <sup>[2]</sup>				Surface Mount Lead Configurations
012	Gull Wing Lead, Bulk Packaging <sup>[3]</sup>				
013	Gull Wing Lead, Arrays, Shipping Tube				
021	Yoke Lead, Tape and Reel <sup>[2]</sup>				
022	Yoke Lead, Bulk Packaging <sup>[3]</sup>				
031	Z-Bend, Tape and Reel <sup>[2]</sup>				
032	Z-Bend, Bulk Packaging <sup>[3]</sup>				
1L1	2.54 mm (0.100 inch) Center Lead Spacing	Long Leads; 10.4 mm (0.410 in.)			H
1S1		Short Leads; 3.7 mm (0.145 in.)			I
2L1	5.08 mm (0.200 inch) Center Lead Spacing	Long Leads; 9.2 mm (0.364 in.)			J
2S1		Short Leads; 3.7 mm (0.145 in.)			K

**Notes:**

- Diffused lamps have tinted lenses. Nondiffused lamps have untinted lenses.
- Lamps are supplied in 12 mm embossed tape on 178 mm (7 inch) diameter reels, with 1500 lamps per reel. Minimum order quantity and order increment are in quantity of reels only.
- Vapor barrier bags are used for bulk packaging.

# Package Dimensions

## (A) Flat Top Lamps

SOLID STATE LAMPS

### NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETRES (INCHES).
2. PROTRUDING SUPPORT TAB IS CONNECTED TO CATHODE LEAD.

## (B) Diffused and Nondiffused

### NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETRES (INCHES).
2. PROTRUDING SUPPORT TAB IS CONNECTED TO CATHODE LEAD.

**(C) Arrays**

**NOTES:**

1. ALL DIMENSIONS ARE IN MILLIMETRES (INCHES).
2. OVERALL LENGTH IS THE NUMBER OF ELEMENTS TIMES 2.54 mm (0.100 IN.).
3. PROTRUDING SUPPORT TAB IS CONNECTED TO CATHODE LEAD.

**Package Dimensions, Lead Bend Options**

**(D) Individual Lamp, Gull Wing Lead, Option 011 and 012**

### Absolute Maximum Ratings at $T_A = 25^\circ\text{C}$

Parameter	Standard Red	DH AS AlGaAs Red	High Eff. Red	Orange	Yellow	High Perf. Green	Units
Power Dissipation	100	87	135	135	85	135	mW
DC Forward Current <sup>[1]</sup>	50	30	30	30	20	30	mA
Peak Forward Current <sup>[2]</sup>	1000	300	90	90	60	90	mA
DC Forward Voltage (Resistor Lamps Only)			6		6	6	V
Reverse Voltage ( $I_R = 100 \mu\text{A}$ )	5	5	5	5	5	5	V
Transient Forward Current <sup>[3]</sup> (10 $\mu\text{s}$ Pulse)	2000	500	500	500	500	500	mA
Operating Temperature Range: Non-Resistor Lamps	-55 to +100	-20 to +100	-55 to +100			-20 to +100	°C
Resistor Lamps			-40 to +85			-20 to +85	
Storage Temperature Range	-55 to +100						°C
Wave Soldering Temperature [1.6 mm (0.063 in.) from body]	260°C for 3 Seconds						
Surface Mount Reflow Soldering: Convective IR	235°C for 90 Seconds						
Vapor Phase	215°C for 3 Minutes						

#### Notes:

1. See Figure 5 for current derating vs. ambient temperature. Derating is not applicable to resistor lamps.
2. Refer to Figure 6 showing Max. Tolerable Peak Current vs. Pulse Duration to establish pulsed operating conditions.
3. The transient peak current is the maximum non-recurring peak current the device can withstand without failure. Do not operate these lamps at this high current.

## Notes:

- The luminous intensity for arrays is tested to assure a 2.1 to 1.0 matching between elements. The average luminous intensity for an array determines its light output category bin. Arrays are binned for luminous intensity to allow  $I_v$  matching between arrays.
- $\theta_{1/2}$  is the off-axis angle where the luminous intensity is half the on-axis value.
- Dominant wavelength,  $\lambda_d$ , is derived from the CIE Chromaticity Diagram and represents the single wavelength that defines the color of the device.
- Radiant intensity,  $I_r$ , in watts/steradian, may be calculated from the equation  $I_r = I_v/\eta_v$ , where  $I_v$  is the luminous intensity in candelas and  $\eta_v$  is the luminous efficacy in lumens/watt.

## Technical Data

**HLMP-4000 T-1 3/4 (5 mm)**  
**HLMP-0800 2 mm x 5 mm**  
**Rectangular**

### Features:

- Two Color (Red, Green) Operation
- (Other Two LED Color Combinations Available)
- Three Leads with One Common Cathode
- Diffused, Wide Visibility Lens

HER and Green can be generated by independently pulse width modulating the LED chips.

Note: Other possible LED combinations available are AlGaAs, orange, yellow.

### Package Dimensions

**HLMP-4000**

**HLMP-0800**

- NOTES:  
1. ALL DIMENSIONS ARE IN MILLIMETRES (INCHES).  
2. AN EPOXY MENISCUS MAY EXTEND ABOUT 1 mm (0.040") DOWN THE LEADS.

### Description

The T-1 3/4 HLMP-4000 and 2 mm by 5 mm rectangular HLMP-0800 are three leaded bicolor light sources designed for a variety of applications where dual state illumination is required in the same package. There are two LED chips, high efficiency red (HER), and high performance green (Green), mounted on a central common cathode lead for maximum on-axis viewability. Colors between

### Absolute Maximum Ratings at $T_A = 25^\circ\text{C}$

Parameter	High Efficiency Red/Green	Units
Peak Forward Current	90	mA
Average Forward Current <sup>[1,2]</sup> (Total)	25	mA
DC Current <sup>[2,4]</sup> (Total)	30	mA
Power Dissipation <sup>[3,5]</sup> (Total)	135	mW
Operating Temperature Range	-20 to +85	°C
Storage Temperature Range	-55 to +100	
Reverse Voltage ( $I_R = 100 \mu\text{A}$ )	5	V
Transient Forward Current <sup>[6]</sup> (10 $\mu\text{sec}$ Pulse)	500	mA
Lead Soldering Temperature [1.6 mm (0.063 in.) below seating plane]	260°C for 5 seconds	

**Notes:**

1. See Figure 5 to establish pulsed operating conditions.
2. The combined simultaneous current must not exceed the maximum.
3. The combined simultaneous power must not exceed the maximum.
4. For HER and Green derate linearly from 50°C at 0.5 mA/°C.
5. For HER and Green derate linearly from 25°C at 1.8 mW/°C.
6. The transient peak current is the maximum non-recurring current that can be applied to the device without damaging the LED die and wirebond. It is not recommended that the device be operated at peak currents beyond the peak forward current listed in the Absolute Maximum Ratings.

### Electrical/Optical Characteristics at $T_A = 25^\circ\text{C}$

Sym.	Parameter	Red			Green			Units	Test Conditions	
		Min.	Typ.	Max.	Min.	Typ.	Max.			
$I_V$	Luminous Intensity HLMP-4000	2.1	5		4.2	8		mcd	$I_F = 10\text{ mA}$	
	HLMP-0800	2.1	3.5		2.6	4.0			$I_F = 20\text{ mA}$	
$\lambda_{PEAK}$	Peak Wavelength		635			565		nm		
$\lambda_d$	Dominant Wavelength <sup>[1]</sup>		626			569				
$\tau_s$	Speed of Response		90			500		ns		
C	Capacitance		11			18		pF	$V_F = 0, f = 1\text{ MHz}$	
$V_F$	Forward Voltage		2.1	2.5		2.3	2.7	V	$I_F = 10\text{ mA}$	
$V_R$	Reverse Breakdown Voltage	5			5			V	$I_R = 100\ \mu\text{A}$	
$\theta_{JC}$	Thermal Resistance		120		120			$^\circ\text{C/W}$	Junction to Cathode Lead	
$2\theta_{1/2}$	Included Angle Between Half Luminous Intensity Points <sup>[2]</sup>							Deg.		
	HLMP-4000		65			65				$I_F = 10\text{ mA}$
	HLMP-0800		100			100				$I_F = 20\text{ mA}$
$\eta_V$	Luminous Efficacy <sup>[3]</sup>		145			595		Lumen/Watt		

**Notes:**

1. The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and represents the single wavelength which defines the color of the device.
2.  $\theta_{1/2}$  is the off-axis angle at which the luminous intensity is half the axial luminous intensity.
3. Radiant intensity,  $I_s$ , in watts steradian, may be found from the equation  $I_s = I_V/\eta_V$ , where  $I_V$  is the luminous intensity in candelas and  $\eta_V$  is the luminous efficacy in lumens/watt.

## INTEGRATED RESISTOR LAMPS 5 Volt and 12 Volt in T-1 and T-1 3/4 Packages

### Features

- **INTEGRAL CURRENT LIMITING RESISTOR**
- **TTL COMPATIBLE**  
Requires no External Current Limiter with 5 Volt/12 Volt Supply
- **COST EFFECTIVE**  
Saves Space and Resistor Cost
- **WIDE VIEWING ANGLE**
- **AVAILABLE IN ALL COLORS**  
Red, High Efficiency Red, Yellow and High Performance Green in T-1 and T-1 3/4 Packages

SOLID STATE LAMPS

### Description

The 5 volt and 12 volt series lamps contain an integral current limiting resistor in series with the LED. This allows the lamp to be driven from a 5 volt/12 volt source without an external current limiter. The red LEDs are made from GaAsP on a GaAs substrate. The High Efficiency Red and Yellow devices use GaAsP on a GaP substrate.

The green devices use GaP on a GaP substrate. The diffused lamps provide a wide off-axis viewing angle.

The T-1 3/4 lamps are provided with sturdy leads suitable for wire wrap applications. The T-1 3/4 lamps may be front panel mounted by using the HLMP-0103 clip and ring.

## TAPE AND REEL SOLID STATE LAMPS

Leads: 5 mm (0.197 inch) Formed Leads — OPTION 001  
2.54 mm (0.100 inch) Straight Leads — OPTION 002

### Features

- COMPATIBLE WITH RADIAL LEAD AUTOMATIC INSERTION EQUIPMENT
- MEETS DIMENSIONAL SPECIFICATIONS OF IEC PUBLICATION 286 AND ANSI/EIA STANDARD RS-468 FOR TAPE AND REEL
- REEL PACKAGING SIMPLIFIES HANDLING AND TESTING
- T-1 AND T-1 3/4 LED LAMPS AVAILABLE PACKAGED ON TAPE AND REEL
- 5 mm (0.197 INCH) FORMED LEAD AND 2.54 mm (0.100 INCH) STRAIGHT LEAD SPACING AVAILABLE

### Description

T-1 and T-1 3/4 LED lamps are available on tape and reel as specified by the IEC Publication 286 and ANSI/EIA Standard RS-468. The Option 001 lamp devices have formed leads with 5 mm (0.197 inch) spacing for automatic insertion into PC boards by radial lead insertion equipment. The Option 002 lamp devices have straight leads with 2.54 mm (0.100 inch) spacing, packaged on tape and reel for ease of handling. T-1 lamps are packaged 1800/reel. T-1 3/4 lamps are packaged 1300/reel.

### Ordering Information

To order LED lamps packaged on tape and reel, include the appropriate option code along with the device catalog part number. Example: to order the HLMP-3300 on tape and reel with formed leads (5 mm lead spacing) order as follows: HLMP-3300 Option 001. Minimum order quantities vary by part number. Orders must be placed in reel increments. Please contact your local Hewlett-Packard sales office or franchised Hewlett-Packard distributor for a complete list of lamps available on tape and reel.

LED lamps with 0.46 mm (0.018 inch) square leads with 5 mm (0.197 inch) lead spacing are recommended for use with automatic insertion equipment. It is suggested that insertion machine compatibility be confirmed.

### Device Selection Guide

Option	Description
001	Tape and reel, 5 mm (0.197 inch) formed leads.
002	Tape and reel, 2.54 mm (0.100 inch) straight leads.

Package	Quantity/Reel	Order Increments
T-1	1800	1800
T-1 3/4	1300	1300

### Absolute Maximum Ratings and Electrical/Optical Characteristics

The absolute maximum ratings, mechanical dimension tolerances and electrical/optical characteristics for lamps packaged on tape and reel are identical to the basic catalog device. Refer to the basic data sheet for the specified values.

#### Notes:

1. Minimum leader length at either end of tape is 3 blank part spaces.
2. Silver saver paper is used as the interlayer for silver plated lead devices.
3. The maximum number of consecutive missing lamps is 3.
4. In accordance with EIA and IEC specs, the anode lead leaves the reel first.
5. Drawings apply to devices with 0.46 mm (0.018 inch) square leads only. Contact Hewlett-Packard Sales Office for dimensions of 0.635 mm (0.025 inch) square lead devices.

# T-1 3/4 (5mm) LED RIGHT ANGLE INDICATORS

OPTION - 010  
OPTION - 100

## Features

- IDEAL FOR CARD EDGE STATUS INDICATION
- PACKAGE DESIGN ALLOWS FLUSH SEATING ON A PC BOARD
- MAY BE SIDE STACKED ON 6.35 mm (0.25") CENTERS
- LEDs AVAILABLE IN FOUR COLORS, WITH OR WITHOUT INTEGRATED CURRENT LIMITING RESISTOR IN T-1 3/4 TINTED DIFFUSED PACKAGES
- ADDITIONAL CATALOG LAMPS AVAILABLE AS OPTIONS

SOLID STATE LAMPS

## Description

The T-1 3/4 Option 010 and 100 series of Right Angle Indicators are industry standard status indicators that incorporate a tinted diffused T-1 3/4 LED lamp in a black plastic housing. The indicators are available in standard Red, High Efficiency Red, Yellow, or High Performance

Green with or without an integrated current limiting resistor. These products are designed to be used as back panel diagnostic indicators and card edge logic status indicators.

## Package Dimensions

OPTION NO.	CATHODE LEAD LENGTH	ANODE LEAD LENGTH	
#010	4.70 (0.185) 3.68 (0.145)	4.70 (0.185) 3.68 (0.145)	SHEARED EVEN LEADS
#100	20.32 (0.800) MIN.	1.27 (0.050) NOM. LONGER THAN CATHODE	UNSHEARED UNEVEN LEADS

- NOTES:  
1. ALL DIMENSIONS ARE IN MILLIMETRES (INCHES).  
2. LEAD WIDTH MAY BE 0.45 (0.018) OR 0.64 (0.025) SQUARE NOMINAL DEPENDING UPON PRODUCT TYPE.  
3. OPTION 100 IS AVAILABLE FOR LONGER LEADS.

## Ordering Information

To order T-1 3/4 high dome lamps in addition to the parts indicated above, select the base part number and add the option code 010 or 100. For example: HLMP-3750-010.

All Hewlett-Packard T-1 3/4 high-dome lamps are available in right angle housing. Contact your local Hewlett-Packard Sales Office or authorized components distributor for additional ordering information.

The Plastic right angle housing may be purchased separately as part number HLMP-5029.

## Absolute Maximum Ratings and Electrical/Optical Characteristics

The absolute maximum ratings and device characteristics are identical to those of the T-1 3/4 LED lamps. For information about these characteristics, see the data sheets of the equivalent T-1 3/4 LED lamp.

**HEWLETT  
PACKARD**

# T-1 (3mm) RIGHT ANGLE LED INDICATORS

OPTION - 010  
OPTION - 101

## Features

- IDEAL FOR CARD EDGE STATUS INDICATION
- PACKAGE DESIGN ALLOWS FLUSH SEATING ON A PC BOARD
- MAY BE SIDE STACKED ON 4.57 mm (0.18 in) CENTERS
- UP TO 8 UNITS MAY BE COUPLED FOR A HORIZONTAL ARRAY CONFIGURATION WITH A COMMON COUPLING BAR (SEE T-1 RIGHT ANGLE ARRAY DATA SHEET)
- LEDS AVAILABLE IN ALL LED COLORS, WITH OR WITHOUT INTEGRATED CURRENT LIMITING RESISTOR IN T-1 PACKAGES
- EASY FLUX REMOVAL DESIGN
- HOUSING MATERIAL MEETS UL 94V-0 RATING
- ADDITIONAL CATALOG LAMPS AVAILABLE AS OPTIONS

## Description

Hewlett-Packard T-1 Right Angle Indicators are industry standard status indicators that incorporate a tinted diffused T-1 LED lamp in a black plastic housing. The indicators are available in Standard Red, High Efficiency Red, Orange, Yellow, and High Performance Green, with or without an integrated current limiting resistor. These products are designed to be used as back panel diagnostic indicators and card edge logic status indicators.

## Ordering Information

To order other T-1 High Dome Lamps in Right Angle Housings in addition to the parts indicated above, select the base part number and add the option code 010 or 101, depending on the lead length desired (see drawing below).

## Package Dimensions

For example, by ordering HLMP-1302-010, you would receive the long lead option. By ordering HLMP-1302-101, you would receive the short lead option.

Arrays made by connecting two to eight single Right Angle Indicators with a Common Coupling Bar are available. Ordering information for arrays may be found on the T-1 Right Angle Array data sheet.

The above data sheet information is for the most commonly ordered part numbers. Refer to other T-1 base part number specifications in this catalog for other lamp types that may be ordered with the right angle option.

## Absolute Maximum Ratings and Other Electrical/Optical Characteristics

The absolute maximum ratings and typical device characteristics are identical to those of the T-1 LED lamps. For information about these characteristics, see the data sheets of the equivalent T-1 LED lamp.

OPTION NO.	CATHODE LEAD LENGTH	ANODE LEAD LENGTH	
#010	18.03 (0.710) MIN.	1.27 (0.050) NOM. LONGER THAN CATHODE	UNSHEARED UNEVEN LEADS

## T-1 (3 mm) RIGHT ANGLE ARRAYS

OPTION:

102	104	106	108
103	105	107	

### Features

- IDEAL FOR PC BOARD STATUS INDICATION
- STANDARD 4 ELEMENT CONFIGURATION
- EASY HANDLING
- EASY FLUX REMOVAL
- HOUSING MEETS UL 94V-O FLAMMABILITY SPECIFICATIONS
- OTHER CATALOG LAMPS AVAILABLE

### Description

These T-1 right angle arrays incorporate standard T-1 lamps for a good balance of viewing angle and intensity. Single units are held together by a plastic tie bar. The leads of each member of the array are spaced on 2.54 mm (0.100 in) centers. Lead spacing between adjacent lamps in the array is on 2.03 mm (0.080 in) centers. These products are designed to be used as back panel diagnostic indicators and logic status indicators on PC boards.

### Ordering Information

Use the option code 102 through 108 in addition to the base part number to order these arrays. Arrays from 2 to 8 elements in length and special lamp color combinations within an array are available. Please contact your nearest Hewlett-Packard Components representative for ordering information on these special items.

# CLIP AND RETAINING RING FOR PANEL MOUNTED T1 3/4 LEDS

OPTION 009 (HLMP-0103)

## Description

The Option 009 (HLMP-0103) is a black plastic mounting clip and retaining ring. It is designed to panel mount Hewlett-Packard Solid State high profile T-1 3/4 size lamps. This clip and ring combination is intended for installation in instrument panels from 1.52mm (.060") to 3.18mm (.125") thick. For panels greater than 3.18mm (.125") counterboring is required to the 3.18mm (.125") thickness.

## Mounting Instructions

1. Drill an ASA C size 6.15mm (.242") dia. hole in the panel. Deburr but do not chamfer the edges of the hole.
2. Press the panel clip into the hole from the front of the panel.
3. Press the LED into the clip from the back. Use blunt long nose pliers to push on the LED. Do not use force on the LED leads. A tool such as a nut driver may be used to press on the clip.

Note: Clip and retaining ring are also available for T-1 package, from a non-HP source. Please contact Interconsal Association, 2584 Wyandotte Way, Mountain View, CA for additional information.

4. Slip a plastic retaining ring onto the back of the clip and press tight using tools such as two nut drivers.

## Ordering Information

T-1 3/4 High Dome LED Lamps can be purchased to include clip and ring by adding Option Code 009 to the device catalog part number.

### Example:

To order the HLMP-3300 including clip and ring, order as follows: HLMP-3300 Option 009.

# Hermetic Lamps

# Hermetic Lamps

In addition to Hewlett-Packard commercial solid state lamps, Hewlett-Packard offers a complete line of hermetically sealed solid state lamps which are listed on MIL-S-19500 Qualified Parts List. For applications where suppression of infrared (IR) emission is essential, IR-secure indicators, which conform to the Defense Electronics Supply Center (DESC) Selected Item Drawing 87019 are also available.

Hewlett-Packard offers the following families of military grade hermetic and panel mount hermetic LED lamps, hi-

rel screened to military specifications:

- IR Secure panel mount lamps, designed and screened to meet the requirements of DESC Drawing 87019.
- JAN and JANTX hermetic and panel mount hermetic lamps, screened to the requirements of MIL-S-19500 slash sheet specifications and listed on the MIL-S-19500 Qualified Parts List (QPL).
- Ultrabright hermetic and ultrabright panel mount hermetic lamps screened to

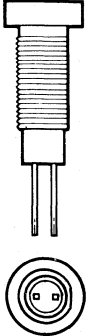

---

the JAN and JANTX requirements of MIL-S-19500.

These military grade hermetic and panel mount hermetic lamps are produced and hi-rel screened at Hewlett-Packard's DESC qualified facilities, approved to the requirements of MIL-S-19500 and MIL-STD-750.

The applicable MIL-S-19500 or DESC 87019 screening tables are detailed on each hermetic lamp data sheet.

### Description

The 87019G01 high performance green and 87019Y01 yellow front panel mountable LED indicators conform to the requirements of the DESC Selected Item Drawing 87019 and are designed for use in infrared (IR) secure lighting applications. These devices are constructed by

assembling true hermetic solid state lamps into panel mountable aluminum sleeves. They are produced on Hewlett-Packard's hermetic lamp line which has been approved and qualified by the Defense Electronics Supply Center (DESC) to the requirements of MIL-S-19500 and MIL-STD-750. An integral night vision goggle (NVG) filter mounted within the collar of each sleeve provides suppression of IR emissions.

### Lamp Selection Guide

DESC Part Number	Color	(λd)	I <sub>v</sub> (10 mA) Typ (mcd)	Typical Suppressed IR Emission
87019G01	Green	567 nm	2.0	0.3% IR (620 nm to 930 nm) <sup>(1)</sup>
87019Y01	Yellow	585 nm	2.0	0.2% IR (675 nm to 930 nm) <sup>(1)</sup>

**Note:**

1. Percent radiometric power emission between specified wavelengths as compared to the radiometric power between 350 nm and 930 nm.

### Absolute Maximum Ratings at $T_A = 25^\circ\text{C}$

Parameter	Green 87019G01	Yellow 87019Y01	Units
Power Dissipation	105	100	mW
DC Forward Current <sup>[1]</sup>	35	35	mA
Peak Forward Current	90	60	mA
Average Forward Current	30	30	mA
Operating and Storage Temperature Range	-55°C to +100°C		
Lead Soldering Temperature [1.6 mm (0.063 in.) from body]	260°C for 7 seconds		

**Note:**

1. Derate from 50°C at 0.5 mA/°C

### Package Dimensions 87019G01/87019Y01

**Notes:**

1. Glass NVG filter with a front surface antireflection coating per MIL-C-14806.
2. Collar of sleeve is black anodized per MIL-A-8625.
3. Panel mount sleeve material is aluminum alloy with conductive chromate conversion coating per MIL-C-5541.
4. Recommended panel hole diameter for mounting is 8.03/8.00 mm (0.319/0.315 inch).
5. Sealing washer, synthetic rubber, black, 60 durometer per MIL-R-6855.
6. Stainless steel flat washer per MS-15795.
7. Steel lock washer, cadmium plated, per MS-35333.
8. Aluminum alloy nut, M8x0.75-6H metric threads, with conductive chromate conversion coating per MIL-C-5541.
9. All dimensions in millimetres (inches).
10. Weight of panel mount lamp assembly, exclusive of mounting hardware, is 2.8 grams.

## Electrical/Optical Characteristics at $T_A = 25^\circ\text{C}$

Symbol	Description	Green			Yellow			Units	Test Conditions

### Notes:

- LED diffusion,  $I_D$ , is the variation of luminous intensity across the face of the NVG filter. Light output measurements are in accordance with DESC Drawing 87019.
- Total power,  $P_E$ , is the amount of radiometric power in watts from 350 nm to 930 nm emitted by the lamp through the NVG filter.
- Infrared power,  $P_{IRG}$  (green) and  $P_{IRY}$  (yellow), is the ratio of the infrared power emitted through the NVG filter between the wavelengths indicated to the total radiometric power emitted between 350 nm and 930 nm,  $P_E$ .
- $\theta_{1/2}$  is the off-axis angle where the luminous intensity is half the on-axis value.  $\theta_{1/2}$  TYP =  $12^\circ\text{C}$ .
- $\theta_c$  is the off-axis angle where the luminous intensity is 0.5% of the on-axis value.  $\theta_c$  TYP =  $25^\circ\text{C}$ ,  $\theta_c$  MAX =  $30^\circ$ .
- The dominant wavelength,  $\lambda_d$ , is derived from the CIE Chromaticity Diagram and represents the single wavelength which defines the color of the device.
- Junction to cathode lead with 3.18 mm (0.125 inch) of lead exposed between base of lamp and heat sink.
- Radiant intensity,  $I_v$ , in watts/steradian, may be determined from the equation  $I_v = I_v/\eta_v$ , where  $I_v$  is the luminous intensity in candelas and  $\eta_v$  is the luminous efficacy in lumens/watt.
- Insulation resistance is between both leads and the metal sleeve.

**Figure 6. Relative Luminous Intensity vs. Angular Displacement**

**High-Reliability Screening as Defined by DESC Drawing 87019**

All lamps are subjected to 100 percent screening as listed in Table I. Random samples are pulled from each lot and are subjected to Group A electrical/

optical and mechanical tests as listed in Table II. Random sample Group B quality conformance tests in accordance with MIL-S-19500 subgroups, as listed in Table III, are performed every six months.

**Table I. Screening Tests**

Test	MIL-STD-750 Method	Measurements and Conditions
High Temperature Storage (Nonoperating)	1032	$T_A = 100^\circ\text{C}$ , time = 72 hours
Thermal Shock (Temperature Cycling)	1051	Test condition A, except $T_{(\text{high})} = +100^\circ\text{C}$ , 10 cycles; time at temperature extremes = 15 minutes minimum.
Constant Acceleration	2006	Nonoperating 20,000 g; $Y_1$ only.
Seal	1011	Test condition A
Pre Burn-in Measurements	4011 4016	$I_V^{(1)}$ $V_F^{(1)}$ $I_R^{(1)}$
Burn-in (Forward Bias)		$I_F = 20$ mA dc for yellow, $I_F = 30$ mA dc for green, 168 hours minimum
Post Burn-in Measurements	4011 4016	$I_V$ (within 72 hours of burn-in) <sup>(1)</sup> $V_F^{(1)}$ $I_R^{(1)}$ $P_E^{(1)}$ $\Delta I_V = -20\%$ maximum from initial value $\Delta V_F = \pm 50$ mV from initial value

**Note:**

1. Limits and conditions are those listed in the electrical/optical characteristics.

## **Application Information**

### **IR Secure Lighting**

The objective of IR secure lighting is to suppress IR emission from a light source in order to reduce the susceptibility of detection by a threat optical infrared image intensifier. IR Secure Lighting is derived from the Priority 1 Wavelength Restriction objective of the U.S. Army CECOM Statement of Work for NVG Secure Lighting. The Priority 1 objective limits the amount of IR energy as follows:

"Between 350 nm and 930 nm, no more than 0.5% of the total energy emitted shall be above 700 nm. The wavelength cut-off to 0.5% shall begin between 600 nm and 700 nm, and shall be as close to 600 nm as possible."

## **Mechanical/Optical**

Each 87019G01 and 87019Y01 secure lamp is constructed by assembling a military grade true hermetic LED lamp into an aluminum alloy panel mountable sleeve. The internal design of the sleeve provides a light trap that shapes the radiation pattern into a narrow viewing angle necessary for IR Secure Lighting applications, limits the luminous intensity to less than 0.5% of the on-axis value at off-axis angles greater than 30°, and provides increased contrast enhancement for daylight viewing. A glass NVG filter with a front surface antireflection coating per MIL-C-14806 is integrally mounted in the collar of the sleeve. The NVG filter provides suppression of IR energy to meet the Priority 1 objective. The IR suppression is constant with respect to off-axis viewing angles. The luminance of these lamps may be reduced by either

decreasing the DC forward current or by using pulse width modulation of the peak current.

The collar of the panel mountable sleeve surrounding the NVG filter is black anodized to enhance viewability. The chromate conversion coating on the body of the sleeve is electrically conductive, thus permitting an effective EMI attenuation seal to be formed with the front panel by way of a positive mechanical and electrical contact through the mounting hardware. The solder dipped leads are electrically insulated from the sleeve. The front and rear sealing techniques and materials maximize the sealed surface areas to achieve superior resistance to moisture and adverse environments, exceeding the sealing and immersion requirements of MIL-L-3661. The maximum torque that may be applied to the nut is 3.62 N-m (32 in-lbs).

### Description

The 1N5765, 1N6092, 1N6093 and 1N6094 solid state LEDs are hermetically sealed in a TO-46 package with a tinted, diffused plastic lens over a glass window. These devices are designed for high reliability applications and provide excellent on-off contrast, high axial luminous intensity, and a wide viewing angle. The panel mount

versions consist of an LED unit permanently mounted in an anodized aluminum sleeve.

The 1N5765 utilizes a GaAsP LED chip with a red diffused lens over a glass window.

The 1N6092 has a high efficiency red GaAsP on GaP LED chip with a red diffused lens over a glass window. This device is comparable to the 1N5765 but its efficiency extends to higher currents and it provides greater luminous intensity.

The 1N6093 provides a yellow GaAsP on GaP LED chip with a yellow, diffused lens over a glass window.

The 1N6094 utilizes a green GaP LED chip with a green, diffused lens over a glass window.

The plastic lens over glass window system is extremely durable and has exceptional temperature cycling capabilities.

### Features

- **Military Qualified**
- **Listed on MIL-S-19500 QPL**
- **Sunlight Viewable with Proper Contrast Enhancement Filter**
- **Hermetically Sealed**
- **Choice of Three Colors**
  - High Efficiency Red
  - Yellow
  - High Performance Green
- **Low Power Operation**
- **IC Compatible**
- **Long Life/Reliable/Rugged**
- **Panel Mount Configuration**

### Description

The 1N6609, 1N6610, and 1N6611 are hermetically sealed solid state lamps in a TO-18 package with a clear glass lens. These hermetic lamps provide improved brightness over conventional hermetic LED lamps, excellent on-off contrast,

and high axial luminous intensity. These LED indicators are designed for use in applications requiring readability in bright sunlight. With a proper contrast enhancement filter, these LED indicators are readable in sunlight ambients, see Application Note 1015 *Contrast Enhancement Techniques for LED Displays*. The panel mount versions consist of an LED unit permanently mounted in an anodized aluminum sleeve.

The 1N6609 utilizes a high efficiency red GaAsP on GaP LED chip. The 1N6610 uses a yellow GaAsP on GaP LED chip. The 1N6611 uses a green GaP LED chip.

\*Panel Mount versions of all of the above are available per the selection matrix on the next page.

Description	Standard Product	With JAN Qualification <sup>[1]</sup>	JAN Plus TX Testing <sup>[2]</sup>	Controlling MIL-S-19500 Document <sup>[4]</sup>
<b>TABLE A. Hermetic TO-18 Part Number System</b>				
High Efficiency Red	1N6609	JAN1N6609	JANTX1N6609	/519
Yellow	1N6610	JAN1N6610	JANTX1N6610	/520
Green	1N6611	JAN1N6611	JANTX1N6611	/521
<b>TABLE B. Panel Mountable Part Number System<sup>[3]</sup></b>				
High Efficiency Red	HLMP-0364	HLMP-0365 (JANM19500/51903)	HLMP-0366 (JANTXM19500/51904)	/519
Yellow	HLMP-0464	HLMP-0465 (JANM19500/52003)	HLMP-0466 (JANTXM19500/52004)	/520
Green	HLMP-0564	HLMP-0565 (JANM19500/52103)	HLMP-0566 (JANTXM19500/52104)	/521

**Notes:**

1. Parts are marked with JAN part number.
2. Parts are marked with JANTX/JTX part number.
3. Panel mountable packaging incorporates the Table A TO-18 part into a panel mount enclosure.
4. JAN and JANTX parts only.

**Package Dimensions**

**HLMP-0364, 0464, 0564**

- NOTES:**
1. THE PANELMOUNT SLEEVE IS BLACK ANODIZED ALUMINUM.
  2. SOLDER DIPPED LEADS. GOLD PLATED LEADS AVAILABLE ON REQUEST.
  3. ONE LOCK WASHER AND ONE HEX-NUT ARE INCLUDED WITH EACH PANEL MOUNT LAMP.
  4. USE OF METRIC DRILL SIZE 8.20 MILLIMETRES OR ENGLISH DRILL SIZE P (.323 INCH) IS RECOMMENDED FOR PRODUCING HOLE IN THE PANEL FOR PANEL MOUNTING.
  5. ALL DIMENSIONS ARE IN MILLIMETRES (INCHES).
  6. PACKAGE WEIGHT INCLUDING LAMP AND PANEL MOUNT IS 1.2 - 1.8 GRAMS. NUT AND WASHER IS AN EXTRA .6 - 1.0 GRAM.

**1N6609, 1N6610, 1N6611**

**OUTLINE TO-18**

- NOTES:**
1. ALL DIMENSIONS ARE IN MILLIMETRES (INCHES).
  2. GOLD-PLATED KOVAR LEADS.
  3. PACKAGE WEIGHT OF LAMP ALONE IS .25 - .40 GRAMS.

### Absolute Maximum Ratings at $T_A = 25^\circ\text{C}$

# Solid State Displays

---

Hewlett-Packard's line of Solid State Displays answers all the needs of the designer. From smart alphanumeric displays to low cost numeric displays in sizes from 3 mm (0.15 in.) to 20 mm (0.8 in.) and colors of red, AlGaAs red, high efficiency red, yellow, and high performance green, the selection is complete.

Hewlett-Packard's 5 x 7 dot matrix alphanumeric display line comes in three character sizes: 3.8 mm (0.15 in.), 5 mm (0.2 in.), and 6.9 mm (0.27 in.). In addition, there are now four colors available for each size: standard red, yellow, high efficiency red, and green. This wide selection of package sizes and colors makes these products ideal for a variety of applications in avionics, industrial control, and instrumentation.

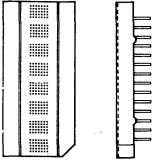

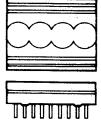

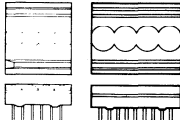

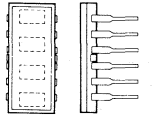

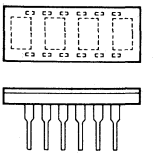

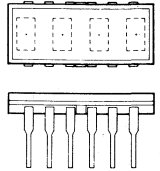

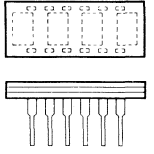

The newest addition to HP's alphanumeric display line, the intelligent eight character, 5.0 mm (0.2 in.) alphanumeric display in the very flexible 5 x 7 dot matrix font. Product features include a low power on-board CMOS IC, ASCII decoder,

the complete 128 ASCII character set, and the LED drivers. In addition, an on-board RAM offers the designer the ability to store up to 16 user-definable characters, such as foreign characters, special symbols and logos. These features make it ideal for avionics, medical, telecommunications, analytical equipment, computer products, office and industrial equipment applications.

Also part of HP's alphanumeric display line is the large (0.68 in. and 1.04 in.) 5 x 7 dot matrix alphanumeric display family. This family is offered in standard red, high efficiency red, AlGaAs red, and high performance green. These displays have excellent viewability; the 1.04 inch character font can be read at up to 18 meters (12 meters for the 0.68 inch display). Applications for these large 5 x 7 displays include industrial machinery and process controllers, weighing scales, computer tape drive systems, and transportation.

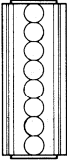

Hewlett-Packard's line of numeric seven segment displays is one of the broadest. From low cost, standard red displays to high light ambient displays producing 7.5 mcd/segment, HP's 0.3 in., 0.43 in., 0.56 in., and 0.8 in. characters can provide a solution to every display need. HP's product offering includes 0.56 in. dual digit displays and a line of small package, bright 0.3 in. displays – the 0.3 in. Microbright. HP's broad line of numeric seven segment displays is ideal for electronic instrumentation, industrial, weighing scales, point-of-sale terminals, and appliance applications. Included in HP's line of numeric seven segment displays is the Double Heterojunction AlGaAs red low current sunlight viewable display family. This family is offered in the 0.3 in. Mini, 0.43 in., 0.56 in., and 0.8 in. package sizes. These AlGaAs numeric displays are very bright at low drive currents – typical intensity of 650 mcd/segment at 1 mA/segment drive. These displays are ideal for battery operated and other low power applications.

SOLID STATE DISPLAYS

# Eight Character 5.0 mm (0.2 inch) Smart 5 X 7 Alphanumeric Displays

## Technical Data

**HDSP-2110**  
**HDSP-2111**  
**HDSP-2112**  
**HDSP-2113**  
**HDSP-2121**  
**HDSP-2122**  
**HDSP-2123**

### Features

- **Smart Alphanumeric Display**  
On-Board CMOS IC  
Built-In RAM  
ASCII or Katakana Decoder  
LED Drive Circuitry
- **128 ASCII Character Set or 128 Katakana Character Set**
- **16 User Definable Characters**
- **Programmable Features**  
Individual Flashing Character  
Full Display Blinking  
Multi-Level Dimming and Blanking  
Self Test  
Clear Function
- **Read/Write Capability**
- **Full TTL Compatibility**
- **Single 5 Volt Supply**
- **Excellent ESD Protection**
- **Wave Solderable**
- **End Stackable**

### Description

These are eight-digit, 5 x 7 dot matrix, alphanumeric displays. The 5.0 mm (0.2 inch) high characters are packaged in a standard 15.24 mm (0.6 inch) 28 pin DIP. The on-board CMOS IC has the ability to decode 128 ASCII (Katakana) characters, which are permanently stored in ROM. In addition, 16 programmable symbols may be stored in on-board RAM. Seven brightness levels provide versatility in adjusting the display intensity and power consumption. The HDSP-211X/-212X is designed for standard microprocessor interface techniques. The display and special features are accessed through a bidirectional eight-bit data bus. These features make the HDSP-211X/-212X ideally suited for applications where a low cost, low power alphanumeric display is required.

### Applications

- **Avionics**
- **Computer Peripherals**
- **Industrial Instrumentation**
- **Medical Equipment**
- **Portable Data Entry Devices**
- **Telecommunications**
- **Test Equipment**

### Devices

High Efficiency Red	Orange	Yellow	Green	Description
HDSP-2112	HDSP-2110	HDSP-2111	HDSP-2113	ASCII
HDSP-2122	-	HDSP-2121	HDSP-2123	Katakana*

\*Katakana is a simplified version of the Japanese alphabet.

## Package Dimensions

- NOTES:  
 1. UNLESS OTHERWISE SPECIFIED, THE TOLERANCE ON ALL DIMENSIONS IS 0.254 mm (0.010 IN).  
 2. DIMENSIONS IN mm (INCHES).  
 3. FOR YELLOW AND GREEN ONLY.

Pin Function Assignment Table

Pin No.	Function	Pin No.	Function
1	RST	15	GND (SUPPLY)
2	FL	16	GND (LOGIC)
3	A <sub>0</sub>	17	CE
4	A <sub>1</sub>	18	RD
5	A <sub>2</sub>	19	D <sub>0</sub>
6	A <sub>3</sub>	20	D <sub>1</sub>
7	SUBSTR. BIAS	21	NO PIN
8	SUBSTR. BIAS	22	NO PIN
9	SUBSTR. BIAS	23	D <sub>2</sub>
10	A <sub>4</sub>	24	D <sub>3</sub>
11	CLS	25	D <sub>4</sub>
12	CLK	26	D <sub>5</sub>
13	WR	27	D <sub>6</sub>
14	V <sub>DD</sub>	28	D <sub>7</sub>

## Absolute Maximum Ratings

Supply Voltage, V <sub>DD</sub> to Ground <sup>[1]</sup>	-0.3 to 7.0 V
Operating Voltage, V <sub>DD</sub> to Ground <sup>[2]</sup>	5.5 V
Input Voltage, Any Pin to Ground	-0.3 to V <sub>DD</sub> + 0.3 V
Free Air Operating Temperature Range, T <sub>A</sub> <sup>[3]</sup>	-45°C to +85°C
Relative Humidity (non-condensing)	85%
Storage Temperature Range, T <sub>s</sub>	-55°C to +100°C
Maximum Solder Temperature	
1.59 mm (0.063 in.) Below Seating Plane, t < 5 sec	260°C
ESD Protection @ 1.5 kΩ, 100 pF	V <sub>z</sub> = 4 kV (each pin)

### Notes:

- Maximum Voltage is with no LEDs illuminated.
- 20 dots ON in all locations at full brightness.
- Maximum supply voltage is 5.25 V for operation above 70°C.

**ESD WARNING: STANDARD CMOS HANDLING PRECAUTIONS SHOULD BE OBSERVED WITH THE HDSP-211X AND HDSP-212X.**

$I_{DD}$ 8 digits 12 dots/character <sup>[2,3]</sup>	$I_{DD}$ (V)		200	255	330	mA	"V" on in all 8 locations
$I_{DD}$ 8 digits 20 dots/character <sup>[2,3,4,5]</sup>	$I_{DD}$ (#)		300	370	430	mA	"#" on in all locations
Input Voltage High	$V_{IH}$	2.0			$V_{DD}$ $+0.3$	V	
Input Voltage Low	$V_{IL}$	GND $-0.3$ V			0.8	V	
Output Voltage High	$V_{OH}$	2.4				V	$V_{DD} = 4.5$ V, $I_{OH} = -40$ $\mu$ A
Output Voltage Low $D_0$ - $D_7$	$V_{OL}$				0.4	V	$V_{DD} = 4.5$ V, $I_{OL} = 1.6$ mA
Output Voltage Low CLK	$V_{OL}$				0.4	V	$V_{DD} = 4.5$ V, $I_{OL} = 40$ $\mu$ A
Thermal Resistance IC Junction-to-Case	$R\theta_{J-C}$		15			$^{\circ}$ C/W	

### Notes:

- $V_{DD} = 5.0$  V.
- Average  $I_{DD}$  measured at full brightness. See Table 2 in Control Word Section for  $I_{DD}$  at lower brightness levels. Peak  $I_{DD} = 28/15 \times I_{DD}(\#)$ .
- Maximum  $I_{DD}$  occurs at  $-55^{\circ}$ C.
- Maximum  $I_{DD}(\#) = 355$  mA at  $V_{DD} = 5.25$  V and IC  $T_j = 150^{\circ}$ C.
- Maximum  $I_{DD}(\#) = 375$  mA at  $V_{DD} = 5.5$  V and IC  $T_j = 150^{\circ}$ C.

### Optical Characteristics at 25°C<sup>[6]</sup>

V<sub>DD</sub> = 5.0 V at Full Brightness

#### High Efficiency Red HDSP-2112/HDSP-2122

#### High Performance Green HDSP-2113/HDSP-2123

Description	Symbol	Min.	Typ.	Units
Luminous Intensity Character Average (#)	I <sub>V</sub>	2.5	7.5	mcd
Peak Wavelength	λ <sub>PEAK</sub>		568	nm
Dominant Wavelength	λ <sub>d</sub>		574	nm

Note:

6. Refers to the initial case temperature of the device immediately prior to the light measurement.

## AC Timing Characteristics Over Temperature Range

$V_{DD} = 4.5$  to  $5.5$  V unless otherwise specified.

Reference Number	Symbol	Description	Min. <sup>[1]</sup>	Units
1	$t_{ACC}$	Display Access Time Write Read	210 230	ns
2	$t_{ACS}$	Address Setup Time to Chip Enable	10	ns
3	$t_{CE}$	Chip Enable Active Time <sup>[2, 3]</sup> Write Read	140 160	ns
4	$t_{ACH}$	Address Hold Time to Chip Enable	20	ns
5	$t_{CER}$	Chip Enable Recovery Time	60	ns
6	$t_{CES}$	Chip Enable Active Prior to Rising Edge of <sup>[2, 3]</sup> Write Read	140 160	ns
7	$t_{CEH}$	Chip Enable Hold Time to Rising Edge of Read/Write Signal <sup>[2, 3]</sup>	0	ns
8	$t_W$	Write Active Time	100	ns
9	$t_{WD}$	Data Valid Prior to Rising Edge of Write Signal	50	ns
10	$t_{DH}$	Data Write Hold Time	20	ns
11	$t_R$	Chip Enable Active Prior to Valid Data	160	ns
12	$t_{RD}$	Read Active Prior to Valid Data	75	ns
13	$t_{DF}$	Read Data Float Delay	10	ns
	$t_{RC}$	Reset Active Time <sup>[4]</sup>	300	ns

### Notes:

- Worst case values occur at an IC junction temperature of 150°C.
- For designers who do not need to read from the display, the Read line can be tied to  $V_{DD}$  and the Write and Chip Enable lines can be tied together.
- Changing the logic levels of the Address lines when  $\overline{CE} = "0"$  may cause erroneous data to be entered into the Character RAM, regardless of the logic levels of the  $\overline{WR}$  and  $\overline{RD}$  lines.
- The display must not be accessed until after 3 clock pulses (110  $\mu$ s min. using the internal refresh clock) after the rising edge of the reset line.

Symbol	Description	25°C Typical	Minimum <sup>[1]</sup>	Units
$F_{OSC}$	Oscillator Frequency	57	28	kHz

## Electrical Description

### Pin Function

RESET ( $\overline{\text{RST}}$ , pin 1)

FLASH ( $\overline{\text{FL}}$ , pin 2)

ADDRESS INPUTS  
( $A_0$ - $A_4$ , pins 3-6, 10)

### Description

Reset initializes the display.

$\overline{\text{FL}}$  low indicates an access to the Flash RAM and is unaffected by the state of address lines  $A_3$ - $A_4$ .

Each location in memory has a distinct address. Address inputs ( $A_0$ - $A_2$ ) select a specific location in the Character RAM, the Flash RAM or a particular row in the UDC (User-Defined Character) RAM.  $A_3$ - $A_4$  are used to select which section of memory is accessed. Table 1 shows the logic levels needed to access each section of memory.

**Table 1. Logic Levels to Access Memory**

FL	$A_4$	$A_3$	Section of Memory	$A_2$ $A_1$ $A_0$
0	X	X	Flash RAM	Character Address
1	0	0	UDC Address Register	Don't Care
1	0	1	UDC RAM	Row Address
1	1	0	Control Word Register	Don't Care
1	1	1	Character RAM	Character Address

CLOCK SELECT  
(CLS, pin 11)

This input is used to select either an internal or external clock source.

CLOCK INPUT/OUTPUT  
(CLK, pin 12)

Outputs the master clock (CLS = 1) or inputs a clock (CLS = 0) for slave displays.

WRITE ( $\overline{\text{WR}}$ , pin 13)

Data is written into the display when the  $\overline{\text{WR}}$  input is low and the  $\overline{\text{CE}}$  input is low.

CHIP ENABLE ( $\overline{\text{CE}}$ , pin 17)

This input must be at a logic low to read or write data to the display and must go high between each read and write cycle.

READ ( $\overline{\text{RD}}$ , pin 18)

Data is read from the display when the  $\overline{\text{RD}}$  input is low and the  $\overline{\text{CE}}$  input is low.

DATA Bus ( $D_0$ - $D_7$ ,  
pins 19, 20, 23-28)

The Data bus is used to read from or write to the display.

GND (SUPPLY) (pin 15)

This is the analog ground for the LED drivers.

GND (LOGIC) (pin 16)

This is the digital ground for internal logic.

$V_{\text{DD}}$  (POWER) (pin 14)

This is the positive power supply input.

$V_{\text{DD}}$  (SUBSTRATE)  
(pins 7-9)

These pins are used to bias the IC substrate and must be connected to  $V_{\text{DD}}$ . These pins cannot be used to supply power to the display.

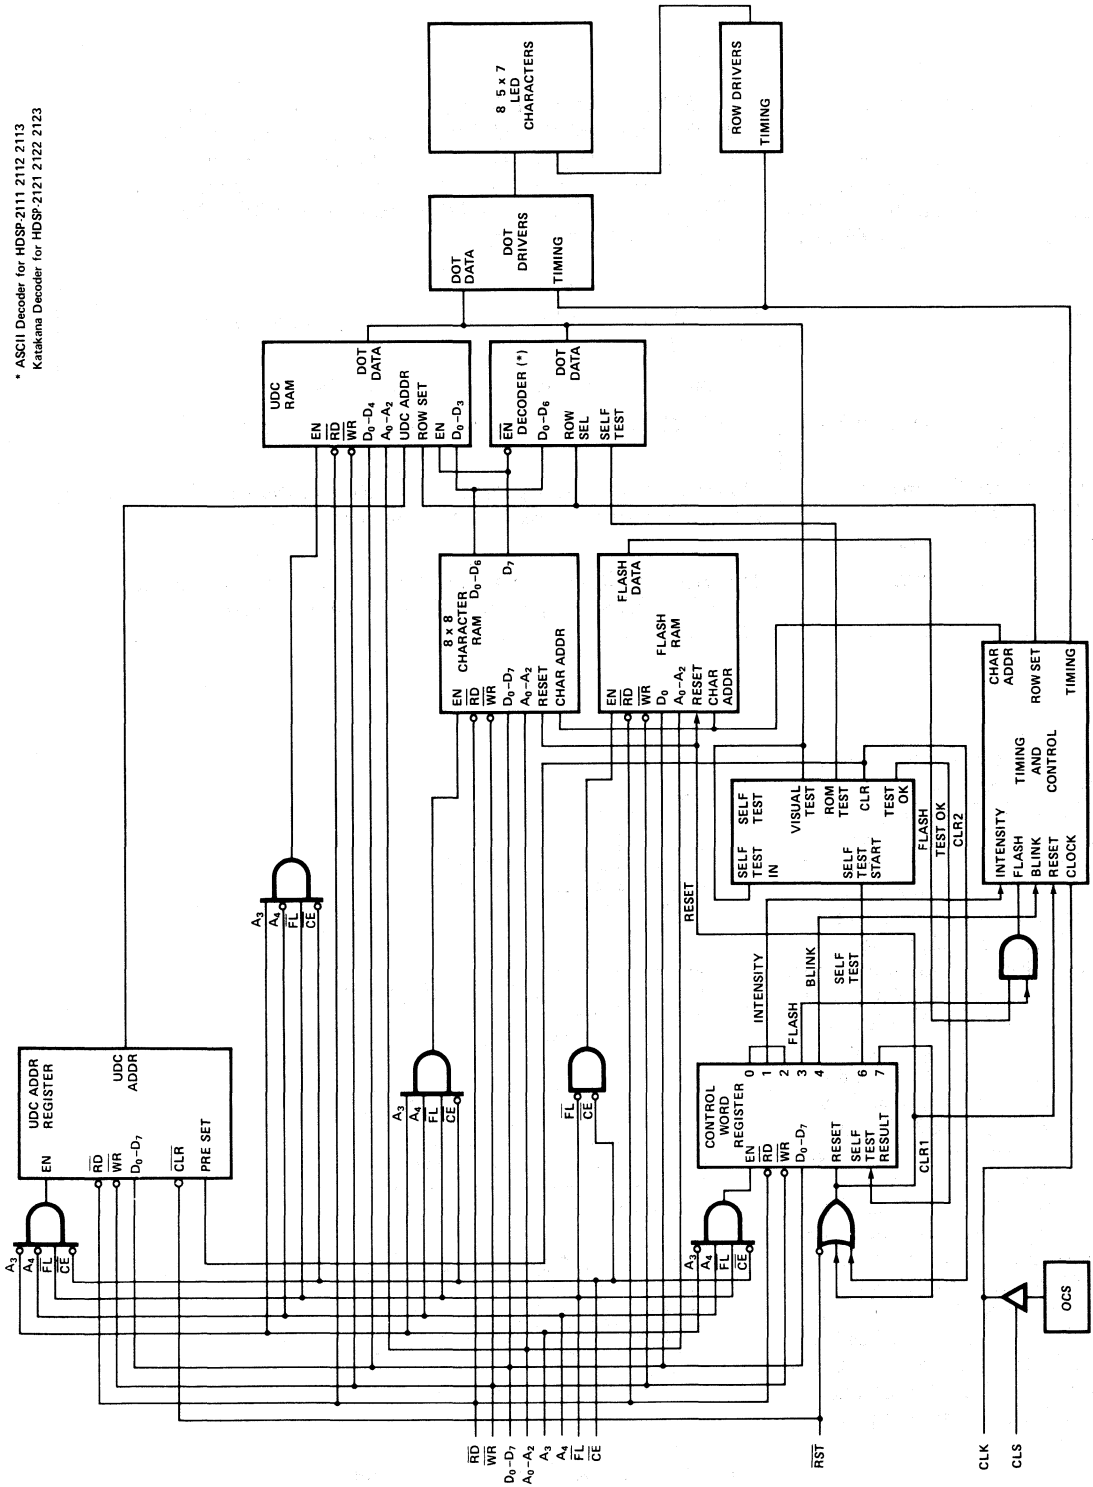

Figure 1. HDSP-213X Internal Block Diagram.

### Display Internal Block Diagram

Figure 1 shows the internal block diagram of the HDSP-211X/-212X display. The CMOS IC consists of an 8 byte Charac-

ter RAM, an 8 bit Flash RAM, a 128 character ASCII (Katakana) decoder, a 16 character UDC RAM, a UDC Address Register, a Control Word Register and the refresh circuitry necessary to

synchronize the decoding and driving of eight 5 x 7 dot matrix characters. The major user accessible portions of the display are listed below:

Character RAM	This RAM stores either ASCII (Katakana) character data or a UDC RAM address.
Flash RAM	This is a 1 x 8 RAM which stores Flash data.
User-Defined Character RAM (UDC RAM)	This RAM stores the dot pattern for custom characters.
User-defined Character Address Register (UDC Address Register)	This register is used to provide the address to the UDC RAM when the user is writing or reading a custom character.
Control Word Register	This register allows the user to adjust the display brightness, flash individual characters, blink, self test or clear the display.

### Character Ram

Figure 2 shows the logic levels needed to access the HDSP-211X/-212X Character RAM. During a normal access the  $\overline{CE} = "0"$  and either  $\overline{RD} = "0"$  or  $\overline{WR} = "0"$ . However, erroneous data may be written into the Character RAM if the Address lines are unstable when  $\overline{CE} = "0"$  regardless of the logic levels of the  $\overline{RD}$  or  $\overline{WR}$  lines. Address lines  $A_0$ - $A_2$  are used to select the location in the Character RAM. Two types of data can be stored in each Character RAM location: an ASCII (Katakana) code or a UDC RAM address. Data bit  $D_7$  is used to differentiate between the ASCII (Katakana) character and a UDC RAM address.  $D_7 = 0$  enables the ASCII (Katakana) decoder and  $D_7 = 1$  enables the UDC RAM.  $D_0$ - $D_6$  are used to input ASCII (Katakana) data and  $D_0$ - $D_3$  are used to input a UDC address.

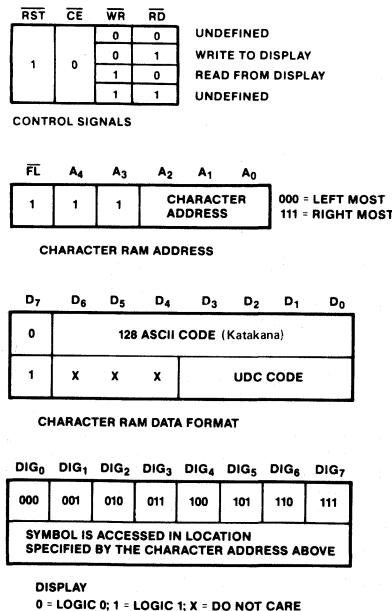

Figure 2. Logic Levels to Access the Character RAM.

### UDC RAM and UDC Address Register

Figure 3 shows the logic levels needed to access the UDC RAM and the UDC Address Register. The UDC Address Register is eight bits wide. The lower four bits ( $D_0$ - $D_3$ ) are used to select one of the 16 UDC locations. The upper four bits ( $D_4$ - $D_7$ ) are not used. Once the UDC address has been stored in the UDC Address Register, the UDC RAM can be accessed.

To completely specify a 5 x 7 character requires eight write cycles. One cycle is used to store the UDC RAM address in the UDC Address Register. Seven cycles are used to store dot data in the UDC RAM. Data is entered by rows. One cycle is needed to access each row. Figure 4 shows the organization of a UDC character assuming the symbol to be stored is an "F".  $A_0$ - $A_2$  are used to select the row to be accessed and  $D_0$ - $D_4$  are used to transmit the row dot data. The upper three bits ( $D_5$ - $D_7$ ) are ignored.  $D_0$  (least significant bit) corresponds to the right most column of the 5 x 7 matrix and  $D_4$  (most significant bit) corresponds to the left most column of the 5 x 7 matrix.

### Flash RAM

Figure 5 shows the logic levels needed to access the Flash RAM. The Flash RAM has one bit associated with each location of the Character RAM. The Flash input is used to select the Flash RAM. Address lines  $A_3$ - $A_4$  are ignored. Address lines  $A_0$ - $A_2$  are used to select the location in the Flash RAM to store the attribute.  $D_0$  is used to store or remove the flash attribute.  $D_0 = "1"$  stores the attribute and  $D_0 = "0"$  removes the attribute.

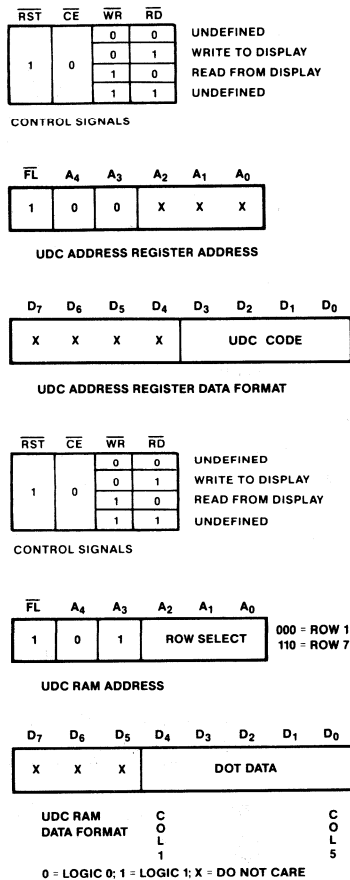

Figure 3. Logic Levels to Access a UDC Character.

Figure 4. Data to Load "F" into the UDC RAM.

When the attribute is enabled through bit 3 of the Control Word and a "1" is stored in the Flash RAM, the corresponding character will flash at approximately 2 Hz. The actual rate is

dependent on the clock frequency. For an external clock the flash rate can be calculated by dividing the clock frequency by 28,672.

Figure 5. Logic Levels to access the Flash RAM.

### Control Word Register

Figure 6 shows how to access the Control Word Register. This is an eight bit register which performs five functions. They are Brightness control, Flash RAM control, Blinking, Self Test and Clear. Each function is independent of the others. However, all bits are updated during each Control Word write cycle.

Figure 6. Logic Levels to Access the Control Word Register

### Brightness (Bits 0-2)

Bits 0-2 of the Control Word adjust the brightness of the display. Bits 0-2 are interpreted as a three bit binary code with code (000) corresponding to maximum brightness and code (111) corresponding to a blanked display. In addition to varying the display brightness, bits 0-2 also vary the average value of  $I_{DD}$ .  $I_{DD}$  can be calculated at any brightness level by multiplying the percent brightness level by the value of  $I_{DD}$  at the 100% brightness level. These values of  $I_{DD}$  are shown in Table 2.

Table 2. Current Requirements at Different Brightness Levels

Symbol	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>	% Brightness	V <sub>DD</sub> = 5.0 V 25°C Typ.	Units
I <sub>DD</sub> (V)	0	0	0	100	200	mA
	0	0	1	80	160	mA
	0	1	0	53	106	mA
	0	1	1	40	80	mA
	1	0	0	27	54	mA
	1	0	1	20	40	mA
	1	1	0	13	26	mA

### Flash Function (Bit 3)

Bit 3 determines whether the flashing character attribute is on or off. When bit 3 is a "1", the output of the Flash RAM is checked. If the content of a location in the Flash RAM is a "1", the associated digit will flash at

approximately 2 Hz. For an external clock, the blink rate can be calculated by dividing the clock frequency by 28,672. If the flash enable bit of the Control Word is a "0", the content of the Flash RAM is ignored. To use this function with multiple display systems see the Reset section.

### Blink Function (Bit 4)

Bit 4 of the Control Word is used to synchronize blinking of

all eight digits of the display. When this bit is a "1" all eight digits of the display will blink at approximately 2 Hz. The actual rate is dependent on the clock frequency. For an external clock, the blink rate can be calculated by dividing the clock frequency by 28,672. This function will override the Flash function when it is active. To use this function with multiple display systems see the Reset section.

**Self Test Function (Bits 5, 6)**

Bit 6 of the Control Word Register is used to initiate the self test function. Results of the internal self test are stored in bit 5 of the Control Word. Bit 5 is a read only bit where bit 5 = "1" indicates a passed self test and bit 5 = "0" indicates a failed self test.

Setting bit 6 to a logic 1 will start the self test function. The built-in self test function of the IC consists of two internal routines which exercises major portions of the IC and illuminates all of the LEDs. The first routine cycles the ASCII (Katakana) decoder ROM through all states and performs a checksum on the output. If the checksum agrees with the correct value, bit 5 is set to "1". The second routine provides a visual test of the LEDs using the drive circuitry. This is accomplished by writing checkered and inverse checkered patterns to the display. Each pattern is displayed for approximately 2 seconds.

During the self test function the display must not be accessed. The time needed to execute the self test function is calculated by multiplying the clock period by 262,144. For example, assume a clock frequency of 58 KHz, then the time to execute the self test function frequency is equal to  $(262,144/58,000) = 4.5$  second duration.

At the end of the self test function, the Character RAM is loaded with blanks, the Control Word Register is set to zeros except for bit 5, and the Flash RAM is cleared and the UDC Address Register is set to all ones.

**Clear Function (Bit 7)**

Bit 7 of the Control Word will clear the Character RAM and the Flash RAM. Setting bit 7 to a "1" will start the clear function. Three clock cycles (110  $\mu$ s min. using the internal refresh clock) are required to complete the clear function. The display must not be accessed while the display is being cleared. When the clear function has been completed, bit 7 will be reset to a "0". The ASCII (Katakana) character code for a space (20H) will be loaded into the Character RAM to blank the display and the Flash RAM will be loaded with "0"s. The UDC RAM, UDC Address Register and the remainder of the Control Word are unaffected.

**Display Reset**

Figure 7 shows the logic levels needed to Reset the display. The display should be Reset on Power-up. The external Reset clears the Character RAM, Flash RAM, Control Word and resets the internal counters. After the rising edge of the Reset signal, three clock cycles (110  $\mu$ s min. using the internal refresh clock) are required to complete the reset sequence. The display must not be accessed while the display is being reset. The ASCII (Katakana) Character code for a space (20H) will be loaded into the Character RAM to blank the display. The Flash RAM and

Control Word Register are loaded with all "0"s. The UDC RAM and UDC Address Register are unaffected. All displays which operate with the same clock source must be simultaneously reset to synchronize the Flashing and Blinking functions.

**Mechanical and Electrical Considerations**

The HDSP-211X/-212X is a 28 pin dual-in-line package with 26 external pins, which can be stacked horizontally and vertically to create arrays of any size. The HDSP-211X/212X is designed to operate continuously from -45°C to +85°C with a maximum of 20 dots on per character at 5.25 V. Illuminating all thirty-five dots at full brightness is not recommended.

The HDSP-211X/-212X is assembled by die attaching and wire bonding 280 LED chips and a CMOS IC to a thermally conductive printed circuit board. A polycarbonate lens is placed over the PC board creating an air gap over the LED wire bonds. A protective cap creates an air gap over the CMOS IC. Backfill epoxy environmentally seals the display package. This package construction makes the display highly tolerant to temperature cycling and allows wave soldering.

The inputs to the IC are protected against static discharge and input current latchup. However, for best results standard CMOS handling precautions should be used. Prior to use, the HDSP-211X/-212X should be stored in antistatic tubes or in conductive material. During assembly, a grounded conductive work area should be used, and assembly personnel should wear

RST	CE	WR	RD	FL	A <sub>4</sub> -A <sub>0</sub>	D <sub>7</sub> -D <sub>0</sub>

0 - LOGIC 0; 1 - LOGIC 1; X - DO NOT CARE  
 NOTE:  
 IF RST, CE AND WR ARE LOW, UNKNOWN  
 DATA MAY BE WRITTEN INTO THE DISPLAY.

**Figure 7. Logic Levels to Reset the Display.**

conductive wrist straps. Lab coats made of synthetic material should be avoided since they are prone to static buildup. Input current latchup is caused when the CMOS inputs are subjected to either a voltage below ground ( $V_{IN} < \text{ground}$ ) or to a voltage higher than  $V_{DD}$  ( $V_{IN} > V_{DD}$ ) and when a high current is forced into the input. To prevent input current latchup and ESD damage, unused inputs should be connected either to ground or to  $V_{DD}$ . Voltages should not be applied to the inputs until  $V_{DD}$  has been applied to the display.

### Thermal Considerations

The HDSP-211X/-212X has been designed to provide a low thermal resistance path for the CMOS IC to the 26 package pins. This heat is then typically conducted through the traces of the printed circuit board to free air. For most applications no additional heatsinking is required.

Measurements were made on a 32 character display string to determine the thermal resistance of the display assembly. Several display boards were constructed using 62 mil printed circuit material, and one ounce copper 20-mil traces. Some of the device pins were connected to a heatsink formed by etching a copper area on the printed circuit board surrounding the display. A maximum metalized printed circuit board was also evaluated. The junction temperature was measured for displays soldered directly to these PC boards, displays installed in sockets, and finally displays installed in sockets with a filter over the display to restrict airflow. The results of these ther-

mal resistance measurements,  $R\theta_{JA}$  are shown in Table 3 and include the effects of  $R\theta_{JC}$ .

### Ground Connections

Two ground pins are provided to keep the internal IC logic ground clean. The designer can, when necessary, route the analog ground for the LED drivers separately from the logic ground until an appropriate ground plane is available. On long interconnections between the display and the host system, the designer can keep voltage drops on the analog ground from affecting the display logic levels by isolating the two grounds.

The logic ground should be connected to the same ground potential as the logic interface circuitry. The analog ground and the logic ground should be connected at a common ground which can withstand the current introduced by the switching LED drivers. When separate ground connections are used, the analog ground can vary from -0.3 V to +0.3 V with respect to the logic ground. Voltage below -0.3 V can cause all dots to be on. Voltage above +0.3 V can cause dimming and dot mismatch.

### Soldering and Post Solder Cleaning Instructions for the HDSP-211X/-212X

The HDSP-211X/-212X may be hand soldered or wave soldered with SN63 solder. When hand soldering it is recommended that an electronically temperature controlled and securely grounded soldering iron be used. For best results, the iron tip temperature should be set at 315°C (600°F). For wave soldering, a rosin-based RMA flux can be used. The solder wave temperature should be set at 245°C  $\pm$  5°C (473°F  $\pm$  9°F), and the dwell in the wave should be set between 1-1/2 to 3 seconds for optimum soldering. The preheat temperature should not exceed 105°C (221°F) as measured on the solder side of the PC board.

Post solder cleaning may be performed with a solvent or aqueous process. For solvent cleaning, Allied Chemical's Genesolv DES, Baron Blakeslee's Blaco-Tron TES or DuPont's Freon TE may be used. These solvents are azeotropes of trichlorotrifluoroethane FC-113 with low concentrations of ethanol (5%). The

**Table 3. Thermal Resistance,  $\theta_{JA}$ , Using Various Amounts of Heatsinking Material**

Heatsinking Metal per Device sq. in.	W/Sockets W/O Filter (Avg.)	W/O Sockets W/O Filter (Avg.)	W/Sockets W/Filter (Avg.)	Units
0	31	30	35	°C/W
1	31	28	33	°C/W
3	30	26	33	°C/W
Max. Metal	29	25	32	°C/W
4 Board Avg.	30	27	33	°C/W

maximum exposure time in the solvent vapors at boiling temperature should not exceed 2 minutes. Solvents containing high concentrations of alcohols such as methanol, ketones such as acetone, or chlorinated solvents should not be used as they will chemically attack the polycarbonate lens. Solvents containing trichloroethylene (TCE), FC-111, FC-112 or trichloroethylene (TCA) are also not recommended.

An aqueous cleaning process may be used. A saponifier, such as Kesterbio-kleen Formula 5799 or its equivalent, may be added to the wash cycle of an aqueous process to remove rosin flux residues. Organic acid flux residues must be thoroughly removed by an aqueous cleaning process to prevent corrosion of the leads and solder connections. The optimum water temperature is 60°C (140°F). The maximum cumulative exposure of the HDSP-211X/-212X to

wash and rinse cycles should not exceed 15 minutes. For additional information on soldering and post solder cleaning, see Application Note 1027.

### **Contrast Enhancement**

The objective of contrast enhancement is to provide good readability in the end user's ambient lighting conditions. The concept is to employ both luminance and chrominance contrast techniques. These enhance readability by having the OFF-dots blend into the display background and the ON-dots vividly stand out against the same background. Contrast enhancement may be achieved by using one of the following suggested filters.

HDSP-2112/-2122  
Panelgraphic SCARLET RED  
65 or GRAY 10  
SGL Homalite H100-1670 RED

# Four Character 5.0mm (0.2 in.) Smart 5 x 7 Alphanumeric Displays

## Technical Data

**HDLR-2416**  
**HDLO-2416**  
**HDLA-2416**  
**HDLY-2416**  
**HDLG-2416**

### Features

- **Enhanced Drop-in Replacement to HPDL-2416**
- **Smart Alphanumeric Display**  
Built-in RAM, ASCII Decoder, and LED Drive Circuitry
- **CMOS IC for Low Power Consumption**
- **Software Controlled Dimming Levels and Blank**
- **128 ASCII Character Set**
- **End-Stackable**
- **Categorized for Luminous Intensity; YELLOW and GREEN Categorized for Color**
- **Wide Operating Temperature Range**  
-40°C to +85°C
- **Excellent ESD Protection**
- **Wave Solderable**
- **Wide Viewing Angle**  
(50° typ)

### Description

These are 5.0 mm (0.2 inch) four character 5 x 7 dot matrix displays driven by an on-board CMOS IC. These displays are pin for pin compatible with the HPDL-2416. The IC stores and decodes 7 bit ASCII data and displays it using a 5 x 7 font. Multiplexing circuitry, and drivers are also part of the IC. The IC has fast setup and hold times which makes it easy to interface to a microprocessor.

### Absolute Maximum Ratings

Supply Voltage,  $V_{DD}$  to Ground<sup>(1)</sup> ..... -0.5 V to 7.0 V  
 Input Voltage, Any Pin to Ground ..... -0.5 V to  $V_{DD} + 0.5$  V  
 Free Air Operating Temperature Range,  $T_A$  ..... -40°C to +85°C  
 Relative Humidity (non-condensing) at 65°C ..... 85%  
 Storage Temperature,  $T_S$  ..... -40°C to 100°C  
 Maximum Solder Temperature, 1.59 mm  
 (0.063 in.) below Seating Plane,  $t < 5$  sec. .... 260°C  
 ESD Protection,  $R = 1.5$  k $\Omega$ ,  $C = 100$  pF .....  $V_Z = 2$  kV (each pin)

**Note:**

1. Maximum Voltage is with no LEDs illuminated.

### Devices:

Standard Red	High Efficiency Red	Orange	Yellow	Green
HDLR-2416	HDLO-2416	HDLA-2416	HDLY-2416	HDLG-2416

**ESD WARNING: STANDARD CMOS HANDLING PRECAUTIONS SHOULD BE OBSERVED WITH THE HDLX-2416**

The address and data inputs can be directly connected to the microprocessor address and data buses.

The HDLX-2416 has several enhancements over the HPDL-2416. These features include an expanded character set, internal

8 level dimming control, external dimming capability, and individual digit blanking. Finally, the extended functions can be disabled which allows the HDLX-2416 to operate exactly like an HPDL-2416 by disabling all of the enhancements except the expanded character set.

### Package Dimensions

**Notes:**

1. Unless otherwise specified the tolerance on all dimensions is  $\pm 0.254$  mm ( $\pm 0.010$ " )
2. All dimensions are in mm/inches.
3. For yellow and green displays only.

## Electrical Description

Pin Function	Description
Chip Enable ( $\overline{CE}_1$ and $\overline{CE}_2$ , pins 1 and 2)	$\overline{CE}_1$ and $\overline{CE}_2$ must be a logic 0 to write to the display.
Clear ( $\overline{CLR}$ , pin 3)	When $\overline{CLR}$ is a logic 0 the ASCII RAM is reset to 20hex (space) and the Control Register/Attribute RAM is reset to 00hex.
Cursor Enable (CUE pin 4)	CUE determines whether the IC displays the ASCII or the Cursor memory. (1 = Cursor, 0 = ASCII).
Cursor Select ( $\overline{CU}$ , pin 5)	$\overline{CU}$ determines whether data is stored in the ASCII RAM or the Attribute RAM/Control Register. (1 = ASCII, 0 = Attribute RAM/Control Register).
Write ( $\overline{WR}$ , pin 6)	$\overline{WR}$ must be a logic 0 to store data in the display.
Address Inputs ( $A_1$ and $A_0$ , pins 8 and 7)	$A_0$ - $A_1$ selects a specific location in the display memory. Address 00 accesses the far right display location. Address 11 accesses the far left location.
Data Inputs ( $D_0$ - $D_6$ , pins 11-17)	$D_0$ - $D_6$ are used to specify the input data for the display.
$V_{DD}$ (pin 9)	$V_{DD}$ is the positive power supply input.
GND (pin 10)	GND is the display ground.
Blanking Input ( $\overline{BL}$ , pin 18)	$\overline{BL}$ is used to flash the display, blank the display or to dim the display.

## Display Internal Block Diagram

Figure 1 shows the HDLX-2416 display internal block diagram. The CMOS IC consists of a 4 x 7 Character RAM, a 2 x 4 Attribute RAM, a 5 bit Control Register, a 128 character ASCII decoder and the refresh circuitry necessary to synchronize the decoding and driving of four 5 x 7 dot matrix displays.

Four 7 bit ASCII words are stored in the Character RAM. The IC reads the ASCII data and decodes it via the 128 character ASCII decoder. The ASCII decoder includes the 64 character set of the HPDL-2416, 32 lower case ASCII symbols, and 32 foreign language symbols.

A 5 bit word is stored in the Control Register. Three fields within the Control Register provide an 8 level brightness control, master blank, and extended functions disable.

For each display digit location, two bits are stored in the Attribute RAM. One bit is used to enable a cursor character at each digit location. A second bit is used to individually disable the blanking features at each digit location.

The display is blanked and dimmed through an internal blanking input on the row drivers. Logic within the IC allows the user to dim the display either through the  $\overline{BL}$  input or through the brightness control in the control register. Similarly the display can be blanked through the  $\overline{BL}$  input, the Master Blank in the Control Register, or the Digit Blank Disable in the Attribute RAM.

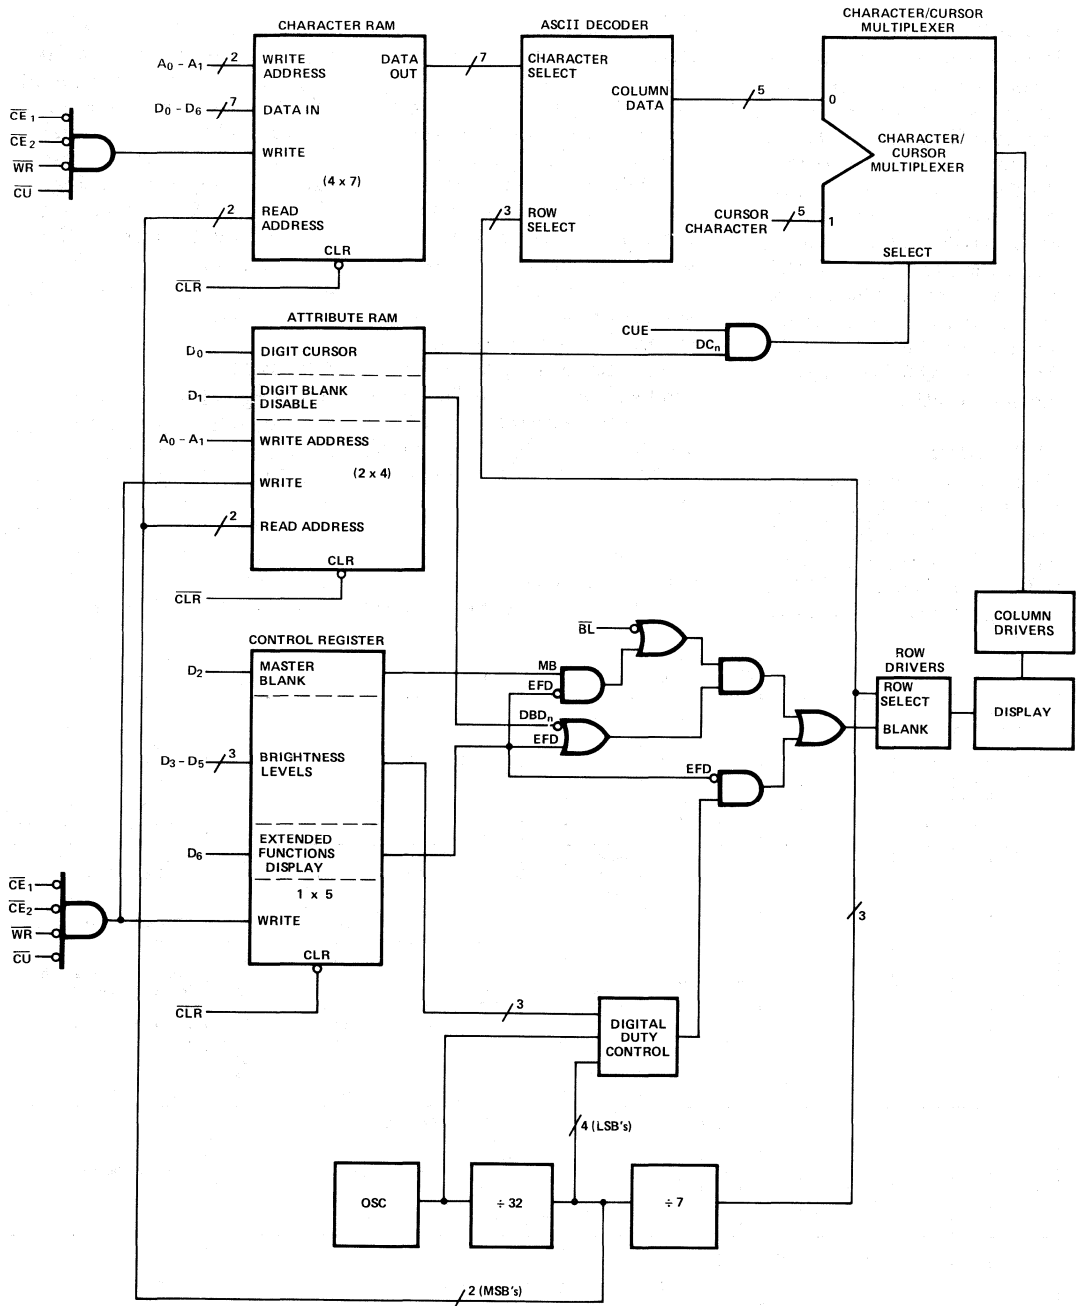

Figure 1. Internal Block Diagram

## Display Clear

Data stored in the Character RAM, Control Register, and Attribute RAM will be cleared if the clear ( $\overline{CLR}$ ) is held low for a minimum of 10  $\mu$ s. Note that the display will be cleared regardless of the state of the chip enables ( $\overline{CE}_1, \overline{CE}_2$ ). After the display is cleared, the ASCII code for a space (20hex) is loaded into all character RAM locations and 00hex is loaded into all Attribute RAM/Control Register memory locations.

## Data Entry

Figure 2 shows a truth table for the HDLX-2416 display. Setting the chip enables ( $\overline{CE}_1, \overline{CE}_2$ ) to logic 0 and the cursor select ( $\overline{CU}$ ) to logic 1 will enable ASCII data loading. When cursor select

( $\overline{CU}$ ) is set to logic 0, data will be loaded into the Control Register and Attribute RAM. Address inputs  $A_0-A_1$  are used to select the digit location in the display. Data inputs  $D_0-D_6$  are used to load information into the display. Data will be latched into the display on the rising edge of the  $\overline{WR}$  signal.  $D_0-D_6, A_0-A_1, \overline{CE}_1, \overline{CE}_2$ , and  $\overline{CU}$  must be held stable during the write cycle to ensure that correct data is stored into the display. Data can be loaded into the display in any order. Note that when  $A_0$  and  $A_1$  are logic 0, data is stored in the right most display location.

## Cursor

When cursor enable (CUE) is a logic 1, a cursor will be displayed

in all digit locations where a logic 1 has been stored in the Digit Cursor memory in the Attribute RAM. The cursor consists of all 35 dots ON at half brightness. A flashing cursor can be displayed by pulsing CUE. When CUE is a logic 0, the ASCII data stored in the Character RAM will be displayed regardless of the Digit Cursor bits.

## Blanking

Blanking of the display is controlled through the  $\overline{BL}$  input, the Control Register and Attribute RAM. The user can achieve a variety of functions by using these controls in different combinations, such as full hardware display blank, software blank, blanking of individual charac-

CUE	$\overline{BL}$	$\overline{CLR}$	$\overline{CE}_1$	$\overline{CE}_2$	$\overline{WR}$	$\overline{CU}$	$A_1$	$A_0$	$D_6$	$D_5$	$D_4$	$D_3$	$D_2$	$D_1$	$D_0$	Function					
0	1	1														Display ASCII

0 = Logic 0; 1 = Logic 1; X = Do Not Care

Figure 2. Display Truth Table

ters, and synchronized flashing of individual characters or entire display (by strobing the blank input). All of these blanking modes affect only the output drivers, maintaining the contents and write capability of the internal RAMs and Control Register, so that normal loading of RAMs and Control Register can take place even with the display blanked.

Figure 3 shows how the Extended Function Disable (bit  $D_6$  of the Control Register), Master Blank (bit  $D_2$  of the Control Register), Digit Blank Disable (bit  $D_1$  of the Attribute RAM), and  $\overline{BL}$  input can be used to blank the display.

When the Extended Function Disable is a logic 1, the display can be blanked only with the  $\overline{BL}$  input. When the Extended Function Disable is a logic 0, the display can be blanked through the  $\overline{BL}$  input, the Master Blank, and the Digit Blank Disable. The entire display will be blanked if either the  $\overline{BL}$  input is logic 0 or the Master Blank is logic 1, providing all Digit Blank Disable bits are logic 0. Those digits with Digit Blank Disable bits a logic 1 will ignore

EFD	MB	DBD <sub>n</sub>	$\overline{BL}$	
0	0	0	0	Display Blanked by $\overline{BL}$
0	0	X	1	Display ON
0	X	1	0	Display Blanked by $\overline{BL}$ . Individual characters "ON" based on "1" being stored in DBD <sub>n</sub>
0	1	0	X	Display Blanked by MB
0	1	1	1	Display Blanked by MB. Individual characters "ON" based on "1" being stored in DBD <sub>n</sub>
1	X	X	0	Display Blanked by $\overline{BL}$
1	X	X	1	Display ON

Figure 3. Display Blanking Truth Table

both blank signals and remain ON. The Digit Blank Disable bits allow individual characters to be blanked or flashed in synchronization with the  $\overline{BL}$  input.

### Dimming

Dimming of the display is controlled through either the  $\overline{BL}$  input or the Control Register. A pulse width modulated signal can be applied to the  $\overline{BL}$  input to dim the display. A three bit word in the Control Register generates an internal pulse width modulated signal to dim the display. The internal

dimming feature is enabled only if the Extended Function Disable is a logic 0.

Bits 3-5 in the Control Register provide internal brightness control. These bits are interpreted as a three bit binary code, with code (000) corresponding to the maximum brightness and code (111) to the minimum brightness. In addition to varying the display brightness, bits 3-5 also vary the average value of  $I_{DD}$ .  $I_{DD}$  can be specified at any brightness level as shown in Table 1:

Table 1. Current Requirements at Different Brightness Levels

Symbol	$D_5$	$D_4$	$D_3$	Brightness	25°C Typ.	25°C Max.	Max. over Temp.	Units
$I_{DD}(\#)$	0	0	0	100%	110	130	160	mA
	0	0	1	60%	66	79	98	mA
	0	1	0	40%	45	53	66	mA
	0	1	1	27%	30	37	46	mA
	1	0	0	17%	20	24	31	mA
	1	0	1	10%	12	15	20	mA
	1	1	0	7%	9	11	15	mA
	1	1	1	3%	4	6	9	mA

**Figure 4. Intensity Modulation Control Using an Astable Multivibrator (reprinted with permission from *Electronics* magazine, Sept. 19, 1974, VNU Business pub. Inc.)**

Figure 4 shows a circuit designed to dim the display from 98% to 2% by pulse width modulating the BL input. A logarithmic or a linear potentiometer may be used to adjust the display intensity. However, a logarithmic potentiometer matches the response of the human eye and therefore provides better resolution at low intensities. The circuit frequency should be designed to operate at 10 kHz or higher. Lower frequencies may cause the display to flicker.

### Extended Function Disable

Extended Function Disable (bit  $D_6$  of the Control Register) disables the extended blanking and dimming functions in the HDLX-2416. If the Extended Function Disable is a logic 1, the internal brightness control, Master Blank, and Digit Blank Disable bits are ignored. However the BL input and Cursor control are still active. This allows downward compatibility to the HPDL-2416.

### Mechanical and Electrical Considerations

The HDLX-2416 is an 18 pin DIP package that can be stacked horizontally and vertically to create arrays of any size. The HDLX-2416 is designed to operate continuously from  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  for all possible input conditions.

The HDLX-2416 is assembled by die attaching and wire bonding 140 LEDs and a CMOS IC to a high temperature printed circuit board. A polycarbonate lens is placed over the PC board creating an air gap environment for the LED wire bonds. Backfill epoxy environmentally seals the display package. This package construction makes the display highly tolerant to temperature cycling and allows wave soldering.

The inputs to the CMOS IC are protected against static discharge and input current latchup. However, for best results standard CMOS handling precautions should be used. Prior to use, the HDLX-2416 should be stored in anti-static tubes or conductive material. During assembly a grounded conductive work area should be used, and assembly personnel should wear conductive wrist straps. Lab coats made of synthetic material should be avoided since they are prone to static charge build-up.

Input current latchup is caused when the CMOS inputs are subjected either to a voltage below ground ( $V_{in} < \text{ground}$ ) or to a voltage higher than  $V_{DD}$  ( $V_{in} > V_{DD}$ ) and when a high current is forced into the input. To prevent input current latchup and ESD

damage, unused inputs should be connected either to ground or to  $V_{DD}$ . Voltages should not be applied to the inputs until  $V_{DD}$  has been applied to the display. Transient input voltages should be eliminated.

### Soldering and Post Solder Cleaning Instructions for the HDLX-2416

The HDLX-2416 may be hand soldered or wave soldered with SN63 solder. When hand soldering it is recommended that an electronically temperature controlled and securely grounded soldering iron be used. For best results, the iron tip temperature should be set at  $315^{\circ}\text{C}$  ( $600^{\circ}\text{F}$ ). For wave soldering, a rosin-based RMA flux can be used. The solder wave temperature should be set at  $245^{\circ}\text{C} \pm 5^{\circ}\text{C}$  ( $473^{\circ}\text{F} \pm 9^{\circ}\text{F}$ ), and dwell in the wave should be set between 1 1/2 to 3 seconds for optimum soldering. The preheat temperature should not exceed  $110^{\circ}\text{C}$  ( $230^{\circ}\text{F}$ ) as measured on the solder side of the PC board.

Post solder cleaning may be performed with a solvent or aqueous process. For solvent cleaning, Allied Chemical's Genesolv DES, or DuPont's Freon TE may be used. These solvents are azeotropes of trichlorotrifluoroethane FC-113 with low concentrations of ethanol (5%). The maximum exposure time in the solvent vapors at boiling temperature should not exceed 2 minutes. Parts should not be handled until dry and cool. Solvents containing high concentrations of alcohols such as methanol, ketones such as acetone or chlorinated solvent should not

be used as they will chemically attack the polycarbonate lens. Solvents containing trichloroethane FC-111 or FC-112 and trichloroethylene (TCE) are also not recommended.

An aqueous cleaning process may be used. A saponifier, such as Kester bio-kleen Formula 5799 or its equivalent, may be added to the wash cycle of an aqueous process to remove rosin flux residues. Organic acid flux residues must be thoroughly removed by an aqueous cleaning process to prevent corrosion of the leads and solder connections. The optimum water temperature is 60°C (140°F). The maximum cumulative exposure of the HDLX-2416 to wash and rinse cycles should not exceed 15 minutes. For additional information on soldering and post solder cleaning, see Application Note 1027.

### **Contrast Enhancement**

The objective of contrast enhancement is to provide good

readability in the end user's ambient lighting conditions. The concept is to employ both luminance and chrominance contrast techniques. These enhance readability by having the OFF-dots blend into the display background and the ON-

dots vividly stand out against the same background. Contrast enhancement may be achieved by using one of the following filters listed below. For additional information on contrast enhancement, see Application Note 1015.

# Four Character Smart Alphanumeric Display

## Technical Data

**HPDL-1414**  
**HPDL-2416**

### Features

- **Smart Alphanumeric Display**  
Built-in RAM, ASCII Decoder and LED Drive Circuitry
- **Wide Operating Temperature Range**  
-40°C to +85°C
- **Fast Access Time**  
160 ns
- **Excellent ESD Protection**  
Built-in Input Protection Diodes
- **CMOS IC for Low Power Consumption**
- **Full TTL Compatibility Over Operating Temperature Range**  
 $V_{IL} = 0.8 \text{ V}$   
 $V_{IH} = 2.0 \text{ V}$
- **Wave Solderable**
- **Rugged Package Construction**
- **End-Stackable**
- **Wide Viewing Angle**

### Description

The HPDL-1414 and 2416 are smart, four character, sixteen-segment, red GaAsP displays. The HPDL-1414 has a character height of 2.85 mm (0.112"). The

HPDL-2416 has a character height of 4.10 mm (0.160"). The on-board CMOS IC contains memory, ASCII decoder, multiplexing circuitry and drivers. The monolithic LED characters are magnified by an immersion lens which increases both character size and luminous intensity. The encapsulated dual-in-line package provides a rugged, environmentally sealed unit.

The HPDL-1414 and 2416 incorporate many improvements over competitive products. They have a wide operating temperature range, very fast IC access time, and improved ESD protection. The displays are also fully TTL compatible, wave solderable, and highly reliable. These displays are ideally suited for industrial and commercial applications where a good-looking, easy-to-use alphanumeric display is required.

### Typical Applications

- **Portable Data Entry Devices**
- **Medical Equipment**
- **Process Control Equipment**
- **Test Equipment**
- **Industrial Instrumentation**
- **Computer Peripherals**
- **Telecommunication Instrumentation**

**ESD WARNING: STANDARD CMOS HANDLING PRECAUTIONS SHOULD BE OBSERVED WITH THE HPDL-1414 AND HPDL-2416.**

## Magnified Character Font Description

## Relative Luminous Intensity vs. Temperature

**Electrical Description**  
**Display Internal Block**  
**Diagram HPDL-1414**

Figure 1 shows the internal block diagram of the HPDL-1414. It consists of two parts: the display LEDs and the CMOS IC. The CMOS IC consists of a four-word ASCII memory, a 64-word character generator, 17 segment drivers, four digit drivers, and the scanning circuitry necessary to multiplex the four monolithic LED characters. In normal

operation, the divide-by-four counter sequentially accesses each of the four RAM locations and simultaneously enables the appropriate display digit driver. The output of the RAM is decoded by the character generator which, in turn, enables the appropriate display segment drivers. Seven-bit ASCII data is stored in RAM. Since the display uses a 64-character decoder, half of the possible 128 input combinations are invalid. For each display location where  $D_5 = D_6$  in the

ASCII RAM, the display character is blanked.

**Data Entry HPDL-1414**

Figure 2 shows a truth table for the HPDL-1414. Data is loaded into the display through the DATA inputs ( $D_6-D_0$ ), ADDRESS inputs ( $A_1-A_0$ ), and WRITE ( $WR$ ). After a character has been written to memory, the IC decodes the ASCII data, drives the display and refreshes it without any external hardware or software.

Figure 2. HPDL-1414 Write Truth Table.

### Display Internal Block Diagram HPDL-2416

Figure 3 shows the internal block diagram for the HPDL-2416 display. The CMOS IC consists of a four-word ASCII memory, a four-word cursor memory, a 64-word character generator, 17 segment drivers, four digit drivers, and the scanning circuitry necessary to multiplex the four monolithic LED characters. In normal operation, the divide-by-four counter sequentially accesses each of the four RAM locations and simultaneously enables the appropriate display digit driver. The output of the RAM is decoded by the character generator which, in turn, enables the appropriate display segment drivers. For each display location, the cursor enable (CUE) selects whether the data from the ASCII RAM (CUE = 0) or the stored cursor (CUE = 1) is to be displayed. The cursor character is denoted by all sixteen segments and the DP ON. Seven-bit ASCII data is stored in RAM. Since the display utilizes a 64-character decoder, half of the possible 128 input combinations are invalid. For each display location where

$D_6 = D_5$  in the ASCII RAM, the display character is blanked. The entire display is blanked when  $BL = 0$ .

Data is loaded into the display through the data inputs ( $D_6 - D_0$ ), address inputs ( $A_1, A_0$ ), chip enables ( $CE_1, CE_2$ ), cursor select ( $\overline{CU}$ ), and write ( $\overline{WR}$ ). The cursor select ( $\overline{CU}$ ) determines whether data is stored in the ASCII RAM ( $\overline{CU} = 1$ ) or cursor memory ( $\overline{CU} = 0$ ). When  $CE_1 = CE_2 = \overline{WR} = 0$  and  $\overline{CU} = 1$ , the information on the data inputs is stored in the ASCII RAM at the location specified by the address inputs ( $A_1, A_0$ ). When  $CE_1 = CE_2 = \overline{WR} = 0$  and  $\overline{CU} = 0$ , information on the data input,  $D_0$ , is stored in the cursor at the location specified by the address inputs ( $A_1, A_0$ ). If  $D_0 = 1$ , a cursor character is stored in the cursor memory. If  $D_0 = 0$ , a previously stored cursor character will be removed from the cursor memory.

If the clear input ( $\overline{CLR}$ ) equals zero for one internal display cycle (4 ms minimum), the data in the ASCII RAM will be rewritten with zeros and the display will be blanked. Note

that the blanking input ( $\overline{BL}$ ) must be equal to logical one during this time.

### Data Entry HPDL-2416

Figure 4 shows a truth table for the HPDL-2416 display. Setting the chip enables ( $CE_1, CE_2$ ) to their low state and the cursor select ( $\overline{CU}$ ) to its high state will enable data loading. The desired data inputs ( $D_6 - D_0$ ) and address inputs ( $A_1, A_0$ ) as well as the chip enables ( $CE_1, CE_2$ ) and cursor select ( $\overline{CU}$ ) must be held stable during the write cycle to ensure that the correct data is stored into the display. Valid ASCII data codes are shown in Figure 1. The display accepts standard seven-bit ASCII data. Note that  $D_6 \neq D_5$  for the codes shown in Figure 4. If  $D_6 = D_5$  during the write cycle, then a blank will be stored in the display. Data can be loaded into the display in any order. Note that when  $A_1 = A_0 = 0$ , data is stored in the furthest right-hand display location.

### Cursor Entry HPDL-2416

As shown in Figure 4, setting the chip enables ( $CE_1, CE_2$ ) to their low state and the cursor select ( $\overline{CU}$ ) to its low state will enable cursor loading. The cursor character is indicated by the display symbol having all 16 segments and the DP ON. The least significant data input ( $D_0$ ), the address inputs ( $A_1, A_0$ ), the chip enables ( $CE_1, CE_2$ ), and the cursor select ( $\overline{CU}$ ) must be held stable during the write cycle to ensure that the correct data is stored in the display. If  $D_0$  is in a low state during the write cycle, then a cursor character will be removed at the indicated location. If  $D_0$  is in a high state during the write

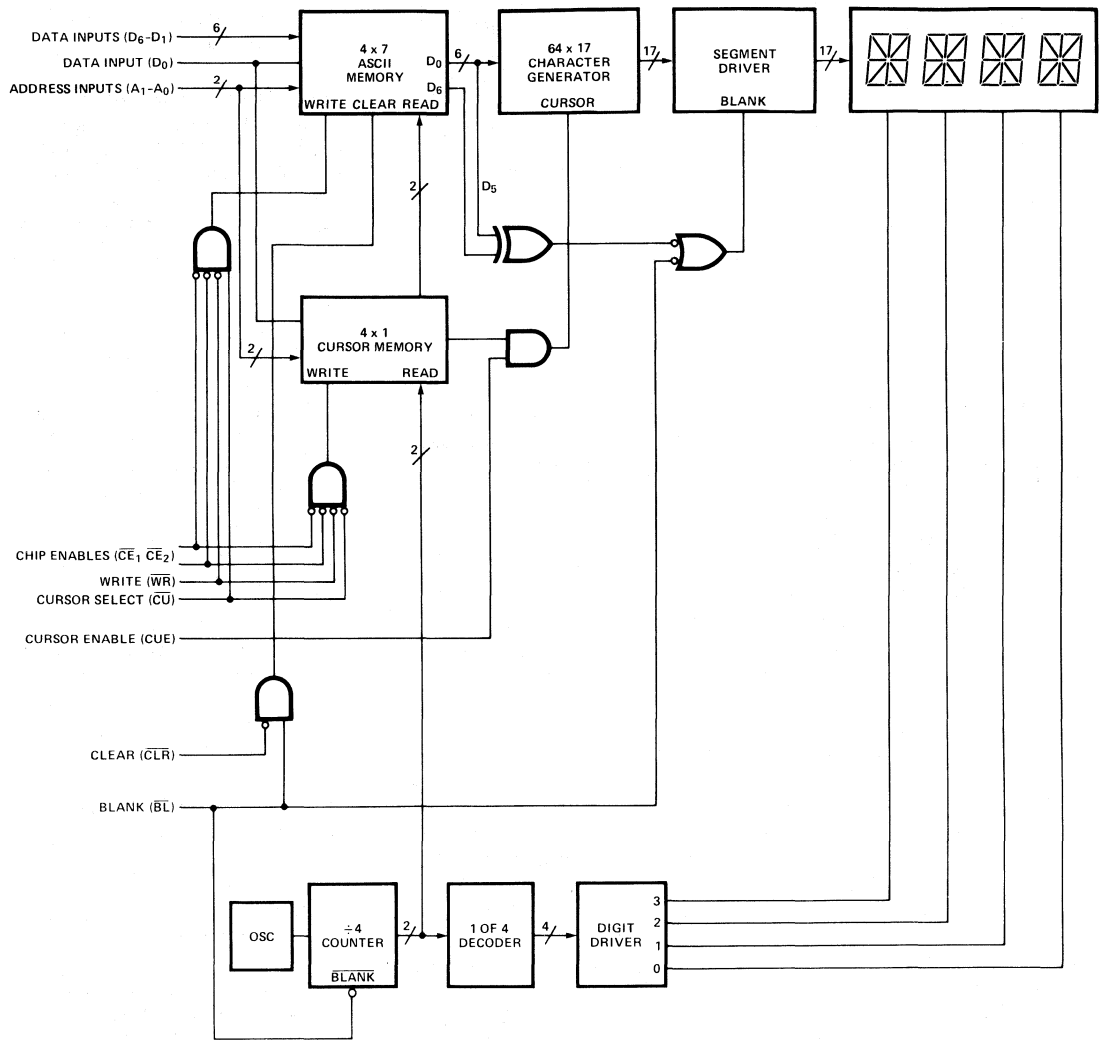

Figure 3. HPDL-2416 Internal Block Diagram.

cycle, then a cursor character will be stored at the indicated location. The presence or absence of a cursor character does not affect the ASCII data stored at that location. Again, when  $A_1 = A_0 = 0$ , the cursor character is stored in the furthest right-hand display location.

All stored cursor characters are displayed if the cursor enable (CUE) is high. Similarly, the stored ASCII data words are displayed, regardless of the cursor characters, if the cursor enable (CUE) is low. The cursor enable (CUE) has no effect on the storage or removal of the cursor characters within the display. A flashing cursor is

displayed by pulsing the cursor enable (CUE). For applications not requiring a cursor, the cursor enable (CUE) can be connected to ground and the cursor select (CU) can be connected to  $V_{CC}$ . This inhibits the cursor function and allows only ASCII data to be loaded into the display.

SOLID STATE DISPLAYS

### Display Clear HPDL-2416

As shown in Figure 4, the ASCII data stored in the display will be cleared if the clear (CLR) is held low and the blanking input (BL) is held high for 4 ms minimum. The cursor memory is not affected by the clear (CLR) input. Cursor characters can be stored or removed even while the clear (CLR) is low. Note that the display will be cleared regardless of the state of the chip enables ( $\overline{CE}_1$ ,  $\overline{CE}_2$ ). However, to ensure that all four display characters are cleared, CLR should be held low for 4 ms following the last write cycle.

### Display Blank HPDL-2416

As shown in Figure 4, the display will be blanked if the blanking input (BL) is held low. Note that the display will be blanked regardless of the state of the chip enables ( $\overline{CE}_1$ ,  $\overline{CE}_2$ ) or write (WR) inputs. The ASCII data stored in the display and the cursor memory are not affected by the blanking input. ASCII data and cursor data can be stored even while the blanking input (BL) is low. Note that while the blanking input (BL) is low, the clear (CLR) function is inhibited. A flashing display can be obtained by applying a low frequency square wave to the blanking input (BL). Because the blanking input (BL) also resets the internal display multiplex counter, the frequency applied to the blanking input (BL) should be much slower than the display multiplex rate. Finally, dimming of the display through the blanking input (BL) is not recommended.

For further application information please consult Application Note 1026.

### Optical Considerations/ Contrast Enhancement

The HPDL-1414 and HPDL-2416 displays use a precision aspheric immersion lens to provide excellent readability and low off-axis distortion. For the HPDL-1414, the aspheric lens produces a magnified character height of 2.85 mm (0.112 in.) and a viewing angle of  $\pm 40^\circ$ . For the HPDL-2416, the aspheric lens produces a magnified character height of 4.1 mm (0.160 in.) and a viewing angle of  $\pm 50^\circ$ . These features provide excellent readability at distances up to 1.5 metres (4 feet) for the HPDL-1414 and 2 metres (6 feet) for the HPDL-2416.

Each HPDL-1414/2416 display is tested for luminous intensity and marked with an intensity category on the side of the display package. To ensure intensity matching for multiple package applications, mixing intensity categories for a given panel is not recommended.

The HPDL-1414/2416 display is designed to provide maximum contrast when placed behind an appropriate contrast enhancement filter. Some suggested filters are Panelgraphic Ruby Red 60, Panelgraphic Dark Red 63, SGL Homalite H100-1650, Rohm and Haas 2423, Chequers Engraving 118, and 3M R6510. For further information on contrast enhancement, see Hewlett-Packard Application Note 1015.

### Mechanical and Electrical Considerations

The HPDL-1414/2416 are dual in-line packages that can be stacked horizontally and

vertically to create arrays of any size. These displays are designed to operate continuously between  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$  with a maximum of 10 segments on per digit.

During continuous operation of all four Cursors the operating temperature should be limited to  $-40^\circ\text{C}$  to  $+55^\circ\text{C}$ . At temperatures above  $+55^\circ\text{C}$ , the maximum number of Cursors illuminated continuously should be reduced as follows: No Cursors illuminated at operating temperatures above  $75^\circ\text{C}$ . One Cursor can be illuminated continuously at operating temperatures below  $75^\circ\text{C}$ . Two Cursors can be illuminated continuously at operating temperatures below  $68^\circ\text{C}$ . Three Cursors can be illuminated continuously at operating temperatures below  $60^\circ\text{C}$ .

The HPDL-1414/2416 are assembled by die attaching and wire bonding the four GaAsP/GaAs monolithic LED chips and the CMOS IC to a high temperature printed circuit board. An immersion lens is formed by placing the PC board assembly into a nylon lens filled with epoxy. A plastic cap creates an air gap to protect the CMOS IC. Backfill epoxy environmentally seals the display package. This package construction provides the display with a high tolerance to temperature cycling.

The inputs to the CMOS IC are protected against static discharge and input current latchup. However, for best results standard CMOS handling precautions should be used. Prior to use, the HPDL-1414/2416 should be stored in

anti-static tubes or conductive material. During assembly a grounded conductive work area should be used, and assembly personnel should wear conductive wrist straps. Lab coats made of synthetic material should be avoided since they are prone to static charge build-up. Input current latchup is caused when the CMOS inputs are subjected either to a voltage below ground ( $V_{IN} < \text{ground}$ ) or to a voltage higher than  $V_{DD}$  ( $V_{IN} > V_{DD}$ ) and when a high current is forced into the input. To prevent input current latchup and ESD damage, unused inputs should be connected either to ground or to  $V_{DD}$ . Voltages should not be applied to the inputs until  $V_{DD}$  has been applied to the display. Transient input voltages should be eliminated.

### **Soldering and Post Solder Cleaning Instructions**

The HPDL-1414/2416 may be hand soldered or wave soldered with SN63 solder. Hand soldering may be safely performed only with an electronically temperature-controlled and securely grounded soldering iron. For best results, the iron tip temperature should be set at 315°C (600°F). For wave soldering, a rosin-based RMA flux can be used. The solder wave temperature should be 245°C ± 5°C (473°F ± 9°F), and the dwell in the wave should be set at 1-1/2 to 3 seconds for optimum soldering. Preheat temperature should not exceed 93°C (200°F) as measured on the solder side of the PC board.

Post solder cleaning may be performed with a solvent or aqueous process. For solvent cleaning, Allied Chemical Genesolv DES, Baron Blakeslee Blaco-Tron TES or DuPont Freon TE can only be used. These solvents are azeotropes of trichlorotrifluoroethane FC-113 with low concentrations of ethanol (5%). The maximum exposure time in the solvent vapors at boiling temperature should not exceed 2 minutes. Solvents containing high concentrations of alcohols, pure alcohols, isopropanol or acetone should not be used as they will chemically attack the nylon lens. Solvents containing trichloroethane FC-111 or FC-112 and trichloroethylene (TCE) are not recommended.

An aqueous cleaning process is highly recommended. A saponifier, such as Kester-Bio-kleen Formula 5799 or equivalent, may be added to the wash cycle of an aqueous process to remove rosin flux residues. Organic acid flux residues must be thoroughly removed by an aqueous cleaning process to prevent corrosion of the leads and solder connections. The optimum water temperature is 60°C (140°F). The maximum cumulative exposure of the HPDL-2416 to wash and rinse cycles should not exceed 15 minutes.

# CMOS 5x7 Alphanumeric Displays

## Technical Data

### HCMS-200X Series HCMS-230X Series

#### Features

- **On-Board Low Power CMOS IC:**  
Integrated Shift Register with Constant Current LED Drivers
- **Wide Operating Temperature Range:**  
-40°C to +85°C
- **Compact Glass Ceramic 4 Character Package:**  
HCMS-200X Series End Stackable  
HCMS-230X Series X-Y Stackable
- **Five Colors:**  
Standard Red  
High Efficiency Red  
Orange  
Yellow  
High Performance Green
- **5 X 7 LED Matrix Displays Full ASCII Set**
- **Two Character Heights:**  
3.8mm (0.15 inch)  
5.0mm (0.20 inch)
- **Wide Viewing Angle:**  
X Axis =  $\pm 50^\circ$   
Y Axis =  $\pm 65^\circ$
- **Long Viewing Distance:**  
HCMS-200X Series to 2.6 Meters (8.6 Feet)  
HCMS-230X Series to 3.5 Meters (11.5 Feet)
- **Categorized for Luminous Intensity**

- **HCMS-2001/-2003, HCMS-2301/-2303:**  
Categorized for Color

#### Typical Applications

- **Commercial Avionics**
- **Instrumentation**
- **Medical Instruments**
- **Business Machines**

#### Description

The HCMS-200X and HCMS-230X series are 5x7 LED four character displays contained in 12 pin dual-in-line packages designed for displaying alphanumeric information. The character height for the HCMS-200X series displays is 3.8mm (0.15

inch), and for the HCMS-230X series displays the character height is 5.0mm (0.20 inch). These displays are available in all five LED colors: standard red, high efficiency red, orange, yellow and high performance green. The HCMS-200X series displays are end stackable and the HCMS-230X series displays are end/row stackable.

#### Display Selection Table

Part Number	Character Size	LED Color
HCMS-2000	3.8 mm (0.15 inch)	Standard Red
HCMS-2001	3.8 mm (0.15 inch)	Yellow
HCMS-2002	3.8 mm (0.15 inch)	High-Efficiency Red
HCMS-2003	3.8 mm (0.15 inch)	High-Performance Green
HCMS-2004	3.8 mm (0.15 inch)	Orange
HCMS-2300	5.0 mm (0.20 inch)	Standard Red
HCMS-2301	5.0 mm (0.20 inch)	Yellow
HCMS-2302	5.0 mm (0.20 inch)	High-Efficiency Red
HCMS-2303	5.0 mm (0.20 inch)	High-Performance Green
HCMS-2304	5.0 mm (0.20 inch)	Orange

ESD WARNING: STANDARD CMOS HANDLING PRECAUTIONS SHOULD BE OBSERVED.

These displays are designed with on-board CMOS integrated circuits for use in applications where conservation of power is important. The two CMOS ICs form an on-board serial-in-parallel-out 28-bit shift register with constant current output LED row drivers. Decoded column data is clocked into the

on-board shift register for each refresh cycle. Full character display is achieved with external column strobing.

### Compatibility with HDSP-200X/230X TTL IC Series Displays

The HCMS-200X, HCMS-230X CMOS IC displays are "drop-in"

replacements for the equivalent HDSP-200X, HDSP-230X TTL IC displays. The 12 pin glass/ceramic package configuration, four digit character matrix and pin functions are identical.

### Package Dimensions

\* DO NOT CONNECT OR USE

- NOTES:
1. DIMENSIONS IN MILLIMETRES (INCHES)
  2. UNLESS OTHERWISE SPECIFIED THE TOLERANCE ON ALL DIMENSIONS IS ±0.38mm (±0.015).
  3. CHARACTERS ARE CENTERED WITH RESPECT TO LEADS WITHIN ±0.13mm (±0.005").
  4. LEAD MATERIAL IS COPPER ALLOY, SOLDER DIPPED.

### HCMS-230X Series

## Absolute Maximum Ratings

Supply Voltage $V_{DD}$ to Ground	-0.3 V to 7.0 V
Data Input, Data Output, $V_B$	-0.3 V to $V_{DD}$
Column Input Voltage, $V_{COL}$	-0.3 V to $V_{DD}$
Free Air Operating Temperature Range, $T_A$	-40°C to +85°C
Storage Temperature Range, $T_S$	-55°C to +100°C
Maximum Allowable Package Power Dissipation, $P_D$ <sup>(1,2)</sup>	
HCMS-2000/-2001/-2002/-2003/-2004 at $T_A = 78^\circ\text{C}$	0.79 Watts
HCMS-2300 at $T_A = 85^\circ\text{C}$	0.79 Watts
HCMS-2301/-2302/-2303/-2304 at $T_A = 85^\circ\text{C}$	0.92 Watts
Maximum Solder Temperature	
1.59 mm (0.063") Below Seating Plane, $t < 5$ sec	260°C
ESD Protection @ 1.5 k $\Omega$ , 100 pF	$V_Z = 4$ kV (each pin)

### Notes:

- Maximum allowable power dissipation is derived from  $V_{DD} = 5.25$  V,  $V_B = 2.4$  V,  $V_{COL} = 3.5$  V, 20 LEDs on per character, 20% DF.
- The power dissipation for these displays should be derated as follows:  
 HCMS-200X series derate above 78°C at 18 mW/°C,  $R\theta_{JA} = 60^\circ\text{C/W}$ .  
 HCMS-230X series may be operated without derating up to  $T_A = 85^\circ\text{C}$ ,  
 $R\theta_{JA} = 45^\circ\text{C/W}$ .  
 Deratings based on  $R\theta_{PC,A} = 35^\circ\text{C/W}$  per display for printed circuit board assembly.  
 See Figure 1 for power derating.

## Recommended Operating Conditions Over Operating Temperature Range (-40°C to +85°C)

Parameter	Symbol	Min.	Typ.	Max.	Units
Supply Voltage	$V_{DD}$	4.75	5.00	5.25	V
Data Out Current, Low State	$I_{OL}$			1.6	mA
Data Out Current, High State	$I_{OH}$			-0.5	mA
Column Input Voltage	$V_{COL}$	2.75	3.0	3.5	V
Setup Time	$t_{SETUP}$	10			ns
Hold Time	$t_{HOLD}$	25			ns
Clock Pulse Width High	$t_{WH(CLOCK)}$	50			ns
Clock Pulse Width Low	$t_{WL(CLOCK)}$	50			ns
Clock High to Low Transition	$t_{THL}$			200	ns
Clock Frequency	$f_{CLOCK}$			5	MHz

\*All typical values specified at  $V_{DD} = 5.0 \text{ V}$  and  $T_A = 25^{\circ}\text{C}$ .

### Notes:

- $I_{DD}$  Dynamic is the IC current while clocking column data through the on-board shift register at a clock frequency of 5MHz, the display is not illuminated.
- $I_{DD}$  Static is the IC current after column data is loaded and not being clocked through the on-board shift register.
- Four characters are illuminated with a typical ASCII character composed of 15 dots per character.
- IC junction temperature  $T_J(\text{IC}) = (P_D)(R\theta_{J-PIN} + R\theta_{PC-A}) + T_A$

**Notes:**

- These LED displays are categorized for luminous intensity, with the intensity category designated by a letter code on the back of the package.
- The HCMS-2001/-2301 and HCMS-2003/-2303 are categorized for color with the color category designated by a number on the back of the package.
- $T_i$  refers to the initial case temperature of the display immediately prior to the light measurement.
- Dominant wavelength,  $\lambda_d$ , is derived from the CIE Chromaticity Diagram, and represents the single wavelength which defines the color of the device.
- The luminous sterance of the individual LED pixels may be calculated using the following equations:

$$L_v(\text{cd/m}^2) = I_v(\text{Candela}) * \text{DF} / \text{A}(\text{Metre})^2$$

$$L_v(\text{Footlamberts}) = \pi I_v(\text{Candela}) * \text{DF} / \text{A}(\text{Foot})^2$$

Where: A = LED pixel area =  $5.3 \times 10^{-8}\text{M}^2$  or  $5.8 \times 10^{-7}\text{ft}^2$   
DF = LED on-time duty factor

## Electrical Description

Each display device contains four 5x7 LED dot matrix characters and two CMOS integrated circuits, as shown in Figure 4. The two CMOS integrated circuits form an on-board 28 bit serial-in-parallel-out shift register that will accept standard TTL logic levels. The Data Input, pin 12, is connected to bit position 1 and the Data Output, pin 7, is connected to bit position 28. The shift register outputs control constant current sinking LED row drivers. The nominal current sink per LED driver is 11mA for the HCMS-200X displays, 13 mA for the HCMS-230X. A logic 1 stored in the shift register enables the corresponding LED row driver and a logic 0 stored in the shift register disables the corresponding LED row driver.

The electrical configuration of these CMOS IC alphanumeric displays allows for an effective

interface to a display controller circuit that supplies decoded character information. The row data for a given column (one 7 bit byte per character) is loaded (bit serial) into the on-board 28 bit shift register with high to low transitions of the Clock input. To load decoded character information into the display, column data for character 4 is loaded first and the column data for character 1 is loaded last in the following manner. The 7 data bits for column 1, character 4, are loaded into the on-board shift register. Next, the 7 data bits for column 1, character 3, are loaded into the shift register, shifting the character 4 data over one character position. This process is repeated for the other two characters until all 28 bits of column data (four 7 bit bytes of character column data) are loaded into the on-board shift register. Then the column 1 input,  $V_{\text{COL}}$  pin 1, is energized to illuminate column 1 in all

four characters. This process is repeated for columns 2, 3, 4 and 5. All  $V_{\text{COL}}$  inputs should be at logic low to insure the display is off when loading data. The display will be blanked when the blanking input  $V_B$ , pin 8, is at logic low regardless of the outputs of the shift register or whether one of the  $V_{\text{COL}}$  inputs is energized.

Refer to Application Note 1016 for drive circuit information.

## ESD Susceptibility

The HCMS-200X/-230X series displays have an ESD susceptibility ratings of CLASS 3 per DOD-STD-1686 and CLASS B per MIL-STD-883C. It is recommended that normal CMOS handling precautions be observed with these devices.

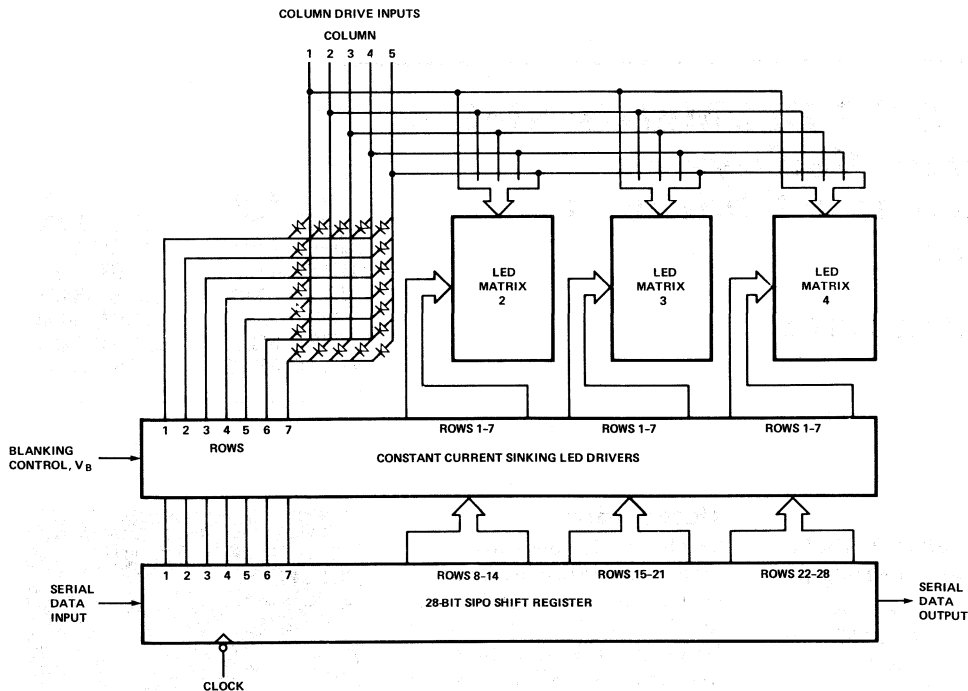

Figure 4. Block Diagram of an HCMS-2XXX Series LED Alphanumeric Display.

### Soldering and Post Solder Cleaning

These displays may be soldered with a standard wave solder process using either an RMA flux and solvent cleaning or an OA flux and aqueous cleaning. For optimum soldering, the solder wave temperature should be 245°C and the dwell time for any display lead passing through the wave should be 1 1/2 to 2 seconds. The recommended solvent for post solder cleaning is Genesolv DES, manufactured by Allied Chemical. For aqueous cleaning, a water temperature of 60°C

(140°F) with an immersion time not exceeding 15 minutes is recommended. For more detailed information, refer to Application Note 1027 *Soldering LED Components*.

### Contrast Enhancement

When used with the proper contrast enhancement filters, the HCMS-200X/-230X series displays are readable in bright ambients. Refer to Application Note 1029 *Luminous Contrast and Sunlight Readability of the HDSP-238X Series Alphanumeric Displays for Military Applications* for contrast en-

hancement in bright ambients. Refer to Application Note 1015 *Contrast Enhancement Techniques for LED Displays* for information on contrast enhancement in moderate ambients.

### Controller Circuits, Power Calculations and Display Dimming

Refer to Application Note 1016 *Using the HDSP-2000 Alphanumeric Display Family* for information on controller circuits to drive these displays, how to do power calculations and a technique for display dimming.

#### Features

- Multiple Colors Available
- Large Character Height
- 5 X 7 Dot Matrix Font
- Viewable Up to 18 Meters (26.5 mm Display)
- X-Y Stackable
- Ideal for Graphics Panels
- Available in Common Row Anode and Common Row Cathode Configurations
- AlGaAs Displays Suitable for Low Power or Bright Ambients
  - Typical Intensity 1650  $\mu$ cd at 2 mA Average Drive Current
- Categorized for Intensity
- Mechanically Rugged
- Green Categorized for Color

#### Description

The large 5 X 7 dot matrix alphanumeric display family consists of 26.5 mm (1.04 inch) and 17.3 mm (0.68 inch) character height packages. These devices have excellent viewability; the 26.5 mm character can be read at up to 18 meters (12 meters for the 0.68 inch part).

The 26.5 mm font has a 10.2 mm (0.4 inch) dual-in-line (DIP) configuration, while the 17.3 mm font has an industry standard 7.6 mm (0.3 inch) DIP configuration.

The HDSP-L203/4503 can be ordered with a smart driver IC. Information about the IC is available in the HDSP-211X

data sheet. For ordering information see the HP Smart Display Sets data sheet.

Applications include electronic instrumentation, computer peripherals, point of sale terminals, weighing scales, and industrial electronics.

## Absolute Maximum Ratings at 25°C

Description	HDSP-470X/ 440X Series	HDSP-L10X/ M10X Series	HDSP-L20X/ 450X Series	HDSP-540X/ 510X Series
Average Power per Dot ( $T_A = 25^\circ\text{C}$ ) <sup>[1]</sup>	75 mW			
Peak Forward Current per Dot ( $T_A = 25^\circ\text{C}$ ) <sup>[1,2]</sup>	125 mA	125 mA	90 mA	90 mA
Average Forward Current per Dot ( $T_A = 25^\circ\text{C}$ ) <sup>[1,3]</sup>	32 mA	23 mA	15 mA	15 mA
Operating Temperature Range	-40°C to +85°C	-20°C to +85°C	-40°C to +85°C	-20°C to +85°C
Storage Temperature Range	-40°C to +85°C			
Lead Solder Temperature (1.59 mm [0.062 in.] below seating plane)	260°C for 3 s			

### Notes:

1. Average power is based on 20 dots per character. Total package power dissipation should not exceed 1.5 W.
2. Do not exceed maximum average current per dot.
3. For the HDSP-440X/470X series displays, derate maximum average current above 35°C at 0.43 mA/°C. For the HDSP-L10X/M10X series displays, derate maximum average current above 35°C at 0.31 mA/°C. For the HDSP-L20X/450X series and HDSP-540X/510X series displays, derate maximum average current above 35°C at 0.2 mA/°C. This derating is based on a device mounted in a socket having a thermal resistance junction to ambient of 50°C/W per package.

#### Notes:

- The displays are categorized for luminous intensity with the intensity category designated by a letter on the left hand side of the package. The luminous intensity minimum and categories are determined by computing the numerical average of the individual dot intensities.
- The dominant wavelength is derived from the C.I.E. Chromaticity diagram and is that single wavelength which defines the color of the device.
- Typical specification for reference only. Do not exceed absolute maximum ratings.
- The displays are categorized for dominant wavelength with the category designated by a number adjacent to the intensity category letter.

**Figure 2. Forward Current vs. Forward Voltage.**

**Figure 3. Relative Efficiency (Luminous Intensity per Unit Dot) vs. Peak Current per Dot.**

## Operational Considerations

### Electrical Description

These display devices are composed of light emitting diodes, with the light from each LED optically stretched to form individual dots.

These display devices are well suited for strobed operation. The typical forward voltage values can be scaled from Figure 2. These values should be used to calculate the current

limiting resistor value and the typical power dissipation. Expected maximum  $V_F$  values, for driver circuit design and maximum power dissipation, may be calculated using the following  $V_F$  MAX models:

Red (HDSP-440X/470X):

$$V_F \text{ MAX} = 1.55 \text{ V} + I_{\text{Peak}} (6.5\Omega)$$

$$\text{For } I_{\text{Peak}} \geq 5 \text{ mA}$$

AlGaAs Red

(HDSP-L10X/M10X):

$$V_F \text{ MAX} = 1.8 \text{ V} + I_{\text{Peak}} (20\Omega)$$

$$\text{For } I_{\text{Peak}} \leq 20 \text{ mA}$$

$$V_F \text{ MAX} = 2.0 \text{ V} + I_{\text{Peak}} (10\Omega)$$

For  $I_{\text{Peak}} \geq 20 \text{ mA}$

HER (HDSP-450X/L20X):

$$V_F \text{ MAX} = 1.75 \text{ V} + I_{\text{Peak}} (35\Omega)$$

$$\text{For } I_{\text{Peak}} \geq 5 \text{ mA}$$

Green (HDSP-540X/510X):

$$V_F \text{ MAX} = 1.75 \text{ V} + I_{\text{Peak}} (38\Omega)$$

$$\text{For } I_{\text{Peak}} \geq 5 \text{ mA}$$

Figure 3 allows the designer to calculate the luminous intensity at different peak and average currents. The following equation calculates intensity at different peak and average currents:

$$I_V \text{AVG} = (I_F \text{AVG} / I_F \text{AVG DATA SHEET}) (\eta_{\text{peak}}) (I_V \text{ DATA SHEET})$$

Where:

$I_F \text{AVG}$  is the desired time averaged LED current.

$I_F \text{AVG DATA SHEET}$  is the time averaged data sheet test current for  $I_V \text{ DATA SHEET}$ .

$\eta_{\text{peak}}$  is the relative efficiency at the peak current, scaled from Figure 3.

$I_V \text{ DATA SHEET}$  is the time averaged data sheet luminous intensity, resulting from  $I_F \text{AVG DATA SHEET}$ .

$I_V \text{AVG}$  is the calculated time averaged luminous intensity resulting from  $I_F \text{AVG}$ .

For example, what is the luminous intensity of an AlGaAs Red (HDSP-L10X) driven at 50 mA peak 1/5 duty factor?

$$I_F \text{AVG} = 50 \text{ mA} * 0.2 = 10 \text{ mA}$$

$$I_F \text{AVG DATA SHEET} = 2 \text{ mA}$$

$$\eta_{\text{peak}} = 0.98$$

$$I_V \text{ DATA SHEET} = 1650 \mu\text{cd}$$

Therefore

$$I_V \text{AVG} = (10 \text{ mA} / 2 \text{ mA}) (0.98) (1650 \mu\text{cd}) = 8085 \mu\text{cd}$$

## Circuit Design

### Smart IC Circuit

HDSP-L203/4503 displays can be ordered with a smart IC driver. Information about the IC is available in the HDSP-211X data sheet. For ordering information see the HP Smart Displays Sets data sheet. Contact your HP field sales engineer or an authorized HP distributor for information about ordering this IC with the other parts.

Figure 4 shows how to connect one IC to drive eight 5 x 7 displays.

### Coded Data Controller

Figure 5 shows a circuit designed to display eight characters of ASCII text. ASCII coded data is stored in a local 128 x 8 RAM. After the microprocessor has loaded the RAM, this circuit provides all the necessary signals to decode and display eight characters. With minor modifications the circuit can drive up to 128 display characters. The RAM used in this circuit is an MCM6810P with the address and data inputs isolated with tristate buffers. This allows the RAM to be accessed either by the microprocessor or by the local scanning electronics. The protocol is arranged such that the microprocessor always takes precedence over the local scanning electronics.

The Motorola 6810 RAM stores 8 bytes of ASCII data which is continuously read, decoded, and displayed. The ASCII data from the RAM is decoded by the Motorola 6674 128 ASCII character decoder. The 6674 decoder has five column outputs which are gated to the Sprague UCN5832A 32-bit shift register data input via a 74LS151 multiplexer. Strobing of the display is accomplished via the 74LS90, 74LS393, and 74LS197 counter string.

The 74LS197 is used as a divide by 7 counter. Output  $Q_D$  resets the counter, sets output  $Q_A$  to logic 1, and sets outputs  $Q_B$ ,  $Q_C$ , and  $Q_D$  to logic 0. 74LS197 outputs  $Q_A$ ,  $Q_B$ , and  $Q_C$  synchronize the row drivers and the row data entry into the shift register. Row drivers are sequentially turned on and off so only one row driver is on at a given time.

The 74LS393 counter is used as a divide by 64 counter. This counter has two functions. The first is to provide the character address to be decoded. Outputs  $1Q_A$ ,  $1Q_B$ , and  $1Q_C$  supply the address to the RAM. The second is to generate a control signal. This signal simultaneously clocks the 74LS197 and disables the row drivers and shift register outputs. It also provides one of the logic signals needed to enable the system clock to clock data into the shift register. Outputs  $1Q_D$ ,  $2Q_A$ , and  $2Q_B$  are gated to create this signal. The clock is enabled for 1 count and disabled for 7 counts. Thus, the overall display duty factor is  $(7/8)(1/7) = 12.5\%$ .

The 74LS90 is connected as a divide by 5 cascaded into a divide by 2 for an effective divide by 10 counter. Outputs  $Q_B$ ,  $Q_C$ , and  $Q_D$  are used to convert the parallel output from the character generator to serial input for entry into the UCN5832 shift register. Output  $Q_A$  in combination with the system clock and the gated 74LS393 counter outputs clock data into the shift register. When character data is loaded into the shift register, output  $Q_A$  alternates between allowing data to be loaded and providing enough time for data to propagate from the 74LS393 counter through the tristate buffers, RAM, character generator, and multiplexer.

This circuit can be used with the HDSP-4701 by changing the display pin assignments. HDSP-4X03 and HDSP-5X03 devices require a change of both the shift register and drive transistors. The shift register can be changed to a Sprague

Figure 4. Low Current Circuit to Refresh Eight 5 x 7 Displays. HDSP-4503 (HDSP-L203) Display Pin Numbers Are Denoted as XX(XX).

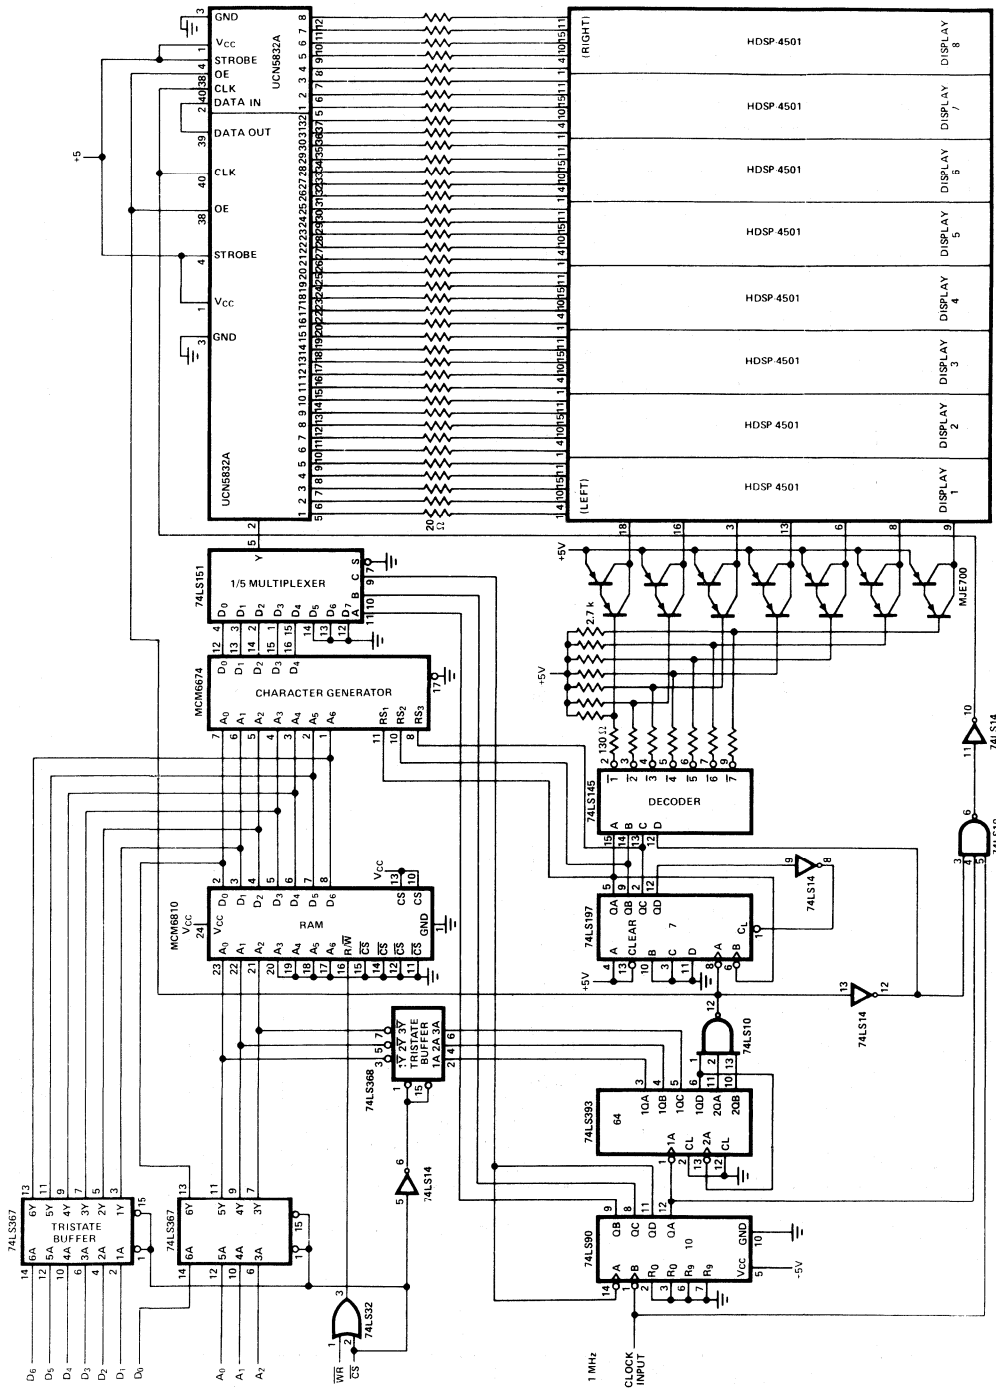

Figure 5. Coded Data Controller Circuit.

UCN-5818. This part has different pin assignments than the UCN-5832. For further details consult the Sprague data sheet. The MJE700 Darlingtons transistors need to be replaced with suitable npn Darlington transistors.

## Thermal Considerations

The device thermal resistance may be used to calculate the junction temperature of the central LED. The equation below calculates the junction temperature of the central (hottest) LED.

$$T_J = T_A + (P_D)(R_{\theta_{J-A}})(N)$$

$$P_D = (V_F \text{MAX})(I_F \text{AVG})$$

$$R_{\theta_{J-A}} = R_{\theta_{J-PIN}} + R_{\theta_{PIN-A}}$$

$T_J$  is the junction temperature of the central LED.

$T_A$  is the ambient temperature.

$P_D$  is the power dissipated by one LED.

$N$  is the number of LEDs ON per character.

$V_F \text{MAX}$  is calculated using the appropriate  $V_F$  model.

$R_{\theta_{J-A}}$  is the package thermal resistance from the central LED to the ambient.

$R_{\theta_{J-PIN}}$  is the package thermal resistance from the central LED to pin.

$R_{\theta_{PIN-A}}$  is the package thermal resistance from the pin to the ambient.

For example, what is the maximum ambient temperature an HDSP-L10X can operate with the following conditions:

$$I_{PEAK} = 125 \text{ mA}$$

$$I_{FAVG} = 10 \text{ mA}$$

$$R_{\theta_{J-A}} = 50^\circ\text{C/W}$$

$$N = 35$$

$$T_{JMAX} = 110^\circ\text{C}$$

$$V_F \text{MAX} = 2.0 \text{ V} + (0.125 \text{ A})(10)$$

$$= 3.25 \text{ V}$$

$$P_D = (3.25 \text{ V})(0.01 \text{ A})$$

$$= 0.0325 \text{ W}$$

$$T_A = 110^\circ\text{C} -$$

$$(50^\circ\text{C/W})(0.0325 \text{ W})(35)$$

$$= 53^\circ\text{C}$$

The maximum number of dots ON for the ASCII character set is 20. What is the maximum ambient temperature an HDSP-L10X can operate with the following conditions:

$$I_{PEAK} = 125 \text{ mA}$$

$$I_{FAVG} = 10 \text{ mA}$$

$$R_{\theta_{J-A}} = 50^\circ\text{C/W}$$

$$N = 20$$

$$T_{JMAX} = 110^\circ\text{C}$$

$$V_F \text{MAX} = 3.25 \text{ V}$$

$$P_D = 0.0325 \text{ W}$$

$$T_A = 110^\circ\text{C} -$$

$$(50^\circ\text{C/W})(0.0325 \text{ W})(20)$$

$$= 77^\circ\text{C}$$

Therefore, the maximum ambient temperature can be increased by reducing the average number of dots ON from 35 to 20 dots ON per display.

## Contrast Enhancement

The objective of contrast enhancement is to provide good display readability in the end use ambient light. The concept is to employ both luminance and chrominance contrast techniques to enhance the readability. This is accomplished by having the OFF dots blend into the display background and the ON dots stand out vividly against this same background. Therefore, these display devices are assembled with a gray package and matching encapsulating epoxy in the dots.

Contrast enhancement may be achieved by using one of the

following suggested filters:

HDSP-440X/470X/L10X/M10X  
Panelgraphic RUBY RED 60  
SGL-HOMALITE H100-1605  
RED

3M Louvered Filter R6610 RED  
OR N0210 GRAY

HDSP-450X/L20X  
Panelgraphic SCARLET RED  
65

SGL-Homalite H100-1670 RED  
or H100-1250 GRAY  
3M Louvered Filter R6310 RED  
or N0210 GRAY

HDSP-540X/510X  
Panelgraphic GREEN 48  
SGL-Homalite H100-1440  
GREEN or H100-1250 GRAY  
3M Louvered Filter YG5610  
GREEN or N0210 GRAY

For further information on contrast enhancement please see Application Note 1015.

For further information on soldering LEDs please refer to Application Note 1027.

### Features

- **Low Power Consumption**
- **Industry Standard Size**
- **Industry Standard Pinout**
- **Choice of Character Size**  
7.6 mm (0.30 in), 10 mm (0.40 in), 10.9 mm (0.43 in), 14.2 mm (0.56 in), 20 mm (0.8 in)
- **Choice of Colors**  
AlGaAs Red, High Efficiency Red (HER), Yellow, Green
- **Excellent Appearance**  
Evenly Lighted Segments  
 $\pm 50^\circ$  Viewing Angle
- **Design Flexibility**  
Common Anode or Common Cathode  
Single and Dual Digits  
Left and Right Hand Decimal Points  
 $\pm 1$ . Overflow Character
- **Categorized for Luminous Intensity**  
Yellow and Green  
Categorized for Color  
Use of Like Categories Yields a Uniform Display
- **Excellent for Long Digit String Multiplexing**

### Description

These low current seven segment displays are designed for applications requiring low power consumption. They are tested and selected for their excellent low current characteristics to ensure that the segments are matched at low currents. Drive currents as low as 1 mA per segment are available.

Pin for pin equivalent displays are also available in a standard current or high light ambient design. The standard current displays are available in all colors and are ideal for most applications. The high light ambient displays are ideal for sunlight ambients or long string lengths. For additional information see the 7.6 mm Micro Bright Seven Segment Displays, 10 mm Seven Segment Displays, 7.6 mm/10.9 mm Seven Segment Displays, 14.2 mm Seven Segment Displays, 20 mm Seven Segment Displays, or High Light Ambient Seven Segment Displays data sheets.

Thermal Resistance LED Junction-to-Pin	$R\theta_{\text{J-PIN}}$		200		$^\circ\text{C/W}$			

## Notes:

1. Device case temperature is 25 $^\circ\text{C}$  prior to the intensity measurement.
2. The digits are categorized for luminous intensity. The intensity category is designated by a letter on the side of the package.
3. The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and is the single wavelength which defines the color of the device.
4. Typical specification for reference only. Do not exceed absolute maximum ratings.
5. The yellow (HDSP-A800) and Green (HDSP-A900) displays are categorized for dominant wavelength. The category is designated by a number adjacent to the luminous intensity category letter.

**Figure 5. Maximum Allowable Average or DC Current vs. Ambient Temperature.**

**Figure 7. Relative Luminous Intensity vs. DC Forward Current.**

**Figure 6. Forward Current vs. Forward Voltage.**

**Figure 8. Relative Efficiency (Luminous Intensity per Unit Current) vs. Peak Current.**

## Electrical/Optical

These displays use light emitting diodes, with the light from each LED optically stretched to form individual segments and decimal points. The AlGaAs Red HDSP-X100 series LEDs use double heterojunction AlGaAs on a GaAs substrate. HER HDSP-7510/3350/5550 and Yellow HDSP-A800 series LEDs have their p-n junctions diffused into a GaAsP epitaxial layer on a GaP substrate. The Green HDSP-A900 series LEDs use a liquid phase GaP epitaxial layer on GaP.

The typical forward voltage values can be scaled from Figures 2 and 6. These values should be used to calculate the current limiting resistor value and typical power consumption. Expected maximum  $V_F$  values for driver circuit design and maximum power dissipation, may be calculated using the following  $V_{F\_MAX}$  models:

AlGaAs Red HDSP-X100 series  
 $V_{F\_MAX} = 1.8 \text{ V} + I_{Peak} (20 \Omega)$   
 For:  $I_{Peak} \leq 20 \text{ mA}$   
 $V_{F\_MAX} = 2.0 \text{ V} + I_{Peak} (10 \Omega)$   
 For:  $I_{Peak} \geq 20 \text{ mA}$

HER (HDSP-7510/3350/5550)  
 and Yellow (HDSP-A801) series  
 $V_{F\_MAX} = 1.6 + I_{Peak} (45 \Omega)$   
 For:  $I_{Peak} \leq 20 \text{ mA}$   
 $V_{F\_MAX} = 1.75 + I_{Peak} (38 \Omega)$   
 For:  $I_{Peak} \geq 20 \text{ mA}$

Green (HDSP-A901) series  
 $V_{F\_MAX} = 2.0 \text{ V} + I_{Peak} (50 \Omega)$   
 For:  $I_{Peak} \geq 4 \text{ mA}$

Figures 4 and 8 allow the designer to calculate the luminous intensity at different peak and average currents. The following equation calculates

intensity at different peak and average currents:

$$I_V\text{AVG} = (I_F\text{AVG}/I_F\text{AVG DATA SHEET})(\eta_{Peak})(I_V\text{DATA SHEET})$$

Where:

$I_V\text{AVG}$  is the desired time averaged luminous intensity resulting from  $I_F\text{AVG}$ .

$I_F\text{AVG}$  is the desired time averaged LED current.

$I_F\text{AVG DATA SHEET}$  is the data sheet test current for  $I_V\text{DATA SHEET}$ .

$\eta_{Peak}$  is the relative efficiency at the peak current, scaled from Figure 4 or 8.

$I_V\text{DATA SHEET}$  is the data sheet luminous intensity, resulting from  $I_F\text{AVG DATA SHEET}$ .

For example, what is the luminous intensity of an HDSP-7511 driven at 20 mA peak 1/5 duty factor?

$$I_F\text{AVG} = (50 \text{ mA})(0.2) = 4 \text{ mA}$$

$$I_F\text{AVG DATA SHEET} = 2 \text{ mA}$$

$$\eta_{Peak} = 2.6$$

$$I_V\text{DATA SHEET} = 270 \mu\text{cd}$$

Therefore

$$I_V\text{AVG} = (4 \text{ mA}/2 \text{ mA})(2.6)(270 \mu\text{cd}) = 1400 \mu\text{cd}$$

## Contrast Enhancement

The objective of contrast enhancement is to provide good display readability in the end use ambient light. The concept is to employ both luminance and chrominance contrast techniques to enhance the readability. This is accomplished by having the OFF dots blend into the display background and the ON dots stand out vividly against this same background. Therefore, these display devices are

assembled with a gray package and matching encapsulating epoxy in the dots.

Contrast enhancement may be achieved by using one of the following suggested filters:

AlGaAs Red (HDSP-X100)  
 Panelgraphic RUBY RED 60  
 SGL-Homalite H100-1605 RED  
 or H100-1250 GRAY  
 3M Louvered Filter R6310 RED  
 or ND0220 GRAY

HER (HDSP-7510/3350/5550)  
 Panelgraphic SCARLET RED  
 65  
 SGL-Homalite H100-1670 RED  
 or H100-1250 GRAY  
 3M Louvered Filter R6310 RED  
 or ND0220 GRAY

Yellow (HDSP-A801)  
 Panelgraphic YELLOW 27 or  
 GRAY 10  
 SGL-Homalite H100-1720  
 AMBER or H100-1250 GRAY  
 3M Louvered Filter ND0220  
 GRAY

Green (HDSP-A901)  
 Panelgraphic GREEN 48  
 SGL-Homalite H100-1440  
 GREEN or H100-1250 GRAY  
 3M Louvered Filter ND0220  
 GRAY

For further information on contrast enhancement please see Application Note 1015.

## Mechanical

Specifically developed plastics are used to optimize the displays optical performance. These plastics restrict the solvents that may be used for cleaning. Only mixtures of Freon (F113) and alcohol should be used for vapor cleaning processes. Total immersion time

in the vapors is two minutes. Some suggested mixtures are Freon TE, Arklone A or K, or Genesolv DI-15 or DE-15. A 60°C (140°F) water cleaning process may also be used. This process includes a neutralizer rinse (3% ammonia solution or equivalent), a surfactant rinse (1% detergent solution or

equivalent), a water rinse, and a thorough air dry. Room temperature cleaning may be done with Freon T-E35 or T-P35, Ethanol, Isopropanol, or water with a mild detergent.

Cleaning agents from the ketone family (acetone, methyl ethyl ketone, etc.) and from the

chlorinated hydrocarbon family (methylene chloride, trichloroethylene, carbon tetrachloride, etc.) are not recommended for cleaning LED parts. All of these various solvents attack or dissolve the encapsulating epoxies used to form the package of plastic LED parts.

### Features

- **Available with Colon for Clock Display**
  - **Compact Package**  
0.300 x 0.500 inches  
Leads on 2.54 mm (0.1 inch) Centers
  - **Choice of Colors**  
Red, AlGaAs Red, High Efficiency Red, Yellow, Green
  - **Excellent Appearance**  
Evenly Lighted Segments  
Mitered Corners on Segments  
Gray Package Gives Optimum Contrast  
±50° Viewing Angle
  - **Design Flexibility**  
Common Anode or Common Cathode
- **Right Hand Decimal Point ±1. Overflow Character**
  - **Categorized for Luminous Intensity**  
Yellow and Green Categorized for Color  
Use of Like Categories Yields a Uniform Display
  - **High Light Output**
  - **High Peak Current**
  - **Excellent for Long Digit String Multiplexing**
  - **Intensity and Color Selection Available**  
See Intensity and Color Selected Displays Data Sheet
  - **Sunlight Viewable AlGaAs**

### Description

The 7.6 mm (0.3 inch) LED seven segment displays are designed for viewing distances up to 3 metres (10 feet). These devices use an industry standard size package and

### Electrical/Optical

These displays use light emitting diodes, with the light from each LED optically stretched to form individual segments and decimal points. The Red HDSP-7300 series LEDs use a p-n junction diffused into a GaAsP epitaxial layer on a GaAs substrate. The AlGaAs Red HDSP-A150 series LEDs use double heterojunction AlGaAs on a GaAs substrate. HER HDSP-7500 and Yellow HDSP-7400 series LEDs have their p-n junctions diffused into a GaAsP epitaxial layer on a GaP substrate. The Green HDSP-7800 series LEDs use a liquid phase GaP epitaxial layer on GaP.

These displays are designed for strobed operation. The typical forward voltage values can be scaled from Figures 4 and 11. These values should be used to calculate the current limiting resistor value and typical power consumption. Expected maximum  $V_F$  values for driver circuit design and maximum power dissipation, may be

calculated using the following  $V_{F,MAX}$  models:

Red HDSP-7300 series

$$V_{F,MAX} = 1.8 \text{ V} + I_{Peak} (10 \Omega)$$

For:  $I_{Peak} > 5 \text{ mA}$

AlGaAs Red HDSP-A150 series

$$V_{F,MAX} = 1.8 \text{ V} + I_{Peak} (20 \Omega)$$

For:  $I_{Peak} \leq 20 \text{ mA}$

$$V_{F,MAX} = 2.0 \text{ V} + I_{Peak} (10 \Omega)$$

For:  $20 \text{ mA} \leq I_{Peak} \leq 100 \text{ mA}$

$$V_{F,MAX} = 2.27 \text{ V} + I_{Peak} (7.2 \Omega)$$

For:  $I_{Peak} \geq 100 \text{ mA}$

HER (HDSP-7500) and Yellow (7400) series

$$V_{F,MAX} = 1.6 + I_{Peak} (45 \Omega)$$

For:  $5 \text{ mA} \leq I_{Peak} \leq 20 \text{ mA}$

$$V_{F,MAX} = 1.75 + I_{Peak} (38 \Omega)$$

For:  $I_{Peak} \geq 20 \text{ mA}$

Green (HDSP-7800) series

$$V_{F,MAX} = 2.0 + I_{Peak} (50 \Omega)$$

For:  $I_{Peak} \geq 5 \text{ mA}$

Figures 6 and 13 allow the designer to calculate the luminous intensity at different peak and average currents. The following equation calculates intensity at different peak and average currents:

$$I_V,AVG = (I_{F,AVG}/I_{F,AVG \text{ DATA SHEET}})(\eta_{peak})(I_V \text{ DATA SHEET})$$

Where:

$I_V,AVG$  is the calculated time averaged luminous intensity resulting from  $I_{F,AVG}$ .

$I_{F,AVG}$  is the desired time averaged LED current.

$I_{F,AVG \text{ DATA SHEET}}$  is the data sheet test current for  $I_V \text{ DATA SHEET}$ .

$\eta_{peak}$  is the relative efficiency at the peak current, scaled from Figure 6 or 13.

$I_V \text{ DATA SHEET}$  is the data sheet luminous intensity, resulting from  $I_{F,AVG \text{ DATA SHEET}}$ .

For example, what is the luminous intensity of an HDSP-7500 driven at 50 mA peak 1/5 duty factor?

$$I_{F,AVG} = (50 \text{ mA})(0.2) = 10 \text{ mA}$$

$$I_{F,AVG \text{ DATA SHEET}} = 5 \text{ mA}$$

$$\eta_{Peak} = 1.62$$

$$I_V \text{ DATA SHEET} = 980 \mu\text{cd}$$

Therefore

$$I_V,AVG = (10 \text{ mA}/5 \text{ mA})(1.62)(980 \mu\text{cd}) = 1587 \mu\text{cd}$$

## Contrast Enhancement

The objective of contrast enhancement is to provide good display readability in the end use ambient light. The concept is to employ both luminance and chrominance contrast techniques to enhance the readability. This is accomplished by having the OFF dots blend into the display background and the ON dots stand out vividly against this same background. Therefore, these display devices are assembled with a gray package and matching encapsulating epoxy in the dots.

Contrast enhancement may be achieved by using one of the following suggested filters:

Red and AlGaAs Red (HDSP-7300/A150)  
Panelgraphic RUBY RED 60  
SGL-Homalite H100-1605 RED  
3M Louvered Filter R6310 RED  
or ND0220 GRAY

HER (HDSP-7500)  
Panelgraphic SCARLET RED 65  
SGL-Homalite H100-1670 RED  
or H100-1250 GRAY  
3M Louvered Filter R6310 RED  
or ND0220 GRAY

Yellow (HDSP-7400)  
Panelgraphic YELLOW 27 or  
GRAY 10  
SGL-Homalite H100-1720  
AMBER or H100-1250 GRAY  
3M Louvered Filter ND0220  
GRAY

Green (HDSP-7800)  
Panelgraphic GREEN 48  
SGL-Homalite H100-1440  
GREEN or H100-1250 GRAY  
3M Louvered Filter ND0220  
GRAY

For further information on contrast enhancement please see Application Note 1015.

## Mechanical

Specially developed plastics are used to optimize the displays optical performance. These plastics restrict the solvents that may be used for cleaning.

Only mixtures of Freon (F113) and alcohol should be used for vapor cleaning processes. Total immersion time in the vapors is two minutes. Some suggested mixtures are Freon TE, Arklone A or K, or Genesolv DES. A 60°C (140°F) water cleaning process may also be used. This process includes a neutralizer rinse (3% ammonia solution or equivalent), a surfactant rinse (1% detergent solution or equivalent), a water rinse, and a thorough air dry. Room temperature cleaning may be done with Freon T-E35 or T-P35, Ethanol, Isopropanol, or water with a mild detergent.

Cleaning agents from the ketone family (acetone, methyl ethyl ketone, etc.) and from the chlorinated hydrocarbon family (methylene chloride, trichloroethylene, carbon tetrachloride, etc.) are not recommended for cleaning LED parts. All of these various solvents attack or dissolve the encapsulating epoxies used to form the package of plastic LED parts.

For further information on soldering LEDs please refer to Application Note 1027.

- **Sunlight Viewable AlGaAs**

### Description

The 10 mm (0.40 inch) LED seven segment displays are HP's most space-efficient character size. They are designed for viewing distances up to 4.5

metres (15 feet). These devices use an industry standard size package and pinout. Both the numeric and ±1. overflow devices feature a right hand decimal point. All devices are available as either common anode or common cathode.

Typical applications include instruments, point of sale terminals, and appliances.

	Thermal Resistance LED Junction-to-Pin	$R\theta_{J-PIN}$		320		$^\circ\text{C/W/Seg}$	

### Notes:

- Case temperature of device immediately prior to the intensity measurement is 25°C.
- The digits are categorized for luminous intensity. The intensity category is designated by a letter on the side of the package.
- The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and is that single wavelength which defines the color of the device.
- Typical specification for reference only. Do not exceed absolute maximum ratings.
- For low current operation, the AlGaAs HDSP-F10X series displays are recommended. They are tested at 1 mA dc/segment and are pin for pin compatible with the HDSP-F15X series.
- The Yellow (HDSP-F30X) series and Green (HDSP-F50X) series displays are categorized for dominant wavelength. The category is designated by a number adjacent to the luminous intensity category letter.

## Electrical/Optical

These displays use light emitting diodes, with the light from each LED optically stretched to form individual segments and decimal points. The Red HDSP-F00X series LEDs use a p-n junction diffused into a GaAsP epitaxial layer on a GaAs substrate. The AlGaAs Red HDSP-F15X series LEDs use double heterojunction AlGaAs on a GaAs substrate. HER HDSP-F20X, Orange HDSP-F40X, and Yellow HDSP-F30X series LEDs have their p-n junctions diffused into a GaAsP epitaxial layer on a GaP substrate. The Green HDSP-F50X series LEDs use a liquid phase Gap epitaxial layer on GaP.

These displays are designed for strobed operation. The typical forward voltage values can be scaled from Figures 4 and 11. These values should be used to calculate the current limiting resistor value and typical power consumption. Expected maximum  $V_F$  values for driver circuit design and maximum power dissipation, may be calculated using the following  $V_{F,MAX}$  models:

Red HDSP-F00X series

$$V_{F,MAX} = 1.8 \text{ V} + I_{Peak} (10 \Omega)$$

$$\text{For: } I_{Peak} > 5 \text{ mA}$$

AlGaAs Red HDSP-F15X series

$$V_{F,MAX} = 1.8 \text{ V} + I_{Peak} (20 \Omega)$$

$$\text{For: } I_{Peak} \leq 20 \text{ mA}$$

$$V_{F,MAX} = 2.0 \text{ V} + I_{Peak} (10 \Omega)$$

$$\text{For: } 20 \text{ mA} \leq I_{Peak} \leq 100 \text{ mA}$$

$$V_{F,MAX} = 2.27 \text{ V} + I_{Peak} (7.2 \Omega)$$

$$\text{For } I_{Peak} \geq 100 \text{ mA}$$

HER HDSP-F20X, Orange HDSP-F40X, and Yellow HDSP-F30X series

$$V_{F,MAX} = 1.6 + I_{Peak} (45 \Omega)$$

$$\text{For: } 5 \text{ mA} \leq I_{Peak} \leq 20 \text{ mA}$$

$$V_{F,MAX} = 1.75 + I_{Peak} (38 \Omega)$$

$$\text{For: } I_{Peak} \geq 20 \text{ mA}$$

Green HDSP-F50X series

$$V_{F,MAX} = 2.0 + I_{Peak} (50 \Omega)$$

$$\text{For: } I_{Peak} > 5 \text{ mA}$$

Figures 6 and 13 allow the designer to calculate the luminous intensity at different peak and average currents. The following equation calculates intensity at different peak and average currents:

$$I_V \text{AVG} = (I_P \text{AVG} / I_P \text{AVG DATA SHEET}) (\eta_{\text{peak}}) (I_V \text{DATA SHEET})$$

Where:

$I_V \text{AVG}$  is the calculated time averaged luminous intensity resulting from  $I_P \text{AVG}$ .

$I_P \text{AVG}$  is the desired time averaged LED current.

$I_P \text{AVG DATA SHEET}$  is the data sheet test current for  $I_V \text{DATA SHEET}$ .

$\eta_{\text{peak}}$  is the relative efficiency at the peak current, scaled from Figure 6 or 13.

$I_V \text{DATA SHEET}$  is the data sheet luminous intensity, resulting from  $I_P \text{AVG DATA SHEET}$ .

For example, what is the luminous intensity of an HDSP-F201 driven at 50 mA peak 1/5 duty factor?

$$I_P \text{AVG} = (50 \text{ mA})(0.2) = 10 \text{ mA}$$

$$I_P \text{AVG DATA SHEET} = 5 \text{ mA}$$

$$\eta_{\text{peak}} = 1.63$$

$$I_V \text{DATA SHEET} = 1200 \mu\text{cd}$$

Therefore

$$I_V \text{AVG} = (10 \text{ mA} / 5 \text{ mA}) (1.63)(1200 \mu\text{cd}) = 3912 \mu\text{cd}$$

## Contrast Enhancement

The objective of contrast enhancement is to provide good display readability in the end use ambient light. The concept

is to employ both luminance and chrominance contrast techniques to enhance the readability. This is accomplished by having the OFF dots blend into the display background and the ON dots stand out vividly against this same background. Therefore, these display devices are assembled with a gray package and matching encapsulating epoxy in the dots.

Contrast enhancement may be achieved by using one of the following suggested filters:

Red (HDSP-F00X) and AlGaAs Red (HDSP-F15X)  
Panelgraphic RUBY RED 60, or GRAY 10

SGL-Homalite H100-1605 RED or H100-1250 GRAY  
3M Louvered Filter R6310 RED or ND0220 GRAY

HER (HDSP-F20X)  
Panelgraphic SCARLET RED 65, or GRAY 10  
SGL-Homalite H100-1670 RED or H100-1250 GRAY  
3M Louvered Filter R6310 RED or ND0220 GRAY

Yellow (HDSP-F30X)  
Panelgraphic YELLOW 27 or GRAY 10  
SGL-Homalite H100-1720 AMBER or H100-1250 GRAY  
3M Louvered Filter ND0220 GRAY

Orange (HDSP-F40X)  
Panelgraphic AMBER 23, AMBER 26, or GRAY 10  
SGL-Homalite H100-1709 AMBER or H100-1250 GRAY  
3M Louvered Filter ND0220 GRAY

Green (HDSP-F50X)  
Panelgraphic GREEN 48, or GRAY 10  
SGL-Homalite H100-1440 GREEN or H100-1250 GRAY  
3M Louvered Filter ND0220 GRAY

For further information on contrast enhancement please see Application Note 1015.

## Mechanical

Specially developed plastics are used to optimize the displays optical performance. These plastics restrict the solvents that may be used for cleaning. Only mixtures of Freon (F113) and alcohol should be used for vapor cleaning processes. Total immersion time in the vapors is two minutes. Some suggested mixtures are Freon TE, Arklone A or K, or Genesolv DI-15 or DE-15. A 60°C (140°F) water cleaning process may also be used. This process includes a neutralizer rinse (3% ammonia solution or equivalent), a surfactant rinse (1% detergent solution or equivalent), a water rinse, and a thorough air dry. Room temperature cleaning may be done with Freon T-E35 or T-P35, Ethanol, Isopropanol, or water with a mild detergent.

Cleaning agents from the ketone family (acetone, methyl ethyl ketone, etc.) and from the chlorinated hydrocarbon family (methylene chloride, trichloroethylene, carbon tetrachloride, etc.) are not recommended for cleaning LED parts. All of these various solvents attack or dissolve the encapsulating epoxies used to form the package of plastic LED parts.

SOLID STATE DISPLAYS

### Description

The 7.6 mm (0.3 inch) and 10.9 mm (0.43 inch) LED seven segment displays are designed

for viewing distances up to 3 metres (10 feet) and 5 metres (16 feet). These devices use an industry standard size package and pinouts. All devices are available as either common anode or common cathode.

### Devices

#### Notes:

1. These displays are recommended for high ambient light operation. Please refer to the HDSP-E10X AlGaAs and HDSP-335X HER data sheet for low current operation.
2. Universal pinout brings the anode and cathode of each segment's LED out to separate pins. See internal diagram H.

These displays are ideal for most applications. Pin for pin equivalent displays are also available in a low current or high light ambient design. The

low current displays are ideal for portable applications. The high light ambient displays are ideal for high light ambients or long string lengths. For

additional information see the Low Current Seven Segment Displays, or High Light Ambient Seven Segment Displays data sheets.

### Notes:

1. Device case temperature is 25°C prior to the intensity measurement.
2. The digits are categorized for luminous intensity. The intensity category is designated by a letter on the side of the package.
3. The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and is that single wavelength which defines the color of the device.
4. Typical specification for reference only. Do not exceed absolute maximum ratings.
5. For low current operation, the AlGaAs HDSP-E10X series displays are recommended. They are tested at 1 mA dc/segment and are pin for pin compatible with the HDSP-E15X series.
6. For low current operation, the HER HDSP-335X series displays are recommended. They are tested at 2 mA dc/segment and are pin for pin compatible with the 5082-7650 series.
7. The Yellow (5082-7620/7660) and Green (HDSP-3600/4600) displays are categorized for dominant wavelength. The category is designated by a number adjacent to the luminous intensity category letter.

## Electrical/Optical

These displays use light emitting diodes, with the light from each LED optically stretched to form individual segments and decimal points. The Red 5082-7730/7750 series LEDs use a p-n junction diffused into a GaAsP epitaxial layer on a GaAs substrate. The AlGaAs Red HDSP-E150 series LEDs use double heterojunction AlGaAs on a GaAs substrate. HER 5082-7610/7650 and Yellow 5082-7620/7660 series LEDs have their p-n junctions diffused into a GaAsP epitaxial layer on a GaP substrate. The Green HDSP-3600/4600 series LEDs use a liquid phase GaP epitaxial layer on GaP.

These displays are designed for strobed operation. The typical forward voltage values can be scaled from Figures 4 and 11. These values should be used to calculate the current limiting resistor value and typical power consumption. Expected maximum  $V_F$  values for driver circuit design and maximum power dissipation may be calculated using the following  $V_{F,MAX}$  models:

Red 5082-7730/7750 series

$$V_{F,MAX} = 1.8 \text{ V} + I_{Peak} (10 \Omega) \\ \text{For: } I_{Peak} > 5 \text{ mA}$$

AlGaAs Red HDSP-E150 series

$$V_{F,MAX} = 1.8 \text{ V} + I_{Peak} (20 \Omega) \\ \text{For: } I_{Peak} \leq 20 \text{ mA} \\ V_{F,MAX} = 2.0 \text{ V} + I_{Peak} (10 \Omega) \\ \text{For: } 20 \text{ mA} \leq I_{Peak} \leq 100 \text{ mA} \\ V_{F,MAX} = 2.27 \text{ V} + I_{Peak} (7.2 \Omega) \\ \text{For } I_{Peak} \geq 100 \text{ mA}$$

HER (5082-7610/7650) and  
Yellow (5082-7620/7660) series

$$V_{F,MAX} = 1.6 + I_{Peak} (45 \Omega) \\ \text{For: } 5 \text{ mA} \leq I_{Peak} \leq 20 \text{ mA}$$

$$V_{F,MAX} = 1.75 + I_{Peak} (38 \Omega) \\ \text{For: } I_{Peak} \geq 20 \text{ mA}$$

Green (HDSP-3600/4600) series

$$V_{F,MAX} = 2.0 + I_{Peak} (50 \Omega) \\ \text{For: } I_{Peak} > 5 \text{ mA}$$

Figures 6 and 13 allow the designer to calculate the luminous intensity at different peak and average currents. The following equation calculates intensity at different peak and average currents:

$$I_{V,AVG} = (I_{F,AVG}/I_{F,AVG \text{ DATA SHEET}})(\eta_{Peak})(I_{V,DATA SHEET})$$

Where:

$I_{V,AVG}$  is the calculated time averaged luminous intensity resulting from  $I_{F,AVG}$ .

$I_{F,AVG}$  is the desired time averaged LED current.

$I_{F,AVG \text{ DATA SHEET}}$  is the data sheet test current for  $I_{V,DATA SHEET}$ .

$\eta_{Peak}$  is the relative efficiency at the peak current, scaled from Figure 6 or 13.

$I_{V,DATA SHEET}$  is the data sheet luminous intensity, resulting from  $I_{F,AVG \text{ DATA SHEET}}$ .

For example, what is the luminous intensity of a 5082-7610 driven at 50 mA peak 1/5 duty factor?

$$I_{F,AVG} = (50 \text{ mA})(0.2) = 10 \text{ mA} \\ I_{F,AVG \text{ DATA SHEET}} = 5 \text{ mA} \\ \eta_{Peak} = 1.62 \\ I_{V,DATA SHEET} = 800 \mu\text{cd}$$

Therefore

$$I_{V,AVG} = (10 \text{ mA}/5 \text{ mA}) \\ (1.62)(800 \mu\text{cd}) \\ = 2592 \mu\text{cd}$$

## Contrast Enhancement

The objective of contrast enhancement is to provide good display readability in the end use ambient light. The concept is to employ both luminance and chrominance contrast techniques to enhance the readability. This is accomplished by having the OFF dots blend into the display background and the ON dots stand out vividly against this same background. Therefore, these display devices are assembled with a gray package and matching encapsulating epoxy in the dots.

Contrast enhancement may be achieved by using one of the following suggested filters:

Red and AlGaAs Red (5082-7730/7750/HDSP-E150)  
Panelgraphic RUBY RED 60  
SGL-Homalite H100-1605 RED  
3M Louvered Filter R6310 RED  
or ND0220 GRAY

HER (5082-7610/7650)  
Panelgraphic SCARLET RED 65  
SGL-Homalite H100-1670 RED  
or H100-1250 GRAY  
3M Louvered Filter R6310 RED  
or ND0220 GRAY

Yellow (5082-7620/7660)  
Panelgraphic YELLOW 27 or  
GRAY 10  
SGL-Homalite H100-1720  
AMBER or H100-1250 GRAY  
3M Louvered Filter ND0220  
GRAY

Green (HDSP-3600/4600)  
Panelgraphic GREEN 48  
SGL-Homalite H100-1440  
GREEN or H100-1250 GRAY  
3M Louvered Filter ND0220  
GRAY

For further information on contrast enhancement please see Application Note 1015.

## **Mechanical**

Specially developed plastics are used to optimize the displays optical performance. These plastics restrict the solvents that may be used for cleaning. Only mixtures of Freon (F113) and alcohol should be used for vapor cleaning processes. Total immersion time in the vapors is two minutes. Some suggested mixtures are Freon TE, Arklone A or K, or Genesolv DES. A 60°C (140°F) water cleaning

process may also be used. This process includes a neutralizer rinse (3% ammonia solution or equivalent), a surfactant rinse (1% detergent solution or equivalent), a water rinse, and a thorough air dry. Room temperature cleaning may be done with Freon T-E35 or T-P35, Ethanol, Isopropanol, or water with a mild detergent.

Cleaning agents from the ketone family (acetone, methyl

ethyl ketone, etc.) and from the chlorinated hydrocarbon family (methylene chloride, trichloroethylene, carbon tetrachloride, etc.) are not recommended for cleaning LED parts. All of these various solvents attack or dissolve the encapsulating epoxies used to form the package of plastic LED parts.

For further information on soldering LEDs please refer to Application Note 1027.

### Description

The 14.2 mm (0.56 inch) LED seven segment displays are designed for viewing distances

up to 7 metres (23 feet). These devices use an industry standard size package and pinout. Both the numeric and ±1 overflow devices feature a right hand decimal point. All devices are available as either common anode or common cathode.

SOLID STATE DISPLAYS

### Devices

Red HDSP-	AlGaAs Red HDSP- <sup>(1)</sup>	HER HDSP- <sup>(1)</sup>	Yellow HDSP-	Green HDSP-	Description	Package Drawing

5323		5523	5723	5623	Two Digit Common Cathode Right Hand Decimal	F

#### Note:

1. These displays are recommended for high ambient light operation. Please refer to the HDSP-H10X/K12X AlGaAs and HDSP-555X HER data sheet for low current operation.

These displays are ideal for most applications. Pin for pin equivalent displays are also available in a low current design. The low current displays

are ideal for portable applications. For additional information see the Low Current Seven Segment Displays data sheet.

### Notes:

1. Device case temperature is 25°C prior to the intensity measurement.
2. The digits are categorized for luminous intensity. The intensity category is designated by a letter on the side of the package.
3. The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and is that single wavelength which defines the color of the device.
4. Typical specification for reference only. Do not exceed absolute maximum ratings.
5. For low current operation, the AlGaAs HDSP-H10X series displays are recommended. They are tested at 1 mA dc/segment and are pin for pin compatible with the HDSP-H15X series.
6. For low current operation, the HER HDSP-555X series displays are recommended. They are tested at 2 mA dc/segment and are pin for pin compatible with the HDSP-550X series.
7. The Yellow (HDSP-5700) and Green (HDSP-5600) displays are categorized for dominant wavelength. The category is designated by a number adjacent to the luminous intensity category letter.

## Electrical/Optical

These displays use light emitting diodes, with the light from each LED optically stretched to form individual segments and decimal points. The Red HDSP-5300 series LEDs use a p-n junction diffused into a GaAsP epitaxial layer on a GaAs substrate. The AlGaAs Red HDSP-H150 series LEDs use double heterojunction AlGaAs on a GaAs substrate. HER HDSP-5500 and Yellow HDSP-5700 series LEDs have their p-n junctions diffused into a GaAsP epitaxial layer on a GaP substrate. The Green HDSP-5600 series LEDs use a liquid phase GaP epitaxial layer on GaP.

These displays are designed for strobed operation. The typical forward voltage values can be scaled from Figures 4 and 11. These values should be used to calculate the current limiting resistor value and typical power consumption. Expected maximum  $V_F$  values for driver circuit design and maximum power dissipation, may be calculated using the following  $V_{F,MAX}$  models:

Red HDSP-5300 series

$$V_{F,MAX} = 1.8 \text{ V} + I_{Peak} (10 \Omega)$$

For:  $I_{Peak} > 5 \text{ mA}$

AlGaAs Red HDSP-H150 series

$$V_{F,MAX} = 1.8 \text{ V} + I_{Peak} (20 \Omega)$$

For:  $I_{Peak} \leq 20 \text{ mA}$

$$V_{F,MAX} = 2.0 \text{ V} + I_{Peak} (10 \Omega)$$

For:  $20 \text{ mA} \leq I_{Peak} \leq 100 \text{ mA}$

$$V_{F,MAX} = 2.27 \text{ V} + I_{Peak} (7.2 \Omega)$$

For  $I_{Peak} \geq 100 \text{ mA}$

HER (HDSP-5500) and Yellow (5700) series

$$V_{F,MAX} = 1.6 + I_{Peak} (45 \Omega)$$

For:  $5 \text{ mA} \leq I_{Peak} \leq 20 \text{ mA}$

$$V_{F,MAX} = 1.75 + I_{Peak} (38 \Omega)$$

For:  $I_{Peak} \geq 20 \text{ mA}$

Green (HDSP-5600) series

$$V_{F,MAX} = 2.0 + I_{Peak} (50 \Omega)$$

For:  $I_{Peak} > 5 \text{ mA}$

Figures 6 and 13 allow the designer to calculate the luminous intensity at different peak and average currents. The following equation calculates intensity at different peak and average currents:

$$I_{v,AVG} = (I_{v,AVG}/I_{v,AVG \text{ DATA SHEET}})(\eta_{peak})(I_{v,DATA SHEET})$$

Where:

$I_{v,AVG}$  is the calculated time averaged luminous intensity resulting from  $I_{v,AVG}$ .

$I_{v,AVG}$  is the desired time averaged LED current.

$I_{v,AVG \text{ DATA SHEET}}$  is the data sheet test current for  $I_{v,DATA SHEET}$ .

$\eta_{peak}$  is the relative efficiency at the peak current, scaled from Figure 6 or 13.

$I_{v,DATA SHEET}$  is the data sheet luminous intensity, resulting from  $I_{v,AVG \text{ DATA SHEET}}$ .

For example, what is the luminous intensity of an HDSP-5500 driven at 50 mA peak 1/5 duty factor?

$$I_{v,AVG} = (50 \text{ mA}) \cdot (0.2) = 10 \text{ mA}$$

$$I_{v,AVG \text{ DATA SHEET}} = 10 \text{ mA}$$

$$\eta_{Peak} = 1.3$$

$$I_{v,DATA SHEET} = 2800 \mu\text{cd}$$

Therefore

$$I_{v,AVG} = (10 \text{ mA}/10 \text{ mA}) (1.3)(2800 \mu\text{cd}) = 3640 \mu\text{cd}$$

## Contrast Enhancement

The objective of contrast enhancement is to provide good display readability in the end use ambient light. The concept is to employ both luminance and chrominance contrast techniques to enhance the readability. This is accomplished by having the OFF dots blend into the display background and the ON dots stand out vividly against this same background. Therefore, these display devices are assembled with a gray package and matching encapsulating epoxy in the dots.

Contrast enhancement may be achieved by using one of the following suggested filters:

Red and AlGaAs Red (HDSP-5300/H150)

Panelgraphic RUBY RED 60  
SGL-Homalite H100-1605 RED  
3M Louvered Filter R6310 RED  
or ND0220 GRAY

HER (HDSP-5500)

Panelgraphic SCARLET RED 65  
SGL-Homalite H100-1670 RED  
or H100-1250 GRAY  
3M Louvered Filter R6310 RED  
or ND0220 GRAY

Yellow (HDSP-5700)

Panelgraphic YELLOW 27 or GRAY 10  
SGL-Homalite H100-1720  
AMBER or H100-1250 GRAY  
3M Louvered Filter ND0220 GRAY

Green (HDSP-5600)

Panelgraphic GREEN 48  
SGL-Homalite H100-1440  
GREEN or H100-1250 GRAY  
3M Louvered Filter ND0220 GRAY

For further information on contrast enhancement please see Application Note 1015.

### **Mechanical**

Specially developed plastics are used to optimize the displays optical performance. These plastics restrict the solvents that may be used for cleaning. Only mixtures of Freon (F113) and alcohol should be used for vapor cleaning processes. Total immersion time in the vapors is two minutes. Some suggested mixtures are Freon TE, Arklone A or K, or Genesolv DES. A 60°C (140°F) water cleaning process may also be used. This process includes a neutralizer rinse (3% ammonia solution or equivalent), a surfactant rinse (1% detergent solution or equivalent), a water rinse, and a thorough air dry. Room temperature cleaning may be done with Freon T-E35 or T-P35, Ethanol, Isopropanol, or water with a mild detergent.

Cleaning agents from the ketone family (acetone, methyl ethyl ketone, etc.) and from the chlorinated hydrocarbon family (methylene chloride, trichloroethylene, carbon tetrachloride, etc.) are not recommended for cleaning LED parts. All of these various solvents attack or dissolve the encapsulating epoxies used to form the package of plastic LED parts.

For further information on soldering LEDs please refer to Application Note 1027.

### Description

The 20 mm (0.8 inch) LED seven segment displays are designed for viewing distances up to 10 metres (33 feet). These devices use an industry standard size package and pinout. All devices are available as either common anode or common cathode.

These displays are ideal for most applications. Pin for pin equivalent displays are also available in a low current design. The low current displays are ideal for portable applications. For additional information see the Low Current Seven Segment Displays data sheet.

### Devices

Red HDSP-	AlGaAs <sup>(1)</sup> HDSP-	HER HDSP-	Yellow HDSP-	Green HDSP-	Description	Package Drawing
3400	N150	3900	4200	8600	Common Anode Left Hand Decimal	A
3401	N151	3901	4201	8601	Common Anode Right Hand Decimal	B
3403	N153	3903	4203	8603	Common Cathode Right Hand Decimal	C
3405	N155	3905	4205	8605	Common Cathode Left Hand Decimal	D
3406	N156	3906	4206	8606	Universal ±1. Overflow <sup>(2)</sup>	E

#### Notes:

1. These displays are recommended for high ambient light operation. Please refer to the HDSP-N10X AlGaAs data sheet for low current operation.
2. Universal pinout brings the anode and cathode of each segment's LED out to separate pins. See internal diagram E.

## Electrical/Optical

These displays use light emitting diodes, with the light from each LED optically stretched to form individual segments and decimal points. The Red HDSP-3400 series LEDs use a p-n junction diffused into a GaAsP epitaxial layer on a GaAs substrate. The AlGaAs Red HDSP-N150 series LEDs use double heterojunction AlGaAs on a GaAs substrate. HER HDSP-3900 and Yellow HDSP-4200 series LEDs have their p-n junctions diffused into a GaAsP epitaxial layer on a GaP substrate. The Green HDSP-8600 series LEDs use a liquid phase GaP epitaxial layer on GaP.

These displays are designed for strobed operation. The typical forward voltage values can be scaled from Figures 4 and 10. These values should be used to calculate the current limiting resistor value and typical power consumption. Expected maximum  $V_F$  values for driver circuit design and maximum power dissipation, may be calculated using the following  $V_{F,MAX}$  models:

Red HDSP-3400 series

$$V_{F,MAX} = 1.8 \text{ V} + I_{Peak} (10 \Omega)$$

For:  $I_{Peak} > 5 \text{ mA}$

AlGaAs Red HDSP-N150 series

$$V_{F,MAX} = 1.8 \text{ V} + I_{Peak} (20 \Omega)$$

For:  $I_{Peak} \leq 20 \text{ mA}$

$$V_{F,MAX} = 2.0 \text{ V} + I_{Peak} (10 \Omega)$$

For:  $20 \text{ mA} \leq I_{Peak} \leq 100 \text{ mA}$

$$V_{F,MAX} = 2.27 \text{ V} + I_{Peak} (7.2 \Omega)$$

For:  $I_{Peak} \geq 100 \text{ mA}$

HER (HDSP-3900) and Yellow (HDSP-4200) series

$$V_{F,MAX} = 1.9 + I_{Peak} (21.8 \Omega)$$

For:  $10 \text{ mA} \leq I_{Peak} \leq 30 \text{ mA}$

$$V_{F,MAX} = 2.15 + I_{Peak} (13.5 \Omega)$$

For:  $I_{Peak} \geq 30 \text{ mA}$

Green (HDSP-8600) series

$$V_{F,MAX} = 2.0 \text{ V} + I_{Peak} (50 \Omega)$$

For:  $I_{Peak} > 5 \text{ mA}$

Figures 6 and 12 allow the designer to calculate the luminous intensity at different peak and average currents. The following equation calculates intensity at different peak and average currents:

$$I_{V,AVG} = (I_{F,AVG}/I_{F,AVG \text{ DATA SHEET}})(\eta_{Peak})(I_{V,DATA SHEET})$$

Where:

$I_{V,AVG}$  is the calculated time averaged luminous intensity resulting from  $I_{F,AVG}$

$I_{F,AVG}$  is the desired time averaged LED current

$I_{F,AVG \text{ DATA SHEET}}$  is the data sheet test current for  $I_{V,DATA SHEET}$

$\eta_{Peak}$  is the relative efficiency at the peak current, scaled from Figure 6 or 12

$I_{V,DATA SHEET}$  is the data sheet luminous intensity, resulting from  $I_{F,AVG \text{ DATA SHEET}}$

For example, what is the luminous intensity of an HER HDSP-3900 driven at 135 mA peak 1/6 duty factor?

$$I_{F,AVG} = (135 \text{ mA})(1/6) = 22.5 \text{ mA}$$

$$I_{F,AVG \text{ DATA SHEET}} = 20 \text{ mA}$$

$$\eta_{Peak} = 1.03$$

$$I_{V,DATA SHEET} = 7000 \mu\text{cd}$$

Therefore

$$I_{V,AVG} = (22.5 \text{ mA}/20 \text{ mA})(1.03)(7000 \mu\text{cd}) = 8111 \mu\text{cd}$$

## Contrast Enhancement

The objective of contrast enhancement is to provide good display readability in the end use ambient light. The concept is to employ both luminance and chrominance contrast techniques to enhance the readability. This is accomplished by having the OFF dots blend into the display background and the ON dots stand out vividly against this same background. Therefore, these display devices are assembled with a gray package and matching encapsulating epoxy in the dots.

Contrast enhancement may be achieved by using one of the following suggested filters:

Red and AlGaAs Red (HDSP-3400/N150)  
Panelgraphic RUBY RED 60  
SGL-Homalite H100-1605 RED  
3M Louvered Filter R6310 RED  
or ND0220 GRAY

HER (HDSP-3900)  
Panelgraphic SCARLET RED 65  
SGL-Homalite H100-1670 RED  
or H100-1250 GRAY  
3M Louvered Filter R6310 RED  
or ND0220 GRAY

Yellow (HDSP-4200)  
Panelgraphic YELLOW 27 or GRAY 10  
SGL-Homalite H100-1720  
AMBER or H100-1250 GRAY  
3M Louvered Filter ND0220 GRAY

Green (HDSP-8600)  
Panelgraphic GREEN 48  
SGL-Homalite H100-1440  
GREEN or H100-1250 GRAY  
3M Louvered Filter ND0220 GRAY

For further information on contrast enhancement please see Application Note 1015.

## Mechanical

Specifically developed plastics are used to optimize the displays optical performance. These plastics restrict the solvents that may be used for cleaning. Only mixtures of Freon (F113) and alcohol should be used for vapor cleaning processes. Total immersion time in the vapors is two minutes. Some suggested mixtures are Freon TE, Arklone A or K, or Genesolv DES. A 60°C (140°F) water cleaning process may also be used. This process includes a

neutralizer rinse (3% ammonia solution or equivalent), a surfactant rinse (1% detergent solution or equivalent), a water rinse, and a thorough air dry. Room temperature cleaning may be done with Freon T-E35 or T-P35, Ethanol, Isopropanol, or water with a mild detergent.

Cleaning agents from the ketone family (acetone, methyl ethyl ketone, etc.) and from the chlorinated hydrocarbon family (methylene chloride, trichloroethylene, carbon tetrachloride, etc.) are not recommended for cleaning LED parts. All of these various solvents attack or dissolve the encapsulating epoxies used to form the package of plastic LED parts.

For further information on soldering LEDs please refer to Application Note 1027.

## 2.3 Inch AlGaAs Red 5 x 8 Dot Matrix Alphanumeric Displays

### Technical Data

#### HDSP-P101/HDSP-P151 HDSP-P103/HDSP-P153

#### Features

- **Very Large Character Height**
- **Easily Expandable to Larger Displays**
- **X-Y Stackable**
- **Wide Viewing Angle**
- **Ideal for Graphics Panels**
- **Exceptional Brightness**  
HDSP-P15X Series Designed for High Ambient Light Conditions
- **Categorized for Intensity**
- **Mechanically Rugged**

#### Description

The large 5 x 8 dot matrix alphanumeric display uses newly developed Double Heterojunction (DH) AlGaAs/

GaAs material technology. This LED material has outstanding light output efficiency over a wide range of drive currents. The color is deep red at the dominant wavelength of 637 nanometres. The 2.3 inch (58.4 mm) display is ideal for applications such as graphics displays and moving message panels.

The HDSP-P10X and HDSP-P15X have different optical characteristics that are optimized for different applications. The HDSP-P10X and HDSP-P15X displays differ in the amount of diffusant. The HDSP-P10X uses a large amount of diffusant. This causes the dots to have a

uniform appearance across the light emitting area. The HDSP-P15X uses a smaller amount of diffusant. This causes the dots to appear brightest in the center. The HDSP-P15X is designed for high ambient light conditions or long viewing distances, where brightness is more important than uniformity.

#### Absolute Maximum Ratings at 25°C

Average Power per Dot .....	36 mW
Peak Forward Current per Dot <sup>(1)</sup> .....	125 mA
Average Forward Current per Dot.....	11 mA
Operating Temperature Range .....	-20°C to +85°C
Storage Temperature Range .....	-20°C to +85°C
Reverse Voltage per Dot .....	3 V
Lead Solder Temperature .....	260°C for 3 sec.
(1.59 mm [1/16 inch] below seating plane)	

#### Note:

1. Do not exceed maximum average current per dot.

Thermal Resistance LED Junction-to-Pin per Package	$R\theta_{\text{J-PIN}}$		18		$^\circ\text{C/W/Pack}$	

### Notes:

- The displays are categorized for luminous intensity with the intensity category designated by a letter on the bottom end of the package. The luminous intensity minimum and categories are determined by computing the numerical average of the individual dot intensities.
- The HDSP-P151 is designed for high ambient light operation. Mixing the HDSP-P101 and the HDSP-P151 displays may cause digit to digit mismatch.
- The dominant wavelength,  $\lambda_d$ , is derived from the C.I.E. Chromaticity diagram and is that single wavelength which defines the color of the device.
- Typical specification for reference only. Do not exceed absolute maximum ratings.

**Figure 1. Maximum Allowable Average Current per Dot vs. Ambient Temperature.**  
 $T_J\text{ MAX} = 110^\circ\text{C}$ .

**Figure 3. Relative Luminous Efficiency (per Dot) vs. Peak Current per Dot.**

## Operational Considerations

### Electrical Description

These display devices are composed of light emitting diodes, with the light from each LED optically stretched to form individual dots.

These display devices are well suited for strobed operation. The typical forward voltage can be scaled from Figure 2. These values should be used to calculate the current limiting resistor value and the typical power dissipation. Expected maximum  $V_F$  values, for driver circuit design and maximum power dissipation, may be calculated using the following  $V_{F,MAX}$  model:

$$V_{F,MAX} = 1.8 \text{ V} + I_{Peak} (20 \Omega)$$

For:  $I_{Peak} \leq 20 \text{ mA}$

$$V_{F,MAX} = 2.0 \text{ V} + I_{Peak} (10 \Omega)$$

For:  $I_{Peak} \geq 20 \text{ mA}$

Figure 3 allows the designer to calculate the luminous intensity at different peak and average currents. The following equation calculates intensity at different peak and average currents:

$$I_V,AVG = (I_F,AVG / I_{F,AVG \text{ DATA SHEET}}) (\eta_{peak}) (I_V,DATA \text{ SHEET})$$

Where:

$I_F,AVG$  is the desired time averaged LED current.  
 $I_{F,AVG \text{ DATA SHEET}}$  is the time averaged data sheet test current for  $I_V,DATA \text{ SHEET}$ .

$\eta_{peak}$  is the relative efficiency at the peak current, scaled from Figure 3.

$I_V,AVG$  is the calculated time averaged luminous intensity resulting from  $I_F,AVG$ .

For example, what is the luminous intensity of an AlGaAs Red (HDSP-P15X) driven at 100 mA peak 1/100 duty factor?

$$I_F,AVG = (100 \text{ mA})(0.01) = 1 \text{ mA}$$

$$I_{F,AVG \text{ DATA SHEET}} = 10 \text{ mA}$$

$$\eta_{Peak} = 0.97$$

$$I_V,DATA \text{ SHEET} = 15000 \mu\text{cd}$$

Therefore

$$I_V,AVG = (1 \text{ mA} / 10 \text{ mA})(0.97) (15000 \mu\text{cd}) = 1455 \mu\text{cd}$$

### Thermal Considerations

The device thermal resistance may be used to calculate the junction temperature of the central LED. The following equation calculates the junction temperature of the central (hottest) LED.

$$T_J = T_A + (P_D)(R_{\theta_{J-A}})(N)$$

$$P_D = (V_{F,MAX})(I_F,AVG)$$

$$R_{\theta_{J-A}} = R_{\theta_{J-PIN}} + R_{\theta_{PIN-A}}$$

$T_J$  is the junction temperature of the central LED.

$T_A$  is the ambient temperature.

$P_D$  is the power dissipated by one LED.

$N$  is the number of LEDs on per character.

$V_{F,MAX}$  is calculated using the appropriate  $V_F$  model.

$R_{\theta_{J-A}}$  is the package thermal resistance from the central LED to the ambient.

$R_{\theta_{J-PIN}}$  is the package thermal resistance from the central LED to the pin.

$R_{\theta_{PIN-A}}$  is the thermal resistance from the pin to the ambient.

For example, what is the maximum ambient temperature an HDSP-P1XX can operate with the following conditions:

$$I_{Peak} = 125 \text{ mA}$$

$$I_{F,AVG} = 11 \text{ mA}$$

$$R_{\theta_{J-A}} = 50^\circ\text{C/W}$$

$$N = 40$$

$$T_{J,MAX} = 110^\circ\text{C}$$

$$V_{F,MAX} = 2.0 \text{ V} + (0.125 \text{ A})(10 \Omega) = 3.25 \text{ V}$$

$$P_D = (3.25 \text{ V})(0.011 \text{ A}) = 0.03575 \text{ W}$$

$$T_A = 110^\circ\text{C} - (50^\circ\text{C/W})(0.03575)(40) = 38.5^\circ\text{C}$$

The maximum number of dots on for the ASCII character set is 20. What is the maximum ambient temperature an HDSP-P1XX can operate with the following conditions:

$$I_{Peak} = 125 \text{ mA}$$

$$I_{F,AVG} = 11 \text{ mA}$$

$$R_{\theta_{J-A}} = 50^\circ\text{C/W}$$

$$N = 20$$

$$T_{J,MAX} = 110^\circ\text{C}$$

$$V_{F,MAX} = 2.0 \text{ V} + (0.125 \text{ A})(10 \Omega) = 3.25 \text{ V}$$

$$P_D = (3.25 \text{ V})(0.011 \text{ A}) = 0.03575 \text{ W}$$

$$T_A = 110^\circ\text{C} - (50^\circ\text{C/W})(0.03575)(20) = 74.3^\circ\text{C}$$

### Contrast Enhancement

The objective of contrast enhancement is to provide good display readability in the end use ambient light. The concept is to employ both luminance and chrominance contrast techniques to enhance the readability. This is accomplished by having the OFF dots blend into the display background and the ON dots stand out vividly against this same background. Therefore, these display devices are assembled with a gray package and matching encapsulating epoxy in the dots.

Contrast enhancement may be achieved by using one of the following suggested filters:

Panelgraphic RUBY RED 60 or GRAY 10  
SGL-Homalite H100-1605 RED or H100-1650 GRAY  
3M Louvered Filter R6310 RED or ND0220 GRAY

For further information on contrast enhancement please see Application Note 1015.

### **Mechanical**

Specially developed plastics are used to optimize the displays

optical performance. These plastics restrict the solvents that may be used for cleaning. Only mixtures of Freon (F113) and alcohol should be used for vapor cleaning processes. Total immersion time in the vapors is two minutes. Some suggested mixtures are Freon TE, Arklone A or K, or Genesolv DI-15 or DE-15. A 60°C (140°F) water cleaning process may also be used. This process includes a neutralizer rinse (3% ammonia solution or equivalent), a surfactant rinse (1% detergent solution or equivalent), a water rinse, and a thorough air dry.

Room temperature cleaning may be done with Freon T-E35 or T-P35, Ethanol, Isopropanol, or water with a mild detergent.

Cleaning agents from the ketone family (acetone, methyl ethyl ketone, etc.) and from the chlorinated hydrocarbon family (methylene chloride, trichloroethylene, carbon tetrachloride, etc.) are not recommended for cleaning LED parts. All of these various solvents attack or dissolve the encapsulating epoxies used to form the package of plastic LED parts.

Shaped Character, Excellent Readability
- **STANDARD DUAL-IN-LINE PACKAGE INCLUDING CONTRAST FILTER**  
15.2 mm x 10.2 mm (0.6 inch x 0.4 inch)
- **CATEGORIZED FOR LUMINOUS INTENSITY**

The 5082-7302 is the same as the 5082-7300, except that the decimal point is located on the left-hand side of the digit.

The 5082-7340 hexadecimal display decodes positive 8421 logic inputs into 16 states, 0-9 and A-F. In place of the decimal point an input is provided for blanking the display (all LEDs off), without losing the contents of the memory. Applications include terminals and computer systems using the base-16 character set.

The 5082-7304 is a ( $\pm 1$ ) overrange display including a right-hand decimal point.

The ESD susceptibility of these IC devices is Class A of MIL-STD-883 or Class 2 of DOD-STD-1686 and DOD-HDBK-263.

## Description

The HP 5082-7300 series solid state numeric and hexadecimal displays with on-board decoder/driver and memory provide 7.4 mm (0.29 inch) displays for reliable, low-cost methods of displaying digital information.

The 5082-7300 numeric display decodes positive 8421 BCD logic inputs into characters 0-9, a "—" sign, a test pattern, and four blanks in the invalid BCD states. The unit employs a right-hand decimal point.

## Applications

Typical applications include point-of-sale terminals, instrumentation, and computer system.

## Features

- CERAMIC/GLASS PACKAGE
- ADDED RELIABILITY
- NUMERIC 5082-7356/-7357  
0-9, Test State, Minus Sign, Blank States,  
Decimal Point  
7356 Right Hand D.P., 7357 Left Hand D.P.
- HEXADECIMAL 5082-7359  
0-9, A-F, Base 16 Operation, Blanking Control,  
Conserves Power, No Decimal Point
- TTL COMPATIBLE
- INCLUDES DECODER/DRIVER WITH MEMORY  
8421 Positive Logic Input
- 4 x 7 DOT MATRIX ARRAY  
Shaped Character, Excellent Readability
- STANDARD DUAL-IN-LINE PACKAGE  
15.2 mm x 10.2 mm (0.6 inch x 0.4 inch)
- CATEGORIZED FOR LUMINOUS INTENSITY

## Description

The HP 5082-735X series solid state numeric and hexadecimal displays with on-board decoder/driver and memory provide 7.4 mm (0.29 inch) displays for use in adverse industrial environments.

The 5082-7356 numeric display decodes positive 8421 BCD logic inputs into characters 0-9 "—" sign, a test pattern, and four blanks in the invalid BCD states. The unit employs a right-hand decimal point.

## Package Dimensions

The 5082-7357 is the same as the 5082-7356, except that the decimal point is located on the left-hand side of the digit.

The 5082-7359 hexadecimal display decodes positive 8421 logic inputs into 16 states, 0-9 and A-F. In place of the decimal point an input is provided for blanking the display (all LED's off), without losing the contents of the memory. Applications include terminals and computer systems using the base-16 character set.

The 5082-7358 is a ( $\pm 1$ ) overrange display including a right-hand decimal point.

## Applications

Typical applications include control systems, instrumentation, communication systems, and transportation equipment.

PIN	FUNCTION	
	5082-7356 AND 7357 NUMERIC	5082-7359 HEXA- DECIMAL

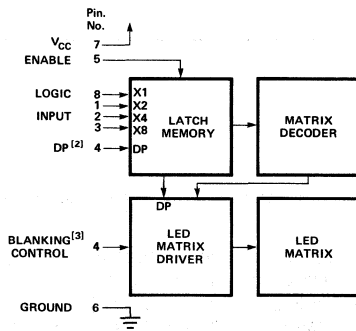

Figure 2. Block Diagram of 5082-735X Series Logic.

Notes:

1. H = Logic High; L = Logic Low. With the enable input at logic high changes in BCD input logic levels or D.P. input have no effect upon display memory, displayed character, or D.P.
2. The decimal point input, DP, pertains only to the 5082-7356 and 5082-7357 displays.
3. The blanking control input, B, pertains only to the 5082-7359 hexadecimal display. Blanking input has no effect upon display memory.

## Operational Considerations

### ELECTRICAL

The 5082-735X series devices use a modified 4 x 7 dot matrix of light emitting diodes (LED's) to display decimal/hexadecimal numeric information. The LED's are driven by constant current drivers. BCD information is accepted by the display memory when the enable line is at logic low and the data is latched when the enable is at logic high. To avoid the latching of erroneous information, the enable pulse rise time should not exceed 200 nanoseconds. Using the enable pulse width and data setup and hold times listed in the Recommended Operating Conditions allows data to be clocked into an array of displays at a 6.7MHz rate.

The blanking control input on the 5082-7395 display blanks (turns off) the displayed hexadecimal information without disturbing the contents of display memory. The display is blanked at a minimum threshold level of 3.5 volts. This may be easily achieved by using an open collector TTL gate and a pull-up resistor. For example, (1/6) 7416 hexinverter buffer/driver and a 120 ohm pull-up resistor will provide sufficient drive to blank eight displays. The size of the blanking pull-up resistor may be calculated from the following formula, where N is the number of digits:

$$R_{\text{blank}} = (V_{\text{CC}} - 3.5\text{V}) / [N (1.0\text{mA})]$$

The decimal point input is active low true and this data is latched into the display memory in the same fashion as is the BCD data. The decimal point LED is driven by the on-board IC.

The ESD susceptibility of these IC devices is Class A of MIL-STD-883 or Class 2 of DOD-STD-1686 and DOD-HDBK-263.

### MECHANICAL

These displays are designed for use in adverse industrial environments.

These displays may be mounted by soldering directly to a printed circuit board or inserted into a socket. The lead-to-lead pin spacing is 2.54mm (0.100 inch) and the lead row spacing is 15.24mm (0.600 inch). These displays may be end stacked with 2.54mm (0.100 inch) spacing between outside pins of adjacent displays. Sockets such as Augat 324-AG2D (3 digits) or Augat 508-AG8D (one digit, right angle mounting) may be used.

The primary thermal path for power dissipation is through the device leads. Therefore, to insure reliable operation up to an ambient temperature of +100°C, it is important to maintain a case-to-ambient thermal resistance of less than 35°C/watt as measured on top of display pin 3.

Post solder cleaning may be accomplished using water, Freon/alcohol mixtures formulated for vapor cleaning processing (up to 2 minutes in vapors at boiling) or Freon/alcohol mixtures formulated for room temperature cleaning. Suggested solvents: Freon TF, Freon TE, Genesolv DI-15, Genesolv DE-15.

### CONTRAST ENHANCEMENT

The 5082-735X displays have been designed to provide the maximum possible ON/OFF contrast when placed behind an appropriate contrast enhancement filter. Some suggested filters are Panelgraphic Ruby Red 60 and Dark Red 63, SGL Homalite H100-1605, 3M Light Control Film and Polaroid HRCF Red Circular Polarizing Filter. For further information see Hewlett-Packard Application Note 964.

# Solid State Over Range Display

For display applications requiring a  $\pm$ , 1, or decimal point designation, the 5082-7358 over range display is available. This display module comes in the same package as the 5082-735X series numeric display and is completely compatible with it.

## Description

These solid state display devices are designed and tested for use in adverse industrial environments. The character height is 7.4mm (0.29 inch). The numeric and hexadecimal devices incorporate an on-board IC that contains the data memory, decoder and display driver functions.

The numeric devices decode positive BCD logic into characters "0-9", a "-" sign, decimal point, and a test pattern. The hexadecimal devices decode positive BCD logic into 16 characters, "0-9, A-F". An input is provided on the hexadecimal devices to blank the display (all LED's off) without losing the contents of the memory.

The over range device displays " $\pm 1$ " and right hand decimal point and is typically driven via external switching transistors.

### Notes:

- The nominal thermal resistance of a display mounted in a socket that is soldered onto a printed circuit board is  $R\theta_{JA} = 50^\circ\text{C/W/device}$ . The device package thermal resistance is  $R\theta_{J-PIN} = 15^\circ\text{C/W/device}$ . The thermal resistance device pin-to-ambient through the PC board should not exceed  $35^\circ\text{C/W/device}$  for operation at  $T_A = +85^\circ\text{C}$ .
- Voltage values are with respect to device ground, pin 6.
- These displays are categorized for luminous intensity with the intensity category designated by a letter code located on the back of the display package. Case temperature of the device immediately prior to the light measurement is equal to  $25^\circ\text{C}$ .

 6. The HDSP-0860 and HDSP-0960 series devices are categorized as to dominant wavelength with the category designated by a number on the back side of the display package.  
 7. All typical values at V<sub>CC</sub> = 5.0V and T<sub>A</sub> = 25°C.

## Operational Considerations

### ELECTRICAL

These devices use a modified 4 x 7 dot matrix of light emitting diode to display decimal/hexadecimal numeric information. The high efficiency red and yellow LED's are GaAsP epitaxial layer on a GaP transparent substrate. The green LED's are GaP epitaxial layer on a GaP transparent substrate. The LED's are driven by constant current drivers, BCD information is accepted by the display memory when the enable line is at logic low and the data is latched when the enable is at logic high. Using the enable pulse width and data setup and hold times listed in the Recommended Operating Conditions allows data to be clocked into an array of displays at a 6.7 MHz rate.

The decimal point input is active low true and this data is latched into the display memory in the same fashion as the BCD data. The decimal point LED is driven by the on-board IC.

The blanking control input on the hexadecimal displays blanks (turns off) the displayed information without disturbing the contents of display memory. The display is

blanked at a minimum threshold level of 2.0 volts. When blanked, the display standby power is nominally 250 mW at T<sub>A</sub> = 25°C.

### MECHANICAL

The primary thermal path for power dissipation is through the device leads. Therefore, to insure reliable operation up to an ambient temperature of +85°C, it is important to maintain a cast-to-ambient thermal resistance of less than 35°C watt/device as measured on top of display pin 3.

Post solder cleaning may be accomplished using water, Freon/alcohol mixtures formulated for vapor cleaning processing (up to 2 minutes in vapors at boiling) or Freon/alcohol mixtures formulated for room temperature cleaning. Suggested solvents: Freon TF, Freon TE, Genesolv DI-15, Genesolv DE-15.

## CONTRAST ENHANCEMENT

These display devices are designed to provide an optimum ON/OFF contrast when placed behind an

appropriate contrast enhancement filter. The following filters are suggested:

Display Color	Ambient Lighting		
	Dim	Moderate	Bright
HDSP-0860 Series Yellow	Panelgraphic Yellow 27 Chequers Amber 107	Polaroid HNCP 37 3M Light Control Film  Panelgraphic Gray 10	Polaroid Gray HNCP10 HOYA Yellowish-Orange HLF-608-3Y Marks Gray MCP-0301-8-10

## Over Range Display

The over range devices display "±1" and decimal point. The character height and package configuration are the same as the numeric and hexadecimal devices. Character selection is obtained via external switching transistors and current limiting resistors.

PACKARD

# RED HEXADECIMAL 6.86mm (0.27in)

HTIL-311A

## Features

- ON-BOARD LOW POWER, EASY TO INTERFACE  
CMOS IC INCLUDES DECODER, DRIVER AND  
4-BIT MEMORY
- DISPLAYS 4 X 7 DOT MATRIX HEXADECIMAL  
CHARACTERS DIRECTLY FROM 4 BIT DATA
- OPERATES FROM 5 VOLT SUPPLY
- CONSTANT CURRENT DRIVERS
- STANDARD 14 PIN DUAL-IN-LINE PACKAGE  
INCLUDING CONTRAST ENHANCEMENT  
FILTER
- CATEGORIZED FOR LUMINOUS INTENSITY
- WIDE VIEWING ANGLE
- STURDY ROUND LEADS
- SUITABLE FOR AUTOMATIC INSERTION

IC. The encapsulated dual-in-line package construction provides a rugged, environmentally sealed unit. The display may be stacked in either the X or Y direction to create either single or multiline systems. The bullet ended round pins are easy to insert in either PC boards or sockets.

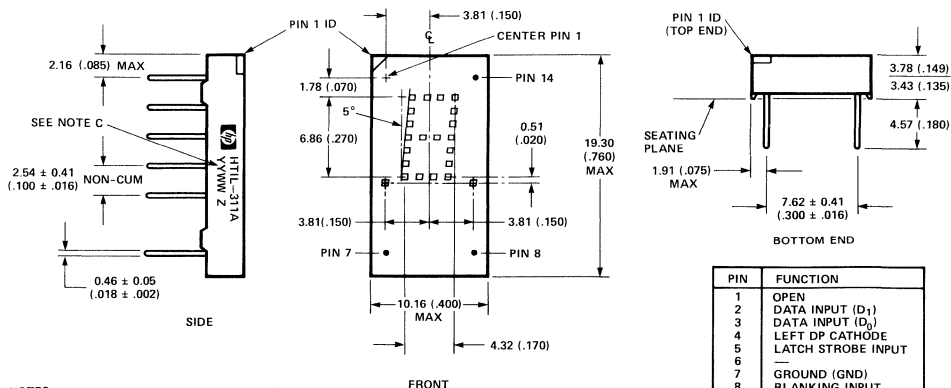

## Description

The HTIL-311A is a single character red 4X7 dot matrix display with an on-board CMOS IC to accept, store and display 4-bit binary data. This display decodes positive 4-bit binary data into 16 states, 0-9 and A-F. The character height is 6.86mm (0.27 inch). The LEDs and IC are attached to a substrate which is enclosed by a plastic cap and backfill, creating an air gap environment for the LEDs and

## Applications

- INSTRUMENTATION
- COMPUTERS AND PERIPHERALS
- STATUS INDICATORS
- TELECOMMUNICATIONS

## Package Dimensions

Spectral Bandwidth	$\lambda_W$		24		nm	
Thermal Resistance	$\theta_{JC}$		48		°C/W	

### Notes:

- Case temperature is the surface temperature of the plastic measured directly over the integrated circuit. Forced air cooling may be required to maintain this temperature. Maximum IC junction temperature should not exceed 125°C.
- Typicals measured at  $V_{DD} = 5.0$  V.
- $V_{F(DP)}$  is not tested. See Figure 3 for forward voltage versus forward current.
- Measured at 25°C case temperature.
- This parameter is measured with "A" displayed, then again with "E" displayed.
- These displays are categorized for luminous intensity with the intensity category designated by a letter located on the side of the display.
- See Figure 4 for relative luminous intensity versus ambient temperature. See Figure 5 for relative luminous intensity versus logic supply voltage.
- The dominant wavelength,  $\lambda_D$ , is derived from the CIE chromaticity diagram and represents the single wavelength which defines the color of the device.
- Measured at 5 seconds.

# Pin Function

## LATCH STROBE INPUT (pin 5)

L: Data inputs are transferred to the decoder and displayed.  
 H: Data at D<sub>0</sub>-D<sub>3</sub> is stored. Stored character is displayed regardless of the input data changes. Data stored in the latch is not affected by the blanking input.

## BLANKING INPUT (BLK, pin 8)

L: Character is displayed.  
 H: Display is blanked, except for the decimal points. The display will be blanked regardless of the state of the other inputs. The blanking input may be used to dim the display by pulse width modulation of this input.

## DATA INPUTS (D<sub>0</sub>-D<sub>3</sub>, pins 3, 2, 13, 12)

Four bit hexadecimal data is entered into the latch via the data inputs.

## DECIMAL POINT CATHODES (pins 4, 10)

The anodes of the left and right decimal points are connected to V<sub>DD</sub>. To illuminate the decimal point, the decimal point cathode must be connected to ground with a resistor or other current limiting device.

## OPEN PIN (pin 1)

## DISPLAY SUPPLY (V<sub>DD</sub>, pin 14)

This input supplies power to the LEDs and the IC.

## GROUND (GND, pin 7)

This is the display ground.

## INSERTION INTO A SOCKET

During insertion into a socket, care must be taken to apply pressure only along the edges of the display window. Pressure applied at the center of the window may cause it to deform sufficiently to damage LED and IC wire bonds.

## TRUTH TABLE

Blanking	Latch	Data Input				Character Displayed

### Notes:

1. The character stored in the Latch will be displayed. The contents of the Latch will remain unchanged.
2. The display will be blanked, except for the decimal points. The Latch will be updated based on the current logic levels present at the data inputs.
3. The display, except for the decimal points, will be blanked. The contents of the Latch will remain unchanged.

# Hermetic Displays

## Military Grade Displays

Hewlett-Packard families of military grade numeric and alphanumeric LED displays are screened to the requirements of MIL-D-87157. MIL-D-87157 is the general specification for LED display devices and defines four screening levels for hermetic and nonhermetic devices, termed "Quality Levels".

**Quality Level A:** Hermetic displays with 100% screening and Group A, B, and C testing.

**Quality Level B:** Hermetic displays with Group A, B, and C testing, but without 100% screening.

**Quality Level C:** Nonhermetic displays with 100% screening and Group A, B, and C testing.

**Quality Level D:** Nonhermetic displays with Group A, B, and C testing, but without 100% screening.

The 4N5X series single digit dot matrix numeric and hexadecimal displays are listed on the MIL-D-87157 Qualified Parts List (QPL) under the numeric series M871570010XAAX.

Displays with TXV part numbers are 100% screened with Group A testing. Displays with TXVB part numbers are 100% screened to Quality Level A.

The applicable MIL-D-87157 screening tables are detailed on each display data sheet.

## High Reliability Displays

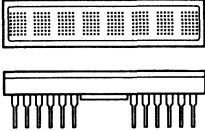

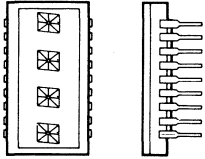

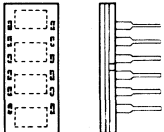

In addition to Hewlett-Packard commercial solid state displays, Hewlett-Packard offers a complete line of hermetic packages for high reliability military and aerospace applications. These packages consist of numeric and hexadecimal displays, 5 x 7 dot matrix alphanumeric displays with extended temperature ranges, and fully intelligent monolithic 16 segment displays with extended temperature ranges and on board CMOS ICs. Similar to the commercial display product selection, the high reliability display products are offered in a variety of character sizes and colors: standard red, high efficiency red, yellow, and high

performance green. Orange displays are sometimes available upon request.

Hewlett-Packard offers three different testing programs for the high reliability conscious display customer. These programs include DESC Qualification on the MIL-D-87157 for the hermetically sealed 4N51-4N54 hexadecimal and numeric displays; and two levels of in-house high reliability testing programs that conform or a modification to MIL-D-87157 Quality Level A Test Tables for all other high reliability display products. Please refer to the individual data sheets for a complete description of each display's testing program.

Integrated numeric and hexadecimal displays (with on-board ICs) solve the designer's decoding/driving problems. They are available in plastic packages for general purpose usage, ceramic/glass packages for industrial applications, and hermetic packages for high reliability applications. This family of displays has been designed for ease of use in a wide range of environments.

### Features

- Wide Operating Temperature Range -55°C to +85°C
- True Hermetic Package for Yellow, Orange and High Efficiency Red Displays<sup>[1]</sup>
- TXVB Version Conforms to MIL-D-87157 Quality Level A Test Tables
- Smart Alphanumeric Display  
On-Board CMOS IC  
Built-In RAM  
ASCII Decoder  
LED Drive Circuitry
- 128 ASCII Character Set
- 16 User Definable Characters
- Programmable Features  
Individual Flashing Character  
Full Display Blinking  
Multi-Level Dimming and Blanking  
Self Test  
Clear Function
- Read/Write Capability

- Full TTL Compatibility
- HDSP-2131/-2133/-2179 Useable in Night Vision Lighting Applications
- Categorized for Luminous Intensity
- HDSP-2131/2133 Categorized for Color
- Excellent ESD Protection
- Wave Solderable
- X-Y Stackable

### Description

The HDSP-2131 (yellow), HDSP-2179 (orange), HDSP-2132 (high efficiency red) and the HDSP-2133 (green) are eight-digit, 5 x 7 dot matrix, alphanumeric displays. The 5.0 mm (0.2 inch) high characters are packaged in a standard 7.64 mm (0.30 inch) 32 pin DIP. The on-board CMOS IC has the ability to decode 128 ASCII characters, which are permanently stored in ROM. In addition, 16 programmable symbols may be

stored in an on-board RAM. Seven brightness levels provide versatility in adjusting the display intensity and power consumption. The HDSP-213X is designed for standard micro-processor interface techniques. The display and special features are accessed through a bidirectional eight-bit data bus. These features make the HDSP-213X ideally suited for applications where an hermetic, low power alphanumeric display is required.

### Devices

Yellow	High Efficiency Red	High Performance Green	Orange
HDSP-2131	HDSP-2132	HDSP-2133	HDSP-2179
HDSP-2131TXV	HDSP-2132TXV	HDSP-2133TXV	HDSP-2179TXV
HDSP-2131TXVB	HDSP-2132TXVB	HDSP-2133TXVB	HDSP-2179TXVB

**Note:** 1. The HDSP-2133 high performance green displays conform to MIL-D-87157 hermeticity requirements.

## Package Dimensions

PIN NO.	FUNCTION	PIN NO.	FUNCTION
1	CLS	17	GND (SUPPLY)
2	CLK	18	GND (LOGIC)
3	WR	19	D4
4	CE	20	D5
5	RST	21	D6
6	RD	22	D7
7	NO PIN	23	NO PIN
8	NO PIN	24	NO PIN
9	NO PIN	25	NO PIN
10	NO PIN	26	NO PIN
11	D0	27	FL
12	D1	28	A0
13	D2	29	A1
14	D3	30	A2
15	NC	31	A3
16	V <sub>DD</sub>	32	A4

### Note:

1. All dimensions are in mm (inches).
2. Unless otherwise specified tolerance is  $\pm 0.30$  mm ( $\pm 0.015$ ).
3. For green and yellow devices only.
4. Leads are copper alloy, solder dipped.

## Absolute Maximum Ratings

Supply Voltage, V <sub>DD</sub> to Ground <sup>[1]</sup>	-0.3 to 7.0 V
Operating Voltage, V <sub>DD</sub> to Ground <sup>[2]</sup>	5.5 V
Input Voltage, Any Pin to Ground	-0.3 to V <sub>DD</sub> + 0.3 V
Free Air Operating Temperature Range, T <sub>A</sub>	-55°C to +85°C
Storage Temperature, T <sub>S</sub>	
HDSP-2131/-2132/-2179	-65°C to +125°C
HDSP-2133	-55°C to +100°C
Maximum Solder Temperature 1.59 mm (0.063 in.) Below Seating Plane, t < 5 sec	260°C
ESD Protection @ 1.5 kΩ, 100 pF	V <sub>Z</sub> = 4 kV (each pin)

### Notes:

1. Maximum Voltage is with no LEDs illuminated.
2. 20 dots ON in all locations at full brightness.

**ESD WARNING: STANDARD CMOS HANDLING PRECAUTIONS SHOULD BE OBSERVED WITH THE HDSP-2131, HDSP-2132, HDSP-2133, AND HDSP-2179.**

$I_{DD}$ 8 digits 20 dots/character <sup>[3]</sup>	$I_{DD}$ (#)		300	370	430	mA	"#" on in all 8 locations
Input Voltage High	$V_{IH}$	2.0			$V_{DD}$ +0.3	V	$V_{DD} = 5.5$ V
Input Voltage Low	$V_{IL}$	GND -0.3 V			0.8	V	$V_{DD} = 4.5$ V
Output Voltage High	$V_{OH}$	2.4				V	$V_{DD} = 4.5$ V, $I_{OH} = -40$ $\mu$ A
Output Voltage Low D <sub>0</sub> -D <sub>7</sub>	$V_{OL}$				0.4	V	$V_{DD} = 4.5$ V, $I_{OL} = 1.6$ mA
Output Voltage Low CLK					0.4	V	$V_{DD} = 4.5$ V, $I_{OL} = 40$ $\mu$ A
Thermal Resistance IC Junction-to-PIN	$R\theta_{J-PIN}$		11			°C/W	

### Notes:

- $V_{DD} = 5.0$  V.
- Maximum  $I_{DD}$  occurs at -55°C.
- Average  $I_{DD}$  measured at full brightness. See Table 2 in Control Word Section for  $I_{DD}$  at lower brightness levels. Peak  $I_{DD} = 28/15 \times$  Average  $I_{DD}$  (#).

## Optical Characteristics at 25°C<sup>[4]</sup>

V<sub>DD</sub> = 5.0 V at Full Brightness

### High Efficiency Red HDSP-2132

Description	Symbol	Minimum	Typical	Units
Luminous Intensity Character Average (#)	I <sub>V</sub>	2.5	7.5	mcd
Peak Wavelength	λ <sub>PEAK</sub>		635	nm
Dominant Wavelength	λ <sub>d</sub>		626	nm

### Orange HDSP-2179

Description	Symbol	Minimum	Typical	Units
Luminous Intensity Character Average (#)	I <sub>V</sub>	2.5	7.5	mcd
Peak Wavelength	λ <sub>PEAK</sub>		600	nm
Dominant Wavelength	λ <sub>d</sub>		602	nm

### Yellow HDSP-2131

Description	Symbol	Minimum	Typical	Units
Luminous Intensity Character Average (#)	I <sub>V</sub>	2.5	7.5	mcd
Peak Wavelength	λ <sub>PEAK</sub>		583	nm
Dominant Wavelength	λ <sub>d</sub>		585	nm

### High Performance Green HDSP-2133

Description	Symbol	Minimum	Typical	Units
Luminous Intensity Character Average (#)	I <sub>V</sub>	2.5	7.5	mcd
Peak Wavelength	λ <sub>PEAK</sub>		568	nm
Dominant Wavelength	λ <sub>d</sub>		574	nm

**Note:**

4. Refers to the initial case temperature of the device immediately prior to the light measurement.

## AC Timing Characteristics Over Temperature Range

$V_{DD} = 4.5$  to  $5.5$  V unless otherwise specified.

Reference Number	Symbol	Description	Min. <sup>(1)</sup>	Units
1	$t_{ACC}$	Display Access Time Write Read	210 230	ns
2	$t_{ACS}$	Address Setup Time to Chip Enable	10	ns
3	$t_{CE}$	Chip Enable Active Time <sup>(2,3)</sup> Write Read	140 160	ns
4	$t_{ACH}$	Address Hold Time to Chip Enable	20	ns
5	$t_{CER}$	Chip Enable Recovery Time	60	ns
6	$t_{CES}$	Chip Enable Active Prior to Rising Edge of <sup>(1,2)</sup> Write Read	140 160	ns
7	$t_{CEH}$	Chip Enable Hold Time to Rising Edge of Read/Write Signal <sup>(2,3)</sup>	0	ns
8	$t_W$	Write Active Time <sup>(2,3)</sup>	100	ns
9	$t_{WD}$	Data Valid Prior to Rising Edge of Write Signal	50	ns
10	$t_{DH}$	Data Write Hold Time	20	ns
11	$t_R$	Chip Enable Active Prior to Valid Data	160	ns
12	$t_{RD}$	Read Active Prior to Valid Data	75	ns
13	$t_{DF}$	Read Data Float Delay	10	ns
	$t_{RC}$	Reset Active Time <sup>(4)</sup>	300	ns

### Notes:

1. Worst case values occur at an IC junction temperature of 125°C.
2. For designers who do not need to read from the display, the Read line can be tied to  $V_{DD}$  and the Write and Chip Enable lines can be tied together.
3. Changing the logic levels of the Address lines when  $\overline{CE} = "0"$  may cause erroneous data to be entered into the Character RAM, regardless of the logic levels of the WR and RD lines.
4. The display must not be accessed until after 3 clock pulses (110  $\mu$ s min. using the internal refresh clock) after the rising edge of the reset line.

Symbol	Description	25°C Typical	Minimum <sup>(1)</sup>	Units
$F_{OSC}$	Oscillator Frequency	57	28	kHz
$F_{RF}^{(5)}$	Display Refresh Rate	256	128	Hz
$F_{FL}^{(6)}$	Character Flash Rate	2	1	Hz
$t_{ST}^{(7)}$	Self Test Cycle Time	4.6	9.2	Sec

**Notes:**

5.  $F_{RF} = F_{OSC} / 224$

6.  $F_{FL} = F_{OSC} / 28,672$

7.  $t_{ST} = 262,144 / F_{OSC}$

## Character Font

(Not to Scale)

## Relative Luminous Intensity vs. Temperature

## Electrical Description

### Pin Function

RESET ( $\overline{\text{RST}}$ , pin 5)

Reset initializes the display.

FLASH ( $\overline{\text{FL}}$ , pin 27)

$\overline{\text{FL}}$  low indicates an access to the Flash RAM and is unaffected by the state of address lines  $A_3$ - $A_4$ .

ADDRESS INPUTS ( $A_0$ - $A_4$ , pins 28-32)

Each location in memory has a distinct address. Address inputs ( $A_0$ - $A_2$ ) select a specific location in the Character RAM, the Flash RAM or a particular row in the UDC (User-Defined Character) RAM.  $A_3$ - $A_4$  are used to select which section of memory is accessed. Table 1 shows the logic levels needed to access each section of memory.

**Table 1. Logic Levels to Access Memory**

$\overline{\text{FL}}$	$A_4$	$A_3$	Section of Memory	$A_2$ $A_1$ $A_0$
0	X	X	Flash RAM	Character Address
1	0	0	UDC Address Register	Don't Care
1	0	1	UDC RAM	Row Address
1	1	0	Control Word Register	Don't Care
1	1	1	Character RAM	Character Address

CLOCK SELECT (CLS, pin 1)

This input is used to select either an internal or external clock source.

CLOCK INPUT/OUTPUT (CLK, pin 2)

Outputs the master clock (CLS = 1) or inputs a clock (CLS = 0) for slave displays.

WRITE ( $\overline{\text{WR}}$ , pin 3)

Data is written into the display when the  $\overline{\text{WR}}$  input is low and the  $\overline{\text{CE}}$  input is low.

CHIP ENABLE ( $\overline{\text{CE}}$ , pin 4)

This input must be at a logic low to read or write data to the display and must go high between each read and write cycle.

READ ( $\overline{\text{RD}}$ , pin 6)

Data is read from the display when the  $\overline{\text{RD}}$  input is low and the  $\overline{\text{CE}}$  input is low.

DATA Bus ( $D_0$ - $D_7$ , pins 11-14, 19-22)

The Data bus is used to read from or write to the display.

$\text{GND}_{(\text{SUPPLY})}$  (pin 17)

This is the analog ground for the LED drivers.

$\text{GND}_{(\text{LOGIC})}$  (pin 18)

This is the digital ground for internal logic.

$V_{\text{DD}(\text{POWER})}$  (pin 16)

This is the positive power supply input.

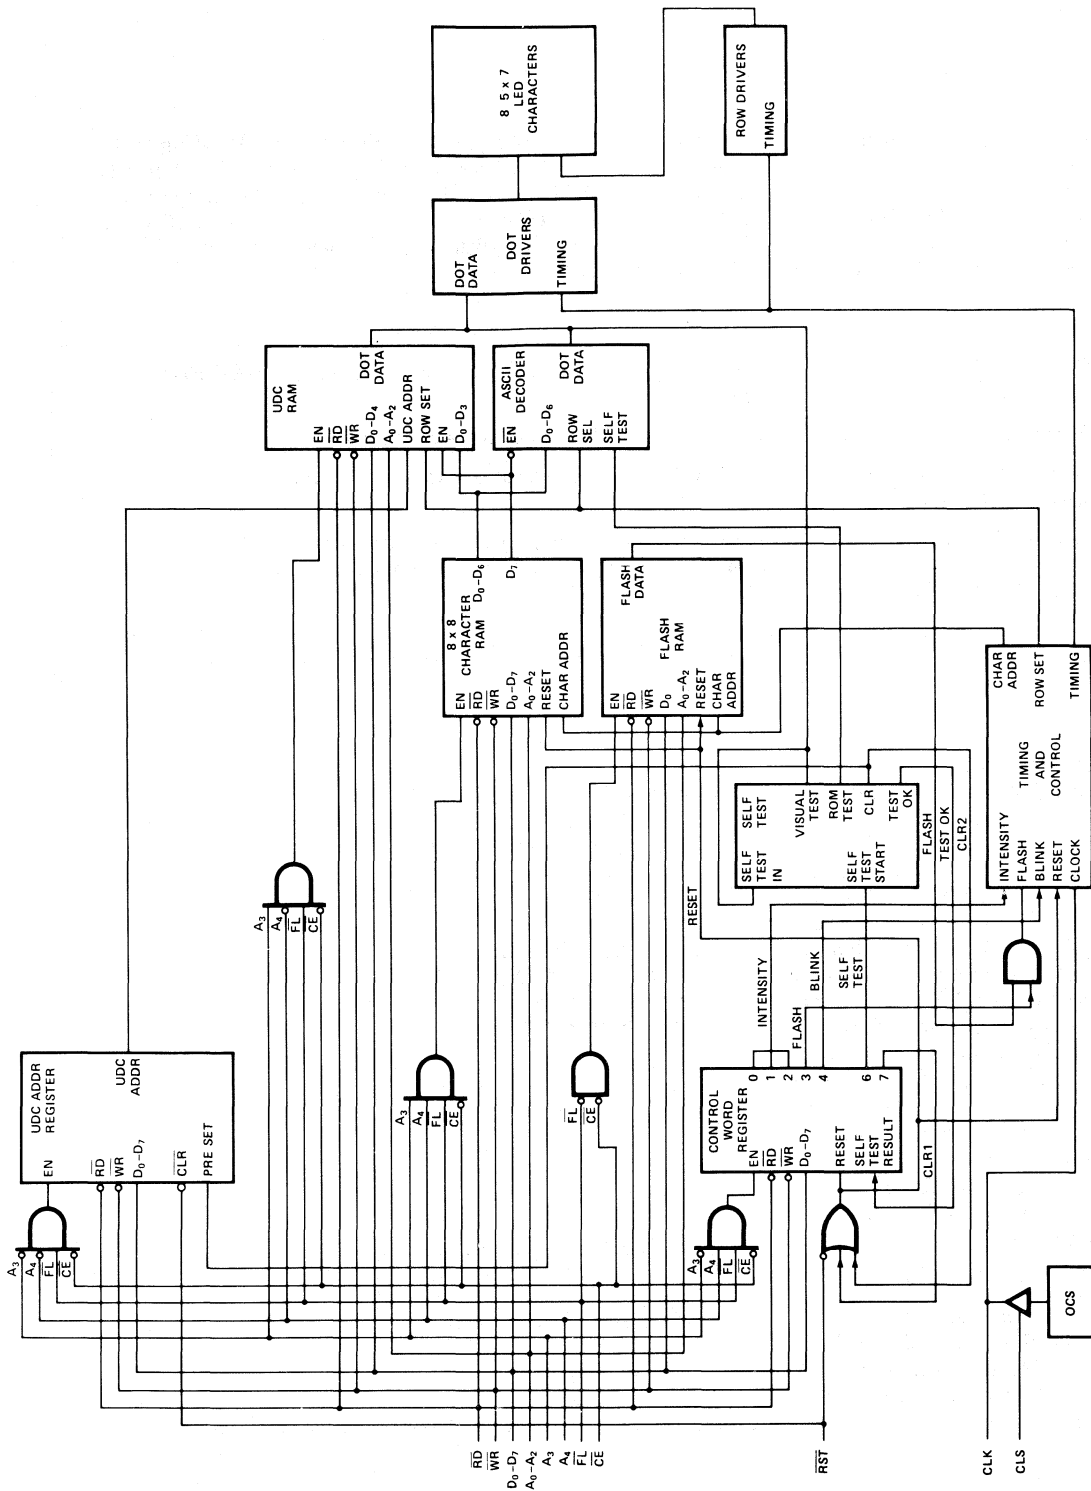

Figure 1. HDSP-213X Internal Block Diagram.

## Display Internal Block Diagram

Figure 1 shows the internal block diagram of the HDSP-213X display. The CMOS IC consists of an 8 byte Character

RAM, an 8 bit Flash RAM, a 128 character ASCII decoder, a 16 character UDC RAM, a UDC Address Register, a Control Word Register, and the refresh circuitry necessary to syn-

chronize the decoding and driving of eight 5 x 7 dot matrix characters. The major user accessible portions of the display are listed below:

Character RAM	This RAM stores either ASCII character data or a UDC RAM address.
Flash RAM	This is a 1 x 8 RAM which stores Flash data.
User-Defined Character RAM (UDC RAM)	This RAM stores the dot pattern for custom characters.
User-defined Character Address Register (UDC Address Register)	This register is used to provide the address to the UDC RAM when the user is writing or reading a custom character.
Control Word Register	This register allows the user to adjust the display brightness, flash individual characters, blink, self test or clear the display.

## Character Ram

Figure 2 shows the logic levels needed to access the HDSP-213X Character RAM. During a normal access the  $\overline{CE}$  = "0" and either  $\overline{RD}$  = "0" or  $\overline{WR}$  = "0". However, erroneous data may be written into the Character RAM if the Address lines are unstable when  $\overline{CE}$  = "0" regardless of the logic levels of the  $\overline{RD}$  or  $\overline{WR}$  lines. Address lines  $A_0$ - $A_2$  are used to select the location in the Character RAM. Two types of data can be stored in each Character RAM location: an ASCII code or a UDC RAM address. Data bit  $D_7$  is used to differentiate between an ASCII character and a UDC RAM address.  $D_7 = 0$  enables the ASCII decoder and  $D_7 = 1$  enables the UDC RAM.  $D_0$ - $D_6$  are used to input ASCII data and  $D_0$ - $D_3$  are used to input a UDC address.

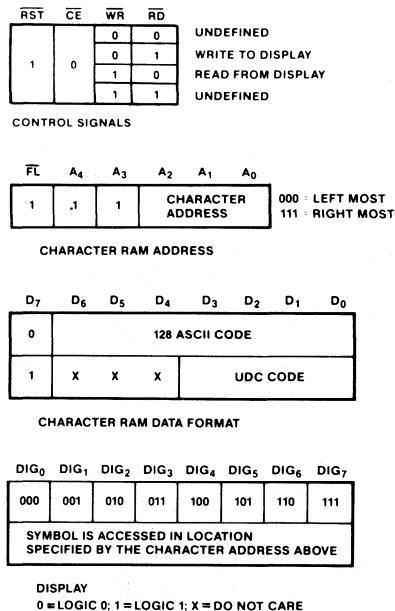

Figure 2. Logic Levels to Access the Character RAM.

## UDC RAM and UDC Address Register

Figure 3 shows the logic levels needed to access the UDC RAM and the UDC Address Register. The UDC Address Register is eight bits wide. The lower four bits ( $D_0$ - $D_3$ ) are used to select one of the 16 UDC locations. The upper four bits ( $D_4$ - $D_7$ ) are not used. Once the UDC address has been stored in the UDC Address Register, the UDC RAM can be accessed.

To completely specify a 5 x 7 character requires eight write cycles. One cycle is used to store the UDC RAM address in the UDC Address Register. Seven cycles are used to store dot data in the UDC RAM. Data is entered by rows. One cycle is needed to access each row. Figure 4 shows the organization of a UDC character assuming the symbol to be stored is an "F".  $A_0$ - $A_2$  are used to select the row to be accessed and  $D_0$ - $D_4$  are used to transmit the row dot data. The upper three bits ( $D_5$ - $D_7$ ) are ignored.  $D_0$  (least significant bit) corresponds to the right most column of the 5 x 7 matrix and  $D_4$  (most significant bit) corresponds to the left most column of the 5 x 7 matrix.

## Flash RAM

Figure 5 shows the logic levels needed to access the Flash RAM. The Flash RAM has one bit associated with each location of the Character RAM. The Flash input is used to select the Flash RAM. Address lines  $A_3$ - $A_4$  are ignored. Address lines  $A_0$ - $A_2$  are used to select the location in the Flash RAM to store the attribute.  $D_0$  is used to store or remove the flash attribute.  $D_0 = "1"$  stores the attribute and  $D_0 = "0"$  removes the attribute.

Figure 4. Data to Load "F" into the UDC RAM.

When the attribute is enabled through bit 3 of the Control Word and a "1" is stored in the Flash RAM, the corresponding character will flash at approximately 2 Hz. The actual rate is

dependent on the clock frequency. For an external clock the flash rate can be calculated by dividing the clock frequency by 28,672.

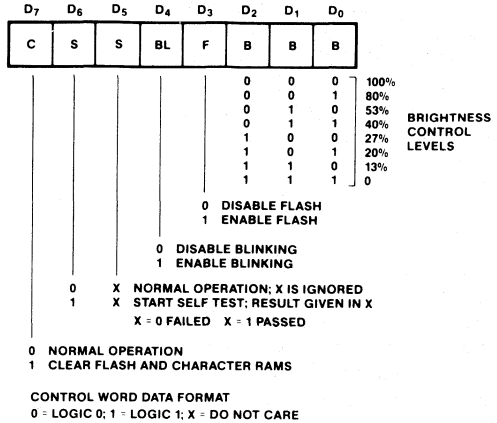

Figure 5. Logic Levels to Access the Flash RAM.

### Control Word Register

Figure 6 shows how to access the Control Word Register. This is an eight bit register which performs five functions. They are Brightness control, Flash RAM control, Blinking, Self Test and Clear. Each function is independent of the others. However, all bits are updated during each Control Word write cycle.

#### Brightness (Bits 0-2)

Bits 0-2 of the Control Word adjust the brightness of the display. Bits 0-2 are interpreted as a three bit binary code with code (000) corresponding to maximum brightness and code (111) corresponding to a blanked display. In addition to varying the display brightness, bits 0-2 also vary the average value of  $I_{DD}$ .  $I_{DD}$  can be calculated at any brightness level by multiplying the percent brightness level by the value of  $I_{DD}$  at the 100% brightness level. These values of  $I_{DD}$  are shown in Table 2.

#### Flash Function (Bit 3)

Bit 3 determines whether the flashing character attribute is on or off. When bit 3 is a "1", the output of the Flash RAM is checked. If the content of a location in the Flash RAM is a "1", the associated digit will flash at

Table 2. Current Requirements at Different Brightness Levels

Symbol	$D_2$	$D_1$	$D_0$	% Brightness	25°C Typical	Units
$I_{DD}$ (V)	0	0	0	100	200	mA
	0	0	1	80	160	mA
	0	1	0	53	106	mA
	0	1	1	40	80	mA
	1	0	0	27	54	mA
	1	0	1	20	40	mA
	1	1	0	13	26	mA

approximately 2 Hz. For an external clock, the blink rate can be calculated by driving the clock frequency by 28,672. If the flash enable bit of the Control Word is a "0", the content of the Flash RAM is ignored. To use this function with multiple display systems see the Reset section.

#### Blink Function (Bit 4)

Bit 4 of the Control Word is used to synchronize blinking of

all eight digits of the display. When this bit is a "1" all eight digits of the display will blink at approximately 2 Hz. The actual rate is dependent on the clock frequency. For an external clock, the blink rate can be calculated by dividing the clock frequency by 28,672. This function will override the Flash function when it is active. To use this function with multiple display systems see the Reset section.

### Self Test Function (Bits 5, 6)

Bit 6 of the Control Word Register is used to initiate the self test function. Results of the internal self test are stored in bit 5 of the Control Word. Bit 5 is a read only bit where bit 5 = "1" indicates a passed self test and bit 5 = "0" indicates a failed self test.

Setting bit 6 to a logic 1 will start the self test function. The built-in self test function of the IC consists of two internal routines which exercises major portions of the IC and illuminates all of the LEDs. The first routine cycles the ASCII decoder ROM through all states and performs a checksum on the output. If the checksum agrees with the correct value, bit 5 is set to "1". The second routine provides a visual test of the LEDs using the drive circuitry. This is accomplished by writing checkered and inverse checkered patterns to the display. Each pattern is displayed for approximately 2 seconds.

During the self test function the display must not be accessed. The time needed to execute the self test function is calculated by multiplying the clock period by 262,144. For example, assume a clock frequency of 58 KHz, then the time to execute the self test function frequency is equal to  $(262,144/58,000) = 4.5$  second duration.

At the end of the self test function, the Character RAM is loaded with blanks, the Control Word Register is set to zeros except for bit 5, and the Flash RAM is cleared and the UDC Address Register is set to all ones.

### Clear Function (Bit 7)

Bit 7 of the Control Word will clear the Character RAM and the Flash RAM. Setting bit 7 to a "1" will start the clear function. Three clock cycles (110  $\mu$ s min. using the internal refresh clock) are required to complete the clear function. The display must not be accessed while the display is being cleared. When the clear function has been completed, bit 7 will be reset to a "0". The ASCII character code for a space (20H) will be loaded into the Character RAM to blank the display and the Flash RAM will be loaded with "0"s. The UDC RAM, UDC Address Register, and the remainder of the Control Word are unaffected.

### Display Reset

Figure 7 shows the logic levels needed to Reset the display. The display should be Reset on Power-up. The external Reset clears the Character RAM, Flash RAM, Control Word and resets the internal counters. After the rising edge of the Reset signal, three clock cycles (110  $\mu$ s min. using the internal refresh clock) are required to complete the reset sequence. The display must not be accessed while the display is being reset. The ASCII Character code for a space (20H) will be loaded into the Character RAM to blank the display. The Flash RAM and Control Word Register are loaded with all "0"s. The UDC RAM and UDC Address

RST	CE	WR	RD	FL	A <sub>4</sub> -A <sub>0</sub>	D <sub>7</sub> -D <sub>0</sub>
0	1	X	X	X	X	X

0 = LOGIC 0; 1 = LOGIC 1; X = DO NOT CARE  
NOTE:  
IF RST, CE AND WR ARE LOW, UNKNOWN  
DATA MAY BE WRITTEN INTO THE DISPLAY.

Figure 7. Logic Levels to Reset the Display.

Register are unaffected. All displays which operate with the same clock source must be simultaneously reset to synchronize the Flashing and Blinking functions.

### Mechanical and Electrical Considerations

The HDSP-213X is a 32 pin dual-in-line package with 24 external pins, which can be stacked horizontally and vertically to create arrays of any size. The HDSP-213X is designed to operate continuously from -55°C to +85°C with a maximum of 20 dots ON per character. Illuminating all thirty-five dots at full brightness is not recommended.

The HDSP-213X is assembled by die attaching and wire bonding 280 LED chips and a CMOS IC to a ceramic substrate. A glass window is placed over the ceramic substrate creating an air gap over the LED wire bonds. A second glass window creates an air gap over the CMOS IC. This package construction makes the display highly tolerant to temperature cycling and allows wave soldering and visual inspection of the IC.

Figure 8. Maximum Power Dissipation vs. Ambient Temperature Derating Based on  $T_{J,MAX} = 125^{\circ}\text{C}$ .

The inputs to the CMOS IC are protected against static discharge and input current latch-up. However, for best results standard CMOS handling precautions should be used. Prior to use, the HDSP-213X should be stored in antistatic packages or conductive material. During assembly, a grounded conductive work area should be used, and assembly personnel should wear conductive wrist straps. Lab coats made of synthetic material should be avoided since they are prone to static charge buildup. Input current latchup is caused when the CMOS inputs are subjected to either a voltage below ground ( $V_{IN} < \text{ground}$ ) or to a voltage higher than  $V_{DD}$  ( $V_{IN} > V_{DD}$ ) and when a high current is forced into the input. To prevent input current latchup and ESD damage, unused inputs should be connected either to ground or to  $V_{DD}$ . Voltages should not be applied to the inputs until  $V_{DD}$  has been applied to the display. Transient input voltages should be eliminated.

### Thermal Considerations

The HDSP-213X has been designed to provide a low thermal resistance path from the CMOS IC to the 24 package pins. This heat is then typically conducted through the traces of the user's printed circuit board to free air. For most applications no additional heatsinking is required.

The maximum operating IC junction temperature is 125°C. The maximum IC junction temperature can be calculated using the following equation:

$$T_{J(IC) \text{ MAX}} = T_A + (P_D \text{ MAX}) (R\theta_{J-PIN} + R\theta_{PIN-A})$$

Where

$$P_D \text{ MAX} = (V_{DD} \text{ MAX}) (I_{DD} \text{ MAX})$$

$I_{DD} \text{ MAX} = 370 \text{ mA}$  with 20 dots ON in eight character locations at 25°C ambient. This value is from the Electrical Characteristics table.

$$P_D \text{ MAX} = (5.5 \text{ V}) (0.370 \text{ A}) = 2.04 \text{ W}$$

### Ground Connections

Two ground pins are provided to keep the internal IC logic ground clean. The designer can, when necessary, route the analog ground for the LED drivers separately from the logic ground until an appropriate ground plane is available. On long interconnects between the display and the host system, the designer can keep voltage drops on the analog ground from affecting the display logic levels by isolating the two grounds.

The logic ground should be connected to the same ground potential as the logic interface circuitry. The analog ground and the logic ground should be connected at a common ground which can withstand the current introduced by the switching LED drivers. When separate ground connections are used, the analog ground can vary from -0.3 V to +0.3 V with respect to the logic ground. Voltage below -0.3 V can cause all dots to be on. Voltage above +0.3 V can cause dimming and dot mismatch.

### ESD Susceptibility

These displays have ESD susceptibility ratings of CLASS 3 per DOD-STD-1686 and CLASS B per MIL-STD-883C.

### Soldering and Post Solder Cleaning Instructions for the HDSP-213X

The HDSP-213X may be hand soldered or wave soldered with SN63 solder. When hand soldering it is recommended that an electronically temperature controlled and securely grounded soldering iron be used. For best results, the iron tip temperature should be set at 315°C (600°F). For wave soldering, a rosin-based RMA flux can be used. The solder wave temperature should be set at 245°C ± 5°C (473°F ± 9°F), and dwell in the wave should be set between 1-1/2 to 3 seconds for optimum soldering. The preheat temperature should not exceed 105°C (221°F) as measured on the solder side of the PC board.

Post solder cleaning may be performed using water or Freon/alcohol mixtures formulated for vapor cleaning processing or Freon/alcohol mixtures formulated for room temperature cleaning. Freon/alcohol vapor cleaning processing for up to 2 minutes in vapors at boiling temperature is permissible. Suggested solvents include Freon TF, Freon TE, Genesolv DI-15, Genesolv DE-15, Genesolv DES, and water.

An aqueous cleaning process may be used. A saponifier, such as Kester Bio-Kleen Formula 5799 or its equivalent, may be added to the wash cycle of an aqueous process to remove rosin flux residues. Organic acid flux residues must be thoroughly removed by an aqueous cleaning process to prevent corrosion of the leads and solder connections. The optimum water temper-

ature is 60°C (140°F). The maximum cumulative exposure of the HDSP-213X to wash and rinse cycles should not exceed 15 minutes. For additional information on soldering and post solder cleaning, see Application Note 1027.

### High Reliability Testing

Two standard high reliability testing programs are available. The TXVB program is in conformance with MIL-D-87157 level A Test Tables. The TXVB product is tested to Tables I, II, IIIa and IVa. The TXV program is an HP modification to the full conformance program and offers the 100% screening of Quality Level A, Table I, and Group A, Table II.

### Contrast Enhancement

When used with the proper contrast enhancement filters, the HCMS-213X series displays are readable daylight ambients. Refer to Application Note 1029 *Luminous Contrast and Sunlight Readability of the HDSP-238X Series Alphanumeric Displays for Military Applications* for information on contrast enhancement for daylight ambients. Refer to Application Note 1015 *Contrast Enhancement Techniques for LED Displays* for information on contrast enhancement in moderate ambients.

### Night Vision Lighting

When used with the proper NVG/DV filters, the HDSP-2131, HDSP-2179 and

HDSP-2133 may be used in night vision lighting applications. The HDSP-2131 (yellow), HDSP-2179 (orange) displays are used as master caution and warning indicators. The HDSP-2133 (high performance green) displays are used for general instrumentation. For a list of NVG/DV filters and a discussion on night vision lighting technology, refer to Application Note 1030 *LED Displays and Indicators and Night Vision Imaging System Lighting*. An external dimming circuit must be used to dim these displays to night vision lighting levels to meet NVIS radiance requirements. Refer to AN 1039 *Dimming HDSP-213X Displays to Meet Night Vision Lighting Levels*.

## 100% Screening

Table I. Quality Level A of MIL-D-87157

Test Screen	MIL-STD-750 Method	Conditions
1. Precap Visual	2072	Interpreted by HP Procedure 5956-7512-52
2. High Temperature Storage	1032	$T_A = 125^\circ\text{C}^{(3)}$ , Time = 24 hours
3. Temperature Cycling	1051	Condition B <sup>(4)</sup> , 10 cycles, 15 minute dwell
4. Constant Acceleration	2006	10,000 Gs at $Y_1$ & $Y_2$ orientation
5. Fine Leak	1071	Condition H
6. Gross Leak	1071	Condition C or K <sup>(5)</sup>
7. Interim Electrical/Optical Tests <sup>(2)</sup>	—	$I_{DD}(\text{BLK})$ , $I_{DD}(V)$ , $I_{DD}(\#)$ , $I_{IH}$ , $I_{IL}$ , $I_{OH}$ , $I_{OL}$ , $I_V$ and Visual Function $T_A = 25^\circ\text{C}$
8. Burn-In <sup>(1)</sup>	1015	Condition B at $V_{DD} = 5.5$ V, cycle through character set 1 per second, $T_A = +85^\circ\text{C}$ , Time = 160 hours
9. Final Electrical Test <sup>(2)</sup>	—	Same as step 7
10. Delta Determinations	—	$I_{DD}(V)$ & $I_{DD}(\#) = \pm 10\%$ , $I_V = -20\%$
11. External Visual <sup>(1)</sup>	2009	

#### Notes:

- MIL-STD-883 Test Method applies.
- Limits and conditions are per the electrical/optical characteristics.
- $T_A = +100^\circ\text{C}$  for HDSP-2133.
- $T_A = -55^\circ\text{C}$  to  $+100^\circ\text{C}$  for HDSP-2133.
- Fluid temperature =  $+100^\circ\text{C}$  for HDSP-2133.

- **WAVE SOLDERABLE**

## Description

The HMDL-2416 is a smart 3.8 mm (0.15") four character, sixteen segment red GaAsP display. It is contained in a hermetic 18 pin dual-in-line, glass sealed ceramic package. The on-board CMOS IC contains memory, ASCII decoder, multiplexing circuitry, and drivers. It has a wide operating temperature range, and is fully TTL compatible, wave solderable, and highly reliable. This display is ideally suited for military and high reliability industrial applications where a rugged, reliable, easy-to-use alphanumeric display is required.

## Typical Applications

- **MILITARY EQUIPMENT**
- **AVIONICS**
- **HIGH RELIABILITY INDUSTRIAL EQUIPMENT**

## Absolute Maximum Ratings

## Electrical Description

### Display Internal Block Diagram

Figure 1 shows the internal block diagram for the HMDL-2416 display. The CMOS IC consists of a four-word ASCII memory, a four-word cursor memory, a 64-word character generator, 17 segment drivers, four digit drivers, and the scanning circuitry necessary to multiplex the four monolithic LED characters. In normal operation, the divide-by-four counter sequentially accesses each of the four RAM locations and simultaneously enables the appropriate display digit driver. The output of the RAM is decoded by the character generator which, in turn, enables the appropriate display segment drivers. For each display location, the cursor enable (CUE) selects whether the data from the ASCII RAM (CUE = 0) or the stored cursor (CUE = 1) is to be displayed. The cursor character is denoted by all sixteen segments and the DP ON. Seven-bit ASCII data is stored in RAM. Since the display utilizes a 64-character decoder, half of the possible 128 input combinations are invalid. For each display location where  $D_5 = D_6$  in the ASCII RAM, the display character is blanked. The entire display is blanked when  $\overline{BL} = 0$ .

Data is loaded into the display through the data inputs ( $D_6 - D_0$ ), digit selects ( $A_1, A_0$ ), chip enables ( $\overline{CE}_1, \overline{CE}_2$ ), cursor select ( $\overline{CU}$ ), and write ( $\overline{WR}$ ). The cursor select ( $\overline{CU}$ ) determines whether data is stored in the ASCII RAM ( $\overline{CU} = 1$ ) or cursor memory ( $\overline{CU} = 0$ ). When  $\overline{CE}_1 = \overline{CE}_2 = \overline{WR} = 0$  and  $\overline{CU} = 1$ , the information on the data inputs is stored in the ASCII RAM at the location specified by the digit selects ( $A_1, A_0$ ). When  $\overline{CE}_1 = \overline{CE}_2 = \overline{WR} = 0$  and  $\overline{CU} = 0$ , the information on the data input,  $D_0$ , is stored in the cursor at the location specified by the digit selects ( $A_1, A_0$ ). If  $D_0 = 1$ , a cursor character is stored in the cursor memory. If  $D_0 = 0$ , a previously stored cursor character will be removed from the cursor memory.

If the clear input ( $\overline{CLR}$ ) equals zero for one internal display cycle (4 ms minimum), the data in the ASCII RAM will be rewritten with zeroes and the display will be blanked. Note that the blanking input ( $\overline{BL}$ ) must be equal to logical one during this time.

### Data Entry

Figure 2 shows a truth table for the HMDL-2416 display. Setting the chip enables ( $\overline{CE}_1, \overline{CE}_2$ ) to their low state and the cursor select ( $\overline{CU}$ ) to its high state will enable data loading. The desired data inputs ( $D_6 - D_0$ ) and address inputs ( $A_1, A_0$ ) as well as the chip enables ( $\overline{CE}_1, \overline{CE}_2$ ) and cursor select ( $\overline{CU}$ ) must be held stable during the write cycle to ensure that the correct data is stored into the display. Valid ASCII data codes are shown in Figure 3. The display accepts standard seven-bit ASCII data. Note that  $D_6 = \overline{D}_5$  for the codes shown in Figure 2. If  $D_6 = D_5$  during the write cycle, then a blank will be stored in the display. Data can be loaded into the display in any order. Note that when  $A_1 = A_0 = 0$ , data is stored in the furthest right-hand display location.

### Cursor Entry

As shown in Figure 2, setting the chip enables ( $\overline{CE}_1, \overline{CE}_2$ ) to their low state and the cursor select ( $\overline{CU}$ ) to its low state will enable cursor loading. The cursor character is indicated by the display symbol having all 16 segments and the DP ON. The least significant data input ( $D_0$ ), the digit selects ( $A_1, A_0$ ), the chip enables ( $\overline{CE}_1, \overline{CE}_2$ ), and the cursor select ( $\overline{CU}$ ) must be held stable during the write cycle to ensure that the correct data is stored in the display. If  $D_0$  is in a low state during the write cycle, then a cursor character will be removed at the indicated location. If  $D_0$  is in a high state during the write cycle, then a cursor character will be stored at the indicated location. The presence or absence of a cursor character does not affect the ASCII data stored at that location. Again, when  $A_1 = A_0 = 0$ , the cursor character is stored in the furthest right-hand display location.

All stored cursor characters are displayed if the cursor enable (CUE) is high. Similarly, the stored ASCII data words are displayed, regardless of the cursor characters, if the cursor enable (CUE) is low. The cursor enable (CUE) has no effect on the storage or removal of the cursor characters within the display. A flashing cursor is displayed by pulsing the cursor enable (CUE). For applications not requiring a cursor, the cursor enable (CUE) can be connected to ground and the cursor select ( $\overline{CU}$ ) can be connected to  $V_{CC}$ . This inhibits the cursor function and allows only ASCII data to be loaded into the display.

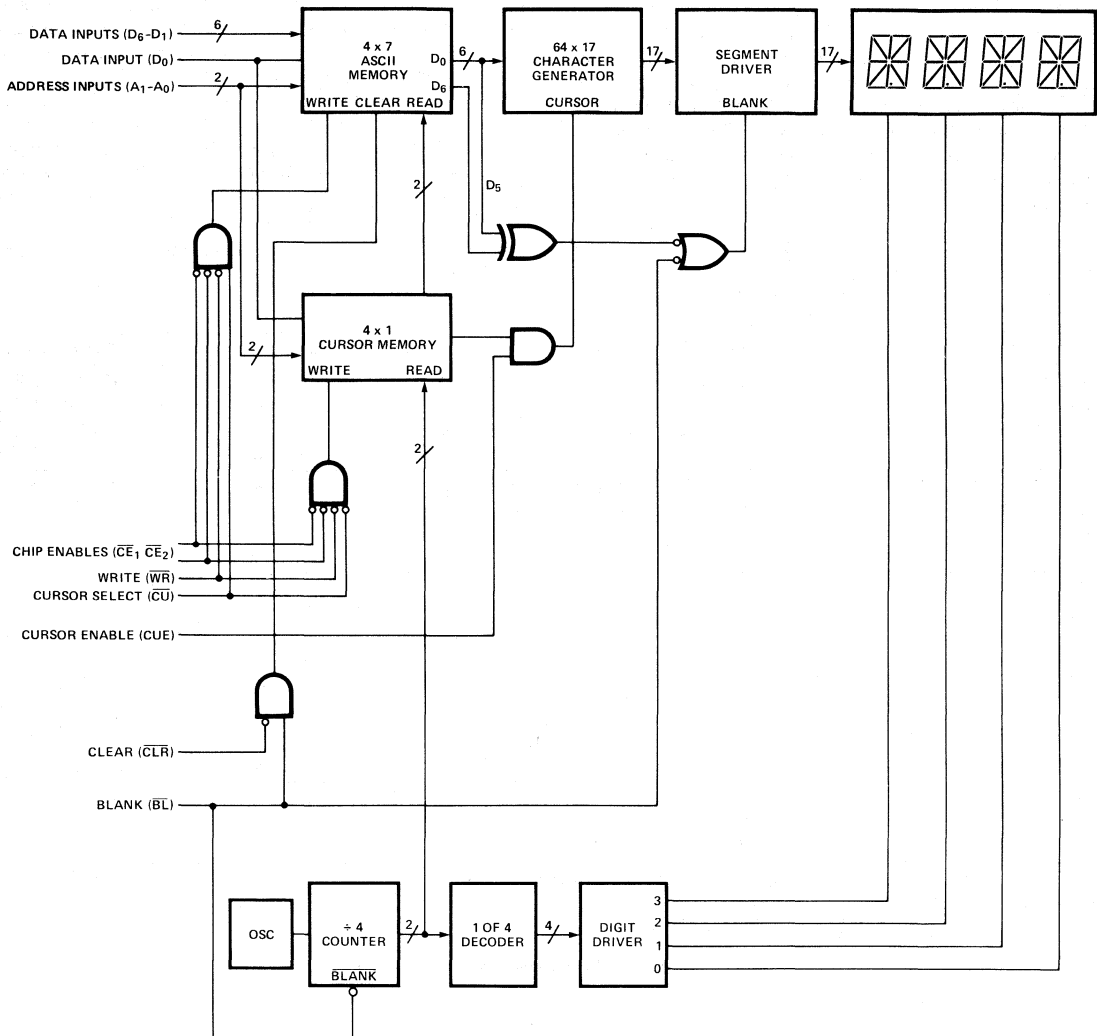

Figure 1. HMDL-2416 Internal Block Diagram

### Display Clear

As shown in Figure 2, the ASCII data stored in the display will be cleared if the clear ( $\overline{\text{CLR}}$ ) is held low and the blanking input ( $\overline{\text{BL}}$ ) is held high for 4 ms minimum. The cursor memory is not affected by the clear ( $\overline{\text{CLR}}$ ) input. Cursor characters can be stored or removed even while the clear ( $\overline{\text{CLR}}$ ) is low. Note that the display will be cleared regardless of the state of the chip enables ( $\overline{\text{CE}}_1$ ,  $\overline{\text{CE}}_2$ ). However, to ensure that all four display characters are cleared,  $\overline{\text{CLR}}$  should be held low for 4 ms following the last write cycle.

### Display Blank

As shown in Figure 2, the display will be blanked if the blanking input ( $\overline{\text{BL}}$ ) is held low. Note that the display will be blanked regardless of the state of the chip enables ( $\overline{\text{CE}}_1$ ,

$\overline{\text{CE}}_2$ ) or write ( $\overline{\text{WR}}$ ) inputs. The ASCII data stored in the display and the cursor memory are not affected by the blanking input. ASCII data and cursor data can be stored even while the blanking input ( $\overline{\text{BL}}$ ) is low. Note that while the blanking input ( $\overline{\text{BL}}$ ) is low, the clear ( $\overline{\text{CLR}}$ ) function is inhibited. A flashing display can be obtained by applying a low frequency square wave to the blanking input ( $\overline{\text{BL}}$ ). Because the blanking input ( $\overline{\text{BL}}$ ) also resets the internal display multiplex counter, the frequency applied to the blanking input ( $\overline{\text{BL}}$ ) should be much slower than the display multiplex rate. Finally, dimming of the display through the blanking input ( $\overline{\text{BL}}$ ) is not recommended.

For further application information please consult Application Note 1026.

## Mechanical and Electrical Considerations

The HMDL-2416 is an 18 pin dual-in-line package, that can be stacked horizontally and vertically to create arrays of any size. The HMDL-2416 is designed to operate continuously from -55° to +100°C for all possible input conditions including the illuminated cursor in all four character locations. The HMDL-2416 is assembled by die attaching and wire bonding the four GaAsP/GaAs monolithic LED chips and the CMOS IC to a 18 lead ceramic-glass dual-in-line package. It is designed either to plug into DIP sockets or to solder into PC boards.

The inputs of the CMOS IC are protected against static discharge and input current latchup. However, for best results standard CMOS handling precautions should be used. Prior to use, the HMDL-2416 should be stored in anti-static tubes or conductive material. During assembly, a grounded conductive work area should be used. The assembly personnel should use conductive wrist straps. Lab coats made of synthetic materials should be avoided since they are prone to static charge build-up. Input current latchup is caused when the CMOS inputs are subjected to a voltage either below ground ( $V_{IN} < \text{ground}$ ) or to a higher voltage than  $V_{CC}$  ( $V_{IN} > V_{CC}$ ) and a high current is forced into the input. To prevent input current latchup and ESD damage, unused inputs should be connected either to ground or to  $V_{CC}$ , voltages should not be applied to the inputs until  $V_{CC}$  has been applied to the display, and transient input voltages should be eliminated.

## Soldering and Post Solder Cleaning Instructions for the HMDL-2416

The HMDL-2416 may be hand soldered or wave soldered with SN63 solder. Hand soldering may be safely performed only with an electronically temperature-controlled and securely grounded soldering iron. For best results, the iron tip temperature should be set at 315°C (600°F). For wave soldering, a rosin-based RMA flux or a water soluble organic acid (OA) flux can be used. The solder wave temperature should be 245°C ±5°C (473°F ±9°F), and the dwell in the wave should be set at 1 1/2 to 3 seconds for optimum soldering.

Post solder cleaning may be accomplished using water or Freon/alcohol mixtures formulated for vapor cleaning processing or Freon/alcohol mixtures formulated for room temperature cleaning. Freon/alcohol vapor cleaning processing for up to 2 minutes in vapors at boiling is permissible. Suggested solvents include Freon TF, Freon TE, Genesolv DI-15, Genesolv DE-15, Genesolv DES, and water.

For further information on soldering, refer to Application Note 1027, "Soldering LED Components".

## Optical Considerations/ Contrast Enhancement

Each HMDL-2416 display is tested for luminous intensity and marked with an intensity category on the back of the display package. To ensure intensity matching for multiple package applications, all displays for a given panel should have the same category.

The HMDL-2416 display is designed to provide maximum contrast when placed behind an appropriate contrast enhancement filter. Some suggested filters are Panelgraphic Dark Red 63, SGL Homalite H100-1650, Rohm and Haas 2423, Chequers Engraving 118, and 3M R6510. For further information on contrast enhancement, see Hewlett-Packard Application Note 1015.

## High Reliability Testing

Two standard high reliability testing programs are available. The TXVB program is in conformance with MIL-D-87157 level A Test Tables. The TXV product is tested to Tables I, II, IIIa, and IVa. The TXV program is an HP modification to the full conformance program and offers the 100% screening of Quality Level A, Table I, and Group A, Table II.

**Part Marking System**

Standard Product	With Table I and II	With Tables I, II, IIIa, IVa

### Description

The HCMS-201X, HCMS-231X and the sunlight viewable HCMS-235X series are 5x7 LED four character displays contained in 12 pin dual-in-line packages designed for displaying alphanumeric information. The character height for the HCMS-201X series displays is 3.8mm (0.15 inch), and for the HCMS-231X and HCMS-235X series displays the character height is 5.0mm (0.20 inch). The HCMS-201X series displays are available in four LED colors: standard red, high efficiency red, yellow and high performance green. The HCMS-231X series are available in all five

ESD WARNING: STANDARD CMOS HANDLING PRECAUTIONS SHOULD BE OBSERVED.

LED colors. The HCMS-235X series displays are available in four LED colors: high efficiency red, orange, yellow and high performance green. The HCMS-201X series displays are end stackable. The HCMS-231X and HCMS-235X series displays are end/row stackable.

These displays are designed with on-board CMOS integrated

circuits for use in applications where conservation of power is important. The two CMOS ICs form an on-board 28-bit serial-in-parallel-out shift register with constant current output LED row drivers. Decoded column data is clocked into the on-board shift register for each refresh cycle. Full character display is achieved with external column strobing.

### Compatibility with HDSP-201X/-231X/-235X TTL IC Series Displays

The HCMS-201X, HCMS-231X and HCMS-235X CMOS IC displays are "drop-in" replacements for the equivalent HDSP-201X, HDSP-231X and HDSP-235X TTL IC displays. The 12 pin glass/ceramic package configuration, four digit character matrix and pin functions are identical.

### Display Selection Table

Part Number	Character Size	LED Color
HCMS-2010/2010TXV/2010TXVB	3.8 mm (0.15 inch)	Standard Red

Supply Voltage $V_{DD}$ to Ground .....	-0.3 V to 7.0 V
Data Input, Data Output, $V_B$ .....	-0.3 V to $V_{DD}$
Column Input Voltage, $V_{COL}$ .....	-0.3 V to $V_{DD}$
Free Air Operating Temperature Range, $T_A$ .....	-55°C to +100°C
Storage Temperature Range, $T_S$ .....	-65°C to +125°C
HCMS-2310/-2311/-2312/-2314	
HCMS-2351/-2352/-2354	
Storage Temperature Range, $T_S$ .....	-55°C to +100°C
HCMS-2010/-2011/-2012/-2013	
HCMS-2313	
HCMS-2353	
Maximum Allowable Package Power Dissipation, $P_D$ <sup>(1,2)</sup>	
HCMS-2010/-2011/-2012/-2013 at $T_A = 83^\circ\text{C}$ .....	0.79 Watts
HCMS-2310/-2311/-2312/-2313/-2314 at $T_A = 88^\circ\text{C}$ .....	0.92 Watts
HCMS-2351/-2352/-2353/-2354 at $T_A = 71^\circ\text{C}$ .....	1.31 Watts
Maximum Solder Temperature	
1.59 mm (0.063") Below Seating Plane, $t \leq 5$ sec .....	260°C
ESD Protection @ 1.5k $\Omega$ , 100pf .....	$V_z = 4$ kV (each pin)

### Notes:

- Maximum allowable power dissipation is derived from  $V_{DD} = 5.25$  V,  $V_B = 2.4$  V,  $V_{COL} = 3.5$  V, 20 LEDs ON per character, 20% DF.
  - The power dissipation for these displays should be derated as follows:
    - HCMS-201X series derate above 83°C at 17 mW/°C,  $R\theta_{JA} = 60^\circ\text{C/W}$
    - HCMS-231X series derate above 88°C at 22 mW/°C,  $R\theta_{JA} = 45^\circ\text{C/W}$
    - HCMS-325X series derate above 71°C at 23 mW/°C,  $R\theta_{JA} = 45^\circ\text{C/W}$ .
- Deratings based on  $R\theta_{PC-A} = 35^\circ\text{C/W}$  per display for printed circuit board assembly.  
See Figure 1 for power derating based on lower  $R\theta_{JA}$  values.

## Recommended Operating Conditions Over Operating Temperature Range (-55°C to +100°C)

Parameter	Symbol	Min.	Typ.	Max.	Units
Supply Voltage	$V_{DD}$	4.75	5.00	5.25	V
Data Out Current, Low State	$I_{OL}$			1.6	mA
Data Out Current, High State	$I_{OH}$			-0.5	mA
Column Input Voltage	$V_{COL}$	2.75	3.0	3.5	V
Setup Time	$t_{SETUP}$	10			ns
Hold Time	$t_{HOLD}$	25			ns
Clock Pulse Width High	$t_{WH(CLOCK)}$	50			ns
Clock Pulse Width Low	$t_{WL(CLOCK)}$	50			ns
Clock High to Low Transition	$t_{THL}$			200	ns
Clock Frequency	$f_{CLOCK}$			5	MHz

\*All typical values specified at  $V_{\text{DD}} = 5.0\text{V}$  and  $T_A = 25^{\circ}\text{C}$ .

### Notes:

- $I_{\text{DD}}$  Dynamic is the IC current while clocking column data through the on-board shift register at a clock frequency of 5MHz, the display is not illuminated.
- $I_{\text{DD}}$  Static is the IC current after column data is loaded and not being clocked through the on-board shift register.
- Four characters are illuminated with a typical ASCII character composed of 15 dots per character.
- IC junction temperature  $T_{\text{J}}(\text{IC}) = (P_{\text{D}})(R_{\theta_{\text{J-PIN}}} + R_{\theta_{\text{PC-A}}}) + T_A$

## Optical Characteristics at $T_A = 25^\circ\text{C}$

### Standard Red HCMS-2010/-2310

## Orange HCMS-2314/-2354

Description	Symbol	Test Condition	Min.	Typ.	Max.	Units
Peak Luminous Intensity per LED <sup>(5,9)</sup> (Character Average) HCMS-2314 HCMS-2354	$I_{VPEAK}$	$V_{DD} = 5.0\text{ V}$ $V_{COL} = 3.5\text{ V}$ $V_B = 2.4\text{ V}$ $T_i = 25^\circ\text{C}^{(7)}$	650 1920	1430 2850		$\mu\text{cd}$
Dominant Wavelength <sup>(8)</sup>	$\lambda_d$			602		nm
Peak Wavelength	$\lambda_{PEAK}$			600		nm

All typical values specified at  $V_{DD} = 5.0\text{ V}$  and  $T_A = 25^\circ\text{C}$  unless otherwise noted.

### Notes:

- These LED displays are categorized for luminous intensity, with the intensity category designated by a letter code on the back of the package.
- The HCMS-2011/-2311/-2351 and HCMS-2013/-2313/-2353 are categorized for color with the color category designated by a number on the back of the package.
- $T_i$  refers to the initial case temperature of the display immediately prior to the light measurement.
- Dominant wavelength,  $\lambda_d$ , is derived from the CIE Chromaticity Diagram, and represents the single wavelength which defines the color of the device.
- The luminous sterance of the individual LED pixels may be calculated using the following equations:

$$L_v (\text{cd/m}^2) = I_v (\text{Candela}) * \text{DF} / A (\text{Metre})^2$$

$$L_v (\text{Footlamberts}) = \pi I_v (\text{Candela}) * \text{DF} / A (\text{Foot})^2$$

Where: A = LED pixel area =  $5.3 \times 10^{-8}\text{M}^2$  or  $5.8 \times 10^{-7}\text{ft}^2$   
 DF = LED on-time duty factor

## Switching Characteristics, $T_A = -55^\circ\text{C}$ to $+100^\circ\text{C}$

Parameter	Condition	Typ.	Max.	Units
$f_{\text{clock}}$ CLOCK Rate			5	MHz

**Figure 1. Maximum Allowable Power Dissipation vs Ambient Temperature as a Function of Thermal Resistance Junction-to-Ambient,  $R_{\theta J-A}$ . Derated Operation Assumes  $R_{\theta PC-A} = 35^{\circ}\text{C/W}$  per Display for Printed Circuit Board.  $T_J(\text{IC}) \text{ MAX} = 130^{\circ}\text{C}$ .  $R_{\theta J-A}(T_A = 100^{\circ}\text{C})$**   
 =  $22^{\circ}\text{C/W}$  for HCMS-235X Series  
 =  $32^{\circ}\text{C/W}$  for HCMS-231X Series  
 =  $38^{\circ}\text{C/W}$  for HCMS-201X Series

## Electrical Description

Each display device contains four 5x7 LED dot matrix characters and two CMOS integrated circuits, as shown in Figure 4. The two CMOS integrated circuits form an on-board 28 bit serial-in-parallel-out shift register that will accept standard TTL logic levels. The Data Input, pin 12, is connected to bit position 1 and the Data Output, pin 7, is connected to bit position 28. The shift register outputs control constant current sinking LED row drivers. The nominal current sink per LED driver is 11mA for the HCMS-201X displays, 13mA for the HCMS-231X displays and 18mA for the HCMS-235X displays. A logic 1 stored in the shift register enables the corresponding LED row driver and a logic 0 stored in the shift register disables the corresponding LED row driver.

The electrical configuration of these CMOS IC alphanumeric displays allows for an effective

**Figure 2. Relative Luminous Intensity vs Display Pin Temperature**

**Figure 3. Peak Column Current vs Column Voltage**

interface to a display controller circuit that supplies decoded character information. The row data for a given column (one 7 bit byte per character) is loaded (bit serial) into the on-board 28 bit shift register with high to low transitions of the Clock input. To load decoded character information into the display, column data for character 4 is loaded first and the column data for character 1 is loaded last in the following manner. The 7 data bits for column 1, character 4, are loaded into the on-board shift register. Next, the 7 data bits for column 1, character 3, are loaded into the shift register, shifting the character 4 data over one character position. This process is repeated for the other two characters until all 28 bits of column data (four 7 bit bytes of character column data) are loaded into the on-board shift register. Then the column 1 input,  $V_{\text{COL}}$ , pin 1, is energized to illuminate column 1 in all four characters. This process is repeated for

columns 2, 3, 4 and 5. All  $V_{\text{COL}}$  inputs should be at logic low to insure the display is off when loading data. The display will be blanked when the blanking input  $V_B$ , pin 8, is at logic low regardless of the outputs of the shift register or whether one of the  $V_{\text{COL}}$  inputs is energized.

Refer to Application Note 1016 for drive circuit information.

## ESD Susceptibility

The HCMS-201X/-231X/-235X series displays have an ESD susceptibility ratings of CLASS 3 per DOD-STD-1686 and CLASS B per MIL-STD-883C. It is recommended that normal CMOS handling precautions be observed with these devices.

## Soldering and Post Solder Cleaning

These displays may be soldered with a standard wave solder process using either an RMA flux and solvent cleaning or an OA flux and aqueous cleaning.

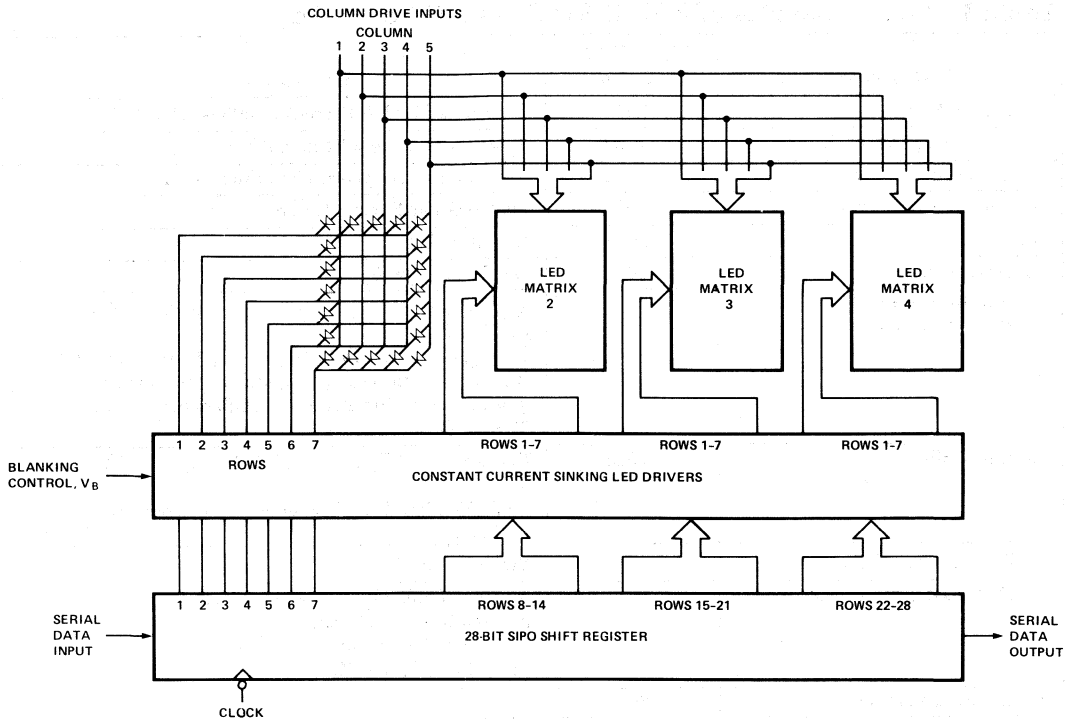

Figure 4. Block Diagram of an HCMS-2XXX Series LED Alphanumeric Display.

For optimum soldering, the solder wave temperature should be 245°C and the dwell time for any display lead passing through the wave should be 1/2 to 2 seconds. The recommended solvent for post solder cleaning is Genesolv DES, manufactured by Allied Chemical. For aqueous cleaning, a water temperature of 60°C (140°F) with an immersion time not exceeding 15 minutes is recommended. For more detailed information, refer to Application Note 1027 *Soldering LED Components*.

### Contrast Enhancement

When used with the proper contrast enhancement filters, the HCMS-235X series displays are readable in sunlight and the HCMS-201X/231X series dis-

plays are readable in daylight ambients. Refer to Application Note 1029 *Luminous Contrast and Sunlight Readability of the HDSP-238X Series Alphanumeric Displays* for Military Applications for information on contrast enhancement for sunlight and daylight ambients. Refer to Application Note 1015 *Contrast Enhancement Techniques for LED Displays* for information on contrast enhancement in moderate ambients.

### Night Vision Lighting

When used with the proper NVG/DV filters, the HCMS-2311/-2351 and HCMS-2133/-2353 displays may be used in night vision lighting applications. The HCMS-2311/-2351 (yellow) displays are used as

master caution and warning indicators. The HCMS-2313/-2353 (high performance green) displays are used for general instrumentation. For a list of NVG/DV filters and a discussion on night vision lighting technology, refer to Application Note 1030 *LED Displays and Indicators and Night Vision Imaging System Lighting*.

### Controller Circuits, Power Calculations and Display Dimming

Refer to Application Note 1016 *Using the HDSP-2000 Alphanumeric Display Family* for information on controller circuits to drive these displays, how to do power calculations and a technique for display dimming.

**Table I. Quality Level A of MIL-D-87157 – 100% Screening**

Test Screen	MIL-STD-750 Method	Conditions
1. Precap Visual	2072	Interpreted by HP Procedure 5956-7512-52
2. High Temperature Storage	1032	$T_A = 125^\circ\text{C}$ , Time = 24 hours <sup>[3]</sup>
3. Temperature Cycling	1051	Condition B, 10 cycles, 15 minute dwell
4. Constant Acceleration	2006	10,000 G's at $Y_1$ orientation
5. Fine Leak	1071	Condition H
6. Gross Leak	1071	Condition C or K <sup>[4]</sup>
7. Interim Electrical/ Optical Tests <sup>[1]</sup>	—	$I_{DD}$ (at $V_B = 0.4\text{ V}$ and $2.4\text{ V}$ ), $I_{COL}$ (at $V_B = 0.4\text{ V}$ and $2.4\text{ V}$ ) $I_{IH}$ ( $V_B$ , Clock and Data In), $I_{IL}$ ( $V_B$ , Clock and Data In), $I_{OH}$ , $I_{OL}$ and $I_{VPEAK}$ . $V_{IH}$ and $V_{IL}$ inputs are guaranteed by the electronic shift register test. $T_A = 25^\circ\text{C}$
8. Burn-In <sup>[1]</sup>	1015	Condition B at $V_{DD} = V_B = 5.25\text{ V}$ , $V_{COL} = 3.5\text{ V}$ , $T_A = +100^\circ\text{C}$ LED ON-Time Duty Factor = 5%, 35 Dots On; $t = 160\text{ hours}$
9. Final Electrical Test <sup>[2]</sup>	—	Same as step 7
10. Delta Determinations	—	$\Delta I_{DD} = \pm 6\text{ mA}$ , $\Delta I_{IH}$ (clock) = $\pm 10\text{ }\mu\text{A}$ , $\Delta I_{IH}$ (Data In) = $\pm 10\text{ }\mu\text{A}$ $\Delta I_{OH} = \pm 10\%$ of initial value, and $\Delta I_V = -20\%$ , $T_A = 25^\circ\text{C}$
11. External Visual <sup>[1]</sup>	2009	

**Notes:**

- MIL-STD-883 Test Method applies.
- Limits and conditions are per the electrical/optical characteristics. The  $I_{OH}$  and  $I_{OL}$  tests are the inverse of  $V_{OH}$  and  $V_{OL}$  specified in the electrical characteristics.
- $T_A = +100^\circ\text{C}$  for HCMS-2013/-2313/-2353.
- Fluid temperature =  $+100^\circ\text{C}$  for HCMS-2013/-2313/-2353.

- The LTPD applies to the number of leads inspected except in no case shall less than 3 displays be used to provide the number of leads required.
- Solderability samples shall not be used.
- Visual requirements shall be as specified in MIL-STD-883, Methods 1010 or 1011.
- Displays may be selected prior to seal.
- If a given inspection lot undergoing Group B inspection has been selected to satisfy Group C inspection requirements the 340 hour life tests may be continued on test to 1000 hours in order to satisfy the Group C life test requirements. In such cases either the 340 hour endpoint measurements shall be made a basis for Group B lot acceptance or the 1000 hour endpoint measurement shall be used as the basis for both Group B and Group C acceptance.
- MIL-STD-883 test method applies.
- Limits and conditions are per the electrical/optical characteristics. The I<sub>OH</sub> and I<sub>OL</sub> tests are the inverse of V<sub>OH</sub> and V<sub>OL</sub> specified in the electrical specifications.
- Initial conditioning is a 15° inward bend for three cycles.
- Fluid temperature = +100°C for HCMS-2013/-2313/-2353.

## Features

- **MILITARY QUALIFIED LISTED ON MIL-D-87157 QPL**
- **TRUE HERMETIC PACKAGE**
- **TXV VERSION AVAILABLE**
- **THREE CHARACTER OPTIONS**  
Numeric, Hexadecimal, Over Range
- **4 x 7 DOT MATRIX CHARACTER**
- **PERFORMANCE GUARANTEED OVER TEMPERATURE**
- **HIGH TEMPERATURE STABILIZED**
- **SOLDER DIPPED LEADS**
- **MEMORY LATCH/DECODER/DRIVER**  
TTL Compatible
- **CATEGORIZED FOR LUMINOUS INTENSITY**

## Description

These standard red solid state displays have a 7.4 mm (0.29 inch) dot matrix character and an on-board IC with data memory latch/decoder and LED drivers in a glass/ceramic package. These devices utilize a solder glass frit seal and conform to the hermeticity requirements of MIL-D-87157, the general specification for LED displays. These 4N5X series displays are designed for use in military and aerospace applications.

These military qualified displays are designated as M87157/00101 AAX through -/00104AAX in the MIL-D-87157 Qualified Parts List (QPL). The letter designations at the end of the

part numbers are defined as follows: "A" signifies MIL-D-87157 Quality Level A. "A" signifies solder dipped leads, "X" signifies the luminous intensity category.

The 4N51 numeric display decodes positive 8421 BCD logic inputs into characters 0-9, a "—" sign, a test pattern, and four blanks in the invalid BCD states. The unit employs a right-hand decimal point.

The 4N52 is the same as the 4N51 except that the decimal point is located on the left-hand side of the digit.

The 4N54 hexadecimal display decodes positive 8421 logic inputs into 16 states, 0-9 and A-F. In place of the decimal point an input is provided for blanking the display (all LED's off), without losing the contents of the memory.

The 4N53 is a "±1." overrange display, including a right-hand decimal point.

## Package Dimensions\*

PIN	FUNCTION	
	4N51 4N52 NUMERIC	4N54 HEXA- DECIMAL
1	Input 2	Input 2
2	Input 4	Input 4
3	Input 8	Input 8
4	Decimal point	Blanking control
5	Latch enable	Latch enable
6	Ground	Ground
7	V <sub>CC</sub>	V <sub>CC</sub>
8	Input 1	Input 1

### NOTES:

1. Dimensions in millimetres and (inches).
2. Unless otherwise specified, the tolerance on all dimensions is ±.38mm (±.015")
3. Digit center line is ±.25mm (±.01") from package center line.
4. Solder dipped leads.
5. See over range package drawing for HP standard marking.

SOLID STATE DISPLAYS

## Absolute Maximum Ratings\*

Description	Symbol	Min.	Max.	Unit
Storage temperature, ambient	$T_S$	-65	+125	°C

Peak wavelength	$\lambda_{PEAK}$	$T_A=25^\circ\text{C}$		655		nm
Dominant Wavelength <sup>(8)</sup>	$\lambda_d$	$T_A=25^\circ\text{C}$		640		nm
Weight **				1.0		gm
Leak Rate					$5 \times 10^{-8}$	cc/sec

Notes: 1. Nominal thermal resistance of a display mounted in a socket which is soldered into a printed circuit board:  $\theta_{JA}=50^\circ\text{C/W}$ ;  $\theta_{JC}=15^\circ\text{C/W}$ . 2.  $\theta_{CA}$  of a mounted display should not exceed  $35^\circ\text{C/W}$  for operation up to  $T_A=+100^\circ\text{C}$ . 3. Voltage values are with respect to device ground, pin 6. 4. All typical values at  $V_{CC}=5.0\text{ Volts}, T_A=25^\circ\text{C}$ . 5. These displays are categorized for luminous intensity with the intensity category designated by a letter located on the back of the display contiguous with the Hewlett-Packard logo marking. 6. The luminous intensity at a specific ambient temperature,  $I_v(T_A)$ , may be calculated from this relationship:  $I_v(T_A)=I_v(25^\circ\text{C}) (.985)^{[T_A-25^\circ\text{C}]}$ . 7. Applies only to 4N54. 8. The dominant wavelength,  $\lambda_d$ , is derived from the CIE chromaticity diagram and represents the single wavelength which defines the color of the device.

**Figure 2. Block Diagram of 4N51-4N54 Series Logic.**

**Notes:**

1. H = Logic High; L = Logic Low. With the enable input at logic high changes in BCD input logic levels or D.P. input have no effect upon display memory, displayed character, or D.P.
2. The decimal point input, DP, pertains only to the 4N51 and 4N52 displays.
3. The blanking control input, B, pertains only to the 4N54 hexadecimal display. Blanking input has no effect upon display memory.

Figure 8. Typical Logic and Enable High Input Current vs. Ambient Temperature.

## Operational Considerations

### ELECTRICAL

The 4N51-4N54 series devices use a modified 4 x 7 dot matrix of light emitting diodes (LED's) to display decimal/hexadecimal numeric information. The LED's are driven by constant current drivers. BCD information is accepted by the display memory when the enable line is at logic low and the data is latched when the enable is at logic high. To avoid the latching of erroneous information, the enable pulse rise time should not exceed 200 nanoseconds. Using the enable pulse width and data setup and hold times listed in the Recommended Operating Conditions allows data to be clocked into an array of displays at a 6.7MHz rate.

The blanking control input on the 4N54 display blanks (turns off) the displayed hexadecimal information without disturbing the contents of display memory. The display is blanked at a minimum threshold level of 3.5 volts. This may be easily achieved by using an open collector TTL gate and a pull-up resistor. For example, (1/6) 7416 hexinverter buffer/driver and a 120 ohm pull-up resistor will provide sufficient drive to blank eight displays. The size of the blanking pull-up resistor may be calculated from the following formula, where N is the number of digits:

$$R_{\text{blank}} = (V_{\text{CC}} - 3.5\text{V}) / [N (1.0\text{mA})]$$

The decimal point input is active low true and this data is latched into the display memory in the same fashion as the BCD data. The decimal point LED is driven by the on-board IC.

The ESD susceptibility of the IC devices is Class A of MIL-STD-883 or Class 2 of DOD-STD-1686 and DOD-HDBK-263.

### MECHANICAL

4N51-4N54 series displays are hermetically tested for use in environments which require a high reliability device. These displays are designed and tested to meet a helium

leak rate of  $5 \times 10^{-8}$  CC/SEC and a fluorocarbon gross leak bubble test.

These displays may be mounted by soldering directly to a printed circuit board or inserted into a socket. The lead-to-lead pin spacing is 2.54mm (0.100 inch) and the lead row spacing is 15.24mm (0.600 inch). These displays may be end stacked with 2.54mm (0.100 inch) spacing between outside pins of adjacent displays. Sockets such as Augat 324-AG2D (3 digits) or Augat 508-AG8D (one digit, right angle mounting) may be used.

The primary thermal path for power dissipation is through the device leads. Therefore, to insure reliable operation up to an ambient temperature of +100°C, it is important to maintain a case-to-ambient thermal resistance of less than 35°C/watt as measured on top of display pin 3.

Post solder cleaning may be accomplished using water, Freon/alcohol mixtures formulated for vapor cleaning processing (up to 2 minutes in vapors at boiling) or Freon/alcohol mixtures formulated for room temperature cleaning. Suggested solvents: Freon TF, Freon TE, Genesolv DI-15, Genesolv DE-15.

### PRECONDITIONING

4N51-4N54 series displays are 100% preconditioned by 24 hour storage at 125°C.

### CONTRAST ENHANCEMENT

The 4N51-4N54 displays have been designed to provide the maximum possible ON/OFF contrast when placed behind an appropriate contrast enhancement filter. Some suggested filters are Panelgraphic Ruby Red 60 and Dark Red 63, SGL Homalite H100-1605, 3M Light Control Film and Polaroid HRCF Red Circular Polarizing Filter. For further information see Hewlett-Packard Application Note 1015.

# Solid State Over Range Display

For display applications requiring a  $\pm 1$ , or decimal point designation, the 4N53 over range display is available. This display module comes in the same package as the 4N51-4N54 series numeric display and is completely compatible with it.

# High Reliability Testing

Two standard reliability testing programs are available. The military program provides QPL parts that comply to MIL-D-87157 Quality Level A, per Tables I, II, IIIa, and IVa. A second program is an HP modification to the full conformance program and offers the 100% screening portion of Level A, Table I, and Group A, Table II. In addition, a MIL-D-87157 Level B equivalent testing program is available upon request.

## Description

These solid state displays have a 7.4 mm (0.29 inch) dot matrix character and an onboard IC with data memory latch/decoder and LED drivers in a glass/ceramic package.

The hermetic HDSP-078X,-079X/-088X displays utilize a solder glass frit seal. The HDSP-098X displays utilize an epoxy glass-to-ceramic seal. All packages conform to the hermeticity requirements of MIL-D-87157, the general specification for LED displays. These displays are designed for use in military and aerospace applications.

The numeric devices decode positive BCD logic into characters "0-9", a "—" sign, decimal point, and a test pattern. The hexadecimal devices decode positive BCD logic into 16 characters, "0-9, A-F". An input is provided on the hexadecimal devices to blank the display (all LEDs off) without losing the contents of the memory.

The over range device displays "±1" and right hand decimal point and is typically driven via external switching transistors.

### Note:

1. The HDSP-098X high performance green displays are epoxy sealed and conform to MIL-D-87157 hermeticity requirements.

	Peak Wavelength	λ <sub>PEAK</sub>		568		nm
	Dominant Wavelength	λ <sub>d</sub>		574		nm

### Notes:

- The nominal thermal resistance of a display mounted in a socket that is soldered onto a printed circuit board is R<sub>θJA</sub> = 50°C/W/device. The device package thermal resistance is R<sub>θJ-PIN</sub> = 15°C/W/device. The thermal resistance device pin-to-ambient through the PC board should not exceed 35°C/W/device for operation at T<sub>A</sub> = +100°C.
- Voltage values are with respect to device ground, pin 6.
- These displays are categorized for luminous intensity with the intensity category designated by a letter code located on the back of the display package. Case temperature of the device immediately prior to the light measurement is equal to 25°C.

# Electrical Characteristics; ( $T_A = -55^\circ\text{C}$ to $+100^\circ\text{C}$ )

Description		Symbol	Test Conditions	Min.	Typ.[7]	Max.	Unit
Supply Current	HDSP-078X Series	I <sub>CC</sub>	V <sub>CC</sub> = 5.5 V Characters "5." or "B" displayed		78	105	mA
	HDSP-079X/-088X/ -098X Series				120	175	
Power Dissipation	HDSP-078X Series	P <sub>T</sub>	V <sub>CC</sub> = 5.5 V Characters "5." or "B" displayed		390	573	mW

Logic, Enable and Blanking Low-Level Input Voltage		V <sub>IL</sub>	V <sub>CC</sub> = 4.5 V			0.8	V
Logic, Enable High-Level Input Voltage		V <sub>IH</sub>		2.0			V
Blanking High Voltage; Display Blanked		V <sub>BH</sub>		2.3			V
Logic and Enable Low-Level Input Current		I <sub>IL</sub>	V <sub>CC</sub> = 5.5 V			-1.6	mA
Blanking Low-Level Input Current		I <sub>BL</sub>	V <sub>IL</sub> = 0.4 V			-10	μA
Logic, Enable and Blanking High-Level Input Current		I <sub>IH</sub>	V <sub>CC</sub> = 5.5 V V <sub>IH</sub> = 2.4 V			+40	μA
Weight					1.0		gm
Leak Rate						5 x 10 <sup>-8</sup>	cc/sec.

## Notes:

4. The luminous intensity at a specific operating ambient temperature, I<sub>V</sub>(T<sub>A</sub>) may be approximated from the following exponential equation: I<sub>V</sub>(T<sub>A</sub>) = I<sub>V</sub>(25°C) e<sup>K(T<sub>A</sub>-25°C)</sup>.

Device	K
HDSP-078X Series HDSP-079X Series	-0.0131/°C
HDSP-088X Series	-0.0112/°C
HDSP-098X Series	-0.0104/°C

5. The dominant wavelength, λ<sub>d</sub>, is derived from the CIE Chromaticity Diagram and is that single wavelength which defines the color of the device.

6. The HDSP-088X and HDSP-098X series devices are categorized as to dominant wavelength with the category designated by a number on the back side of the display package.
7. All typical values at V<sub>CC</sub> = 5.0 V and T<sub>A</sub> = 25°C.

## Operational Considerations

### ELECTRICAL

These devices use a modified 4 x 7 dot matrix of light emitting diodes to display decimal/hexadecimal numeric information. The high efficiency red and yellow displays use GaAsP/GaP LEDs and the high performance green displays use GaP/GaP LEDs. The LEDs are driven by constant current drivers, BCD information is accepted by the display memory when the enable line is at logic low and the data is latched when the enable is at logic high. Using the enable pulse width and data setup and hold times listed in the Recommended Operating Conditions allows data to be clocked into an array of displays at 6.7 MHz rate.

The decimal point input is active low true and this data is latched into the display memory in the same fashion as the BCD data. The decimal point LED is driven by the on-board IC.

The blanking control input on the hexadecimal displays blanks (turns off) the displayed information without disturbing the contents of display memory. The display is blanked at a minimum threshold level of 2.0 volts. When blanked, the display standby power is nominally 250 mW at T<sub>A</sub> = 25°C.

The ESD susceptibility of the IC devices is Class A of MIL-STD-883 or Class 2 of DOD-STD-1686 and DOD-HDBK-263.

### MECHANICAL

These displays are hermetically sealed for use in environments that require a high reliability device. These displays are designed and tested to meet a helium leak rate of 5 x 10<sup>-8</sup> cc/sec.

These displays may be mounted by soldering directly to a printed circuit board or insertion into a socket. The lead-to-lead pin spacing is 2.54 mm (0.100 inch) and the lead row spacing is 15.24 mm (0.600 inch). These displays may be end stacked with 2.54 mm (0.100 inch) spacing between outside pins of adjacent displays. Sockets such as Augat 324-AG2D (3 digits) or Augat 508-AG8D (one digit, right angle mounting) may be used.

The primary thermal path for power dissipation is through the device leads. Therefore, to insure reliable operation up to an ambient temperature of +100°C, it is important to maintain a base-to-ambient thermal resistance of less than 35°C watt/device as measured on top of display pin 3.

Post solder cleaning may be accomplished using water, Freon/alcohol mixtures formulated for vapor cleaning processing (up to 2 minutes in vapors at boiling) or Freon/alcohol mixtures formulated for room temperature cleaning. Suggested solvents: Freon TF, Freon TE, Genesolv DI-15, Genesolv DE-15.

## PRECONDITIONING

These displays are 100% preconditioned by 24 hour storage at 125°C, at 100°C for the HDSP-098X Series.

## CONTRAST ENHANCEMENT

These display devices are designed to provide an optimum ON/OFF contrast when placed behind an appropriate contrast enhancement filter. The following filters are suggested:

Display Color	Ambient Lighting		
	Dim	Moderate	Bright
HDSP-088X Yellow	Panelgraphic Yellow 27 Chequers Amber 107	Polaroid HNCP 37 3M Light Control Film  Panelgraphic Gray 10	Polaroid Gray HNCP10 HOYA Yellowish-Orange HLF-608-3Y Marks Gray MCP-0301-8-10
HDSP-078X/-079X HER	Panelgraphic Ruby Red 60 Chequers Red 112	Chequers Grey 105	Polaroid Gray HNCP10 HOYA Reddish-Orange HLF-608-5R Marks Gray MCP-0301-8-10 Marks Reddish-Orange MCP-0201-2-22
HDSP-098X HP Green	Panelgraphic Green 48 Chequers Green 107		Polaroid Gray HNCP10 HOYA Yellow-Green HLF-608-1G Marks Yellow-Green MCP-0101-5-12

## Over Range Display

The over range devices display "±1" and decimal point. The character height and package configuration are the same as the numeric and hexadecimal devices. Character selection is obtained via external switching transistors and current limiting resistors.

## Absolute Maximum Ratings

Description	Symbol	Min.	Max.	Unit
Storage Temperature, Ambient	T <sub>S</sub>	-65	+125	°C
Operating Temperature, Ambient	T <sub>A</sub>	-55	+100	°C
Forward Current, Each LED	I <sub>F</sub>		10	mA
Reverse Voltage, Each LED	V <sub>R</sub>		5	V

Character	Pin

	Forward Voltage per LED	$V_F$			1.90	2.2	V
HDSP-0983	Power Dissipation (all LEDs Illuminated)	$P_T$	$I_F = 8\text{ mA}$		243	282	mW
	Forward Voltage per LED	$V_F$			1.85	2.2	V

## High Reliability Testing

Two standard reliability testing programs are available. The TXVB program is in conformance with Quality Level A Test Tables of MIL-D-87157 for hermetically sealed displays with 100% screening tests. A TXVB product is tested to Tables I, II, IIIa, and IVa, A second program is an HP modification to the full conformance program and offers the 100% screening portion of Level A, Table I, and Group A, Table II.

### PART MARKING SYSTEM

Standard Product	With Table I and II	With Tables I, II, IIIa and IVa
HDSP-078X	HDSP-078XTXV	HDSP-078XTXVB
HDSP-079X	HDSP-079XTXV	HDSP-079XTXVB
HDSP-088X	HDSP-088XTXV	HDSP-088XTXVB
HDSP-098X	HDSP-098XTXV	HDSP-098XTXVB

### 100% Screening

TABLE I. QUALITY LEVEL A OF MIL-D-87157

Test Screen	MIL-STD-750 Method	Conditions
1. Precap Visual	2072	Interpreted by HP Procedure 5956-7572-52
2. High Temperature Storage	1032	$T_A = 125^\circ\text{C}$ , Time = 24 hours <sup>[4]</sup>
3. Temperature Cycling	1051	Condition B, 10 Cycles, 15 Min. Dwell
4. Constant Acceleration	2006	10,000 G at $Y_1$ orientation
5. Fine Leak	1071	Condition H
6. Gross Leak	1071	Condition C or K <sup>[5]</sup>
7. Interim Electrical/Optical Tests <sup>[2]</sup>	—	$I_V, I_{CC}, I_{BL}, I_{BH}, I_{EL}, I_{EH}, I_{IL},$ and $I_{IH}$ $T_A = 25^\circ\text{C}$
8. Burn-In <sup>[1, 3]</sup>	1015	Condition B at $V_{CC} = 5\text{V}$ and cycle through logic at 1 character per second. $T_A = 100^\circ\text{C}$ , $t = 160$ hours
9. Final Electrical Test <sup>[2]</sup>	—	Same as Step 7
10. Delta Determinations	—	$\Delta I_V = -20\%$ , $\Delta I_{CC} = \pm 10\text{ mA}$ , $\Delta I_{IH} = \pm 10\mu\text{A}$ and $\Delta I_{EH} = \pm 13\mu\text{A}$
11. External Visual <sup>[1]</sup>	2009	

#### Notes:

- MIL-STD-883 Test Method applies.
- Limits and conditions are per the electrical/optical characteristics.
- Burn-in for the over range display shall use Condition B at a nominal  $I_F = 8\text{ mA}$  per LED, with all LEDs illuminated for  $T = 160$  hours minimum.
- $T_A = +100^\circ\text{C}$  for HDSP-098X Series.
- Fluid temperature =  $+100^\circ\text{C}$  for HDSP-098X Series.

**TABLE II  
GROUP A ELECTRICAL TESTS — MIL-D-87157**

Test	Parameters	LTPD
<b>Subgroup 1</b> DC Electrical Tests at 25°C <sup>[1]</sup>	I <sub>V</sub> , I <sub>CC</sub> , I <sub>BL</sub> , I <sub>BH</sub> , I <sub>EL</sub> , I <sub>EH</sub> , I <sub>IL</sub> , and I <sub>IH</sub> and visual function, T <sub>A</sub> = 25°C	5
<b>Subgroup 2</b> DC Electrical Tests at High Temperature <sup>[1]</sup>	Same as Subgroup 1, except delete I <sub>V</sub> and visual function. T <sub>A</sub> = +100°C	7
<b>Subgroup 3</b> DC Electrical Tests at Low Temperature <sup>[1]</sup>	Same as Subgroup 1, except delete I <sub>V</sub> and visual function. T <sub>A</sub> = -55°C	7
<b>Subgroup 4, 5, and 6 not applicable</b>		
<b>Subgroup 7</b> Optical and Functional Tests at 25°C	Satisfied by Subgroup 1	5
<b>Subgroup 8</b> External Visual	MIL-STD-883, Method 2009	7

**Notes:**

- Limits and conditions are per the electrical/optical characteristics.

**TABLE IIIa  
GROUP B, CLASS A AND B OF MIL-D-87157**

Test	MIL-STD-750 Method	Conditions	Sample Size
<b>Subgroup 1</b> Resistance to Solvents	1022		4 Devices/ 0 Failures
Internal Visual and Design Verification <sup>[1]</sup>	2075 <sup>[7]</sup>		1 Device/ 0 Failures
<b>Subgroup 2<sup>[2,3]</sup></b> Solderability	2026	T <sub>A</sub> = 245°C for 5 seconds	LTPD = 15
<b>Subgroup 3</b> Thermal Shock (Temp. Cycle)	1051	Condition B1, 15 min. Dwell	LTPD = 15
Moisture Resistance <sup>[4]</sup>	1021		
Fine Leak	1071	Condition H	
Gross Leak	1071	Condition C or K <sup>[9]</sup>	
Electrical/Optical Endpoints <sup>[5]</sup>	—	I <sub>V</sub> , I <sub>CC</sub> , I <sub>BL</sub> , I <sub>BH</sub> , I <sub>EL</sub> , I <sub>EH</sub> , I <sub>IL</sub> , I <sub>IH</sub> and visual function. T <sub>A</sub> = 25°C	
<b>Subgroup 4</b> Operating Life Test (340 hrs.) <sup>[6]</sup>	1027	T <sub>A</sub> = +100°C at V <sub>CC</sub> = 5.0V and cycling through logic at 1 character per second.	LTPD = 10
Electrical/Optical Endpoints <sup>[5]</sup>	—	Same as Subgroup 3.	
<b>Subgroup 5</b> Non-operating (Storage) Life Test (340 hrs.)	1032	T <sub>A</sub> = +125°C <sup>[7,8]</sup>	LTPD = 10
Electrical/Optical Endpoints <sup>[5]</sup>	—	Same as Subgroup 3	

**Notes:**

- Visual inspection performed through the display window.
- Whenever electrical/optical tests are not required as endpoints, electrical rejects may be used.
- The LTPD applies to the number of leads inspected except in no case shall less than 3 displays be used to provide the number of leads required.
- Initial conditioning is a 15° inward bend, one cycle.
- Limits and conditions are per the electrical/optical characteristics.
- Burn-in for the over range display shall use Condition B at a nominal I<sub>F</sub> ± 8 mA with '+' illuminated for t = 160 hours.
- Equivalent to MIL-STD-883, Method 2014.
- T<sub>A</sub> = +100°C for HDSP-098X Series.
- Fluid temperature = +100°C for HDSP-098X Series.

---

# Fiber Optics

---

## **HP's Commitment**

Hewlett-Packard has been committed to Fiber Optics since the introduction of our first link in 1978. Years of technological experience with LED emitters, detectors, integrated circuits, precision optical packaging, and optical fiber qualify HP to provide practical solutions for your application needs.

HP's unique combination of technologies and high volume manufacturing processes provide you with high quality transmitter and receiver components to meet a wide variety of computer, local area network, telecommunication, and industrial communication needs.

Three major families of fiber optic components offer a wide range of application solutions. Each family is designed to match HP's technology to your application requirements resulting in minimum cost and maximum reliability. The design and specification of each of these families allow easy design-in and provide guaranteed performance.

Hewlett-Packard's method of specification assures guaranteed link performance and easy design-in. The transmitter optical power and receiver sensitivity are specified at the end of a length of test cable. These specifications take into account variations over temperature and connector tolerances. All families of components incorporate the fiber optic connector receptacle in the transmitter and receiver packages. Factory alignment of the emitter/detector inside the package minimizes the variation of coupled optical power, resulting in smaller dynamic range requirements for the receiver. The guaranteed distance and data rates for various transmitter/receiver pairs are shown in the following selection guide.

Hewlett-Packard offers a choice of fiber optic cable, either glass fiber or plastic, simplex or duplex, factory connected or bulk. Connector attachment has been designed for your production line economy.

## **Versatile Link Components**

Low cost and ease of use make this family of link components well suited for applications connecting computers to terminals, printers, plotters, test equipment, medical equipment, and industrial control equipment. These links utilize 665 nm technology and 1 mm diameter plastic fiber cable. Assembling the plastic snap-in connectors onto the cable is extremely easy. The HFBR-0501 evaluation kit contains a complete working link including transmitter, receiver, five metres of connected cable, extra connectors, polishing kit, and technical literature.

## **Low Cost Miniature Link Components**

This family offers a wide range of price/performance choice for computers, central office switch, PBX, local area network, and industrial-control applications. These components utilize 820 nm technology and glass or plastic clad silica fiber cable. The unique design of the lensed optical coupling system makes this family of components extremely reliable. The dual-in-line package

requires no mounting hardware. The package is designed for auto insertion and wave soldering. The components are available for use with industry standard ST\* or SMA connectors. Specifications are provided for four fiber sizes: 62.5/125  $\mu\text{m}$ , 50/125  $\mu\text{m}$ , 100/140  $\mu\text{m}$ , and 200  $\mu\text{m}$  Plastic Clad Silica (PCS) cable. Evaluation kits are available for both ST and SMA connectors. A transmitter, receiver, connected cable, and technical literature are contained in the evaluation kits.

### 1300 nm Module Components

Hewlett-Packard began the development of 1300 nm materials and device technology in the early 1980s based on the need for greater performance and reliability in the local area fiber optic component market. After many years of development, Hewlett-Packard is proud to introduce its new family of 1300 nm transmitters and receivers. These components are available for use with the industry standard ST\* connector. The precision stainless steel bore assures that the ST\* connector ferrule tip will be optimally aligned with the optics of the module.

Hewlett-Packard's long tradition of quality and reliability is insured by the vertical integration of this new product family. The 1300 nm LED, PIN, and three custom bipolar integrated circuits (IC) used in these products have been developed and are manufactured by HP. Hewlett-Packard's manufacturing and test facilities provide consistent performance and

high volume capability. A driver IC allows the 1300 nm LED to translate ECL signals into an optical signal. On the other end of the link, the PIN receiver converts the optical pulses into electrical signals. These signals are processed in Hewlett-Packard's module through pre-amplifier and quantizer ICs before being transferred as an ECL signal to the external circuitry.

### New General Purpose High Speed Transmitter and Receiver Pair

HP now offers two varieties of high speed, general purpose 1300 nm components. They are specified for applications between 10-160 MBd (HFBR-1160/2100) or 10-200 MBd (HFBR-1160/2100). Alternate sources of supply are available to those designers who require multiple sources.

### New FDDI Transmitter and Receiver Pair

Hewlett-Packard's first Fiber Distributed Data Interface (FDDI) compatible transmitter and receiver pair, the HFBR-1125/2125 parts are fully characterized and guaranteed to meet or exceed the optoelectronic requirements of the FDDI Local Area Network Standard. Drawing on Hewlett-Packard's experience in the test and measurement field, the outgoing production tests for the module guarantee interoperability with other FDDI compatible components.

The modules use a shifted ECL interface and are directly compatible with the FDDI PHY

integrated circuits available today. Designed for FDDI stations with minimum board space, the component pair has a sufficient power budget to allow for optical bypass switches.

### 1300 nm Products under Development

#### FDDI Transceiver

The second generation of FDDI optical components from Hewlett-Packard is packaged in a transceiver module with a PMD-compatible MIC receptacle. The module is directly compatible with FDDI PHY integrated circuits. It uses the same LED, PIN, and integrated circuits as the individual transmitter and receiver modules.

The Hewlett-Packard transceiver is packaged in a dual-in-line package with two rows of 11 pins. Several suppliers have committed to supply FDDI transceivers in this package assuring multiple sources of supply. The HP transceiver has been Beta Site tested during mid-1990. Product release is targeted for the fourth quarter 1990. Contact your local field sales engineer for more information.

\*ST (R) is a registered trademark of AT&T for Lightguide Cable Connectors.

## HP Fiber Optic Performance Characteristics

The charts on this page illustrate the performance ranges of Hewlett-Packard's fiber optic components. Both charts are coded by family. To determine which family is appropriate for your design, use the distance/data rate chart (Figure 1). The performance of each family

incorporates the entire area below each boundary. Specific component choices and their associated optical-power budget are indicated in Figure 2.

The optical-power budget is determined by subtracting the receiver sensitivity (dBm) from the transmitter optical output power (dBm). The distance specification can be calculated simply by dividing the optical-

power budget (dBm) by the cable attenuation (dB/km).

The newer transmitter/receiver product families provide the designer with significantly improved price/performance benefits over older products. These newer product families have been specifically designed for easy use in high volume manufacturing operations.

- NOTES:  
 1. Optical power budget calculations are at 25°C.  
 2. For Link performance with other fiber sizes contact your local HP sales office.  
 3. All transmitters are LEDs except for 1300 nm modules which include a driver IC.

Future 1300 nm modules are discussed on page 8-3.  
 \*Distance is limited by a combination of fiber bandwidth and transmitter optical rise/fall time and LED spectral width.

## Versatile Link Family

**Features:** Dual-in-line package, horizontal and vertical PCB mounting, plastic snap-in connectors, specified for 1 mm dia. plastic fiber. TTL/CMOS compatible output, auto insertable, wave solderable.

## **VERSATILE LINK**

The Versatile Fiber  
Optic Connection

**HFBR-0501  
SERIES**

### Features

- **LOW COST FIBER OPTIC COMPONENTS**
- **GUARANTEED LINK PERFORMANCE OVER TEMPERATURE**  
High Speed Links: dc to 5 MBd  
Extended Distance Links: up to 82 m  
Low Current Link: 6 mA Peak Supply Current  
Low Cost Standard Link: dc to 1 MBd  
Photo Interrupter Link
- **COMPACT, LOW PROFILE PACKAGES**  
Horizontal and Vertical Mounting  
"N-plex" Stackable  
Flame Retardant
- **EASY TO USE RECEIVERS**  
TTL, CMOS Compatible Output Level  
High Noise Immunity
- **EASY CONNECTING**  
Simplex, Duplex and Latching Connectors  
Flame Retardant Material
- **LOW LOSS PLASTIC CABLE**  
Selected Super Low Loss Simplex  
Simplex and Zip Cord Style Duplex  
Flame Retardant
- **NO OPTICAL DESIGN REQUIRED**
- **AUTO-INSERTABLE AND WAVE SOLDERABLE**
- **DEMONSTRATED RELIABILITY @ 40°C  
EXCEEDS 2 MILLION HOURS MTBF**

### Description

The Versatile Link series is a complete family of fiber optic link components for applications requiring a low cost solution. The HFBR-0501 series includes transmitters, receivers, connectors and cable specified for easy design. This series of components is ideal for solving problems with voltage isolation/insulation, EMI/RFI immunity or data security. The Link design is simplified by the logic compatible receivers and complete specifications for each component. No optical design is necessary. The key optical and electrical parameters of links configured with the HFBR-0501 family are fully guaranteed from 0° to 70° C. A wide variety of package configurations and connectors provide the designer with numerous mechanical solutions to meet application requirements. The transmitter and receiver components have been designed for use in high volume/low cost assembly processes such as auto-insertion and wave soldering.

### Versatile Link Applications

- Reduction of lightning/voltage transient susceptibility
- Motor controller triggering
- Data communications and Local Area Networks
- Electromagnetic Compatibility (EMC) for regulated systems: FCC, VDE, CSA, etc.
- Tempest—secure data processing equipment
- Isolation in test and measurement instruments
- Error free signalling for industrial and manufacturing equipment
- Automotive communications and control networks
- Power supply control
- Communication and isolation in medical instruments
- Noise immune communication in audio and video equipment
- Remote photo interrupter for office and industrial equipment
- Robotics communication
- PC to peripheral links

## Versatile Link Product Description

**Mechanical:** The compact Versatile Link package is made of a flame retardant material (UL V-0) in a standard, eight pin dual-in-line package (DIP) with 7.6 millimetre (0.3 inch) pin spacing. Vertical and horizontal mountable parts are available. These low profile Versatile Link packages are stackable and are enclosed to provide a dust resistant seal. Snap action simplex, simplex latching, duplex, and duplex latching connectors are offered with simplex or duplex cables.

**Electrical:** Transmitters incorporate a 660 nanometre light emitting diode (LED). Receivers include a monolithic dc coupled, digital IC receiver with open collector Schottky output transistor. An internal pullup resistor is available for use in the HFBR-25X1/2/4 receivers. Transmitter and receiver are compatible with standard TTL circuitry. A shield has been integrated into the receiver IC to provide additional, localized noise immunity.

**Optical:** Internal optics have been optimized for use with 1 mm diameter plastic optical fiber. Versatile Link specifications incorporate all component interface losses. Therefore, the need of optical calculations for common link applications is eliminated.

Optical power budget is graphically displayed to facilitate electrical design for customized links.

## Designing with Versatile Link

When designing with Versatile Link, the following topics should be considered:

### Distance and Data Rate

Distances and data rates guaranteed with Versatile Link depend upon the Versatile Link transmitter/receiver pair chosen. See the Versatile Link guide (page 5-14).

Typically, a data rate requirement is first specified. This determines the choice of the 5 MBd, 1 MBd or 40 kBd Versatile Link components. Distances guaranteed with Versatile Link then depend upon choice of cable, specific drive condition and circuit configuration. Extended distance operation is possible with pulsed operation of the LED (see Figure 2a, 2b, 2c, 2d, 2e and 2f dotted lines.)

Drive circuits are described on page 5-17. Cable is discussed on page 5-29. Pulsed operation of the LED at larger current will result in increased pulse width distortion of the receiver output signal.

Versatile Link can also be used as a photo interrupter at frequencies up to 500 KHz. This is described on page 10.

### Package Orientation

As shown in the photograph, Versatile Link is available in vertical and horizontal packages. Performance and pinouts for the two packages are identical. To provide additional attachment support for the Vertical Versatile Link housing, the designer has the option of using a self-tapping screw through a printed circuit board into a mounting hole at the bottom of the package. For most applications this is not necessary.

### Package Housing Color

Versatile Link components and simplex connectors are color coded to eliminate confusion when making connections. The HFBR-15X1/2/4 transmitters are gray, and the HFBR-25X1/2/3/4 receivers are blue. The HFBR-15X3 transmitter is black.

All of the above transmitters and receivers are also available in black versions for special applications. These black components, combined with black fiber optic cable, form a "black link" which has superior immunity to external light. The black link is appropriate where improved housing opacity is required due to very bright ambient light or bright flashes of light. Black link components are otherwise identical to blue and gray components.

### Connector Style

As shown, Versatile Link can be used with snap-in connectors: simplex, simplex latching, duplex, and duplex latching.

The simplex connector is intended for applications requiring simple, stable connection capability with a moderate retention force. The simplex latching connector provides similar convenience with a larger retention force. Connector/cable retention force can be improved by using a RTV adhesive within the connector. A suggested adhesive is 3M Company product: RTV-739.

The duplex connector connects a cable containing two fibers to two similar Versatile Link components. A lockout feature ensures the connection can be made in only one orientation. The duplex connector is intended for Versatile Link components "n-plexed" together, as discussed in the next section.

### N-plexing

Versatile Link components can be stacked or interlocked (n-plexed) together to minimize use of printed circuit board space and to provide efficient, dual connections via the duplex connector. Up to eight identical package styles can be n-plexed and inserted by hand into a printed circuit board without difficulty. However, auto-insertability of stacked units becomes limited when more than two packages are n-plexed together.

### Cable

Two cable versions are available: Simplex (single channel) and color coded duplex (dual channel). Each version of the cable is flame retardant (UL VW-1) and of low optical loss.

Two grades of the simplex cable are available: standard cable and improved cable. Improved cable is recommended for applications requiring longer distance needs, as reflected in the Link Selection Guide on page 5-12. Flexible cable construction allows simple cable installation techniques. Cables are discussed in detail on page 5-29.

### Accessories

A variety of accessories are available. The bulkhead feed-

through adapter discussed on page 5-30 can be used to mate two simplex snap-in connectors. It can be used either as a splice or a panel feedthrough for a panel thickness < 4.1 mm (0.16 inch).

Several accessories are offered to help with proper fiber/connector polishing. These are shown on page 5-31.

## Manufacturing with Versatile Link

Non-stacked Versatile Link parts require no special handling during assembly of units onto printed circuit boards. Versatile Link components are auto-insertable. When wave soldering is performed with Versatile Link components, an optical port plug is recommended to be used to prevent contamination of the port. Water soluble fluxes, not rosin based fluxes, are recommended for use with Versatile Link components.

Refer to the Connecting Section on page 5-33 for details of connectors and cable connecting.

## Versatile Link Performance

- 5 MEGABITS PER SECOND (NRZ)**
- 1 MEGABIT PER SECOND (NRZ)**
- 40 KILOBITS PER SECOND (NRZ)**

The 5 Megabaud (MBd) Versatile Link is guaranteed to perform from dc to 5 Mb/s (megabits per second, NRZ). Distances up to 17 metres are guaranteed when the transmitter is driven with a current of 60 milliamperes. This represents worst case performance throughout the temperature range of 0 to 70 degrees centigrade. With the required drive circuit of Figure 1b and at 60 milliamp drive current, the 1 Megabaud Versatile Link has guaranteed performance over 0 to 70 degrees centigrade from dc to 1 Mb/s (NRZ) up to 34 metres.

The low current link requires only 6mA peak supply current for the transmitter and receiver combined to achieve an 11 metre link. Extended distances up to 82 metres can

be achieved at a maximum transmitter drive current of 60 mA peak. The 40 kBd Versatile Link is guaranteed to perform from dc to 40 kb/s (NRZ) over 0° to 70°C up to the distances just described.

Receivers are compatible with LSTTL, TTL, CMOS logic levels and offer a choice of an internal pull-up resistor or an open collector output. Horizontal or vertical packages provide identical performance and are compatible with simplex, simplex latching, duplex, and duplex latching connectors. Refer to the connector section (page 5-30) and the cable section (page 5-29) for further information about these products. A list of specific part numbers is found below and in the Selection Guide on page 5-11.

			17			m	I <sub>Fpk</sub> = 120 mA		50% Duty Factor
			25	50		m	I <sub>Fpk</sub> = 120 mA, 25°C		
	Propagation Delay	t <sub>PLH</sub> t <sub>PHL</sub>		180	250	ns	R <sub>L</sub> = 560 Ω, C <sub>L</sub> = 30 pF ℓ = 0.5 metre	Fig. 3, 5 Notes 3, 8	
			100	140	ns	P <sub>R</sub> = -20 dBm			
Pulse Width Distortion	t <sub>D</sub>		80			ns	P <sub>R</sub> = -20 dBm R <sub>L</sub> = 560 Ω, C <sub>L</sub> = 30 pF	Fig. 3, 4 Notes 4, 8	

**Notes:**

- For I<sub>Fpk</sub> > 80 mA, the duty factor must be such as to keep I<sub>Fdc</sub> ≤ 80 mA. In addition, for I<sub>Fpk</sub> > 80 mA, the following rules for pulse width apply:  
I<sub>Fpk</sub> ≤ 160 mA: Pulse width ≤ 1 ms  
I<sub>Fpk</sub> ≥ 160 mA: Pulse width ≤ 1 μs, period ≥ 20 μs.
- It is essential that a bypass capacitor, 0.1 μF ceramic, be connected from pin 2 to pin 3 of the HFBR-25X1/25X2/25X4 receivers and from pin 2 to pin 4 of the HFBR-25X3 receiver. Total lead length between both ends of the capacitor and the supply pins should not exceed 20 mm.
- The propagation delay for one metre of cable is typically 5 ns.
- t<sub>D</sub> = t<sub>PLH</sub> - t<sub>PHL</sub>.
- Typical data is at 25°C, V<sub>CC</sub> = 5 V.
- Typical propagation delay is measured at P<sub>R</sub> = -15 dBm.
- Estimated typical link life expectancy at 40°C exceeds 10 years at 60 mA.
- Pulsed LED operation at I<sub>Fpk</sub> > 80 mA will cause increased link t<sub>PLH</sub> propagation delay time. This extended t<sub>PLH</sub> time contributes to increased pulse width distortion of the receiver output signal.
- Pins 5 and 8 of both the transmitter and receiver are for mounting and retaining purposes only. Do not electrically connect pin 5 and/or pin 8.

# Versatile Link Design Considerations

Simple interface circuits for 5 MBd, 1 MBd and 40 kBd applications are shown in Figure 1. The value of the transmitter drive current depends upon the desired link distance. This is shown in Figures 2a through 2f. After selecting a value of transmitter drive current,  $I_F$ , the value of  $R_1$  can be determined with the aid of Figures 1a, 1b and 1d. Note that the 5 MBd and 40 kBd Versatile Links can have an overdrive and underdrive limit for the chosen value of  $I_F$  while the 1 MBd Versatile Link has only an underdrive limit. Dotted lines in Figures 2a through 2f

represent pulsed operation for extended link distance requirements. For the 1 MBd interface circuit, the  $R1C1$  time constant must be  $> 75$  ns. Conditions described in Note 1 must be met for pulsed operation. Refer to Note 8 for performance comments when pulsed operation is used.

All specifications are guardbanded for worst case conditions between 0 to 70 degrees centigrade. All tolerances and variations (including end-of-life transmitter power, receiver sensitivity, coupling variances, connector and cable variations) are taken into account.

## Versatile Link Photo Interrupter

### 20 KHz (40 kBd) LINK, 500 kHz (1 MBd) LINK

Versatile Link may be used as a photo-interrupter in optical switches, shaft position sensors, velocity sensors, position sensors, and other similar applications. This link is particularly useful where high voltage, electrical noise, or explosive environments prohibit the use of electromechanical or optoelectronic sensors. The 20 kHz (40 kBd) transmitter/receiver pair has an optical power budget of 25 dB. The 500 kHz (1 MBd) transmitter/receiver pair has an optical power budget of 10 dB. Total system losses (cable attenuation, air gap loss, etc.) must not exceed the link optical power budget.

### RECOMMENDED OPERATING CONDITIONS

Recommended operating conditions are identical to those of the Low Current/Extended Distance and High Performance 1 MBd links. Refer to page 5-15.

### SYSTEM PERFORMANCE

These specification apply when using Standard and Improved cable and, unless otherwise specified, under recommended operating conditions. Refer to the appropriate link data on pages 5-17 and 5-18 for additional design information.

Parameter	Min.	Typ.[1]	Max.	Units	Conditions	Ref.

	12.8	15.6		dB	I <sub>Fdc</sub> = 60 mA, 25°C	

1. Typical data is at T<sub>A</sub> = 25°C, V<sub>CC</sub> = 5 V.

2. Optical Power Budget = P<sub>T</sub> min. = P<sub>R</sub> (L) min. Refer to page XX for additional design information.

# Photo Interrupter Link Design Considerations

The fiber optic Transmitter/Receiver pair is intended for applications where the photo interrupter must be physically separated from the optoelectronic emitter and detector. This separation would be useful where high voltage, electrical noise or explosive environments prohibit the use of electronic devices. To ensure reliable long term operation, link design for this application should operate with an ample optical power margin  $\alpha_M \geq 3$  dB, since the exposed fiber ends are subject to environmental contamination that will increase the optical attenuation of the slot with time. A graph of air gap separation versus attenuation for clean fiber ends with minimum radial error  $\leq 0.127$  mm (0.005 inches) and angular error ( $\leq 3.0^\circ$ ) is provided in Figure 8.

The following equations can be used to determine the

transmitter output power,  $P_T$ , for both the overdrive and underdrive cases. Overdrive is defined as a condition where excessive optical power is delivered to the receiver. The first equation calculates, for a predetermined link length and slot attenuation, the maximum  $P_T$  in order not to overdrive the receiver. The second equation defines the minimum  $P_T$  allowed for link operation to prevent underdrive condition from occurring, where  $\alpha_o$  is the fiber attenuation.

$$P_T (\text{MAX}) - P_R (\text{MAX}) \leq \alpha_O \text{ MIN } \ell + \alpha_{\text{SLOT}} \quad \text{Eq. 1}$$

$$P_T (\text{MIN}) - P_{RL} (\text{MIN}) \geq \alpha_O \text{ MAX } \ell + \alpha_{\text{SLOT}} + \alpha_M \quad \text{Eq. 2}$$

Once  $P_T (\text{MIN})$  has been determined in the second equation for a specific link length ( $\ell$ ), slot attenuation ( $\alpha_{\text{SLOT}}$ ) and margin ( $\alpha_M$ ). Figure 9 can then be used to find  $I_F$ .

# Interlocked (Stacked) Assemblies

## STACKING HORIZONTAL MODULES

Recommended stacking assembly of horizontal packages is easily accomplished by placing units upside down with pins facing upward. Initially engage the interlocking mechanism by sliding the L bracket body from above into the L slot body of the lower package. Lay the partially interlocked units on a flat surface and push down with a thin, rigid, rectangular edged object to bring all stacked units into uniform alignment. This technique prevents potential harm that could occur to fingers and hands of assemblers from the package pins. Refer to Figure 1 below that illustrates this assembly. Stacked horizontal packages can be disengaged should there be a need to do so. Repeated stacking and unstacking causes no damage to individual units.

## STACKING VERTICAL MODULES

Recommended stacking of vertical packages is to hold two vertical units, one in each hand, with the pins facing away from the assembler and the optical ports located in the bottom front of each unit. Engage completely, the L bracket unit from above into the lower L slot unit. Package to package alignment is easily insured by laying the full, flat, bottom side of the assembled units onto a flat surface pushing with a finger the two packages into complete, parallel alignment. The thin rectangular edged tool, used for horizontal package alignment, is not needed with the vertical packages. Stacked vertical packages can be disengaged should there be a need to do so. Repeated stacking and unstacking causes no damage to individual units.

Figure 11. Interlocked (Stacked) Horizontal or Vertical Packages.

# Versatile Link Transmitters

- HFBR-1521/1531 (5 MBd - High Performance)**
- HFBR-1522/1532 (1 MBd - High Performance)**
- HFBR-1523/1533 (40 kBd - Low Current/Extended Distance)**
- HFBR-1524/1534 (1 MBd - Standard)**

Versatile Link transmitters incorporate a 660 nanometre LED in a horizontal or vertical housing. The HFBR-15X3 transmitter housing is black. HFBR-15X1/2/4 standard housings are gray, but black versions are available. The transmitters can be easily interfaced to standard TTL or CMOS logic. The optical output power of the HFBR-152X/153X series is specified at the end of 0.5 m of cable. The mechanical and electrical pin spacing and connections are identical for both the horizontal and vertical packages.

**Figure 13. Normalized HFBR-152X/153X Series Transmitter Typical Output Optical Power vs. Drive Current.**

# Versatile Link Receivers

- HFBR-2521/2531 (5 MBd - High Performance)
- HFBR-2522/2532 (1 MBd - High Performance)
- HFBR-2524/2534 (1 MBd - Standard)

The Versatile Link receivers feature a shielded, integrated photodetector and a wide bandwidth dc amplifier with high EMI immunity. A Schottky clamped open-collector output transistor allows interfacing to common logic families and enables "wired-OR" circuit designs. The open collector output is specified up to 18 V. An integrated 1000 ohm resistor internally connected to  $V_{CC}$  may be externally connected to provide a pull-up for ease of use with +5 V logic. Under

pulsed LED current operation ( $I_F > 80$  mA), the combination of a high optical power level and the optical falling edge of the LED transmitter will result in increased pulse width distortion of the receiver output signal. The standard receiver housings are blue; black versions are available.

- 1.6 mm below seating plan.
- Optical flux, P (dBm) = 10 Log [P ( $\mu$ W)/1000  $\mu$ W].
- Measured at the end of Fiber Optic Cable with large area detector.
- $R_L$  is open.
- Typical data is at 25°C,  $V_{CC} = 5$  V.
- It is essential that a bypass capacitor 0.01  $\mu$ F be connected from pin 2 to pin 3 of the receiver. Total lead length between both ends

- of the capacitor and the pins should not exceed 20 mm.
- Pins 5 and 8 of both the transmitter and receiver are for mounting and retaining purposes only. Do not electrically connect pin 5 and/or pin 8.
- Pulsed LED operation at  $I_F > 80$  mA will cause increased link  $t_{PLH}$  propagation delay time. This extended  $t_{PLH}$  time contributes to increased pulse width distortion of the receiver output signal.
- The LED driver circuit of Figure 1b (Link Design Considerations) is required for 1 Mbd operation of the HFBR-2522/2532/2524/2534.

## High Sensitivity Receiver

### HFBR-25X3

The blue plastic HFBR-25X3 Receiver module has a sensitivity of -39 dBm. It features an integrated photodetector and dc amplifier with high EMI immunity. The output is an open collector with a 150  $\mu$ A internal current source pull-up and is compatible with TTL/LSTTL and most CMOS logic families. For minimum rise time add an external pull-up resistor of at least 3.3K ohms.  $V_{CC}$  must be greater than or equal to the supply voltage for the pull-up resistor.

## Absolute Maximum Ratings

Effective Diameter	$D_R$		1		mm		
Numerical Aperture	N.A.		0.5				

**Notes:**

- 1.6 mm below seating plan.
- Optical flux, P (dBm) = 10 Log P ( $\mu$ W)/1000  $\mu$ W.
- Measured at the end of Fiber Optic Cable with large area detector.
- Because of the very high sensitivity of the HFBR-25X3, the digital output may switch in response to ambient light levels when a cable is not occupying the receiver optical port. The designer should take care to filter out signals from this source if they pose a hazard to the system.

- Typical data is at 25°C,  $V_{CC} = 5$  V.
- Including current in 3.3 K pull-up resistor.
- It is recommended that a bypass capacitor 0.01  $\mu$ F to 0.1  $\mu$ F ceramic be connected from pin 2 to pin 4 of the receiver.
- Pins 5 and 8 are for mounting and retaining purposes only. Do not electrically connect pin 5 and/or pin 8.

# Plastic Fiber Optic Cable

Simplex Fiber Optic Cable is constructed of a single step index plastic fiber sheathed in a plastic jacket. Duplex Fiber Optic Cable has two plastic fibers, each in a cable of construction similar to the Simplex Cable, joined with a web. The individual channels are identified by a marking on one channel of the cable. The Improved Fiber Optic Cable is identical to the Standard Cable except that the attenuation is lower.

These cables are UL recognized components and pass UL VW-1 flame retardancy specification. Safe cable properties in flammable environments, along with non-conductive electrical characteristics of the cable may make the use of conduit unnecessary. Plastic cable is available unconnected or connected. Refer to page 5-34 for part numbers, numbers.

Cable Attenuation	Standard Cable	0.19	0.31	0.43	dB/m	Source is HFBR-152X/153X (660 nm), ℓ = 20 m	Note 7
	Improved Cable	0.19	0.25	0.31			
Numerical Aperture	N.A.		0.5			ℓ > 2 m	
Diameter, Core	D <sub>C</sub>		1.0		mm		
Diameter, Jacket	D <sub>J</sub>		2.2		mm	Simplex Cable	
Travel Time Constant	ℓ/v		5.0		nsec/m		Note 6
Mass per Unit Length/Channel	m/ℓ		4.6		g/m	Without Connectors	
Cable Leakage Current	I <sub>L</sub>		12		nA	50 kV, ℓ = 0.3 m	

**Notes:**

1. Less than 30 minutes.
2. Less than 1 hour, non-operating.
3. 90° bend on 10 mm radius mandrel. Bend radius is the radius of the mandrel around which the cable is bent.
4. Tested at 1 impact according to MIL-STD-1678, Method 2030, Procedure 1.
5. Typical data is at 25°C.
6. Travel time constant is the reciprocal of the group velocity for propagation of optical power. Group velocity is  $v = c/n$ , where c is the

7. In addition to standard Hewlett-Packard 100% product testing, HP provides additional margin to ensure link performance. Under certain conditions, cable installation and improper connecting may reduce performance. Contact Hewlett-Packard for recommendations.
8. Improved cable is available in 500 metre spools and in factory-connected lengths less than 100 metres.

FIBER OPTICS

# Versatile Link Fiber Optic Connectors

## CONNECTORS FEEDTHROUGH/SPLICE POLISHING TOOLS

Versatile Link transmitters and receivers are compatible with three connector styles; simplex, simplex latching, and duplex. All connectors provide a snap-action when mated to Versatile Link components. Simplex connectors are color coded to match with transmitter and receiver color coding. Duplex connectors are keyed so that proper orientation is ensured. When removing a connector from a module, pull at the connector body. Do not pull on the cable alone. The same, quick and simple connecting technique is used with all connectors and cable. This technique is described on page 18. Note that simplex and duplex crimp rings are different.

### Simplex Connector Styles

HFBR-4501/4511 — Simplex

The simplex connector provides a quick and stable connection for applications that require a component to provide retention force of 8 newtons (1.8 lb). These connectors are available in colors of gray (HFBR-4501) or blue (HFBR-4511).

HFBR-4503/4513 — Simplex Latching

The simplex latching connector is designed for rugged applications requiring greater retention force, 80 N (18 lbs), than that provided by a simplex connector. When inserting the simplex latching connector into a module, the connector latch mechanism should be aligned with the top surface of the horizontal module, or with the tall vertical side of the vertical module. Misorientation of an inserted latching connector into either module housing will not result in a positive latch. The connector is released by depressing the rear section of the connector lever, and then pulling the connector assembly away from the module housing.

If the cable/connector will be used at elevated operating temperatures or experience frequent and wide temperature cycling effects, the cable/connector attachment can be strengthened by applying a RTV adhesive within the connector. A recommended adhesive is GE Company RTV-128. In most applications, use of RTV is unnecessary. The simplex latching connector is available in gray (HFBR-4503) or blue (HFBR-4513).

**Duplex Connector** HFBR-4506 — Duplex

Duplex connectors provide convenient duplex cable termination and are keyed to prevent incorrect connection. The duplex connector is compatible with dual combinations of identical Versatile Link components (e.g., two horizontal transmitters, two vertical receivers, a horizontal transmitter and a horizontal receiver, etc.). A duplex connector cannot connect to two different packages simultaneously. The duplex connector is an off-white color.

**Feedthrough/Splice** HFBR-4505/4515 — Adapter

The HFBR-4505/4515 adapter mates two simplex connectors for panel/bulkhead feedthrough of plastic fiber cable. Maximum panel thickness is 4.1 mm (0.16 inch). This adapter can serve as a cable in-line splice using two simplex connectors. The colors of the adapters are gray (HFBR-4505) and blue (HFBR-4515). The adapter is not compatible with the duplex or simplex latching connectors.

## Absolute Maximum Ratings

Parameter	Symbol	Min.	Max.	Units	Notes
Storage Temperature	$T_S$	-40	+75	°C	
Operating Temperature	$T_A$	0	+70	°C	
Nut Torque HFBR-4505/4515	$T_N$		0.7 100	N-m OzF-in	1

### Notes:

1. Recommended nut torque is 0.57 N-m (80 OzF-in).

	Duplex Latching	HFBR-4516			22	51		

**Notes:**

1. Factory polish or field polish per recommended procedure.
2. No perceivable reduction in insertion force was observed after 2000 insertions. Destructive insertion force was typically at 178 N (40 lbs).
3. For applications where frequent temperature cycling over temperature extremes is expected please contact Hewlett-Packard for alternate connecting techniques.
4. All mechanical forces were measured after units were stored at 70°C for 168 hours and returned to 25°C for one hour.
5. Minimum and maximum limits of α<sub>CC</sub> are for 0°C to 70°C temperature range. Typical value of α<sub>CC</sub> is at 25°C.

**Connecting**

The following easy procedure describes how to make cable terminations. It is ideal for both field and factory installation. If a high volume connecting technique is required please contact your Hewlett-Packard sales engineer for the recommended procedure and equipment.

Connecting the cable is accomplished with the Hewlett-Packard HFBR-4593 Polishing Kit consisting of a Polishing Fixture, 600 grit abrasive paper and 3-μm pink lapping film (3M Company, OC3-14). No adhesive material is needed to secure the cable in the connector, and the connector can be used immediately after polishing. Improved connector to cable attachment can be achieved with the use of a RTV (GE Company, RTV-128) adhesive for frequent, extreme temperature cycling environments or for elevated temperature operation.

Connectors may be easily installed on the cable ends with readily available tools. Materials needed for the terminating procedure are:

- 1) Hewlett-Packard Plastic Fiber Optic Cable
- 2) HFBR-4593 Polishing Kit
- 3) HFBR-4501/4503 Gray Simplex/Simplex Latching Connector and Silver Color Crimp Ring
- 4) HFBR-4511/4513 Blue Simplex/Simplex Latching Connector and Silver Color Crimp Ring
- 5) HFBR-4506 Parchment Duplex Connector and Duplex Crimp Ring
- 6) Industrial Razor Blade or Wire Cutters
- 7) 16 Gauge Latching Wire Strippers
- 8) Crimp Tool, HFBR-4597

**Step 1**

The zip cord structure of the duplex cable permits easy separation of the channels. The channels should be separated approximately 50 mm (2.0 in.) back from the ends to permit connecting and polishing.

After cutting the cable to the desired length, strip off approximately 7 mm (0.3 in.) of the outer jacket with the 16 gauge wire strippers. Excess webbing on duplex cable may have to be trimmed to allow the simplex or simplex latching connector to slide over the cable.

When using the duplex connector and duplex cable, the separated duplex cable must be stripped to equal lengths on each cable. This allows easy and proper seating of the cable into the duplex connector.

## Step 2

Place the crimp ring and connector over the end of the cable; the fiber should protrude about 3 mm (0.12 in.) through the end of the connector. Carefully position the ring so that it is entirely on the connector with the rim of the crimp ring flush with the connector, leaving a small space between the crimp ring and the flange. Then crimp the ring in place with the crimping tool. One crimp tool is used for all connector crimping requirements.

**Note:** Place the gray connector on the cable end to be connected to the transmitter and the blue connector on the cable end to be connected to the receiver to maintain the color coding (both connectors are the same mechanically). For duplex connector and duplex cable application, align the color coded side of the cable with the appropriate ferrule of the duplex connector in order to match connections to the respective optical ports. The simplex connector crimp ring cannot be used with the duplex connector. The duplex connector crimp ring cannot be used with the simplex or simplex latching connectors. The simplex crimp has a dull lustre; the duplex ring is shiny and has a thinner wall.

### SIMPLEX

### SIMPLEX LATCHING

### DUPLEX/DUPLEX LATCHING

## Step 3

Any excess fiber protruding from the connector end may be cut off; however, the trimmed fiber should extend at least 1.5 mm (0.06 in.) from the connector end.

Insert the connector fully into the polishing fixture with the trimmed fiber protruding from the bottom of the fixture. This plastic polishing fixture can be used to polish two simplex connectors or two simplex latching connectors simultaneously, or one duplex connector.

**Note:** The four dots on the bottom of the polishing fixture are wear indicators. Replace the polishing fixture when any dot is no longer visible.

Place the 600 grit abrasive paper on a flat smooth surface. Pressing down on the connector, polish the fiber and the connector using a figure eight pattern of strokes until the connector is flush with the bottom of the polishing fixture. Wipe the connector and fixture with a clean cloth or tissue.

## Step 4

Place the flush connector and polishing fixture on the dull side of the 3 micron pink lapping film and continue to polish the fiber and connector for approximately 25 strokes. The fiber end should be flat, smooth and clean.

The cable is now ready for use.

**Note:** Use of the pink lapping film fine polishing step results in approximately 2dB improvement in coupling performance of either a transmitter-receiver link or a bulkhead/splice over 600 grit polish alone. This fine polish is comparable to Hewlett-Packard factory polish. The fine polishing step may be omitted where an extra 2dB of optical power is not essential, as with short link lengths. Proper polishing of the tip of the fiber/connector face results in a tip diameter between 2.8 mm (0.110 in.) minimum and 3.2 mm (0.125 in.) maximum.

For simultaneous multiple connector polishing techniques please contact Hewlett-Packard.

# A Note About Ordering Cable

Four steps are required to determine the proper part number for a desired cable.

### Step 1 Select Standard or Improved Cable.

As explained on page 5-29, two levels of attenuation are available: Standard and Improved.

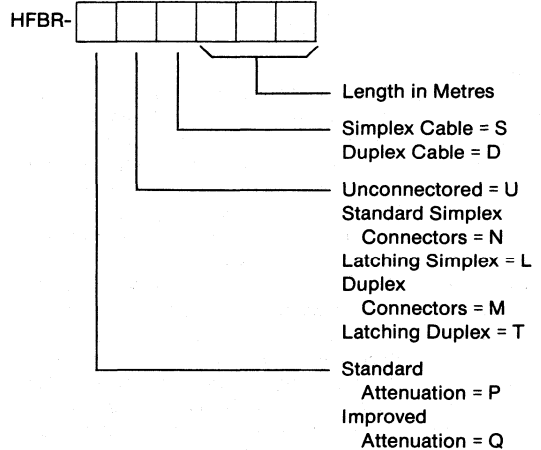

### Step 2 Select the connector style.

Connector styles are described on page 5-30.

### Step 3 Select Simplex or Duplex.

### Step 4 Determine the cable length.

To determine the appropriate part number, select the letter corresponding to your selection and fill in the following:

For example:

HFBR-PUD500 is a Standard Attenuation, Unconnected, Duplex, 500 metre cable.

HFBR-QLS001 is an Improved Attenuation, Latching Simplex Connected, Simplex, 1 metre cable.

HFBR-PMD010 is a Standard Attenuation, Standard Duplex Connected, Duplex, 10 metre cable.

HFBR-PND100 is a Standard Attenuation, Standard Simplex Connected, Duplex, 100 metre cable.

**Note:** 0.1 metre Standard Attenuation Simplex lengths are available; 0.5 metre Standard Attenuation Simplex and Duplex lengths are also available. The lengths are ordered as HFBR-xxx1DM or HFBR-xxx5DM.

**ATTENTION:** Pre-connected simplex cables have oppositely colored (GRAY vs. BLUE) connectors at the opposite ends of the same fiber; although oppositely colored, the connectors are mechanically identical. For duplex cables with simplex connectors, the same rule applies to each fiber; also, the side-by-side fibers at each end of the cable have oppositely colored connectors. For duplex cables with duplex connectors similar rules apply, so the connectors at opposite ends are oppositely keyed relative to the marked fiber in a duplex cable.

# Low Cost, Miniature Fiber Optic Components with ST\* and SMA Ports

## Technical Data

### HFBR-0400 ST\* and SMA Series

#### Features

- Low Cost Transmitters and Receivers
- Choice of ST or SMA Ports
- 820 Nanometre Wavelength Technology
- Signal Rates up to 150 Megabaud
- Link Distances up to 4 Kilometres
- Specified with 50/125  $\mu\text{m}$ , 62.5/125  $\mu\text{m}$ , 100/140  $\mu\text{m}$ , and 200  $\mu\text{m}$  PCS Fiber Sizes
- Repeatable ST Connections within 0.2 dB Typical
- Unique Optical Port Design for Efficient Coupling
- Auto-Insertable and Wave Solderable
- No Board Mounting Hardware Required
- Wide Operating Temperature Range -40°C to 85°C
- AlGaAs Emitters 100% Burn-In Ensures High Reliability
- Demonstrated Reliability @ 40°C Exceeds 4 Million Hours MTBF

#### Applications

- Local Area Networks
- Computer to Peripheral Links
- Computer Monitor Links
- Digital Cross Connect Links
- Central Office Switch Links
- PBX Links
- Video Links
- Modems and Multiplexers
- Suitable for Tempest Systems

#### Description

The HFBR-0400 Series of components is designed to provide cost effective, high performance fiber optic communication links for information systems and industrial applications with link distances of up to 4 kilometres. With the latest addition to the HFBR-0400 series, the 125 MHz analog receiver, data rates of up to 150 megabaud are attainable.

Transmitters and receivers are directly compatible with popular "industry-standard" connectors:

ST and SMA. They are completely specified with multiple fiber sizes; including 50/125  $\mu\text{m}$ , 62.5/125  $\mu\text{m}$ , 100/140  $\mu\text{m}$ , and 200  $\mu\text{m}$ .

Complete evaluation kits are available for ST and SMA product offerings; including transmitter, receiver, connected cable, and technical literature. In addition, ST and SMA connected cables are available.

\*ST is a registered trademark of AT&T Lightguide Cable Connectors.

## HFBR-0400 Series Selection Guide

### Package Information

All HFBR-0400 Series transmitters and receivers are housed in a low-cost, dual-in-line package that is made of high strength, heat resistant, chemically resistant, and UL V-O flame retardant plastic. The transmitters are easily identified by the light grey color connector port. The receivers are easily identified by the dark grey color connector port. (Black color for conductive port.) The package is designed for auto-insertion and wave soldering so it is ideal for high volume production applications.

### Handling and Design Information

When soldering, it is advisable to leave the protective cap on the unit to keep the optics clean.

Good system performance requires clean port optics and cable ferrules to avoid obstructing the optical path.

Clean compressed air often is sufficient to remove particles of dirt; methanol on a cotton swab also works well.

**CAUTION:** The small junction sizes inherent to the design of these components increases the components' susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of these components to prevent damage and/or degradation which may be induced by ESD.

Figure 1. HFBR-0400 ST Series Cross-Sectional View

## Link Design Considerations

The HFBR-14XX transmitter and the HFBR-24XX receiver can be used to design fiber optic data links that operate with 50/125  $\mu\text{m}$ , 62.5/125  $\mu\text{m}$ , 100/140  $\mu\text{m}$  and 200  $\mu\text{m}$  PCS fiber cables.

The HFBR-14X2 standard transmitter and the HFBR-24X2 receiver are suitable for systems requiring up to 5 MBd and 2 Km. For higher data rate or longer

distance, the HFBR-14X4 high power transmitter and/or the HFBR-24X4 receiver should be considered.

### 5 MBd Logic Link Design

The HFBR-14X4/24X2 Logic Link is guaranteed to work with 62.5/125  $\mu\text{m}$  fiber optic cable over the entire range of 0 to 1200 metres at a data rate of dc to 5 MBd, with arbitrary data format and typically less than 25% pulse width distortion, when the transmitter is driven with  $I_F = 30 \text{ mA}$ ,  $R_L = 115 \text{ Ohm}$

as shown in Figure 2. If it is desired to economize on power or achieve lower pulse distortion, then a lower drive current ( $I_F$ ) may be used. The following example will illustrate the technique for optimizing  $I_F$ .

**Example:** Maximum distance required = 400 metres. From Figure 3 the drive current should be 15 mA. From the transmitter data  $V_F = 1.5 \text{ V}$  (max.) as shown in Figure 9.

$$R_1 = \frac{V_{CC} - V_F}{I_F} = \frac{5 \text{ V} - 1.5 \text{ V}}{15 \text{ mA}} = 233 \text{ ohm}$$

The curves in Figures 3, 4, and 5 are constructed assuming no in-line splice or any additional system loss. Should the link consist of any in-line splices, these curves can still be used to calculate link limits provided they are shifted by the additional system loss in dB. For example, with 20 mA of transmitter drive current, 1.6 km link distance is achievable. With 2 dB of additional system loss, 1.2 km link distance is achievable.

## 5 MBd Link Performance

NOTE:  
IT IS ESSENTIAL THAT A BYPASS CAPACITOR (0.01  $\mu\text{F}$  TO 0.1  $\mu\text{F}$  CERAMIC) BE CONNECTED FROM PIN 2 TO PIN 7 OF THE RECEIVER. TOTAL LEAD LENGTH BETWEEN BOTH ENDS OF THE CAPACITOR AND THE PINS SHOULD NOT EXCEED 20 mm.

### **Logic Link Design up to 35 MBd**

For data rates up to 35 MBd, or longer distance, the HFBR-14X4 high power transmitter and/or the HFBR-24X4 receiver can be used. The table on the following page summarizes the typical performance of a 30 MBd link. For more details, please refer to HP Application Bulletin 73 (5954-8415). If circuit design assistance is needed, please contact your local Hewlett-Packard Components Field Sales Engineer.

### **Logic Link Design up to 150 MBd**

For data rates of up to 150 MBd, the HFBR-14XX transmitters and the HFBR-24X6 receiver can be used. The table on the following page summarizes the typical performance of a 100 MBd link. For more details, please refer to HP Application Bulletin 78. If circuit design assistance is needed, please contact your local Hewlett-Packard Components Field Sales Engineer.

### **Cable Selection**

The HFBR-0400 Series can be used with fiber sizes such as 50/125  $\mu\text{m}$ , 62.5/125  $\mu\text{m}$ , 100/140  $\mu\text{m}$ , 200  $\mu\text{m}$  PCS, and 1000  $\mu\text{m}$  Plastic. Before selecting a fiber type, several parameters need to be carefully evaluated.

The bandwidth and attenuation (dB/km) of the selected fiber, in conjunction with the amount of optical power coupled into it will determine the achievable link length. The parameters that will significantly affect the optical power coupled into the fiber are as follows:

- a. **Fiber Core Diameter.** As the core diameter is increased, the optical power coupled increases, leveling off at about 250  $\mu\text{m}$  diameter.
- b. **Numerical Aperture (NA).** As the NA is increased, the optical power coupled increases, leveling off at an NA of about 0.34.

In addition to the optical parameters, the environmental performance of the selected fiber/cable must be evaluated. Finally, the ease of installing connectors on the selected fiber/cable must be considered.

ST connected fiber optic cable is available from a variety of manufacturers and distributors, including those listed in HP Technical Brief 105; ST Connector/Cable Guide. For ST Evaluation Cables from Hewlett-Packard, please refer to page 12.

### **ST Connectors**

ST connections are locking, vibration resistant, low loss and very repeatable. The HFBR-0400 ST Series Transmitters and Receivers are compatible with AT&T's ST and ST-II Connectors and bayonet connectors from a variety of manufacturers and distributors. For more information about ST Connectors, please refer to Technical Brief 105; ST Connector/Cable Guide.

### **SMA Connectors**

The HFBR-0400 SMA Series Transmitters and Receivers are compatible with SMA type connectors. Depending upon the type of SMA connector that is chosen, price, performance, and reliability will vary. For more information about SMA connectors, please refer to Technical Brief 101; Fiber Optic SMA Connector Technology.

Propagation Delay HIGH to LOW	t <sub>PHL</sub>		46		nsec		
System Pulse Width Distortion	t <sub>PLH</sub> -t <sub>PHL</sub>		26		nsec		
Bit Error Rate	BER			10 <sup>-9</sup>		Data Rate ≤ 5 MBaud P <sub>R</sub> > -24 dBm Peak	

### Notes:

- Typical data at T = 25°C, V<sub>CC</sub> = 5.0 V dc, P<sub>R</sub> = 27.0 dBm.
- Synchronous data rate limit is based on these assumptions: a) 50% duty factor modulation, e.g., Manchester I or BiPhase Manchester II; b) continuous data; c) PLL Phase Lock Loop demodulation; d) TTL threshold.

Asynchronous data rate limit is based on these assumptions: a) NRZ data; b) arbitrary timing—no duty factor restriction; c) TTL threshold.

The EYE pattern describes the timing range within which there is no uncertainty of the logic state, relative to a specific threshold, due to either noise or intersymbol prop. delay effects.

### 30 MBd Link Performance (see Application Bulletin 73 for details)

Parameter	Symbol	Min.	Typ. <sup>[1]</sup>	Max.	Units	Conditions
Optical Power Budget w/50/125 µm Fiber	OPB <sub>50</sub>		9.7		dB	HFBR-14X4/24X4 w/50/125 µm, NA = 0.2
Optical Power Budget w/62.5/125 µm Fiber	OPB <sub>62.5</sub>		13.5		dB	HFBR-14X4/24X4 w/62.5/125 µm, NA = 0.27
Optical Power Budget w/100/140 µm Fiber	OPB <sub>100</sub>		13.5		dB	HFBR-14X2/24X4 w/100/140 µm, NA = 0.30
Optical Power Budget w/200 µm PCS Fiber	OPB <sub>200</sub>		19		dB	HFBR-14X4/24X4 w/200 µm PCS, NA = 0.40
Data Format NRZ		dc	30		MBaud	Reference AB 73 for circuit details, Note 2, 3
Propagation Delay LOW to HIGH	t <sub>PLH</sub>		12		nsec	T <sub>A</sub> = 25°C P <sub>R</sub> = -13 dBm Peak  = 1.0 metre
Propagation Delay HIGH to LOW	t <sub>PHL</sub>		8		nsec	
System Pulse Width Distortion	t <sub>PLH</sub> -t <sub>PHL</sub>		4		nsec	
Bit Error Rate	BER			10 <sup>-9</sup>		Data Rate ≤ 30 MBaud P <sub>R</sub> > -25.5 dBm Peak

**Notes:**

1. Typical data at T = 25°C, V<sub>CC</sub> = 5.0 V dc.
2. This circuit utilizes the LT1016 comparator from Linear Technology Corporation. If operated at 5 MBd, an additional 4.5 dB of optical power budget can be obtained.
3. If HFBR-24X4 is replaced with the HFBR-24X6, an additional 5.5 dB of optical power budget can be obtained at 30 MHz NRZ.

### 100 MBd Link Performance (see Application Bulletin 78 for details)

Parameter	Symbol	Min.	Typ. <sup>[1]</sup>	Max.	Units	Conditions
Optical Power Budget w/50/125 µm Fiber	OPB <sub>50</sub>		14.7		dB	HFBR-14X4/24X6 w/50/125 µm, NA = 0.2
Optical Power Budget w/62.5/125 µm Fiber	OPB <sub>62.5</sub>		19		dB	HFBR-14X4/24X6 w/62.5/125 µm, NA = 0.27
Optical Power Budget w/100/140 µm Fiber	OPB <sub>100</sub>		19		dB	HFBR-14X2/24X6 w/100/140 µm, NA = 0.30
Optical Power Budget w/200 µm PCS Fiber	OPB <sub>200</sub>		24		dB	HFBR-14X2/24X6 w/200 µm PCS, NA = 0.40
Data Format 20% to 80% Duty Factor			100		MBaud	Reference AB 78 for circuit details, Note 2
Propagation Delay LOW to HIGH	t <sub>PLH</sub>		5		nsec	T <sub>A</sub> = 25°C P <sub>R</sub> = -7 dBm Peak  = 1.0 metre
Propagation Delay HIGH to LOW	t <sub>PHL</sub>		4		nsec	
System Pulse Width Distortion	t <sub>PLH</sub> -t <sub>PHL</sub>		1		nsec	
Bit Error Rate	BER			10 <sup>-9</sup>		Data Rate ≤ 100 MBaud P <sub>R</sub> > -31 dBm Peak

**Notes:**

1. Typical data at T<sub>A</sub> = 25°C, V<sub>EE</sub> = -5.2 V dc, V<sub>CC</sub> = 0 (ECL).
2. The optical power budgets at 100 MBd were measured with an unrestricted receiver, without a Nyquist filter. A 10116 ECL line receiver was used in the receiver digitizing circuit. If unnecessary bandwidth is eliminated by low-pass filtering, an additional 2 dB of link budget is attainable at 30 MBd.

### **ST Evaluation Kit**

The HFBR-0410 kit is a simple and inexpensive way to demonstrate the performance of Hewlett-Packard's HFBR-0400 ST Series transmitters and receivers.

The HFBR-0410 ST Evaluation Kit contains the following items:

- One HFBR-1412 transmitter
- One HFBR-2412 five megabaud TTL receiver
- Three metres of ST connected 62.5/125  $\mu\text{m}$  fiber optic cable with low cost plastic ferrules
- HFBR-0400 Series data sheets
- HP Application Bulletin 73
- ST connector and cable data sheets

To order an ST Evaluation Kit, please specify HFBR-0410, Quantity 1.

### **SMA Evaluation Kit**

The HFBR-0400 kit is a simple and inexpensive way to demonstrate the performance of Hewlett-Packard's HFBR-0400 SMA Series transmitters and receivers.

The HFBR-0400 SMA Evaluation Kit contains the following items:

- One HFBR-1402 transmitter
- One HFBR-2402 five megabaud TTL receiver
- Two metres of SMA connected 1000  $\mu\text{m}$  plastic core fiber optic cable
- HFBR-0400 Series data sheets
- HP Application Bulletin 73

To order an SMA Evaluation Kit, please specify HFBR-0400, Quantity 1.

# High Speed Low Cost Fiber Optic Transmitter

## Technical Data

### Description

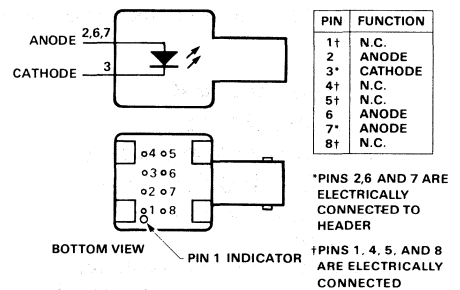

The HFBR-14XX fiber optic transmitter contains an 820 nm GaAlAs emitter capable of efficiently launching optical power into four different optical fiber sizes: 50/125  $\mu\text{m}$ , 62.5/125  $\mu\text{m}$ , 100/140  $\mu\text{m}$ , and 200  $\mu\text{m}$  PCS. This allows the designer flexibility in choosing the fiber size. The HFBR-14XX is designed to operate with the Hewlett-Packard HFBR-24XX fiber optic receivers.

The HFBR-14XX transmitter's high coupling efficiency allows the emitter to be driven at low current levels resulting in low power consumption and

increased reliability of the transmitter. The HFBR-14X4 high power transmitter is optimized for small size fiber and typically can launch -15.8 dBm optical power @ 60 mA into 50/125  $\mu\text{m}$  fiber and -12 dBm into 62.5/125  $\mu\text{m}$  fiber. The HFBR-14X2 standard transmitter typically can couple -11.5 dBm of optical power @ 60 mA into 100/140  $\mu\text{m}$  fiber cable. It is ideal for large size fiber such as 100/140  $\mu\text{m}$ . The high power level is useful for systems where star couplers, taps, or inline connectors create large fixed losses.

Forward Input Current	Peak	$I_{FPK}$	200	mA	Note 1
	DC	$I_{FDC}$	100	mA	
Reverse Input Voltage	$V_{BR}$		1.8	V	

Consistent coupling efficiency is assured by the double-lens optical system (Figure 1). Power coupled into any of the three fiber types varies less than 5 dB from part to part at a given drive current and temperature. The benefit of this is reduced dynamic range requirements on the receiver.

**CAUTION:** The small junction sizes inherent to the design of this component increases the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

**Electrical / Optical Specifications** –40°C to +85°C unless otherwise specified.

**WARNING:** Observing the transmitter output power under magnification may cause injury to the eye. When viewed with the unaided eye, the infrared output is radiologically safe. However, when viewed under magnification, precaution should be taken to avoid exceeding the limits recommended in ANSI Z136.1-1981.

## Dynamic Characteristics

Parameter	Symbol	Min.	Typ. <sup>[9]</sup>	Max.	Units	Conditions	Reference
Rise Time, Fall Time (10% to 90%)	$t_r, t_f$		4.0	6.5	nsec	$I_F = 60$ mA No Pre-bias	Note 7, Figure 13
Rise Time, Fall Time (10% to 90%)	$t_r, t_f$		3.0		nsec	$I_F = 10$ to 100 mA	Note 7, Figure 11
Pulse Width Distortion	PWD		0.5		nsec		Figure 11

### Notes:

- For  $I_{F_{PK}} > 100$  mA, the time duration should not exceed 2 ns.
- Typical data at  $T_A = 25^\circ\text{C}$ .
- Thermal resistance is measured with the transmitter coupled to a connector assembly and mounted on a printed circuit board.
- $D_p$  is measured at the plane of the fiber face and defines a diameter where the optical power density is within 10 dB of the maximum.
- $P_r$  is measured with a large area detector at the end of 1 metre of mode stripped cable, with an ST\* precision ceramic ferrule (MIL-STD-83522/13) for HFBR-1412/1414, and with an SMA 905 precision ceramic ferrule for HFBR-1402/1404. This approximates a standard test connector.
- When changing  $\mu\text{W}$  to dBm, the optical power is referenced to 1 mW (1000  $\mu\text{W}$ ). Optical Power P (dBm) =  $10 \log P (\mu\text{W}) / 1000 \mu\text{W}$ .
- Pre-bias is recommended if signal rate > 10 MBd, see recommended drive circuit in Figure 11.
- Pins 2, 6 and 7 are welded to the anode header connection to minimize the thermal resistance from junction to ambient. To further reduce the thermal resistance, the anode trace should be made as large as is consistent with good RF circuit design.
- Fiber NA is measured at the end of 2 metres of mode stripped fiber, using the far-field pattern. NA is defined as the sine of the half angle, determined at 5% of the peak intensity point. When using other manufacturer's fiber cable, results will vary due to differing NA values and specification methods.

## Recommended Drive Circuits

The circuit used to supply current to the LED transmitter can significantly influence the optical switching characteristics of the LED. The optical rise/fall times and propagations delays can be improved by using certain circuit techniques.

The LED drive circuit shown in Figure 11 uses current-peaking

to reduce the typical rise/fall times of the LED and a small pre-bias voltage to minimize propagation delay differences that cause pulse-width distortion. The circuit will typically produce rise/fall times of 3 ns, and a total jitter including pulse-width distortion of less than 2 ns. This circuit is recommended for applications requiring low edge jitter or high-speed data transmission at

signal rates of up to 125 MBd. Component values for this circuit can be calculated for different LED drive currents using the equations shown below.

For additional details about LED drive circuits, the reader is encouraged to read Hewlett-Packard Application Bulletin 78 and Application Note 1038.

$$R_y (\Omega) = \frac{(V_{CC} - V_F) + 3.97 (V_{CC} - V_F - 1.6 V)}{I_{F_{ON}} (A)}$$

$$R_y = \frac{(5 - 1.84) + 3.97 (5 - 1.79 - 1.6)}{0.100}$$

$$R_{x_1} (\Omega) = \frac{1}{2} \left( \frac{R_y}{3.97} \right)$$

$$R_y = \frac{3.16 + 6.39}{0.100} = 95.5 \Omega$$

$$R_{EQ_2} (\Omega) = R_{x_1} - 1$$

$$R_{x_1} = \frac{1}{2} \left( \frac{R_y}{3.97} \right) = 12.0 \Omega$$

$$R_{x_2} = R_{x_3} = R_{x_4} = 3 (R_{EQ_2})$$

$$R_{EQ_2} = 12.0 - 1 = 11.0 \Omega$$

$$C (pF) = \frac{2000 (ps)}{R_{x_1} (\Omega)}$$

$$R_{x_2} = R_{x_3} = R_{x_4} = 3 (11.0) = 33.0 \Omega$$

Example for  $I_{F_{ON}} = 100$  mA:  $V_F$  can be obtained from Figure 9 (= 1.84 V)

$$C = \frac{2,000 \text{ pS}}{12.0 \Omega} = 167 \text{ pF}$$

# 5 MBd Low Cost Fiber Optic Receiver

## Technical Data

### Description

The HFBR-24X2 fiber optic receiver is designed to operate with the Hewlett-Packard HFBR-14XX fiber optic transmitter and 50/125  $\mu\text{m}$ , 62.5/125  $\mu\text{m}$ , and 100/140  $\mu\text{m}$  fiber optic cable. Consistent coupling into the receiver is assured by the lensed optical system (Figure 1). Response does not vary with fiber size.

The HFBR-24X2 receiver incorporates an integrated photo IC containing a photodetector and dc amplifier driving an open-collector Schottky output transistor. The HFBR-24X2 is designed for direct interfacing to popular

logic families. The absence of an internal pull-up resistor allows the open-collector output to be used with logic families such as CMOS requiring voltage excursions much higher than  $V_{CC}$ .

Both the open-collector "Data" output Pin 6 and  $V_{CC}$  Pin 2 are referenced to "Com" Pin 3, 7. The "Data" output allows busing, strobing and wired "OR" circuit configurations. The transmitter is designed to operate from a single +5 V supply. It is essential that a bypass capacitor (0.1  $\mu\text{F}$  ceramic) be connected from Pin 2 ( $V_{CC}$ ) to Pin 3 (circuit common) of the receiver.

**CAUTION:** The small junction sizes inherent to the design of this component increases the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

- 8 mA load (5 x 1.6 mA),  $R_{\text{L}} = 560\ \Omega$ .
- Typical data at  $T_{\text{A}} = 25^{\circ}\text{C}$ ,  $V_{\text{CC}} = 5.0\text{ Vdc}$ .
- $D_{\text{a}}$  is the effective diameter of the detector image on the plane of the fiber face. The numerical value is the product of the actual detector diameter and the lens magnification.
- Measured at the end of 100/140  $\mu\text{m}$  fiber optic cable with large area detector.
- Propagation delay through the system is the result of several sequentially-occurring phenomena. Consequently it is a combination of data-rate-limiting effects and of transmission-time effects. Because of this, the data-rate limit of the system must be described in terms of time differentials between delays imposed on falling and rising edges. As the cable length is increased, the propagation delays increase at 5 ns per metre of length. Data rate, as limited by pulse width distortion, is not affected by increasing cable length if the optical power level at the receiver is maintained.

# 25 MHz Low Cost Fiber Optic Receiver

## Technical Data

### Description

The HFBR-24X4 fiber optic receiver is designed to operate with the Hewlett-Packard HFBR-14XX fiber optic transmitters and 50/125  $\mu\text{m}$ , 62.5/125  $\mu\text{m}$ , and 100/140  $\mu\text{m}$  fiber optic cable. Consistent coupling into the receiver is assured by the lensed optical system (Figure 1). Response does not vary with fiber size.

The receiver output is an analog signal that can be optimized for a variety of distance/data rate requirements. Low-cost external components can be used to convert the analog output to logic compatible signal levels for various data formats and data rates up to 35 MBaud. This distance/data rate tradeoff results in increased optical power budget at lower data rates which can be used for additional distance or splices.

The HFBR-24X4 receiver contains a PIN photodiode and

low noise transimpedance pre-amplifier integrated circuit with an inverting output (see note 3). The HFBR-24X4 receives an optical signal and converts it to an analog voltage. The output is a buffered emitter-follower. Because the signal amplitude from the HFBR-24X4 receiver is much larger than from a simple PIN photodiode, it is less susceptible to EMI, especially at high signal rates. A receiver dynamic range of 15 dB over temperature is achievable (assuming  $10^{-9}$  BER). For very noisy environments, the conductive port option is recommended.

The frequency response is typically dc to 25 MHz. Although the HFBR-24X4 is an analog receiver, it is easily made compatible with digital systems. Please refer to Application Bulletin 73 for simple and inexpensive circuits that operate up to 35 MBd.

FIBER OPTICS

# 125 MHz Low Cost Fiber Optic Receiver

## Technical Data

### Description

The HFBR-24X6 fiber optic receiver is designed to operate with the Hewlett-Packard HFBR-14XX fiber optic transmitters and 50/125  $\mu\text{m}$ , 62.5/125  $\mu\text{m}$ , and 100/140  $\mu\text{m}$  fiber optic cable. Consistent coupling into the receiver is assured by the lensed optical system (Figure 1). Response does not vary with fiber size for core diameters of 100  $\mu\text{m}$  or less.

The receiver output is an analog signal which allows follow-on circuitry to be optimized for a variety of distance/data rate requirements. Low-cost external components can be used to convert the analog output to logic compatible signal levels for various data formats and data rates up to 150 MBd. This distance/data rate tradeoff results in increased optical power budget at lower data rates which can be used for additional distance or splices.

The HFBR-24X6 receiver contains a PIN photodiode and low noise transimpedance pre-amplifier integrated circuit. The HFBR-24X6 receives an optical signal and converts it to an analog voltage. The output is a buffered emitter-follower. Because the signal amplitude from the HFBR-24X6 receiver is much larger than from a simple PIN photodiode, it is less susceptible to EMI, especially at high signal rates. For very noisy environments, the conductive port option is recommended. A receiver dynamic range of 23 dB over temperature is achievable (assuming  $10^{-9}$  BER). Because the maximum receiver input power is 6 dB larger and the noise is 2 dB lower over temperature than HP's HFBR-24X4 25 MHz receiver, the HFBR-24X6 is well suited for more demanding link designs that require wide receiver dynamic range.

Parameter	Symbol	Min.	Typ. <sup>[8]</sup>	Max.	Units	Conditions	Reference
Rise/Fall Time 10% to 90%	$t_r, t_f$		3.3	6.3	ns	$P_R = 100\ \mu\text{W}$	Figure 20
Pulse Width Distortion	PWD		0.4	2.5	ns	$P_R = 150\ \mu\text{W Peak}$	Note 8, Figure 19
Overshoot			2		%	$P_R = 5\ \mu\text{W Peak}$ , $t_{r\text{optimal}} = 1.5\text{ ns}$	Note 9
Bandwidth (Electrical)	$BW_e$		125		MHz	-3 dB Electrical	
Power Supply Rejection Ratio	PSRR		20		dB	@ 10 MHz	Note 10
Bandwidth - Rise Time Product			0.41		Hz · s		Note 11

**Notes:**

- 2.0 mm from where leads enter case.
- Typical specifications are for operation at  $T_A = 25^{\circ}\text{C}$  and  $V_{EE} = -5.2\text{ Vdc}$ .
- For 200  $\mu\text{m}$  PCS fibers, typical responsivity will be 6 mV/ $\mu\text{W}$ . Other parameters will change as well.
- Pin #2 should be ac coupled to a 511 ohm load. Load capacitance must be less than 5 pF.
- Measured with a 3 pole Bessel filter with a 75 MHz, -3 dB bandwidth. Recommended receiver filters for various bandwidths are provided in Application Bulletin 78.
- Overdrive is defined at PWD = 2.5 ns.
- $D_r$  is the effective diameter of the detector image on the plane of the fiber face. The numerical value is the product of the actual detector diameter and the lens magnification.
- Measured with a 10 ns pulse width, 50% duty cycle, at the 50% amplitude point of the waveform.
- Percent overshoot is defined as:  $\left( \frac{V_{PK} - V_{100\%}}{V_{100\%}} \right) \times 100\%$ .
- Output referred P.S.R.R. is defined as  $20 \log \left( \frac{V_{\text{POWER SUPPLY RIPPLE}}}{V_{\text{OUT RIPPLE}}} \right)$ .
- The conversion factor for the rise time to bandwidth is 0.41 since the HFBR-24X6 has a second order bandwidth limiting characteristic.

# Conductive Port Option for Low Cost Miniature Link Components

## Technical Data

### Features

- Withstands Electro-static Discharge (ESD) of 25kV to the Port
- Significantly Decreases Effect of Electro-magnetic Interference (EMI) on Receiver Sensitivity
- Available with Both SMA and Threaded ST Styled Port Receivers
- Allows the Designer to Separate the Signal and Conductive Port Grounds

### Description

The conductive port option for the Low Cost Miniature Link component family consists of a grounding path from the conductive port to four grounding pins as shown in the package outline drawing. Signal ground is separate from the four grounding pins to give the designer more flexibility. This option is available with all SMA and ST panel mount styled port receivers. Electrical/optical performance of the receivers is not affected by the conductive port. Refer to the HFBR-0400 data sheets for more information.

### Applications

HP recommends that the designer use separate ground paths for the signal ground and the conductive port ground in order to minimize the effects of coupled noise on the receiver circuitry. If the designer notices that extreme noise is present on the system chassis, care should be taken to electrically isolate the conductive port from the chassis.

In the case of ESD, the conductive port option does not alleviate the need for system recovery procedures. This option ensures

### OPTION C

FIBER OPTICS

that a 25kV ESD event entering through the connector port will not cause catastrophic failure, but does not guarantee error-free performance.

## Reliability Information

Low Cost Miniature Link components with the Conductive Port Option are as reliable as standard HFBR-0400 components. The following tests were performed to verify the mechanical reliability of this option.

## Ordering Information

To order the Conductive Port Option with a particular receiver component, place a "C" after the base part number. For example, to order an HFBR-2406 with this option, order an HFBR-2406C. As another example, to order an HFBR-2416T with this option, order an HFBR-2416TC.

This option is available with the following part numbers:

HFBR-2402	HFBR-2442T
HFBR-2404	HFBR-2444T
HFBR-2406	HFBR-2446T
HFBR-2412T	HFBR-2452
HFBR-2414T	HFBR-2454
HFBR-2416T	HFBR-2456
HFBR-2432	HFBR-2462T
HFBR-2434	HFBR-2464T
HFBR-2436	HFBR-2466T

## Mechanical and Environmental Tests<sup>[1]</sup>

Test	MIL-STD-883/ Other Reference	Test Conditions	Units Tested	Total Failed

Resistance to Solvents	2015	3 one min. immersion brush after solvent	13	0
Chemical Resistance	—	5 minutes in Acetone, Methanol, Boiling Water	12	0
Temperature-Humidity	—	T <sub>A</sub> = 85°C, RH = 85% Biased, 500 hours	30	0
Lead Integrity	2004 Condition B2	8 Oz. Wt. to each lead tested for three 90° arcs of the case	16	0

### Notes:

1. Tests were performed on both SMA and ST products with the conductive port option.
2. The Port Strength test was designed to address the concerns with hand tightening the SMA connector to the fiber optic port. The limit is set to a level beyond most reasonable hand fastening loading.

# Threaded ST Port Option for Low Cost Miniature Link Components

## Technical Data

### Features

- **Threading Allows ST Styled Port Components to be Panel Mounted**
- **Compatible with all Current Makes of ST Multimode Connectors**
- **Mechanical Dimensions are Compliant with MIL-STD-83522/13**

### Description

Low Cost Miniature Link components with the Threaded ST Port Option come with 0.2 inch (5.1mm) of 3/8-32 UNEF-2A threads on the port. This option is available with all HFBR-0400, ST styled port components. Components with this option retain the same superior electrical/optical and mechanical performance as that of the base HFBR-0400 components. Refer to the HFBR-0400 data sheets for more information on electrical/optical performance and the HFBR-0400 Reliability data sheet for more information on mechanical durability.

### Panel Mounting

Low Cost Miniature Link components with the Threaded ST Port Option are suitable for panel mounting to chassis walls. The maximum wall thickness possible when using nuts and washers from the HFBR-4411 kit is 0.11 inch (2.8mm).

### OPTION T

(Recommended for New Designs)

### Package Outline

Housed Product

# Package Outline

## Port Product

NOTE: ALL DIMENSIONS IN MILLIMETRES AND (INCHES)

The HFBR-4411 kit consists of 100 nuts and 100 washers with dimensions as shown in Figure 1. These kits are available from HP or any authorized distributor. Any standard size nut and washer will work, provided the total thickness of the wall, nut, and washer does not exceed 0.2 inch (5.1mm).

When preparing the chasis wall for panel mounting, use the mounting template in Figure 2. When tightening the nut, torque should not exceed 0.8 N-m (8.0 in-lb).

## Ordering Information

To order the Threaded ST Port Option with a particular component, place a "T" after the base part number. For example, to order an HFBR-2416 with this option, order an HFBR-2416T.

This option is available with the following part numbers:

HFBR-1412	HFBR-2416
HFBR-1414	HFBR-2442
HFBR-1442	HFBR-2444
HFBR-1444	HFBR-2446
HFBR-1462	HFBR-2462

# Glass Fiber-Optic Cable/ Connector Assemblies

## Technical Data

### Features

- Choice of ST or SMA Connectors
- Connectors Factory Installed and Tested
- Choice of 50/125  $\mu\text{m}$ , 62.5/125  $\mu\text{m}$  or 100/140  $\mu\text{m}$  Fiber
- Tight Jacket Construction
- UL Recognized, Meets OFNR Listing (UL 1666)
- Parameters Optimized for Data Communication Applications

### Description

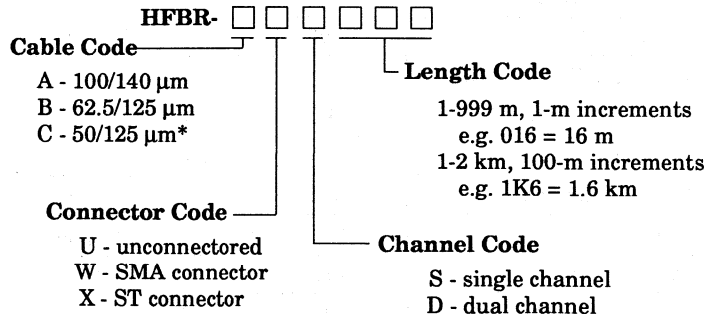

HP connected cable assemblies are available in various industry standard sizes and styles. The designer may choose among 50/125  $\mu\text{m}$ , 62.5/125  $\mu\text{m}$  and 100/140  $\mu\text{m}$  cable and ST and SMA connectors (50/125  $\mu\text{m}$  is available with only ST connectors in one- and ten-metre lengths). These cable assemblies have been specified for use with HP's 820 nm and 1300 nm fiber-optic transmitters and receivers and are ideal for various data communication applications.

Each cable assembly has been factory assembled and 100% tested according to industry-standard procedures. Therefore, designers can be assured that they are receiving the highest possible quality cable assemblies for their prototyping, testing or production needs.

FIBER OPTICS

### Ordering Information<sup>[1]</sup>

\* Available only in single channel one- and ten-metre lengths with ST connectors.

## Order Examples

HFBR-AWS050, quantity 1:  
one 50 m simplex, 100/140  $\mu\text{m}$   
cable assembly with SMA  
connectors

HFBR-BXD2K0, quantity 2:  
two 2 km duplex, 62.5/125  $\mu\text{m}$   
cable assemblies with ST  
connectors

### Notes:

1. HP is in the process of obsoleting the following part numbers and does not recommend their use for new designs: HFBR-AHDxxx and HFBR-AHSxxx cable assemblies, the HFBR-4000 connector, the HFBR-3099 mating adapter, and HFBR-0100/0101/0102 connecting kits. Please contact your local HP components representative for more information.
2. Short term is  $\leq 6$  hours.
3. Calculations are based on worst case parameters of HP 820 nm and 1300 nm optical components.
4. Recommended connecting kit: OFTI 400 Series Field Installation Kit.
5. Fixed losses (length independent) apply only to the use of mating adapters in link design calculations. Fixed losses at transmitter/receiver interfaces are included in HP transmitter/receiver optical specifications.
6. Dimensions in millimetres (inches).

- **STATIC PROTECTION**
- **EMC REGULATED SYSTEMS (FCC, VDE)**

## Description

The HFBR-0500 series is a complete family of fiber optic link components for configuring low-cost control, data transmission, and photo interrupter links. These components are designed to mate with plastic snap-in connectors and low-cost plastic cable.\* Link design is simplified by the logic compatible receivers and the ease of connecting the plastic fiber cable. The key parameters of links configured with the HFBR-0500 family are fully guaranteed.

\* Cable is available in standard low loss and selected super low loss varieties.

## Link Selection Guide

## 5 MBd Link

### HFBR-1510 AND HFBR-2501

The dc to 5 MBd link is guaranteed over temperature to operate up to 17 m with a transmitter drive current of 60 mA. This link uses the 665 nm HFBR-1510 Transmitter, the

HFBR-2501 Receiver, and Plastic Cable. The receiver compatible with LSTTL/TTL/CMOS logic levels offers a choice of internal pull-up or open collector output.

## RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Min.	Max.	Units	Ref.
Ambient Temperature	$T_A$	0	70	°C	
Transmitter Peak Forward Current	$I_{F PK}$	10	750	mA	Note 1
Avg. Forward Current	$I_{F AV}$		60	mA	
Receiver Supply Voltage	$V_{CC}$	4.75	5.25	V	Note 2
Fan-Out (TTL)	N		5		

**SYSTEM PERFORMANCE** Using Standard Cable under recommended operating conditions unless otherwise specified.

Parameter	Symbol	Min.	Typ. <sup>[5]</sup>	Max.	Units	Conditions	Ref.
Data Rate		dc		5	MBd	BER ≤ 10 <sup>-9</sup>	
Transmission Distance Standard Cable	ℓ	12	35		m	I <sub>FPK</sub> = 60 mA, 0-70°C	
		17				I <sub>FPK</sub> = 60 mA, 25°C	
Transmission Distance Improved Cable		17	40		m	I <sub>FPK</sub> = 60 mA, 0-70°C	
		24				I <sub>FPK</sub> = 60 mA, 25°C	
Propagation Delay	t <sub>PLH</sub>		80	140	ns	R <sub>L</sub> = 560 Ω, C <sub>L</sub> = 30 pF	Fig. 4, 5
						t <sub>PHL</sub>	
Pulse Width Distortion	t <sub>D</sub>		30		ns	P <sub>R</sub> = -15 dBm R <sub>L</sub> = 560 Ω, C <sub>L</sub> = 30 pF	Fig. 4, 6 Note 4
EMI Immunity			8000		V/m	BER ≤ 10 <sup>-9</sup>	

- Notes:**
1. For I<sub>FPK</sub> > 80 mA, the duty factor must be such as to keep I<sub>FAV</sub> ≤ 80 mA. In addition, for I<sub>FPK</sub> > 80 mA, the following rules for pulse width apply: I<sub>FPK</sub> ≤ 160 mA: Pulse width ≤ 1 ms I<sub>FPK</sub> > 160 mA: Pulse width ≤ 1 μs
  2. It is essential that a bypass capacitor (0.01 μF to 0.1 μF ceramic) be connected from pin 3 to pin 4 of the receiver. Total lead length between both ends of the capacitor and the pins should not exceed 20 mm.
  3. The propagation delay of 1 m of cable (5 ns) is included.
  4. T<sub>D</sub> = t<sub>PLH</sub> - t<sub>PHL</sub>.
  5. Typical data is at 25°C, V<sub>CC</sub> = 5 V.

## Link Design Considerations

The HFBR-1510/2501 Transmitter/Receiver pair is guaranteed for operation at data rates up to 5 MBd over link distances from 0 to 12 metres with standard cable and from 0 to 17 metres with improved cable. The value of transmitter drive current, I<sub>F</sub>, depends on the link distance as shown in Figures 2 and 3. Note that there is an upper as well as a lower limit on the value of I<sub>F</sub> for any given

distance. The dotted lines in Figures 2 and 3 represent pulsed operation. When operating in the pulsed mode, the conditions in Note 1 must be met. After selecting a value of the transmitter drive current I<sub>F</sub>, the value of R<sub>1</sub> in Figure 1 can be calculated as follows:

$$R_1 = \frac{V_{CC} - V_F}{I_F}$$

# 1 MBd Link HFBR-1502 AND HFBR-2502

The dc to 1 MBd link is guaranteed over temperature to operate from 0 to 34 m with a transmitter drive current of 60 mA. This link uses the 665 nm HFBR-1502 Transmitter,

the HFBR-2502 Receiver, and Improved Cable. The receiver is compatible with LSTTL/TTL/CMOS logic levels and offers a choice of an internal pull-up or open collector output.

## RECOMMENDED OPERATING CONDITIONS

Propagation Delay	$t_{PLH}$		180	250	ns	$R_L = 560 \Omega, C_L = 30 \text{ pF}$	Fig. 4, 5
				100	140	ns	$P_R = -24 \text{ dBm}$
Pulse Width Distortion	$t_D$		80		ns	$P_R = -24 \text{ dBm}$	Fig. 4, 6
						$R_L = 560 \Omega, C_L = 30 \text{ pF}$	
EMI Immunity			8000		V/m	$BER \leq 10^{-9}$	

- Notes:** 1. For  $I_{F PK} > 80 \text{ mA}$ , the duty factor must be such as to keep  $I_{F AV} \leq 80 \text{ mA}$ . In addition, for  $I_{F PK} > 80 \text{ mA}$ , the following rules for pulse width apply:  $I_{F PK} \leq 160 \text{ mA}$ : Pulse width  $\leq 1 \text{ ms}$   $I_{F PK} > 160 \text{ mA}$ : Pulse width  $\leq 1 \mu\text{s}$   
 2. It is essential that a bypass capacitor (0.01  $\mu\text{F}$  to 0.1  $\mu\text{F}$  ceramic) be connected from pin 3 to pin 4 of the receiver. Total lead length between both ends of the capacitor and the pins should not exceed 20 mm.  
 3. The propagation delay of 1 m of cable (5 ns) is included. 4.  $T_D = t_{PLH} - t_{PHL}$ . 5. Typical data is at 25°C,  $V_{CC} = 5 \text{ V}$ .

## Link Design Considerations

The HFBR-1502/2502 Transmitter/Receiver pair is guaranteed for operation at data rates up to 1 MBd over link distances from 0 to 24 metres with standard cable and from 0 to 34 metres with improved cable. The value of transmitter drive current,  $I_F$ , depends on the link distance as shown in Figures 2 and 3. Note that there is a lower limit on the value of  $I_F$  for any given distance. The dotted lines in Figures 2 and 3 represent pulsed operation. When

operating in the pulsed mode, the conditions in Note 1 must be met. After selecting a value of the transmitter drive current  $I_F$ , the value of  $R_1$  in Figure 1 can be calculated as follows:

$$R_1 = \frac{V_{CC} - V_F - V_{OL} (75451)}{I_F}$$

For the HFBR-1502/2502 pair, the value of the capacitor,  $C_1$  (Figure 1) must be chosen such that  $R_1 C_1 \geq 75 \text{ ns}$ .

Figure 6. HFBR-1502/2502 Link Propagation Delay vs. Optical Power

# Low Current/Extended Distance Link

## HFBR-1512 AND HFBR-2503

The low current link requires only 6 mA peak supply current for the transmitter and receiver combined to achieve an 11 m link. Extended distances up to 82 m can be achieved at a maximum transmitter drive current of 60 mA peak. This link can be driven with TTL/LSTTL and most CMOS logic gates.

The black plastic housing of the HFBR-1512 Transmitter is designed to prevent the penetration of ambient light into the cable through the transmitter. This prevents the sensitive receiver from being triggered by ambient light pulses.

### RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Min.	Max.	Units	Ref.
Ambient Temperature	T <sub>A</sub>	0	70	°C	
Transmitter					
Peak Forward Current	I <sub>F PK</sub>	2	120	mA	Note 1
Avg. Forward Current	I <sub>F AV</sub>		60	mA	
Receiver					
Supply Voltage	V <sub>CC</sub>	4.5	5.5	V	Note 2
Output Voltage	V <sub>O</sub>		V <sub>CC</sub>	V	
Fan-Out (TTL)	N		1		

### SYSTEM PERFORMANCE

Using Standard Cable under recommended operating conditions unless otherwise specified.

Parameter	Symbol	Min.	Typ. <sup>[5]</sup>	Max.	Units	Conditions	Ref.
Data Rate		dc		40	kBd	t <sub>D</sub> ≤ 7.0 μs	
Transmission Distance Standard Cable	ℓ	8	30		m	I <sub>F PK</sub> = 2 mA, 0–70°C	
		60	100		m	I <sub>F PK</sub> = 60 mA, 0–70°C	
Transmission Distance Improved Cable	ℓ	11	35		m	I <sub>F PK</sub> = 2 mA, 0–70°C	
		82	125		m	I <sub>F PK</sub> = 60 mA, 0–70°C	
Propagation Delay	t <sub>PLH</sub>		4		μs	R <sub>L</sub> = 3.3K Ω, C <sub>L</sub> = 30 pF	Fig. 4, 5
	t <sub>PHL</sub>		2.5		μs	P <sub>R</sub> = -25 dBm	Note 3
Pulse Width Distortion	t <sub>D</sub>			7.0	μs	-39 ≤ P <sub>R</sub> ≤ -14 dBm R <sub>L</sub> = 3.3 KΩ, C <sub>L</sub> = 30 pF	Fig. 4, 6 Note 4
Bit Error Rate	BER		10 <sup>-9</sup>			P <sub>R</sub> = -30 dBm	
EMI Immunity			5000		V/m	P <sub>R</sub> = 0 mW	

#### Notes:

- For I<sub>F PK</sub> > 80 mA, the duty factor must be such as to keep I<sub>F AV</sub> ≤ 80 mA. In addition, if I<sub>F AV</sub> > 80 mA, then the pulse width must be equal to or less than 1 ms.
- It is recommended that a bypass capacitor (0.01 μF to 0.1 μF ceramic) be connected from pin 3 to pin 4 of the receiver.
- The propagation delay of 1 m of cable (5 ns) is included.
- t<sub>D</sub> = t<sub>PLH</sub> - t<sub>PHL</sub>.
- Typical data is at 25°C, V<sub>CC</sub> = 5 V.

## Link Design Considerations

The HFBR-1512/2503 Transmitter/Receiver pair is guaranteed for operation at data rates up to 40 kBd for transmitter drives as low as 2 mA. The value of transmitter drive current, I<sub>F</sub>, depends on the link distance as shown in Figures 2 and 3. Note that there is an upper as well as a lower limit on

the value of I<sub>F</sub> for any given distance. After selecting a value of the transmitter drive current I<sub>F</sub>, the value of R<sub>1</sub> in Figure 1 can be calculated as follows:

$$R_1 = \frac{V_{CC} - V_F}{I_F}$$

Figure 1. Typical Circuit Operation (40 kBd)

Figure 6. HFBR-1512/2503 Link Propagation Delay vs. Optical Power

# Photo Interrupter Links

**HFBR-1502/2502**

**HFBR-1512/2503**

These links may be used in optical switches, shaft position sensors, and velocity sensors. They are particularly useful where high voltage, electrical noise, or explosive environments prohibit the use of electromechanical or optoelectronic sensors.

The HFBR-1512/2503 link (20 kHz) has an optical power budget of 24 dB, and the HFBR-1502/2502 link (500 kHz) budget is 10 dB. Total system losses (cable attenuation, air-gap loss, etc) must not exceed the link optical power budget.

## RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Min.	Max.	Units	Ref.
Ambient Temperature	T <sub>A</sub>	0	70	°C	
Transmitter					
Peak Forward Current	I <sub>FPK</sub>	10	750	mA	Note 1
Avg. Forward Current	I <sub>FAV</sub>		60	mA	
Receiver					
Supply Voltage	V <sub>CC</sub>	4.50	5.50	V	Note 2
		4.75	5.25		
Output Voltage	V <sub>O</sub>		V <sub>CC</sub>	V	
			18		
Fanout (TTL)			1		
			5		

## SYSTEM PERFORMANCE

See HFBR-1502/2502 link data sheet (page 5) and HFBR-1512/2503 link data sheet (page 7) for more design information. These specifications apply when using Standard Cable and, unless otherwise specified, under recommended operating conditions.

Parameter	Symbol	Min.	Typ. <sup>[5]</sup>	Max.	Units	Conditions	Ref.
<b>HFBR-1512/HFBR-2503</b>							
Max. Count Frequency		dc		20	kHz		
Optical Power Budget		25.4			dB	I <sub>FPK</sub> = 60 mA, 0–70°C	Note 3, 4
		27.8	34		dB	I <sub>FPK</sub> = 60 mA, 25°C	
<b>HFBR-1502, HFBR-2502</b>							
Max. Count Frequency		dc		500	kHz		
Optical Power Budget		10.4			dB	I <sub>FPK</sub> = 60 mA, 0–70°C	Note 3
		12.8	15.6		dB	I <sub>FPK</sub> = 60 mA, 25°C	

### Notes:

- For I<sub>FPK</sub> > 80 mA, the duty factor must be such as to keep I<sub>FAV</sub> ≤ 80 mA. In addition, for I<sub>FPK</sub> > 80 mA, the following rules for pulse width apply:  
 I<sub>FPK</sub> ≤ 160 mA: Pulse width ≤ 1 ms  
 I<sub>FPK</sub> > 160 mA: Pulse width ≤ 1 μs
- A bypass capacitor (0.01 μF to 0.1 μF ceramic) connected from pin 3 to pin 4 of the receiver is recommended for the HFBR-2503 and essential for the HFBR-2502. For the HFBR-2502, the total lead length between both ends of the capacitor and the pins should not exceed 20 mm.
- Optical Power Budget = P<sub>T</sub> Min. – P<sub>R(L)</sub> Min. Refer to HFBR-1502/1512 data sheet, page 11; HFBR-2502 data sheet, page 12; and HFBR-2503 data sheet, page 14 for additional design information.
- In addition to a minimum power budget, care should be taken to avoid overdriving the HFBR-2503 receiver with too much optical power. For this reason power levels into the receiver should be kept less than –13.7 dBm to eliminate any overdrive with the recommended operating conditions.
- Typical data is at 25°C, V<sub>CC</sub> = 5 V.

# Link Design Considerations

The HFBR-1512/2503 and HFBR-1502/2502 Transmitter/Receiver pairs are intended for applications where the photo interrupter must be physically separate from the optoelectronic emitter and detector. This separation would be useful where high voltage, electrical noise or explosive environments prohibit the use of electronic devices. To ensure reliable long term operation, links designed for this application should operate with an ample optical power margin  $\alpha_M \geq 3$  dB, since the exposed fiber ends are subject to environmental contamination that will increase the optical attenuation of the slot with time. A graph of air gap separation versus attenuation for clean fiber ends with minimum radial error  $\leq 0.005$  inches (0.127 mm) and angular error  $\leq 3.0^\circ$  is provided in Figure 2. The following equations can

now be used to determine the transmitter output power,  $P_T$ , for both the overdrive and minimum drive cases. Overdrive is defined as a condition where excessive optical power is delivered to the receiver. The first equation enables the maximum  $P_T$  that will not result in receiver overdrive to be calculated for a predetermined link length and slot attenuation. The second equation defines the minimum  $P_T$  allowed for link operation.

$$P_T(\text{MAX}) - P_R(\text{MAX}) \leq \alpha_O \text{ MIN} \ell + \alpha_{\text{SLOT}} \quad \text{Eq. 1}$$

$$P_T(\text{MIN}) - P_{RL}(\text{MIN}) \geq \alpha_O \text{ MAX} \ell + \alpha_{\text{SLOT}} + \alpha_M \quad \text{Eq. 2}$$

Once  $P_T(\text{MIN})$  has been determined in the second equation for a specific link length ( $\ell$ ), slot attenuation ( $\alpha_{\text{SLOT}}$ ) and margin ( $\alpha_M$ ), Figure 3 can then be used to find  $I_F$ .

# 665 nm Transmitters

## HFBR-1502/HFBR-1510 and HFBR-1512

The HFBR-1510/1502/1512 Transmitter modules incorporate a 665 nm LED emitting at a low attenuation wavelength for the HFBR-3510/3610 plastic fiber optic cable. The transmitters can be easily interfaced to standard TTL logic. The optical power output of the HFBR-1510/1512/1502 is specified at the end of 0.5 m of cable. The HFBR-1512 output optical power is tested and guaranteed at low drive currents.

HFBR-1510/1512/1502 Transmitter

## Receivers

### HFBR-2501 (5 MBd) and HFBR-2502 (1 MBd)

The HFBR-2501/2502 Receiver modules feature a shielded integrated photodetector and wide bandwidth DC amplifier for high EMI immunity. A Schottky clamped open-collector output transistor allows interfacing to common logic families and enables "wired-OR" circuit designs. The open collector output is specified up to 18V. An integrated 1000 ohm resistor internally connected to VCC may be externally jumpered to provide a pull-up for ease-of-use with +5V logic. The combination of high optical power levels and fast transitions falling edge could result in distortion of the output signal (HFBR-2502 only), that could lead to multiple triggering of following circuitry.

HFBR-2501/2502 Receiver

- Measured at the end of standard Fiber Optic Cable with large area detector.
- $R_L$  is open.
- Typical data is at  $25^{\circ}\text{C}$ ,  $V_{CC} = 5\text{ V}$ .
- It is essential that a bypass capacitor  $0.01\ \mu\text{F}$  to  $0.1\ \mu\text{F}$  be connected from pin 3 to pin 4 of the receiver. Total lead length between both ends of the capacitor and the pins should not exceed 20 mm.

# High Sensitivity Receiver

## HFBR-2503

The blue plastic HFBR-2503 Receiver module has a sensitivity of  $-39$  dBm. It features an integrated photodetector and DC amplifier for high EMI immunity. The output is an open collector with a  $150 \mu\text{A}$  internal current source pull-up and is compatible with TTL/LSTTL and most CMOS logic families. For minimum rise time add an external pull-up resistor of at least  $3.3\text{K}$  ohms.  $V_{CC}$  must be greater than or equal to the supply voltage for the pull-up resistor.

HFBR-2503 Receiver

Low Level Supply Current	$I_{CCL}$		$2.9$	$3.7$	mA	$V_{CC} = 5.5\text{V}$ , $P_R \geq P_{RL \text{ (MIN)}}$	Note 6
Effective Diameter	$D_R$		$1$		mm		
Numerical Aperture	$N.A.R$		$0.5$				

### Notes:

- 1.6 mm below seating plane.
- Optical flux,  $P$  (dBm) =  $10 \text{ Log } P (\mu\text{W})/1000 \mu\text{W}$ .
- Measured at the end of the standard Fiber Optic Cable with large area detector.
- Because of the very high sensitivity of the HFBR-2503, the digital output may switch in response to ambient light levels when a cable is not occupying the receiver optical port. The designer should take care to filter out signals from this source if they pose a hazard to the system.
- Typical data is at  $25^{\circ}\text{C}$ ,  $V_{CC} = 5 \text{ V}$ .
- Including current in  $3.3\text{K}$  pull-up resistor.
- It is recommended that a bypass capacitor  $0.01 \mu\text{F}$  to  $0.1 \mu\text{F}$  ceramic be connected from pin 3 to pin 4 of the receiver.

# Snap-in Fiber Optic Connector, Bulkhead Feedthrough/Splice and Polishing Tools

HFBR-4501 (GRAY)/4511 (BLUE) CONNECTOR

## HFBR-4501/4511 CONNECTORS HFBR-4505/4515 BULKHEAD FEEDTHROUGHS

The HFBR-4501 and HFBR-4511 snap-in connectors terminate low cost plastic fiber cable and mate with the Hewlett-Packard HFBR-0500 family of fiber optic transmitters and receivers. They are quick and easy to install. The metal crimp ring provides strong and stable cable retention and the polishing technique ensures a smooth optical finish which results in consistently high optical coupling efficiency.

The HFBR-4505 and HFBR-4515 bulkhead feedthroughs mate two snap-in connectors and can be used either as an in-line splice or as a panel feedthrough for plastic fiber cable. The connector to connector loss is low and repeatable.

**Notes:**

- Factory polish or field polish per recommended procedure.
- Module to connector insertion loss is factored into the transmitter output optical power and the receiver input optical power level specifications.

**Note:**

For applications where frequent temperature cycling over extremes is expected please contact Hewlett-Packard for alternate connecting techniques.

## Cable Terminations

The following easy procedure describes how to make cable terminations. It is ideal for both field and factory installation. If a high volume connecting technique is required please contact your Hewlett-Packard sales engineer for the recommended procedure and equipment.

Connecting the cable is accomplished with the Hewlett-Packard HFBR-4595 Polishing Kit consisting of a Polishing Fixture and 600 grit abrasive paper and 3 micron pink lapping film (3M Company, OC3-14). No adhesive material is needed to secure the cable in the connector, and the connector can be used immediately after polishing.

Connectors may be easily installed on the cable ends with readily available tools. Materials needed for the terminating procedure are:

- 1) Plastic Fiber Optic Cable
- 2) HFBR-4595 Polishing Kit
- 3) HFBR-4501 Gray Connector and Crimp Ring
- 4) HFBR-4511 Blue Connector and Crimp Ring
- 5) Industrial razor blade or wire cutters
- 6) 16 gauge latching wire strippers
- 7) Crimp Tool, AMP 90364-2

**Step 1**

The zip cord structure of the duplex cable permits easy separation of the channels. The channels should be separated approximately 50 mm (2.0 in.) back from the ends to permit connecting and polishing.

After cutting the cable to the desired length, strip off approximately 7 mm (0.3 in) of the outer jacket with the 16 gauge wire strippers. Excess webbing on duplex cable may have to be trimmed to allow the connector to slide over the cable.

**Step 2**

Place the crimp ring and connector over the end of the cable; the fiber should protrude about 3 mm (0.12 in.) through the end of the connector. Carefully position the ring so that it is entirely on the connector and then crimp the ring in place with the crimping tool.

**Note:** Place the gray connector on the cable end to be connected to the transmitter and the blue connector on the cable end to be connected to the receiver to maintain the color coding (both connectors are the same mechanically).

**Step 3**

Any excess fiber protruding from the connector end may be cut off; however, the trimmed fiber should extend at least 1.5 mm (0.06 in.) from the connector end.

Insert the connector fully into the polishing fixture with the connector end protruding from the bottom of the fixture.

For high volume connecting use the hardened steel HFBR-4596 polishing fixture.

**Note:** The four dots on the bottom of the polishing fixture are wear indicators. Replace the polishing fixture when any dot is no longer visible.

Place the 600 grit abrasive paper on a flat smooth surface. Pressing down on the connector, polish the fiber and the connector until the connector is flush with the end of the polishing fixture. Wipe the connector and fixture with a clean cloth or tissue.

FIBER OPTICS

#### Step 4

Place the flush connector and polishing fixture on the dull side of the 3 micron pink lapping film and continue to polish the fiber and connector for approximately 25 strokes. The fiber end should be flat, smooth and clean.

The cable can now be used.

**Note:** Use of the pink lapping film fine polishing step results in approximately a 2 dB improvement in coupling performance of either a transmitter-receiver link or a bulkhead/splice over 600 grit polish alone. This polish is comparable to Hewlett-Packard's factory polish. The fine polishing step may be omitted where an extra 2 dB of optical power is not essential as with short link lengths.

# MINIATURE FIBER OPTIC LOGIC LINK

HFBR-1202  
HFBR-2202  
HFBR-4202

## Features

- DC TO 5 MBAUD DATA RATE
- MAXIMUM LINK LENGTH  
625 Metres (Guaranteed)  
1600 Metres (Typical)
- TTL/CMOS COMPATIBLE OUTPUT
- MINIATURE, RUGGED METAL PACKAGE
- SINGLE +5V RECEIVER POWER SUPPLY
- INTERNALLY SHIELDED RECEIVER FOR  
EMI/RFI IMMUNITY
- PCB AND PANEL MOUNTABLE
- LOW POWER CONSUMPTION

## Applications

- EMC REGULATED SYSTEMS (FCC, VDE)
- EXPLOSION PROOF SYSTEMS IN OIL  
INDUSTRY/CHEMICAL PROCESS  
CONTROL INDUSTRY
- SECURE DATA COMMUNICATIONS
- WEIGHT SENSITIVE SYSTEMS  
(e.g. Avionics, Mobile Stations)
- HIGH VOLTAGE ISOLATION IN POWER  
GENERATION

## Description

The HFBR-1202 Transmitter and HFBR-2202 Receiver are SMA style connector compatible fiber optic link components. Distances to 1600 metres at data rates up to 5 MBaud are achievable with these components.

The HFBR-1202 Transmitter contains a high efficiency GaAIAs emitter operating at 820 nm. Consistent coupling

efficiency is assured by factory alignment of the LED with the optical axis of the package. Power coupled into the fiber varies less than 4dB from part to part at a given temperature and drive current. The benefit of this is reduced dynamic range requirements on the receiver.

The HFBR-2202 Receiver incorporates a photo IC containing a photodetector and dc amplifier. An open collector Schottky transistor on the IC provides logic compatibility. The combination of an internal EMI shield, the metal package and an isolated case ground provides excellent immunity to EMI/RFI. For unusually severe EMI/ESD environments, a snap-on metal shield is available. The receiver is easily identified by the black epoxy backfill.

The HFBR-1202 Transmitter and HFBR-2202 Receiver are compatible with SMA style connectors, types A and B (see Figure 11).

# System Design Considerations

The Miniature Fiber Optic Logic Link is guaranteed to work over the entire range of 0 to 625 metres at a data rate of dc -5 MBd, with arbitrary data format and typically less than 25% pulse width distortion, if the Transmitter is driven with  $I_F = 40$  mA,  $R_1 = 82\Omega$ . If it is desired to economize on power or achieve lower pulse distortion, then a lower drive current ( $I_F$ ) may be used. The following example will illustrate the technique for optimizing  $I_F$ .

EXAMPLE: Maximum distance required = 250 metres. From Figure 2 the worst case drive current = 20 mA. From the Transmitter data —  $V_F = 1.8V$  (max.).

$$R_1 = \frac{V_{CC} - V_F}{I_F} = \frac{5 - 1.8V}{20 \text{ mA}} = 160\Omega$$

The optical power margin between the typical and worst case curves (Figure 2) at 250 metres is 4 dB. To calculate the worst case pulse width distortion at 250 metres, see Figure 8. The power into the Receiver is  $P_{RL} + 4 \text{ dB} = -20 \text{ dBm}$ . Therefore, the typical distortion is 40 ns or 20% at 5 MBd.

## CABLE SELECTION

The link performance specifications on the following page are based on using cables that contain glass-clad silica fibers with a  $100\mu\text{m}$  core diameter and  $140\mu\text{m}$  cladding diameter. This fiber type is now a user accepted standard for local data communications links (RS-458, Class I, Type B). The HFBR-1202 Transmitter and HFBR-2202 Receiver are optimized for use with the  $100/140\mu\text{m}$  fiber. There is, however, no fundamental restriction against using other fiber types. Before selecting an alternate fiber type, several parameters need to be carefully evaluated.

will significantly affect the optical power coupled into the fiber are as follows:

- Fiber Core Diameter.** As the core diameter is increased, the optical power coupled increases, leveling off at about  $250\mu\text{m}$  diameter.
- Numerical Aperture (NA).** As the NA is increased, the optical power coupled increases, leveling off at an NA of about 0.34.
- Index Profile ( $\alpha$ ).** The Index profile parameter of fibers varies from 2 (fully graded index) to infinite (step index). Some gains in coupled optical power can be achieved at the expense of bandwidth, when  $\alpha$  is increased.

In addition to the optical parameters, the environmental performance of the selected fiber/cable must be evaluated. Finally, the ease of installing connectors on the selected fiber/cable must be considered. Given the large number of parameters that must be evaluated when using a non-standard fiber, it is recommended that the  $100/140\mu\text{m}$  fiber be used unless unusual circumstances warrant the use of an alternate fiber/cable type.

## SMA STYLE CONNECTORS

The HFBR-1202/2202 is compatible with either the Type A or Type B SMA style fiber optic connector (see Figure 11). The basic difference between the two connectors is the plastic half-sleeve on the stepped ferrule tip of the Type B connector. This step provides the capability to use a full length plastic sleeve to ensure good alignment of two connectors for an inline splice. Hewlett-Packard offers connectorized cable that utilizes the Type A connector system because of the inherent environmental advantages of metal-to-metal interfaces.

# Typical Circuit Configuration

NOTE:  
IT IS ESSENTIAL THAT A BYPASS CAPACITOR ( $0.01\mu\text{F}$  to  $0.1\mu\text{F}$  CERAMIC) BE CONNECTED FROM PIN 2 TO PIN 4 OF THE RECEIVER. TOTAL LEAD LENGTH BETWEEN BOTH ENDS OF THE CAPACITOR AND THE PINS SHOULD NOT EXCEED 20 mm.

4. Measured at the end of 1.0 metre HP's 100/140 μm Fiber Optic Cable with large area detector and cladding modes stripped, terminated with the appropriate type of connector. This assembly approximates a Standard Test Fiber. The fiber NA is 0.28, measured at the end of greater than 300 metres length of fiber, the NA being defined as the sine of the half angle determined by the 10% intensity points.
5. Measured at the end of HP's 100/140 μm Fiber Optic Cable with large area detector.
6. When changing microwatts to dBm, the optical flux is referenced to one milliwatt (1000 μW).  

$$\text{Optical Flux, P (dBm)} = 10 \log \frac{P (\mu\text{W})}{1000 \mu\text{W}}$$
7. I<sub>F, PK</sub> should not be less than 10 mA in the "ON" state. This is to avoid the long turn-on time that occurs at low input current. I<sub>F, AV</sub> may be arbitrarily low, as there is no duty factor restriction.

**WARNING:** OBSERVING THE TRANSMITTER OUTPUT POWER UNDER MAGNIFICATION MAY CAUSE INJURY TO THE EYE. When viewed with the unaided eye, the infrared output is radiologically safe; however, when

viewed under magnification, precaution should be taken to avoid exceeding the limits recommended in ANSI Z136.1-1981.

Propagation Delay HIGH to LOW	t <sub>PHLR</sub>		49		nsec		

**Notes:**

- Propagation delay through the system is the result of several sequentially-occurring phenomena. Consequently it is a combination of data-rate-limiting effects and of transmission-time effects. Because of this, the data-rate limit of the system must be described in terms of time differentials between delays imposed on falling and rising edges. As the cable length is increased, the propagation delays increase at 5 ns per metre of length increase. Data rate, as limited by pulse width distortion, is not affected by increasing cable length if the optical power level at the Receiver is maintained.
- Worst case system performance is based on worst case performance of individual components: transmitter at +85° C, receiver at -40° C and cable at -20° C.
- Synchronous data rate limit is based on these assumptions: (a) 50% duty factor modulation, e.g. Manchester I or BiPhase I (Manchester II); (b) continuous data; (c) PLL (Phase Lock Loop) demodulation; (d) TTL threshold. Asynchronous data rate limit is based on these assumptions: (a) NRZ data; (b) arbitrary timing — no duty factor restriction; (c) TTL threshold. The EYE pattern describes the timing range within which there is no uncertainty of the logic state, relative to a specific threshold, due to either noise or intersymbol (prop. delay) effects.

- D<sub>T</sub> is measured at the plane of the fiber face and defines a diameter where the optical power density is within 10 dB of its maximum.
- D<sub>R</sub> is the effective diameter of the detector image on the plane of the fiber face. The numerical value is the product of the actual detector diameter and the lens magnification.
- HP's 100/140 μm Fiber Cable is specified at a narrower temperature range, -20° C to 85° C.
- Measured at the end of 1.0 metre 50/125 μm fiber with large area detector and cladding modes stripped, approximating a Standard Test Fiber. The fiber NA is 0.21, measured at the end of a 2.0 metre length, the NA being defined as the sine of the half angle determined by the 5% of peak intensity points.
- Output Optical Power into connected fiber cable other than HP's Fiber Optic Cable/Connector Assemblies may be different than specified because of mechanical tolerances of the connector, quality of the fiber surface, and other variables.
- Measured at the end of 1.0 metre Siccor 100/140 μm fiber cable or equivalent, with large area detector and cladding modes stripped, terminated with the appropriate type of connector. This assembly approximates a Standard Test Fiber. The fiber NA is 0.275, measured at the end of a 2.0 metre length, the NA being defined as the sine of the half angle determined by the 5% of peak intensity points.

# Typical Circuit Configuration

**HFBR-1201 TRANSMITTER**

**HFBR-2201 RECEIVER**

Good system performance requires clean port optics and cable ferrules to avoid obstructing the optical path. Clean compressed air often is sufficient to remove particles of dirt; methanol or Freon™ on a cotton swab also works well.

It is essential that a bypass capacitor (0.01 μF to 0.1 μF ceramic) be connected from pin 2 to pin 4 of the receiver. Total lead length between both ends of the capacitor and the pins should not exceed 20 mm.

## Horizontal PCB Mounting

Mounting at the edge of a printed circuit board with the lock nut overhanging the edge is recommended.

When bending the leads, avoid sharp bends right where the lead enters the backfill. Use needle nose pliers to support

the leads at the base of the package and bend the leads as desired.

When soldering, it is advisable to leave the protective cap on the unit to keep the optics clean.

# HIGH EFFICIENCY FIBER OPTIC TRANSMITTER

HFBR-1204

## Features

- **OPTICAL POWER COUPLED INTO 100/140  $\mu\text{m}$  FIBER CABLE**  
—9.8 dBm Guaranteed at 25° C  
—7.4 dBm Typical
- **FACTORY ALIGNED OPTICS**
- **RUGGED MINIATURE PACKAGE**
- **COMPATIBLE WITH SMA CONNECTORS**

## Description

The HFBR-1204 Fiber Optic Transmitter contains an etched-well 820 nm GaAlAs emitter capable of coupling greater than -10 dBm of optical power into HP's 100/140  $\mu\text{m}$  SMA connected cable assemblies. This high power level is useful for fiber lengths greater than 1 km, or systems where star couplers, taps, or in-line connectors create large fixed losses.

Consistent coupling efficiency is assured by factory alignment of the LED with the mechanical axis of the package connector port. Power coupled into the fiber varies less than 5 dB from part to part at a given drive current and temperature. The benefit of this is reduced dynamic range requirements on the receiver.

High coupling efficiency allows the emitters to be driven at low current levels resulting in low power consumption and increased reliability of the transmitter. Another advantage of the high coupling efficiency is that a significant amount of power can still be launched into smaller fiber such as 50/125  $\mu\text{m}$  (-19.1 dBm typ.).

The HFBR-1204 transmitter is housed in a rugged miniature package. The lens is suspended to avoid mechanical contact with the active devices. This assures improved reliability by eliminating mechanical stress on the die due to the lens. For increased ESD protection and design flexibility, both the anode and cathode are insulated from the case.

HFBR-1204 is compatible with SMA style connectors. The low profile package is designed for direct mounting on printed circuit boards or through panels without additional heat sinking. A complete mounting hardware package (HFBR-4202) is available for horizontal mounting on PCBs, including a snap-on metal shield for harsh EMI/ESD environments.

# High Speed Operation

Rise and fall times can be improved by using a pre-bias current and "speed-up" capacitor. A 1 mA pre-bias current will significantly reduce the junction capacitance and will couple less than -34 dBm of optical power into the fiber cable. The TTL compatible circuit in Figure 7 using a speed-up capacitor will provide typical rise and fall times of 10 ns.

$$I_{PEAK} = 100 \text{ mA} = \frac{V_{CC} - V_F}{34.9 \Omega}$$

$$I_{AVG} = 78 \text{ mA} = \frac{V_{CC} - V_F}{34.9 + 10 \Omega}$$

Figure 6. Test Circuit for Measuring  $t_r$ ,  $t_f$

Figure 7. High Speed TTL Circuit

## Link Design

With transmitter performance specified as power in dBm into a fiber of particular properties (core size, NA, and index profile), and receiver performance given in terms of the power in dBm radiated from the same kind of fiber, then the link design equation is simply:

$$(1) P_T - \ell \cdot \alpha_o = P_R$$

where

$P_T$  = transmitter power into fiber (dBm)

$\ell$  = fiber (cable) length (km)

$\alpha_o$  = fiber attenuation (dB/km)

$P_R$  = receiver power, from fiber, (dBm)

For transmitter input current in the range from 10 to 100 mA, the power varies approximately linearly:

$$(2) P_T = P_o + 10 \log (I/I_o)$$

where

$P_o$  = transmitter power specification (dBm) at  $I_o$

$I_o$  = specified transmitter current (100 mA)

$I$  = selected transmitter current (mA)

To allow for the dynamic range limits of proper receiver performance, it is necessary that a link with maximum transmitter power and minimum attenuation does not OVERDRIVE the receiver and that minimum transmitter power with maximum attenuation does not UNDERDRIVE it. These limits can be expressed in a combination of the two equations above:

$$(3) P_o \text{ MAX} + 10 \log (I_{MAX}/I_o) - \ell \cdot \alpha_o \text{ MIN} < P_R \text{ MAX}$$

$$(4) P_o \text{ MIN} + 10 \log (I_{MIN}/I_o) - \ell \cdot \alpha_o \text{ MAX} > P_R \text{ MIN}$$

where

$P_o \text{ MAX}, P_o \text{ MIN}$  = max., min. specified power from transmitter (dBm) at  $I = I_o$

$I_{MAX}, I_{MIN}$  = max., min. selected transmitter operating current (mA)

$P_R \text{ MAX}, P_R \text{ MIN}$  = max., min. specified power at receiver (dBm)

$\alpha_o \text{ MAX}, \alpha_o \text{ MIN}$  = max., min. attenuation (dB/km)

A more useful form of these equations comes from solving them for the current ratio, expressed in dB:

$$(5) 10 \log (I_{MAX}/I_o) < P_R \text{ MAX} - P_o \text{ MAX} + \ell \cdot \alpha_o \text{ MIN}$$

$$(6) 10 \log (I_{MIN}/I_o) > P_R \text{ MIN} - P_o \text{ MIN} + \ell \cdot \alpha_o \text{ MAX}$$

These are plotted in Figure 8 as the OVERDRIVE LINE, and UNDERDRIVE LINE, respectively for the following components:

HFBR-1204 Transmitter -11.2 <  $P_T$  < -4 dBm

HFBR-2204 Receiver (25 MHz) -28.5 <  $P_R$  < 12.6 dBm

HFBR-2204 Receiver (2.5 MHz) -35.5 <  $P_R$  < -12.6 dBm

HP's 100/140  $\mu$ m Fiber Cable 4 <  $\alpha_o$  < 8 dB/km

Figure 8. Link Design Limits.

These design equations take account only of the power loss due to attenuation. The specifications for the receiver and transmitter include loss effects in end connectors. If the system has other fixed losses, such as from directional couplers or additional in-line connectors, the effect is to shift both OVERDRIVE and UNDERDRIVE lines upward by the amount of the additional loss ratio.

FIBER OPTICS

**HEWLETT  
PACKARD**

# 40 MBd MINIATURE FIBER OPTIC RECEIVER

HFBR-2204

## Features

- DATA RATES UP TO 40 MBd
- HIGH OPTICAL COUPLING EFFICIENCY
- RUGGED, MINIATURE METAL PACKAGE
- COMPATIBLE WITH SMA STYLE CONNECTORS
- VERSATILE ANALOG RECEIVER OUTPUT
- 25 MHz ANALOG BANDWIDTH

## Applications

- DATA ACQUISITION AND PROCESS CONTROL
- SECURE DATA COMMUNICATION
- EMC REGULATED SYSTEMS (FCC/VDE)
- EXPLOSION PROOF SYSTEMS
- WEIGHT SENSITIVE SYSTEMS (e.g., AVIONICS, MOBILE STATIONS)
- VIDEO TRANSMISSION

The signal from this simple analog receiver can be optimized for a variety of transmission requirements. For example, the circuits in Application Bulletin 73 add low-cost external components to achieve logic compatible signal levels optimized for various data formats and data rates.

Each of these fiber optic components uses the same rugged, lensed, miniature package. This package assures a consistent, efficient optical coupling between the active devices and the optical fiber.

## Description

The HFBR-2204 Receiver is capable of data rates up to 40 MBd at distances greater than 1 km when used with cable and HFBR-1202/4 Transmitters. The HFBR-2204 Receivers contains a discrete PIN photodiode and preamplifier IC.

The HFBR-2204 Receiver is compatible with SMA style connectors, types A and B (see Figure 11 and HP's 100/140  $\mu\text{m}$  SMA connected cable assemblies. HP's 100/140  $\mu\text{m}$  fiber optic cable can be ordered with or without connectors.

## Mechanical Dimensions

UNLESS OTHERWISE SPECIFIED, THE TOLERANCES ARE:  
.X = .51 mm (.02 IN)  
.XX = .13 mm (.005 IN)

## Electrical Description

The HFBR-2204 Fiber Optic Receiver contains a PIN photodiode and low noise transimpedance pre-amplifier hybrid circuit with an inverting output (see note 10). The HFBR-2204 receives an optical signal and converts it to an analog voltage. The output is a buffered emitter-follower. Because the signal amplitude from the HFBR-2204 Receiver is much larger than from a simple PIN photodiode, it is less susceptible to EMI, especially at high signal rates.

The frequency response is typically dc to 25 MHz. Although the HFBR-2204 is an analog receiver, it is easily made compatible with digital systems (see Application Bulletin 73). Separate case and signal ground leads are provided for maximum design flexibility.

It is essential that a bypass capacitor (0.01  $\mu\text{F}$  to 0.1  $\mu\text{F}$  ceramic) be connected from Pin 4 ( $V_{CC}$ ) to Pin 3 (circuit common) of the receiver. Total lead length between both ends of the capacitor and the pins should be less than 20 mm.

## Mechanical Description

The HFBR-2204 Fiber Optic Receiver is housed in a miniature package intended for use with HP's 100/140  $\mu\text{m}$  SMA connected cable assemblies. This package has important performance advantages:

1. Precision mechanical design and assembly procedures assure the user of consistent high efficiency optical coupling.
2. The lens is suspended to avoid contact with the active devices, thereby assuring improved reliability.

3. The versatile miniature package is easy to mount. This low profile package is designed for direct mounting on printed circuit boards or through panels without additional heat sinking.

A complete mounting hardware package is available for horizontal PCB applications, including a snap-on metal shield for harsh EMI/ESD environments.

Good system performance requires clean port optics and cable ferrules to avoid obstructing the optical path. Clean compressed air often is sufficient to remove particles of dirt; Methanol or Freon on a cotton swab also works well.

### Note:

When installing connected cable on the optical port, do not use excessive force to tighten the nut. Finger tightening is sufficient to ensure connecting integrity, while use of a wrench may cause damage to the connector or the optics.

## System Design Considerations

For additional information, see Application Bulletin 73.

### OPTICAL POWER BUDGETING

The HFBR-2204 Fiber Optic Receivers when used with the HFBR-1202 Fiber Optic Transmitter can be operated at a signalling rate of more than 40 MBd over a distance greater than 1000 metres (assuming 8 dB/km cable attenuation). For shorter transmission distances, power consumption can be reduced by decreasing Transmitter drive current. At a lower data rate, the transmission distance may be increased by applying bandwidth-filtering at the output of the HFBR-

Figure 1. Cross Sectional View

2204 Receiver; since noise is reduced as the square root of the bandwidth, the sensitivity of the circuit is proportionately improved provided these two conditions are met:

- input-referred noise of the follow on circuit is well below the filtered noise of the Receiver
- logic comparator threshold is reduced in the same proportion as the noise reduction

As an example, consider a link with a maximum data rate of 10 MBd (e.g., 5 Mb/s Manchester); this requires a 3 dB bandwidth of only 5 MHz. For this example, the input-referred rms noise voltage of the follow-on circuit is 0.03 mV. The equivalent optical noise power of the complete receiver (P<sub>NO</sub>) is given by:

$$P_{NO} = [(V_{NO})^2 (B/B_0) + (V_{NI})^2]^{0.5} / R_P$$

V<sub>NO</sub> = rms output noise voltage of the HFBR-2203/04 with no bandwidth filtering

V<sub>NI</sub> = input-referred rms noise voltage of the follow-on circuit

B = filtered 3 dB bandwidth

B<sub>0</sub> = Unfiltered 3dB bandwidth of the HFBR-2203/04 (25 MHz)

R<sub>P</sub> = optical-to-electrical responsivity (mV/μW) of the HFBR-2240

Note that noise adds in an rms fashion, and that the square of the rms noise voltage of the HFBR-2204 is reduced by the bandwidth ratio, B/B<sub>0</sub>.

From the receiver data (Electrical/Optical Characteristics) taking worst-case values, and applying NO bandwidth filtering (B/B<sub>0</sub> = 1):

$$P_{NO} = \frac{[(0.43)^2 + (0.03)^2]^{0.5} \text{ mV}}{4.6 \text{ mV}/\mu\text{W}} = 0.094 \mu\text{W} \text{ or } -40.3 \text{ dBm}$$

To ensure a bit error rate less than 10<sup>-9</sup> requires the signal power to be 12 times larger (+11 dB) than the rms noise as referred to the Receiver input. The minimum Receiver input power is then:

$$P_{RMIN} = P_{NO} + 11 \text{ dB} = -29.3 \text{ dBm}$$

With the application of a 5 MHz low-pass filter, the bandwidth ratio becomes:

$$B/B_0 = 5 \text{ MHz}/25 \text{ MHz} = 0.2$$

Note that 25 MHz should be used for the total noise bandwidth of the HFBR-2204. Inserting this value of the bandwidth ratio in the expressions for P<sub>NO</sub> and P<sub>RMIN</sub> above yields the results:

$$P_{NO} = 0.042 \mu\text{W} \text{ or } -43.8 \text{ dBm} \text{ and } P_{RMIN} = -32.8 \text{ dBm}$$

Given the HFBR-1202 Transmitter optical power P<sub>T</sub> = -18 dBm at I<sub>F</sub> = 40 mA, and allowing a 3 dB margin, a

minimum optical power budget of 11.8 dB is obtained:

$$[-18 \text{ dBm } -3 \text{ dB } -(-32.8 \text{ dBm})] = 11.8 \text{ dB}$$

Using 8 dB/km optical fiber, this translates into a minimum link length of 1475 metres (typical link power budget for this configuration is approximately 17.2 dB or 3130 metres with 5.5 dB/km fiber).

## BANDWIDTH

The bandwidth of the HFBR—2204 is typically 25 MHz. Over the entire temperature range of -40° C to +85° C, the rise and fall times vary in an approximately linear fashion with temperature. Under worst case conditions, t<sub>r</sub> and t<sub>f</sub> may reach a maximum of 26 ns, which translates to a 3 dB bandwidth of:

$$f_{3dB} \approx \frac{350}{t_r} = \frac{350}{26 \text{ ns}} = 13.5 \text{ MHz}$$

The receiver response is essentially that of a single-pole system, rolling off at 6 dB/octave. In order for the receiver to operate up to 40 MBd even though its worst case 3 dB bandwidth is 13.5 MHz, the received optical power must be increased by 3 dB to compensate for the restricted receiver transmission bandwidth.

## PRINTED CIRCUIT BOARD LAYOUT

When operating at data rates above 10 MBd, standard PC board precautions should be taken. Lead lengths greater than 20 mm should be avoided whenever possible and a ground plane should be used. Although transmission line techniques are not required, wire wrap and plug boards are not recommended.

## OPERATION WITH HEWLETT-PACKARD TRANSMITTERS

Hewlett-Packard offers two transmitters compatible with the HFBR-2204 Link performance with each transmitter is shown below for 25°C operation with HP's 100/140 μm glass fiber cable. See product data sheets for further information.

	HFBR-1202 -17 dBm Coupled Optical Power	HFBR-1204 -9.8 dBm Coupled Optical Power
HFBR-2204 -27 dBm Sensitivity	1200 m 40 MBd	2100 m 40 MBd
HFBR-2204 -32 dBm Sensitivity	1800 M 10 MBd	2800 M 10 MBd

- If P<sub>in</sub> < 40 μW, then pulse width distortion may increase. At P<sub>in</sub> = 80 μW and T<sub>A</sub> = 80° C, some units have exhibited as much as 100 ns pulse width distortion.

FIBER OPTICS

**Notes (cont.):**

3.  $D_R$  is the effective diameter of the detector image on the plane of the fiber face. The numerical value is the product of the actual detector diameter and the lens magnification.
4. Typical specifications are for operation at  $T_A = 25^\circ\text{C}$  and  $V_{CC} = 5.0\text{V}$ .
5. Input optical signal is assumed to have 10% — 90% rise and fall times of less than 6 ns.
6. Percent overshoot is defined as:
 
$$\frac{V_{PK} - V_{100\%}}{V_{100\%}} \times 100\% \quad \text{See Figure 16.}$$
7. Output referred P.S.R.R. is defined as
 
$$20 \log \left( \frac{V_{\text{POWER SUPPLY RIPPLE}}}{V_{\text{OUT RIPPLE}}} \right)$$
8. It is essential that a bypass capacitor (0.01  $\mu\text{F}$  to 0.1  $\mu\text{F}$  ceramic) be connected from pin 4 ( $V_{CC}$ ) to pin 3 (circuit common) of the receiver. Total lead length between both ends of the capacitor and the pins should be less than 20 mm.
9. HP's 100/140  $\mu\text{m}$  fiber cable is specified at a narrower temperature range,  $-20^\circ\text{C}$  to  $85^\circ\text{C}$ .
10.  $V_{OUT} = V_{ODC} - (R_P \times P_{IN})$ .

## Description

The HFBR-2208 Fiber Optic Receiver is a silicon PIN photodiode mounted in a rugged metal package. Well suited for high speed applications, the HFBR-2208 Fiber Optic Receiver has low capacitance and low noise. The high coupling efficiency of the miniature package provides a minimum of 0.29 A/W responsivity. Receiver responsivity includes the optical power lost in coupling light from the fiber onto the PIN photodiode as well as the responsivity of the PIN photodiode itself.

HFBR-2208 mates with SMA style connectors.

The HFBR-2208 is a member of the family of transmitters and receivers which use the miniature package. HP also offers connected and unconnected 100/140  $\mu\text{m}$  fiber cable in simplex and duplex configurations.

# Dynamic Characteristics

T<sub>A</sub> = 25°C, R<sub>LOAD</sub> = 50 Ω, P<sub>R</sub> = -20 dBm at 820 nm unless otherwise specified.

Parameter	Symbol	Min.	Typ.	Max.	Unit	Conditions	Reference
3 dB Bandwidth	BW	60	100		MHz	V <sub>R</sub> = 5 V	Fig. 6, 7
		150	250			V <sub>R</sub> = 20 V	Fig. 10
Rise/Fall Time (10-90%)	t <sub>r</sub> , t <sub>f</sub>		3.5		ns	V <sub>R</sub> = 5 V	Note 4
Relative Incremental Response	ΔR <sub>P</sub> /R <sub>P</sub>		0.5		%	P <sub>R</sub> ≤ -20 dBm V <sub>R</sub> = 5 V	Fig. 8 Note 6

**Notes:**

- 2.0 mm from where leads enter case.
- V<sub>C</sub> (100 V) is applied simultaneously to Pin 2 and Pin 3 with respect to Pin 1.
- D<sub>R</sub> is the effective diameter of the detector image on the plane of the fiber face. The numerical value is the product of the actual detector diameter and the lens magnification.
- Rise/Fall time is calculated from the equation:

$$t_r, t_f = \frac{350}{3 \text{ dB BW (MHz)}} \text{ ns}$$

- For (λ, f, Δf) = (820 nm, 100 Hz, 6 Hz) where f is the frequency for a spot noise measurement and Δf is the noise bandwidth, NEP is the optical flux required for unity signal/noise ratio normalized for bandwidth.

Thus:

$$NEP = \frac{I_N \sqrt{\Delta f}}{R_P}$$

where I<sub>N</sub>√Δf is the bandwidth — normalized noise current computed from the shot noise formula:

$$I_N \sqrt{\Delta f} = \sqrt{2qI_D} = 17.9 \times 10^{-15} \sqrt{I_D} \text{ (A}\sqrt{\text{Hz)}} \text{ where } I_D \text{ is nA.}$$

- Relative incremental response is defined as:

$$\frac{\Delta R_P}{R_P} \times 100\% = \frac{R_{AC}(P_R) - R_{AC}(-25 \text{ dBm})}{R_{AC}(-25 \text{ dBm})} \times 100\%$$

where:

R<sub>AC</sub> = Small signal AC (20 MHz, -30 dBm) response  
P<sub>R</sub> = DC optical power incident on port.

$V_R = 5\text{ V}$ ;  $P_R = -20\text{ dBm}$  at  $820\text{ nm}$ ;  $T_A = 25^\circ\text{C}$  unless otherwise specified.

## Mechanical Description

The HFBR-2208 fiber optic receivers are housed in rugged metal packages intended for use with the SMA style connected fiber cables. The low profile package is designed for direct mounting on printed circuit boards or through panels without additional heat sinking. A flat on the mounting threads of the device is provided to prevent rotation in all mounting configurations and to provide an orientation reference for the pin-out. Hardware is available for horizontal mounting applications on printed circuit boards. The hardware consists of a stainless steel mounting bracket fastened directly to the printed circuit board with two stainless steel self-tapping screws and a nut and washer for fastening the device in the bracket. A metal

shield which snaps directly on the mounting bracket is also available for unusually severe EMI/ESD environments. When mounted in the horizontal configuration, the overall height of the component conforms with guidelines allowing printed circuit board spacing on 12.7 mm (0.500) centers. A thorough environmental characterization has been performed on these products. The test data as well as information regarding operation beyond the specified limits is available from any Hewlett-Packard sales office.

Good system performance requires clean port optics and cable ferrules to avoid obstructing the optical path. Clean compressed air often is sufficient to remove particles of dirt; methanol or Freon™ on a cotton swab also works well.

## Horizontal PCB Mounting

Mounting at the edge of a printed circuit board with the lock nut overhanging the edge is recommended.

When bending the leads, avoid sharp bends right where the lead enters the backfill. Use needle nose pliers to support the leads at the base of the package and bend the leads as desired.

When soldering, it is advisable to leave the protective cap on the unit to keep the optics clean.

## Application Information

### NOISE FREE PROPERTIES

The noise current of the HFBR-2208 is negligible. This is a direct result of the exceptionally low leakage current, in accordance with the shot noise formula  $I_N = (2qI_D \Delta f)^{1/2}$ . Since the leakage current does not exceed 500 picoamps at a reverse bias of 20 volts, shot noise current is less than  $9.8 \times 10^{-15}$  amp  $\text{Hz}^{-1/2}$  at this voltage.

Excess noise is also very low, appearing only at frequencies below 10 Hz, and varying approximately as  $1/f$ . When the output of the diode is observed in a load, thermal noise of the load resistance ( $R_L$ ) is  $1.28 \times 10^{-10} (R_L)^{-1/2} \times (\Delta f)^{1/2}$  at 25° C, and far exceeds the diode shot noise for load resistance less than 100 megohms. Thus in high frequency operation where low values of load resistance are required for high cut-off frequency, the HFBR-2208 contributes virtually no noise to the system.

### HIGH SPEED PROPERTIES

High speed operation is possible since the HFBR-2208 has low capacitance and wide bandwidth at a low reverse bias.

Figure 11. Photodiode Equivalent Circuit

$I_S$  = Signal current  $\approx 0.38 \mu\text{A}/\mu\text{W} \times P_R$

$I_N$  = Shot noise current  
 $< 9.8 \times 10^{-15}$  amps/ $\text{Hz}^{1/2}$

$I_D$  = Dark current  
 $< 500 \times 10^{-12}$  amps at 20 V dc bias

$R_P = 10^{11} \Omega$

$R_S = < 50 \Omega$

### LINEAR OPERATION

Operation of the photodiode is most linear when operated with a current amplifier as shown in Figure 12.

Figure 12. Linear Operation

Lowest noise is obtained with  $E_C = 0$ , but higher speed and wider dynamic range are obtained if  $5 < E_C < 20$  volts. The amplifier should have as high an input resistance as possible to permit high loop gain. If the photodiode is reversed, bias should also be reversed.

### Applications

- General Purpose Serial Data Links with Encoded Data Rates of 10 MBd to 200 MBd
- Multimode Telecommunication Links at T3, and T3C Rates
- SONET Multimode Links at STS-1 and STS-3c Rates
- High Speed Computer to Disc or Tape Memory Interconnects

- Proprietary Local Area Networks
- High Speed Multiplexer Interconnects
- Digital Graphics and Digital Video Transmission Links

### Description

The general purpose transmitter and receiver products described in this data sheet are members of a growing family of 1300 nm technology fiber optic products available from Hewlett-Packard. These products supply the performance necessary for the system designer who seeks to develop data links using multimode fiber that will have distance capability beyond that obtainable with first window (820 nm wavelength) products. Link lengths of 2000 meters are possible at 200 MBd data rates with margin to spare for in-line connection losses. Longer distances are possible depending on data rate and the number of in-line connections. The performance of both the transmitter and receiver

products are guaranteed over the operating temperature and power supply voltage ranges found in most commercial equipment with sufficient margin to allow for substantial equipment mission-life and configuration flexibility.

Hewlett-Packard is a vertically integrated supplier. The 1300 nm LED and PIN devices along with the three custom bipolar integrated circuits (ICs) used in these products have been developed and manufactured by Hewlett-Packard. The assembly and testing of the transmitter and receiver products is performed in facilities wholly owned and operated by Hewlett-Packard.

\*\*TAXIchip<sup>TM</sup> is a trademark of Advanced Micro Devices, Inc.

Figure 1. Outline Drawing.

### Transmitters - HFBR-1100 and HFBR-1160

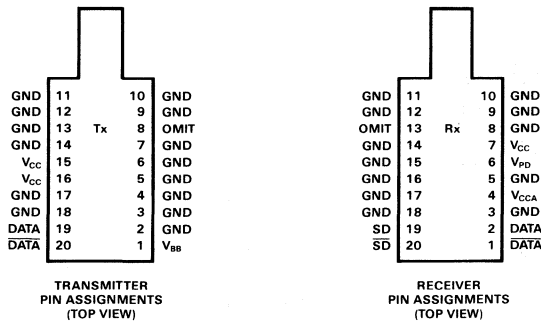

The transmitters use a 1300 nm InGaAsP LED and a single, custom silicon bipolar LED driver integrated circuit. The LED is an advanced planar device with an integral etched lens that provides efficient coupling to multimode fibers when combined with the Hewlett-Packard custom optical subassembly. The driver circuit provides temperature compensation for a predictable output optical power over the recommended operating temperature range. It also maintains a steady power supply current due to internal loads which conduct the LED drive current when logic "0s" are being transmitted to

minimize creation of high frequency noise on power supply lines. The data input to the transmitter is differential, 100K ECL compatible, referenced (shifted) to operate from a +5 volt supply. The HFBR-1100 is specified to operate from dc to 200 MBd and the HFBR-1160 is specified from dc to 160 MBd.

### Receiver - HFBR-2100

The receiver uses a 1300 nm InGaAs PIN photodiode and two custom silicon bipolar integrated circuits. The PIN is a planar top-illuminated device which provides ease of assembly into the Hewlett-Packard custom optical subassembly. The preamplifier IC is mounted in the optical subassembly with the PIN detector to maximize

the receiver sensitivity. This sensitivity is guaranteed over a wide time-window in the data output eye-pattern. This assures performance with various clock recovery circuitry. The second IC, a quantizer, provides the final pulse shaping for the logic output and the Signal Detect functions. Both the data and Signal Detect logic outputs are differential, 100K ECL compatible, referenced (shifted) to a +5 volt power supply. The HFBR-2100 is specified for operation from 10 to 200 MBd and is compatible with both the HFBR-1100 and HFBR-1160 transmitters.

NOTE: THE CASE IS INTERNALLY CONNECTED TO SIGNAL GROUND PINS.

Figure 2. Pin Assignments.

### Package

The overall package concept for the Hewlett-Packard general purpose transmitter and receiver products consists of three basic elements: the optical subassembly, the electrical subassembly, and the overall housing and connector port. The objective of the design is to provide consistent optoelectronic performance in commercial equipment environments over extended equipment mission-lifetimes.

The optical subassembly contains either the 1300 nm LED or the 1300 nm PIN and preamplifier devices in a hermetic enclosure which is actively aligned to a GRIN rod optical element in the precision stainless steel ferrule-bore. This active alignment provides optimal optical performance for both the transmitters and the receiver. The precision stainless steel bore assures that the ST<sup>®</sup> connector ferrule tip containing the fiber will be precisely positioned relative to the focal point of the optics.

The electrical subassembly is a multilayer, ceramic substrate containing the driver or quantizer integrated circuits along with various surface-mounted passive components. This multilayer substrate provides optimum electrical performance with good noise immunity and noise emission suppression.

The housing and connector port are die-cast zinc with nickel plating. Zinc is used for its excellent thermal conductivity which maintains the junction temperatures of the active semiconductors at the lowest levels possible for high reliability and long mission-life. The optical subassembly with its precision stainless steel connector ferrule bore fits into the ST<sup>®</sup> style bayonet connector port. The electrical and optical subassembly signal grounds are connected to the zinc housing for maximum shielding. The electrical and optical subassemblies are mounted into the zinc housing and epoxy sealed for environmental protection. The optical port is protected with an easily removable, high temperature, vinyl cap for protection from contamination during assembly onto circuit boards and shipment to the end-user site.

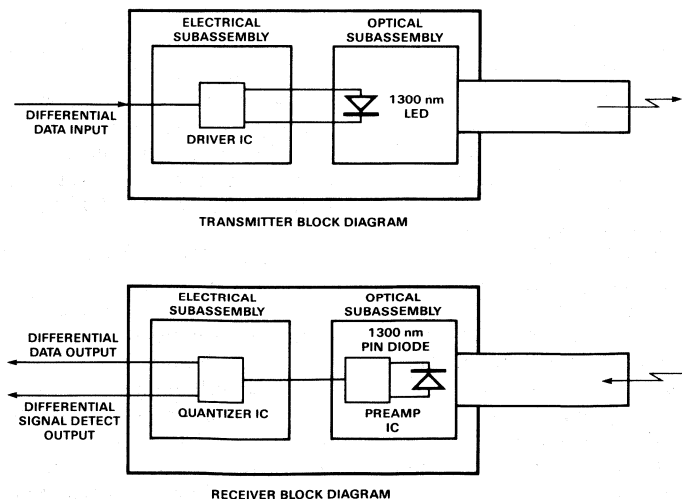

Figure 3. Block Diagrams.

## Application Assistance

The Applications Engineering group in the Hewlett Packard Optical Communication Division is available to assist with the analysis of the performance of these products within a given circuit design. The effects of various data-encoding schemes and cable plants can be analyzed to predict the system performance for a particular data link.

Assistance is also available to obtain the best performance from these parts with appropriate board layout techniques for these high signaling rates. Figure 8 provides a good example of a decoupling scheme that works well with these products. Contact your local Hewlett-Packard sales representative to obtain this assistance.

## Product Reliability Data

Various environmental and life tests have been performed on these products and these tests are ongoing. Contact your local Hewlett-Packard sales representative to obtain copies of the summaries of these test results as they become available.

#### Notes:

1. This maximum rating applies to still air environments around the transmitter and the receiver.
2. When component testing these products all supply voltages should be applied simultaneously to avoid damage to the part.
3. This is the maximum voltage that can be applied across the Differential Transmitter Data Inputs to prevent damage to the input ESD protection circuit.
4. When component testing these products do not short the receiver data or signal detect outputs directly to ground to avoid damage to the part.
5. The outputs are terminated with 50 ohms connected to  $V_{CC} - 2 V$ .
6. The specified signaling rate guarantees operation of the transmitter and receiver link to the full conditions described in the Electrical and Optical Characteristics sections. Specifically, the link bit error ratio will be equal to or better than  $10^{-12}$  for pseudo-random-bit-sequences (PRBS) of  $2^7 - 1$  data patterns with a 50% duty factor. The HFBR-1100 transmitter is capable of dc to 200 MBd operation. The HFBR-1160 is capable of operation from dc to 160 MBd. The HFBR-2100 receiver is internally ac-coupled which limits the lower signaling rate to 10 MBd. For purposes of definition, the symbol rate  $f_s$  (Baud), also called signaling rate, is the reciprocal of the shortest symbol time. Data rate (bits/sec) is the symbol rate divided by the encoding factor used to encode the data (symbols/bit).
7. The power supply current needed to operate the transmitter is provided to differential ECL circuitry. This circuitry maintains a nearly constant current flow from the power supply. Constant current operation helps to prevent unwanted electrical noise from being generated, whether the noise is conducted or emitted, to neighboring receiver or logic circuitry.
8. This value is measured with an output load  $R_L = 10$  kohms.
9. These optical power values are measured with the following conditions;
  - At the Beginning Of Life (BOL).
  - Over the specified operating voltage and temperature ranges.
  - With a data input of 200 MBd (100 MHz) square wave.
  - At the end of one meter of noted optical fiber with cladding modes removed.
- The average power value can be converted to a peak power value by adding 3 dB.
- Higher output optical power transmitters are available on special request.
10. This transmitter is available on special request with coupled optical power guaranteed into 50/125  $\mu m$  fiber cables. The value will depend on the specific NA of the 50/125  $\mu m$  fiber used.
11. These optical power values are measured with the following conditions;
  - At the Beginning Of Life (BOL).
  - Over the specified operating voltage and temperature ranges.
  - With a data input of 160 MBd (80 MHz) square wave.
  - At the end of one meter of noted optical fiber with cladding modes removed.The average power value can be converted to a peak power value by adding 3 dB. Higher output optical power transmitters are available on special request.
12. This value of Optical Extinction Ratio is the ratio of the steady state optical power in the logic-low state to the steady state optical power in the logic-high state.
13. The temperature coefficient of the center wavelength is typically  $+0.37$  nm/ $^{\circ}C$ .
14. The temperature coefficient of the spectral width is typically  $+0.25$  nm/ $^{\circ}C$ .
15. The optical rise and fall times are measured from 10% to 90% when the transmitter is driven by 12.5 MHz square wave data input.
16. Duty Cycle Distortion is measured at a 50% threshold using a 200 MBd (100 MHz) square wave input signal. The input optical power level is -20 dBm average.
17. Data Dependent Jitter is specified with a  $2^7 - 1$  PRBS input signal at 200 MBd. The input optical power level is -20 dBm average.
18. The Input Optical Power range from -31 dBm average to -14 dBm average is the range over which the receiver is guaranteed to provide a Data Output with a Bit Error Rate (BER) better than or equal to  $1 \times 10^{-12}$ . The measurement conditions are stated below.
  - At the Beginning Of Life (BOL).
  - Over the specified operating temperature and voltage ranges.
  - Input symbol pattern is  $2^7 - 1$  PRBS at 200 MBd.
  - Sampled over the range from the center of the symbol  $\pm 1.0$  ns.
  - Input optical signal rise/fall times are approximately 1 ns/2 ns.
19. All conditions of Note 18 apply except that the measurement is made at the center of the symbol with no window time-width.
20. This value is measured during the transition from low to high levels of input optical power.
21. This value is measured during the transition from high to low levels of input optical power.
22. These values are measured with the outputs terminated into 50 ohms connected to  $V_{CC} - 2 V$ .
23. Measured at  $P_{IN} = -14$  dBm average.
24. The power dissipation value is the power dissipated in the receiver itself. Power dissipation is calculated as the sum of the products of supply voltage and supply currents, minus the sum of the products of the output voltages and currents.
25. These values are measured with respect to  $V_{CC}$  with the output terminated into 50 ohms connected to  $V_{CC} - 2 V$ . The minimum values are corrected for +5.25 V operation for 100K ECL values that are usually specified at -4.8 V operation.
26. The output rise and fall times are measured between 20% and 80% levels with the output connected to  $V_{CC} - 2 V$  through 50 ohms.
27. Duty Cycle Distortion is measured at a 50% threshold using a 200 MBd (100 MHz) square wave input signal. The input optical power level is -20 dBm average.
28. Data Dependent Jitter is specified with a  $2^7 - 1$  PRBS input signal at 200 MBd. The input optical power level is -20 dBm average.
29. The output rise and fall times are measured between 20% and 80% levels with the output connected to  $V_{CC} - 2 V$  through 50 ohms.

**CONDITIONS:**

1.  $P_{IN}$  NORMALIZED ( $\Delta P_{IN} = 0$  dB) TO  $P_{IN\ Min}$  (C) AT 200 MBd AT CENTER OF SYMBOL.
2.  $\Delta P_{IN} = P_{IN} @$  MBd -  $P_{IN} @$  200 MBd
3. TEST DATA PATTERN IS PRBS  $2^7 - 1$ .
4. BER =  $10^{-12}$
5.  $T_A = 25^\circ\text{C}$ .
6.  $V_{CC} = 5$  Vdc
7. INPUT OPTICAL RISE/FALL TIMES = 1.2 ns/2.3 ns

# 1300 nm FDDI Transmitter and Receiver

## Technical Data

**Transmitter HFBR-1125**  
**Receiver HFBR-2125**

### Features

- Full Compliance with FDDI PMD Standard Performance Requirements
- Single +5 V Power Supply
- Shifted ECL Logic Interface Directly Compatible with FDDI PHY Integrated Circuits
- Directly Compatible with TAXIchip™\* Encode/Decode Circuits
- High Reliability
- ST\*\*\* Style Fiber Optic Connector
- High Immunity to EMI/RFI and ESD

### Applications

- FDDI Single or Dual Attachment Stations
- FDDI Bridges, Routers and Concentrators
- FDDI Backbone Servers
- FDDI Workstations
- FDDI Stations With Internal Optical Bypass Switches to Minimize Board Space

- FDDI Stations With Packaging That Does Not Allow The Use of The FDDI Media Interface Connector (MIC)
- Non-FDDI Proprietary Data Links

### Description

The FDDI† transmitter and receiver described in this data sheet are members of a growing family of 1300 nm technology fiber optic products available from Hewlett-Packard. These FDDI transmitter and receiver products supply the performance necessary for the system designer who seeks to develop equipment with fully compliant FDDI interfaces per the FDDI Physical Layer Medium Dependent (PMD) standard. The performance of both the transmitter and receiver are guaranteed over the operating temperature and power supply voltage ranges found in most commercial equipment with sufficient margin over the FDDI

PMD requirements to allow for substantial equipment mission-life and configuration flexibility.

Hewlett-Packard is a vertically integrated supplier. The 1300 nm LED and PIN devices along with the three custom bipolar integrated circuits (ICs) used in these products have been developed and manufactured by Hewlett-Packard. The assembly and testing of the transmitter and receiver products is performed in facilities wholly owned and operated by Hewlett-Packard.

\*TAXIchip™ is a trademark of Advanced Micro Devices, Inc.

\*\*ST\* is a registered trademark of AT&T for Lightguide Cable Connectors.

†FDDI represents Fiber Distributed Data Interface. The FDDI Physical Layer Medium Dependent (PMD) document has been approved as International Standard for Organization (ISO) Developmental International Standard (DIS) 9314-3.

Figure 1. Outline Drawing.

### Transmitter - HFBR-1125

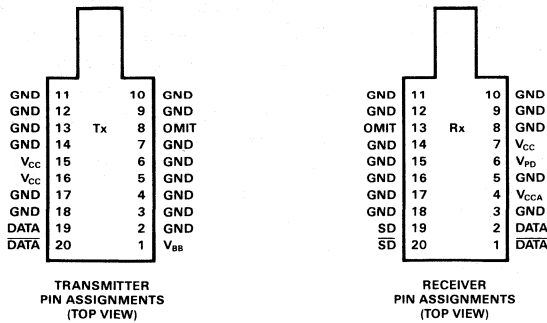

The HFBR-1125 transmitter uses a 1300 nm InGaAsP LED and a single, custom silicon bipolar LED driver integrated circuit. The LED is an advanced planar device with an integral etched lens that provides efficient coupling to multimode fibers when combined with the Hewlett-Packard custom optical subassembly. The driver circuit provides temperature compensation for a predictable output optical power over the recommended operating temperature range. It also maintains a steady power supply current due to internal loads which conduct the LED

drive current when logic "0s" are being transmitted to minimize creation of high frequency noise on power supply lines. The data input to the transmitter is differential, 100K ECL compatible, referenced (shifted) to operate from a +5 volt supply.

### Receiver - HFBR-2125

The HFBR-2125 receiver uses a 1300 nm InGaAs PIN photodiode and two custom silicon bipolar integrated circuits. The PIN is a planar top-illuminated device which provides ease of assembly into the Hewlett-Packard custom optical subassembly. The preamplifier IC is mounted in

the optical subassembly with the PIN detector to maximize the receiver sensitivity. This sensitivity is guaranteed over a wide time-window in the data output eye-pattern. This assures performance with the clock recovery circuit when any possible FDDI input optical signal condition exists. The second IC, a quantizer, provides the final pulse shaping for the logic output and the Signal Detect function. Both the data and Signal Detect logic outputs are differential, 100K ECL compatible, referenced (shifted) to a +5 volt power supply.

NOTE: THE CASE IS INTERNALLY CONNECTED TO SIGNAL GROUND PINS.

Figure 2. Pin Assignments.

### Package

The overall package concept for the Hewlett-Packard FDDI transmitter and receiver consists of three basic elements: the optical subassembly, the electrical subassembly and the overall housing and connector port. The objective of the design is to provide consistent optoelectronic performance in commercial equipment environments over extended equipment mission-lifetimes.

The optical subassembly contains either the 1300 nm LED or the 1300 nm PIN and preamplifier devices in a hermetic enclosure which is actively aligned to a GRIN rod optical element in the precision stainless steel ferrule-bore. This active alignment provides optimal optical performance for both the transmitter and receiver. The precision stainless steel bore assures that the ST® connector ferrule tip containing the fiber will be precisely positioned relative to the focal point of the optics.

The electrical subassembly is a multilayer, ceramic substrate containing the driver or quantizer integrated circuits along with various surface-mounted passive components. This multilayer substrate provides optimum electrical performance with good noise immunity and noise emission suppression.

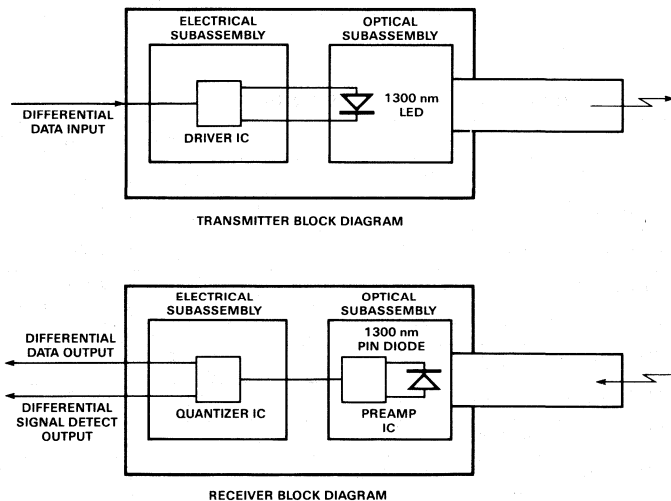

Figure 3. Block Diagrams.

The housing and connector port are die-cast zinc with nickel plating. Zinc is used for its excellent thermal conductivity which maintains the junction temperatures of the active semiconductors at the lowest levels possible for high reliability and long mission-life. The optical subassembly with its precision stainless steel connector ferrule bore fits into the ST® style bayonet connector port. The electrical and optical subassembly signal grounds are connected to the zinc housing for maximum shielding. The electrical and optical subassemblies are mounted into the zinc housing and epoxy sealed for environmental protection. The optical port is protected with an easily removable, high temperature, vinyl cap for protection from contamination during assembly onto circuit boards and shipment to the end-user site.

## Application Assistance

The Applications Engineering group in the Hewlett Packard Optical Communication Division is available to assist with the analysis of the performance of these products within a given circuit design. The effects of various data-encoding schemes and cable plants can be analyzed to predict the system performance for a particular data link.

Assistance is also available to obtain the best performance from these parts with appropriate board layout techniques for these high signaling rates. Figure 10 provides a good example of a decoupling scheme that works well with these products. Contact your local Hewlett-Packard sales representative to obtain this assistance.

## Product Reliability Data

Various environmental and life tests have been performed on these products and these tests are ongoing. Contact your local Hewlett-Packard sales representative to obtain copies of the summaries of these test results as they become available.

## Notes:

1. This maximum rating applies to still air environments around the transmitter and receiver.
2. When component testing these products all supply voltages should be applied simultaneously to avoid damage to the part.
3. This is the maximum voltage that can be applied across the Differential Transmitter Data Inputs to prevent damage to the input ESD protection circuit.
4. When component testing these products do not short the receiver data or signal detect outputs directly to ground to avoid damage to the part.
5. The outputs are terminated with 50 ohms connected to  $V_{CC} - 2 V$ .
6. The specified signaling rate of 10 MBd to 125 MBd guarantees operation of the transmitter and receiver link to the full conditions listed in the FDDI Physical Layer Medium Dependent standard. Specifically, the link bit error ratio will be equal to or better than  $2.5 \times 10^{-10}$  for any valid FDDI pattern. The transmitter section of the link is capable of dc to 125 MBd operation. The receiver is internally ac-coupled which limits the lower signaling rate to 10 MBd. For purposes of definition, the symbol rate (Baud), also called signaling rate,  $f_s$ , is the reciprocal of the shortest symbol time. Data rate (bits/sec) is the symbol rate divided by the encoding factor used to encode the data (symbols/bit).
7. The power supply current needed to operate the transmitter is provided to differential ECL circuitry. This circuitry maintains a nearly constant current flow from the power supply. Constant current operation helps to prevent unwanted electrical noise from being generated, whether the noise is conducted or emitted, to neighboring receiver or logic circuitry.
8. This value is measured with an output load  $R_L = 10$  kohms.
9. These optical power values are measured with the following conditions:
  - At the Beginning Of Life (BOL).
  - Over the specified operating voltage and temperature ranges.
  - With HALT Line State, (12.5 MHz) square-wave, input signal.
  - At the end of one meter of noted optical fiber with cladding modes removed.

The average power value can be converted to a peak power value by adding 3 dB.

Higher output optical power transmitters are available on special request.

10. This transmitter is available on special request with coupled optical power guaranteed into 50/125  $\mu$ m fiber cables. The value will depend on the specific NA of the 50/125  $\mu$ m fiber used.
11. The Extinction Ratio is a measure of the modulation depth of the optical signal. The data "0" output optical power is compared to the data "1" peak output optical power and expressed as a percentage. With the transmitter driven by a HALT Line State (12.5 MHz square-wave) the optical signal is detected with a receiver that linearly converts optical power to voltage, the extinction ratio is the ratio of the voltage of the "0" level compared to the voltage at the "1" level expressed as a percentage.
12. This parameter complies with the FDDI PMD requirements for the tradeoffs between center wavelength, spectral width, and rise/fall times shown in Figure 6. The temperature coefficient of the center wavelength is typically  $+0.37$  nm/ $^{\circ}$ C.
13. This parameter complies with the FDDI PMD requirements for the tradeoffs between center wavelength, spectral width, and rise/fall times shown in Figure 6. The temperature coefficient of the spectral width is typically  $+0.25$  nm/ $^{\circ}$ C.
14. This parameter complies with the FDDI PMD requirements for the tradeoffs between center wavelength, spectral width, and rise/fall times shown in Figure 6. This parameter also complies with the optical pulse envelope shown in Figure 7. The optical rise and fall times are measured from 10% to 90% when the transmitter is driven by the FDDI HALT Line State logic input signal.
15. Duty Cycle Distortion is measured at a 50% threshold using an IDLE Line State, 125 MBd (62.5 MHz) square-wave, input signal.
16. Data Dependent Jitter is specified with the FDDI test pattern described in FDDI PMD Appendix A.5.
17. Random Jitter is specified with an IDLE Line State, 125 MBd (62.5 MHz) square-wave, input signal.
18. The Input Optical Power dynamic range, from the maximum value of " $P_{IN Max}$  (W)" to the minimum value of " $P_{IN Min}$ ", is the range over which the receiver is guaranteed to provide output data with a Bit Error Rate (BER) better than or equal to  $2.5 \times 10^{-10}$ . The BER will be better than or equal to  $1 \times 10^{-12}$  at input optical power levels greater than the maximum " $P_{IN Min}$  (W)" plus approximately 0.8 dB with this Hewlett-Packard receiver. This is 1.2 dB better than required by the FDDI PMD. The measurement conditions are stated below.
  - At the Beginning of Life (BOL)
  - Over the specified operating temperature and voltage ranges
  - Input symbol pattern is the FDDI test pattern defined in FDDI PMD Appendix A.5 with 4B/5B NRZI encoded data that contains a baseline wander effect of 50 kHz. Baseline wander is the alternation of data that contains a low frequency variation in the data pattern.
  - Input optical rise and fall times are approximately 1 ns and 2 ns respectively.
  - Sampled over the range from the center of the symbol  $\pm 2.3$  ns. This is because a window time-width of 4.6 ns is the worst case allowed between the FDDI PMD Active Input Interface and the FDDI PHY PM\_Data.indication input per the example in FDDI PMD Appendix E. This window time-width value is based upon a nearly ideal input optical signal presented to the receiver, i.e., no DCD, insignificant DDJ and RJ and fast optical rise and fall times. Per the Appendix E example the receiver is allowed to contribute a peak-to-peak jitter of  $DCD(0.4ns) + DDJ(1.0ns) + RJ(2.14ns\ pk-pk) = 3.54ns$ . The valid data window time-width then becomes  $8.0ns - 3.54ns = 4.46ns$ , or conservatively 4.6ns.
19. All conditions of Note 18 apply except that the measurement is made at the center of the symbol with no window time-width.
20. This value is measured during the transition from low to high levels of input optical power.
21. This value is measured during the transition from high to low levels of input optical power. The minimum value will be either  $-45$  dBm average or when the input optical power yields a BER of  $10^{-2}$  or less which ever power is higher.

22. These values are measured with the outputs terminated into 50 ohms connected to  $V_{CC} - 2 V$ .
23. Measured at  $P_{IN} = -14$  dBm average.
24. The power dissipation value is the power dissipated in the receiver itself. Power dissipation is calculated as the sum of the products of supply voltage and supply currents, minus the sum of the products of the output voltages and currents.
25. These values are measured with respect to  $V_{CC}$  with the output terminated into 50 ohms connected to  $V_{CC} - 2 V$ . The minimum values are corrected for +5.25 V operation for 100K ECL values that are usually specified at -4.8 V operation.
26. The output rise and fall times are measured between 20% and 80% levels with the output connected to  $V_{CC} - 2 V$  through 50 ohms.
27. Duty Cycle Distortion is measured at a 50% threshold using an IDLE pattern, 125 MBd (62.5 MHz) square-wave, input signal. The input optical power level is -20 dBm average.
28. Data Dependent Jitter is specified with the FDDI test pattern described in PMD Appendix A.5. The input optical power level is -20 dBm average.
29. Random Jitter is specified with an IDLE Line State pattern, 125 MBd (62.5 MHz) square-wave, input signal. The input optical power level is at maximum " $P_{IN, Min} (W)$ ".
30. The output rise and fall times are measured between 20% and 80% levels with the output connected to  $V_{CC} - 2 V$  through 50 ohms.
31. The Signal Detect output shall be asserted within 100  $\mu s$  after a step increase of the Input Optical Power. The step will be from a low Input Optical Power,  $\leq -45$  dBm, into the range between greater than  $P_A$  and -14 dBm. The BER of the receiver output will be less than  $10^{-2}$  from 15  $\mu s$  (LS\_Max) after Signal Detect has been asserted. See Figure 9 for more information.

32. Signal detect output shall be deasserted within 350  $\mu s$  after a step decrease in the Input Optical Power from a level which is the lower of; -31 dBm or  $P_D + 4$  dB ( $P_D$  is the power level at which signal detect was deasserted), to a power level of -45 dBm or less. This step decrease will have occurred in less than 8 ns. The receiver output will have a BER of  $10^{-2}$  or less for a period of 12  $\mu s$  or until signal detect is deasserted. The input data stream is Quiet symbols. Also, signal detect will be deasserted within a maximum of 350  $\mu s$  after the BER of the receiver output degrades below  $10^{-2}$  for an input optical data stream that decays with a negative ramp function instead of a step function. See Figure 9 for more information.

**CONDITIONS:**

1.  $P_{IN}$  NORMALIZED ( $\Delta P_{IN} = 0$  dB) TO  $P_{IN, Min} (C)$  AT 125 MBd AT CENTER OF SYMBOL
2.  $\Delta P_{IN} = P_{IN} @$  MBd -  $P_{IN} @$  125 MBd
3. FDDI PMD APPENDIX A.5 125 MBd TEST PATTERN WITH 50 kHz BASELINE WANDER
4. BER =  $2.5 \times 10^{-10}$
5.  $T_A = 25^\circ C$
6.  $V_{CC} = 5$  Vdc
7. INPUT OPTICAL RISE/FALL TIMES = 1.0 ns/2.1 ns

**Figure 4. Relative Input Optical Power vs. Signaling Rate.**

**CONDITIONS:**

1.  $P_{IN}$  IS NORMALIZED ( $\Delta P_{IN} = 0$  dB) AT  $P_{IN, Min} (W)$  WITH BER =  $2.5 \times 10^{-10}$  AND WINDOW TIME-WIDTH OF  $\pm 2.3$  ns EITHER SIDE OF SYMBOL CENTER.
2.  $\Delta P_{IN} = P_{IN} @$  BER -  $P_{IN} @$   $2.5 \times 10^{-10}$  BER
3. FDDI PMD APPENDIX A.5 125 MBd TEST PATTERN WITH 50 kHz BASELINE WANDER.
4.  $T_A = 25^\circ C$
5.  $V_{CC} = 5.0$  Vdc
6. INPUT OPTICAL RISE/FALL TIMES = 1.0 ns/2.1 ns

**Figure 5. Typical Bit Error Rate vs. Relative Input Optical Power.**

HEWLETT PACKARD FDDI TRANSMITTER TEST RESULTS OF  $\lambda_c$ ,  $\Delta\lambda$  AND  $t_{r/f}$  ARE CORRELATED AND COMPLY WITH THE ALLOWED SPECTRAL WIDTH AS A FUNCTION OF CENTER WAVELENGTH FOR VARIOUS RISE AND FALL TIMES. REFERENCE FIGURE 5-1 OF FDDI PMD.

**Figure 6. Transmitter Output Optical Spectral Width (FWHM) vs. Transmitter Output Optical Center Wavelength.**

THE OUTPUT OPTICAL PULSE SHAPE SHALL FIT WITHIN THE BOUNDARIES OF THE PULSE ENVELOPE. FOR RISE AND FALL TIME MEASUREMENTS, THE MAXIMUM POSITIVE AND MINIMUM NEGATIVE WAVEFORM EXCURSIONS IN THE ZERO AND 100% TIME INTERVALS SHALL BE CENTERED AROUND THE 0.0 AND 1.00 LEVELS, RESPECTIVELY. A MINIMUM BANDWIDTH RANGE OF 100 kHz TO 750 MHz IS REQUIRED FOR THE MEASUREMENT EQUIPMENT USED TO EVALUATE THE PULSE ENVELOPE.

Figure 7. Output Optical Pulse Envelope.

CONDITIONS:

1.  $P_{IN}$  IS NORMALIZED TO  $P_{IN Min}$  (C) AT CENTER OF SYMBOL.
2.  $\Delta P_{IN} = P_{IN} @ t_1 - P_{IN} @ t_{center}$
3. FDDI PMD APPENDIX A.5 125 Mb/d TEST PATTERN WITH 50 kHz BASELINE WANDER.
4. BER =  $2.5 \times 10^{-10}$
5.  $T_A = 25^\circ C$
6.  $V_{CC} = 5 V_{dc}$
7. INPUT OPTICAL RISE/FALL TIMES = 1.0 ns/2.1 ns

Figure 8. Relative Input Optical Power vs. Sampling Time Position.

AS\_MAX—MAXIMUM ACQUISITION TIME (SIGNAL).  
 AS\_MAX IS THE MAXIMUM SIGNAL\_DETECT ASSERTION TIME FOR THE STATION.  
 AS\_MAX SHALL NOT EXCEED 100.0  $\mu$ s. THE DEFAULT VALUE OF AS\_MAX IS 100.0  $\mu$ s.

ANS\_MAX—MAXIMUM ACQUISITION TIME (NO SIGNAL).  
 ANS\_MAX IS THE MAXIMUM SIGNAL\_DETECT DEASSERTION TIME FOR A STATION.  
 ANS\_MAX SHALL NOT EXCEED 350  $\mu$ s. THE DEFAULT VALUE OF ANS\_MAX IS 350  $\mu$ s.

## Plastic Optocouplers

Put an end to erroneous data, false control signals, and damaged circuits with HP's line of high-performance plastic optocouplers. There are six basic families of optocouplers to choose from: high-speed logic gate, high-speed transistor output, high-gain, high-speed CMOS logic-to-logic, AC/DC-to-logic interface, and 20 mA current loop. All plastic optocouplers are UL approved and have a withstand voltage of 2500 Vrms/1 minute as a standard feature. A 5000 Vrms/1 minute option is available on selected families. VDE 0883 approval has been obtained for our entire line of plastic optocouplers. Also available are two surface mount options for our standard package.

New this year are two new packages and a new optocoupler family. A true surface mount SO-8 package is available for all 6N series optocouplers, the HCPL-2601/11, and the HCPL-4502/3.

A VDE 0884 approved version of the 6N135/6 and 6N138/9

optocouplers has been designed to meet safety requirements worldwide. The CNW135/6 and CNW138/9 optocouplers feature a "widebody" package to ensure conformance to stringent creepage and clearance requirements.

The HCPL-7100 is the first optocoupler of our new CMOS family. This optocoupler combines the latest CMOS IC technology, a new high-speed AlGaAs LED and an optimized light coupling system to achieve outstanding performance with very low power consumption.

Common mode noise rejection has been improved on several of our optocouplers. Enhanced performance up to 15 kV/ $\mu$ s and a Vcm of 1500 volts are available.

Hewlett-Packard offers a new miniature solid-state relay featuring withstand voltages of 200 V; and current rating of 40 mA. This 4 pin dual in-line package (DIP) product offers the reliability and long life required in instrumentation, telecommunication, and

industrial control applications. The HSSR-8200 replaces electromechanical relays now used in signal and low power switching applications.

Furthermore, with Hewlett-Packard's solid-state relays you get lower power dissipation as a result of the 1 mA control current requirement. The HSSR-8200 features an output with very low leakage current, offset voltage, and capacitance which permits the design of multiplexers that require greater measurement accuracy.

A Selection Flowchart has been added immediately following this introduction to facilitate selection of the correct optocoupler or solid state relay for your application.

## Product Safety Regulations and Optocouplers

Optocouplers are frequently used to optically connect a signal line to an electrical circuit in a piece of equipment. Besides providing signal isolation, the optocoupler may be used to provide high voltage insulation. It does this by preventing voltage transients on

a signal line from affecting the equipment, and by preventing high voltage powerline transients, which may be present inside the box, from reaching an equipment user.

Because optocouplers perform this safety function, they are regulated by many national safety agencies. They can be regulated in two ways: at a component level, as UL (US) and VDE (West Germany) do and at an electrical system or sub-system level. Additional national agencies that have regulations concerning optocouplers include BSI (UK), CSA (Canada), and FEI (Finland).

The key items that are regulated are insulation integrity under an array of use conditions, flammability, and in the case of telecommunications applications, ability to protect the telecom network and equipment connected to it. Different types of equipment have different levels of requirements.

### **Insulation Coordination**

The equipment designer selecting an optocoupler to provide insulation uses the principles of insulation coordination found in the IEC 664 and 664A (1980 and 1981). The optocoupler must block both the working voltage and allowable transients. The driving factors are power line (or working) voltage, installation classification, and pollution degree. The higher the installation class, the higher the magnitude of transient voltages

on the line can be. The power line voltage and the max rated impulse value together determine the CLEARANCE (distance through air between input metal and output metal).

The power line voltage, pollution degree, and CTI (comparative tracking index) of the molding compound determine the CREEPAGE, (minimum distance along the surface of the package from input metal to output metal). Pollution degree comes from the end-use application and corresponds to the conductivity of dust, dirt, water, etc. that the optocoupler may be exposed to. The higher the CTI, the more resistant the material is to electrical arc tracking, so the creepage distances can be smaller.

### **VDE 0883 and 0884**

There are currently two VDE standards that govern optocouplers, VDE 0883 and its successor, VDE 0884. As of January 1990 VDE 0883 approval will no longer be granted for new equipment. A grandfather clause will be in effect for two years to allow time for recertification under VDE 0884. There are two basic differences between the standards: the dielectric voltage test and the manner in which the parts are evaluated for equipment applications. The production dielectric test in VDE 0883 is a one-minute withstand test of four times the working voltage plus one kilovolt AC. The production test in VDE 0884 is a more sensitive test which measures partial discharge carried out at a lower

voltage to guarantee the integrity of the insulation. Parts submitted under VDE 0883 would also be evaluated for suitability for various equipment applications. Each equipment standard is listed separately on the optocoupler license. This will no longer be the case under VDE 0884. VDE 0884 is a safety standard, VDE 0883 was not. The partial discharge testing of VDE 0884 more thoroughly guarantees the insulation integrity than VDE 0883 could. VDE supplies a letter saying which equipment standards the VDE 0884 optocoupler is suitable for.

Currently, all Hewlett-Packard plastic bipolar optocouplers are certified to VDE 0883 and UL 1577. In addition, the CNW family of "widebody" optocouplers and the HCPL-7100 CMOS optocoupler are certified to VDE 0884 and have received other approvals from agencies worldwide.

Please see the data sheets of these products for a complete list.

### **Optocoupler for Safe Electrical Separation per VDE 0884**

Optocouplers providing safe electrical separation per VDE 0884 do so only within the safety-limiting values to which they are qualified. Protective cut-out switches must be used to ensure that the safety limits are not exceeded.

The partial discharge measurement ensures that no partial discharge will occur

during operation at maximum allowable working insulation voltage ( $V_{\text{INITIAL}}$ ). Prolonged partial discharge degrades the insulation material and can lead to high voltage breakdown.

The Mains Voltage and Installation Class desired determines the required voltages for Type and Production testing. For example, if the mains voltage is 300 volts and the Installation

Class desired is Class III, then  $V_{\text{INITIAL}}$  must be 2828 Vrms (4000 V peak).  $V_{\text{PR}}$  is determined from the value of  $V_{\text{IORM}}$ . See Figure 1 and Table 1 below.

TIME -- TEST VOLTAGE DIAGRAM IN ACC. WITH VDE 0884

Figure 1.

Table 1.

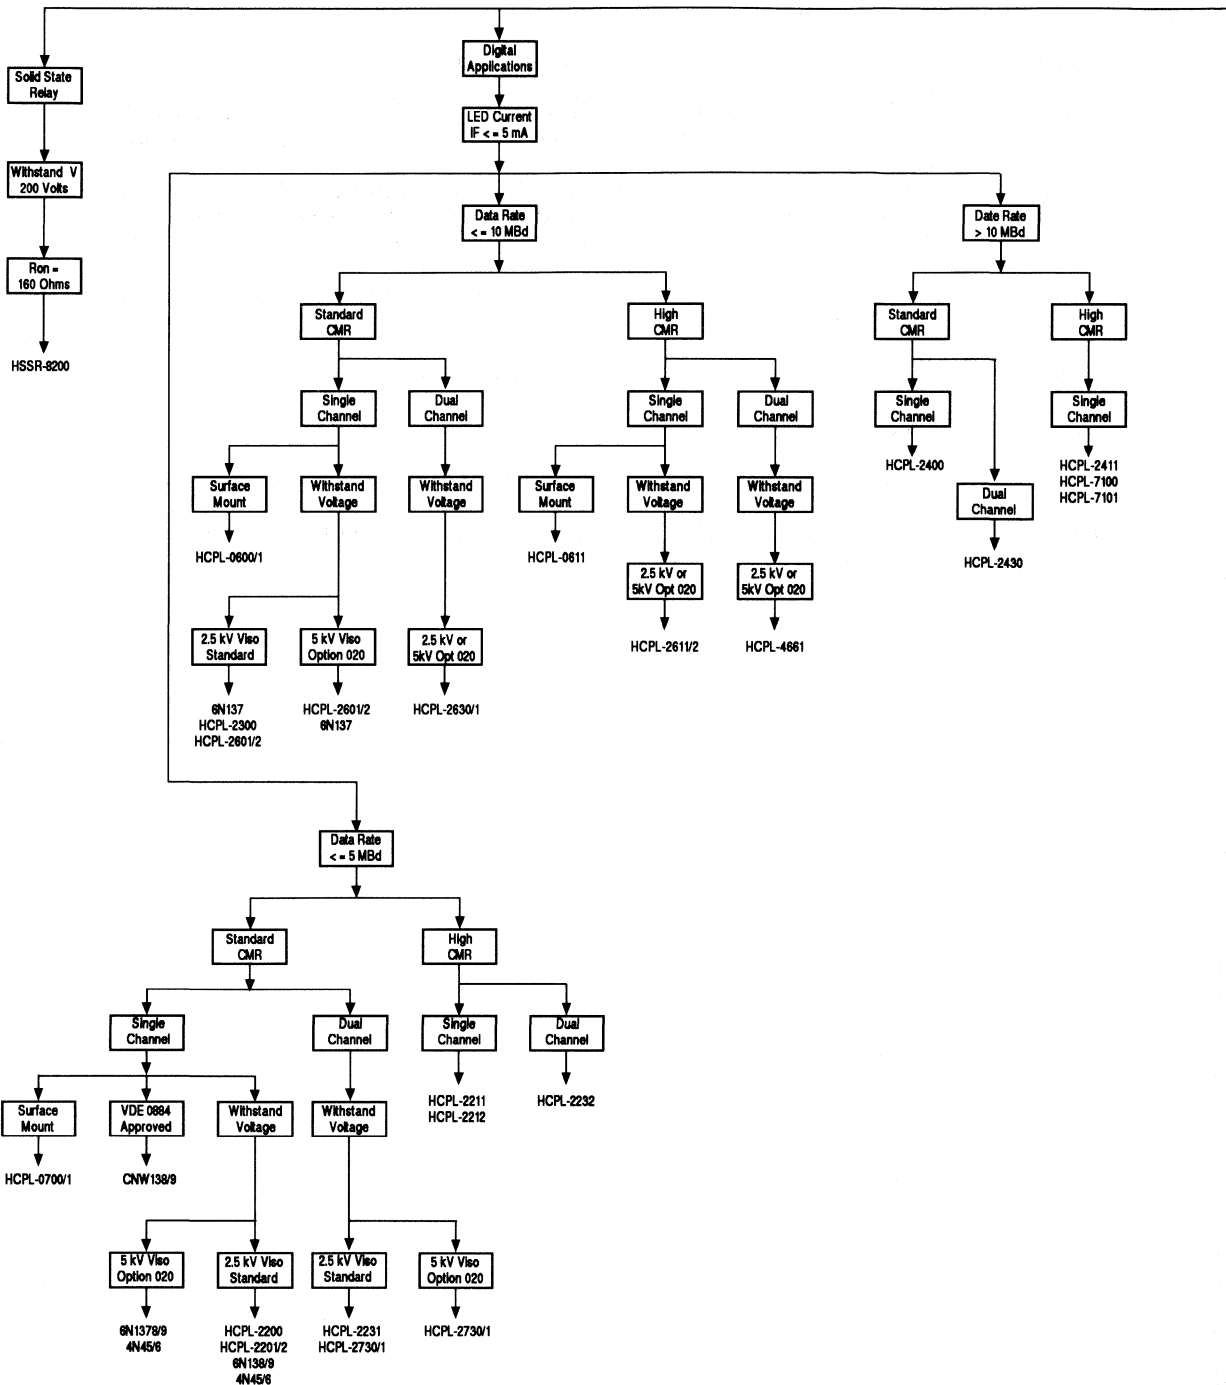

Mains Voltage (RMS) $V_{\text{IORM}}$	Preferred Insulation Test Voltages for Service Class ( $V_{\text{INITIAL}}$ )							
	I		II		III		IV	
	PEAK (VAC)	RMS	PEAK (VAC)	RMS	PEAK (VAC)	RMS	PEAK (VAC)	RMS
50	330	233	500	353	800	565	1500	1060
100	500	353	800	565	1500	1060	2500	1767
150	800	656	1500	1060	2500	1767	4000	2828
300	1500	1060	2500	1767	4000	2828	6000	4242
600	2500	1767	4000	2828	6000	4242	8000	5656
1000	4000	2828	6000	4242	8000	5656	12000	8484

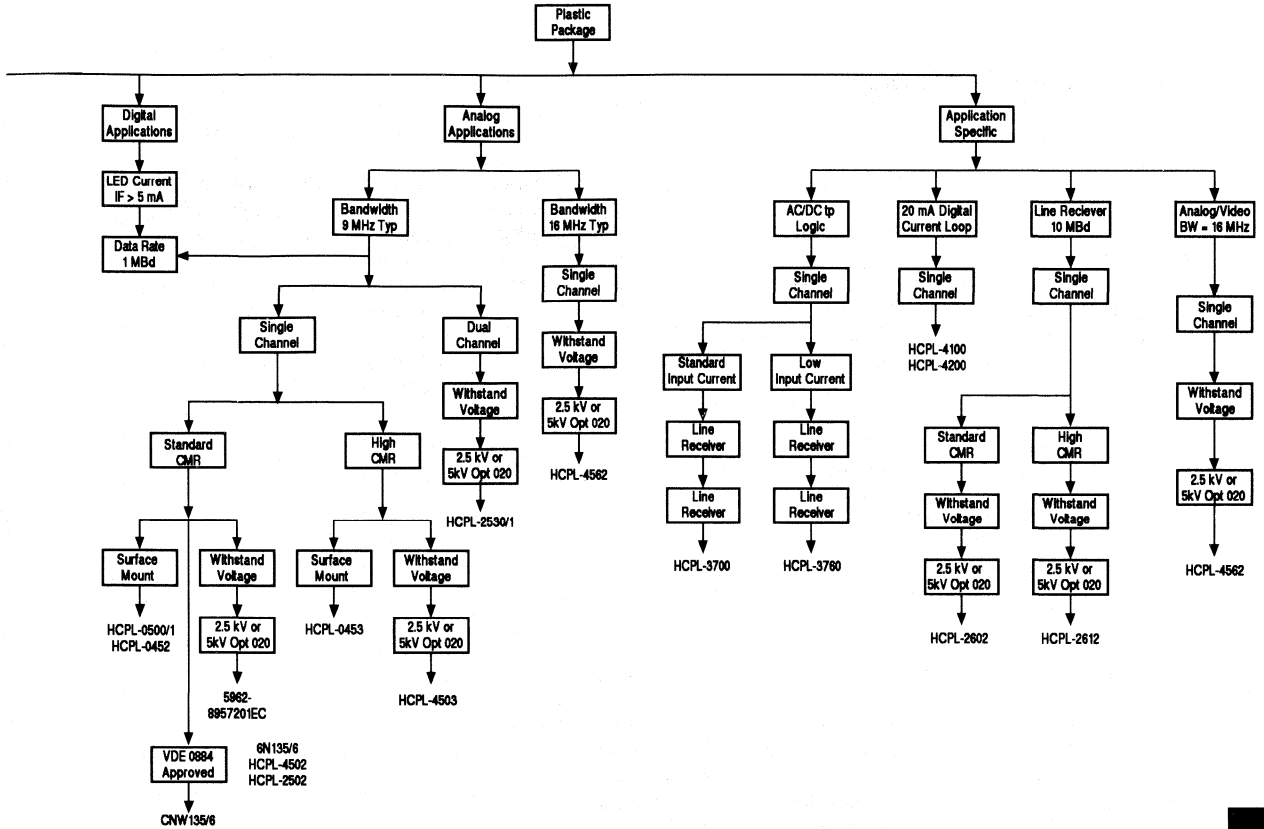

Either the peak AC or the RMS ac test voltage can be used in this test. In the case of the AOT VISO-700 tester the RMS test voltage has to be used because test voltage settings are in RMS.

## Definition of Terms Used in the Qualification Test Diagram

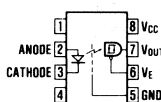

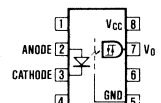

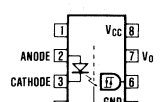

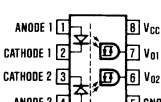

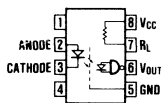

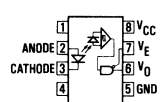

Term Name	Definition
$V_{\text{INITIAL}}$	Maximum test voltage applied to device under test. This voltage is determined from the Mains Voltage rating and the preferred insulation test voltage by service class.
$V_{\text{PR}}$	Test voltage applied to the device to verify isolation capacity. This voltage is usually 1.2 times the mains rating ( $V_{\text{IORM}}$ ) for Procedure a and 1.6 times $V_{\text{IORM}}$ for Procedure b.
$V_{\text{IORM}}$	Maximum continuous voltage which may be applied to device. Also known as the mains voltage in Table 2, above.
$T_p$	Test time for partial discharge testing and equals 60 seconds.
T (ini)	Time at $V_{\text{INITIAL}}$ test voltage and equals 10 seconds.
T1, T2, T3, T4	These test times are preset by the VISO-700 and are not to be adjusted.
Pass/Fail Criteria	No leakage failures and no unit to have more than 5 pC Partial Discharge during partial discharge test time $T_p$ .

# LOW INPUT CURRENT LOGIC GATE OPTOCOUPLER

HCPL-2200  
HCPL-2219

## Features

- **VERY HIGH COMMON MODE REJECTION**  
2.5 KV/ $\mu$ S AT 400 V  $V_{CM}$  GUARANTEED (HCPL-2219)
- **COMPATIBLE WITH LSTTL, TTL, AND CMOS LOGIC**
- **WIDE  $V_{CC}$  RANGE (4.5 TO 20 VOLTS)**
- **2.5 MBAUD GUARANTEED OVER TEMPERATURE**
- **LOW INPUT CURRENT (1.6 mA)**
- **THREE STATE OUTPUT (NO PULLUP RESISTOR REQUIRED)**
- **GUARANTEED PERFORMANCE FROM 0° C TO +85° C**
- **INTERNAL SHIELD FOR HIGH COMMON MODE REJECTION**
- **RECOGNIZED UNDER THE COMPONENT PROGRAM OF U.L. (FILE NO. E55361) FOR DIELECTRIC WITHSTAND PROOF TEST VOLTAGES OF 2500 Vac, 1 MINUTE**
- **VDE 0883 APPROVAL AVAILABLE**
- **MIL-STD-1772 VERSION AVAILABLE (HCPL-5200/1)**

## Applications

- Isolation of High Speed Logic Systems
- Computer-Peripheral Interfaces
- Microprocessor System Interfaces
- Ground Loop Elimination
- Pulse Transformer Replacement
- Isolated Buss Driver
- High Speed Line Receiver

## Description

The HCPL-2200 is an optically coupled logic gate that combines a GaAsP LED and an integrated high gain photon

detector. The detector has a three state output stage and has a detector threshold with hysteresis. The three state output eliminates the need for a pullup resistor and allows for direct drive of data busses. The hysteresis provides differential mode noise immunity and eliminates the potential for output signal chatter. The detector IC has an internal shield that provides a guaranteed common mode transient immunity of 1,000 volts/ $\mu$ sec. Higher CMR specifications are available upon request.

The Electrical and Switching Characteristics of the HCPL-2200 are guaranteed over the temperature range of 0° C to 85° C. The HCPL-2200 is guaranteed to operate over a  $V_{CC}$  range of 4.5 volts to 20 volts. Low  $I_F$  and wide  $V_{CC}$  range allow compatibility with TTL, LSTTL, and CMOS logic. Low  $I_F$  and low  $I_{CC}$  result in lower power consumption compared to other high speed optocouplers. Logic signals are transmitted with a typical propagation delay of 160 nsec.

The HCPL-2200 is useful for isolating high speed logic interfaces, buffering of input and output lines, and implementing isolated line receivers in high noise environments.

## Recommended Operating Conditions

Parameter	Symbol	Min.	Max.	Units
Power Supply Voltage	$V_{CC}$	4.5	20	Volts
Enable Voltage High	$V_{EH}$	2.0	20	Volts
Enable Voltage Low	$V_{EL}$	0	0.8	Volts
Forward Input Current	$I_{F(ON)}$	1.6*	5	mA
Forward Input Current	$I_{F(OFF)}$	—	0.1	mA
Operating Temperature	$T_A$	0	85 <sup>(1)</sup>	°C
Fan Out	N		4	TTL Loads

\*The initial switching threshold is 1.6 mA or less. It is recommended that 2.2 mA be used to permit at least a 20% CTR degradation guardband.

The 120 pF capacitor may be omitted in applications where 500 ns propagation delay is sufficient.

**Notes:**

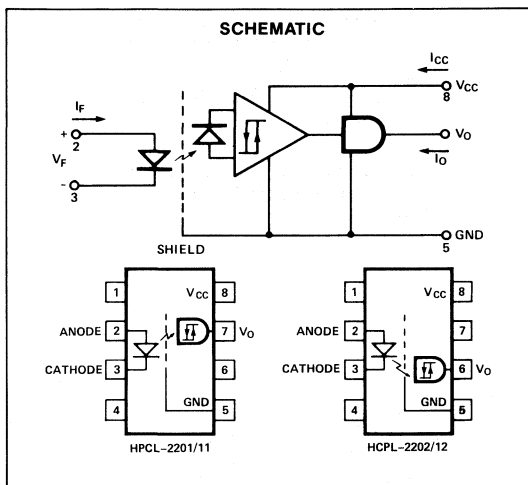

- Derate total package power dissipation, P, linearly above 70°C free air temperature at a rate of 4.5 mW/°C.
- Duration of output short circuit time should not exceed 10 ms.
- Device considered a two terminal device: pins 1, 2, 3 and 4 shorted together, and pins 5, 6, 7 and 8 shorted together.
- The tPLH propagation delay is measured from the 50% point on the leading edge of the input pulse to the 1.3V point on the leading edge of the output pulse. The tPHL propagation delay is measured from the 50% point on the trailing edge of the input pulse to the 1.3V point on the trailing edge of the output pulse.
- When the peaking capacitor is omitted, propagation delay times may increase by 100 ns.
- CML is the maximum rate of rise of the common mode voltage that can be sustained with the output voltage in the logic low state (VO < 0.8V). CMH is the maximum rate of fall of the common mode voltage that can be sustained with the output voltage in the logic high state (VO > 2.0V).
- Use of a 0.1 μF bypass capacitor connected between pins 5 and 8 is recommended.

## Description

The HCPL-2201/02/11/12 are single-channel, optically-coupled logic gates. The detectors have totem pole output stages and optical receiver input stages with built-in Schmitt triggers to provide logic-compatible waveforms, eliminating the need for additional waveshaping.

A superior internal shield on the HCPL-2211/12 guarantees common mode transient immunity of 5,000  $V/\mu s$  at a common mode voltage of 300 volts.

The electrical and switching characteristics of the HCPL-2201/02/11/12 are guaranteed from  $-40^{\circ}C$  to  $+85^{\circ}C$  and a  $V_{CC}$  from 4.5 volts to 20 volts. Low  $I_F$  and wide  $V_{CC}$  range allow compatibility with TTL, LSTTL, and CMOS logic and result in lower power consumption compared to other high speed couplers. Logic signals are transmitted with a typical propagation delay of 150 ns.

# VERY HIGH CMR, WIDE $V_{CC}$ DUAL LOGIC GATE OPTOCOUPLER

HCPL-2231  
HCPL-2232

## Features

- **VERY HIGH COMMON MODE REJECTION**  
5  $\text{KV}/\mu\text{s}$  AT 300 V GUARANTEED (HCPL-2232)
- **WIDE  $V_{CC}$  RANGE (4.5 TO 20 VOLTS)**
- **300 ns PROPAGATION DELAY GUARANTEED OVER THE FULL TEMPERATURE RANGE**
- **5 Mb/d TYPICAL SIGNAL RATE**
- **LOW INPUT CURRENT (1.8 mA)**
- **TOTEM POLE OUTPUT (NO PULLUP RESISTOR REQUIRED)**
- **GUARANTEED PERFORMANCE FROM  $-40^{\circ}\text{C}$  TO  $+85^{\circ}\text{C}$**
- **RECOGNIZED UNDER THE COMPONENT PROGRAM OF U.L. (FILE NO. E55361) FOR DIELECTRIC WITHSTAND PROOF TEST VOLTAGES OF 2500 Vac, 1 MINUTE**
- **VDE 0883 APPROVAL AVAILABLE**
- **MIL-STD-1772 VERSION AVAILABLE (HCPL-5230/1)**

## Applications

- **ISOLATION OF HIGH SPEED LOGIC SYSTEMS**
- **COMPUTER-PERIPHERAL INTERFACES**
- **MICROPROCESSOR SYSTEM INTERFACES**
- **GROUND LOOP ELIMINATION**
- **PULSE TRANSFORMER REPLACEMENT**
- **HIGH SPEED LINE RECEIVER**

## Description

The HCPL-2231/2 are dual-channel, optically-coupled logic gates. The detectors have totem pole output stages and optical receiver input stages with built-in Schmitt triggers to provide logic compatible waveforms, eliminating the need for additional waveshaping.

A superior internal shield on the HCPL-2232 guarantees common mode transient immunity of 5,000  $\text{V}/\mu\text{s}$  at a common mode voltage of 300 volts.

The electrical and switching characteristics of the HCPL-2231/2 are guaranteed from  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  and a  $V_{CC}$  from 4.5 volts to 20 volts. Low  $I_F$  and wide  $V_{CC}$  range allow compatibility with TTL, LSTTL, and CMOS logic and result in lower power consumption compared to other high speed couplers. Logic signals are transmitted with a typical propagation delay of 150 ns.

## Recommended Operating Conditions

Parameter	Symbol	Min.	Max.	Units
Power Supply Voltage	$V_{CC}$	4.5	20	Volts
Input Current (High)	$I_{F(ON)}$	1.8*	5	mA
Input Voltage (Low)	$V_{F(OFF)}$	—	0.8	Volts
Operating Temperature	$T_A$	-40	85	$^{\circ}\text{C}$
Fan Out per Channel	N		4	TTL Loads

\*The initial switching threshold is 1.8 mA or less. It is recommended that 2.5 mA be used to permit at least a 20% CTR degradation guardband.

- **MICROPROCESSOR SYSTEM INTERFACES**
- **DIGITAL ISOLATION FOR A/D, D/A CONVERSION**
- **RS-232-C INTERFACE**
- **HIGH SPEED, LONG DISTANCE ISOLATED LINE RECEIVER**

## Description

The HCPL-2300 optocoupler combines an 820 nm AlGaAs photon emitting diode with an integrated high gain photon detector. This combination of Hewlett-Packard designed and manufactured semiconductor devices brings new high performance capabilities to designers of isolated logic and data communication circuits.

The new low current, high speed AlGaAs emitter manufactured with a unique diffused junction, has the virtue of fast rise and fall times at low drive currents. Figure 6 illustrates the propagation delay vs. input current characteristic. These unique characteristics enable this device to be used in an RS-232-C interface with ground loop isolation and improved common mode rejection. As a line receiver, the HCPL-2300 will operate over longer line lengths for a given data rate because of lower  $I_F$  and  $V_F$  specifications.

The output of the shielded integrated detector circuit is an open collector Schottky clamped transistor. The shield, which shunts capacitively coupled common mode noise to ground, provides a guaranteed transient immunity specification of  $100 \text{ V}/\mu\text{s}$ . The output circuit includes an optional integrated 1000 Ohm pull-up resistor for the open collector. This gives designers the flexibility to use the internal resistor for pull-up to five volt logic or to use an external resistor for 18 volt CMOS logic.

The Electrical and Switching Characteristics of the HCPL-2300 are guaranteed over a temperature range of  $-40^\circ\text{C}$  to  $85^\circ\text{C}$ . This enables the user to confidently design a circuit which will operate under a broad range of operating conditions.

# Applications

The HCPL-2300 optocoupler has the unique combination of low 0.5 mA LED operating drive current at a 5 MBd speed performance. Low power supply current requirement of 10 mA maximum and the ability to provide isolation between logic systems fulfills numerous applications ranging from logic level translations, line receiver and party line receiver applications, microprocessor I/O port isolation, etc. The open collector output allows for wired-OR arrangement. Specific interface circuits are illustrated in Figures 11 through 18 with corresponding component values, performance data and recommended layout.

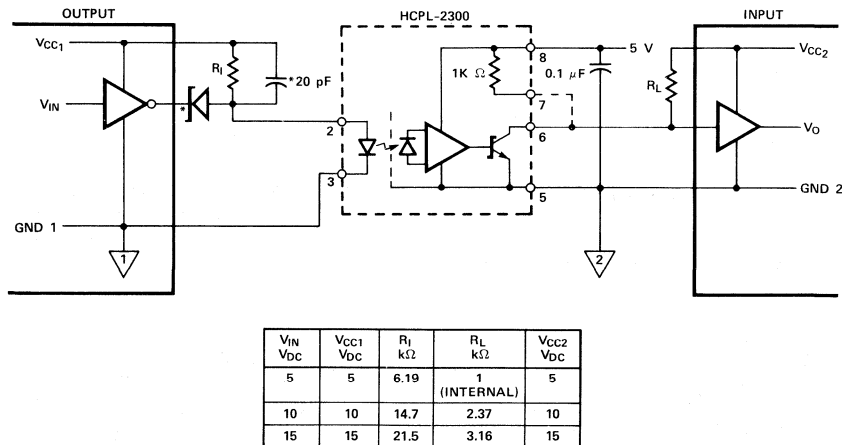

For  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  operating temperature range, a mid range LED forward current ( $I_F$ ) of 0.625 mA is recommended in order to prevent overdriving the integrated circuit detector due to increased LED efficiency at temperatures between  $0^{\circ}\text{C}$  and  $-40^{\circ}\text{C}$ . For narrower temperature range of  $0^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ , a suggested operating LED current of 0.75 mA is recommended for the mid range operating point and for minimal propagation delay skew. A peaking capacitance of 20 pF in parallel with the current limiting resistor for the LED shortens  $t_{PHL}$  by approximately 33% and  $t_{PLH}$  by 13%. Maintaining LED forward voltage ( $V_F$ ) below 0.8 V will guarantee that the HCPL-2300 output is off.

The recommended shunt drive technique for TTL/LSTTL/CMOS of Figure 11 provides for optimal speed performance, no leakage current path through the LED, and reduced common mode influences associated with series switching of a "floating" LED. Alternate series drive techniques with either an active CMOS inverter or an open col-

lector TTL/LSTTL inverter are illustrated in Figures 12 and 13 respectively. Open collector leakage current of  $250\ \mu\text{A}$  has been compensated by the 3.16K Ohms resistor (Figure 13) at the expense of twice the operating forward current.

An application of the HCPL-2300 as an unbalanced line receiver for use in long line twisted wire pair communication links is shown in Figure 14. Low LED  $I_F$  and  $V_F$  allow longer line length, higher speed and multiple stations on the line in comparison to higher  $I_F$ ,  $V_F$  optocouplers. Greater speed performance along with nearly infinite common mode immunity are achieved via the balanced split phase circuit of Figure 15. Basic balanced (differential line receiver can be accomplished with one HCPL-2300 in Figure 15, but with a typical  $400\ \text{V}/\mu\text{s}$  common mode immunity. Data rate versus distance for both the above unbalanced and balanced line receiver applications are compared in Figure 16. The RS-232-C interface circuit of Figure 17 provides guaranteed minimum common mode immunity of  $100\ \text{V}/\mu\text{s}$  while maintaining the 2:1 dynamic range of  $I_F$ .

A recommended layout for use with an internal 1000 Ohms resistor or an external pull-up resistor and required  $V_{CC}$  bypass capacitor is given in Figure 18.  $V_{CC1}$  is used with an external pull-up resistor for output voltage levels ( $V_O$ ) greater than or equal to 5 V. As illustrated in Figure 18, an optional  $V_{CC}$  and GND trace can be located between the input and the output leads of the HCPL-2300 to provide additional noise immunity at the compromise of insulation capability ( $V_{I-O}$ ).

\*SCHOTTKY DIODE (HP 5082-2800, OR EQUIVALENT) AND 20 pF CAPACITOR ARE NOT REQUIRED FOR UNITS WITH OPEN COLLECTOR OUTPUT.

NOTES:

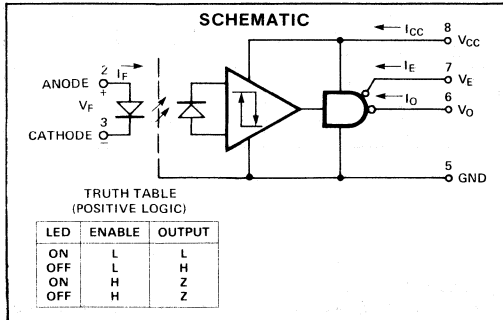

1. Bypassing the power supply line is required with a  $0.1 \mu\text{F}$  ceramic disc capacitor adjacent to each optocoupler as illustrated in Figure 18. The power supply bus for the optocoupler(s) should be separate from the bus for any active loads, otherwise a larger value of bypass capacitor (up to  $0.1 \mu\text{F}$ ) may be needed to suppress regenerative feedback via the power supply.
2. Peaking circuits may produce transient input currents up to 100 mA, 500 ns maximum pulse width, provided average current does not exceed 5 mA.
3. Device considered a two terminal device: pins 1, 2, 3 and 4 shorted together, and pins 5, 6, 7 and 8 shorted together.
4. The  $t_{PLH}$  propagation delay is measured from the 50% point on the trailing edge of the input pulse to the 1.5 V point on the trailing edge of the output pulse.
5. The  $t_{PHL}$  propagation delay is measured from the 50% point on the leading edge of the input pulse to the 1.5 V point on the leading edge of the output pulse.
6.  $CM_H$  is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state (i.e.,  $V_{OUT} > 2.0 \text{ V}$ ).
7.  $CM_L$  is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state (i.e.,  $V_{OUT} < 0.8 \text{ V}$ ).
8.  $C_p$  is the peaking capacitance. Refer to test circuit in Figure 8.

## Description

The HCPL-2400/11 high speed optocouplers combine an 820 nm AlGaAs light emitting diode with a high speed photo-detector. This combination results in very high data rate capability and low input current. The three state output eliminates the need for a pull-up resistor and allows for direct drive of data buses. The hysteresis provides differential mode noise immunity and minimizes the potential for output signal chatter. Improved power supply rejection minimizes the need for special power supply bypassing precautions.

The electrical and switching characteristics of the HCPL-2400/11 are guaranteed over the temperature range of 0°C to 70°C.

The HCPL-2400/11 are compatible with TTL, STTL, LSTTL and HCMOS logic families. When Schottky type TTL devices (STTL) are used, a data rate performance of 20 MBd over temperature is guaranteed when using the application circuit of Figure 13. Typical data rates are 40 MBd.

### Notes:

- Duration of output short circuit time not to exceed 10 ms.
- Device considered a two terminal device: pins 1-4 shorted together, and pins 5-8 shorted together.
- t<sub>PHL</sub> propagation delay is measured from the 50% level on the rising edge of the input current pulse to the 1.5 V level on the falling edge of the output pulse. The t<sub>PLH</sub> propagation delay is measured from the 50% level on the falling edge of the input current pulse to the 1.5 V level on the rising edge of the output pulse.
- This specification simulates the worst case operating conditions of the HCPL-2400/11 over the recommended operating temperature and V<sub>CC</sub> range with the suggested applications circuit of Figure 13.
- Propagation delay skew is discussed later in this data sheet.
- CM<sub>H</sub> is the maximum slew rate of common mode voltage that can be sustained with the output voltage in the logic high state (V<sub>O(MIN)</sub> > 2.0 V). CM<sub>L</sub> is the maximum slew rate of common mode voltage that can be sustained with the output voltage in the logic low state (V<sub>O(MAX)</sub> < 0.8 V).
- Power Supply Noise Immunity is the peak to peak amplitude of the ac ripple voltage on the V<sub>CC</sub> line that the device will withstand and still remain in the desired logic state. For desired logic high state, V<sub>OH(MIN)</sub> > 2.0 V, and for desired logic low state, V<sub>OL(MAX)</sub> < 0.8 volts.
- Peak Forward Input Current pulse width < 50 μs at 1 KHz maximum repetition rate.
- Use of a 0.1 μF bypass capacitor connected between pins 5 and 8 is recommended.

Figure 15. Illustration of Propagation Delay Skew —  $t_{PSK}$ .

## Propagation Delay, Pulse-Width Distortion and Propagation Delay Skew

Propagation delay is a figure of merit which describes how quickly a logic signal propagates through a system. The propagation delay from low to high ( $t_{PLH}$ ) is the amount of time required for an input signal to propagate to the output, causing the output to change from low to high. Similarly, the propagation delay from high to low ( $t_{PHL}$ ) is the amount of time required for the input signal to propagate to the output, causing the output to change from high to low (see Figure 5).

Pulse-width distortion (PWD) results when  $t_{PLH}$  and  $t_{PHL}$  differ in value. PWD is defined as the difference between  $t_{PLH}$  and  $t_{PHL}$  and often determines the maximum data rate capability of a transmission system. PWD can be expressed in percent by dividing the PWD (in ns) by the minimum pulse width (in ns) being transmitted. Typically, PWD on the order of 20–30% of the minimum pulse width is tolerable; the exact figure depends on the particular application (RS232, RS422, T-1, etc.).

Propagation delay skew,  $t_{PSK}$ , is an important parameter to consider in parallel data applications where synchronization of signals on parallel data lines is a concern. If the parallel data is being sent through a group of optocouplers, differences in propagation delays will cause the data to arrive at the outputs of the optocouplers at different times. If this difference in propagation delays is large enough, it will determine the maximum rate at which parallel data can be sent through the optocouplers.

Propagation delay skew is defined as the difference between the minimum and maximum propagation delays, either  $t_{PLH}$  or  $t_{PHL}$  for any given group of optocouplers which are operating under the same conditions (i.e., the same drive current, supply voltage, output load, and operating temperature). As illustrated in Figure 15, if the inputs of a group of

optocouplers are switched either ON or OFF at the same time,  $t_{PSK}$  is the difference between the shortest propagation delay, either  $t_{PLH}$  or  $t_{PHL}$ , and the longest propagation delay, either  $t_{PLH}$  or  $t_{PHL}$ .

As mentioned earlier,  $t_{PSK}$  can determine the maximum parallel data transmission rate. Figure 16 is the timing diagram of a typical parallel data application with both the clock and the data lines being sent through optocouplers. The figure shows data and clock signals at the inputs and outputs of the optocouplers. To obtain the maximum data transmission rate, both edges of the clock signal are being used to clock the data; if only one edge were used, the clock signal would need to be twice as fast.

Propagation delay skew represents the uncertainty of where an edge might be after being sent through an optocoupler. Figure 16 shows that there will be uncertainty in both the data and the clock lines. It is important that these two areas of uncertainty not overlap, otherwise the clock signal might arrive before all of the data outputs have settled, or some of the data outputs may start to change before the clock signal has arrived. From these considerations, the absolute minimum pulse width that can be sent through optocouplers in a parallel application is twice  $t_{PSK}$ . A cautious design should use a slightly longer pulse width to ensure that any additional uncertainty in the rest of the circuit does not cause a problem.

The HCPL-2400/11 optocouplers offer the advantages of guaranteed specifications for propagation delays, pulse-width distortion, and propagation delay skew over the recommended temperature, input current, and power supply ranges.

Figure 16. Parallel Data Transmission Example.

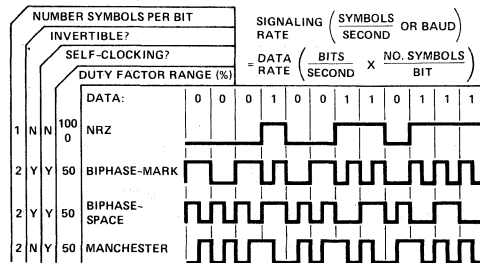

Figure 17. Modulation Code Selections

## Application Circuit

A recommended LED drive circuit is shown in Figure 13. This circuit utilizes several techniques to minimize the total pulse-width distortion at the output of the optocoupler. By using two inverting TTL gates connected in series, the inherent pulse-width distortion of each gate cancels the distortion of the other gate. For best results, the two series-connected gates should be from the same package.

The circuit in Figure 13 also uses techniques known as prebias and peaking to enhance the performance of the optocoupler LED. Prebias is a small forward voltage applied to the LED when the LED is off. This small prebias voltage partially charges the junction capacitance of the LED, allowing the LED to turn on more quickly. The speed of the LED is further increased by applying momentary current peaks to the LED during the turn-on and turn-off transitions of the drive current. These peak currents help

to charge and discharge the capacitances of the LED more quickly, shortening the time required for the LED to turn on and off.

Switching performance of the HCPL-2400/11 optocouplers is not sensitive to the TTL logic family used in the recommended drive circuit. The typical and worst-case switching parameters given in the data sheet can be met using common 74LS TTL inverting gates or buffers. Use of faster TTL families will slightly reduce the overall propagation delays from the input of the drive circuit to the output of the optocoupler, but will not necessarily result in lower pulse-width distortion or propagation delay skew. This reduction in overall propagation delays is due to shorter delays in the drive circuit, not to changes in the propagation delays of the optocoupler; optocoupler propagation delays are not affected by the speed of the logic used in the drive circuit.

## Description

The HCPL-2430 high speed optocoupler combines an 820 nm AlGaAs LED with a high speed photo detector. This combination results in very high data rate capability and low input current. The totem pole output eliminates the need for a pull-up resistor.

The detectors have totem pole output stages and optical receiver input stages with built-in Schmitt triggers to provide logic compatible waveforms, eliminating the need for additional waveshaping. Improved power supply rejection minimizes the need for special power supply bypassing precautions; however, it is still recommended as good design practice.

The electrical and switching characteristics of the HCPL-2430 are guaranteed over the temperature range of 0°C to 70°C.

The HCPL-2430 is compatible with TTL, STTL, LSTTL and HCMOS logic families. A data rate performance of 20 MBd over temperature is guaranteed when using the application circuit of Figure 10. Typical data rates are 40 MBd.

### Notes:

- Each channel.
- Duration of output short circuit time should not exceed 10 ms.
- Device considered a two terminal device: pins 1, 2, 3 and 4 shorted together, and pins 5, 6, 7 and 8 shorted together.
- The  $t_{PLH}$  propagation delay is measured from the 50% point on the leading edge of the input pulse to the 1.3 V point on the leading edge of the output pulse. The  $t_{PHL}$  propagation delay is measured from the 50% point on the trailing edge of the input pulse to the 1.3 V point on the trailing edge of the output pulse.
- The typical data shown is indicative of what can be expected using the application circuit in Figure 11.
- Propagation delay skew is discussed later in this data sheet.
- $CM_H$  is the maximum slew rate of common mode voltage that can be sustained with the output voltage in the logic high state ( $V_{O(MIN)} > 2.0\text{ V}$ ).  $CM_L$  is the maximum slew rate of common mode voltage that can be sustained with the output voltage in the logic low state ( $V_{O(MAX)} < 0.8\text{ V}$ ).
- Power Supply Noise Immunity is the peak to peak amplitude of the ac ripple voltage on the  $V_{CC}$  line that the device will withstand and still remain in the desired logic state. For desired logic high state,  $V_{OH(MIN)} > 2.0\text{ V}$ , and for desired logic low state, ( $V_{OL(MAX)} < 0.8\text{ V}$ ).
- Peak Forward Input Current pulse width  $< 50\ \mu\text{s}$  at 1 KHz maximum repetition rate.
- Derate power dissipation above  $70^{\circ}\text{C}$  at  $6.0\text{ mW}/^{\circ}\text{C}$ .
- Measured between pins 1 and 2, shorted together, and pins 3 and 4, shorted together.
- Use of a  $0.1\ \mu\text{F}$  bypass capacitor connected between pins 5 and 8 is recommended.

# Propagation Delay, Pulse-Width Distortion and Propagation Delay Skew

Propagation delay is a figure of merit which describes how quickly a logic signal propagates through a system. The propagation delay from low to high ( $t_{PLH}$ ) is the amount of time required for an input signal to propagate to the output, causing the output to change from low to high. Similarly, the propagation delay from high to low ( $t_{PHL}$ ) is the amount of time required for the input signal to propagate to the output, causing the output to change from high to low (see Figure 5).

Pulse-width distortion (PWD) results when  $t_{PLH}$  and  $t_{PHL}$  differ in value. PWD is defined as the difference between  $t_{PLH}$  and  $t_{PHL}$  and often determines the maximum data rate capability of a transmission system. PWD can be expressed in percent by dividing the PWD (in ns) by the minimum pulse width (in ns) being transmitted. Typically, PWD on the order of 20-30% of the minimum pulse width is tolerable; the exact figure depends on the particular application (RS232, RS422, T-1, etc.).

Propagation delay skew,  $t_{PSK}$ , is an important parameter to consider in parallel data applications where synchronization of signals on parallel data lines is a concern. If the parallel data is being sent through a group of optocouplers, differences in propagation delays will cause the data to arrive at the outputs of the optocouplers at different times. If this difference in propagation delays is large enough, it will determine the maximum rate at which parallel data can be sent through the optocouplers.

Propagation delay skew is defined as the difference between the minimum and maximum propagation delays, either  $t_{PLH}$  or  $t_{PHL}$ , for any given group of optocouplers which are operating under the same conditions (i.e., the same drive current, supply voltage, output load, and operating temper-

ature). As illustrated in Figure 11, if the inputs of a group of optocouplers are switched either ON or OFF at the same time,  $t_{PSK}$  is the difference between the shortest propagation delay, either  $t_{PLH}$  or  $t_{PHL}$ , and the longest propagation delay, either  $t_{PLH}$  or  $t_{PHL}$ .

As mentioned earlier,  $t_{PSK}$  can determine the maximum parallel data transmission rate. Figure 12 is the timing diagram of a typical parallel data application with both the clock and the data lines being sent through optocouplers. The figure shows data and clock signals at the inputs and outputs of the optocouplers. To obtain the maximum data transmission rate, both edges of the clock signal are being used to clock the data; if only one edge were used, the clock signal would need to be twice as fast.

Propagation delay skew represents the uncertainty of where an edge might be after being sent through an optocoupler. Figure 12 shows that there will be uncertainty in both the data and the clock lines. It is important that these two areas of uncertainty not overlap, otherwise the clock signal might arrive before all of the data outputs have settled, or some of the data outputs may start to change before the clock signal has arrived. From these considerations, the absolute minimum pulse width that can be sent through optocouplers in a parallel application is twice  $t_{PSK}$ . A cautious design should use a slightly longer pulse width to ensure that any additional uncertainty in the rest of the circuit does not cause a problem.

The HCPL-2430 optocoupler offers the advantages of guaranteed specifications for propagation delays, pulse-width distortion and propagation delay skew over the recommended temperature, input current, and power supply ranges.

Figure 11. Illustration of Propagation Delay Skew —  $t_{PSK}$ .

Figure 12. Parallel Data Transmission Example.

## Application Circuit

A recommended LED drive circuit is shown in Figure 11. This circuit utilizes several techniques to minimize the total pulse-width distortion at the output of the optocoupler. By using two inverting TTL gates connected in series, the inherent pulse-width distortion of each gate cancels the distortion of the other gate. For best results, the two series-connected gates should be from the same package.

The circuit in Figure 11 also uses techniques known as prebias and peaking to enhance the performance of the optocoupler LED. Prebias is a small forward voltage applied to the LED when the LED is off. This small prebias voltage partially charges the junction capacitance of the LED, allowing the LED to turn on more quickly. The speed of the LED is further increased by applying momentary current peaks to the LED during the turn-on and turn-off transistions of the drive current. These peak currents help

to charge and discharge the capacitances of the LED more quickly, shortening the time required for the LED to turn on and off.

Switching performance of the HCPL-2430 optocoupler is not sensitive to the TTL logic family used in the recommended drive circuit. The typical and worst-case switching parameters given in the data sheet can be met using common 74LS TTL inverting gates or buffers. Use of faster TTL families will slightly reduce the overall propagation delays from the input of the drive circuit to the output of the optocoupler, but will not necessarily result in lower pulse-width distortion or propagation delay skew. This reduction in overall propagation delays is due to shorter delays in the drive circuit, not to changes in the propagation delays of the optocoupler; optocoupler propagation delays are not affected by the speed of the logic used in the drive circuit.

# High CMR, High Speed TTL Compatible Optocoupler

## Technical Data

**6N137**  
**HCPL-2601**  
**HCPL-2611**

### Features

- **Internal Shield for High Common Mode Rejection (CMR)**  
HCPL-2601: 1000 V/μs at  $V_{CM} = 50$  V  
HCPL-2611: 5000 V/μs at  $V_{CM} = 1000$  V
- **High Speed: 10 MBd Typical**
- **LSTTL/TTL Compatible**
- **Low Input Current Capability: 5 mA**
- **Guaranteed ac and dc Performance over Temperature: 0°C to 70°C**
- **Stroable Output**
- **Recognized Under the Component Program of U.L. (File No. E55361) for Dielectric Withstand Proof Test Voltages of 2500 VAC, 1 Minute and 5000 VAC, 1 Minute (Option 020)**
- **Hermetic Equivalent Device Available (HCPL-5600/1)**
- **VDE 0883 Approval Available**

\*JEDEC Registered Data (The HCPL-2601 and HCPL-2611 are not registered.)

### Description

The 6N137/HCPL-2601/11 optically coupled gates combine a GaAsP light emitting diode and an integrated high gain photo detector. An enable input allows the detector to be strobed. The output of the detector I.C. is an open collector Schottky clamped transistor. The internal shield provides a guaranteed common mode transient immunity specification of 1000 V/μs for the 2601, and 5000 V/μs with the 2611.

This unique design provides maximum ac and dc circuit isolation while achieving TTL compatibility. The optocoupler ac and dc operational parameters are guaranteed from 0°C to 70°C allowing troublefree system performance.

The 6N137/HCPL-2601/11 are suitable for high speed logic interfacing, input/output buffering, as line receivers in environments that conventional line receivers cannot tolerate and are recommended for use in extremely high ground or induced noise environments.

### Notes:

- Bypassing of the power supply line is required, with a  $0.1\ \mu\text{F}$  ceramic disc capacitor adjacent to each optocoupler as illustrated in Figure 15. The power supply bus for the optocoupler(s) should be separate from the bus for any active loads.
- Peaking circuits may produce transient input currents up to  $50\ \text{mA}$ ,  $50\ \text{ns}$  maximum pulse width, provided average current does not exceed  $20\ \text{mA}$ .
- Device considered a two terminal device: pins 1, 2, 3 and 4 shorted together, and pins 5, 6, 7 and 8 shorted together.
- The  $t_{PLH}$  propagation delay is measured from the  $3.75\ \text{mA}$  point on the trailing edge of the input pulse to the  $1.5\ \text{V}$  point on the trailing edge of the output pulse.
- The  $t_{PHL}$  propagation delay is measured from the  $3.75\ \text{mA}$  point on the leading edge of the input pulse to the  $1.5\ \text{V}$  point on the leading edge of the output pulse.
- The  $t_{ELH}$  enable propagation delay is measured from the  $1.5\ \text{V}$  point on the trailing edge of the enable input pulse to the  $1.5\ \text{V}$  point on the trailing edge of the output pulse.
- The  $t_{EHL}$  enable propagation delay is measured from the  $1.5\ \text{V}$  point on the leading edge of the enable input pulse to the  $1.5\ \text{V}$  point on the leading edge of the output pulse.
- $CM_H$  is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state (i.e.,  $V_{OUT} > 2.0\ \text{V}$ ).
- $CM_L$  is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state (i.e.,  $V_{OUT} < 0.8\ \text{V}$ ).
- For sinusoidal voltages,

$$\left(\frac{dv_{CM}}{dt}\right)_{\text{max}} = \pi f_{CM} V_{CM} (p-p)$$

- No external pull up is required for a high logic state on the enable input.
- See Option 020 data sheet for more information.
- The JEDEC registration for the 6N137 specifies a maximum  $I_{OH}$  of  $250\ \mu\text{A}$ . HP guarantees a maximum  $I_{OH}$  of  $100\ \mu\text{A}$ .
- The JEDEC registration for the 6N137 specifies a maximum  $I_{CCH}$  of  $15\ \text{mA}$ . HP guarantees a maximum  $I_{CCH}$  of  $10\ \text{mA}$ .
- The JEDEC registration for the 6N137 specifies a maximum  $I_{CCL}$  of  $18\ \text{mA}$ . HP guarantees a maximum  $I_{CCL}$  of  $13\ \text{mA}$ .
- The JEDEC registration for the 6N137 specifies a maximum  $I_{EL}$  of  $-2.0\ \text{mA}$ . HP guarantees a maximum  $I_{EL}$  of  $-1.6\ \text{mA}$ .

**HCPL-2612**

### Features

- **Internal Shield for High Common Mode Rejection (CMR)**  
HCPL-2602: 1000 V/μs at  $V_{CM} = 50$  V  
HCPL-2612: 3500 V/μs at  $V_{CM} = 300$  V
- **Line Termination Included - No Extra Circuitry Required**
- **Accepts a Broad Range of Drive Conditions**
- **LED Protection Minimizes LED Efficiency Degradation**
- **High Speed: 10 MBd (Limited by Transmission Line in Many Applications)**
- **Guaranteed ac and dc Performance Over Temperature: 0°C to 70°C**
- **External Base Lead Allows "LED Peaking" and LED Current Adjustment**
- **Recognized Under the Component Program of U.L. (File No. E55361) for Dielectric Withstand Proof Test Voltages of 2500 VAC.**
- **VDE 0883 Approval Pending**

- **Hermetic Equivalent Device Available (HCPL-1930/1)**

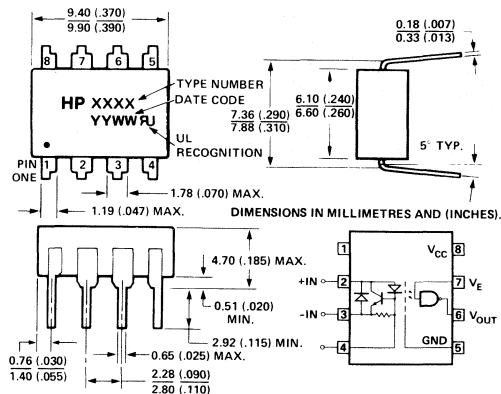

### Description

The HCPL-2602/12 optically coupled line receivers combine a GaAsP light emitting diode, an input current regulator and an integrated high gain photo detector. The input regulator serves as a line termination for line receiver applications. It clamps the line voltage and

regulates the LED current so line reflections do not interfere with circuit performance.

The regulator allows a typical LED current of 8.5 mA before it starts to shunt excess current. The output of the detector IC is an open collector Schottky clamped transistor. An enable input gates the detector. The internal detector shield provides a guaranteed common mode transient immunity specification of 1000 V/μs for the 2602, and 3500 V/μs for the 2612.

### Outline Drawing

**CAUTION:** The small junction sizes inherent to the design of this bipolar component increase the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

DC specifications are defined similar to TTL logic. The optocoupler ac and dc operational parameters are guaranteed from 0°C to 70°C allowing trouble-free interfacing with digital logic circuits. An input current of 5 mA will sink an eight gate fan-out (TTL) at the output.

The HCPL-2602/12 are useful as line receivers in high noise environments that conventional line receivers cannot tolerate. The higher LED threshold voltage provides improved immunity to differential noise and the internally shielded detector provides orders of magnitude improvement in common mode rejection with little or no sacrifice in speed.

### Applications

- Isolated Line Receiver
- Simplex/Multiplex Data Transmission
- Computer-Peripheral Interface
- Microprocessor System Interface
- Digital Isolation for A/D, D/A Conversion
- Current Sensing
- Instrument Input/Output Isolation
- Ground Loop Elimination
- Pulse Transformer Replacement

## Using the HCPL-2602/12 Line Receiver Optocouplers

The primary objectives to fulfill when connecting an optocoupler to a transmission line are to provide a minimum, but not excessive, LED current and to properly terminate the line. The internal regulator in the HCPL-2602/12 simplifies this task. Excess current from variable drive conditions such as line length variations, line driver differences and power supply

fluctuations are shunted by the regulator. In fact, with the LED current regulated, the line current can be increased to improve the immunity of the system to differential-mode noise and to enhance the data rate capability. The designer must keep in mind the 60 mA input current maximum rating of the HCPL-2602/12 in such cases, and may need to use series limiting or shunting to prevent overstress.

Design of the termination circuit is also simplified; in most cases the transmission line can simply be connected directly to the input terminals of the HCPL-2602/12 without the need for additional series or shunt resistors. If reversing line drive is used it may be desirable to use two HCPL-2602/12 or an external Schottky diode to optimize data rate.

## Polarity Non-Reversing Drive

High data rates can be obtained with the HCPL-2602/12 with polarity non-reversing drive. Figure (a) illustrates how a 74S140 line driver can be used with the HCPL-2602/12 and shielded, twisted pair or coax cable without any additional components. There are some reflections due to the "active termination" but they do not interfere with circuit performance because the regulator clamps the line voltage. At longer line lengths  $t_{PLH}$  increases faster than  $t_{PHL}$  since the switching threshold is not exactly halfway between asymptotic line conditions. If optimum data rate is desired, a series resistor and peaking capacitor can be used to equalize  $t_{PLH}$  and  $t_{PHL}$ . In general, the peaking capacitance should be as large as possible; however, if it is too large it may keep the regulator from achieving turn-off during the negative (or zero) excursions of the input signal. A safe rule:

make  $C \leq 16t$

where:

$C$  = peaking capacitance in picofarads

$t$  = data bit interval in nanoseconds

## Polarity Reversing Drive

A single HCPL-2602/12 can also be used with polarity reversing drive (Figure b). Current reversal is obtained by way of the substrate isolation diode (substrate to collector). Some reduction of data rate occurs, however, because the substrate

diode stores charge, which must be removed when the current changes to the forward direction. The effect of this is a longer  $t_{PHL}$ . This effect can be eliminated and data rate improved considerably by use of a Schottky diode on the input of the HCPL-2602/12.

For optimum noise rejection as well as balanced delays a split-phase termination should be used along with a flip-flop at the output (Figure c). The result of current reversal in split-phase operation is seen in Figure (c) with switches A and B both OPEN. The coupler inputs are then connected in ANTI-SERIES; however, because of the higher steady-state termination voltage, in comparison to the single HCPL-2602/12 termination, the forward current in the substrate diode is lower and consequently there is less junction charge to deal with when switching.

Closing switch B with A open is done mainly to enhance common mode rejection, but also reduces propagation delay slightly because line-to-line capacitance offers a slight peaking effect. With switches A and B both CLOSED, the shield acts as a current return path which prevents either input substrate diode from becoming reversed biased. Thus the data rate is optimized as shown in Figure (c).

## Improved Noise Rejection

Use of additional logic at the output of two HCPL-2602/12s, operated in the split phase

termination, will greatly improve system noise rejection in addition to balancing propagation delays as discussed earlier.

A NAND flip-flop offers infinite common mode rejection (CMR) for NEGATIVELY sloped common mode transients but requires  $t_{PHL} > t_{PLH}$  for proper operation. A NOR flip-flop has infinite CMR for POSITIVELY sloped transients but requires  $t_{PHL} < t_{PLH}$  for proper operation. An exclusive-OR flip-flop has infinite CMR for common mode transients of EITHER polarity and operates with either  $t_{PHL} > t_{PLH}$  or  $t_{PHL} < t_{PLH}$ .

With the line driver and transmission line shown in Figure (c),  $t_{PHL} > t_{PLH}$ , so NAND gates are preferred in the R-S flip-flop. A higher drive amplitude or different circuit configuration could make  $t_{PHL} < t_{PLH}$ , in which case NOR gates would be preferred. If it is not known whether  $t_{PHL} > t_{PLH}$  or  $t_{PHL} < t_{PLH}$ , or if the drive conditions may vary over the boundary for these conditions, the exclusive-OR flip-flop of Figure (d) should be used.

## RS-422 and RS-423

Line drivers designed for RS-422 and RS-423 generally provide adequate voltage and current for operating the HCPL-2602/12. Most drivers also have characteristics allowing the HCPL-2602/12 to be connected directly to the driver terminals. Worst case drive conditions, however, would require current shunting to prevent overstress of the HCPL-2602/12.

Figure a. Polarity Non-Reversing.

Figure b. Polarity Reversing, Single Ended.

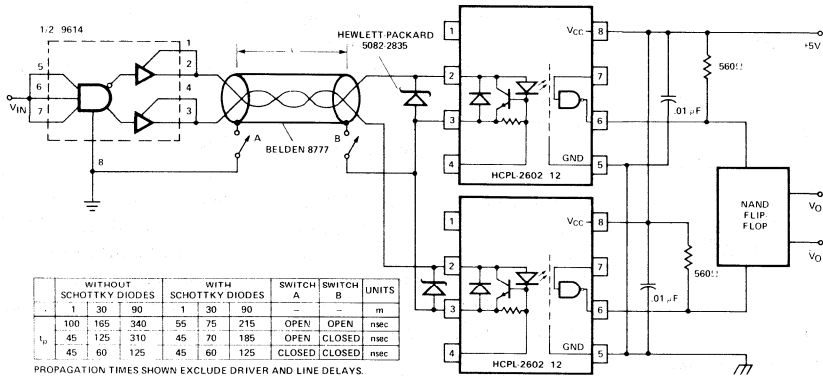

Figure c. Polarity Reversing, Split Phase.

NAND flip flop tolerates simultaneously HIGH inputs; NOR flip flop tolerates simultaneously LOW inputs; EXCLUSIVE OR flip flop tolerates simultaneously HIGH OR LOW inputs without causing either of the outputs to change.

## Technical Data

**HCPL-2630  
HCPL-2631  
HCPL-4661**

### Features

- **Internal Shield for High Common Mode Rejection (CMR)**  
HCPL-2631: 1000 V/ $\mu$ s @  $V_{CM} = 50$  V  
HCPL-4661: 5000 V/ $\mu$ s @  $V_{CM} = 1000$  V
- **High Density Packaging**
- **Low Input Current Capability: 5 mA**
- **High Speed: 10 MBd Typical**
- **LSTTL and TTL Compatible**
- **Guaranteed AC and DC Performance Over Temperature: 0°C to 70°C**
- **Recognized Under the Component Program of U.L. (File No. E55361) for Dielectric Withstand Proof Test Voltages of 2500 VAC, 1 Minute.**
- **VDE 0883 Approval Pending**
- **Hermetic Equivalent Device Available (HCPL-5630/1)**

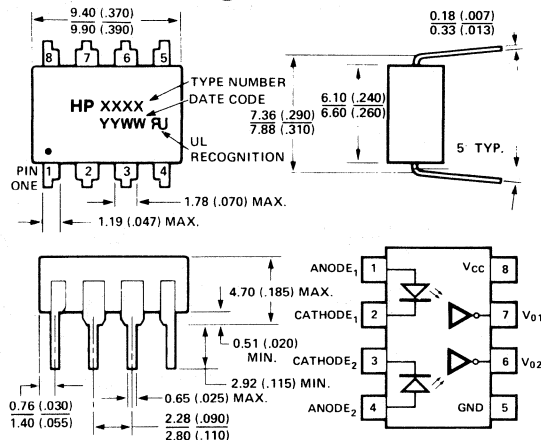

### Description

The HCPL-2630/HCPL-2631/4661 are dual channel optically coupled logic gates that combine GaAsP light emitting diodes and integrated high gain photo-detectors. The photons are collected in the detector by a photodiode and the current is amplified by a high gain linear amplifier that drives a Schottky clamped open collector output transistor. Each circuit is temperature, current and voltage compensated. The internal shield provides a guaranteed

common mode transient immunity specification of 1000 V/ $\mu$ s for the 2631, and 5000 V/ $\mu$ s with the HCPL-4661.

The unique design provides maximum AC and DC circuit isolation while achieving LSTTL and TTL compatibility. The optocoupler AC and DC operational parameters are guaranteed from 0°C to 70°C. The dual channel design minimizes space and results in increased convenience.

### Outline Drawing

DIMENSIONS IN MILLIMETRES AND (INCHES).

The HCPL-2630/2631/4661 are recommended for high speed logic interfacing, input/output buffering, and for use as line receivers in environments that conventional line receivers cannot tolerate. The HCPL-2630/2631/4661 can be used for the digital programming of machine control systems, motors and floating power supplies. The internal shield makes the HCPL-2631/4661 ideal for use in extremely high ground or induced noise environments.

### Applications

- Isolation of High Speed Logic Systems
- Microprocessor System Interfaces
- Isolated Line Receiver
- Computer-Peripheral Interfaces
- Ground Loop Elimination
- Digital Isolation for A/D, D/A Conversion

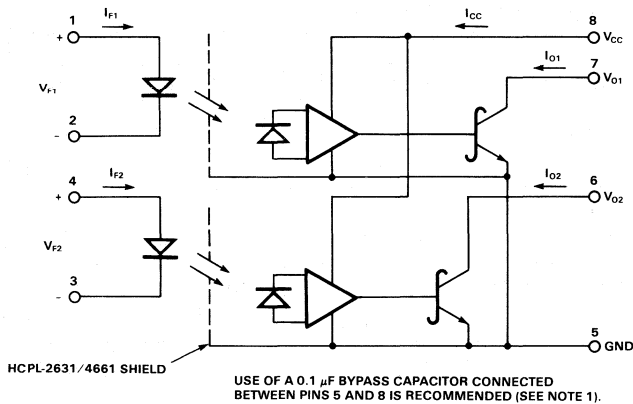

Figure 1. Schematic.

### Recommended Operation Conditions

Parameter	Symbol	Min.	Max.	Units
Input Current, Low Level Each Channel	$I_{FL}$	0	250	$\mu A$
Input Current, High Level Each Channel	$I_{FH}^*$	5	15	mA
Supply Voltage, Output	$V_{CC}$	4.5	5.5	V
Fan Out (TTL Load) Each Channel	N		8	
Operating Temperature	$T_A$	0	70	$^{\circ}C$

\*The initial switching threshold is 5 mA or less. It is recommended that input current between 6.3 mA and 10 mA be used to obtain best performance and to provide at least a 20% LED degradation guardband.

### Absolute Maximum Ratings

(No Derating Required up to 85°C)

Storage Temperature ..... -55°C to +125°C  
 Operating Temperature ..... -40°C to +85°C  
 Lead Solder Temperature ..... 260°C for 10 s  
 (1.6 mm below seating plane)

#### Average Forward

Input Current (each channel, See note 2) ..... 15 mA  
 Reverse Input Voltage (each channel) ..... 5 V  
 Supply Voltage -  $V_{CC}$  (1 Minute Maximum) ..... 7 V  
 Output Collector Current -  $I_O$  (each channel) ..... 16 mA  
 Output Collector Voltage -  $V_O$  (each channel)\*\* ..... 7 V  
 Output Collector Power Dissipation (each channel) ..... 60 mW

\*\*Selection for higher output voltages up to 20 V is available.

Min. Internal Plastic Gap (Clearance)		0.08	mm	Through insulation distance conductor to conductor
Tracking Resistance	CTI	175	Volts	DIN IEC 112/VDE 0303 Part 1
Isolation Group (per DIN VDE 0109)		IIIa		Material Group DIN VDE 0109

### Notes:

- By-passing of the power supply line is required, with a  $0.1\ \mu\text{F}$  ceramic disc capacitor adjacent to each optocoupler as illustrated in Figure 15. Total lead length between both ends of the capacitor and the isolator pins should not exceed 20 mm. The power supply bus for the optocoupler(s) should be separate from the bus for any active loads.
- Peaking circuits may produce transient input currents up to 50 mA, 50 ns maximum pulse width, provided average current does not exceed 15 mA.
- Each channel.
- Measured between pins 1, 2, 3, and 4 shorted together, and pins 5, 6, 7, and 8 shorted together.
- Measured between pins 1 and 2 shorted together, and pins 3 and 4 shorted together.
- The  $t_{PLH}$  propagation delay is measured from the 3.75 mA point on the trailing edge of the input pulse to the 1.5 V point on the trailing edge of the output pulse.
- The  $t_{PHL}$  propagation delay is measured from the 3.75 mA point on the leading edge of the input pulse to the 1.5 V point on the leading edge of the output pulse.
- $CM_H$  is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state (i.e.,  $V_{OUT} > 2.0\text{ V}$ ).
- $CM_L$  is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state (i.e.,  $V_{OUT} > 0.8\text{ V}$ ).
- For sinusoidal voltages,

$$\left( \frac{dV_{CM}}{dt} \right)_{\text{max}} = \pi f_{CM} V_{CM} \text{ (p-p)}$$

- As illustrated in Figure 15 the  $V_{CC}$  and GND traces can be located between the input and the output leads of the HCPL-2630/2631/4661 to provide additional noise immunity at the compromise of insulation capability.

OPTOCOUPERS

# Small Outline High CMR, High Speed, Logic Gate Optocouplers

## Technical Data

**HCPL-0600**  
**HCPL-0601**  
**HCPL-0611**

### Features

- Surface Mountable
- Industry Standard SOIC-8 Footprint
- Compatible with Infrared Vapor Phase Reflow and Wave Soldering Processes
- Internal Shield for High Common Mode Rejection (CMR)  
HCPL-0601: 1000 V/μs at  $V_{CM} = 50\text{ V}$   
HCPL-0611: 5000 V/μs at  $V_{CM} = 1000\text{ V}$
- High Speed: 10 Mbd Typical
- LSTTL/TTL Compatible
- Low Input Current Required: 5 mA
- Guaranteed ac and dc Performance Over Temperature: 0°C to 70°C
- Storable Output
- Recognized under the Component Program of U.L. (File No. E55361) for Dielectric Withstand Proof Test Voltage of 2500 Vac, 1 Minute

### Description

These small outline high CMR, high speed, logic gate optocouplers are single channel devices in an industry standard SOIC-8 footprint. They are electrically equivalent to the following HP optocouplers:

Small Outline	Standard DIP
HCPL-0600	6N137
HCPL-0601	HCPL-2601
HCPL-0611	HCPL-2611

The SOIC-8 package does not require "through holes" in a PCB. This package occupies approximately one-third the footprint area of the standard dual-in-line package. The lead profile is designed to be compatible with standard surface mount processes.

The HCPL-0600/01/11 optically coupled gates combine a GaAsP light emitting diode and an

### Outline Drawing\*

\*See notes, following page.

**CAUTION:** The small junction sizes inherent to the design of this bipolar component increases the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

integrated high gain photon detector. An enable input allows the detector to be strobed. The output of the detector I.C. is an open-collector Schottky-clamped transistor. The internal shield provides a guaranteed common mode transient immunity specification for the HCPL-0601/11.

This unique design provides maximum ac and dc circuit isolation while achieving TTL compatibility. The optocoupler ac and dc operational parameters are guaranteed from 0°C to 70°C allowing trouble free system performance.

The HCPL-0600/01/11 are suitable for high speed logic interfacing, input/output buffering, as line receivers in environments that conventional line receivers cannot tolerate and are recommended for use in extremely high ground or induced noise environments.

### Applications

- Isolated Line Receiver
- Simplex/Multiplex Data Transmission
- Computer-Peripheral Interface
- Microprocessor System Interface
- Digital Isolation for A/D, D/A Conversion
- Switching Power Supply
- Instrument Input/Output Isolation
- Ground Loop Elimination
- Pulse Transformer Replacement

### Schematic

A 0.01 TO 0.1  $\mu$ F BYPASS CAPACITOR MUST BE CONNECTED BETWEEN PINS 8 AND 5 (See Note 1).

### Recommended Operating Conditions

Parameter	Symbol	Min.	Max.	Units
Input Current, Low Level	$I_{FL}$	0	250	$\mu$ A
Input Current, High Level	$I_{FH}^*$	5	15	mA
Supply Voltage, Output	$V_{CC}$	4.5	5.5	V
High Level Enable Voltage	$V_{EH}$	2.0	$V_{CC}$	V
Low Level Enable Voltage	$V_{EL}$	0	0.8	V
Fan Out (TTL Load)	N		8	
Operating Temperature	$T_A$	0	70	$^{\circ}$ C

\*The initial switching threshold is 5 mA or less. It is recommended that an input current between 6.3 mA and 10 mA be used to obtain best performance and to provide at least 20% LED degradation guardband.

### Absolute Maximum Ratings

(No Derating Required up to 85°C)

Storage Temperature .....	-55°C to +125°C
Operating Temperature .....	-40°C to 85°C
Infrared and Vapor Phase Reflow Temperature .....	215°C for 90 s
Forward Input Current – $I_F$ (see Note 2) .....	20 mA
Reverse Input Voltage .....	5 V
Supply Voltage – $V_{CC}$ .....	7 V (1 Minute Maximum)
Enable Input Voltage – $V_E$ .....	5.5 V
	(Not to exceed $V_{CC}$ by more than 500 mV)
Output Collector Current – $I_O$ .....	50 mA
Output Collector Power Dissipation .....	85 mW
Output Collector Voltage – $V_O$ (see Note 12) .....	7 V

## Electrical Characteristics

Over recommended temperature ( $T_A = 0^\circ\text{C}$  to  $70^\circ\text{C}$ ) unless otherwise specified. (See note 1.)

Parameter	Symbol	Min.	Typ.*	Max.	Units	Conditions	Fig.	Note

		HCPL-0601	1000	10,000	$V_{CM} = 50\text{ V}$					
		HCPL-0611	5,000		$V_{CM} = 1000\text{ V}$					

\*All typicals are at  $V_{CC} = 5\text{ V}$ ,  $T_A = 25^\circ\text{C}$ .

### Notes:

- Bypassing of the power supply line is required with a  $0.1\ \mu\text{F}$  ceramic disc capacitor adjacent to each optocoupler. The power supply bus for the optocoupler(s) should be separate from the bus for any active loads.
- Peaking circuits may produce transient input currents up to  $50\text{ mA}$ ,  $50\text{ ns}$  maximum pulse width, provided average current does not exceed  $20\text{ mA}$ .
- Device considered a two terminal device: pins 1, 2, 3 and 4 shorted together, and pins 5, 6, 7 and 8 shorted together.
- The  $t_{PLH}$  propagation delay is measured from the  $3.75\text{ mA}$  point on the trailing edge of the input pulse to the  $1.5\text{ V}$  point on the trailing edge of the output pulse.
- The  $t_{PHL}$  propagation delay is measured from the  $3.75\text{ mA}$  point on the leading edge of the input pulse to the  $1.5\text{ V}$  point on the leading edge of the output pulse.
- The  $t_{ELH}$  enable propagation delay is measured from the  $1.5\text{ V}$  point on the trailing edge of the enable input pulse to the  $1.5\text{ V}$  point on the trailing edge of the output pulse.
- The  $t_{EHL}$  enable propagation delay is measured from the  $1.5\text{ V}$  point on the leading edge of the enable input pulse to the  $1.5\text{ V}$  point on the leading edge of the output pulse.
- $CM_H$  is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state (i.e.,  $V_{OUT} > 2.0\text{ V}$ ).
- $CM_L$  is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state (i.e.,  $V_{OUT} < 0.8\text{ V}$ ).
- For sinusoidal voltages,

$$\left( \frac{dv_{CM}}{dt} \right)_{\max} = \pi f_{CM} V_{CM} (\text{p-p})$$

- No external pull up is required for a high logic state on the enable input.
- Selection for higher output voltages up to  $20\text{ V}$  is available.

# High Speed Optocouplers

## Technical Data

**6N135**  
**6N136**  
**HCPL-2502**  
**HCPL-4502**  
**HCPL-4503**

### Features

- **Very High Common Mode Transient Immunity: 15000 V/ $\mu$ s at  $V_{CM} = 1500$  V Guaranteed (HCPL-4503)**
- **High Speed: 1 Mb/s**
- **TTL Compatible**
- **Guaranteed ac and dc Performance Over Temperature: 0°C to 70°C**
- **Open Collector Output**
- **Recognized under the Component Program of U.L. (File No. E55361) for Dielectric Withstand Proof Test Voltages of 2500 Vac, 1 Minute and 5000 Vac, 1 Minute (Option 020).**
- **VDE 0883 Approval Pending**

the photodiode bias and output transistor collector increase the speed up to a hundred times over that of a conventional photo-transistor coupler by reducing the base-collector capacitance.

The 6N135 is for use in TTL/CMOS, TTL/LSTTL or wide bandwidth analog applications. Current transfer ratio (CTR) for

the 6N135 is 7% minimum at  $I_F = 16$  mA.

The 6N136 is designed for high speed TTL/TTL applications. A standard 16 mA TTL sink current through the input LED will provide enough output current for 1 TTL load and a 5.6 k $\Omega$  pull-up resistor. CTR of the 6N136 is 19% minimum at  $I_F = 16$  mA.

### Outline Drawing

DIMENSIONS IN MILLIMETRES AND (INCHES).

### Description

These diode-transistor optocouplers use an insulating layer between the light emitting diode and an integrated photon detector to provide electrical insulation between input and output. Separate connections for

\*See notes, following page.

**CAUTION:** The small junction sizes inherent to the design of this bipolar component increases the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

The HCPL-2502 is suitable for use in applications where matched or known CTR is desired such as in the feedback path of switch-mode power supplies. CTR is 15 to 22% at  $I_F = 16\text{mA}$ .

The HCPL-4502 provides the electrical and switching performance of the 6N136 with increased ESD protection.

The HCPL-4503 is an HCPL-4502 with increased common mode transient immunity of 15000 V/ $\mu\text{s}$  minimum at  $V_{CM} = 1500$  guaranteed.

## Applications

- **Video Signal Isolation**
- **Line Receivers** – High common mode transient immunity (>1000 V/ $\mu\text{s}$ ) and low input-output capacitance (0.6 pF).
- **High Speed Logic Ground Isolation** – TTL/TTL, TTL/LTTL, TTL/CMOS, TTL/LSTTL.
- **Replace Slow Phototransistor Isolators** – Pins 2-7 of the 6N135/6 series conform to pins 1-6 of 6 pin phototransistor couplers. Pin 8 can be tied to any available bias voltage of 1.5 V to 30 V for high speed operation.
- **Replace Pulse Transformers** – Save board space and weight
- **Analog Signal Ground Isolation** – Integrated photon detector provides improved linearity over phototransistor type.

### Notes:

- Derate linearly above  $70^\circ\text{C}$  free-air temperature at a rate of  $0.8\text{ mA}/^\circ\text{C}$ .
- Derate linearly above  $70^\circ\text{C}$  free-air temperature at a rate of  $1.6\text{ mA}/^\circ\text{C}$ .
- Derate linearly above  $70^\circ\text{C}$  free-air temperature at a rate of  $0.9\text{ mW}/^\circ\text{C}$ .
- Derate linearly above  $70^\circ\text{C}$  free-air temperature at a rate of  $2.0\text{ mW}/^\circ\text{C}$ .
- CURRENT TRANSFER RATIO in percent is defined as the ratio of output collector current,  $I_O$ , to the forward LED input current,  $I_F$ , times 100.
- Device considered a two-terminal device: Pins 1, 2, 3, and 4 shorted together and Pins 5, 6, 7, and 8 shorted together.
- Common mode transient immunity in a Logic High level is the maximum tolerable (positive)  $dV_{CM}/dt$  on the leading edge of the common mode pulse,  $V_{CM}$ , to assure that the output will remain in a Logic High state (i.e.,  $V_O > 2.0\text{ V}$ ). Common mode transient immunity in a Logic Low level is the maximum tolerable (negative)  $dV_{CM}/dt$  on the trailing edge of the common mode pulse signal,  $V_{CM}$ , to assure that the output will remain in a Logic Low state (i.e.,  $V_O < 0.8\text{ V}$ ).
- The  $1.9\text{ k}\Omega$  load represents 1 TTL unit load of  $1.6\text{ mA}$  and the  $5.6\text{ k}\Omega$  pull-up resistor.
- The  $4.1\text{ k}\Omega$  load represents 1 LSTTL unit load of  $0.36\text{ mA}$  and  $6.1\text{ k}\Omega$  pull-up resistor.
- The frequency at which the ac output voltage is 3 dB below its mid-frequency value.
- The JEDEC registration for the 6N136 specifies a minimum CTR of 15%. HP guarantees a minimum CTR of 19%.
- See Option 020 data sheet for more information.
- Use of a  $0.1\text{ }\mu\text{F}$  bypass capacitor connected between pins 5 and 8 is recommended.

## Description

These dual optocouplers contain a pair of light emitting diodes and integrated photo detectors with electrical insulation between input and output. Separate connection for the photodiode bias and output transistor collectors increase the speed up to a hundred times that of a conventional phototransistor coupler by reducing the base-collector capacitance.

The HCPL-2530 is for use in TTL/CMOS, TTL/LSTTL or wide bandwidth analog applications. Current transfer ratio (CTR) for the -2530 is 7% minimum at  $I_F = 16$  mA.

The HCPL-2531 is designed for high speed TTL/TTL applications. A standard 16 mA TTL sink current through the input LED will provide enough output current for 1 TTL

load and a 5.6 kΩ pull-up resistor. CTR of the -2531 is 19% minimum at  $I_F = 16$  mA.

The HCPL-4534 is an HCPL-2531 with increased common mode transient immunity of 15000 V/μs minimum at  $V_{CM} = 1500$  V guaranteed.

## Applications

- **Line Receivers** – High common mode transient immunity (>1000V/μs) and low input-output capacitance (0.6pF).
- **High Speed Logic Ground Isolation** – TTL/TTL, TTL/LTTL, TTL/CMOS, TTL/LSTTL.
- **Replace Pulse Transformers** – Save board space and weight.
- **Analog Signal Ground Isolation** – Integrated photon detector provides improved linearity over phototransistor type.
- **Polarity Sensing.**
- **Isolated Analog Amplifier** – Dual channel packaging enhances thermal tracking.

# Small Outline High Speed Optocouplers

## Technical Data

**HCPL-0500**  
**HCPL-0501**  
**HCPL-0452**  
**HCPL-0453**

### Features

- Surface Mountable
- Industry Standard SOIC-8 Footprint
- Compatible with Infrared Vapor Phase Reflow and Wave Soldering Processes
- Very High Common Mode Transient Immunity: 15000 V/ $\mu$ s at  $V_{CM} = 1500$  V Guaranteed (HCPL-0453)
- High Speed: 1 Mb/s
- TTL Compatible
- Guaranteed ac and dc Performance Over Temperature: 0°C to 70°C
- Open Collector Output
- Recognized Under the Component Program of U.L. (File No. E55361) for Dielectric Withstand Proof Test Voltage of 2500 VAC, 1 Minute

### Description

These small outline high CMR, high speed, logic gate optocouplers are single channel devices in an industry standard SOIC-8 footprint. They are electrically equivalent to the following HP optocouplers:

Small Outline	Standard DIP
HCPL-0500	6N135
HCPL-0501	6N136
HCPL-0452	HCPL-4502
HCPL-0453	HCPL-4503

The SOIC-8 package does not require "through holes" in a PCB. This package occupies approximately one-third the footprint area of the standard dual-in-line package. The lead profile is designed to be compatible with standard surface mount processes.

These diode-transistor optocouplers use an insulating layer between the light emitting diode and an integrated photon detector to provide electrical insulation between input and output. Separate connections for the photodiode bias and output transistor collector increase the speed up to a hundred times over that of a conventional photo-transistor coupler by reducing the base-collector capacitance.

### Outline Drawing\*

\*See notes, following page.

**CAUTION:** The small junction sizes inherent to the design of this bipolar component increases the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

The HCPL-0500 is for use in TTL/CMOS, TTL/LSTTL or wide bandwidth analog applications. Current transfer ratio (CTR) for the HCPL-0500 is 7% minimum at  $I_F = 16$  mA.

The HCPL-0501 is designed for high speed TTL/TTL applications. A standard 16 mA TTL sink current through the input LED will provide enough output current for 1 TTL load and a 5.6 k $\Omega$  pull-up resistor. CTR of the HCPL-0501 is 19% minimum at  $I_F = 16$  mA.

The HCPL-0452 provides the electrical and switching performance of the HCPL-0501 with increased ESD protection.

The HCPL-0453 is an HCPL-0452 with increased common mode transient immunity of 15000 V/ $\mu$ s minimum at  $V_{CM} = 1500$  V guaranteed.

## Applications

- **Video Signal Isolation**
- **Line Receivers** – High common mode transient immunity (>1000 V/ $\mu$ s) and low input-output capacitance (0.6 pF).
- **High Speed Logic Ground Isolation** – TTL/TTL, TTL/LTTL, TTL/CMOS, TTL/LSTTL.
- **Replace Slow Phototransistor Isolators** – Pins 2-7 of the HCPL-0500/0501 series conform to pins 1-6 of 6 pin phototransistor couplers. Pin 8 can be tied to any available bias voltage of 1.5 V to 30 V for high speed operation.
- **Replace Pulse Transformers** – Save board space and weight
- **Analog Signal Ground Isolation** – Integrated photon detector provides improved linearity over phototransistor type.

## Schematic

\*\*NOTE: FOR HCPL-0452/3, PIN 7 IS NOT CONNECTED.

## Absolute Maximum Ratings

Storage Temperature .....	-55°C to +125°C
Operating Temperature .....	-55°C to 100°C
Infrared and Vapor Phase Reflow Temperature .....	215°C for 90 s
Average Input Current – $I_F$ .....	25 mA <sup>[1]</sup>
Peak Input Current – $I_F$ .....	50 mA <sup>[2]</sup>
	(50% duty cycle, 1 ms pulse width)
Peak Transient Input Current – $I_F$ .....	1.0 A
	( $\leq 1$ $\mu$ s pulse width, 300 pps)
Reverse Input Voltage – $V_R$ (Pin 3-2) .....	5 V
Input Power Dissipation .....	45 mW <sup>[3]</sup>
Average Output Current – $I_O$ (Pin 6) .....	8 mA
Peak Output Current .....	16 mA
Emitter-Base Reverse Voltage .....	5 V
	(Pin 5-7, except HCPL-0452/3)
Output Voltage – $V_O$ (Pin 6-5) .....	-0.5 V to 20 V
Supply Voltage – $V_{CC}$ (Pin 8-5) .....	-0.5 V to 30 V
Base Current – $I_B$ (Pin 7, except HCPL-0452/3) .....	5 mA
Output Power Dissipation .....	100 mW <sup>[4]</sup>

\*All typicals at  $T_A = 25^\circ\text{C}$ .

### Notes:

- Derate linearly above  $85^\circ\text{C}$  free-air temperature at a rate of  $0.5\text{ mA}/^\circ\text{C}$ .
- Derate linearly above  $85^\circ\text{C}$  free-air temperature at a rate of  $1.0\text{ mA}/^\circ\text{C}$ .
- Derate linearly above  $85^\circ\text{C}$  free-air temperature at a rate of  $1.1\text{ mW}/^\circ\text{C}$ .
- Derate linearly above  $85^\circ\text{C}$  free-air temperature at a rate of  $2.3\text{ mW}/^\circ\text{C}$ .
- CURRENT TRANSFER RATIO in percent is defined as the ratio of output collector current,  $I_{O1}$ , to the forward LED input current,  $I_F$ , times 100.
- Device considered a two-terminal device: Pins 1, 2, 3, and 4 shorted together and Pins 5, 6, 7, and 8 shorted together. The 2500 Vac/1 MINUTE CAPABILITY IS VALIDATED by a factory 3200 Vac/1 second dielectric voltage withstand test.
- Common mode transient immunity in a Logic High level is the maximum tolerable (positive)  $dV_{CM}/dt$  on the leading edge of the common mode pulse,  $V_{CM}$ , to assure that the output will remain in a Logic High state (i.e.,  $V_O > 2.0\text{ V}$ ). Common mode transient immunity in a Logic Low level is the maximum tolerable (negative)  $dV_{CM}/dt$  on the trailing edge of the common mode pulse signal,  $V_{CM}$ , to assure that the output will remain in a Logic Low state (i.e.,  $V_O < 0.8\text{ V}$ ).
- The  $1.9\text{ k}\Omega$  load represents 1 TTL unit load of  $1.6\text{ mA}$  and the  $5.6\text{ k}\Omega$  pull-up resistor.
- The  $4.1\text{ k}\Omega$  load represents 1 LSTTL unit load of  $0.36\text{ mA}$  and  $6.1\text{ k}\Omega$  pull-up resistor.
- The frequency at which the ac output voltage is 3 dB below its mid-frequency value.
- Use of a  $0.1\text{ }\mu\text{F}$  bypass capacitor connected between pins 5 and 8 is recommended.

# High Speed Optocouplers

## Technical Data

**CNW135**  
**CNW136**  
**CNW4502**

### Features

- 5000 Vrms/1 Minute Insulation Withstand Capability
- Worldwide Safety Approval  
UL1577 (File No. E55361)  
VDE 883/884/860/805/806/804/750  
BS 415/7002/6301  
IEC 65/380/950/335/435/601
- High Speed: 1 Mbit/s
- TTL Compatible
- Performance Guaranteed Over Temperature 0°C to 70°C
- Pin Compatible with 6N135/6 and HCPL-4502

### Applications

- High Voltage Insulation
- Video Signal Isolation
- Feedback Element in Switched Mode Power Supplies
- Line Receivers: >1000 V/μs common mode transient immunity and low input-output capacitance of 0.6 pF
- High Speed Logic Ground Isolation - TTL/TTL, TTL/CMOS, TTL/LSTTL
- Replaces Pulse Transformers

- Analog Signal Ground Isolation - Integrated photon detector provides improved linearity over phototransistor type
- Replaces Slow Phototransistor Isolators - Pins 2-7 of the CNW 135/6 conforms to pins 1-6 of 6 pin phototransistor couplers. Pin 8 can be tied to any available bias voltage of 1.5 V to 30 V for high speed operation

### Description

These devices are high voltage and fast switching optocouplers consisting of an AlGaAs LED and a silicon photodetector. A wide body encapsulation is used to provide creepage and clearance dimensions suitable for safety approval by regulatory agencies worldwide.

The CNW135 is for use in TTL/CMOS, TTL/LSTTL or wide bandwidth analog applications.

### Package Outline

DIMENSIONS IN MILLIMETERS AND (INCHES)

Current transfer ratio (CTR) for the CNW135 is 7% minimum at  $I_F = 16 \text{ mA}$ .

The CNW136 is designed for high speed TTL/TTL applications. A standard 16 mA TTL sink current through the input LED will provide enough output current for 1 TTL load and a 5.6K pullup resistor. CTR of the CNW136 is 19% minimum at  $I_F = 16 \text{ mA}$ .

The CNW4502 provides the electrical and switching performance of the CNW 136, increased ESD protection and increased transient immunity.

## Regulatory Information

The CNW135/6 features a wide body 8 PIN DIP. This package was specifically designed to meet regulatory requirements worldwide. The CNW135/6 has been approved by the following organizations:

- UL – Covered under UL component recognition FILE E55361
- VDE – Approved according to VDE 0883/6.80  
VDE 0884/08.87 certification pending  
Reference voltage (VDE 0110b Tab. 4):  
500 V AC/600 V DC  
Complied for reinforced insulation at 250 V AC with:  
DIN IEC 380/VDE 0806/8.81  
DIN IEC 435/VDE 0805 "ENTWURF" Nov 84  
DIN 57804/VDE 0804/1.83 (isolation group C)  
DIN VDE 0860/8.86/HD 195 S4  
DIN IEC 601 Teil 1/VDE 0750 Teil 1/5.82
- NORDIC – Tested for applications (reinforced insulation) – Class II applications for pluggable apparatus in normal tight execution.  
-SETI-SEMKO-NEMKO-DEMKO-According to  
IEC 65-IEC380-IEC950-IEC335
- BSI – Certification according to BS415:1979, BS7002:1989 and BS6301: 1987 pending
- BABT – Certification pending

## Absolute Maximum Ratings

Storage Temperature .....	-55°C to +150°C
Operating Temperature .....	-55°C to 85°C
Lead Solder Temperature .....	260°C for 10s (up to seating plane)
Average Input Current – $I_F$ .....	100 mA
Peak Transient Input Current – $I_F$ .....	1.0 A ( $\leq 1 \mu\text{s}$ pulse width, 300 Hz)
Reverse Input Voltage – $V_R$ (Pin 3-2) .....	5 V
Input Power Dissipation (up to 70°C) .....	250 mW*
Average Output Current – $I_O$ (Pin 6) .....	10 mA
Emitter-Base Reverse Voltage (Pin 5-7) .....	5 V
Output Voltage – $V_O$ (Pin 6-5) .....	-0.5 V to 20 V
Supply Voltage – $V_{CC}$ (Pin 8-5) .....	-0.5 V to 30 V
Base Current – $I_B$ (Pin 7, except HCPL-4502) .....	5 mA
Output Power Dissipation .....	100 mW

\*Derate at 5.0 mW/°C for operating temperatures above 70°C.

## Schematic

\*\*Note: For CNW4502, Pin 7 is not connected.

**CAUTION:** The small junction sizes inherent to the design of this bipolar component increases the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

## VDE 0884 Insulation Characteristics – Pending Approval

Description	Symbol	Characteristic	Unit
Installation classification per DIN VDE 0109/12.83, Table 1 for rated mains voltage $\leq 600 V_{RMS}$ for rated mains voltage $\leq 1000 V_{RMS}$		I-IV I-III	
Climatic Classification		55/150/21	
Pollution Degree (DIN VDE 0109/12.83)		2	
Maximum Working Insulation Voltage	$V_{IORM}$	1000	$V_{RMS}$
Input to Output Test Voltage, Method b* $V_{PR} = 1.6 \times V_{IORM}$ , 100% Production Test with $t_p = 1$ sec, Partial Discharge $< 5$ pC	$V_{PR}$	1600	$V_{RMS}$
Input to Output Test Voltage, Method a* $V_{PR} = 1.2 \times V_{IORM}$ , Type and sample test, $t_p = 60$ sec, Partial Discharge $< 5$ pC	$V_{PR}$	1200	$V_{RMS}$
Highest Allowable Overvoltage* (Transient Overvoltage, $t_{TR} = 10$ sec)	$V_{TR}$	8000	$V_{PK}$
Safety-Limiting Values (Maximum values allowed in the event of a failure, also see Figure 9) Case Temperature Current (Input Current $I_F$ , $P_{SI} = 0$ ) Output Power (obtained by setting pin 8 = 5.5 V, pins 7, 6, 5 = ground)	$T_{SI}$ $I_{SI}$ $P_{SI, OUTPUT}$	175 400 700	$^{\circ}C$ mA mW
Insulation Resistance at $T_{SI}$ , $V_{IO} = 500$ V $V_{IO} = 500$ V	$R_{IS}$	$\geq 10^9$	ohm

\*Refer to the front of the optocoupler section of the 1991 Designer's Catalog, under regulatory information, (VDE 0884) for a detailed description.

**Note:** Isolation characteristics are guaranteed only within the safety maximum ratings which must be ensured by protective circuits in the application.

- **HIGH OUTPUT CURRENT — 60 mA**
- **RECOGNIZED UNDER THE COMPONENT PROGRAM OF U.L. (FILE NO. E55361) FOR DIELECTRIC WITHSTAND PROOF TEST VOLTAGES OF 2500 Vac, 1 MINUTE AND 5000 Vac, 1 MINUTE (OPTION 020)**
- **VDE 0883 APPROVAL AVAILABLE**
- **MIL-STD-1772 VERSION AVAILABLE (HCPL-5700/1)**

## Description

These high gain series couplers use a Light Emitting Diode and an integrated high gain photo detector to provide extremely high current transfer ratio between input and output. Separate pins for the photodiode and output stage result in TTL compatible saturation voltages and high speed operation. Where desired the V<sub>CC</sub> and V<sub>O</sub> terminals may be tied together to achieve conventional photodarlington operation. A base access terminal allows a gain bandwidth adjustment to be made.

The 6N139 is for use in CMOS, LSTTL or other low power applications. A 400% minimum current transfer ratio is guaranteed over a 0-70°C operating range for only 0.5 mA of LED current.

The 6N138 is designed for use mainly in TTL applications. Current Transfer Ratio is 300% minimum over 0-70°C for an LED current of 1.6 mA [1 TTL Unit load (U.L.)]. A 300% minimum CTR enables operation with 1 U.L. out with a 2.2 kΩ pull-up resistor.

Selection for lower input current down to 250 μA is available upon request.

## Applications

- Ground Isolate Most Logic Families — TTL/TTL, CMOS/TTL, CMOS/CMOS, LSTTL/TTL, CMOS/LSTTL
- Low Input Current Line Receiver — Long Line or Party line
- EIA RS-232C Line Receiver
- Telephone Ring Detector
- 117 V ac Line Voltage Status Indicator — Low Input Power Dissipation
- Low Power Systems — Ground Isolation

## Absolute Maximum Ratings\*

(No Derating Required up to 85°C)

Storage Temperature .....	-55°C to +125°C
Operating Temperature** .....	-40°C to +85°C
Lead Solder Temperature .....	260°C for 10s (1.6 mm below seating plane)
Average Input Current — I <sub>F</sub> .....	20 mA
Peak Input Current — I <sub>F</sub> .....	40 mA (50% duty cycle, 1 ms pulse width)
Peak Transient Input Current — I <sub>F</sub> .....	1.0 A (≤1 μs pulse width, 300 pps)
Reverse Input Voltage — V <sub>R</sub> .....	5 V
Input Power Dissipation .....	35 mW
Output Current — I <sub>O</sub> (Pin 6) .....	60 mA
Emitter-Base Reverse Voltage (Pin 5-7) .....	0.5 V
Supply and Output Voltage — V <sub>CC</sub> (Pin 8-5), V <sub>O</sub> (Pin 6-5)	
6N138 .....	-0.5 to 7 V
6N139 .....	-0.5 to 18 V
Output Power Dissipation .....	100 mW

**CAUTION:** The small junction sizes inherent to the design of this bipolar component increases the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

- DC CURRENT TRANSFER RATIO is defined as the ratio of output collector current,  $I_O$ , to the forward LED input current,  $I_F$ , times 100%.
- Pin 7 Open.
- Device considered a two-terminal device: Pins 1, 2, 3, and 4 shorted together and Pins 5, 6, 7, and 8 shorted together.
- Use of a resistor between pin 5 and 7 will decrease gain and delay time. See Application Note 951-1 for more details.
- Common mode transient immunity in Logic High level is the maximum tolerable (positive)  $dV_{cm}/dt$  on the leading edge of the common mode pulse,  $V_{cm}$ , to assure that the output will remain in a Logic High state (i.e.,  $V_O > 2.0$  V). Common mode transient immunity in Logic Low level is the maximum tolerable (negative)  $dV_{cm}/dt$  on the trailing edge of the common mode pulse signal,  $V_{cm}$ , to assure that the output will remain in a Logic Low state (i.e.,  $V_O < 0.8$  V).
- In applications where  $dV/dt$  may exceed 50,000 V/ $\mu$ s (such as static discharge) a series resistor,  $R_{CC}$ , should be included to protect the detector IC from destructively high surge currents. The recommended value is  $R_{CC} = 220 \Omega$ .
- Use of a 0.1  $\mu$ F bypass capacitor connected between pins 5 and 8 is recommended.

# DUAL LOW INPUT CURRENT, HIGH GAIN OPTOCOUPLED

**HCPL-2730  
HCPL-2731**

## Features

- **HIGH CURRENT TRANSFER RATIO — 1800% TYPICAL**
- **LOW INPUT CURRENT REQUIREMENT — 0.5 mA**
- **LOW OUTPUT SATURATION VOLTAGE — 0.1 V TYPICAL**
- **HIGH DENSITY PACKAGING**
- **PERFORMANCE GUARANTEED OVER 0°C TO 70°C TEMPERATURE RANGE**
- **LSTTL COMPATIBLE**
- **RECOGNIZED UNDER THE COMPONENT PROGRAM OF U.L. (FILE NO. E55361) FOR DIELECTRIC WITHSTAND PROOF TEST VOLTAGES OF 2500 V<sub>ac</sub>, 1 MINUTE**
- **VDE 0883 APPROVAL AVAILABLE**
- **MIL-STD VERSION AVAILABLE (HCPL-5730/1)**

## Description

The HCPL-2730/31 dual channel couplers contain a separated pair of GaAsP light emitting diodes optically coupled to a pair of integrated high gain photo detectors. They provide extremely high current transfer ratio and excellent input-output common mode transient immunity. A separate pin for the photodiodes and first gain stages (V<sub>CC</sub>) permits lower output saturation voltage and higher speed operation than possible with conventional photodarlington type optocouplers. In addition V<sub>CC</sub> may be as low as 1.6 V without adversely affecting the parametric performance.

Guaranteed operation at low input currents and the high current transfer ratio (CTR) reduce the magnitude and effects of CTR degradation.

The outstanding high temperature performance of this split Darlington type output amplifier results from the inclusion of an integrated emitter-base bypass resistor which shunts photodiode and first stage leakage currents to ground.

The HCPL-2731 has a 400% minimum CTR at an input cur-

## Applications

- **Digital Logic Ground Isolation**
- **Telephone Ring Detector**
- **EIA RS-232C Line Receiver**
- **Low Input Current Line Receiver — Long Line or Party Line**
- **Microprocessor Bus Isolation**
- **Current Loop Receiver**
- **Polarity Sensing**
- **Level Shifting**
- **Line Voltage Status Indicator — Low input Power Dissipation**

rent of only 0.5 mA making it ideal for use in low input current application such as MOS, CMOS and low power logic interfacing or RS232C data transmission systems. In addition, the high CTR and high output current capability make this device extremely useful in applications where a high fanout is required. Compatibility with high voltage CMOS logic systems is guaranteed by the 18V V<sub>CC</sub> and V<sub>O</sub> specifications and by testing output high leakage (I<sub>OH</sub>) at 18V.

The HCPL-2730 is specified at an input current of 1.6 mA and has a 7 V V<sub>CC</sub> and V<sub>O</sub> rating. The 300% minimum CTR allows TTL to TTL interfacing at this input current.

Important specifications such as CTR, leakage current and output saturation voltage are guaranteed over the 0°C to 70°C temperature range to allow trouble-free system operation. Selection for lower input current down to 250  $\mu$ A is available upon request.

## Description

The 4N45/46 optocouplers contain a GaAsP light emitting diode optically coupled to a high gain photodetector IC.

The excellent performance over temperature results from the inclusion of an integrated emitter-base bypass resistor which shunts photodiode and first stage leakage currents to ground. External access to the second stage base provides better noise rejection than a conventional photodarlington detector. An external resistor or capacitor at the base can be added to make a gain-bandwidth or input current threshold adjustment. The base lead can also be used for feedback.

The high current transfer ratio at very low input currents permits circuit designs in which adequate margin can be allowed for the effects of CTR degradation over time.

The 4N46 has a 350% minimum CTR at an input current of only 0.5mA making it ideal for use in low input current applications such as MOS, CMOS and low power logic interfacing. Compatibility with high voltage CMOS logic systems is assured by the 20V minimum breakdown voltage of the output transistor and by the guaranteed maximum output leakage ( $I_{OH}$ ) at 18V.

The 4N45 has a 250% minimum CTR at 1.0mA input current and a 7V minimum breakdown voltage rating.

Selection for lower input current down to 250  $\mu$ A is available upon request.

## NOTES:

- Derate linearly above 50°C free-air temperature at a rate of 0.4mA/°C.
- Derate linearly above 50°C free-air temperature at a rate of 0.7mW/°C.
- Derate linearly above 25°C free-air temperature at a rate of 0.8mA/°C.
- Derate linearly above 25°C free-air temperature at a rate of 1.5mW/°C.
- DC CURRENT TRANSFER RATIO is defined as the ratio of output collector current,  $I_O$ , to the forward LED input current,  $I_F$ , times 100%.
- Pin 6 Open.
- Device considered a two-terminal device: Pins 1, 2, 3 shorted together and Pins 4, 5, and 6 shorted together.
- Use of a resistor between pin 4 and 6 will decrease gain and delay time. (See Figures 10 and 12).
- Common mode transient immunity in Logic High level is the maximum tolerable (positive)  $dV_{CM}/dt$  on the leading edge of the common mode pulse,  $V_{CM}$ , to assure that the output will remain in a Logic High state (i.e.,  $V_O > 2.5V$ ). Common mode transient immunity in Logic Low level is the maximum tolerable (negative)  $dV_{CM}/dt$  on the trailing edge of the common mode pulse signal,  $V_{CM}$ , to assure that the output will remain in a Logic Low state (i.e.,  $V_O < 2.5V$ ).

## CHARACTERISTICS

R<sub>IN</sub> ≈ 30MΩ, R<sub>OUT</sub> ≈ 50Ω  
V<sub>IN</sub>(MAX.) = V<sub>CC1</sub> - 1V, LINEARITY BETTER THAN 5%

## DESIGN COMMENTS

R<sub>1</sub> - NOT CRITICAL ( $\ll \frac{V_{IN}(MAX.) - (-V_{CC1}) - V_{BE}}{I_F(MAX.)}$ ) h<sub>FE</sub> Q<sub>3</sub>

R<sub>2</sub> - NOT CRITICAL (OMIT IF 0.2 TO 0.3V OFFSET IS TOLERABLE)

R<sub>4</sub> >  $\frac{V_{IN}(MAX.) + V_{BE}}{1 \text{ mA}}$

R<sub>5</sub> >  $\frac{V_{IN}(MAX.)}{2.5 \text{ mA}}$

NOTE: ADJUST R<sub>3</sub> SO V<sub>OUT</sub> = V<sub>IN</sub> AT V<sub>IN</sub> =  $\frac{V_{IN}(MAX.)}{2}$

# Small Outline Low Input Current, High Gain Optocouplers

## Technical Data

**HCPL-0700**  
**HCPL-0701**

### Features

- Surface Mountable
- Industry Standard SOIC-8 Footprint
- Compatible With Infrared Vapor Phase Reflow and Wave Soldering Processes
- High Current Transfer Ratio - 2000% Typical
- Low Input Current Requirement - 0.5 mA
- TTL Compatible Output - 0.1 V  $V_{OL}$  Typical
- Guaranteed ac and dc Performance Over Temperature 0°C to 70°C
- Base Access Allows Gain Bandwidth Adjustment
- High Output Current - 60 mA
- Recognized Under The Component Program Of U.L. (File No. E55361) For Dielectric Withstand Proof Test Voltage Of 2500 VAC, 1 Minute

### Description

These small outline, low input

current, high gain optocouplers are single channel devices in an industry standard SOIC-8 footprint. They are electrically equivalent to the following HP optocouplers:

<b>Small Outline</b>	<b>Standard DIP</b>
HCPL-0700	6N138
HCPL-0701	6N139

The SOIC-8 package does not require "through holes" in a

PCB. This package occupies approximately one-third the footprint area of the standard dual-in-line package. The lead profile is designed to be compatible with standard surface mount processes.

These high gain series couplers use a Light Emitting Diode and an integrated high gain photodetector to provide extremely high current transfer

### Outline Drawing\*

**CAUTION:** The small junction sizes inherent to the design of this bipolar component increase the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

ratio between input and output. Separate pins for the photodiode and output stage result in TTL compatible saturation voltages and high speed operation. Where desired the  $V_{CC}$  and  $V_O$  terminals may be tied together to achieve conventional photodarlington operation. A base access terminal allows a gain bandwidth adjustment to be made.

The HCPL-0701 is for use in CMOS, LSTTL or other low power applications. A 400% minimum current transfer ratio is guaranteed over a 0-70°C operating range for only 0.5 mA of LED current.

The HCPL-0700 is designed for use mainly in TTL applications. Current Transfer Ratio is 300% minimum over 0-70°C for an LED current of 1.6 mA [1 TTL Unit Load (U.L.)]. A 300% minimum CTR enables operation with 1 U.L. out with a 2.2 kΩ pull-up resistor.

Selection for lower input currents down to 250 μA is available upon request.

### Absolute Maximum Ratings

(No Derating Required Up To 85°C)

Storage Temperature .....	-55°C to +125°C
Operating Temperature .....	-40°C to +85°C
Infrared and Vapor Phase Reflow Temperature .....	215°C for 90 s
Average Input Current – $I_F$ .....	20 mA
Peak Input Current – $I_F$ .....	40 mA
	(50% duty cycle, 1 ms pulse width)
Peak Transient Input Current – $I_F$ .....	1.0 A
	(≤1 μs pulse width, 300 pps)
Reverse Input Voltage – $V_R$ .....	5 V
Input Power Dissipation .....	35 mW
Output Current – $I_O$ (Pin 6) .....	60 mA
Emitter-Base Reverse Voltage (Pin 5-7) .....	0.5 V
Supply and Output Voltage – $V_{CC}$ (Pin 8-5), $V_O$ (Pin 6-5)	
HCPL-0700 .....	-0.5 V to 7 V
HCPL-0701 .....	-0.5 V to 18 V
Output Power Dissipation .....	100 mW

### Schematic

### Applications

- Ground Isolate Most Logic Families – TTL/TTL, CMOS/TTL, CMOS/CMOS, LSTTL/TTL, CMOS/LSTTL
- Low Input Current Line Receiver – Long Line or Party Line
- EIA RS-232C Line Receiver
- Telephone Ring Detector
- 117 V ac Line Voltage Status Indicator – Low Input Power Dissipation
- Low Power Systems – Ground Isolation

## Electrical Specifications

\*All typicals are at  $T_A = 25^\circ\text{C}$ .

### Notes:

- DC CURRENT TRANSFER RATIO in percent is defined as the ratio of output collector current,  $I_O$ , to the forward LED input current,  $I_F$ , times 100.
- Pin 7 open.
- Device considered a two-terminal device: pins 1, 2, 3, and 4 shorted together and pins 5, 6, 7, and 8 shorted together.
- Use of a resistor between pin 5 and 7 will decrease gain and delay time. See Application Note 951-1 for more details.
- Common mode transient immunity in a Logic High level is the maximum tolerable (positive)  $dV_{CM}/dt$  on the leading edge of the common mode pulse,  $V_{CM}$ , to assure that the output will remain in a Logic High state (i.e.,  $V_O > 2.0\text{ V}$ ). Common mode transient immunity in a Logic Low level is the maximum tolerable (negative)  $dV_{CM}/dt$  on the trailing edge of the common mode pulse signal,  $V_{CM}$ , to assure that the output will remain in a Logic Low state (i.e.,  $V_O < 0.8\text{ V}$ ).
- In applications where  $dV/dt$  may exceed  $50,000\text{ V}/\mu\text{s}$  (such as static discharge) a series resistor,  $R_{DC}$ , should be included to protect the detector IC from destructively high surge currents. The recommended value is  $R_{CC} = 220\ \Omega$ .
- Use of a  $0.1\ \mu\text{F}$  bypass capacitor connected between pins 5 and 8 is recommended.

**CNW139**

### Features

- 5000 Vrms/1 Minute Insulation Withstand Capability
- Worldwide Safety Approval  
UL1577 (File No. E55361)  
VDE 883/884/804/805/806/  
860/750  
IEC 65/380/950/335/435/601  
BS 415/7002/6301
- High Current Transfer Ratio - 3000% Typical
- Low Input Current Requirement - 0.5 mA
- TTL Compatible Output - 0.1 V  $V_{OL}$  Typical
- Performance Guaranteed Over Temperature 0°C to 70°C
- Base Access Allows Gain Bandwidth Adjustment
- High Output Current - 60 mA
- Pin Compatible with 6N138/9

### Applications

- High Voltage Insulation
- Low Input Current Line Receiver
- Ground Isolation - TTL/TTL, CMOS/TTL, CMOS/CMOS, LSTTL/TTL, CMOS/LSTTL
- EIA RS-232C Line Receiver
- Telephone Ring Detector
- AC Line Voltage Sensing
- Low Power Systems

### Description

These high-voltage, high-gain optocouplers use an AlGaAs LED and an integrated high gain photodetector to provide extremely high current transfer ratio between input and output. Separate pins for the photodiode and output stage result in TTL compatible saturation voltages and high speed operation. Where desired the  $V_{CC}$  and  $V_O$  terminals may be tied together to achieve conventional photodarlington operation. A base access terminal allows a gain bandwidth adjustment to be made.

### Package Outline

DIMENSIONS IN MILLIMETERS AND (INCHES)

A widebody encapsulation is used to provide creepage and clearance dimensions suitable for safety approval by regulatory agencies worldwide.

The CNW139 is for use in CMOS, LSTTL or other low power applications. A 400% minimum current transfer ratio is guaranteed over a 0-70°C operating range for only 0.5 mA of LED current.

The CNW138 is designed for use mainly in TTL applications. Current Transfer Ratio is 300% minimum over 0-70°C for an LED current of 1.6 mA (1 TTL load). A 300% minimum CTR enables operation with a fanout of 1 TTL Load using a 2.2 kΩ pull-up resistor.

### Regulatory Information

The CNW138/9 features a wide body DIL 8 encapsulation. This package was specifically designed to meet regulatory insulation requirements worldwide. The CNW138/9 has been approved by the following organizations:

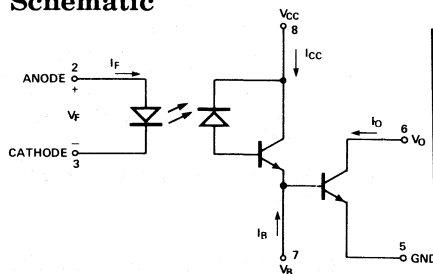

- UL – Covered under UL component recognition FILE E55361
- VDE – Approved according to VDE 0883/6.80  
VDE 0884/08.87 certification pending  
Reference voltage (VDE 0110b Tab. 4):  
500 V AC/600 V DC  
Complied for reinforced insulation at 250 V AC with:  
DIN IEC 380/VDE 0806/8.81  
DIN IEC 435/VDE 0805 "ENTWURF" Nov 84  
DIN 57804/VDE 0804/1.83 (insulation group C)  
DIN VDE 0860/8.86/HD 195 S4  
DIN IEC 601 Teil 1/VDE 0750 Teil 1/5.82
- NORDIC – Tested for applications (reinforced insulation) – Class II applications for plugable apparatus in normal tight execution.  
-SETI-SEMKO-NEMKO-DEMKO-According to IEC 65-IEC380-IEC950-IEC335
- BSI – Certification according to BS415:1979, BS7002:1989 and BS6301:1987 pending
- BABT – Certification pending

### Absolute Maximum Ratings

Storage Temperature .....	-55°C to +150°C
Operating Temperature .....	-55°C to 85°C
Lead Solder Temperature .....	260°C for 10 s (up to seating plane)
Average Input Current – $I_F$ .....	100 mA
Peak Transient Input Current – $I_F$ .....	1.0 A ( $\leq 1 \mu s$ pulse width, 300 pps)
Reverse Input Voltage – $V_R$ .....	5 V
Input Power Dissipation (up to 70°C) .....	250 mW*
Output Current – $I_O$ (Pin 6) .....	60 mA
Emitter-Base Reverse Voltage (Pin 5-7) .....	0.5 V
Supply and Output Voltage – $V_{CC}$ (Pin 8-5), $V_O$ (Pin 6-5)	
CNW138 .....	-0.5 to 7 V
CNW139 .....	-0.5 to 18 V
Output Power Dissipation .....	100 mW

\*Derate at 5.0 mW/°C for operating temperatures above 70°C.

### Schematic

OPTOCOUPLED

**CAUTION:** The small junction sizes inherent to the design of this bipolar component increases the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

## VDE 0884 Insulation Characteristics – Pending Approval

Description	Symbol	Characteristic	Unit
Installation classification per DIN VDE 0109/12.83, Table 1 for rated mains voltage $\leq 600 V_{RMS}$ for rated mains voltage $\leq 1000 V_{RMS}$		I-IV I-III	
Climatic Classification		55/150/21	
Pollution Degree (DIN VDE 0109/12.83)		2	
Maximum Working Insulation Voltage	$V_{IORM}$	1000	$V_{RMS}$
Input to Output Test Voltage, Method b* $V_{PR} = 1.6 \times V_{IORM}$ , 100% Production Test with $t_p = 1$ sec, Partial Discharge $< 5$ pC	$V_{PR}$	1600	$V_{RMS}$
Input to Output Test Voltage, Method a* $V_{PR} = 1.2 \times V_{IORM}$ , Type and sample test, $t_p = 60$ sec, Partial Discharge $< 5$ pC	$V_{PR}$	1200	$V_{RMS}$
Highest Allowable Overvoltage* (Transient Overvoltage, $t_{TR} = 10$ sec)	$V_{TR}$	8000	$V_{PK}$
Safety-Limiting Values (Maximum values allowed in the event of a failure, also see Figure 10) Case Temperature Current (Input Current $I_F$ , $P_{SI} = 0$ ) Output Power (obtained by setting pin 8 = 5.5 V, pins 7, 6, 5 = ground)	$T_{SI}$ $I_{SI}$ $P_{SI, OUTPUT}$	175 400 700	$^{\circ}C$ mA mW
Insulation Resistance at $T_{SP}$ , $V_{IO} = 500$ V	$R_{IS}$	$\geq 10^9$	ohm

\*Refer to the front of the optocoupler section of the 1991 Designer's Catalog, under regulatory information, (VDE 0884) for a detailed description.

**Note:** Isolation characteristics are guaranteed only within the safety maximum ratings which must be ensured by protective circuits in application.

					11				
		CNW138	20	35	$T_A = 25^\circ\text{C}$ $I_F = 1.6\text{ mA}$ $R_L = 2.2\text{ k}\Omega$	6, 11			
				70					
Common Mode Transient Immunity at Logic High Output	$ CM_H $		500			$\text{V}/\mu\text{s}$	$I_F = 0\text{ mA}$ , $R_L = 2.2\text{ k}\Omega$ , $R_{CC} = 0\ \Omega$ , $V_{CM} = 10\text{ V}$ , $T_A = 25^\circ\text{C}$	12	5, 6
Common Mode Transient Immunity at Logic Low Output	$ CM_L $		500			$\text{V}/\mu\text{s}$	$I_F = 1.6\text{ mA}$ , $R_L = 2.2\text{ k}\Omega$ , $R_{CC} = 0\ \Omega$ , $V_{CM} = 10\text{ V}$ , $T_A = 25^\circ\text{C}$	12	5, 6

\*All typicals are at  $T_A = 25^\circ\text{C}$ .

### Notes:

- DC CURRENT TRANSFER RATIO in percent is defined as the ratio of output collector current,  $I_O$ , to the forward LED input current,  $I_F$ , times 100.
- Pin 7 Open.
- Device considered a two-terminal device: Pins 1, 2, 3, and 4 shorted together and Pins 5, 6, 7, and 8 shorted together.
- Use of a resistor between pin 5 and 7 will decrease gain and delay time. See Application Note 951-1 for more details.
- Common mode transient immunity in Logic High level is the maximum tolerable (positive)  $dV_{CM}/dt$  on the leading edge of the common mode pulse  $V_{CM}$ , to assure that the output will remain in a Logic High state (i.e.  $V_O > 2.0\text{ V}$ ) Common mode transient immunity in Logic Low level is the maximum tolerable (negative)  $dV_{CM}/dt$  on the trailing edge of the common mode pulse signal,  $V_{CM}$ , to assure that the output will remain in a Logic Low state (i.e.  $V_O < 0.8\text{ V}$ ).
- In applications where  $dV/dt$  may exceed  $50,000\text{ V}/\mu\text{s}$  (such as a static discharge) a series resistor,  $R_{CC}$ , should be included to protect the detector IC from destructively high surge currents. The recommended value is

$$R_{CC} \approx \frac{1\text{ V}}{0.15 I_F (\text{mA})} \text{ k}\Omega.$$

- Use of a 0.1 mf bypass capacitor connected between pins 5 and 8 is recommended for operation.
- Each product is tested by applying an isolation test voltage of 6000 Vrms for 2 seconds. This test is in accordance with UL1577 and is performed in addition to the tests shown in the VDE 0884 INSULATION CHARACTERISTICS TABLE.

# High Speed CMOS Optocoupler

## Technical Data

### Features

- CMOS IC Technology
- Compatibility with All +5 V CMOS and TTL Logic Families
- No External Components Required for Logic Interface
- High Speed: 15 MBd Guaranteed
- Low Power Consumption
- World Wide Safety Approval  
UL 1577  
VDE 0884/0700/0804/  
0860/0160  
EN 60 950
- 3-State Output
- 3750 Vac/1 Minute Dielectric Withstand

### Applications

- Multiplexed Data Transmission
- Computer-Peripheral Interface
- Microprocessor System Interface
- Digital Isolation for A/D, D/A Conversion
- Instrument Input/Output Isolation
- Motor Control
- Power Inverter

### Description

The HCPL-7100 optocoupler combines the latest CMOS IC technology, a new high-speed high-efficiency AlGaAs LED, and an optimized light coupling system to achieve outstanding performance with very low power consumption. It requires only two bypass capacitors for complete CMOS/TTL compatibility.

Basic building blocks of the HCPL-7100 are a CMOS LED driver IC, an AlGaAs LED, and a CMOS detector IC. A CMOS or TTL logic input signal controls the LED driver IC which supplies current to the LED. The detector IC incorporates an integrated photodiode, a high-speed transimpedance amplifier and a voltage comparator with hysteresis. The 3-state

output is CMOS and TTL compatible and is controlled by the output enable pin,  $V_{OE}$ .

The HCPL-7100 consumes very little power, due to the CMOS IC technology and the light coupling system. The entire optocoupler typically uses only 10 mA of supply current, including the LED current.

World wide safety approval and 3750 Vac/1 minute dielectric withstand is achieved with a new packaging process.

The HCPL-7100 provides the user with an easy-to-use CMOS or TTL compatible optocoupler ideally suited for a variety of applications where high speed and low power consumption are desired.

### Schematic

**CAUTION:** The small device geometries inherent to the design of this CMOS component increase the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

## Regulatory Information

The HCPL-7100 has been approved by the following organizations:

### UL

Covered under UL component recognition FILE E55361

### VDE

Approved according to VDE 0884/08.87

Can be used for safe electrical separation between AC mains

and SELV (safety extra-low voltage) in equipment according to the following specifications:

DIN VDE 0700 part 1/09.86

DIN VDE 0804/05.89

DIN VDE 0860/05.89/HD 195 S4

DIN VDE 0160/05.88

EN 60 950/09.87 (CENELEC)

Reference voltage (VDE 0110b Tab 4): 650 Vac

## VDE 0884 Insulation Characteristics

Description	Symbol	Characteristic	Unit

Output Dynamic Power Dissipation Capacitance	$C_{PD2}$		10		pF			10

### Notes:

- The LED is OFF when the  $V_I$  is high and ON when  $V_I$  is low.
- Device considered a two terminal device; pins 1-4 shorted together and pins 5-8 shorted together.
- This is a proof test.
- $C_I$  is the capacitance measured at pin 2 ( $V_I$ ).
- $t_{PHL}$  propagation delay is measured from the 50% level on the falling edge of the  $V_I$  signal to the logic switching level of the  $V_O$  signal.  $t_{PLH}$  propagation delay is measured from the 50% level on the rising edge of the  $V_I$  signal to the logic switching level of the  $V_O$  signal.
- The logic switching levels are 1.5 V for TTL signals (0-3 V) and 2.5 V for CMOS signals (0-5 V).
- PWD is defined as  $|t_{PHL} - t_{PLH}|$ . %PWD (percent pulse width distortion) is equal to PWD in ns divided by symbol duration (bit length) in ns.
- Minimum data rate is calculated as follows: %PWD/PWD where %PWD is typically chosen by the design engineer (30% is common).
- $CM_H$  is the maximum common mode voltage slew rate that can be sustained while maintaining  $V_O > 3.2$  V.  $CM_L$  is the maximum common mode voltage slew rate that can be sustained while maintaining  $V_O < 0.8$  V. The common mode voltage slew rates apply to both rising and falling common mode voltage edges.
- Unloaded dynamic power dissipation is calculated as follows:  $C_{PD} \cdot V_{DD}^2 \cdot f + I_{DD} \cdot V_{DD}$  where  $f$  is switching frequency in MHz.

## HCPL-7100 Application Information

The HCPL-7100 is extremely easy to use. Because the optocoupler uses high-speed CMOS IC technology, the inputs and output are fully compatible with all +5 V TTL and CMOS logic.

TTL or CMOS logic can be connected directly to the inputs and output; no external interface circuitry is required.

As shown in Figure 1, the only external components required for proper operation are two ceramic bypass capacitors.

Capacitor values should be between 0.01  $\mu$ F and 0.1  $\mu$ F. For each capacitor, the total lead length between both ends of the capacitor and the power-supply pins should not exceed 20 mm. Figure 2 illustrates the recommended printed circuit board layout for the HCPL-7100.

C1, C2 = 0.01  $\mu$ F to 0.1  $\mu$ F

# Ultra High Speed CMOS Optocoupler

## Technical Data

### HCPL-7101

#### Features

- Ultra High Speed: 50 MBd Guaranteed
- Lowest Power-Delay Product Available
- CMOS IC Technology
- Compatible with All CMOS and TTL +5 V Logic Families
- No External Components Required for Logic Interface
- Low Power Consumption
- World Wide Safety Approval  
UL 1577  
VDE 0884/0804/0160
- 2500 Vac/1 Minute Dielectric Withstand
- 3-State Output
- High Common Mode Transient Immunity:  
>2000 V/ $\mu$ s @ 200 V Vcm

#### Applications

- Microprocessor System Interface
- Multiplexed Data Transmission
- Digital Isolation for A/D, D/A Conversion
- Computer-Peripheral Interface
- Isolated Line Receiver

#### Description

The HCPL-7101 ultra high-speed optocoupler utilizes CMOS IC technology, a new high-speed AlGaAs LED and an optimized light coupling system to achieve 50 MBd data rates with very low power consumption.

Both the LED driver IC and the detector IC have been designed using the state-of-the-art CMOS IC technology. The light coupling system and the high-speed high efficiency AlGaAs LED provide optimum light coupling from the LED to the integrated photodiode at minimal power levels. The LED driver IC can be controlled by either CMOS or TTL input logic signals. Pre-biasing and

peaking circuitry in the driver IC ensure maximum speed from the LED. In addition, the internal LED drive current is compensated for LED degradation.

The detector IC incorporates an integrated photodiode, a high-speed transimpedance amplifier and a voltage comparator with hysteresis. The 3-state output is CMOS and TTL compatible and is controlled by the output enable pin,  $V_{OE}$ .

The HCPL-7101 provides the user with an easy-to-use ultra high-speed and low-power optocoupler. Compatibility with CMOS and TTL logic makes it ideally suited for a variety of applications.

### Notes:

- The LED is OFF when the  $V_I$  is high and ON when  $V_I$  is low.
- Device considered a two terminal device; pins 1-4 shorted together and pins 5-8 shorted together.
- This is a proof test.
- $C_i$  is the capacitance measured at pin 2 ( $V_i$ ).
- $t_{PHL}$  propagation delay is measured from the 50% level on the falling edge of the  $V_I$  signal to the logic switching level of the  $V_O$  signal.  $t_{PLH}$  propagation delay is measured from the 50% level on the rising edge of the  $V_I$  signal to the logic switching level of the  $V_O$  signal.
- The logic switching levels are 1.5 V for TTL signals (0-3 V) and 2.5 V for CMOS signals (0-5 V).
- PWD is defined as  $|t_{PHL} - t_{PLH}|$ . %PWD (percent pulse width distortion) is equal to PWD in ns divided by symbol duration (bit length) in ns.
- Minimum data rate is calculated as follows: %PWD/PWD where %PWD is typically chosen by the design engineer (30% is common).
- $t_{PSK}$  is equal to the worst case difference in  $t_{PHL}$  and/or  $t_{PLH}$  that will be seen between units at any given temperature within the operating condition range.
- $CM_H$  is the maximum common mode voltage slew rate that can be sustained while maintaining  $V_O > 3.2$  V.  $CM_L$  is the maximum common mode voltage slew rate that can be sustained while maintaining  $V_O < 0.8$  V. The common mode voltage slew rates apply to both rising and falling common mode voltage edges.
- Unloaded dynamic power dissipation is calculated as follows:  $C_{PD} \cdot V_{DD}^2 \cdot f + I_{DD} \cdot V_{DD}$  where  $f$  is switching frequency in MHz.

## HCPL-7101 Application Information

The HCPL-7101 is extremely easy to use. Because the optocoupler uses high-speed CMOS IC technology, the inputs and output are fully compatible with all +5 V TTL and CMOS logic.

TTL or CMOS logic can be connected directly to the inputs and output; no external interface circuitry is required.

As shown in Figure 1, the only external components required for proper operation are two ceramic bypass capacitors.

Capacitor values should be between 0.01  $\mu$ F and 0.1  $\mu$ F. For each capacitor, the total lead length between both ends of the capacitor and the power-supply pins should not exceed 20 mm. Figure 2 illustrates the recommended printed circuit board layout for the HCPL-7101.

## Propagation Delay, Pulse-Width Distortion and Propagation Delay Skew

Propagation delay is a figure of merit which describes how quickly a logic signal propagates through a system. The propagation delay from low to high ( $t_{PLH}$ ) is the amount of time required for an input signal to propagate to the output, causing the output to change from low to high. Similarly, the propagation delay from high to low ( $t_{PHL}$ ) is the amount of time required for the input signal to propagate to the output, causing the output to change from high to low (see Figure 7).

Pulse-width distortion (PWD) results when  $t_{PLH}$  and  $t_{PHL}$  differ in value. PWD is defined as the difference between  $t_{PLH}$  and  $t_{PHL}$  and often determines the maximum data rate capability of a transmission system. PWD can be expressed in percent by dividing the PWD (in ns) by the minimum pulse width (in ns) being transmitted. Typically, PWD on the order of 20-30% of the minimum pulse width is tolerable; the exact figure depends on the particular application (RS232, RS422, T-1, etc.).

Propagation delay skew,  $t_{PSK}$ , is an important parameter to consider in parallel data applications where synchronization of signals on parallel data lines is a concern. If the parallel data is being sent through a group of optocouplers, differences in propagation delays will cause the data to arrive at the outputs of the optocouplers at different times. If this difference in propagation delays is large enough, it will determine the

maximum rate at which parallel data can be sent through the optocouplers.

Propagation delay skew is defined as the difference between the minimum and maximum propagation delays, either  $t_{PLH}$  or  $t_{PHL}$ , for any given group of optocouplers which are operating under the same conditions (i.e., the same supply voltage, output load, and operating temperature). As illustrated in Figure 10, if the inputs of a group of optocouplers are switched either ON or OFF at the same time,  $t_{PSK}$  is the difference between the shortest propagation delay, either  $t_{PLH}$  or  $t_{PHL}$ , and the longest propagation delay, either  $t_{PLH}$  or  $t_{PHL}$ .

As mentioned earlier,  $t_{PSK}$  can determine the maximum parallel data transmission rate. Figure 11 is the timing diagram of a typical parallel data application with both the clock and the data lines being sent through optocouplers. The figure shows data and clock signals at the inputs and outputs of the optocouplers. To obtain the maximum data transmission rate, both edges of the clock signal are being used to clock the data; if only one edge were used, the clock signal would need to be twice as fast.

Propagation delay skew represents the uncertainty of where an edge might be after being sent through an optocoupler. Figure 11 shows that there will be uncertainty in both the data and the clock lines. It is important that these two areas of uncertainty not overlap, otherwise the clock signal might

arrive before all of the data outputs have settled, or some of the data outputs may start to change before the clock signal has arrived. From these considerations, the absolute minimum pulse width that can be sent through optocouplers in a parallel application is twice  $t_{PSK}$ . A cautious design should use a slightly longer pulse width to ensure that any additional uncertainty in the rest of the circuit does not cause a problem.

The HCPL-7101 optocoupler offers the advantages of guaranteed specifications for propagation delays, pulse-width distortion and propagation delay skew over the recommended temperature, and power supply ranges.

# WIDEBAND ANALOG/VIDEO OPTOCOUPLER

HCPL-4562

## Features

- **WIDE BANDWIDTH: 17 MHz<sup>[1]</sup>**
- **HIGH VOLTAGE GAIN: 2.0<sup>[1]</sup>**
- **LOW TEMPERATURE COEFFICIENT (G<sub>V</sub>): -0.3% PER °C<sup>[1]</sup>**
- **HIGHLY LINEAR AT LOW DRIVE CURRENTS**
- **HIGH-SPEED AlGaAs EMITTER**
- **RECOGNIZED UNDER THE COMPONENT PROGRAM OF U.L. (FILE NO. E55361) FOR DIELECTRIC WITHSTAND PROOF VOLTAGES OF 2500 VAC, 1 MINUTE AND 5000 VAC, 1 MINUTE (OPTION 020).**
- **VDE 0883 APPROVAL AVAILABLE**

## Description

The HCPL-4562 optocoupler provides wide-bandwidth isolation for analog signals. It is ideal for video isolation when combined with its application circuit (Figure 4). High linearity and low phase shift are achieved through an 820 nm AlGaAs emitter, combined with a high-speed detector.

## Applications

- **VIDEO ISOLATION FOR THE FOLLOWING STANDARDS/FORMATS: NTSC, PAL, SECAM, S-VHS, ANALOG RGB**
- **LOW-DRIVE-CURRENT FEEDBACK ELEMENT IN SWITCHING POWER SUPPLIES, e.g. FOR ISDN NETWORKS**
- **A/D CONVERTER SIGNAL ISOLATION**
- **ANALOG SIGNAL GROUND ISOLATION**

## Recommended Operating Conditions

Operating Temperature ..... -10°C to +70°C  
 Quiescent Input Current — I<sub>FQ</sub> ..... 6 mA  
 Peak Input Current — I<sub>F</sub> ..... 10 mA

## Absolute Maximum Ratings

Storage Temperature ..... -55°C to +125°C  
 Operating Temperature ..... -40°C to +85°C  
 Lead Solder Temperature ..... 260°C for 10 s  
 (1.6 mm below seating plane)

Average Input Current — I<sub>F</sub> ..... 12 mA DC  
 Peak Input Current — I<sub>F</sub> ..... 18.6 mA  
 Effective Input Current — I<sub>F</sub> ..... 12.9 mA rms  
 Supply Voltage — V<sub>CC</sub> (Pin 8-5) ..... -0.3 V to 30 V  
 Output Voltage — V<sub>O</sub> (Pin 6-5) ..... -0.3 V to 20 V  
 Reverse Input Voltage — V<sub>R</sub> (Pin 3-2) ..... 1.8 V  
 Emitter-Base Reverse Voltage (Pin 5-7) ..... 5 V  
 Peak Output Current — I<sub>O</sub> (Pin 6) ..... 16 mA  
 Average Output Current — I<sub>O</sub> (Pin 6) ..... 8 mA  
 Base Current — I<sub>B</sub> (Pin 7) ..... 5 mA  
 Output Power Dissipation<sup>[2]</sup> ..... 100 mW

**CAUTION:** The small junction sizes inherent to the design of this bipolar component increase the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

OPTOCOUPERS

## Notes:

- When used in the circuit of Figure 1 or Figure 4:  $G_V = V_{OUT}/V_{IN}$ .
- Derate linearly above 70°C free-air temperature at a rate of 2.0 mW/°C.
- Maximum variation from the best fit line of  $I_{PB}$  vs.  $I_F$  expressed as a percentage of the peak-to-peak full-scale output.
- CURRENT TRANSFER RATIO is defined as the ratio of output collector current,  $I_O$ , to the forward LED input current,  $I_F$ , times 100%.
- Device considered a two-terminal device: Pins 1, 2, 3, and 4 shorted together and Pins 5, 6, 7, and 8 shorted together.
- Flat-band small-signal voltage gain.
- The frequency at which the gain is 3 dB below the flat-band gain.
- Differential gain is the change in the small-signal gain of the optocoupler at 3.58 MHz as the bias level is varied over a given range.
- Differential phase is the change in the small-signal phase response of the optocoupler at 3.58 MHz as the bias level is varied over a given range.
- TOTAL HARMONIC DISTORTION is defined as the square root of the sum of the square of each harmonic distortion component.
- ISOLATION MODE REJECTION RATIO, a measure of the optocoupler's ability to reject signals or noise that may exist between input and output terminals, is defined by  $(V_{OUT}/V_{IN})/(V_{OUT}/V_{IM})$ , where  $V_{IM}$  is the isolation mode voltage signal.

## Design Considerations of the Application Circuit

The application circuit in Figure 4 incorporates several features that help maximize the bandwidth performance of the HCPL-4562. Most important of these features is peaked response of the detector circuit that helps extend the frequency range over which the voltage gain is relatively constant. The number of gain stages, the overall circuit topology and the choice of DC bias points are all consequences of the desire to maximize bandwidth performance.

To use the circuit, first select  $R_1$  to set  $V_E$  for the desired LED quiescent current by:

$$I_{FQ} = \frac{V_E}{R_4} \cong \frac{G_V V_E R_{10}}{(\partial I_{PB} / \partial I_F) R_7 R_9} \quad (1)$$

For a constant value of  $V_{IN_{p-p}}$ , the circuit topology (adjusting the gain with  $R_4$ ) preserves linearity by keeping the modulation factor (MF) dependent only on  $V_E$ .

$$i_{F_{p-p}} \cong V_{IN_{p-p}} / R_4 \quad (2)$$

$$\frac{i_{F_{p-p}}}{I_{FQ}} \cong \frac{i_{PB_{p-p}}}{I_{PBQ}} = \frac{V_{IN_{p-p}}}{V_E} \quad (3)$$

$$\text{Modulation Factor (MF)} = \frac{i_{F_{p-p}}}{2 I_{FQ}} \cong \frac{V_{IN_{p-p}}}{2 V_E} \quad (4)$$

For a given  $G_V$ ,  $V_E$ , and  $V_{CC}$ , DC output voltage will vary only with  $h_{FEX}$ .

$$V_O = V_{CC} - V_{BE_4} - \frac{R_9}{R_{10}} (V_{BEX} - (I_{PBQ} - I_{BQ}) R_7) \quad (5)$$

Where:

$$I_{PBQ} \cong \frac{G_V V_E R_{10}}{R_7 R_9} \quad (6)$$

and,

$$I_{BQ} \cong \frac{V_{CC} - 2 V_{BE}}{R_6 h_{FEX}} \quad (7)$$

Figure 15 shows the dependency of the DC output voltage on  $h_{FEX}$ .

For  $9 V < V_{CC} < 12 V$ , select the value of  $R_{11}$  such that

$$I_{CQ4} \cong \frac{V_O}{R_{11}} \leq \frac{4.25 V}{470 \Omega} \leq 9.0 \text{ mA} \quad (8)$$

The voltage gain of the second stage ( $Q_3$ ) is approximately equal to:

$$\frac{R_9}{R_{10}} * \frac{1}{1 + s R_9 \left[ C_{CQ3} + \frac{1}{2\pi R_{11} f_{T4}} \right]} \quad (9)$$

Increasing  $R'_{11}$  ( $R'_{11}$  includes the parallel combination of  $R_{11}$  and the load impedance) or reducing  $R_9$  (keeping  $R_9/R_{10}$  ratio constant) will improve the bandwidth.

If it is necessary to drive a low impedance load, bandwidth may also be preserved by adding an additional emitter following the buffer stage ( $Q_5$  in Figure 16), in which case  $R_{11}$  can be increased to set  $I_{CQ4} \cong 2 \text{ mA}$ .

Finally, adjust  $R_4$  to achieve the desired voltage gain.

$$G_V \cong \frac{V_{OUT}}{V_{IN}} \cong \frac{\partial I_{PB}}{\partial I_F} \left[ \frac{R_7 R_9}{R_4 R_{10}} \right] \quad (10)$$

$$\text{where typically } \frac{\partial I_{PB}}{\partial I_F} = 0.0032$$

Definition:

- $G_V$  = Voltage Gain
- $I_{FQ}$  = Quiescent LED forward current
- $i_{F_{p-p}}$  = Peak-to-peak small signal LED forward current
- $V_{IN_{p-p}}$  = Peak-to-peak small signal input voltage
- $i_{PB_{p-p}}$  = Peak-to-peak small signal base photo current
- $I_{PBQ}$  = Quiescent base photo current
- $V_{BEX}$  = Base-Emitter voltage of HCPL-4562 transistor
- $I_{BQ}$  = Quiescent base current of HCPL-4562 transistor
- $h_{FEX}$  = Current Gain ( $I_C/I_B$ ) of HCPL-4562 transistor
- $V_E$  = Voltage across emitter degeneration resistor  $R_4$
- $f_{T4}$  = Unity gain frequency of  $Q_4$
- $C_{CQ3}$  = Effective capacitance from collector of  $Q_3$  to ground

# AC/DC to Logic Interface Optocoupler

## Technical Data

### Features

- Standard and Low Input Current (HCPL-3760) Versions
- AC or DC Input
- Programmable Sense Voltage
- Hysteresis
- Logic Compatible Output
- Thresholds Guaranteed Over Temperature
- Thresholds Independent of LED Degradation
- Recognized Under the Component Program of U.L. (File No. E55361) for Dielectric Withstand Proof Test Voltages of 2500 VAC, 1 Minute
- VDE 0883 Approval Available

### Applications

- Limit Switch Sensing
- Low Voltage Detector
- 5 V-240 V AC/DC Voltage Sensing
- Relay Contact Monitor
- Relay Coil Voltage Monitor
- Current Sensing
- Microprocessor Interfacing

### Description

The HCPL-3700 and HCPL-3760 are voltage/current threshold detection optocouplers. The HCPL-3760 is a low-current version of the HCPL-3700. To obtain lower current operation, the HCPL-3760 uses a high-efficiency AlGaAs LED which provides higher light output at lower drive currents. Both devices utilize threshold sensing input buffer ICs which permit control of threshold levels over a wide range of input voltages with a single external resistor.

The input buffer incorporates

### HCPL-3700 HCPL-3760

several features: hysteresis for extra noise immunity and diode switching immunity, a diode bridge for easy use with ac input signals, and internal clamping diodes to protect the buffer and LED from a wide range of over-voltage and over-current transients. Because

### Outline Drawing

DIMENSIONS IN MILLIMETRES AND (INCHES).

threshold sensing is done prior to driving the LED, variations in optical coupling from the LED to the detector will have no effect on the threshold levels.

The HCPL-3700's input buffer IC has a nominal turn on threshold of 2.5 mA ( $I_{TH+}$ ) and 3.7 volts ( $V_{TH+}$ ).

The buffer IC for the HCPL-3760 was redesigned to permit a lower input current. The nominal turn on threshold for the HCPL-3760 is 1.2 mA ( $I_{TH+}$ ) and 3.7 volts ( $V_{TH+}$ ).

The high gain output stage features an open collector output providing both TTL compatible saturation voltages and CMOS compatible breakdown voltages.

By combining several unique functions in a single package, the user is provided with an ideal component for industrial control computer input boards and other applications where a predetermined input threshold level is desirable.

Min. External Tracking Path (Creepage)	L (IO2)	≥ 7	mm	Measured from input terminals to output terminals
Min. Internal Plastic Gap (Clearance)		0.08	mm	Through insulation distance conductor to conductor
Tracking Resistance	CTI	175	Volts	DIN IEC 112/VDE 0303 Part 1
Isolation Group (per DIN VDE 0109)		IIIa		Material Group DIN VDE 0109

### Notes:

1. Measured at a point 1.6 mm below seating plane.
2. Current into/out of any single lead.
3. Surge input current duration is 3 ms at 120 Hz pulse repetition rate. Transient input current duration is 10  $\mu$ s at 120 Hz pulse repetition rate. Note that maximum input power,  $P_{IN}$ , must be observed.
4. Derate linearly above 70°C free-air temperature at a rate of 4.1 mW/°C. Maximum input power dissipation of 230 mW allows an input IC junction temperature of 125°C at an ambient temperature of  $T_A = 70^\circ\text{C}$  with a typical thermal resistance from junction to ambient of  $\theta_{JA} = 240^\circ\text{C/W}$ . Excessive  $P_{IN}$  and  $T_J$  may result in IC chip degradation.
5. Derate linearly above 70°C free-air temperature at a rate of 5.4 mW/°C.
6. Derate linearly above 70°C free-air temperature at a rate of 3.9 mW/°C. Maximum output power dissipation of 210 mW allows an output IC junction temperature of 125°C at an ambient temperature of  $T_A = 70^\circ\text{C}$  with a typical thermal resistance from junction to ambient of  $\theta_{JAO} = 265^\circ\text{C/W}$ .
7. Derate linearly above 70°C free-air temperature at a rate of 0.6 mA/°C.
8. Maximum operating frequency is defined when output waveform Pin 6 obtains only 90% of  $V_{CC}$  with  $R_L = 4.7\text{ k}\Omega$ ,  $C_L = 30\text{ pF}$  using a 5 V square wave input signal.
9. All typical values are at  $T_A = 25^\circ\text{C}$ ,  $V_{CC} = 5.0\text{ V}$  unless otherwise stated.
10. The  $t_{PHL}$  propagation delay is measured from the 2.5 V level of the leading edge of a 5.0 V input pulse (1  $\mu$ s rise time) to the 1.5 V level on the leading edge of the output pulse (see Figure 9).
11. The  $t_{PLH}$  propagation delay is measured from the 2.5 V level of the trailing edge of a 5.0 V input pulse (1  $\mu$ s fall time) to the 1.5 V level on the trailing edge of the output pulse (see Figure 9).
12. Common mode transient immunity in Logic High level is the maximum tolerable (positive)  $dV_{CM/dt}$  on the leading edge of the common mode pulse,  $V_{CM}$ , to insure that the output will remain in a Logic High state (i.e.,  $V_O > 2.0\text{ V}$ ). Common mode transient immunity in Logic Low level is the maximum tolerable (negative)  $dV_{CM/dt}$  on the trailing edge of the common mode pulse signal,  $V_{CM}$ , to insure that the output will remain in a Logic Low state (i.e.,  $V_O < 0.8\text{ V}$ ). See Figure 10.
13. In applications where  $dV_{CM/dt}$  may exceed 50,000 V/ $\mu$ s (such as static discharge), a series resistor,  $R_{CC}$ , should be included to protect the detector IC from destructively high surge currents. The recommended value for  $R_{CC}$  is 240 $\Omega$  per volt of allowable drop in  $V_{CC}$  (between Pin 8 and  $V_{CC}$ ) with a minimum value of 240 $\Omega$ .
14. Logic low output level at Pin 6 occurs under the conditions of  $V_{IN} \geq V_{TH}$ , as well as the range of  $V_{IN} > V_{TH}$  once  $V_{IN}$  has exceeded  $V_{TH}$ . Logic high output level at Pin 6 occurs under the conditions of  $V_{IN} \leq V_{TH}$ , as well as the range of  $V_{IN} < V_{TH}$  once  $V_{IN}$  has decreased below  $V_{TH}$ .
15. AC voltage is instantaneous voltage.
16. Device considered a two terminal device: Pins 1, 2, 3, 4 connected together, and Pins 5, 6, 7, 8 connected together.

Figure 1. Typical Input Characteristics,  $I_{IN}$  vs.  $V_{IN}$  (AC Voltage is Instantaneous Value).

OPTOCOUPLED

## Electrical Considerations

The HCPL-3700/3760 optocouplers have internal temperature compensated, predictable voltage and current threshold points which allow selection of an external resistor,  $R_x$ , to determine larger external threshold voltage levels. For a desired external threshold voltage,  $V_x$ , a corresponding typical value of  $R_x$  can be obtained from Figure 11. Specific calculation of  $R_x$  can be obtained from Equation (1). Specification of both  $V_+$  and  $V_-$  voltage threshold levels simultaneously can be obtained by the use of  $R_x$  and  $R_p$  as shown in Figure 12 and determined by Equations (2) and (3).

$R_x$  can provide over-current transient protection by limiting input current during a transient condition. For monitoring contacts of a relay or switch, the HCPL-3700/3760 in combination with  $R_x$  and  $R_p$  can be used to allow a specific current to be conducted through the contacts for cleaning purposes (wetting current).

The choice of which input voltage clamp level to choose depends upon the application of this device (see Figure 1). It is recommended that the low

clamp condition be used when possible. The low clamp condition in conjunction with the low input current feature will ensure extremely low input power dissipation.

In applications where  $dV_{CM/dt}$  may be extremely large (such as static discharge), a series resistor,  $R_{CC}$ , should be connected in series with  $V_{CC}$  and Pin 8 to protect the detector IC from destructively high surge currents. See Note 13 for determination of  $R_{CC}$ . In addition, it is recommended that a ceramic disc bypass capacitor of 0.01  $\mu$ f be placed between Pins 8 and 5 to reduce the effect of power supply noise.

For interfacing AC signals to TTL systems, output low pass filtering can be performed with a pullup resistor of 1.5 k $\Omega$  and 20  $\mu$ f capacitor. This application requires a Schmitt trigger gate to avoid slow rise time chatter problems. For AC input applications, a filter capacitor can be placed across the DC input terminals for either signal or transient filtering.

Either AC (Pins 1, 4) or DC (Pins 2, 3) input can be used to determine external threshold levels.

For one specifically selected external threshold voltage level  $V_+$  or  $V_-$ ,  $R_x$  can be determined without use of  $R_p$  via

$$R_x = \frac{V_x - V_{TH(-)}}{I_{TH+(-)}} \quad (1)$$

For two specifically selected external threshold voltage levels,  $V_+$  and  $V_-$ , the use of  $R_x$  and  $R_p$  will permit this selection via equations (2), (3) provided the following conditions are met. If the denominator of equation (2) is positive, then

$$\frac{V_+}{V_-} \geq \frac{V_{TH+}}{V_{TH-}} \text{ and } \frac{V_+ - V_{TH+}}{V_- - V_{TH-}} < \frac{I_{TH+}}{I_{TH-}}$$

Conversely, if the denominator of equation (2) is negative, then

$$\frac{V_+}{V_-} \leq \frac{V_{TH+}}{V_{TH-}} \text{ and } \frac{V_+ - V_{TH+}}{V_- - V_{TH-}} > \frac{I_{TH+}}{I_{TH-}}$$

$$R_x = \frac{V_{TH-}(V_+) - V_{TH+}(V_-)}{I_{TH+}(V_{TH-}) - I_{TH-}(V_{TH+})} \quad (2)$$

$$R_p = \frac{V_{TH-}(V_+) - V_{TH+}(V_-)}{I_{TH+}(V_- - V_{TH-}) + I_{TH-}(V_{TH+} - V_+)} \quad (3)$$

## Applications

- **IMPLEMENT AN ISOLATED 20 mA CURRENT LOOP TRANSMITTER IN:**
  - Computer Peripherals
  - Industrial Control Equipment
  - Data Communications Equipment

## Description

The HCPL-4100 optocoupler is designed to operate as a transmitter in equipment using the 20 mA current loop. 20 mA current loop systems conventionally signal a logic high state by transmitting 20 mA of loop current (MARK), and signal a logic low state by allowing no more than a few milliamperes of loop current (SPACE). Optical coupling of the signal from the logic input to the 20 mA current loop breaks ground loops and provides very high immunity to common mode interference.

The HCPL-4100 data input is compatible with LSTTL, TTL, and CMOS logic gates. The input integrated circuit drives a GaAsP LED. The light emitted by the LED is sensed by a second integrated circuit that allows 20 mA to pass with a voltage drop of less than 2.7 volts when no light is emitted and allows less than 2 mA to pass when light is emitted. The transmitter output is capable of withstanding 27 volts. The input integrated circuit provides a controlled amount of LED drive current and takes into account LED light output degradation. The internal shield allows a guaranteed 1000 V/ $\mu$ s common mode transient immunity.

## Recommended Operating Conditions

### Notes:

- Derate linearly above 55°C free air temperature at a rate of 3.8 mW/°C. Proper application of the derating factors will prevent IC junction temperatures from exceeding 125°C for ambient temperatures up to 85°C.
- Derate linearly above a free-air temperature of 70°C at a rate of 2.3 mW/°C. A significant amount of power may be dissipated in the HCPL-4100 output circuit during the transition from the SPACE state to the MARK state when driving a data line or capacitive load (C<sub>OUT</sub>). The average power dissipation during the transition can be estimated from the following equation which assumes a linear discharge of a capacitive load: P = I<sub>SC</sub> (V<sub>SO</sub> + V<sub>MO</sub>)/2, where V<sub>SO</sub> is the output voltage in the SPACE state. The duration of this transition can be estimated as t = C<sub>OUT</sub> (V<sub>SO</sub> - V<sub>MO</sub>)/I<sub>SC</sub>. For typical applications driving twisted pair data lines with NRZ data as shown in Figure 11, the transition time will be less than 10% of one bit time.
- Derate linearly above 55°C free-air temperature at a rate of 5.1 mW/°C.
- The maximum current that will flow into the output in the mark state (I<sub>SC</sub>) is internally limited to protect the device. The duration of the output short circuit shall not exceed 10 ms.
- The device is considered a two terminal device, pins 1, 2, 3, and 4 are connected together, and pins 5, 6, 7, and 8 are connected together.

### Notes:

- The  $t_{PLH}$  propagation delay is measured from the 1.3 volt level on the leading edge of the input pulse to the 10 mA level on the leading edge of the output pulse.
- The  $t_{PHL}$  propagation delay is measured from the 1.3 volt level on the trailing edge of the input pulse to the 10 mA level on the trailing edge of the output pulse.
- The rise time,  $t_r$ , is measured from the 10% to the 90% level on the rising edge of the output current pulse.
- The fall time,  $t_f$ , is measured from the 90% to the 10% level on the falling edge of the output current pulse.
- The common mode transient immunity in the logic high level is the maximum (positive)  $dV_{CM}/dt$  on the leading edge of the common mode pulse,  $V_{CM}$ , that can be sustained with the output in a Mark ("H") state (i.e.,  $I_O > 12 \text{ mA}$ ).
- The common mode transient immunity in the logic low level is the maximum (negative)  $dV_{CM}/dt$  on the leading edge of the common mode pulse,  $V_{CM}$ , that can be sustained with the output in a Space ("L") state (i.e.,  $I_O > 3 \text{ mA}$ ).
- Use of a  $0.1 \mu\text{F}$  bypass capacitor connected between pins 5 and 8 is recommended.

## Applications

Data transfer between equipment which employs current loop circuits can be accomplished via one of three configurations: simplex, half duplex or full duplex communication. With these configurations, point to point and multidrop arrangements are possible. The appropriate configuration to use depends upon data rate, number of stations, number and length of lines, direction of data flow, protocol, current source location and voltage compliance value, etc.

### SIMPLEX

The simplex configuration, whether point to point or multidrop, gives unidirectional data flow from transmitter(s) to receiver. This is the simplest configuration for use in long line length (two wire), moderate data rate, and low current source compliance level applications. A block diagram of simplex point to point arrangement is given in Figure 10 for the HCPL-4100 transmitter optocoupler.

Figure 10. Simplex Point to Point Current Loop System Configuration

Major factors which limit maximum data rate performance for a simplex loop are the location and compliance voltage of the loop current source as well as the total line capacitance. Application of the HCPL-4100 transmitter in a simplex loop necessitates that a non-isolated active receiver (containing current source) be used at the opposite end of the current loop. With long line length, large line capacitance will need to be charged to the compliance voltage level of the current source before the receiver loop current decreases to zero. This effect limits upper data rate performance. Slower data rates will occur with larger compliance voltage levels. The maximum compliance level is determined by the transmitter breakdown characteristic. In addition, adequate compliance of the current source must be available for voltage drops across station(s) during the MARK state in multidrop applications for long line lengths.

In a simplex multidrop application with multiple HCPL-4100 transmitters and one non-isolated active receiver, priority of transmitters must be established.

A recommended non-isolated active receiver circuit which can be used with the HCPL-4100 in point to point or in multidrop 20 mA current loop applications is given in Figure 11. This non-isolated active receiver current threshold must be chosen properly in order to provide adequate noise immunity as well as not to detect SPACE state current (bias current) of the HCPL-4100 transmitter. The receiver input threshold current is  $V_{th}/R_{th} \approx 10$  mA. A simple transistor current source provides a nominal 20 mA loop current over a  $V_{CC}$  compliance range of 6 V dc to 27 V dc. A resistor can be used in place of the constant current source for simple applications where the wire loop

distance and number of stations on the loop are fixed. A minimum transmitter output load capacitance of 1000 pF is required between pins 3 and 4 to ensure absolute stability.

Length of the current loop (one direction) versus minimum required DC supply voltage,  $V_{CC}$ , of the circuit in Figure 11 is graphically illustrated in Figure 12. Multidrop configurations will require larger  $V_{CC}$  than Figure 12 predicts in order to account for additional station terminal voltage drops.

Figure 12. Minimum Required Supply Voltage,  $V_{CC}$ , vs. Loop Length for Current Loop Circuit of Figure 12

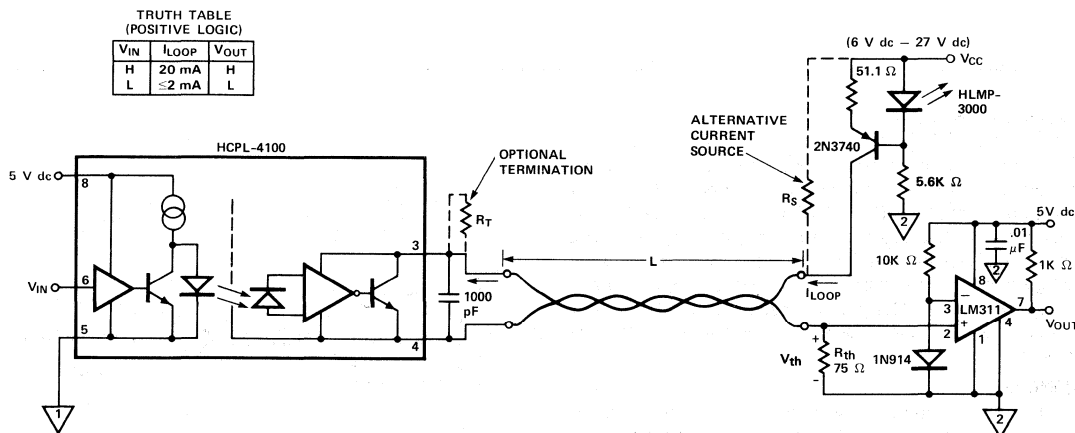

Figure 11. Recommended Non-Isolated Active Receiver with HCPL-4100 Isolated Transmitter for Simplex Point to Point 20 mA Current Loop

**Figure 13. Typical Data Rate vs. Distance and Supply Voltage**

Typical data rate performance versus distance is illustrated in Figure 13 for the combination of a non-isolated active receiver and HCPL-4100 optically coupled current loop transmitter shown in Figure 11. Curves are shown for 25% distortion data rate at different V<sub>CC</sub> values. 25% distortion data rate is defined as that rate at which 25% distortion occurs to output bit interval with respect to the input bit interval. Maximum data rate (dotted line) is restricted by device characteristics. An input Non-Return-to-Zero (NRZ) test waveform of 16 bits (0000001011111101) was used for data rate distortion measurements. Enhanced speed performance of the loop system can be obtained with lower V<sub>CC</sub> supply levels, as illustrated in Figure 13. In addition, when loop current is supplied through a resistor instead of by a current source, an additional series termination resistance equal to the characteristic line impedance can be used at the HCPL-4100 transmitter end to enhance speed of response by approximately 20%.

The cable used contained five pairs of unshielded, twisted, 22 AWG wire (Dearborn #862205). Loop current is 20 mA nominal. Input and output logic supply voltages are 5 V dc.

**Figure 14. Full Duplex Point to Point Current Loop System Configuration**

## FULL DUPLEX

Full duplex point to point communication of Figure 14 uses a four wire system to provide simultaneous, bidirectional data communication between local and remote equipment. Basic application uses two simplex point to point loops which have two separate, active, non-isolated units at one common end of the loops. The other end of each loop is isolated.

As Figure 14 illustrates, the combination of Hewlett-Packard current loop optocouplers, HCPL-4100 transmitter and HCPL-4200 receiver, can be used at the isolated end of current loops. Cross talk and common mode coupling are greatly reduced when optical isolation is implemented at the same end of both loops, as shown. Full duplex data rate is limited by the non-isolated active receiver current loop. Comments mentioned under simplex configuration apply to the full duplex case. Consult the HCPL-4200 receiver optocoupler data sheet for specified device performance.

## HALF DUPLEX

The half duplex configuration, whether point to point or multidrop, gives non-simultaneous bidirectional data flow from transmitters to receivers shown in Figures 15a and 15b. This configuration allows the use of two wires to carry data back and forth between local and remote units. However, protocol must be used to determine which specific transmitter can operate at any given time. Maximum data rate for a half duplex system is limited by the loop current charging time. These considerations were explained in the Simplex configuration section.

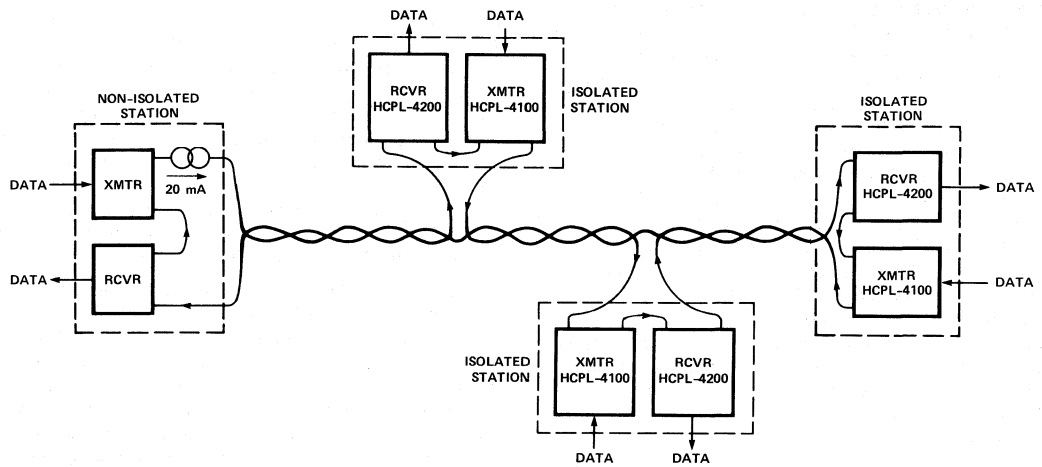

Figures 15a and 15b illustrate half duplex application for the combination of HCPL-4100/-4200 optocouplers. The unique and complementary designs of the HCPL-4100 transmitter and HCPL-4200 receiver optocouplers provide many designed-in benefits. For example, total optical isolation at one end of the current loop is easily accomplished, which results in substantial removal of common mode influences, elimination of ground potential differences and reduction of power supply requirements. With this combination of HCPL-4100/-4200 optocouplers, specific current loop noise immunity is provided, i.e., minimum SPACE state current noise immunity is 1 mA, MARK state noise immunity is 8 mA.

Voltage compliance of the current source must be of an adequate level for operating all units in the loop while not exceeding 27 V dc, the maximum breakdown voltage for the HCPL-4100. Note that the HCPL-4100 transmitter will allow output loop current to conduct when input V<sub>CC</sub> power is off. Consult the HCPL-4200 receiver optocoupler data sheet for specified device performance.

For more information about the HCPL-4100/-4200 optocouplers, consult Application Note 1018.

## Features

- DATA OUTPUT COMPATIBLE WITH LSTTL, TTL AND CMOS
- 20 K BAUD DATA RATE AT 1400 METRES LINE LENGTH
- GUARANTEED PERFORMANCE OVER TEMPERATURE (0°C TO 70°C)
- GUARANTEED ON AND OFF THRESHOLDS
- LED IS PROTECTED FROM EXCESS CURRENT
- INPUT THRESHOLD HYSTERESIS
- THREE-STATE OUTPUT COMPATIBLE WITH DATA BUSES
- INTERNAL SHIELD FOR HIGH COMMON MODE REJECTION
- RECOGNIZED UNDER THE COMPONENT PROGRAM OF U.L. (FILE NO. E55361) FOR DIELECTRIC WITHSTAND PROOF TEST VOLTAGES OF 2500 Vac, 1 MINUTE
- OPTICALLY COUPLED 20 mA CURRENT LOOP TRANSMITTER, HCPL-4100, ALSO AVAILABLE.
- VDE 0883 APPROVAL PENDING

## Applications

- IMPLEMENT AN ISOLATED 20 mA CURRENT LOOP RECEIVER IN:
  - Computer Peripherals
  - Industrial Control Equipment
  - Data Communications Equipment

## Description

The HCPL-4200 optocoupler is designed to operate as a receiver in equipment using the 20 mA Current Loop. 20 mA current loop systems conventionally signal a logic high state by transmitting 20 mA of loop current (MARK), and signal a logic low state by allowing no more than a few milliamperes of loop current (SPACE). Optical coupling of the signal from the 20 mA current loop to the logic output breaks ground loops and provides for a very high common mode rejection. The HCPL-4200 aids in the design process by providing guaranteed thresholds for logic high state and logic low state for the current loop, providing an LSTTL, TTL, or CMOS compatible logic interface, and providing guaranteed common mode rejection. The buffer circuit on the current loop side of the HCPL-4200 provides typically 0.8 mA of hysteresis which increases the immunity to common mode and differential mode noise. The buffer also provides a controlled amount of LED drive current which takes into account LED light output degradation. The internal shield allows a guaranteed 1000 V/μs common mode transient immunity.

## Recommended Operating Conditions

### NOTES:

- $\leq 1\text{ }\mu\text{s}$  pulse width, 300 pps.
- Derate linearly above  $70^{\circ}\text{C}$  free air temperature at a rate of  $1.6\text{ mW}/^{\circ}\text{C}$ . Proper application of the derating factors will prevent IC junction temperatures from exceeding  $125^{\circ}\text{C}$  for ambient temperatures up to  $85^{\circ}\text{C}$ .
- Derate linearly above  $70^{\circ}\text{C}$  free air temperature at a rate of  $3.8\text{ mW}/^{\circ}\text{C}$ .
- Derate linearly above  $70^{\circ}\text{C}$  free air temperature at a rate of  $4.6\text{ mW}/^{\circ}\text{C}$ .
- Duration of output short circuit time shall not exceed 10 ms.
- The device is considered a two terminal device, pins 1, 2, 3, and 4 are connected together and pins 5, 6, 7, and 8 are connected together.
- The  $t_{PLH}$  propagation delay is measured from the 10 mA level on the leading edge of the input pulse to the 1.3 V level on the leading edge of the output pulse.
- The  $t_{PHL}$  propagation delay is measured from the 10 mA level on the trailing edge of the input pulse to the 1.3 V level on the trailing edge of the output pulse.
- The rise time,  $t_r$ , is measured from the 10% to the 90% level on the rising edge of the output logic pulse.
- The fall time,  $t_f$ , is measured from the 90% to the 10% level on the falling edge of the output logic pulse.
- Common mode transient immunity in the logic high level is the maximum (negative)  $dV_{CM}/dt$  on the trailing edge of the common mode pulse,  $V_{CM}$ , which can be sustained with the output voltage in the logic high state (i.e.,  $V_O \geq 2\text{ V}$ ).
- Common mode transient immunity in the logic low level is the maximum (positive)  $dV_{CM}/dt$  on the leading edge of the common mode pulse,  $V_{CM}$ , which can be sustained with the output voltage in the logic low state (i.e.,  $V_O \geq 0.8\text{ V}$ ).
- Use of a  $0.1\text{ }\mu\text{F}$  bypass capacitor connected between pins 5 and 8 is recommended.

OPTOCOUPERS

# Applications

Data transfer between equipment which employs current loop circuits can be accomplished via one of three configurations: simplex, half duplex or full duplex communication. With these configurations, point-to-point and multidrop arrangements are possible. The appropriate configuration to use depends upon data rate, number of stations, number and length of lines, direction of data flow, protocol, current source location and voltage compliance value, etc.

## SIMPLEX

The simplex configuration, whether point to point or multidrop, gives unidirectional data flow from transmitter to receiver(s). This is the simplest configuration for use in long line length (two wire), for high data rate, and low current source compliance level applications. Block diagrams of simplex point-to-point and multidrop arrangements are given in Figures 16a and 16b respectively for the HCPL-4200 receiver optocoupler.

For the highest data rate performance in a current loop, the configuration of a non-isolated active transmitter (containing current source) transmitting data to a remote isolated receiver(s) should be used. When the current

source is located at the transmitter end, the loop is charged approximately to  $V_{MI}$  (2.5 V). Alternatively, when the current source is located at the receiver end, the loop is charged to the full compliance voltage level. The lower the charged voltage level the faster the data rate will be. In the configurations of Figures 16a and 16b, data rate is independent of the current source voltage compliance level. An adequate compliance level of current source must be available for voltage drops across station(s) during the MARK state in multidrop applications or for long line length. The maximum compliance level is determined by the transmitter breakdown characteristic.

A recommended non-isolated active transmitter circuit which can be used with the HCPL-4200 in point-to-point or in multidrop 20 mA current loop applications is given in Figure 18. The current source is controlled via a standard TTL 7407 buffer to provide high output impedance of current source in both the ON and OFF states. This non-isolated active transmitter provides a nominal 20 mA loop current for the listed values of  $V_{CC}$ ,  $R_2$  and  $R_3$  in Figure 17.

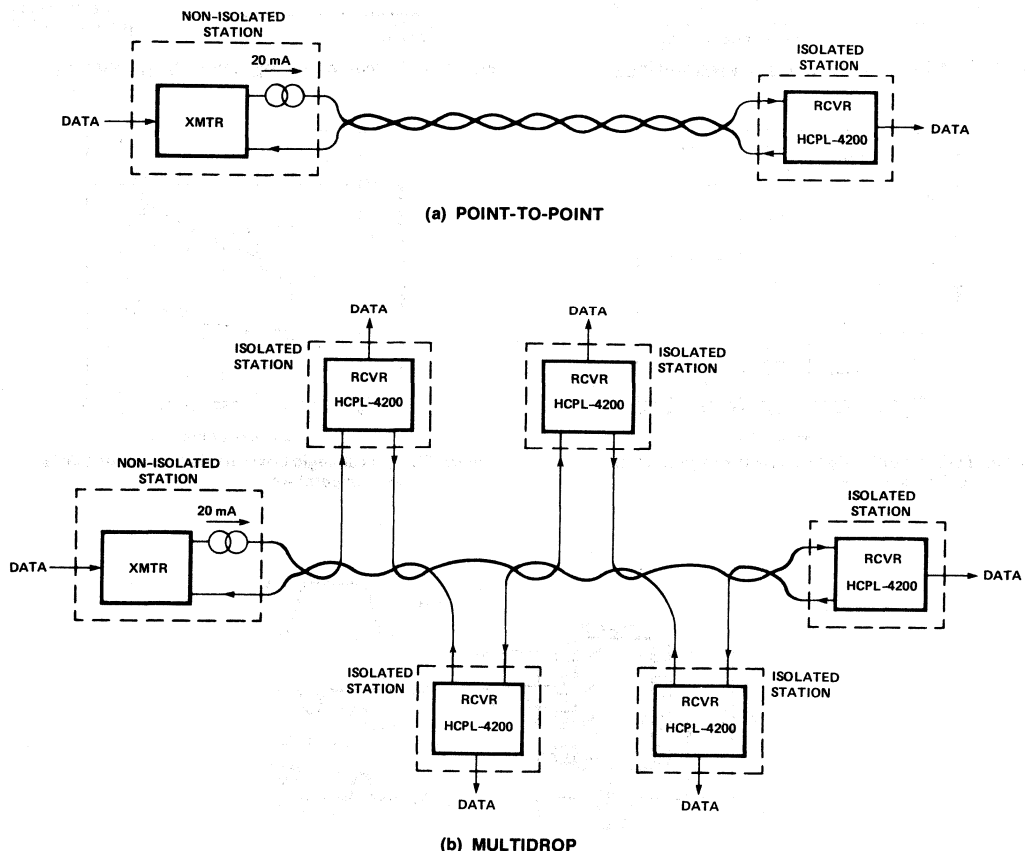

Figure 16. Simplex Current Loop System Configurations for (a) Point-to-Point, (b) Multidrop

Figure 17. Recommended Non-Isolated Active Transmitter with HCPL-4200 Isolated Receiver for Simplex Point-to-Point 20 mA Current Loop

Length of current loop (one direction) versus minimum required DC supply voltage,  $V_{CC}$ , of the circuit in Figure 17 is graphically illustrated in Figure 18. Multidrop configurations will require larger  $V_{CC}$  than Figure 18 predicts in order to account for additional station terminal voltage drops.

Typical data rate performance versus distance is illustrated in Figure 19 for the combination of a non-isolated active transmitter and HCPL-4200 optically coupled current loop receiver shown in Figure 17. Curves are shown for 10% and 25% distortion data rate. 10% (25%) distortion data rate is defined as that rate at which 10% (25%) distortion occurs to output bit interval with respect to input bit interval. An input Non-Return-to-Zero (NRZ) test waveform of 16 bits (0000001011111101) was used for data rate distortion measurements. Data rate is independent of current source supply voltage,  $V_{CC}$ .

The cable used contained five pairs of unshielded, twisted, 22 AWG wire (Dearborn #862205). Loop current is 20 mA nominal. Input and output logic supply voltages are 5 V dc.

### FULL DUPLEX

The full duplex point-to-point communication of Figure 20 uses a four wire system to provide simultaneous, bi-directional data communication between local and remote

equipment. The basic application uses two simplex point-to-point loops which have two separate, active, non-isolated units at one common end of the loops. The other end of each loop is isolated.

As Figure 20 illustrates, the combination of Hewlett-Packard current loop optocouplers, HCPL-4100 transmitter and HCPL-4200 receiver, can be used at the isolated end of current loops. Cross talk and common mode coupling are greatly reduced when optical isolation is implemented at the same end of both loops, as shown. The full duplex data rate is limited by the non-isolated active receiver current loop. Comments mentioned under simplex configuration apply to the full duplex case. Consult the HCPL-4100 transmitter optocoupler data sheet for specified device performance.

### HALF DUPLEX

The half duplex configuration, whether point-to-point or multidrop, gives non-simultaneous bidirectional data flow from transmitters to receivers shown in Figures 21a and 21b. This configuration allows the use of two wires to carry data back and forth between local and remote units. However, protocol must be used to determine which specific transmitter can operate at any given time. Maximum data rate for a half duplex system is limited by the loop current charging time. These considerations were explained in the Simplex configuration section.

Figure 18. Minimum Required Supply Voltage,  $V_{CC}$ , vs. Loop Length for Current Loop Circuit of Figure 18

Figure 19. Typical Data Rate vs. Distance

**Figure 20. Full Duplex Point-to-Point Current Loop System Configuration**

Figures 21a and 21b illustrate half duplex application for the combination of HCPL-4100/-4200 optocouplers. The unique and complementary designs of the HCPL-4100 transmitter and HCPL-4200 receiver optocouplers provide many designed-in benefits. For example, total optical iso-

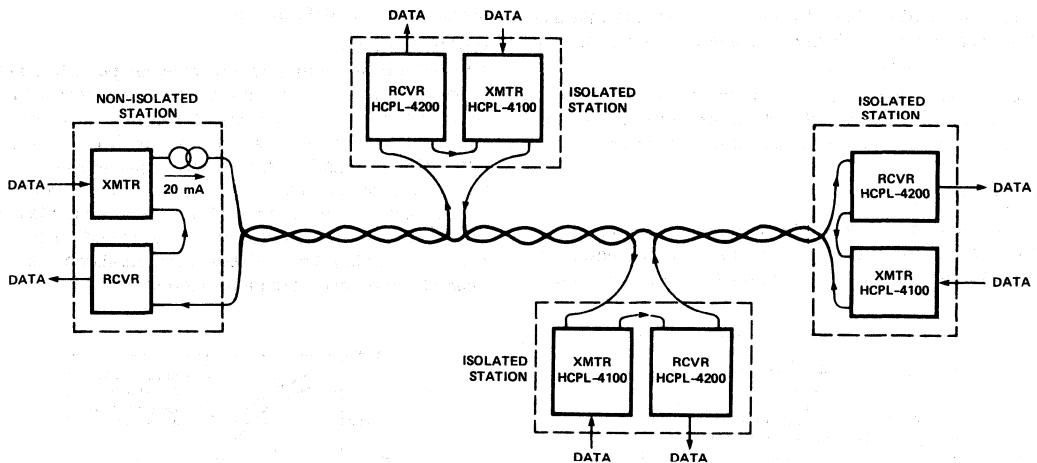

lation at one end of the current loop is easily accomplished, which results in substantial removal of common mode influences, elimination of ground potential differences and reduction of power supply requirements. With this combination of HCPL-4100/-4200 optocouplers, specific current loop noise immunity is provided, i.e., minimum SPACE state current noise immunity is 1 mA, MARK state noise immunity is 8 mA.

Voltage compliance of the current source must be of an adequate level for operating all units in the loop while not exceeding 27 V dc, the maximum breakdown voltage for the HCPL-4100. Note that the HCPL-4100 transmitter will allow loop current to conduct when input VCC power is off. Consult the HCPL-4100 transmitter optocoupler data sheet for specified device performance.

For more information about the HCPL-4100/-4200 optocouplers, consult Application Note 1018.

# Optocoupler Option for 5000 Vac/1 Minute Requirement

## Technical Data

### OPTION 020

#### Features

- **Special Construction and Testing**
- **UL Recognition for 5000 Vac/1 Minute Requirement (File No. E55361)**

Vac/1 Minute dielectric withstand voltage rating provided by Option 020 offers excellent high voltage input to output protection. Some applicable UL documents are listed below.

#### Description

Option 020 consists of special construction on a wide range of Hewlett-Packard plastic optocouplers. After assembly, each unit is subjected to an equivalent electrical performance test to ensure its capability to withstand 5000 Vac input to output for one minute. This test is recognized by Underwriters Laboratory as proof that these components may be used in many high voltage applications.

#### Applications

Dielectric withstand voltage ratings are required by Underwriters Laboratory when components are used in certain types of electronic equipment. The voltage rating depends on the type of electronic equipment and the specific application within the equipment. The 5000

UL Spec Number	Specification Title
1577	Standard for Optical Isolators Applications
114	Appliance and Business Equipment
347	High Voltage Industrial Control Equipment
478	Information Processing and Business Equipment

1410	Television and Video Products

OPTOCOUPLEDERS

## **Specifications**

All specifications for optocouplers remain unchanged when this option is ordered.

## **Ordering Information**

To obtain this high voltage capability on plastic optocouplers order the standard part number and Option 020.

### **Examples:**

6N135	HCPL-2601
Option 020	Option 020

This option is currently available on the following plastic optocouplers.

6N135/6  
6N137  
6N138/9  
HCPL-2601/11  
HCPL-4562  
HCPL-4502/3

Contact your local HP Sales Representative concerning availability of this option for optocouplers not listed.

# Surface Mount Options for Optocouplers

## Technical Data

### Option 100/300

#### Features

- **Surface Mountable**
  - Leads Trimmed for a Butt Joint Connection (Option 100)
  - Leads Formed to a Gull Wing Profile (Option 300)
- **Compatible with Vapor Phase Reflow and Wave Soldering Process**
- **Meets All Electrical Specifications of Corresponding Standard Part Numbers**
- **Available for All Optocouplers in Plastic Packages**

#### Description

Option 100 is an optocoupler in a standard sized dual-in-line package, with trimmed leads (butt joint). The distance from the printed circuit board (PCB), to the bottom of the optocoupler package, will be typically 0.035 inches. The height of the optocoupler package is typically 0.150 inches, leaving a distance of 0.185 inches from PCB to the top of the optocoupler package.

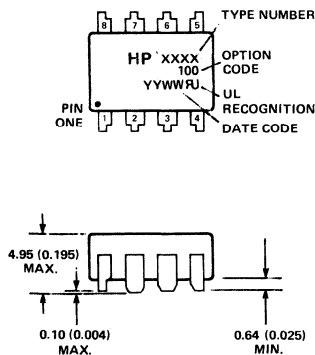

Option 300 is an optocoupler in a standard dual-in-line package with gull wing leads. The lead profile is designed to be

compatible with standard surface mount processes. These optocouplers, particularly the duals, allow efficient utilization of valuable board space.

#### Applications

Both options enable electronic component assemblers to include Hewlett-Packard optocouplers on a PCB that utilizes surface mount assembly processes. These options do not require "through holes" in a PCB. This reduces board costs, while potentially increasing assembly rates and increasing component density per board.

#### Option 100 Drawing

#### Option 300 Drawing

DIMENSIONS IN MILLIMETRES (INCHES)

## **Specifications**

All electrical specifications for optocouplers remain unchanged when this option is ordered. In addition, the device will withstand typical vapor phase reflow soldering conditions of 215°C for 30 seconds, and wave solder immersion for 5 seconds at 260°C.

## **Ordering Information**

Both options are available for all optocouplers in plastic packages. To obtain these options, order the standard part number and Option 100 or 300.

### **Examples:**

6N136	HCPL-2200
Option 100	Option 300

# 200-Volt/160-Ohm, 1 Form A Small-Signal Solid State Relay

## Technical Data

**HSSR-8200**

### Features

- Compact Solid-State Bi-Directional Signal Switch
- Normally-Off Single-Pole Relay Function (1 Form A)
- Very High Output Off-Impedance: 10,000 Gigaohms Typical at 25°C
- Very Low Output Offset Voltage: < 0.5  $\mu$ V
- 200-Volt Output Withstand Voltage
- High-Transient Immunity: > 2000 V/ $\mu$ s
- Monolithic High-Voltage IC
- Operating Range: -40°C to +85°C
- Very Low Input Current (1 mA); CMOS Compatibility
- High-Speed Switching: 50  $\mu$ s Typical
- 160-Ohm Maximum On-Resistance at 25°C
- Surface Mount Option
- 8-kV ESD Immunity: MIL-STD-883 Method 3015
- Input-to-Output Insulation Voltage: 2500 Vac, 1 Minute
- UL Certification Pending

### Applications

- Relay Scanners & Analog Input Modules of Data Acquisition Systems
- Analog Input Modules of Programmable Logic Controllers
- Relay Multiplexers of High-Performance Voltmeters
- Telecommunication Test Instruments
- Functional Tester of Board Test Equipment
- Analog Signal Multiplexer
- Flying Capacitor Multiplexer
- Reed Relay Replacement

### Description

The HSSR-8200 consists of a high-voltage integrated circuit optically coupled with a light emitting diode. This device is a solid-state replacement for single-pole, normally-open electromechanical relays used for general purpose switching of analog signals.

The light-emitting diode controls the ON/OFF function of the solid-state relay. The detector contains high voltage MOS transistors and a high speed photosensitive drive circuit. This relay has superior OFF impedance, very low output offset voltage and input drive current.

**Notes:**

1. Derate linearly above 40°C at a rate of 0.3 mA/°C.
2. Derate linearly above 60°C at a rate of 5 mW/°C.
3.  $V_{\alpha(OS)}$  is a function of  $I_{F(ON)}$ , and is defined between pins 8 and 5 with pin 5 as reference.  $V_{\alpha(OS)}$  must be measured in a stable ambient. See Figure 7 for variation of  $V_{\alpha(OS)}$  around the typical value.
4. Device considered a two terminal device: pins 1 and 4 shorted together, and pins 5 and 8 shorted together.
5. For higher withstand voltage rating and regulatory certification, please contact your HP Field Sales Engineer.
6.  $R_{(OFF)}$  is defined as  $V_{\alpha(OFF)}/I_{\alpha(OFF)}$ .

# Hermetic Optocouplers

---

---

# Hermetic Optocouplers

---

Choose from Hewlett-Packard's broad line of high performance hermetic optocouplers to meet your military, aerospace, and high reliability applications. There are three ceramic package styles to choose from: 8 and 16 pin dual in-line packages, and a 20 terminal leadless chip carrier (LCC) package. Available in each package style are four basic families of optocouplers: high gain, high speed transistor, high speed logic gate, and several application specific devices. Most 8 pin units allow a choice of either single or dual channels. Three functional device types are offered in dual channel configuration in the 16 pin package. Also in the 16 pin package are two functional types in four channel configuration. The LCC catalog products are all two channel optocouplers.

HP's hermetic optocouplers are classified by the Department of Defense as hybrid microcircuits and are manufactured and tested on a MIL-STD-1772 certified and qualified line. Our facilities and assembly processes meet MIL-H-38534 class B, and we have listing on QML-38534.

All product families are represented by standard (commercial grade) units and by high reliability tested units. The hi-rel parts are tested to MIL-STD-883 class B. Most hi-rel tested parts are also offered with recognized DESC part numbers either from DESC Drawings, Standard Military Drawings (SMDs), or from DESC's new, "One Part, One Part Numbering System". All hi-rel parts are tested and guaranteed over the full military temperature range from  $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

New this year is the expanded list and wide variety of optocouplers in three package styles. Our complete line of products offered in 20 terminal LCC were released in 1989. Released in 1990 are the transistor output devices and the expanded line of logic gate units in 8 pin DIP. And, to give you more opportunities to use recognized DESC parts, we now offer 13 devices under DESC drawings with more to come.

**Hermetic Optocoupler Product Screening and Quality Conformance Test Program (MIL-STD-883 Class B)**

The following 100% Screening and Quality Conformance Inspection programs show in detail the capabilities of our hermetic optocouplers. MIL-H-38534 Quality assurance

requirements are in accordance with Option 2 for all testing programs (Methods 5008 and 2017). Hewlett-Packard further exercises a testing option as allowed by MIL-STD-883, Method 5008, Par. 3.1a which states that "hybrid and multi-chip microcircuits, which are contained in packages having an inner seal perimeter of less than 2.0 inches", may be tested

in accordance with the requirements of MIL-STD-883, Methods 5004 and 5005, with a change to the internal visual from Method 2010 to Method 2017. All devices marked /883B and DESC Drawing parts have standardized test programs suitable for product used in military, aerospace, and other high reliability applications and are the preferred devices by systems contractors.

HERMETIC  
OPTOCOUPLEDERS

**Controlling  
Government  
Specifications and  
Standards**

**MIL-H-38534 General  
Specification for Hybrid  
Microcircuits**

All Hewlett-Packard /883B,  
DESC Drawing and SMD  
products are in full compliance  
with the applicable parts of  
MIL-H-38534.

**MIL-STD-883 Test Methods  
and Procedures for  
Microelectronics**

Hewlett-Packard's testing of all  
hermetic hybrid products is in  
compliance with current  
revisions, requirements and test  
methods of MIL-STD-883  
class B.

**MIL-STD-1772 Certification  
Requirements for Hybrid  
Microcircuit Facilities and  
Lines**

Our hermetic optocoupler line is  
certified and parts are qualified  
to MIL-STD-1772. Certification  
to MIL-STD-1772 must exist  
before a part can be marked  
with 883B or with a DESC SMD  
number.

MIL-STD-1772

**Hybrid Microcircuit Certification**

*for*

CLASS B

*is hereby awarded to*

HEWLETT - PACKARD  
OPTICAL COMMUNICATION DIVISION

In accordance with MIL-M-38510 and Appendix G, all assembly operations shall be performed at the Optical Communication Division in San Jose, and MIL-STD-883, Test Methods 5004 and 5005 testing shall be performed at Hewlett-Packard's facilities as outlined in DESC letter EQM-87-563, dated 3 Apr 87. This certification is limited to those processes and materials reviewed by the qualifying activity. This certification is being issued in conjunction with DESC letter EQ (EQM-87-562), dated 3 Apr 87.

*The certification is valid until terminated by written notification from the qualifying activity. The normal period for this certification is one year from 3 Apr 87.*

  
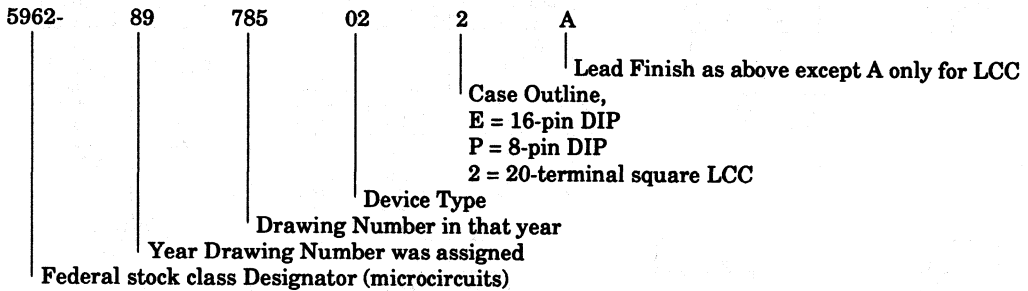

COMMANDER,

## Hermetic Optocoupler Options

Option	Description
100	<p>Surface mountable hermetic optocoupler with leads trimmed for butt joint assembly. This option is available on standard product and /883B hi-rel product in 8 and 16 pin DIP (see drawings below for details). Contact factory for the availability of this option on DESC part types.</p> 
200	<p>Lead finish is solder dipped rather than gold plated. This option is available on standard product and /883B product in 8 and 16 pin DIP. DESC Drawing part numbers contain provisions for lead finish. All leadless chip carrier devices are delivered with solder dipped terminals as a standard feature.</p>
300	<p>Surface mountable hermetic optocoupler with leads cut and bent for gull wing assembly. This option is available on standard product and /883B product in 8 and 16 pin DIP (see drawings below for details). Contact factory for the availability of this option on DESC part types. This option has solder dipped leads.</p>

HCPL-6230  
HCPL-6231 (883B)

### Features

- DESC Standard Military Drawing
- Manufactured and Tested on a MIL-STD-1772 Certified Line
- QML-MIL-H-38534
- Hermetically Sealed Packages
- Performance Guaranteed over -55°C to +125°C Ambient Temperature Range
- MIL-STD-883 Class B Testing
- Wide  $V_{CC}$  Range (4.5 to 20 V)
- 300 ns Maximum Propagation Delay
- Compatible with LSTTL, TTL, and CMOS Logic
- High Common Mode Rejection - 1000 V/ $\mu$ s Guaranteed
- 1500 Vdc Withstand Test Voltage
- Three State Output Available
- HCPL-2200 Function Compatibility

### Applications

- Military/High Reliability Systems
- Isolation of High Speed Logic Systems
- Computer-Peripheral Interfaces

- Microprocessor System Interfaces
- Ground Loop Elimination
- Pulse Transformer Replacement
- Isolated Bus Driver (Single Channel)
- High Speed Line Receiver

### Outline Drawings

#### 8 PIN CERAMIC DUAL IN-LINE PACKAGE

## 20 TERMINAL CERAMIC LEADLESS CHIP CARRIER

### Description

The HCPL-5200, HCPL-5201, and 5962 8876801PC are single channel, logic gate optocouplers. The HCPL-5230, HCPL-5231 and 5962 8876901PC are dual channel units made from the same chip sets. All six products are in eight pin hermetic dual in-line packages. These units are capable of operation and storage over the full military temperature ranges and can be purchased as either single or dual channel standard product (HCPL-5200 and HCPL-5230 respectively), with full MIL-STD-883 Class Level B testing (HCPL-5201 and HCPL-5231 respectively), or from the DESC Standard Military Drawings (SMDs) 5962-88768 and 5962-88769 as (5962 8876801PC or 5962 8876901PC respectively). All parts are normally shipped with gold plated leads. They are also available with solder dipped leads by replacing C with A in the SMD part #, or by adding option #200 to the part number for non-SMD parts.

The HCPL-6230 and HCPL-6231 parts are in twenty terminal hermetic, ceramic, leadless chip carriers. The standard part is HCPL-6230. The product with full MIL-STD-883 Class Level B testing is HCPL-6231. These dual channel devices are configured and function as two independent single channels. Devices are delivered with solder dipped terminals as a standard feature. Units may also be purchased with gold-plated terminals.

Each channel contains an AlGaAs light emitting diode optically coupled to an integrated high gain photon detector. The detector has a threshold with hysteresis. The hysteresis provides differential mode noise immunity and eliminates the potential for output signal chatter. The detector in the single channel units has a three state output stage which allows for direct connection to data buses. The detector IC has an electric

shield that provides a guaranteed common mode transient immunity of 1,000 Volts/usec. Improved power supply rejection eliminates the need for special power supply bypass precautions.

All devices are guaranteed to operate over a  $V_{CC}$  range of 4.5 Volts to 20 Volts. Low  $I_F$  and wide  $V_{CC}$  range allow compatibility with TTL, LSTTL, and CMOS. Logic low  $I_F$  and low  $I_{CC}$  result in lower power consumption compared to other high speed optocouplers. Logic signals are transmitted with a typical propagation delay of 100 nsec when used in the circuit of Figure 11.

These units are useful for isolating high speed logic interfaces, buffering of input and output lines, and implementing isolated line receivers in high noise environments.

HERMETIC OPTOCOUPLED

The test programs on the 5962 8876801PC and 5962 8876901PC are in compliance with DESC (SMDs) 5962-88768 and 5962-88769 respectively. The electrical characteristics

table shows Group A Subgroup testing requirements from these drawings.

All devices are manufactured and tested on a MIL-STD-1772

certified line and are included in the DESC Qualified Manufacturers List (QML) in accordance with requirements for MIL-H-38534.

### Dual Channel Product Only

Input-Input Insulation Leakage Current	$I_{I-I}$	45% Relative Humidity, $V_{I-I} = 500\text{ Vdc}$ , $T_A = 25^\circ\text{C}$ , $t = 5\text{ s}$	0.5	nA		9
Resistance (Input-Input)	$R_{I-I}$	$V_{I-I} = 500\text{ Vdc}$	$10^{13}$	$\Omega$		9
Capacitance (Input-Input)	$C_{I-I}$	$f = 1\text{ MHz}$	1.5	pF		9

#### Notes:

1. Peak Forward Input Current pulse width < 50  $\mu\text{s}$  at 1 KHz maximum repetition rate.
2. Each channel.
3. Duration of output short circuit time not to exceed 10 ms.
4. Device considered a two terminal device: for 8 pin DIP, pins 1 through 4 are shorted together, and pins 5 through 8 are shorted together; for LCC, terminals 19, 20, 1, 2, 3 are shorted together, and terminals 7 through 15 are shorted together.
5. This is a momentary withstand test, not an operating condition.
6.  $t_{PHL}$  propagation delay is measured from the 50% point on the leading edge of the input pulse to the 1.3 V point on the leading edge of the output pulse. The  $t_{PLH}$  propagation delay is measured from the 50% point on the trailing edge of the input pulse to the 1.3 V point on the trailing edge of the output pulse.
7.  $CM_L$  is the maximum rate of rise of the common mode voltage that can be sustained with the output voltage in the logic low state ( $V_o < 0.8\text{ V}$ ).  $CM_H$  is the maximum rate of fall of the common mode voltage that can be sustained with the output voltage in the logic high state ( $V_o > 2.0\text{ V}$ ).
8. Measured between each input pair shorted together and all outputs for that channel shorted together.
9. Measured between adjacent input pairs shorted together; i.e., for 8 pin DIP, between pins 1 and 2 shorted together and pins 3 and 4 shorted together; for LCC, between terminals 19 and 20 shorted together, and terminals 2 and 3 shorted together.
10. Zero-bias capacitance measured between the LED anode and cathode.
11. Standard parts receive 100% testing at 25°C (Subgroups 1 and 9). SMD and /883B parts receive 100% testing at 25, 125, and -55°C (Subgroups 1 and 9, 2 and 10, 3 and 11, respectively).

### SMD 5962 8876801PC, SMD 5962 8876901PC, and MIL-STD-883 Class B Test Program

Hewlett-Packard's 883B Optocouplers are in compliance with MIL-STD-883, Revision C. Deviations listed below are specifically allowed in DESC SMD 5962-88768 for an H.P. Optocoupler from the same generic family using the same manufacturing process, design

rules and elements of the same microcircuit group.

Testing consists of 100% screening to Method 5004 and quality conformance inspection to Method 5005 of MIL-STD-883.

#### Clarifications:

- I. 100% screening per MIL-STD-883, Method 5004 constant acceleration—Condition A not E.

- II. Quality Conformance Inspection per MIL-STD-883, Method 5005, Group A, B, C, and D.
  - Group A—See Electrical Characteristics Table.
  - Group B—No change.
  - Group C—No change.
  - Group D—Constant Acceleration — Condition A not E.

### Features

- DESC Standard Military Drawing
- Manufactured and Tested on a MIL-STD-1772 Certified Line
- QML-MIL-H-38534
- Hermetically Sealed Packages
- Performance Guaranteed Over -55°C to +125°C Ambient Temperature Range
- MIL-STD-883 Class B Testing
- High Speed Guaranteed Over Temperature
- 60 ns Maximum Propagation Delay
- 35 ns Maximum Pulse Width Distortion
- High Common Mode Rejection - 500 V/ $\mu$ s Guaranteed
- Compatible with TTL, STTL, LSTTL and HCMOS Logic Families
- Three State Output (No Pull-Up Resistor Required) - (5400/1 Only)
- HCPL-2400 Function Compatibility
- 1500 Vdc Withstand Test Voltage

### Applications

- Military/High Reliability Systems
- Isolation of High Speed Logic Systems
- Computer-Peripheral Interfaces
- Isolated Bus Driver (Networking Applications) - (5400/1 Only)

- Switching Power Supplies
- Ground Loop Elimination
- High Speed Disk Drive I/O
- Digital Isolation for A/D, D/A Conversion
- Pulse Transformer Replacement

#### 8 PIN CERAMIC DUAL-IN-LINE PACKAGE

DIMENSIONS IN MILLIMETERS AND (INCHES).  
 \*DETECTOR IC INTERNAL ELECTRICAL SHIELD

## 20 TERMINAL CERAMIC LEADLESS CHIP CARRIER

### Description

The HCPL-5400, HCPL-5401, and 5962-8957001PC are single channel, logic gate optocouplers. The HCPL-5430, HCPL-5431, and 5962-8957101PC are dual channel units made from the same chip sets. All six products are in 8 pin hermetic dual in-line packages. These units are capable of operation and storage over the full military temperature ranges and can be purchased as either single or dual channel standard product (HCPL-5400 and HCPL-5430 respectively), with full MIL-STD-883 Class Level B testing (HCPL-5401 and HCPL-5431 respectively), or from the DESC Standard Military Drawings (SMDs) 5962-89570 and 5962-89571 as (5962-8957001PC or 5962-8957101PC respectively). All parts are normally shipped with gold plated leads. They are also available with solder dipped leads by replacing C with A in the SMD part #, or by adding option #200 to the part number for non-SMD parts.

The HCPL-6430, HCPL-6431, and 5962-89571022A are dual channel parts in twenty terminal hermetic, ceramic, leadless chip carriers. The standard part is HCPL-6430. The product with full MIL-STD-883 Class Level B testing is HCPL-6431. The DESC SMD part is 5962-89571022A. All three products are configured and function as two independent single channels without enable. Devices are delivered with solder-dipped terminals as a standard feature. Units may also be purchased with gold-plated terminals.

All devices are manufactured and tested on a MIL-STD-1772 certified line and are included in the DESC Qualified Manufacturers List (QML) in accordance with requirements for MIL-H-38534.

Each channel contains an AlGaAs light emitting diode which is optically coupled to an integrated high gain photon

detector. This combination results in very high data rate capability. The detector has a threshold with hysteresis. The hysteresis provides typically 0.25 mA of differential mode noise immunity and minimizes the potential for output signal chatter. The detector in the single channel units has a three state output stage which eliminates the need for a pull-up resistor and allows for direct drive of a data bus.

All nine units are compatible with TTL, STTL, LSTTL, and HCMOS logic families. The 35 ns pulse width distortion specification guarantees a 10 mBaud signaling rate at +125°C with 35% pulse width distortion. Figures 11 through 16 show recommended circuits for reducing pulse width distortion and optimizing the signal rate of the product.

**CAUTION:** The small junction sizes inherent to the design of this bipolar component increases the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

Input-Input Resistance	$R_{I,I}$	$10^{12}$	ohms	$V_{I,I} = 500\text{ Vdc}$		8

### Notes:

- Not to exceed 5% duty factor, not to exceed 50  $\mu\text{sec}$  pulse width.
- Device considered a two terminal device: for 8 pin DIP, pins 1 through 4 are shorted together, and pins 5 through 8 are shorted together; for LCC, terminals 19, 20, 1, 2, 3 are shorted together, and terminals 7 through 15 are shorted together.
- This is a momentary withstand test, not an operating condition.
- $t_{PHL}$  propagation delay is measured from the 50% level on the rising edge of the input current pulse to the 1.5 V level on the falling edge of the output pulse. The  $t_{PLH}$  propagation delay is measured from the 50% level on the falling edge of the input current pulse to the 1.5 V level on the rising edge of the output pulse. Pulse width distortion,  $PWD = |t_{PHL} - t_{PLH}|$ .
- $CM_H$  is the maximum slew rate of the common mode voltage that can be sustained with the output voltage in the logic high state ( $V_{O(MIN)} > 2.0\text{ V}$ ).  $CM_L$  is the maximum slew rate of common mode voltage that can be sustained with the output voltage in the logic low state ( $V_{O(MAX)} < 0.8\text{ V}$ ).
- Duration of output short circuit time not to exceed 10 ms.
- Power Supply Noise Immunity is the peak to peak amplitude of the ac ripple voltage on the  $V_{CC}$  line that the device will withstand and still remain in the desired logic state. For desired logic high state,  $V_{O(MIN)} > 2.0\text{ V}$ , and for desired logic low state,  $V_{O(MAX)} < 0.8\text{ volts}$ .
- Measured between adjacent input pairs shorted together; i.e., for 8 pin DIP, between pins 1 and 2 shorted together and pins 3 and 4 shorted together; for LCC, between terminals 19 and 20 shorted together, and terminals 2 and 3 shorted together.
- Each channel.
- Standard parts receive 100% testing at 25°C (Subgroups 1 and 9). SMD and/883B parts receive 100% testing at 25, 125, and -55°C (Subgroups 1 and 9, 2 and 10, 3 and 11, respectively).
- Subgroups 10 and 11 shall be tested as part of device initial characterization and after design and process changes. Subgroups 10 and 11 shall be guaranteed to the limits specified for all lots not specifically tested. Subgroup 9 shall be tested with every lot.
- Propagation delay skew is defined as the difference between the minimum and maximum propagation delays for any given group of HCPL-540X, HCPL-543X, and HCPL-643X optocouplers that are all switching at the same time under the same operating conditions. The minimum propagation delay is the shortest delay, either  $t_{PLH}$  or  $t_{PHL}$ , of any of the optocouplers; the maximum delay is the longest delay, either  $t_{PLH}$  or  $t_{PHL}$ , of any of the optocouplers. For more application information see HCPL-2430 data sheet.
- Propagation delay skew is indirectly tested and guaranteed through guardbanding of the minimum and maximum  $t_{PHL}$  and  $t_{PLH}$  limits.
- The HCPL-6430 and HCPL-6431 dual channel parts function as two independent single channel units. Use the single channel parameter limits.

HERMETIC OPTOCOUPLES

## Part Numbering System

Commercial Product	Class B Product	SMD Product
HCPL-5400	HCPL-5401	5962-8957001PC
HCPL-5430	HCPL-5431	5962-8957101PC
HCPL-6430	HCPL-6431	5962-89571022A

### SMD 5962-8957001PC, SMD 5962-8957101PC, SMD 5962-89571022A, and MIL-STD-883 Class B Test Programs

Hewlett-Packard's 883B Optocouplers are in compliance with MIL-STD-883, Revision C. Deviations listed below are specifically allowed in DESC SMDs 5962-89570 and 5962-89571 for Hewlett-Packard Optocouplers from the same generic families using the same manufacturing processes, design rules and elements of the same microcircuit groups.

Testing consists of 100% screening to Method 5004 and quality conformance inspection to Method 5005 of MIL-STD-883.

#### Clarifications:

- I. 100% screening per MIL-STD-883, Method 5004 constant acceleration—Condition A not E.
- II. Quality Conformance Inspection per MIL-STD-883, Method 5005, Group A, B, C, and D.
  - Group A—See Electrical Characteristics Table.
  - Group B—No change.
  - Group C—No change.
  - Group D—Constant Acceleration — Condition A not E.

### Data Rate and Pulse-Width Distortion Definitions

Propagation delay is a figure of merit which describes the finite amount of time required for a system to translate information from input to output when shifting logic levels.

Propagation delay from low to high ( $t_{PLH}$ ) specifies the amount of time required for a system's output to change from a Logic 0 to a Logic 1, when given a stimulus at the input.

Propagation delay from high to low ( $t_{PHL}$ ) specifies the amount of time required for a system's output to change from a Logic 1 to a Logic 0, when given a stimulus at the input (see Figure 5).

When  $t_{PLH}$  and  $t_{PHL}$  differ in value, pulse width distortion results. Pulse width distortion is defined as  $|t_{PHL} - t_{PLH}|$  and determines the maximum data rate capability of a distortion-limited system. Maximum pulse width distortion on the order of 25-35% is typically used when specifying the maximum data rate capabilities of systems. The exact figure depends on the particular application (RS-232, PCM, T-1, etc.).

These high performance optocouplers offer the advantages of specified propagation delay ( $t_{PLH}$ ,  $t_{PHL}$ ), and pulse-width distortion ( $|t_{PLH} - t_{PHL}|$ ) over temperature and power supply voltage ranges.

# Dual Channel High CMR High Speed Hermetically Sealed Optocouplers

## Technical Data

**6N134  
6N134/883B  
8102801EC**

### Features

- DESC Standard Military Drawing
- Manufactured and Tested on a MIL-STD-1772 Certified Line
- QML-MIL-H-38534
- Hermetically Sealed 8-pin Dual In-Line Package
- Performance Guaranteed Over -55°C to +125°C Ambient Temperature Range
- MIL-STD-883 Class B Testing
- Internal Shield for Higher CMR
- 1500 Vdc Withstand Test Voltage
- High Radiation Immunity
- HCPL-2631, HCPL-56XX, 66XX Function Compatibility

### Description

The 6N134, 6N134/883B, and 8102801EC units are hermetically sealed, high CMR, high speed optocouplers. The products are capable of operation and storage over the full military temperature range and can be purchased as either a standard product (6N134), with full MIL-STD-883 Class

Level B testing (6N134/883B) or from the DESC Drawing 81028 as (8102801EC). All three products are dual channel in sixteen pin hermetic dual in-line packages. These parts are normally shipped with gold plated leads. They are also available with solder dipped leads by replacing C with A in the DESC part #, or by adding option #200 to the part number for non-DESC parts.

Each channel contains a GaAsP light emitting diode which is optically coupled to an integrated high speed photon detector. The output of the detector is an open collector Schottky clamped transistor. Internal shields provide a guaranteed common mode transient immunity specification of 1000 V/μs. Selection for higher CMR values are available by special request.

### Outline Drawing

This unique optocoupler design provides maximum dc and ac circuit isolation between each input and output while achieving TTL circuit compatibility. These optocouplers operate such that a minimum input current of 10 mA in each channel will sink a six gate fanout (10 mA) at the output with 4.5 to 5.5 V  $V_{CC}$  applied to the detector. This isolation and coupling is achieved with a typical propagation delay of 55 nsec.

The test program performed on the 8102801EC is in compliance with DESC Drawing 81028. The electrical characteristics table shows Group A Subgroup testing requirements from this drawing.

All devices are manufactured and tested on a MIL-STD-1772

certified line and are included in the DESC Qualified Manufacturers List (QML) in accordance with requirements for MIL-H-38534.

### Applications

- Military/High Reliability Systems

- Logic Ground Isolation
- Line Receiver
- Computer-Peripheral Interface
- Vehicle Command/Control Isolation
- Harsh Industrial Environments
- System Test Equipment Isolation

### Notes:

- Each channel.
- Measured between pins 1 through 8 shorted together and pins 9 through 16 shorted together.
- Measured between pins 1 and 2 or 5 and 6 shorted together, and pins 10, 12, 14 and 15 shorted together.
- Measured between pins 1 and 2 shorted together, and pins 5 and 6 shorted together.
- The  $t_{PLH}$  propagation delay is measured from the 6.5 mA point on the trailing edge of the input pulse to the 1.5 V point on the trailing edge of the output pulse.
- The  $t_{PHL}$  propagation delay is measured from the 6.5 mA point on the leading edge of the input pulse to the 1.5 V point on the leading edge of the output pulse.
- $CM_H$  is the max. tolerable common mode transient to assure that the output will remain in a high logic state (i.e.,  $V_o > 2.0\text{ V}$ ).
- $CM_L$  is the max. tolerable common mode transient to assure that the output will remain in a low logic state (i.e.,  $V_o < 0.8\text{ V}$ ).
- It is essential that a bypass capacitor (0.1  $\mu\text{F}$ , ceramic) be connected from pin 10 to pin 15. Total lead length between both ends of the capacitor and the isolator pins should not exceed 20 mm.
- This is a momentary withstand test, not an operating condition.
- Standard parts receive 100% testing at  $25^\circ\text{C}$  (Subgroups 1 and 9). SMD and /883B parts receive 100% testing at 25, 125, and  $-55^\circ\text{C}$  (Subgroups 1 and 9, 2 and 10, 3 and 11, respectively).
- Subgroups 10 and 11 shall be tested as part of device initial characterization and after design and process changes. Subgroups 10 and 11 shall be guaranteed to the limits specified in table I for all lots not specifically tested. Subgroup 9 shall be tested with every lot.

### Outline Drawings

#### 8-pin Ceramic Dual In-Line Package

DIMENSIONS IN MILLIMETERS AND (INCHES).

### Description

These units are single and dual channel, hermetically sealed optocouplers. The products are capable of operation and storage over the full military temperature range and can be purchased as either a standard product or with full MIL-STD-883 Class Level B testing. All devices are manufactured and tested on a MIL-STD-1772 certified line and are included in the DESC Qualified Manu-

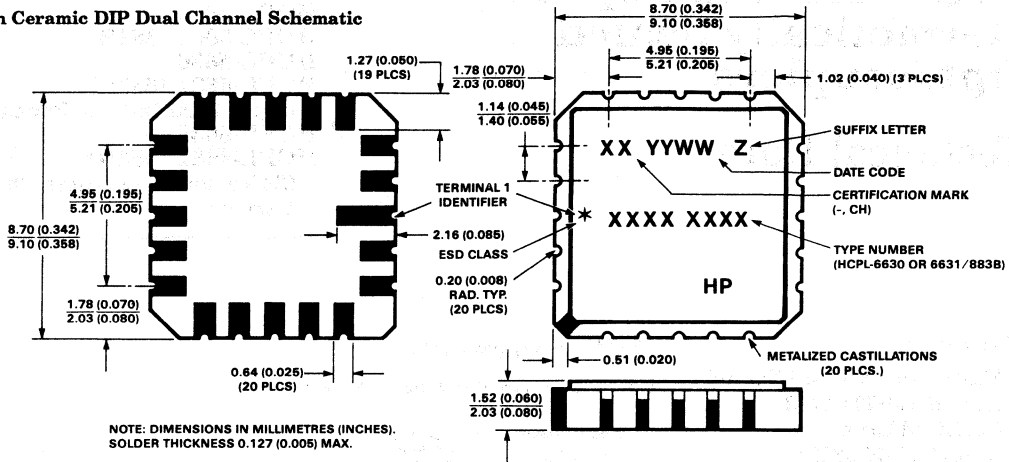

facturers List (QML) in accordance with requirements for MIL-H-38534.

The HCPL-5600, 5601, 5630 and 5631 are in 8 Pin ceramic DIPs configured as either single or dual channel devices. The standard products are HCPL-5600 and HCPL-5630. The products with full MIL-STD-883 Class Level B testing are HCPL-5601 and HCPL-5631.

HERMETIC  
OPTOCOUPERS

# Outline Drawings

## 8 Pin Ceramic DIP Dual Channel Schematic

The HCPL-6630 and HCPL-6631 parts are in twenty terminal hermetic, ceramic, leadless chip carriers. The standard part is HCPL-6630. The product with full MIL-STD-883 Class Level B testing is HCPL-6631. These dual channel devices are configured and function as two independent single channels. Devices are delivered with solder dipped terminals as a standard feature. Units may also be purchased with gold plated terminals.

Each channel contains a light emitting diode optically coupled to an inverting gate providing 1500 Vdc electrical isolation between input and output. The output of the detector is an open collector schottky clamped transistor. Internal shields provide a guaranteed common mode transient immunity specification of 1000 V/ $\mu$ s at VCM = 50 V. Selection for higher CMR values are available by special request. Contact your local HP field sales engineer for ordering information.

### 8 Pin Ceramic DIP

NOTE:  
A 0.01 TO 0.1  $\mu$ F BYPASS CAPACITOR  
MUST BE CONNECTED BETWEEN  
PINS 8 AND 5.

SEE NOTE 10.

TRUTH TABLE (POSITIVE LOGIC)		
INPUT	ENABLE	OUTPUT
H (on)	H	L
L (off)	H	H
H (on)	L	H
L (off)	L	H

This unique design provides maximum D.C. and A.C. circuit isolation while achieving TTL circuit compatibility. The optocoupler operational parameters are guaranteed from -55°C to +125°C, such that a minimum input current of 10 mA per channel will sink a six gate fan-out (10 mA) at the output with 4.5 to 5.5 V V<sub>CC</sub> applied to the detector. This isolation and coupling is achieved with a typical propagation delay of 55 nsec.

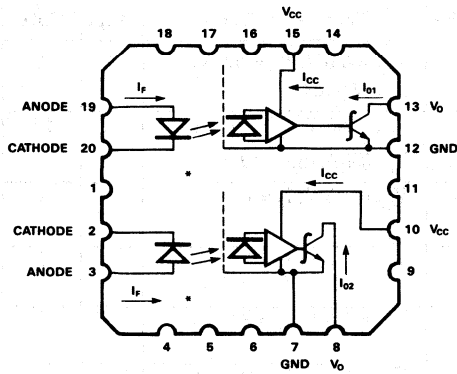

### 8 Pin Ceramic DIP

NOTE:  
A 0.01 TO 0.1  $\mu$ F BYPASS CAPACITOR MUST BE  
CONNECTED BETWEEN PINS 8 AND 5.

External to the unit, a 0.01  $\mu$ F bypass capacitor must be connected between V<sub>CC</sub> and ground. A capacitor immediately adjacent to each optocoupler is necessary. The power supply bus for the optocoupler(s) should be separate from the bus for any active loads, otherwise a larger value of the bypass capacitor (up to 0.1  $\mu$ F) may be needed to suppress regenerative feedback via the power supply.

**20 Terminal Ceramic Leadless Chip Carrier Schematic**

NOTE:  
A .01 to 0.1  $\mu$ F BYPASS CAPACITOR  
MUST BE CONNECTED BETWEEN  
TERMINALS 7 AND 10 AND  
BETWEEN 12 AND 15.

Resistance (Input-Input)	$R_{I,I}$	$10^{12}$	$\Omega$	$V_{I,I} = 500\text{ V}$		4
Capacitance (Input-Input)	$C_{I,I}$	0.55	pF	$f = 1\text{ MHz}$		4

### Notes:

- Each channel of a dual channel device.
- Device considered a two-terminal device: for 8 pin DIP, pins 1 through 4 are shorted together, and pins 5 through 8 are shorted together; for LCC, terminals 19, 20, 1, 2, 3 are shorted together, and terminals 7 through 15 are shorted together.
- Measured between each input pair shorted together and all outputs for that channel shorted together.
- Measured between adjacent input pairs shorted together; i.e., for 8 pin DIP, between pins 1 and 2 shorted together and pins 3 and 4 shorted together; for LCC, between terminals 19 and 20 shorted together, and terminals 2 and 3 shorted together.
- $t_{rH}$ , propagation delay is measured from the 50% point on the leading edge of the input pulse to the 1.5 V point on the leading edge of the output pulse. The  $t_{fH}$  propagation delay is measured from the 50% point on the trailing edge of the input pulse to the 1.5 V point on the trailing edge of the output pulse.
- The HCPL-6630 and HCPL-6631 dual channel parts function as two independent single channel units. Use the single channel parameter limits.
- $CM_L$  is the maximum rate of rise of the common mode voltage that can be sustained with the output voltage in the logic low state ( $V_o < 0.8\text{ V}$ ).  $CM_H$  is the maximum rate of fall of the common mode voltage that can be sustained with the output voltage in the logic high state ( $V_o > 2.0\text{ V}$ ).
- This is a momentary withstand test, not an operating condition.
- It is essential that a bypass capacitor (.01 to 0.1 $\mu\text{F}$ , ceramic) be connected from  $V_{CC}$  to ground. Total lead length between both ends of this external capacitor and the isolator pins should not exceed 20mm.
- No external pull up is required for a high logic state on the enable input.
- The  $t_{ELH}$  enable propagation delay is measured from the 1.5 V point on the trailing edge of the enable input pulse to the 1.5 V point on the trailing edge of the output pulse.
- The  $t_{EHL}$  enable propagation delay is measured from the 1.5 V point on the leading edge of the enable input pulse to the 1.5 V point on the leading edge of the output pulse.

## MIL-STD-883 Class B Test Program

Hewlett-Packard's 883B Optocouplers are in compliance with MIL-STD-883, Revision C. Deviations listed below are specifically allowed in DESC drawing 81028 for the equivalent H.P. Optocoupler.

Testing consists of 100% screening to Method 5004 and quality conformance inspection to Method 5005 of MIL-STD-883.

## Clarifications:

I. 100% screening per MIL-STD-883, Method 5004 constant acceleration - Condition A not E.

II. Quality Conformance Inspection per MIL-STD-883, Method 5005, Group A, B, C, and D.  
 Group A - See table for specific electrical tests.  
 Group B - No change.  
 Group C - No change.  
 Group D - Constant Acceleration - Condition A not E.

## Part Numbering System

Commercial Product	Class B Product

# Dual Channel Line Receiver Hermetic Optocoupler

## Technical Data

**HCPL-1930  
HCPL-1931 (883B)  
5962-8957201EC**

### Features

- DESC Standard Military Drawing
- Manufactured and Tested on a MIL-STD-1772 Certified Line
- QML-MIL-H-38534
- Hermetically Sealed 8-pin Dual In-Line Package
- Performance Guaranteed Over -55°C to +125°C Ambient Temperature Range
- MIL-STD-883 Class B Testing
- High Speed - 10 Mb/s
- Accepts a Broad Range of Drive Conditions
- Adaptive Line Termination Included
- Internal Shield Provides Excellent Common Mode Rejection
- External Base Lead Allows "LED Peaking" and LED Current Adjustment
- 1500 Vdc Withstand Test Voltage
- High Radiation Immunity
- HCPL-2602 Function Compatibility

### Description

The HCPL-1930, HCPL-1931, and 5962-8957201EC units are dual channel, hermetically sealed, high CMR, line receiver optocouplers. The products are capable of operation and storage over the full military temperature range and can be purchased as either a standard product (HCPL-1930), with full

MIL-STD-883 Class Level B testing (HCPL-1931), or from the DESC Standard Military Drawing (SMD) 5962-89572 as (5962-8957201EC). All three products are sixteen pin hermetic dual in-line packages. They are normally shipped with gold plated leads. They are also available with solder dipped leads by replacing C with A in

### Outline Drawing

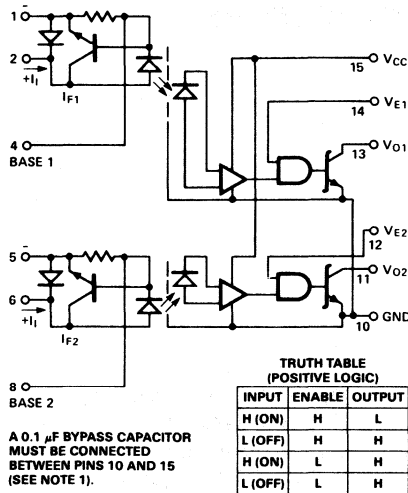

HERMETIC OPTOCOUPLEDERS

the SMD part #, or by adding option #200 to the part number for non-DESC parts.

Each unit contains two independent channels, consisting of a GaAsP light emitting diode, an input current regulator, and an integrated high gain photon detector. The input regulator serves as a line termination for line receiver applications. It clamps the line voltage and regulates the LED current so line reflections do not interfere with circuit performance. The regulator allows a typical LED current of 12.5 mA before it starts to shunt excess current. The output of the detector IC is an open collector Schottky clamped transistor. An enable input gates the detector. The internal detector shield provides a guaranteed common mode transient immunity specification of +1000 V/ $\mu$ sec.

DC specifications are compatible with TTL logic and are guaranteed from -55°C to +125°C allowing trouble-free interfacing with digital logic circuits. An input current of 10 mA will sink a six gate fan-out (TTL) at the output with a typical propagation delay from input to output of only 45 nsec.

## Schematic

The test program performed on the 5962-8957201EC is in compliance with DESC (SMD) 5962-89572. The electrical characteristics table shows Group A Subgroup testing requirements from this drawing.

All devices are manufactured and tested on a MIL-STD-1772 certified line and are included in the DESC Qualified Manufacturers List (QML) in accordance with requirements for MIL-H-38534.

## Applications

- Military/High Reliability Systems
- Isolated Line Receiver
- Simplex/Multiplex Data Transmission
- Computer-Peripheral Interface
- Microprocessor System Interface
- Digital Isolation for A/D, D/A Conversion
- Current Sensing
- Instrument Input/Output Isolation
- Ground Loop Elimination
- Pulse Transformer Replacement

**CAUTION:** The small junction sizes inherent to the design of this bipolar component increase the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

## Recommended Operating Conditions

Parameter	Symbol	Min.	Max.	Units
Input Current, Low Level	$I_{IL}$	0	250	$\mu A$
Input Current, High Level*	$I_{IH}$	12.5	60	mA
Supply Voltage, Output	$V_{CC}$	4.5	5.5	V
High Level Enable Voltage	$V_{EH}$	2.0	$V_{CC}$	V
Low Level Enable Voltage	$V_{EL}$	0	0.8	V
Fan Out (TTL Load)	N		6	
Operating Temperature	$T_A$	-55	125	$^{\circ}C$

\*12.5 mA condition permits at least 20% CTR degradation guardband. Initial switching threshold is 10 mA or less.

## Absolute Maximum Ratings

Storage Temperature .....	-65 $^{\circ}C$ to +150 $^{\circ}C$
Operating Temperature .....	-55 $^{\circ}C$ to +125 $^{\circ}C$
Lead Solder Temperature .....	260 $^{\circ}C$ for 10 s
	1.6 mm below seating plane
Forward Input Current – $I_I$ (each channel) .....	60 mA <sup>2</sup>
Reverse Input Current .....	60 mA
Supply Voltage – $V_{CC}$ .....	7 V 1 Minute Maximum
Enable Input Voltage – $V_E$ (each channel) .....	5.5 V
	Not to exceed $V_{CC}$ by more than 500 mV
Output Collector Current – $I_O$ (each channel) .....	25 mA
Output Collector Power Dissipation (each channel) .....	40 mW
Output Collector Voltage – $V_O$ (each channel) .....	7 V
Total Package Power Dissipation .....	564 mW
Total Input Power Dissipation (each channel) .....	168 mW

Input Capacitance	$C_i$	60	pF	$f = 1\text{ MHz}$ , $V_i = 0$ , PINS 1 to 2 or 5 to 6		3

### Notes:

- Bypassing of the power supply line is required, with a 0.1  $\mu\text{F}$  ceramic disc capacitor adjacent to each isolator. The power supply bus for the isolators should be separate from the bus for any active loads, otherwise additional bypass capacitance may be needed to suppress regenerative feedback via the power supply.
- Derate linearly at 1.2  $\text{mA}/^\circ\text{C}$  above  $T_A = 100^\circ\text{C}$ .
- Each channel.
- Device considered a two terminal device: pins 1 through 8 are shorted together, and pins 9 through 16 are shorted together.
- The  $t_{r,HL}$  propagation delay is measured from the 6.5 mA point on the trailing edge of the input pulse to the 1.5 V point on the trailing edge of the output pulse.
- The  $t_{r,HL}$  propagation delay is measured from the 6.5 mA point on the leading edge of the input pulse to the 1.5 V point on the leading edge of the output pulse.
- The  $t_{ELH}$  enable propagation delay is measured from the 1.5 V point on the trailing edge of the enable input pulse to the 1.5 V point on the trailing edge of the output pulse.
- The  $t_{EHL}$  enable propagation delay is measured from the 1.5 V point on the leading edge of the enable input pulse to the 1.5 V point on the leading edge of the output pulse.
- $CM_H$  is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state, i.e.  $V_{OUT} > 2.0\text{ V}$ .
- $CM_L$  is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state, i.e.  $V_{OUT} < 0.8\text{ V}$ .
- Measured between adjacent input leads shorted together, i.e. between 1, 2 and 4 shorted together and pins 5, 6 and 8 shorted together.
- No external pull up is required for a high logic state on the enable input.
- Measured between pins 1 and 2 or 5 and 6 shorted together, and pins 10 through 15 shorted together.
- Subgroups 10 and 11 shall be tested as part of device initial characterization and after design and process changes. Subgroup 9 shall be tested with every lot.
- Standard parts receive 100% testing at 25°C (Subgroups 1 and 9). SMD and/883B parts receive 100% testing at 25, 125, and -55°C (Subgroups 1 and 9, 2 and 10, 3 and 11, respectively).

### SMD 5962-8957201EC and MIL-STD-883 Class B Test Program

Hewlett-Packard's 883B Optocouplers are in compliance with MIL-STD-883, Revision C. Deviations listed below are specifically allowed in DESC SMD 5962-89572 for an H.P. Optocoupler from the same generic family using the same manufacturing process, design rules and elements of the same microcircuit group.

Testing consists of 100% screening to Method 5004 and quality conformance inspection to Method 5005 of MIL-STD-883.

### 1931/883B Clarifications:

- I. 100% screening per MIL-STD-883, Method 5004 constant acceleration - Condition A not E.

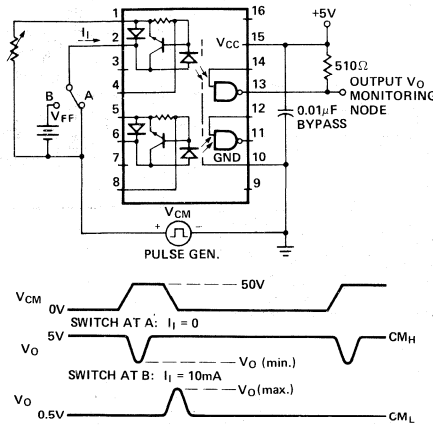

Figure 9. Test Circuit for Common Mode Transient Immunity and Typical Waveforms.

### II. Quality Conformance

Inspection per MIL-STD-883, Method 5005, Group A, B, C, and D.  
Group A - See Electrical Characteristics Table.

Group B - No change.  
Group C - No change.  
Group D - Constant Acceleration - Condition A not E.

# Hermetically Sealed Four Channel Low Input Current Optocoupler

## Technical Data

**6N140A**  
**6N140A/883B**  
**8302401EC**

### Features

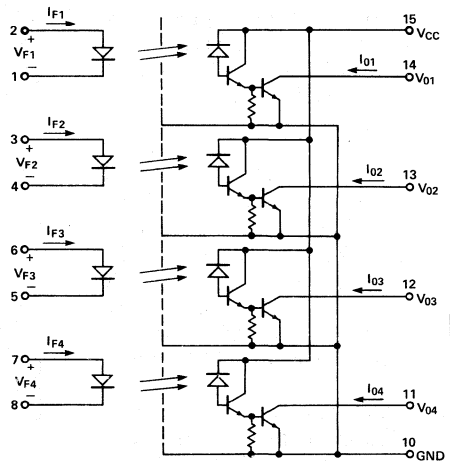

- DESC Standard Military Drawing
- Manufactured and Tested on a MIL-STD-1772 Certified Line
- QML-MIL-H-38534
- Hermetically Sealed 8-Pin Dual In-Line Package
- Performance Guaranteed Over -55°C to +125°C Ambient Temperature Range
- MIL-STD-883 Class B Testing
- Internal Shield for Higher CMR
- Low Input Current Requirement: 0.5 mA
- High Current Transfer Ratio: 1500% Typical
- Low Output Saturation Voltage: 0.1 V Typical
- Low Power Consumption
- 1500 VDC Withstand Test Voltage
- High Radiation Immunity
- 6N138/9, HCPL-57XX, 67XX Function Compatibility

### Applications

- Military/High Reliability Systems
- Isolated Input Line Receiver

- System Test Equipment Isolation
- Digital Logic Ground Isolation
- EIA RS-232C Line Receiver
- Microprocessor System Interface
- Current Loop Receiver
- Level Shifting
- Process Control Input/Output Isolation

### Schematic

HERMETIC  
OPTOCOUPERS

## Description

The 6N140A is an EIA registered hybrid microcircuit which is capable of operation over the full military temperature range from  $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  and is electrically and functionally identical to the 6N140 part. It is an advanced replacement unit for the 6N140. The better performance results from an improved integrated bypass resistor which shunts photodiode and first stage leakage currents. All products within this family have this advanced feature and can be purchased as either a standard product (6N140A), with full MIL-STD-883 Class Level B testing (6N140A/883B) or as parts compliant to DESC Drawing 83024 as (8302401EC). All parts are normally shipped with gold plated leads. They are also available with solder dipped leads by replacing C with A in the DESC part number, or by adding Option 200 to the part number for non-DESC parts.

All three products are in sixteen-pin hermetic dual in-line packages. Each part contains four GaAsP light emitting diodes, each of which is optically coupled to a corresponding integrated high gain photon detector. The high gain output stage features an open collector output providing both lower output saturation voltage and higher speed operation than possible with conventional photodarlington type optocouplers. Also, the separate  $V_{CC}$  pin can be strobed low as an output disable or operated with supply voltages as low as 2.0 V without adversely affecting the parametric performance.

The high current transfer ratio at very low input currents permits circuit designs in which adequate margin can be allowed for the effects of CTR degradation over time.

These products have a 300% minimum CTR at an input current of only 0.5 mA making it ideal for use in low input current applications such as MOS, CMOS and low power logic interfacing or RS-232C data transmission systems. Compatibility with high voltage CMOS logic systems is assured by the 18 V  $V_{CC}$  and by the guaranteed maximum output leakage (IOH) at 18 V. The

shallow depth of the IC photodiode provides better radiation immunity than conventional phototransistor optocouplers.

The test program performed on the 8302401EC is in compliance with DESC Drawing 83024. The electrical characteristics table shows Group A Subgroup testing requirements from this drawing.

All devices are manufactured and tested on a MIL-STD-1772 certified line and are included in the DESC Qualified Manufacturers List (QML) in accordance with requirements for MIL-H-38534.

## Recommended Operating Conditions

Parameter	Symbol	Min.	Max.	Units
Input Voltage, Low Level (Each Channel)	$V_{F,OFF}$		0.8	V
Input Current, High Level (Each Channel)	$I_{F,ON}$	0.5	5	mA
Supply Voltage	$V_{CC}$	2.0	18	V

## Absolute Maximum Ratings

Storage Temperature Range .....	$-65^{\circ}\text{C}$ to $+150^{\circ}\text{C}$
Operating Temperature .....	$-55^{\circ}\text{C}$ to $+125^{\circ}\text{C}$
Lead Solder Temperature .....	$260^{\circ}\text{C}$ for 10 s (1.6 mm below seating plane)
Output Current, $I_o$ (each channel).....	40 mA
Output Voltage, $V_o$ (each channel) .....	$-0.5$ to $20\text{ V}^{(1)}$
Supply Voltage, $V_{CC}$ .....	$-0.5$ to $20\text{ V}^{(1)}$
Output Power Dissipation (each channel) .....	$50\text{ mW}^{(2)}$
Peak Input Current (each channel, $\leq 1$ ms duration) .....	20 mA
Average Input Current, $I_p$ (each channel) .....	10 mA <sup>(3)</sup>
Reverse Input Voltage, $V_R$ (each channel) .....	5 V

Temperature Coefficient of Forward Voltage	$\frac{\Delta V_F}{\Delta T_A}$		-1.8		mV/ $^\circ\text{C}$	$I_F = 1.6\text{ mA}$		4
Input Capacitance	$C_{iN}$		60		pF	$f = 1\text{ MHz}$ , $V_F = 0$ , $T_A = 25^\circ\text{C}$		4

### Notes:

- Pin 10 should be the most negative voltage at the detector side. Keeping  $V_{CC}$  as low as possible, but greater than 2.0 volts, will provide lowest total  $I_{OH}$  over temperature.
- Output power is collector output power plus one fourth of total supply power. Derate at 1.66 mW/ $^\circ\text{C}$  above 110 $^\circ\text{C}$ .
- Derate  $I_F$  at 0.33 mA/ $^\circ\text{C}$  above 110 $^\circ\text{C}$ .
- Each channel.
- CURRENT TRANSFER RATIO is defined as the ratio of output collector current,  $I_{O_1}$ , to the forward LED input current,  $I_F$ , times 100%.
- $I_{OHX}$  is the leakage current resulting from channel to channel optical crosstalk.  $I_F = 2\ \mu\text{A}$  for channel under test. For all other channels,  $I_F = 10\text{ mA}$ .
- Device considered a two-terminal device: Pins 1 through 8 are shorted together and pins 9 through 16 are shorted together.
- Measured between the LED anode and cathode shorted together and pins 10 through 15 shorted together.
- $CM_H$  is the maximum tolerable common mode transient to assure that the output will remain in a high logic state (i.e.,  $V_O > 2.0\text{ V}$ ).
- $CM_L$  is the maximum tolerable common mode transient to assure that the output will remain in a low logic state (i.e.,  $V_O < 0.8\text{ V}$ ).
- In applications where  $dV/dt$  may exceed 50,000 V  $\mu\text{s}$  (such as a static discharge) a series resistor,  $R_{CC}$ , should be included to protect the detector ICs from destructively high surge currents. The recommended value is

$$R_{CC} \approx \frac{1\text{ V}}{0.6 I_F (\text{mA})} \text{ k}\Omega$$

- This is a momentary withstand test, not an operating condition.
- Measured between adjacent input pairs shorted together, i.e., between pins 1 and 2 shorted together, and pins 3 and 4 shorted together, etc.
- Standard parts receive 100% testing at 25 $^\circ\text{C}$  (Subgroups 1 and 9). SMD and /883B parts receive 100% testing at 25, 125, and -55 $^\circ\text{C}$  (Subgroups 1 and 9, 2 and 10, 3 and 11, respectively).
- Subgroups 10 and 11 shall be tested as part of device initial characterization and after design and process changes. Subgroups 10 and 11 shall be guaranteed to the limits specified in Table I for all lots not specifically tested. Subgroup 9 shall be tested with every lot.

#### 8-PIN CERAMIC DUAL IN-LINE PACKAGE

DIMENSIONS IN MILLIMETERS AND (INCHES).

## 20 Terminal Ceramic Leadless Chip Carrier

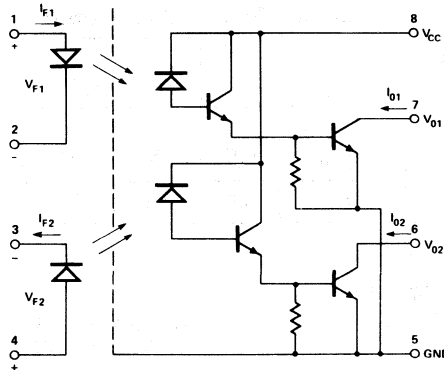

## Description

The HCPL-5700, HCPL-5701, and 5962-8981001PC are single channel, low input current, high gain optocouplers. The HCPL-5730, HCPL-5731 and 5962-8978501PC are dual channel units made from the same chip sets. All six products are in eight pin hermetic dual in-line packages. These units are capable of operation and storage over the full military temperature ranges and can be purchased as either single or dual channel standard product (HCPL-5700 and HCPL-5730 respectively), with full MIL-STD-883 Class Level B testing (HCPL-5701 and HCPL-5731 respectively), or from the DESC Standard Military Drawings (SMDs) 5962-89810 and 5962-89785 as (5962-8981001PC or 5962-8978501PC respectively). All parts are normally shipped with gold plated leads. They are also available with solder dipped leads by replacing C with A in the SMD part number, or by adding Option 200 to the part number for non-SMD parts.

8 PIN CERAMIC DIP SINGLE CHANNEL SCHEMATIC

8 PIN CERAMIC DIP DUAL CHANNEL SCHEMATIC

20 TERMINAL CERAMIC LEADLESS CHIP CARRIER SCHEMATIC

The HCPL-6730, HCPL-6731, and 8962-89785022A are dual channel parts in twenty terminal hermetic, ceramic, leadless chip carriers. The standard part is HCPL-6730. The product with full MIL-STD-883 Class Level B testing is HCPL-6731. The DESC SMD part is 5962-89785022A. All three products are configured and function as two independent single channels. Devices are delivered with solder dipped terminals as a standard feature. Units may also be purchased with gold plated terminals.

All devices are manufactured and tested on a MIL-STD-1772 certified line and are included in the DESC Qualified Manufacturers List (QML) in accordance with requirements for MIL-H-38534.

Each channel contains a GaAsP light emitting diode optically coupled to an integrated high gain photon detector. The high gain output stage features an open collector output providing both lower saturation voltage and higher signaling speed than possible with conventional photo-Darlington optocouplers.

The supply voltage can be operated as low as 2.0 V without adversely affecting the parametric performance.

These devices have a 300% minimum CTR at an input current of only 0.5 mA making them ideal for use in low input current applications such as MOS, CMOS, low power logic interfaces or line receivers.

Compatibility with high voltage CMOS logic systems is assured by the 18V VCC, VOH current and the guaranteed maximum output leakage current at 18 V. The shallow depth and small junctions offered by the IC process provides better radiation immunity than conventional phototransistor optocouplers.

Upon special request, the following device selections can be made: CTR minimum of up to 600% at 0.5 mA, lower drive currents to 0.1 mA, and lower output leakage current levels to 100  $\mu$ A.

## Recommended Operating Conditions

Parameter	Symbol	Min.	Max.	Units
Input Voltage, Low Level (Each Channel)	$V_{F,OFF}$		0.8	V
Input Current, High Level (Each Channel)	$I_{F,ON}$	0.5	5	mA
Supply Voltage	$V_{CC}$	2.0	18	V

## Absolute Maximum Ratings

Storage Temperature Range ..... -65°C to +150°C  
 Operating Temperature ..... -55°C to +125°C  
 Lead Solder Temperature ..... 260°C for 10 s  
 Output Current,  $I_O$  (each channel) ..... 40 mA  
 Output Voltage,  $V_O$  (each channel) ..... -0.5 to 20 V<sup>[1]</sup>  
 Supply Voltage,  $V_{CC}$  ..... -0.5 to 20 V<sup>[1]</sup>  
 Output Power Dissipation (each channel) ..... 50 mW<sup>[2]</sup>  
 Peak Input Current (each channel,  $\leq 1$  ms duration) ..... 20 mA  
 Average Input Current,  $I_P$  (each channel) ..... 10 mA<sup>[3]</sup>  
 Reverse Input Voltage,  $V_R$  (each channel) ..... 5 V

\*All typical values are at  $V_{CC} = 5 \text{ V}, T_A = 25^\circ\text{C}$ .

## Typical Characteristics

$T_A = 25^\circ\text{C}, V_{CC} = 5 \text{ V}$

Parameter	Symbol	Typical	Units	Test Conditions	Figure	Note
Resistance (Input-Output)	$R_{I-O}$	$10^{12}$	$\Omega$	$V_{I-O} = 500 \text{ Vdc}$		4, 8
Capacitance (Input-Input)	$C_{I-O}$	2.0	pF	$f = 1 \text{ MHz}$		4, 8
Temperature Coefficient of Forward Voltage	$\frac{\Delta V_F}{\Delta T_A}$	-1.8	$\text{mV}/^\circ\text{C}$	$I_F = 1.6 \text{ mA}$		4
Input Capacitance	$C_{IN}$	60	pF	$f = 1 \text{ MHz}, V_F = 0$		4

## Dual Channel Product Only

Input-Output Insulation Leakage Current	$I_{I-I}$	0.5	nA	45% Relative Humidity, $V_{I-I} = 500 \text{ Vdc}$ $T_A = 25^\circ\text{C}, t = 5 \text{ s}$		9
Resistance (Input-Input)	$R_{I-I}$	$10^{12}$	$\Omega$	$V_{I-I} = 500 \text{ Vdc}$		9
Capacitance (Input-Input)	$C_{I-I}$	1.0	pF	$f = 1 \text{ MHz}$		9

**Notes:**

1. GND Pin should be the most negative voltage at the detector side. Keeping  $V_{cc}$  as low as possible, but greater than 2.0 V, will provide lowest total  $I_{OH}$  over temperature.
2. Output power is collector output power plus total supply power for the single channel device. For the dual channel device, output power is collector output power plus one half the total supply power. Derate at 1.66 mW/°C above 110°C.
3. Derate  $I_f$  at 0.33 mA/°C above 110°C.
4. Each channel.
5. CURRENT TRANSFER RATIO is defined as the ratio of output collector current,  $I_o$ , to the forward LED input current,  $I_f$ , times 100%.
6.  $I_{OH}$  is the leakage current resulting from channel to channel optical crosstalk.  $I_f = 2 \mu A$  for channel under test. For all other channels,  $I_f = 10 \text{ mA}$ .
7. Device considered a two-terminal device: For 8 pin DIP, pins 1 through 4 are shorted together, and pins 5 through 8 are shorted together; for LCC, terminals 19, 20, 1, 2, 3 are shorted together, and terminals 7 through 15 are shorted together.
8. Measured between each input pair shorted together, and all outputs for that channel shorted together.
9. Measured between adjacent input pairs shorted together; i.e., for 8 pin DIP, between pins 1 and 2 shorted together and pins 3 and 4 shorted together; for LCC, between terminals 19 and 20 shorted together, and terminals 2 and 3 shorted together.
10.  $CM_H$  is the maximum tolerable common mode transient to assure that the output will remain in a high logic state (i.e.,  $V_o > 2.0 \text{ V}$ ).
11.  $CM_L$  is the maximum tolerable common mode transient to assure that the output will remain in a low logic state (i.e.,  $V_o < 0.8 \text{ V}$ ).
12. In applications where  $dV/dt$  may exceed 50,000 V/ $\mu s$  (such as a static discharge) a series resistor,  $R_{cc}$ , should be included to protect the detector ICs from destructively high surge currents. The recommended value is

$$R_{cc} = \frac{1 \text{ V}}{0.15 I_f \text{ (mA)}} \text{ k}\Omega$$

for single channel;

$$R_{cc} = \frac{1 \text{ V}}{0.3 I_f \text{ (mA)}} \text{ k}\Omega$$

for dual channel.

13. This is a momentary withstand test, not an operating condition.
14. Standard parts receive 100% testing at 25°C (Subgroups 1 and 9). SMD and /883B parts receive 100% testing at 25, 125, and -55°C (Subgroups 1 and 9, 2 and 10, 3 and 11, respectively).
15. Subgroups 10 and 11 shall be tested as part of device initial characterization and after design and process changes. Subgroups 10 and 11 shall be guaranteed to the limits specified in Table I for all lots not specifically tested. Subgroup 9 shall be tested with every lot.
16. The HCPL-6730 and HCPL-6731 dual channel parts function as two independent single channel units. Use the single channel parameter limits.

## Description

The HCPL-5760, HCPL-5761, and 5962-8947701PC are single channel, hermetically sealed, voltage/current threshold detection optocouplers. The products are capable of operation and storage over the full military temperature range and can be purchased as either standard product (HCPL-5760), with full MIL-STD-883 Class Level B testing (HCPL-5761), or from the DESC Standard Military Drawings (SMD) 5962-89477 as (5962-8947701PC). All three products are in eight pin hermetic dual in-line packages. They are normally shipped with gold plated leads. They are also available with solder dipped leads by replacing C with A in the SMD part #, or by adding option #200 to the part number for non-SMD parts.

Each unit contains a light emitting diode (LED), a threshold sensing input buffer IC, and a high gain photon detector to provide an optocoupler which permits adjustable external threshold levels. The input buffer circuit has a nominal turn on threshold of 2.5 mA ( $I_{TH}$ ) and 3.6 volts ( $V_{TH}$ ). The addition of one or more external attenuation resistors permits the use of this device over a wide range of input voltages and currents. Threshold sensing prior to the LED and detector elements minimizes effects of different optical gain and LED variations over operating life (CTR degradation). Hysteresis is also provided in the buffer for extra

noise immunity and switching stability.

The buffer circuit is designed with internal clamping diodes to protect the circuitry and LED from a wide range of over-voltage and over-current transients while the diode bridge enables easy use with ac voltage input.

These units combine several unique functions in a single package, providing the user with an ideal component for computer input boards and other applications where a predetermined input threshold optocoupler level is desirable.

The high gain output stage

features an open collector output providing both TTL compatible saturation voltages and CMOS compatible breakdown voltages.

The test program performed on the 5962-8947701PC is in compliance with DESC (SMD) 5962-89477. The electrical characteristics table shows Group A Subgroup testing requirements from this drawing.

All devices are manufactured and tested on a MIL-STD-1772 certified line and are included in the DESC Qualified Manufacturers List (QML) in accordance with requirements for MIL-H-38534.

## Recommended Operating Conditions

Parameter	Symbol	Min.	Max.	Units
Power Supply	$V_{CC}$	3.0	18	V
Operating Frequency <sup>(1)</sup>	f	0	10	KHz

## Absolute Maximum Ratings

Storage Temperature Range	-65°C to +150°C
Operating Temperature	-55°C to 125°C
Lead Solder Temperature	260°C for 10 s <sup>(2)</sup>
Average Input Current - $I_{IN}$	15 mA <sup>(3)</sup>
Surge Input Current - $I_{IN,SG}$	140 mA <sup>(3,4)</sup>
Peak Transient Input Current - $I_{IN,PK}$	500 mA <sup>(3,4)</sup>
Input Power Dissipation - $P_{IN}$	195 mW <sup>(5)</sup>
Total Package Power Dissipation - $P_d$	260 mW
Output Power Dissipation - $P_o$	65 mW
Average Output Current - $I_o$	40 mA
Supply Voltage, $V_{CC}$ (Pins 8-5)	-0.5 min., 20 V max.
Output Voltage, $V_o$ (Pins 6-5)	-0.5 min., 20 V max.

**Electrical Characteristics**  $T_A = -55^\circ\text{C}$  to  $125^\circ\text{C}$ , unless otherwise specified.

Input Capacitance	$C_{IN}$	50	pF	$f = 1\text{ MHz}$ ; $V_{IN} = 0\text{ V}$ , Pins 2 & 3, Pins 1 & 4 Open		
Output Rise Time (10-90%)	$t_r$	10	$\mu\text{s}$		7	
Output Fall Time (90-10%)	$t_f$	0.5	$\mu\text{s}$		7	

**Notes:**

- Maximum operating frequency is defined when output waveform (Pin 6) attains only 90% of  $V_{CC}$  with  $R_L = 1.8\text{ k}\Omega$ ,  $C_L = 15\text{ pF}$  using a 5 V square wave input signal.
- Measured at a point 1.6 mm below seating plane.
- Current into/out of any single lead.
- Surge input current duration is 3 ms at 120 Hz pulse repetition rate. Transient input current duration is 10  $\mu\text{s}$  at 120 Hz pulse repetition rate. Note that maximum input power,  $P_{IN}$ , must be observed.
- Derate linearly above 100°C free-air temperature at a rate of 4.26 mW/°C. Maximum input power dissipation of 195 mW allows an input IC junction temperature of 150°C at an ambient temperature of  $T_A = 125^\circ\text{C}$  with a typical thermal resistance from junction to ambient of  $\theta_{JA} = 235^\circ\text{C/W}$ . The typical thermal resistance from junction to case is equal to 170°C/W. Excessive  $P_{IN}$  and  $T_J$  may result in device degradation.
- The 1.8 k $\Omega$  load represents 1 TTL unit load of 1.6 mA and the 4.7 k $\Omega$  pull-up resistor.
- Logic low output level at Pin 6 occurs under the conditions of  $V_{IN} > V_{TH+}$  as well as the range of  $V_{IN} > V_{TH-}$  once  $V_{IN}$  has exceeded  $V_{TH+}$ .
- Logic high output level at Pin 6 occurs under the conditions of  $V_{IN} \leq V_{TH+}$  as well as the range of  $V_{IN} < V_{TH-}$  once  $V_{IN}$  has decreased below  $V_{TH-}$ .
- The ac voltage is instantaneous voltage.
- Device considered a two terminal device: Pins 1, 2, 3, 4 connected together, Pins 5, 6, 7, 8 connected together.
- This is a momentary withstand test, not an operating condition.
- The  $t_{PHL}$  propagation delay is measured from the 2.5 V level of the leading edge of a 5.0 V input pulse (1  $\mu\text{s}$  rise time) to the 1.5 V level on the leading edge of the output pulse (see Figure 7).
- The  $t_{PLH}$  propagation delay is measured from the 2.5 V level of the trailing edge of a 5.0 V input pulse (1  $\mu\text{s}$  fall time) to the 1.5 V level on the trailing edge of the output pulse (see Figure 7).
- Common mode transient immunity in Logic High level is the maximum tolerable  $dV_{CM/dt}$  of the common mode voltage,  $V_{CM}$ , to ensure that the output will remain in a Logic High state (i.e.,  $V_O > 2.0\text{ V}$ ). Common mode transient immunity in Logic Low level is the maximum tolerable  $dV_{CM/dt}$  of the common mode voltage,  $V_{CM}$ , to ensure that the output will remain in a Logic Low state (i.e.,  $V_O < 0.8\text{ V}$ ). See figure 8.
- In applications where  $dV_{CM/dt}$  may exceed 50,000 V/ $\mu\text{s}$  (such as static discharge), a series resistor,  $R_{CC}$ , should be included to protect the detector IC from destructively high surge currents. The recommended value for  $R_{CC}$  is 240  $\Omega$  per volt of allowable drop in  $V_{CC}$  (between Pin 8 and  $V_{CC}$ ) with a minimum value of 240  $\Omega$ .
- $D_1$  and  $D_2$  are Schottky diodes;  $D_3$  and  $D_4$  are zener diodes.
- Standard parts receive 100% testing at 25°C (Subgroups 1 and 9). SMD and /883B parts receive 100% testing at 25, 125, and -55°C (Subgroups 1 and 9, 2 and 10, 3 and 11, respectively.)

## SMD 5962-8947701PC and MIL-STD-883 Class B Test Program

Hewlett-Packard's 883B Optocouplers are in compliance with MIL-STD-883, Revision C. Deviations listed below are specifically allowed in DESC SMD 5962-89477 for an H. P. Optocoupler from the same generic family using the same manufacturing process, design rules and elements of the same microcircuit group.

Testing consists of 100% screening to Method 5004 and quality conformance inspection to Method 5005 of MIL-STD-883.

### 5761/883B Clarifications:

- I. 100% screening per MIL-STD-883, Method 5004 constant acceleration—Condition A not E.
- II. Quality Conformance Inspection per MIL-STD-883, Method 5005, Group A, B, C, and D.
  - Group A— See Electrical Characteristics Table.
  - Group B— No change.
  - Group C— No change.
  - Group D— Constant Acceleration— Condition A not E.

## Electrical Considerations

The HCPL-5760, HCPL-5761, or 5962-8947701PC optocoupler has internal temperature compensated, predictable voltage and current threshold points which allow selection of an external resistor,  $R_x$ , to determine larger external threshold voltage levels. For a

## Part Numbering System

Commercial Product	Class B Product	SMD Product
HCPL-5760	HCPL-5761	5962-8947701PC

Figure 9. Operating Circuit for Burn-In and Steady State Life Tests

desired external threshold voltage,  $V_{\pm}$ , a corresponding typical value of  $R_x$  can be obtained from Figure 10. Specific calculation of  $R_x$  can be obtained from Equation (1) of Figure 11. Specification of both  $V_+$  and  $V_-$  voltage threshold levels simultaneously can be obtained by the use of  $R_x$  and  $R_p$  as shown in Figure 11 and determined by Equations (2) and (3).

$R_x$  can provide over-current transient protection by limiting input current during a transient condition. For monitoring contacts with a relay or switch, the HCPL-5760/1, or 5962-8947701PC combination with  $R_x$  and  $R_p$  can be used to allow a specific current to be conducted through the contacts for cleaning purposes (wetting current).

The choice of which input voltage clamp level to choose depends upon the application of this device (see Figure 3). It is recommended that the low clamp condition be used when

Figure 10. Typical External Threshold Characteristic,  $V_{\pm}$  vs.  $R_x$

possible to lower the input power dissipation as well as the LED current, which minimizes LED degradation over time.

In applications where  $dV_{CM}/dt$  may be extremely large (such as static discharge), a series resistor,  $R_{CC}$ , should be connected in series with  $V_{CC}$  and Pin 8 to protect the detector IC from destructively high surge currents. See note 14 for determination of  $R_{CC}$ . In addition, it is recommended that a ceramic disc bypass capacitor of 0.01  $\mu F$  to 0.1  $\mu F$  be placed between Pins 8 and 5 to reduce the effect of power supply noise.

**Figure 11. External Threshold Voltage Level Selection**

For interfacing ac signals to TTL systems, output low pass filtering can be performed with a pullup resistor of 1.5 kΩ and 20 μF capacitor. This application requires a Schmitt trigger gate to avoid slow rise time chatter problems. For ac input applications, a filter capacitor can be placed across the dc input terminals for either signal or transient filtering.

Either ac (Pins 1, 4) or dc (Pins 2, 3) input can be used to determine external threshold levels.

For one specifically selected external threshold voltage level  $V_+$  or  $V_-$ ,  $R_x$  can be determined without use of  $R_p$  via

$$R_x = \frac{V_+ - V_{TH+}(-)}{I_{TH+}(-)} \quad (1)$$

For two specifically selected external threshold voltage levels,  $V_+$  and  $V_-$ , the use of  $R_x$  and  $R_p$  will permit this selection via equations (2), (3) provided the following conditions are met:

$$\frac{V_+}{V_-} \geq \frac{V_{TH+}}{V_{TH-}} \text{ and } \frac{V_+ - V_{TH+}}{V_- - V_{TH-}} < \frac{I_{TH+}}{I_{TH-}}$$

$$R_x = \frac{V_{TH-}(V_+) - V_{TH+}(V_-)}{I_{TH+}(V_{TH-}) - I_{TH-}(V_{TH+})} \quad (2)$$

$$R_p = \frac{V_{TH-}(V_+) - V_{TH+}(V_-)}{I_{TH+}(V_- - V_{TH-}) + I_{TH-}(V_{TH+} - V_+)} \quad (3)$$

See Application Note 1004 for more information.

- Level Shifting

### Description

The 4N55, 4N55/883B, and 5962-8767901EC units consist of two completely independent transistor output optocouplers. The products are capable of

operation and storage over the full military temperature range and can be purchased as either a standard product (4N55), with full MIL-STD-883 Class Level B testing (4N55/883B) or from the DESC Standard Military Drawing (SMD) 5962-87679 as (5962-8767901EC). All three products are assembled in hermetic, sixteen pin dual in-line packages. These parts are

### Outline Drawing

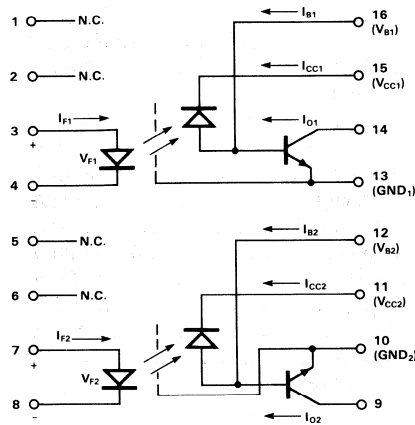

normally shipped with gold plated leads. They are also available with solder dipped leads by replacing C with A in the DESC part #, or by adding option #200 to the part number for non DESC parts.

Each channel has a GaAsP light emitting diode which is optically coupled to an integrated photon detector. Separate connections for the photodiodes and output transistor collectors improve the speed up to a hundred times that of a conventional phototransistor optocoupler by reducing the base-collector capacitance.

These devices are suitable for wide bandwidth analog applications, as well as for interfacing TTL to LSTTL or CMOS. Current Transfer Ratio (CTR) is 9% minimum at  $I_F = 16$  mA. The 18 V  $V_{CC}$  capability will enable the designer to interface any TTL family to CMOS. The availability of the base lead allows optimized gain/bandwidth adjustment in analog applications. The shallow depth of the IC photodiode provides

### Schematic

better radiation immunity than conventional phototransistor couplers.

The test program performed on the 5962-8767901EC is in compliance with DESC (SMD) 5962-87679. The Electrical Characteristics Table shows Group A Subgroup testing requirements from this drawing.

All devices are manufactured and tested on a MIL-STD-1772 certified line and are included in the DESC Qualified Manufacturers List (QML) in accordance with requirements for MIL-H-38534.

HERMETIC OPTOCOUPLES

**CAUTION:** The small junction sizes inherent to the design of this bipolar component increase the component's susceptibility to damage from electrostatic discharge (ESD). It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

### Recommended Operating Conditions

Parameter	Symbol	Min.	Max.	Units
Input Current, Low Level	$I_{FL}$		250	$\mu$ A
Supply Voltage	$V_{CC}$	2	18	V
Operating Temperature	$T_C$	-55	+125	$^{\circ}$ C
Input Current, High Level	$I_{FH}$	12	20	mA

## Absolute Maximum Ratings

Storage Temperature Range .....	-65°C to +150°C
Lead Solder Temperature .....	260°C for 10 s. (1.6 mm below seating plane)
Average Input Current — $I_F$ (each channel) .....	20 mA
Peak Input Current — $I_P$ (each channel, ≤ 1 ms duration) .....	40 mA
Reverse Input Voltage — $V_R$ (each channel) .....	5 V
Input Power Dissipation (each channel) .....	36 mW
Average Output Current — $I_O$ (each channel) .....	8 mA
Peak Output Current — $I_O$ (each channel) .....	16 mA
Supply Voltage — $V_{CC}$ (each channel) .....	-0.5 V to 20 V
Output Voltage — $V_O$ (each channel) .....	-0.5 V to 20 V
Emitter Base Reverse Voltage — $V_{EBO}$ .....	3.0 V
Base Current — $I_B$ (each channel) .....	5 mA
Output Power Dissipation (each channel) .....	50 mW

Derate linearly above 100°C free air temperature  
at a rate of 1.4 mW/°C.

Bandwidth	BW	9	MHz		8	8

### Notes:

- Each channel.
- Current Transfer Ratio is defined as the ratio of output collector current,  $I_O$ , to the forward LED input current,  $I_F$ , times 100%. CTR is known to degrade slightly over the unit's lifetime as a function of input current, temperature, signal duty cycle and system on time. Refer to Application Note 1002 for more detail. In short it is recommended that designers allow at least 20-25% guardband for CTR degradation.
- Measured between pins 1 through 8 shorted together and pins 9 through 16 shorted together.
- Measured between each input pair shorted together and the output pins for that channel shorted together.
- Measured between pins 3 and 4 shorted together and pins 7 and 8 shorted together.
- $CM_H$  is the steepest slope (dV/dt) on the leading edge of the common mode pulse,  $V_{CM}$ , for which the output will remain in the logic high state (i.e.,  $V_O > 2.0 \text{ V}$ ).
- $CM_L$  is the steepest slope (dV/dt) on the trailing edge of the common mode pulse,  $V_{CM}$ , for which the output will remain in the logic low state (i.e.,  $V_O < 0.8 \text{ V}$ ).
- Bandwidth is the frequency at which the ac output voltage is 3 dB below the low frequency asymptote.
- This is a momentary withstand test, not an operating condition.
- Standard parts receive 100% testing at 25°C (Subgroups 1 and 9). SMD and /883B parts receive 100% testing at 25, 125, and -55°C (Subgroups 1 and 9, 2 and 10, 3 and 11, respectively).

### SMD 5962-8767901EC and MIL-STD-883 Class B Test Program

Hewlett-Packard's 883B Optocouplers are in compliance with MIL-STD-883, Revision C. Deviations listed below are specifically allowed in DESC SMD 5962-87679 for an HP Optocoupler from the same generic family using the same manufacturing process, design rules, and elements of the same microcircuit group.

Testing consists of 100% screening to Method 5004 and quality conformance inspection to Method 5005 of MIL-STD-883.

#### 4N55/883B Clarifications:

- I. 100% screening per MIL-STD-883, Method 5004 constant acceleration—Condition A not E.
- II. Quality Conformance Inspection per MIL-STD-883, Method 5005, Group A, B, C, and D.

Group A—See Electrical Characteristics Table.

Group B—No change.

Group C—No change.

Group D—Constant Acceleration—Condition A not E.

### Features

- **Manufactured and Tested on a MIL-STD-1772 Certified Line**
- **QML-MIL-H-38534**
- **Performance Guaranteed Over -55°C to +125°C Ambient Temperature Range**
- **MIL-STD-883 Class B Testing**
- **High Speed: Typically 400 kbit/s**
- **9 MHz Bandwidth**
- **Open Collector Outputs**
- **1500 Vdc Withstand Test Voltage**
- **High Radiation Immunity**
- **4N55, 6N135/6, HCPL-2530/31 Function Compatibility**
- **2-18 Volt  $V_{cc}$  Range**

### Applications

- **Military/High Reliability Systems**
- **Isolated Input Line Receiver**
- **Isolated Output Line Driver**
- **System Test Equipment Isolation**
- **Digital Logic Ground Isolation**
- **Current Loop Receiver**
- **Level Shifting**
- **Analog Signal Ground Isolation**
- **Vehicle Command/Control**
- **Switching Power Supply Feedback Element**

### Description

These units are single and dual channel, hermetically sealed optocouplers. The products are capable of operation and storage over the full military temperature range and can be purchased as either a standard product or with full MIL-STD-883 Class Level B testing. All devices are manufactured and tested on a MIL-STD-1772 certified line and are included in the DESC Qualified Manufacturers List (QML) in accordance with requirements for MIL-H-38534.

The HCPL-5500, 5501, 5530 and 5531 are in a 8 Pin ceramic DIP configured as either single or dual channel devices. The standard products are HCPL-5500 and HCPL-5530. The products with full MIL-STD-883 Class Level B testing are HCPL-5501 and HCPL-5531.

The HCPL-6530 and HCPL-6531 parts are in twenty terminal hermetic, ceramic, leadless chip carriers. The standard part is HCPL-6530. The product with full MIL-STD-883 Class Level B testing is HCPL-6531. These dual channel devices are configured and function as two independent single channels. Devices are delivered with solder dipped terminals as a standard feature. Units may also be purchased with gold plated terminals.

Each channel contains a light emitting diode optically coupled to an integrated photon detector providing 1500 Vdc electrical isolation between input and output. Separate connections for the photodiodes and output transistor collectors improve the speed up to a hundred times that of a conventional phototransistor optocoupler by reducing the base-collector capacitance. These devices are suitable for wide bandwidth analog applications, as well as for interfacing TTL to LSTTL or CMOS. Current Transfer Ratio (CTR) is 9% minimum at  $I_F = 16$  mA over the full military operating temperature range, -55°C to +125°C. The 18 V  $V_{cc}$  capability will enable the designer to interface any TTL family to CMOS. The availability of the base lead allows optimized gain/bandwidth adjustment in analog applications. The shallow depth of the IC photodiode provides better radiation immunity than conventional phototransistor couplers.

These products are also available with the transistor base node unconnected to improve common mode noise immunity and ESD susceptibility. In addition, higher CTR minimums are available by special request. Contact your local HP Field Sales Engineer for ordering information.

Capacitance (Input-Input)	$C_{I-I}$	0.8	pF	$f = 1\text{ MHz}$		5
Resistance (Input-Input)	$R_{I-I}$	$10^{12}$	$\Omega$	$V_{I-I} = 500\text{ Vdc}$		5

**Notes:**

- Each channel of a dual channel device.
- Current Transfer Ratio is defined as the ratio of output collector current,  $I_O$ , to the forward LED input current,  $I_F$ , times 100%. CTR is known to degrade slightly over the unit's lifetime as a function of input current, temperature, signal duty cycle, and system on time. Refer to Application Note 1002 for more detail. In short, it is recommended that designers allow at least 20-25% guardband for CTR degradation.
- Device considered a two-terminal device: for 8 pin DIP, pins 1 through 4 are shorted together, and pins 5 through 8 are shorted together; for LCC, terminals 19, 20, 1, 2, 3 are shorted together, and terminals 7 through 15 are shorted together.
- The HCPL-6530 and HCPL-6531 dual channel parts function as two independent single channel units. Use the single channel parameter limits.
- Measured between adjacent input pairs shorted together; i.e., for 8 pin DIP, between pins 1 and 2 shorted together and pins 3 and 4 shorted together; for LCC, between terminals 19 and 20 shorted together, and terminals 2 and 3 shorted together.
- $t_{PHL}$  propagation delay is measured from the 50% point on the leading edge of the input pulse to the 1.5 V point on the leading edge of the output pulse. The  $t_{PLH}$  propagation delay is measured from the 50% point on the trailing edge of the input pulse to the 1.5 V point on the trailing edge of the output pulse.

7.  $CM_L$  is the maximum rate of rise of the common mode voltage that can be sustained with the output voltage in the logic low state ( $V_o < 0.8$  V).  $CM_H$  is the maximum rate of fall of the common mode voltage that can be sustained with the output voltage in the logic high state ( $V_o > 2.0$  V).
8. Bandwidth is the frequency at which the ac output voltage is 3 dB below the low frequency asymptote. For the HCPL-5530 the typical bandwidth is 2 MHz.
9. This is a momentary withstand test, not an operating condition.
10. Higher CTR minimums are available to support special applications.
11. Measured between each input pair shorted together and all outputs for that channel shorted together.

## MIL-STD-883 Class B Test Program

Hewlett-Packard's 883B Optocouplers are in compliance with MIL-STD-883, Revision C. Deviations listed below are specifically allowed in DESC drawing 5962-87679 for the equivalent H.P. Optocoupler.

Testing consists of 100% screening to Method 5004 and quality conformance inspection to Method 5005 of MIL-STD-883.

### Clarifications:

- I. 100% screening per MIL-STD-883, Method 5004 constant acceleration—Condition A not E.
- II. Quality Conformance Inspection per MIL-STD-883, Method 5005, Group A, B, C, and D.  
 Group A—See table below for specific electrical tests.  
 Group B—No change.  
 Group C—No change.  
 Group D—Constant Acceleration—Condition A not E.

# Electrophotographic Products

---

# Electrophotographic Products

---

Hewlett-Packard's Electrophotographic Products consist of LED Printheads and LED Erase Bars which are used to expose the image and to erase the image, respectively, on the photoreceptor in Non-Impact Plain Paper Printers, Copiers, and FAX machines using the Electrophotographic process.

## LED Printheads

The LED Printhead can replace the Laser which is the principal part of the Raster Output Scanner (ROS) system of the electrophotographic non-impact printers (NIP). The choice of using either a laser or a LED Printhead is dictated by the speed, cost, and performance trade-offs. Some of the advantages of LED Printheads include:

1. Compact size
2. High speed, high power capability

3. No moving parts, solid state reliability
4. Wavelength can be modified as a special option to match the photoreceptor characteristics
5. Precise pixel placement, registration

Hewlett-Packard's binary LED Printheads are a series of compact, efficient, uniform, linear LED arrays with on-board integrated data registers and precise LED drivers. These HP printheads are suitable for use in electrophotographic NIPs, digital copiers, universal office machines, and FAX machines. HP offers its binary LED Printheads in common LED array lengths of 8.5 inches (A4 size) and 12 inches (A3 size).

The resolution choices are 300 DPI (8.5 and 12 inch LED array lengths), 406 DPI (12 inch length), and 480 DPI (12

inch length) where DPI is Dots Per Inch. For these LED Printheads, HP uses a modular design construction consisting of tiles aligned and mounted on a mother substrate to form a single LED row of thousands of pixels. The exact number of pixels depends on the length and resolution (DPI) of the printhead. A precision aligned SELFOC® array lens can be rigidly mounted over the LED linear array of thousands of pixels to focus the LED light output power (LOP) onto the photoreceptor of the electrophotographic machine. The A4 size 300 DPI printhead is supplied with a mounted SLA-20 SELFOC® lens. The A3 size 300 DPI, 406 DPI and 480 DPI printheads are supplied without a SELFOC® lens, but the lenses can be added as a special option.

Table 1 gives some of the optical/electrical parameters and characteristics of HP's LED Printheads.

\*SELFOC® is a registered trademark of Nippon Sheet Glass Co., Ltd.

**Table 1. Optical/Electrical Characteristics at  $T_A = 25^\circ\text{C}$ .**

Type of LED Printhead	Length of LED Array (mm)	Number of LED Pixels	Light Peak Wavelength (nm) (See Note 1)	Radiant Output Intensity (see Note 2) ( $\mu\text{W}/\text{sr}/\text{pixel}$ )	Radiant Output Intensity Variation	Max. Clock Frequency (MHz)	LED Supply Voltage (volts)	Nominal Operating Current (mA/pixel)
300 DPI	219	2592	$660 \pm 10$	3-6	See Note 3	10	$5 \pm 5\%$	5
300 DPI	303	3584	$685 \pm 8$	6-8	See Note 4	10	$5 \pm 5\%$	4
406 DPI	304	4864	$685 \pm 8$	6-8	See Note 4	10	$5 \pm 5\%$	4
480 DPI	298	5632	$685 \pm 8$	6-8	See Note 4	10	$5 \pm 5\%$	4

[SELFOC® – Registered trademark of Nippon Sheet Glass Co. Ltd.]

**Notes:**

- The wavelength can be changed in special options.
- Far-field measurement with a glass cover over the LED array but without a mounted SELFOC® lens.
- Intensity Variation**
  - (a) Pixel intensity variation **Max Values**  $\pm 20\%$
  - (b) Group intensity variation **Max Values**  $\pm 10\%$   
(average of 4 pixels versus adjacent group of 4)  
Eg. LED 1, 2, 3, 4, vs. 5, 6, 7, 8  
vs. 9, 10, 11, 12 ...
- Intensity Variation**
  - (a) Pixel intensity variation **Max Values**  $\pm 20\%$
  - (b) Group intensity variation **Max Values**  $\pm 8\%$   
(average of 8 pixels versus adjacent group of 8)  
Eg. LED 1, 2, 3, 4, 5, 6, 7, 8  
vs. 9, 10, 11, 12, 13, 14, 15, 16  
vs. 17, 18, 19, 20, 21, 22, 23, 24

**Custom Options Available**

- Upon request, the following wavelengths are available: 660 nm and 710 nm for the A4 size 300 DPI; 660 nm, 685 nm and 710 nm for the A3 size 300 DPI, 406 DPI and 480 DPI LED Printheads.
- "With/without" lens options and different types of lens options (SLA-20, SLA-12) are offered upon request for the LED Printheads.

**Outline Drawings of LED Printheads**

300 DPI, 8.5 inches (A4 size)

ELECTROPHOTOGRAPHIC PRODUCTS

**300 DPI, 406 DPI, 480 DPI (All are 12 inches – A3 size)**

NOTE: 1. HEXP-RT00 ... ARRAY LENGTH 304.0 ± 5 mm.

**300 DPI, 8.5 inches (A4 size)**

**300 DPI, 406 DPI, 480 DPI  
12 inches (A3 size)**

## Future LED Printheads

The following types of LED Printheads are in product development at Hewlett-Packard. Please contact your local Hewlett-Packard field sales engineer for more information.

1. Large format: 2 foot and 3 foot binary LED Printheads.
2. Grayscale 400 DPI LED Printheads with the following features:
  - a. 64 levels of gray (6 bits)
  - b.  $\pm 2\%$  accuracy of exposure
  - c. Exposed length of 306 mm (12 inches) or 4820 pixels
  - d. Built in Light Output Power Monitor
3. Narrow Profile Options

## LED Erase Bars

The LED Erase Bar is an ideal illuminator source which is finding widespread application in the copiers and printers which use the electrophotographic process. Some of the advantages of LED Erase Bars include:

1. High reliability.
2. Uniformity of light output
3. Compact size
4. Low voltage/low power
5. Addressability – Segmented and fully addressable erase bars allow precise, electronic control of which pixels are illuminated.
6. Patented optical design – HP's design tailors the pixel's beam profile for optimal performance.
7. Variety of wavelengths – The LED wavelength can be chosen to best match a photoreceptor's sensitivity.
8. On-Board electronics – For high-density addressable erase bars, on-board custom LED driver ICs simplify the electronics interface.

## HP offers 3 families of LED Erase Bars:

Type of Erase Bar	Erase Function	Choices of Wavelength Emitted by Erase Bar (nm)
1. On/Off	Pre-clean, Pre-transfer, Interdocument	655, 635, 610, 565
2. Addressable, Segmented, 10 DPI	Interdocument, Edge Fade Out, Edit	655, 635, 610, 565
3. High Resolution, 25 DPI, OBIC	Edit, Color highlight	655

Hewlett-Packard LED Erase Bars employ a hybrid construction consisting of LED dice, electronic components and optical elements in a compact assembly. The light from each LED pixel is focused to a sharp image at the specified working distance. This HP patented optical technique maintains high uniformity and very low stray light.

Table 2 gives some of the optical/electrical parameters and characteristics of HP's LED Erase Bars.

**Table 2. Optical/Electrical Characteristics at  $T_A = 25^\circ\text{C}$ .**

Type of LED Erase Bar	Length of LED Array (mm)	Number of LED Pixels	Light Peak Wavelength (nm) (See Note 1)	Typical Light Output (see Notes 2 & 3)	Transverse Beam Width (mm)	Detector Height Above LED Array (mm)	Radiant Output Intensity Variation	LED Drive Condition	Test Current per LED mA/LED
On/Off	312	120	655 635 610 565	1700 $\mu\text{W}/\text{cm}$ 450 $\mu\text{W}/\text{cm}$ 130 $\mu\text{W}/\text{cm}$ 95 $\mu\text{W}/\text{cm}$	3	4	$\pm 10\%$	22.5 Vdc	25 dc
10 DPI Addressable	310	124	655 635 610 565	500 $\mu\text{W}/\text{cm}$ 175 $\mu\text{W}/\text{cm}$ 50 $\mu\text{W}/\text{cm}$ 40 $\mu\text{W}/\text{cm}$	2.7	1.05	$\pm 30\%$	Multiplex	12 avg.
25 DPI Addressable	358	352	655	800 $\mu\text{W}/\text{cm}^2$	1.1	1.5	$\pm 45\%$	Digital	5 dc

**Notes:**

1. As of this writing, not all products are released in all the wavelengths shown.
2. The light output figures for on/off and 10 DPI addressable bars are given in  $\mu\text{W}/\text{cm}$ . This is the total radiometric flux emitted per unit of length of the bar. It is typically measured using a 1 mm x 20 mm slit detector oriented perpendicular to the length of the erase bar.
3. The light output figure for 25 DPI addressable bars is an irradiance measurement, specified in  $\mu\text{W}/\text{cm}^2$ . This figure is computed by dividing the total flux emitted from a pixel by the area of its square projected image. That image area is defined by the 50% peak power points at the specified detector height above the LED array.

**Custom Options Available**

HP can design and manufacture custom LED Erase Bars to different optical/electrical specifications and/or different mechanical designs from the ones shown. Please furnish a drawing and specification to your local HP field sales engineer.

### **Future LED Erase Bars**

The following types of LED Erase Bars are in product development at Hewlett-Packard. Please contact your local Hewlett-Packard field sales engineer for more information.

1. Future LED Erase Bar designs driven by customers' needs.
2. Anticipated variations including length, on-board electronics, optical performance, narrower mechanical profiles.

# 406 DPI LED Optical Printhead

## Technical Data

### HEXP-RT00

#### Features

- High Optical Power and Efficiency
- Electronically Trimmed and Programmed to Guarantee Excellent Uniformity
- Designed to Write Image or Background
- Noise Tolerant Interface
- High Data Input Rates
- Custom Wavelengths Available

#### Description

The HEXP-RT00 represents a 12" LED optical binary printhead. Each printhead consists of:

- A 4864 x 1 array of LED pixels at a 406 dpi resolution
- Four serial data line inputs
- A differential line interface

#### Special Options:

- 660 nm and 710 nm peak wavelengths are available upon request
- A selfoc lens can be provided upon request

#### Applications

- Electrophotographic printers to over 100 pages/minute
- High performance editing copiers
- Universal printer/copiers
- High performance facsimile printers
- General purpose optical Raster Output Systems

Reliable operation in high speed applications is achieved by a combination of conservative thermal design, efficient LED materials, careful design of power distribution, and use of individual precision current source drivers.

#### Selection Guide

406 dpi (16 dots/mm) Resolution  
11.97 inches (304 mm) Image Width

## Specifications Summary

### Absolute Maximum Ratings\*

All voltages referenced to Gnd. Driver Outputs Not Enabled.

Supply Voltage, V<sub>DD</sub> ..... -0.3 to 6.0 V

Input Voltage, Any Pin to Ground ..... -0.3 to V<sub>DD</sub> + 0.3 V

Maximum Operating Duty Factor ..... 38%

Free Air Operating Temperature Range, T<sub>A</sub> ..... +15°C to +43°C

Operating Humidity (Non-condensing) ..... 5% to 90% RH

Storage Temperature Range, T<sub>S</sub> ..... -30°C to +65°C at 50% max RH

\*Permanent device failure may occur if parts are stressed beyond these limits. Device reliability may be affected by extended exposure to absolute maximum ratings. Functionality at or above these limits is not guaranteed.

### Recommended Operating Conditions\*

Parameter	Symbol	Minimum	Typical	Maximum	Unit
Supply Voltage <sup>(1)</sup>	V <sub>DD</sub>	4.75	5.0	5.25	V

\*Recommended operating conditions define the limits between which the functionality of the product is guaranteed.

**Note:**

1. Power supply rise time to be less than 10 ms.

### Optical Characteristics\*

Output Characteristics (V <sub>DD</sub> = 5.0 V)	HEXP-RT00
Light Wavelength	685 ± 8 nm
Average Printhead Intensity	6.0 μW/sr/pixel Min 8.0 μW/sr/pixel Typical

\*Unless specified otherwise, T<sub>A</sub> = 25°C and V<sub>DD</sub> = 5.0 volts.

Intensity Variation	Max Values
Pixel Intensity Variation	±20%
Group Intensity Variation (Average of 8 pixels vs. adjacent group of 8)	±8%
Maximum Load Intensity Variation (One pixel on to same pixel with all pixels on at time = 0*)	±2%
Thermally Induced Average Intensity Variation (Average intensity at time = 0* and T <sub>A</sub> = 25°C, compared to average intensity at thermal equilibrium, 1/3 on, 38% DF, T <sub>A</sub> = 43°C, and minimum air flow = 600 liters/min)	±10%

\*Unless specified otherwise, T<sub>A</sub> = 25°C and V<sub>DD</sub> = 5.0 volts.

### DC Characteristics Over Operating Range\*

Parameter	Symbol	Minimum	Nominal	Maximum	Units
Supply Current (All pixels on)	$I_{DD}$			35 <sup>[1]</sup>	A, peak
Pixel Current	$I_{pix}$		4	7	mA, peak
Input Differential Voltage (CLK±, LAT±, OE± and DATA±) and RST± Hi Level (V+ - V-) Lo Level (V- - V+)	$V_{TH}$ $V_{TL}$	-200		200	mV mV
Input Current into V+ (CLK±, LAT±, and DATA±) V+ = V <sub>CC</sub> ; V- = Gnd V+ = Gnd, V- = V <sub>CC</sub>	I <sub>ih</sub> I <sub>il</sub>	44 -56	50 -50	56 -44	mA mA
Input Current into V+ $\overline{OE}$ V+ = V <sub>CC</sub> ; V- = Gnd V+ = Gnd, V- = V <sub>CC</sub>	I <sub>ih</sub> I <sub>il</sub>	44 -61	50 -55	56 -49	mA mA
Input Current into V+ RST V+ = V <sub>CC</sub> ; V- = Gnd V+ = Gnd, V- = V <sub>CC</sub>	I <sub>ih</sub> I <sub>il</sub>	.1 -3	.25 -5	.6 -7	mA mA
Hysteresis	V <sub>hys</sub>		50		mV

\*Unless specified otherwise, min/max limits apply across the temperature range and supply voltage range. All typical values are for T<sub>A</sub> = 25°C and V<sub>DD</sub> = 5.0 volts.

**Note:**

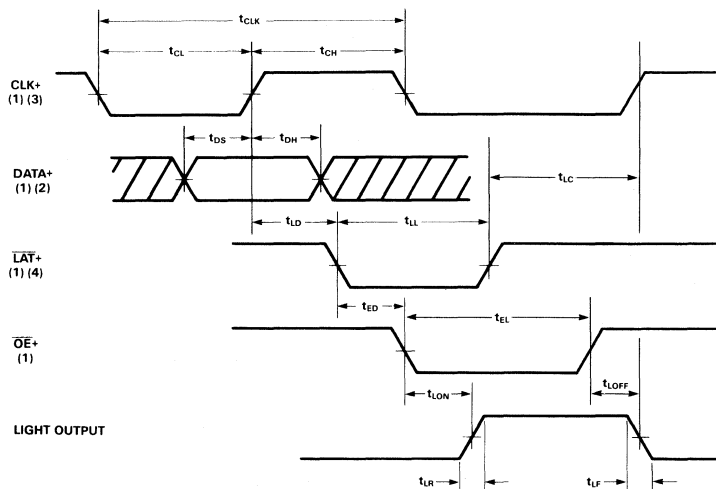

1. Maximum peak current at thermal equilibrium (T<sub>A</sub> = 43°C, DF = 38%, 1/3 pixels on and a minimum air flow of 600 liters/minute).

## AC Switching Characteristics Over Operating Range\*

Parameter	Symbol	Minimum	Typical	Maximum	Units
CLK Period	$t_{CLK}$	100			ns
CLK Frequency	$f_{CLK}$			10	MHz
CLK Hold High Time	$t_{CH}$	45	50	55	ns
CLK Hold Low Time	$t_{CL}$	45	50	55	ns
Data Setup Time Prior to CLK	$t_{DS}$	25			ns
Data Hold Time After CLK	$t_{DH}$	25			ns
$\overline{LAT}$ Active Delay After CLK	$t_{LD}$	25			ns
$\overline{LAT}$ Inactive Before CLK	$t_{LC}$	25			ns
$\overline{LAT}$ Hold Low Time	$t_{LL}$	50			ns
OE Active Delay After $\overline{LAT}$	$t_{ED}$	25			ns
OE Active Low Time	$t_{EL}$			50	ms
Light Output Delay After OE Active	$t_{LON}$			300	ns
Light Output Delay After OE Disable	$t_{LOFF}$			300	ns
Light Output Rise Time	$t_{LR}$			200	ns
Light Output Fall Time	$t_{LF}$			200	ns

\*Unless specified otherwise, min/max limits apply across the temperature range and supply voltage range. All typical values are for  $T_A = 25^\circ\text{C}$  and  $V_{DD} = 5.0$  volts.

## Timing Diagram

- (1) CLK-, DATA-,  $\overline{LAT}$ - AND  $\overline{OE}$ - HAVE INVERTED WAVEFORMS.
- (2) DATA+ IS REPRESENTATIVE OF DAT1+, DAT2+, DAT3+ AND DAT4+.
- (3) POSITIVE EDGE-TRIGGERED SIGNAL.
- (4) LEVEL-SENSITIVE SIGNAL.

### **AN 1011**

#### **Design and Operational Considerations for the HEDS-5000 Incremental Shaft Encoder**

This application note is directed toward the system designer using the HEDS-5000 and HEDS-6000 modular incremental shaft encoders. First the note briefly analyzes the theory of design and operation of the HEDS-5000 and HEDS-6000. A practical approach to design considerations and an error analysis provide an in depth treatment of the relationship between motor mechanical parameters and encoding error accumulation. Several design examples demonstrate the analysis techniques presented. Operation considerations for assembly, test, trouble shooting and repair are presented. Finally, some circuits and software concepts are introduced which will be useful in interfacing the shaft encoder to a digital or microprocessor based system. Appendix A summarizes the uses and advantages of various

encoder technologies while Appendix B provides guidance for selecting DC motors suitable for use with the HEDS-5000 and HEDS-6000.

Ordering No. 5953-9393

### **AN 1025**

#### **Applications and Circuit Design for the HEDS-7500 Series Digital Potentiometer**

This application note demonstrates some of the uses for the Hewlett-Packard HEDS-7500 series digital potentiometer, explains how a digital potentiometer works, and explains some of the advantages of a digital potentiometer over a standard resistive potentiometer. In addition, this application note provides some examples of circuitry which will interface the digital potentiometer to a microprocessor, and provides mechanical design considerations and available options for the HEDS-7500 series digital potentiometer.

Ordering No. 5954-8485

### **AN 1032**

#### **Design of the HCTL-1000's Digital Filter Parameters by the Combination Method**

Digital closed loop motion control systems employing a dedicated IC as a controller are becoming increasingly popular as a solution to the need for controlled velocity and positioning systems. Hewlett-Packard's HCTL-1000 is a general purpose motion control IC which has been designed for this type of closed loop systems. A digital compensator has been designed into the HCTL-1000 to provide a stable response to an input command. This application note explains how the combination method can be used for calculation of the HCTL-1000's digital compensation filter parameters to provide a stable, closed loop position control system.

Ordering No. 5954-8455

## Light Bars & Bar Graph Arrays

### AN 1007

#### Bar Graph Array Applications

This application note begins with a description of the manufacturing process used to construct the 10 element array. Next is a discussion of the package design and basic electrical configuration and how they affect designing with the bar graph array. Mechanical information including pin spacing and wave soldering recommendations are made.

Display interface techniques of two basic types are thoroughly discussed. The first of these two drive schemes is applicable in systems requiring display of analog signals in a bar graph format. The second major drive technique interfaces bar graph arrays in systems where the data is of a digital nature. Examples of microprocessor controlled bar graph arrays are presented.

Summarized for the design engineer are tables of available integrated circuits for use with bar graph arrays. Finally, a list of recommended filters is included.

Ordering No. 5953-0452

### AN 1012

#### Methods of Legend Fabrication

Hewlett-Packard LED Light Bar Modules inscribed with fixed messages or symbols can be used as economical annunciators. Annunciators are often used in front panels to convey the status of a system, to indicate a selected mode of operation, or to indicate the next step in a sequence. This application note discusses alternative ways the message or

symbols (legends) can be designed. A selection matrix is provided to assist in the selection of the most appropriate method of legend fabrication. Each fabrication method is explained in detail along with mounting and attachment techniques. Finally, prevention of cross-talk is discussed for legend areas of a multi-segmented light bar.

Ordering No. 5953-0478

## Solid State Lamps

### AB 74

#### Option 002 Tape and Reel LED Lamps

Hewlett-Packard Option 002 tape and reel LED lamps have straight leads on standard 2.54 mm (0.100 inch) center spacing. These lamps may be auto-inserted into printed circuit boards with most radial auto-insertion equipment. However, it is important to have the proper plated through hole size and spacing, in the printed circuit to assure high insertion yields.

This application bulletin details the specific information on the printed board plated through hole size, spacing, and tolerances necessary to assure high insertion yields of Option 002 LED lamps with 0.46 mm (0.018 inch) square leads.

Ordering No. 5954-8402

### AN 1005

#### Operational Considerations for LED Lamps and Display Devices

In the design of a display system which incorporates LED lamps and display devices, the objective is to achieve an optimum between light output, power dissipation, reliability, and operating life. The perform-

ance characteristics and capabilities of each LED device must be known and understood so that an optimum design can be achieved. The primary source for this information is the LED device data sheet. The data sheet typically contains Electrical/Optical Characteristics that list the performance of the device and Absolute Maximum Ratings in conjunction with characteristic curves and other data which describe the capabilities of the device. A thorough understanding of this information and its intended use provides the basis for achieving an optimum design. This application note presents an in-depth discussion of the theory and use of the electrical and optical information contained within a data sheet. Two designs using this information in the form of numerical examples are presented, one for dc operation and one for pulsed (strobed) operation.

Ordering No. 5953-0419

### AN 1017

#### LED Solid State Reliability

Light emitting diode display technology offers many attractive features including multiple display colors, sunlight readability, and a continuously variable intensity adjustment. One of the most common reasons that LED displays are designed into an application, however, is the high level of reliability of the LED display. Hewlett-Packard has taken a leadership role in setting reliability standards for LED displays and documenting reliability performance.

This note explains how to use the reliability data sheets published for HP LED indicators and displays. It describes the LED indicator and display

packages, defines device failures, and discusses parameters affecting useful life, failure rates, and mechanical test performance.

Ordering Number 5953-7784

#### **AN 1021**

##### **Utilizing LED Lamps**

**Packaged on Tape and Reel**  
Hewlett-Packard offers many of its LED lamps packaged on tape and reel for radial insertion by automatic equipment during high volume production of PC board assemblies.

This application note is a guide to the use of tape and reel LED lamps in the automatic insertion process. Discussed are the LED lamp tape and reel configuration, the radial lead insertion process, PC board design considerations, a method to maintain LED lamp alignment during soldering, and lamp stand-off height information.

#### **AN 1027**

##### **Soldering LED Components**

The modern printed circuit board is assembled with a wide variety of semiconductor components. These components may include LED lamps and displays in combination with other components. The quantity of solder connections will be many times the component count. Therefore, the solder connections must be good on the first pass through the soldering process. The effectiveness of the soldering process is a function of the care and attention paid to the details of the process. It is important for display system designers and PC board assembly engineers to understand the aspects of the soldering process and how they relate to LED components to assure high yields.

This application note provides an in-depth discussion on the aspects of the soldering process and how they relate to LED lamps and display components, with the objective of being to serve as a guide towards achieving high yields for solder connections.

Ordering No. 5954-0893

#### **AN 1028**

##### **Surface Mount**

##### **Subminiature LED Lamps**

Modern printed circuit boards are being assembled with surface mounted components, replacing through hole mounted components in many traditional applications. Hewlett-Packard has surface mount options for its HLMP-6000/7000 series of subminiature LED lamps, Options 011 and 013 for "gull wing" leads, and Option 021 for "yoke" leads, for inverted mounting.

This application note provides information on how to surface mount and vapor phase reflow solder these surface mount subminiature LED lamps.

Ordering No. 5954-0902

#### **Solid State Displays**

##### **AN 1006**

##### **Seven Segment LED Display Applications**

This application note begins with a detailed explanation of the two basic product lines that Hewlett-Packard offers in the seven segment display market. This discussion includes mechanical construction techniques, character heights, and typical areas of application. The two major display drive techniques, dc and strobed, are covered. The resultant tradeoffs of cost, power, and ease of use

are discussed. This is followed by several typical instrument applications including counters, digital voltmeters, and microprocessor interface applications. Several different microprocessor based drive techniques are presented incorporating both the monolithic and the large seven segment LED displays.

The application note contains a discussion of intensity and color considerations made necessary if the devices are to be end stacked. Hewlett-Packard has made several advances in the area of sunlight viewability of LED displays. The basic theory is discussed and recommendations made for achieving viewability in direct sunlight. Information concerning display mounting, soldering, and cleaning is presented. Finally, an extensive set of tables has been compiled to aid the designer in choosing the correct hardware to match a particular application. These tables include seven segment decoder/drivers, digit drivers, LSI chips designed for use with LEDs, printed circuit board edge connectors, and filtering materials.

Ordering No. 5953-0439

#### **AN 1015**

##### **Contrast Enhancement Techniques for LED Displays**

Contrast enhancement is essential to assure readability of LED displays in a variety of indoor and outdoor ambients. Plastic filters are typically used for contrast enhancement with indoor lighting and glass circular polarized filters are typically used to achieve readability in sunlight ambients.

This application note discusses contrast enhancement technology for both indoor and outdoor ambients, the theory of Discrimination Index and provides a list of tested contrast enhancement filters and filter manufacturers.

Ordering No. 5953-7788

#### **AN 1016 Using the HDSP-2000 Alphanumeric Display Family**

The HDSP-2000 family of alphanumeric display products provides the designer with a variety of easy-to-use display modules with on board integrated circuit drivers. The HDSP-2000 family has been expanded to provide three display sizes with character heights ranging from 3.8 mm (0.15 in.) to 6.9 mm (0.27 in.), four display colors, and both commercial and military versions. These displays can be arranged to create both single line and multiple line alphanumeric panels.

This note is intended to serve as a design and application guide for users of the HDSP-2000 family of alphanumeric display devices. It covers the theory of the device design and operation, considerations for specific circuit designs, thermal management, power derating and heat sinking, and intensity modulation techniques.

Ordering No. 5953-7787

#### **AN 1026 Designing with Hewlett- Packard's Smart Display - the HPDL-2416**

The trend in LED Alphanumeric displays is to simplify a designer's job as much as possible by incorporating on board character storage, ASCII character generation, and multiplexing within the display. The HPDL-2416 is a four character alphanumeric display which incorporates a 64 character ASCII decoder and an on board CMOS IC to perform these functions. This application note is intended to serve as a design and application guide for users of the HPDL-2416. The information presented will cover electrical description, electrical design considerations, interfacing to micro-processors, pre-programmed message systems, mechanical and electrical handling, and contrast enhancement.

Ordering No. 5954-0886

#### **AN 1029 Luminous Contrast and Sunlight Readability of the HDSP-238X Series LED Alphanumeric Displays for Military Applications**

Military specifications for avionics and other kinds of electronics that require readability in sunlight use specific definitions for luminous contrast. The concept of chrominance contrast and the theory of Discrimination Index (see Hewlett-Packard Application Note 1015) are not used by the military as a means of determining readability in sunlight. Thus, the military requirements for readability in sunlight are based solely on luminous contrast measurements. This application note discusses the

luminous contrasts used by military specifications, describes anti-reflection/circular polarized filters designed for use with the HDSP-238X series sunlight viewable LED displays, and presents luminous contrast data for various HDSP-238X display/filter combinations.

Ordering No. 5954-0923

#### **AN1030 LED Displays and Indicators and Night Vision Imaging System Lighting**

This application note introduces the concept of night vision imaging. It discusses GEN II and GEN III ANVIS and Cat's Eyes night vision goggles. NVG compatibility problems and compatible lighting objectives for aircraft cockpits are discussed. It illustrates the use of NVG filters with high performance green and yellow LEDs to obtain NVG compatibility. Various aspects of MIL-L-85762A, as they apply to LEDs, are discussed. Calculated NVIS Radiance values are presented for high performance green and yellow LED/NVG/DV filter combinations. A discussion of the U.S. Army's NVG Secure Lighting Program and the objectives of the CECOM SOW are included. Information on dimming LED displays is presented. Daylight readability with NVG/DV filters is also discussed.

Ordering No. 5954-2245

## **AN 1031**

### **Front Panel Design**

In many applications designers are faced with the problem of how to match the perceived brightness of an assortment of seven segment displays, light bars, linear arrays, and lamps on the same front panel. To simplify this problem Hewlett-Packard has introduced S02 option selected parts. S02 option selected parts provide a restricted range of luminous intensity for a given part number. This application note is written as a design guide to matching the perceived brightness of LED displays and lamps on a front panel. The procedure shown in the application note will enable the designer to calculate the needed display drive currents (either dc or pulsed) for a given ambient light level and specified filter. Two techniques are explained. The first is how to calculate the drive currents to insure minimum acceptable brightness. The second is how to calculate the drive currents to match the display on the front panel to a known display.

Ordering No. 5954-0933

## **AN 1033**

### **Designing with the HDSP-211X Smart Display Family**

Hewlett-Packard's smart alphanumeric display, the HDSP-211X, is built to simplify the user's display design. Each HDSP-211X has an onboard CMOS IC which displays eight characters. All of the IC features are software driven. These features include 128 character ASCII decoder, 16 user-defined symbols, seven brightness levels, flashing

characters, a self test, and all of the circuitry needed to decode, drive, and refresh eight 5 x 7 dot matrix characters.

This application note discusses how to interface the HDSP-211X display to either a Motorola 6808 or an Intel 8085 microprocessor. A 32 character display interface is explained for each microprocessor. The note includes a detailed description of the hardware and software. The software illustrates how the user-defined symbols and a string of ASCII characters are loaded into the display.

Ordering No. 5954-8424

## **AN 1039**

### **Dimming HDSP-213X Displays to Meet Night Vision Lighting Levels Abstract**

For normal operation, the seven programmable dimming levels available with the HDSP-213X military grade displays are sufficient. However, the displays must be dimmed well below the lowest available on-board programmable dimming level to meet the requirements for night vision imaging system (NVIS) lighting. This application note describes a circuit that will dim HDSP-213X displays to luminance levels sufficient to meet NVIS lighting requirements.

Ordering No. 5952-0708

## **Fiber Optics**

### **AB 65**

#### **Using 50/125 $\mu$ m Optical Fiber with Hewlett-Packard Components**

Applications Bulletin 65 explains factors that influence the power coupled into various fiber diameters and numerical apertures. Test results showing coupled power from HP LED sources into 100/140  $\mu$  metre and 50/125  $\mu$  metre fiber are included.

Ordering No. 5953-9370

### **AB 71**

#### **200- $\mu$ m PCS Fiber with Hewlett-Packard Fiber-Optic Transmitters and Receivers**

A description of the properties of 200- $\mu$ m PCS fiber is given and the performance when used with Hewlett-Packard fiber optic components is described in the form of graphs and tables.

Ordering No. 5954-1021

### **AB 73**

#### **Low-cost Fiber-Optic Transmitter and Receiver Interface Circuits**

This bulletin provides assistance in designing circuits to interface Hewlett-Packard HFBR-0400 low-cost miniature fiber-optic components with TTL I/O for applications at data rates up to 35 MBD. The TTL  $T_x/R_x$  circuits presented in this applications bulletin have been designed, built, and tested. They are suitable for a wide range of applications. The HFBR-0400 fiber-optic components are compatible with either SMA or ST style connectors. The concepts illustrated in this bulletin are applicable to both types.

Ordering No. 5954-8415

**AB78****Low-Cost Fiber-Optic Links for Digital Applications up to 150 MBd**

The HFBR-2406 and HFBR-2416 are high-speed, low-cost linear light-to-voltage converters with typical bandwidths of 125 MHz. These components can be used to make fiber-optic links for both analog and digital applications. Since the range of possible uses is so varied, this Application Bulletin concentrates on a specific digital application. The application is one of the most prevalent for the HFBR-24X6: the transmission of encoded digital signals, otherwise known as run-length limited\* data.

Ordering No. 5954-8478

**AN 1022****High Speed Fiber-Optic Link Design with Discrete Components**

As the technology of fiber-optic communication matures, design considerations for large volume applications focus as much on cost and reliability as bandwidth and bit-error-rate. This application note describes a 100 MBd fiber-optic communication link which was implemented with low-cost, non-exotic technology, including LED transmitter, PIN photodiode detector, off-the-shelf ICs, and discrete components, laid out on epoxy-glass circuit boards.

Ordering No. 5954-0979

**AN 1035****Versatile Link**

The Versatile Link Application Note describes how fiber optics can be used to solve different types of application problems, introduces Hewlett-Packard's Versatile Link plastic fiber-optic components, and shows how to design a working fiber-optic link using the Versatile Link. It also includes several additional application circuits to help the designer obtain maximum performance from the Versatile Link

Ordering No. 5954-2191

**AN 1038****Low Cost Components for IEEE 802.3 Fiber-Optic Inter-Repeater Links**

The HFBR-0400 family of low cost high performance components can be combined with inexpensive support circuits to construct the Fiber-Optic Inter-Repeater Links (FOIRL) described in the IEEE 802.3 standard. The recommendations shown in this Application Note can also be used to construct 20 MBd optical links which are suited for a variety of point-to-point data communication applications.

Ordering No. 5954-2215

**TB 101****Fiber-Optic SMA Connector Technology**

Technical Brief 101 discusses tradeoffs between various SMA connector techniques and provides a contact matrix of manufacturers versus SMA connector type.

Ordering No. 5954-1004

**TB 102****Fiber/Cable Selection for LED Based Local Communications Systems**

Technical Brief 102 is intended to assist the first time user of fiber optics with the selection of a fiber cable that best meets desired system requirements. Issues discussed in Technical Brief 102 include: Tradeoffs between various fiber types, the effect of LED emitters on fiber performance, coupled power versus numerical aperture and factors that influence cable selection. A contact matrix that lists fiber cable manufacturers versus cable type is also included.

Ordering No. 5954-1004

**TB 104****Baseband Video Transmission with Low Cost Fiber-Optic Components**

The transmission of video signals over fiber-optic links offers several advantages relative to comparable wire distribution systems. Technical Brief 104 describes simple  $T_x/R_x$  circuits providing 20 MHz, 3 dB bandwidth for high resolution analog video transmission.

Ordering No. 5954-1025

**TB 105****ST Connector/Cable Guide**

A fairly recent development by AT&T is the ST\* Connector, and its rapid acceptance by users of fiber-optic components is an indication that it may soon become a standard connector.

Technical Brief 105 provides a quick comparison between the SMA and the ST style connector. A table at the end lists some suppliers of the ST style connected cables.

Ordering No. 5954-8436

## **Optocouplers**

### **AN 69**

#### **CMOS Circuit Design Using Hewlett-Packard Optocouplers**

Within this application bulletin are CMOS isolation interface circuits for use with the various low input current, Hewlett-Packard optocouplers, specifically, the HCPL-2200/2300/2731 and 6N139 devices. Advantages of and recommendations for different input and output circuit configurations are given in tabular form for low power operation at various signalling rates.

Ordering No. 5953-9384

### **AN 947**

#### **Digital Data Transmission Using Optically Coupled Isolators**

Optocouplers make ideal line receivers for digital data transmission applications. They are especially useful for elimination of common mode interference between two isolated data transmission systems. This application note describes design considerations and circuit techniques with special emphasis on selection of line drivers, transmission lines, and line receiver termination for optimum data rate and common mode rejection. Both resistive and active terminations are described in detail. Specific techniques are described for multiplexing applications, and for common mode rejection and data rate enhancement.

Ordering No. 5954-7759

### **AN 951-1**

#### **Applications for Low Input Current, High Gain Optocouplers**

Optocouplers are useful in line receivers, logic isolation, power lines, medical equipment, and telephone lines. This note discusses use of the 6N138/9 series high CTR optocouplers in each of these areas.

Ordering No. 5953-8430

### **AN 951-2**

#### **Linear Applications of Optocouplers**

Although optocouplers are not inherently linear, the separate photodiodes used in Hewlett-Packard optocouplers provide better linearity as well as higher speed of response than phototransistor detectors.

Linearity enhancement by use of paired optocouplers is described with specific circuit examples offering DC-to-25 KHz response. These examples illustrate the relative merits of differential and servo techniques.

A circuit with linear AC response to 10 MHz is also described for analog optocouplers having the photodiode terminals externally accessible.

Digital techniques of voltage-to-frequency conversion and pulse width modulation are discussed. Their linearity is quite independent of optocoupler linearity but require use of high speed optocouplers for low distortion.

Ordering No. 5954-8430

### **AN 1002**

#### **Consideration of CTR Variations in Optocoupler Circuit Designs**

A persistent, and sometimes crucial, concern of designers using optocouplers is that of the current transfer ratio, CTR, changing with time. The change, or CTR degradation, must be accounted for if long, functional lifetime of a system is to be guaranteed. This application note will discuss a number of different sources for this degradation.

Ordering No. 5953-7799

### **AN 1004**

#### **Threshold Sensing for Industrial Control Systems with the HCPL-3700 Interface Optocoupler**

Interfacing from industrial control systems to logic systems is a necessary operation in order to monitor system progress. This interfacing is found in process control systems, programmable controllers, microprocessor subsystems which monitor limit and proximity switches, environmental sensors and ac line status; in switching power supplies for detection of ac power loss; in power back up systems which need an early warning of power loss in order to save special microprocessor memory information or switch to battery operation, etc. Applications of the HCPL-3700 interface optocoupler are addressed in this note. The isolation and threshold detection capability of the HCPL-3700 allows it to provide unique features which no other optocoupler can provide. Addressed in this note are the advantages of using this optocoupler for isolating systems as well as the device characteristics, dc/ac operational performance with

and without filtering, simple calculations for setting desired thresholds, and four typical application examples for the HCPL-3700. Additional coverage is given to protection considerations for the optocoupler from the standpoint of power transients, thermal conditions, and electrical safety requirements of the industrial control environment.

Ordering No. 5953-0406

#### **AN 1018**

##### **Designing with the HCPL-4100 and HCPL-4200**

##### **Current Loop Optocoupler**

Digital current loops provide unique advantages of large noise immunity and long distance communication at low cost. Applications are wide and varied for current loops, but one of the critical concerns of a loop system is to provide a predictable, reliable, and isolated interface with the loop. The HCPL-4100 (transmitter) and HCPL-4200 (receiver) optocouplers provide for easy interfacing to and from a current loop with minimal design effort. Within this application note a complete description of the HCPL-4100/4200 devices is given along with applications for digital, 20 mA, simplex, half duplex, and full duplex loops. These loops can be either point-to-point or multi-drop configurations. Factors which affect data performance are discussed. Circuit arrangements with specific data performance are given in graphical and tabular form.

Ordering No. 5953-9359

#### **AN 1023**

##### **Radiation Immunity of Hewlett-Packard Optocouplers**

Opening with a quotation from MIL-HDBK-279 describing optocouplers containing photodiodes as superior to optocouplers containing phototransistors, the text describes the properties of ionizing radiation (particles and photons) and how it affects the performance of optocouplers. Graphs show degradation of CTR (Current Transfer Ratio) in the 6N140 as a function of gamma total dose (up to 1000 rad [Si]) and as a function of total neutron fluence (up to  $6 \times 10^{12}$  n/cm<sup>2</sup>). A table gives radiation hardness requirements for various military requirements.

Ordering No. 5954-1003

#### **AN 1024**

##### **Ring Detection with the HCPL-3700 Optocoupler**

With the increased use of modems, automatic phone answering equipment, private automatic branch exchange (PABX) systems, etc., low-cost, reliable, isolated ring detection becomes important to many electronic equipment manufacturers. This application note addresses the definition of ringing requirements (U.S.A. and Europe), applications of the HCPL-3700 optocoupler as a simple, but effective, ring detector. A design example is shown with calculations to illustrate proper use of the HCPL-3700. Features which are integrated into the HCPL-3700 provide for predictable detection, protection and isolation when compared to other optocoupler techniques.

Ordering No. 5954-1006

#### **AN 1036**

##### **Solid State Relay Introduction and Applications**

A brief opening describes SSRs (Solid State Relays), their advantages relative to EMRs (Electro Magnetic Relays); and their classification according to contact characteristics. There follows a description of HSSR-8200 "control" and "contact" properties. Arrangement of the contacts for signal switching, multiplexing, gain switching, and low-level sensing are discussed. Circuit suggestions and design rules are given for operation of the "control" LED. Schematics and design rules for overvoltage protection of the open contacts are presented.

Ordering No. 5954-2200

#### **TB 103**

##### **High Speed Optocouplers vs. Pulse Transformers**

For high speed signaling with Ground loop isolation, pulse transformers are often used. Here are summarized briefly the difficulties encountered in the use of pulse transformers, such as rise-time, sag, and interwinding capacitance. A table summarizes the parameters of Hewlett-Packard optocouplers designed for high speed signaling. A second table summarizes the advantages of using these optocouplers instead of pulse transformers.

## How to Order

To order any component in this catalog or additional applications information, call the HP office nearest you and ask for a Components representative. A complete listing of the U.S. sales offices is on page 9-7; offices located outside of the U.S. are listed on page 9-8.

A world-wide listing of HP authorized distributors is on page 9-3. These distributors can offer off-the-shelf delivery for most HP components.

If you need technical assistance, please call our Customer Information Center at 1-800-752-0900.

## Warranty

HP's Components are warranted against defects in material and workmanship for a period of one year from the date of shipment (in the case of designated Fiber Optic products, 90 days from the date of shipment). If HP receives notice of such defects during the warranty period, HP will repair or, at its option, replace components that prove to be defective in material or workmanship under proper use during the warranty period. This warranty extends only to HP customers.

**NO OTHER WARRANTIES ARE EXPRESSED OR IMPLIED. HP SPECIFICALLY DISCLAIMS THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.**

**THE REMEDIES PROVIDED HEREIN ARE BUYER'S SOLE AND EXCLUSIVE REMEDIES. HP SHALL NOT BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES, WHETHER BASED ON CONTRACT, TORT, OR ANY OTHER LEGAL THEORY.**

The foregoing limitation of liability shall not apply in the event that any HP product sold hereunder is determined by a court of competent jurisdiction to be defective and to have directly caused bodily injury, death, or property damage; provided, that in no event shall HP's liability for property damage exceed the greater of \$50,000 or the purchase price of the specific product that caused such damage.
