

HITACHI IC MEMORY DATA BOOK

HITACHI IC MEMORY DATA BOOK

INDEX

■ QUICK REFERENCE GUIDE TO HITACHI IC MEMORIES	8
● MOS RAM	8
● MOS ROM	10
● MOS Memories of Wide Operating Temperature Range	10
● Bipolar RAM	11
● Bipolar PROM	12
■ PACKAGE INFORMATION	13
■ RELIABILITY OF HITACHI IC MEMORIES	18
■ PRECAUTIONS FOR HANDLING IC MEMORIES	26
■ QUALITY ASSURANCE OF IC MEMORIES	29
■ OUTLINE OF TESTING METHOD	35
■ APPLICATION OF DYNAMIC RAMS	38
■ PROGRAMMING & ERASING OF PROMS	40
● Programming & Erasing of EPROM	40
● Programming of Bipolar PROM	44
■ MASK ROM PROGRAMMING INSTRUCTION	47
■ DATA SHEETS	51
● MOS STATIC RAM	51
HM4334-3 1024-word x 4-bit RAM (CMOS)	52
HM4334-4 1024-word x 4-bit RAM (CMOS)	52
HM4334P-3 1024-word x 4-bit RAM (CMOS)	52
HM4334P-4 1024-word x 4-bit RAM (CMOS)	52
HM4334P-3L 1024-word x 4-bit RAM (CMOS)	57
HM4334P-4L 1024-word x 4-bit RAM (CMOS)	57
HM6148 1024-word x 4-bit RAM (CMOS)	62
HM6148-6 1024-word x 4-bit RAM (CMOS)	62
HM6148P 1024-word x 4-bit RAM (CMOS)	62
HM6148P-6 1024-word x 4-bit RAM (CMOS)	62
HM6148LP 1024-word x 4-bit RAM (CMOS)	68
HM6148LP-6 1024-word x 4-bit RAM (CMOS)	68
HM6148H-35 1024-word x 4-bit RAM (CMOS)	74
HM6148H-45 1024-word x 4-bit RAM (CMOS)	74
HM6148H-55 1024-word x 4-bit RAM (CMOS)	74
HM6148HP-35 1024-word x 4-bit RAM (CMOS)	74
HM6148HP-45 1024-word x 4-bit RAM (CMOS)	74
HM6148HP-55 1024-word x 4-bit RAM (CMOS)	74
HM6148HLP-35 1024-word x 4-bit RAM (CMOS)	78
HM6148HLP-45 1024-word x 4-bit RAM (CMOS)	78
HM6148HLP-55 1024-word x 4-bit RAM (CMOS)	78
HM6147 4096-word x 1-bit RAM (CMOS)	83
HM6147-3 4096-word x 1-bit RAM (CMOS)	83
HM6147P 4096-word x 1-bit RAM (CMOS)	83
HM6147P-3 4096-word x 1-bit RAM (CMOS)	83
HM6147LP 4096-word x 1-bit RAM (CMOS)	87
HM6147LP-3 4096-word x 1-bit RAM (CMOS)	87
HM6147H-35 4096-word x 1-bit RAM (CMOS)	91
HM6147H-45 4096-word x 1-bit RAM (CMOS)	91
HM6147H-55 4096-word x 1-bit RAM (CMOS)	91
HM6147HP-35 4096-word x 1-bit RAM (CMOS)	91
HM6147HP-45 4096-word x 1-bit RAM (CMOS)	91
HM6147HP-55 4096-word x 1-bit RAM (CMOS)	91

HM6147HLP-35	4096-word x 1-bit RAM (CMOS)	97
HM6147HLP-45	4096-word x 1-bit RAM (CMOS)	97
HM6147HLP-55	4096-word x 1-bit RAM (CMOS)	97
HM6116-2	2048-word x 8-bit RAM (CMOS)	101
HM6116-3	2048-word x 8-bit RAM (CMOS)	101
HM6116-4	2048-word x 8-bit RAM (CMOS)	101
HM6116I-2	2048-word x 8-bit RAM (CMOS)	107
HM6116I-3	2048-word x 8-bit RAM (CMOS)	107
HM6116I-4	2048-word x 8-bit RAM (CMOS)	107
HM6116P-2	2048-word x 8-bit RAM (CMOS)	101
HM6116P-3	2048-word x 8-bit RAM (CMOS)	101
HM6116P-4	2048-word x 8-bit RAM (CMOS)	101
HM6116PI-2	2048-word x 8-bit RAM (CMOS)	111
HM6116PI-3	2048-word x 8-bit RAM (CMOS)	111
HM6116PI-4	2048-word x 8-bit RAM (CMOS)	111
HM6116FP-2	2048-word x 8-bit RAM (CMOS)	115
HM6116FP-3	2048-word x 8-bit RAM (CMOS)	115
HM6116FP-4	2048-word x 8-bit RAM (CMOS)	115
HM6116CG-2	2048-word x 8-bit RAM (CMOS)	120
HM6116CG-3	2048-word x 8-bit RAM (CMOS)	120
HM6116CG-4	2048-word x 8-bit RAM (CMOS)	120
HM6116L-2	2048-word x 8-bit RAM (CMOS)	124
HM6116L-3	2048-word x 8-bit RAM (CMOS)	124
HM6116L-4	2048-word x 8-bit RAM (CMOS)	124
HM6116LI-2	2048-word x 8-bit RAM (CMOS)	131
HM6116LI-3	2048-word x 8-bit RAM (CMOS)	131
HM6116LI-4	2048-word x 8-bit RAM (CMOS)	131
HM6116LP-2	2048-word x 8-bit RAM (CMOS)	135
HM6116LP-3	2048-word x 8-bit RAM (CMOS)	135
HM6116LP-4	2048-word x 8-bit RAM (CMOS)	135
HM6116LPI-2	2048-word x 8-bit RAM (CMOS)	142
HM6116LPI-3	2048-word x 8-bit RAM (CMOS)	142
HM6116LPI-4	2048-word x 8-bit RAM (CMOS)	142
HM6116LFP-2	2048-word x 8-bit RAM (CMOS)	146
HM6116LFP-3	2048-word x 8-bit RAM (CMOS)	146
HM6116LFP-4	2048-word x 8-bit RAM (CMOS)	146
HM6116K-3	2048-word x 8-bit RAM (CMOS)	150
HM6116K-4	2048-word x 8-bit RAM (CMOS)	150
HM6116AP-10	2048-word x 8-bit RAM (CMOS)	154
HM6116AP-12	2048-word x 8-bit RAM (CMOS)	154
HM6116AP-15	2048-word x 8-bit RAM (CMOS)	154
HM6116AP-20	2048-word x 8-bit RAM (CMOS)	154
HM6116ASP-10	2048-word x 8-bit RAM (CMOS)	154
HM6116ASP-12	2048-word x 8-bit RAM (CMOS)	154
HM6116ASP-15	2048-word x 8-bit RAM (CMOS)	154
HM6116ASP-20	2048-word x 8-bit RAM (CMOS)	154
HM6116ALP-10	2048-word x 8-bit RAM (CMOS)	158
HM6116ALP-12	2048-word x 8-bit RAM (CMOS)	158
HM6116ALP-15	2048-word x 8-bit RAM (CMOS)	158
HM6116ALP-20	2048-word x 8-bit RAM (CMOS)	158
HM6116ALSP-10	2048-word x 8-bit RAM (CMOS)	158
HM6116ALSP-12	2048-word x 8-bit RAM (CMOS)	158
HM6116ALSP-15	2048-word x 8-bit RAM (CMOS)	158
HM6116ALSP-20	2048-word x 8-bit RAM (CMOS)	158

HM6117P-3	2048-word x 8-bit RAM (CMOS)	162
HM6117P-4	2048-word x 8-bit RAM (CMOS)	162
HM6117FP-3	2048-word x 8-bit RAM (CMOS)	167
HM6117FP-4	2048-word x 8-bit RAM (CMOS)	167
HM6117LP-3	2048-word x 8-bit RAM (CMOS)	172
HM6117LP-4	2048-word x 8-bit RAM (CMOS)	172
HM6117LFP-3	2048-word x 8-bit RAM (CMOS)	178
HM6117LFP-4	2048-word x 8-bit RAM (CMOS)	178
HM6168H-45	4096-word x 4-bit RAM (CMOS)	184
HM6168H-55	4096-word x 4-bit RAM (CMOS)	184
HM6168H-70	4096-word x 4-bit RAM (CMOS)	184
HM6168HP-45	4096-word x 4-bit RAM (CMOS)	184
HM6168HP-55	4096-word x 4-bit RAM (CMOS)	184
HM6168HP-70	4096-word x 4-bit RAM (CMOS)	184
HM6168HLP-45	4096-word x 4-bit RAM (CMOS)	185
HM6168HLP-55	4096-word x 4-bit RAM (CMOS)	185
HM6168HLP-70	4096-word x 4-bit RAM (CMOS)	185
HM6167	16384-word x 1-bit RAM (CMOS)	186
HM6167-6	16384-word x 1-bit RAM (CMOS)	186
HM6167-8	16384-word x 1-bit RAM (CMOS)	186
HM6167P	16384-word x 1-bit RAM (CMOS)	186
HM6167P-6	16384-word x 1-bit RAM (CMOS)	186
HM6167P-8	16384-word x 1-bit RAM (CMOS)	186
HM6167LP	16384-word x 1-bit RAM (CMOS)	192
HM6167LP-6	16384-word x 1-bit RAM (CMOS)	192
HM6167LP-8	16384-word x 1-bit RAM (CMOS)	192
HM6167H-45	16384-word x 1-bit RAM (CMOS)	196
HM6167H-55	16384-word x 1-bit RAM (CMOS)	196
HM6167HP-45	16384-word x 1-bit RAM (CMOS)	196
HM6167HP-55	16384-word x 1-bit RAM (CMOS)	196
HM6167HCG-45	16384-word x 1-bit RAM (CMOS)	203
HM6167HCG-55	16384-word x 1-bit RAM (CMOS)	203
HM6167HLP-45	16384-word x 1-bit RAM (CMOS)	207
HM6167HLP-55	16384-word x 1-bit RAM (CMOS)	207
HM6264P-10	8192-word x 8-bit RAM (CMOS)	211
HM6264P-12	8192-word x 8-bit RAM (CMOS)	211
HM6264P-15	8192-word x 8-bit RAM (CMOS)	211
HM6264LP-10	8192-word x 8-bit RAM (CMOS)	215
HM6264LP-12	8192-word x 8-bit RAM (CMOS)	215
HM6264LP-15	8192-word x 8-bit RAM (CMOS)	215
● MOS DYNAMIC RAM		221
HM4716A-1	16384-word x 1-bit RAM (NMOS)	222
HM4716A-2	16384-word x 1-bit RAM (NMOS)	222
HM4716A-3	16384-word x 1-bit RAM (NMOS)	222
HM4716A-4	16384-word x 1-bit RAM (NMOS)	222
HM4716AP-1	16384-word x 1-bit RAM (NMOS)	222
HM4716AP-2	16384-word x 1-bit RAM (NMOS)	222
HM4716AP-3	16384-word x 1-bit RAM (NMOS)	222
HM4716AP-4	16384-word x 1-bit RAM (NMOS)	222
HM4816A-3	16384-word x 1-bit RAM (NMOS)	233
HM4816A-3E	16384-word x 1-bit RAM (NMOS)	233
HM4816A-4	16384-word x 1-bit RAM (NMOS)	233
HM4816A-7	16384-word x 1-bit RAM (NMOS)	233
HM4816AP-3	16384-word x 1-bit RAM (NMOS)	233

HM4816AP-3E	16384-word x 1-bit RAM (NMOS)	233
HM4816AP-4	16384-word x 1-bit RAM (NMOS)	233
HM4816AP-7	16384-word x 1-bit RAM (NMOS)	233
HM4864-2	65536-word x 1-bit RAM (NMOS)	241
HM4864-3	65536-word x 1-bit RAM (NMOS)	241
HM4864P-2	65536-word x 1-bit RAM (NMOS)	241
HM4864P-3	65536-word x 1-bit RAM (NMOS)	241
HM4864CC-2	65536-word x 1-bit RAM (NMOS)	251
HM4864CC-3	65536-word x 1-bit RAM (NMOS)	251
HM4864I-2	65536-word x 1-bit RAM (NMOS)	256
HM4864I-3	65536-word x 1-bit RAM (NMOS)	256
HM4864K-2	65536-word x 1-bit RAM (NMOS)	256
HM4864K-3	65536-word x 1-bit RAM (NMOS)	256
HM4864A-12	65536-word x 1-bit RAM (NMOS)	260
HM4864A-15	65536-word x 1-bit RAM (NMOS)	260
HM4864A-20	65536-word x 1-bit RAM (NMOS)	260
HM4864AP-12	65536-word x 1-bit RAM (NMOS)	260
HM4864AP-15	65536-word x 1-bit RAM (NMOS)	260
HM4864AP-20	65536-word x 1-bit RAM (NMOS)	260
HM4864ACG-12	65536-word x 1-bit RAM (NMOS)	265
HM4864ACG-15	65536-word x 1-bit RAM (NMOS)	265
HM4864ACG-20	65536-word x 1-bit RAM (NMOS)	265
HM4865AP-12	65536-word x 1-bit RAM (NMOS)	270
HM4865AP-15	65536-word x 1-bit RAM (NMOS)	270
HM4865AP-20	65536-word x 1-bit RAM (NMOS)	270
HM50256-12	262144-word x 1-bit RAM (NMOS)	277
HM50256-15	262144-word x 1-bit RAM (NMOS)	277
HM50256-20	262144-word x 1-bit RAM (NMOS)	277
HM50257-12	262144-word x 1-bit RAM (NMOS)	284
HM50257-15	262144-word x 1-bit RAM (NMOS)	284
HM50257-20	262144-word x 1-bit RAM (NMOS)	284
● MOS Mask ROM		291
HN61364P	8192-word x 8-bit ROM (CMOS)	292
HN61364FP	8192-word x 8-bit ROM (CMOS)	292
HN61365P	8192-word x 8-bit ROM (CMOS)	294
HN61366P	8192-word x 8-bit ROM (CMOS)	296
HN43128P	16384-word x 8-bit or 32768-word x 4-bit ROM (CMOS)	298
HN613128P	16384-word x 8-bit ROM (CMOS)	300
HN613128FP	16384-word x 8-bit ROM (CMOS)	300
HN61256P	32768-word x 8-bit or 65536-word x 4-bit ROM (CMOS)	302
HN61256FP	32768-word x 8-bit or 65536-word x 4-bit ROM (CMOS)	302
HN613256P	32768-word x 8-bit ROM (CMOS)	304
HN613256FP	32768-word x 8-bit ROM (CMOS)	304
HN62301P	131072-word x 8-bit ROM (CMOS)	306
● MOS PROM		309
HN462716	2048-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	310
HN462716G	2048-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	310
HN462532	4096-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	314

HN462532G	4096-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	314
HN462732	4096-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	318
HN462732G	4096-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	318
HN462732GI	4096-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	322
HN482732AG-20	4096-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	325
HN482732AG-25	4096-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	325
HN482732AG-30	4096-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	325
HN482764	8192-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	328
HN482764-3	8192-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	328
HN482764-4	8192-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	328
HN482764G	8192-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	328
HN482764G-3	8192-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	328
HN482764G-4	8192-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	328
HN4827128G-25	16384-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	332
HN4827128G-30	16384-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	332
HN4827128G-45	16384-word x 8-bit U.V. Erasable & Electrically PROM (NMOS)	332
HN48016P	2048-word x 8-bit Electrically Erasable & PROM (NMOS)	336
● Bipolar RAM		341
HM10414	256-word x 1-bit RAM (ECL 10K)	342
HM10414-1	256-word x 1-bit RAM (ECL 10K)	342
HM2110	1024-word x 1-bit RAM (ECL 10K)	346
HM2110-1	1024-word x 1-bit RAM (ECL 10K)	346
HM2112	1024-word x 1-bit RAM (ECL 10K)	350
HM2112-1	1024-word x 1-bit RAM (ECL 10K)	350
HM10422	256-word x 4-bit RAM (ECL 10K)	355
HM10422-7	256-word x 4-bit RAM (ECL 10K)	360
HM10470	4096-word x 1-bit RAM (ECL 10K)	363
HM10470-1	4096-word x 1-bit RAM (ECL 10K)	363
HM10470F	4096-word x 1-bit RAM (ECL 10K)	363
HM10470-15	4096-Word x 1-bit RAM (ECL 10K)	368
HM2142	4096-word x 1-bit RAM (ECL 10K)	371
HM10474	1024-word x 4-bit RAM (ECL 10K)	374
HM10474-15	1024-word x 4-bit RAM (ECL 10K)	374
HM10480	16384-word x 1-bit RAM (ECL 10K)	379
HM10480F	16384-word x 1-bit RAM (ECL 10K)	379
HM100415	1024-word x 1-bit RAM (ECL 100K)	382
HM100415CC	1024-word x 1-bit RAM (ECL 100K)	382

HM100422	256-word x 4-bit RAM (ECL 100K)	385
HM100422F	256-word x 4-bit RAM (ECL 100K)	385
HM100422CC	256-word x 4-bit RAM (ECL 100K)	385
HM100470	4096-word x 1-bit RAM (ECL 100K)	388
HM100470-15	4096-word x 1-bit RAM (ECL 100K)	388
HM100474	1024-word x 4-bit RAM (ECL 100K)	391
HM100474-15	1024-word x 4-bit RAM (ECL 100K)	391
HM100474F	1024-word x 4-bit RAM (ECL 100K)	391
HM100474F-15	1024-word x 4-bit RAM (ECL 100K)	391
HM100480	16384-word x 1-bit RAM (ECL 100K)	396
HM100480F	16384-word x 1-bit RAM (ECL 100K)	396
HM2504	256-word x 1-bit RAM (TTL)	399
HM2504-1	256-word x 1-bit RAM (TTL)	399
HM2510	1024-word x 1-bit RAM (TTL)	403
HM2510-1	1024-word x 1-bit RAM (TTL)	403
HM2510-2	1024-word x 1-bit RAM (TTL)	403
HM2511	1024-word x 1-bit RAM (TTL)	407
HM2511-1	1024-word x 1-bit RAM (TTL)	407
● Bipolar PROM		411
HN25044	1024-word x 4-bit PROM (TTL)	414
HN25045	1024-word x 4-bit PROM (TTL)	414
HN25084	2048-word x 4-bit PROM (TTL)	419
HN25085	2048-word x 4-bit PROM (TTL)	419
HN25084S	2048-word x 4-bit PROM (TTL)	422
HN25085S	2048-word x 4-bit PROM (TTL)	422
HN25088	1024-word x 8-bit PROM (TTL)	425

RELIABILITY OF HITACHI IC MEMORIES

1. STRUCTURE

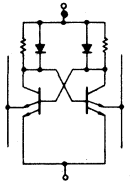

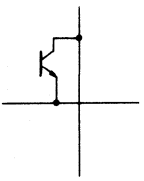

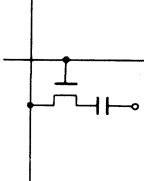

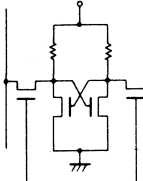

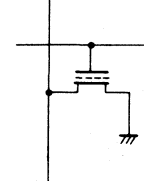

IC memories are structurally classified into bipolar type and MOS type. The former has a characteristic of an extremely high speed. But it is a comparatively small capacity and on the other hand, the latter features a large capacity. These IC memories are utilized by effectively taking the most of their respective characteristics.

Flows from designing, manufacturing and up to inspection for both Bipolar and MOS type IC memories are established under a unified concept, design and inspection standards. Therefore stable results concerning their reliability have been obtained with these IC memories, regardless of differences in the circuit design, pattern, layout, degree of

integration, etc.

From its characteristics, the memory LSI is integrated in high density by unit patterns called "cell" and it is not exaggeration to say that they are produced in the most advanced semiconductor manufacturing technologies. To get the high reliability of such a memory which has been subjected to rapid technological advances, know-hows based on past experience from the design stage of a cell are incorporated. Farther to evaluated reliability of each respective technology applied. Reliability evaluation using TEG (Test Element Group), etc. is carried out. Examples of cell circuits of the Bipolar memory and MOS memory are shown in Table 1.

● Table 1 Examples of Basic Cell Circuit of IC Memories

Classification	Bipolar memory (RAM)	Bipolar memory (PROM)	NMOS memory (Dynamic RAM)	NMOS, CMOS memories (Static RAM)	NMOS memory (PROM)
Application	Buffer memory, control memory of high-speed computer	Microcomputer control use	Main memory of computer, microcomputer memory		For microcomputer control
Example of basic cell circuit					

IC memory chips produced in the latest technologies are sealed in different packages. Ceramic package, Cerdip (glass-sealed type) and Plastic package are the current major IC packages. Also such packages as LCC (Leadless Chip Carrier) for high package density and SO (Small Outline) package are now under development.

Ceramic and Cerdip versions, with their hermetically sealed structure, are suitable to the equipment requiring high reliability. Plastic version, the leading semiconductor package, is applied to various kinds of equipment. Hitachi Plastic package has been improved to the close reliability level as the hermetically sealed devices. Table 2 shows examples of IC memory package outlines.

● Table 2 Examples of IC Memory Package Outlines

2. RELIABILITY DATA Results of reliability tests are listed below.

2-1 Reliability test data on Bipolar memories

The reliability test data on the Bipolar memories are shown in Tables 3 and 4. Since they are manufactured under the aforementioned standardized design

rules and quality control, there is no difference in reliability among various types. In addition, it can be said that the greater the capacity, the higher the reliability per bit.

2.3 Change of electrical characteristics under endurance test for IC memories

The degradation of I_{CBO} of the cell transistor, degradation of h_{FE}, etc., can be considered as main factors in the internal elements for reliability of Bipolar memories. In actual element designing,

however, it has been designed to operate in the range at which these degradations do not happen. Therefore changes of electrical characteristics including access time are not observed. Time dependence in access time for HM10470 is shown in Fig. 1.

Fig. 1 Example of Change in Bipolar Memory Characteristics

V_{TH} is a basic parameter in the MOS memories, however, it has been confirmed there is not any shift in V_{TH} for practical usage because we have applied surface stabilizing technique, clean process, etc.

In case of dynamic RAM which needs refresh cycle, refresh time is also stabilized owing to the above-mentioned process. Time dependence of V_{CC min} and t_{REF} characteristics for the 64K DRAM are shown in Fig. 2 and 3.

Fig. 2 V_{CC min} time dependence in dynamic operation test at 125°C

Fig. 3 Time dependence in refresh time (t_{REF}) in dynamic operation test at 125°C

2.4 Classification of failure modes

Examples of failures happened in the field are shown in Fig. 4 and 5. Since memory LSIs generally require the most fine processing in semiconductor manufacturing technology, the percentage of failures resulting from pinholes, photoresist defects, foreign materials, etc., is tending to increase. To eliminate the latent defects which are generated in these manufacturing processes, we are constantly

improving these processes, and performing burn-in screening under high temperature for all memories. In addition, since the analysis of failures in the field can result in important feedback to improve their design and manufacturing, we are always exerting our efforts to collect customer process data and field data with the aim of further establishing their high reliability.

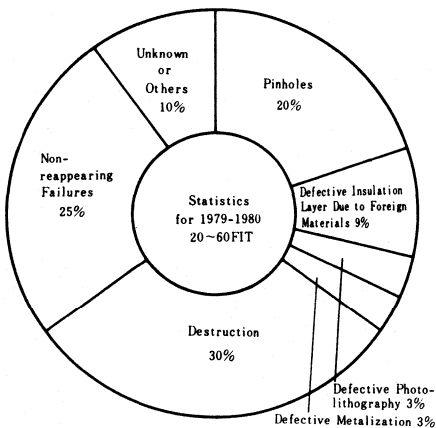

Fig. 4 Classification of Failure Modes of Bipolar Memory in the field

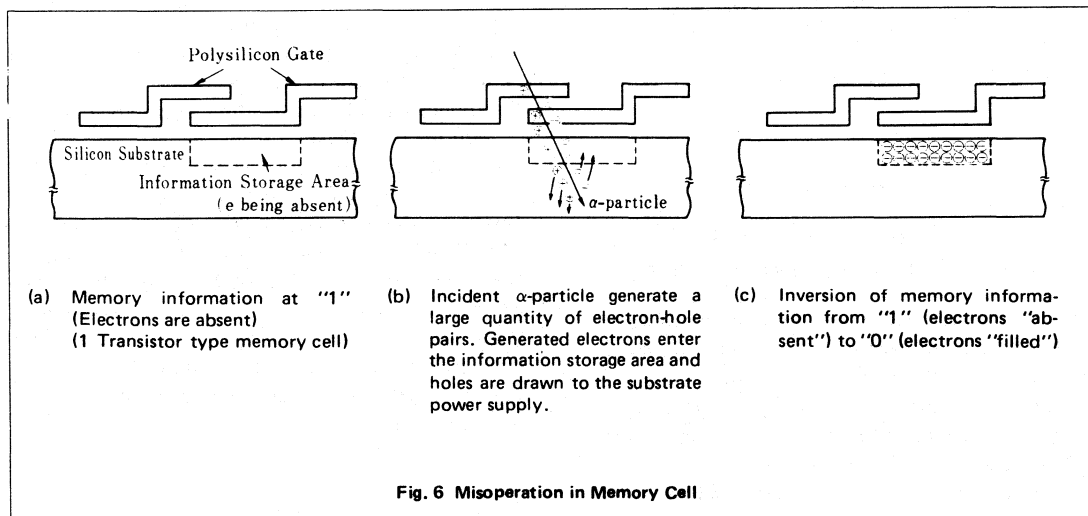

Fig. 5 Classification of Failure Modes of MOS Memory in the field

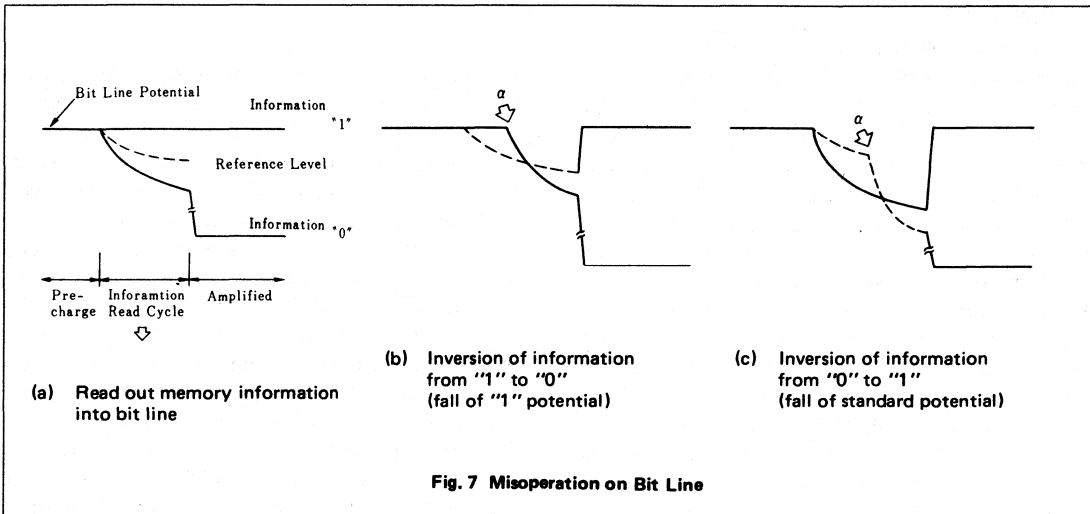

3. SOFT ERROR

3.1 Soft Error Mechanism

As mentioned before, IC memories have been increasingly miniaturized. Miniaturization, which means reduction of the horizontal plane dimensions as well as the vertical dimensions, causes signal level on the chip and storage charge of dynamic memories to be also decreased. An obstacle lying before miniaturization is soft error. Soft errors can be characterized as "transitory failures in which normal memory operation can be recovered by reprogramming information." Soft errors are caused by α -particles emitted from U and T_H contained in the packaging materials. As memory chips are exposed to α -particles, a great deal of electron-hole pairs are induced in Si substrate. These induced electrons cause memory information reversion. Fig. 6 shows the mechanism of information reversion in NMOS dynamic memory by α -particles. In case of NMOS dynamic memory, negative voltage is applied to the Si substrate. Therefore, positive holes are drawn by substrate, and only electrons cause information reversion (from information "1" to "0") of memory

cell. Fig. 6 shows misoperation seen in memory cell. Such a failure mode, which is defined as "Memory cell mode of soft errors," is distinguished from "Bit line mode." "Bit line mode" of soft errors is shown in Fig. 7. As information in memory cell is read out on bit line, bit line potential changes depending on memory cell information. The changing value is very small (several 100 mV), and compared with standard potential (potential read out from dummy cell), it is amplified by sense amplifier. If bit line is exposed to α -particles during the very short period between read-out from memory cell and amplification by sense amplifier, bit line potential decreases. And as it becomes less than standard potential, misoperation from information "0" to "1" will take place. On the other hand, with decrease of standard potential, misoperation from information "1" to "0" is seen. Both are called "Bit line mode" because errors appear at irradiation of α -particles. Soft error dependence on cycle time is shown in Fig. 8.

3.2 Examples of soft error preventive measures in products

At the initial stage of the 64K DRAM development, its soft error rate was estimated from accelerated irradiation test data to be higher than the expected design value. Hitachi has performed the following soft error preventive measures.

- 1) Selection of packaging materials which emit a minimal number of α -particles.
- 2) Application of chip coating technology to prevent the α -particles.
- 3) Use of circuitry and layout technology with inherent ability to resist α -particles.

Owing to these corrective measures, soft errors in 64K DRAM have reached a practically acceptable level. Preventive measures applied for 64K DRAM are also applied to other types. 16K DRAM with single power supply 5V family, for which chip coating was originally used, no longer requires this coating because of remarkable improvement by the third measure.

Actual products will have three types of failure modes, that is, cell mode, bit line mode and mixture of both modes. Soft error mechanism of static MOS memories and of bipolar memories are different from the above-mentioned mechanism in dynamic MOS memories.

In case of static memory, certain level of current always flows through the cell in order to retain the data in flip-flop circuit. When partial current induced by α -particles exceeds the retention current, misoperation occurs because of reversion of flip-flop circuit.

Fig. 9 Example of Soft Error Improvement on 16K-bit Dynamic RAM

3.3 Request for soft error preventative measures in system equipment

Thus our efforts to reduce soft errors have resulted in almost trouble-free memories. System reliability can be more improved by supplying some functions, that is, ECC device for large memory system and parity bit for small one.

4. RELIABILITY CLASSIFICATION

In designing IC memories, Hitachi classifies memory reliability by their application and controls the flows of design, production and test. Reliability can be roughly classified as follows:

- (I) For large scale computers and electronic exchangers
- (II) For important parts for auto-motive application
- (III) General communication-industrial use

In using our products, therefore, we would like you to consider the classification of the application. Especially, when you are going to apply our memories to any special equipment, please do not hesitate to consult our sales engineering staff.

A variety of IC memories of high-speed, high-power and static lower power dissipation CMOS have been developed and commercially available, which allows an electronics designer to properly select the one best suited for a particular application. However, he must be familiar with the advantages and disadvantages of the devices to make the optimum selection and to prevent them from malfunctioning or, in the worst case, from breaking down. Precautions for handling IC memories given below will help the electronics designers to work out their optimum circuit designs.

1. BIPOLAR IC MEMORY

1.1 Prevention of static electricity

Bipolar memories have been considered to have high resistance to the static electricity than MOS ICs. However, the presently available high speed IC, represented by bipolar memories, must be provided with a suitable preventive measure against the static electricity. Because their diffused junctions have become thinner than the conventional types, in order to perform higher capability. Take note of the following points.

- (1) Keep all terminals of a device in the conductive mat during transportation and storage to keep them at the same potential. A conductive mat called "MOSPAK" is commercially available. Unless otherwise specially stated, all HITACHI IC memories will be shipped in our conductive mats. Store them as they are.
- (2) When handling by hand IC memories for inspection or connection, his finger must be grounded as shown in Fig. 1. Do not forget to insert a 1M ohm resistor to protect him against an electric shock.

Fig. 1

- (3) It is advisable to control the ambient relative humidity at about 50 per cent to prevent the occurrence of static electricity.
- (4) It is also recommendable to wear cotton clothes instead of the ones made of synthetic fabrics to prevent the static electricity from occurring.

- (5) It is desirable to ground the soldering iron tips. Use a low voltage soldering iron (12 or 24V), if possible.
- (6) When IC memories mounted on the circuit boards are shipped, it is preferable to pack them with conductive mats.

1.2 Prevention of Reverse Insertion of IC Pinouts

In the case of reverse insertion of IC pinouts to board, ICs which have symmetrical pinouts between V_{EE} and Ground causes high current flow. Interconnection on the chip is melted and device is destroyed. Precaution must be made even for the ICs which do not have symmetrical pinouts between V_{EE} and Ground, because excess current flows and sometimes device is destroyed. On the device package, marking of No. 1 pin is stamped. Please watch this marking and insert ICs properly.

1.3 Mounting and Removal of ICs during Voltage is supplied

Usually, rather high current flows in regulator of bipolar memory. Therefore, if ICs are put in and pulled out to board during voltage is supplied, high voltage induced at current on/off destroys ICs. Mount and remove ICs after supply voltage is cut off. Same precaution must be made in measurement with tester.

1.4 Prevention of Oscillation

ECL bipolar memory has high cut-off frequency of transistor. Therefore, sometimes, oscillation is caused in relation with external circuit, and misoperation of ICs is occurred. In such cases, about 0.1 μ F of capacitor, which has good high frequency characteristics, is recommended to put between ICs and voltage supply line.

1.5 Precaution on Simple "H" Level of ECL Memory

In some cases, it is seen that input of ICs is directly connected to ground to fix input as "H" level. However, it sometimes causes misoperation in conjunction with internal circuit composition. "H" and "L" level of input are specified as $V_{IL(min)}$ and $V_{IH(max)}$ for ICs respectively. Please refer them and use ICs properly.

1.6 Cooling

Power dissipation of bipolar memory is 400mW to 1000mW depending on products. In the case many bipolar memories are mounted on the board, natural convection is insufficient for cooling. Therefore, please run forced air cooling with velocity higher

than 2.5m/s. In addition, by cooling, improvement of reliability can be expected as shown in Fig. 2. We recommend the junction temperature to be kept less than 85°C for high reliability use.

Fig. 2 Example of derating of ECL

1.7 Other Precautions

(1) Deforming of magazine and carrier

Since material of plastic magazine and carrier (for ECL flat package) is usually thermal plasticity, they deforms at temperature higher than 40 to 50°C and may not perform sufficiently. If burn-in is carried out at users, please use aluminum magazine or other metal fixtures.

(2) Shock at transportation

Glass sealed type package is fragile. Usual handling and drop test (JIS C7021 A-8) on individual devices do not cause any problem. However, it devices packed in magazine receive strong shock such as drop shock, devices hit neighbouring devices and packages may be damaged. Therefore, at transportation or loading on/off, be careful not to drop them. Even after devices are mounted on board, IC packages may be damaged if strength of board is not enough and board receives strong deforming stress. Please be careful on strength of board and handling. If any questions rose at using Hitachi products, please feel free to contact closest Hitachi representatives or offices.

2. MOS IC MEMORY

2.1 Prevention of static electricity

Similar to bipolar IC memories, suitable preventive measures should be taken for MOS IC memories by referring to paragraph 1.1.

2.2 Absorption of power source noise

The source current level flowing in the dynamic memory during the time of access is considerably different from that of stand by. Although the current difference is quite effective to save the power consumption, the current spike may be developed into the power source noise. Since all MOS IC memories are, in general, accessed while being refreshed, it is recommended to insert large capacitors (a 10 μ F capacitor for every 9 pieces of 16K-bit HM4716A, for example) as well as a 0.1 μ F capacitor having good high-frequency characteristics for each memory. Needless to say, it is very important to reduce the power circuit impedance when designing.

2.3 Current spike in V_{BB} power

The V_{BB} power is necessary for maintaining the IC memory function in the reverse bias and the current does not generally exceed the level of the reverse leakage current. However, in order to prevent an accidental current spike which is sharply formed in either positive or negative phase by the rise or fall clock pulse at the time of access, use a 0.1 μ F capacitor for every 2 or 3 memories for absorbing such noises.

2.4 Clock drive ICs

The TTL to MOS clock drive ICs have special designs so that they are capable of quick increase in the capacitive load. If a ground wire short-circuits either V_{DD} or V_{CC} which appear in the Pin No. 1 and No. 16 respectively, when the device is at high level, the device may be broken down. Carefully eliminate such possibility beforehand.

2.5 Power application sequence

It is advisable to design the circuits so that power is applied in the sequence of V_{BB} , V_{DD} and V_{CC} and interrupted in the reverse sequence, here the reverse bias V_{BB} is applied first and interrupted last.

It may be impossible for some small-scaled systems to apply power in the above-mentioned sequence (for example, when the V_{BB} is supplied by a DC to DC converter). According to our experiments conducted in the under-mentioned test conditions, it

has been proved that such a small-scaled system as to consist of 200 to 300 memory devices is not affected by the power application sequence.

Power application sequence test for N MOS IC

1.) Test method

- (1) Ambient temperature: 25°C
- (2) Power voltage: $V_{DD}=13.2V, V_{CC}=5.0V, V_{IH}=5.0V$
- (3) Operation mode: AC operation ("0" to "16383" all bits scanning).
 $t_{cyc}=10 \mu s$
 Read modify write operation
- (4) V_{BB} power: ON (1 min.) – Floating (1 min.)

2.) Test results

Type No.	Number of cycles	Number of sample	Number of failures
HM4716A	2000 cycles	50	0

2.6 Assessment of the memory system design

It is quite effective to obtain the power margin curves (shmoo curve) for evaluating the memory system designs (timing margin or adaptability to the peripheral circuits). Investigate the V_{BB} and V_{DD} power behaviors by gradually varying their levels, and the ones which are closer to the margin shown by the memory device itself can be judged to be better than others.

2.7 Overhead parity bit

Application of MOS IC static memory especially to microcomputers has been rapidly increasing due to the advantages that MOS static memory is operated by a single 5V power source and refreshing is not required.

There are some cases where all bits are used as the information bit without inclusion of any parity bit by some circuit designing reasons. It is, however, desirable to add parity bits to thoroughly avoid the memory error.

1. VIEWS ON QUALITY AND RELIABILITY

Basic views on quality in Hitachi are to meet individual users' purchase purpose and quality required, and to be at the satisfied quality level considering general marketability. Quality required by users is specifically clear if the contract specification is provided. If not, quality required is not always definite. In both cases, efforts are made to assure the reliability so that semiconductor devices delivered can perform their ability in actual operating circumstances. To realize the quality in manufacturing process, the key points should be to establish quality control system in the process and to enhance morale for quality. In addition, quality required by users on semiconductor devices are going toward higher level as performance of electronic system in the market is going toward higher one and is expanding size and application fields. To cover the situation, actual bases Hitachi is performing is as follows;

- (1) Build the reliability in design at the stage of new product development.
- (2) Build the quality at the sources of manufacturing process.
- (3) Execute harder the inspection and reliability confirmation of final products.
- (4) Make quality level higher with field data feed back.
- (5) Cooperate with research laboratories for higher quality and reliability.

With the views and methods mentioned above, utmost efforts are made for users' requirements.

2. RELIABILITY DESIGN OF SEMICONDUCTOR DEVICES

2.1 Reliability Targets

Reliability target is the important factor in manufacture and sales as well as performance and price.

It is not practical to rate reliability target with failure rate at the certain common test condition. The reliability target is determined corresponding to character of equipments taking design, manufacture, inner process quality control, screening and test method, etc. into consideration, and considering operating circumstances of equipments the semiconductor device used in, reliability target of system, derating applied in design, operating condition, maintenance, etc.

2.2 Reliability Design

To achieve the reliability required based on reliability targets, timely study and execution of design standardization, device design (include process

design, structure design), design review, reliability test are essential.

(1) Design Standardization

Establishment of design rule, and standardization of parts, material and process are necessary. As for design rule, critical items on quality and reliability are always studied at circuit design, device design, layout design, etc. Therefore, as long as standardized process, material, etc. are used, reliability risk is extremely small even in new development devices only except for in the case special requirements in function needed.

(2) Device Design

It is important for device design to consider total balance of process design, structure design, circuit and layout design. Especially in the case new process and new material are employed, technical study is deeply executed prior to device development.

(3) Reliability Evaluation by Test Site

Test site is sometimes called Test Pattern. It is useful method for design and process reliability evaluation of IC and LSI which have complicated functions.

1. Purposes of Test Site are as follows;

- Making clear about fundamental failure mode
- Analysis of relation between failure mode and manufacturing process condition
- Search for failure mechanism analysis
- Establishment of QC point in manufacturing

2 Effectiveness of evaluation by Test Site are as follows;

- Common fundamental failure mode and failure mechanism in devices can be evaluated.
- Factors dominating failure mode can be picked up, and comparison can be made with process having been experienced in field.
- Able to analyze relation between failure causes and manufacturing factors.
- Easy to run tests.

etc.

2.3 Design Review

Design review is organized method to confirm that design satisfies the performance required including users' and design work follows the specified ways, and whether or not technical improved items accumulated in test data of individual major fields and field data are effectively built in. In addition, from the standpoint of enhancement of competition power of products, the major purpose of design review is to insure quality and reliability of the products. In Hitachi, design review is performed from the planning stage for new products and even

for design changed products. Items discussed and determined at design review are as follows;

- (1) Description of the products based on specified design documents.
- (2) From the standpoint of specialty of individual participants, design documents are studied, and if unclear matter is found, sub program of calculation, experiments, investigation, etc. will be carried out.
- (3) Determine contents of reliability and methods, etc. based on design document and drawing.
- (4) Check process ability of manufacturing line to achieve design goal.
- (5) Discussion about preparation for production.
- (6) Planning and execution of sub-programs for design change proposed by individual specialist, and for tests, experiments and calculation to confirm the design change.
- (7) Reference of past failure experiences with similar devices, confirmation of method to prevent them, and planning and execution of test program for confirmation of them. These study and decision are made using check lists made individually depending on the objects.

3. QUALITY ASSURANCE SYSTEM OF SEMICONDUCTOR DEVICES

3.1 Activity of Quality Assurance

General views of overall quality assurance in Hitachi are as follows;

- (1) Problems in individual process should be solved in the process. Therefore, at final product stage, the potential failure factors have been already removed.
- (2) Feedback of information should be made to insure satisfied level of process ability.
- (3) To assure reliability required as an result of the things mentioned above is the purpose of quality assurance.

The followings are regarding device design, quality approval at mass production, inner process quality control, product inspection and reliability tests.

3.2 Quality Approval

To insure quality and reliability required, quality approval is carried out at trial production stage of device design and mass production stage based on reliability design described at section 2.

The views on quality approval are as follows;

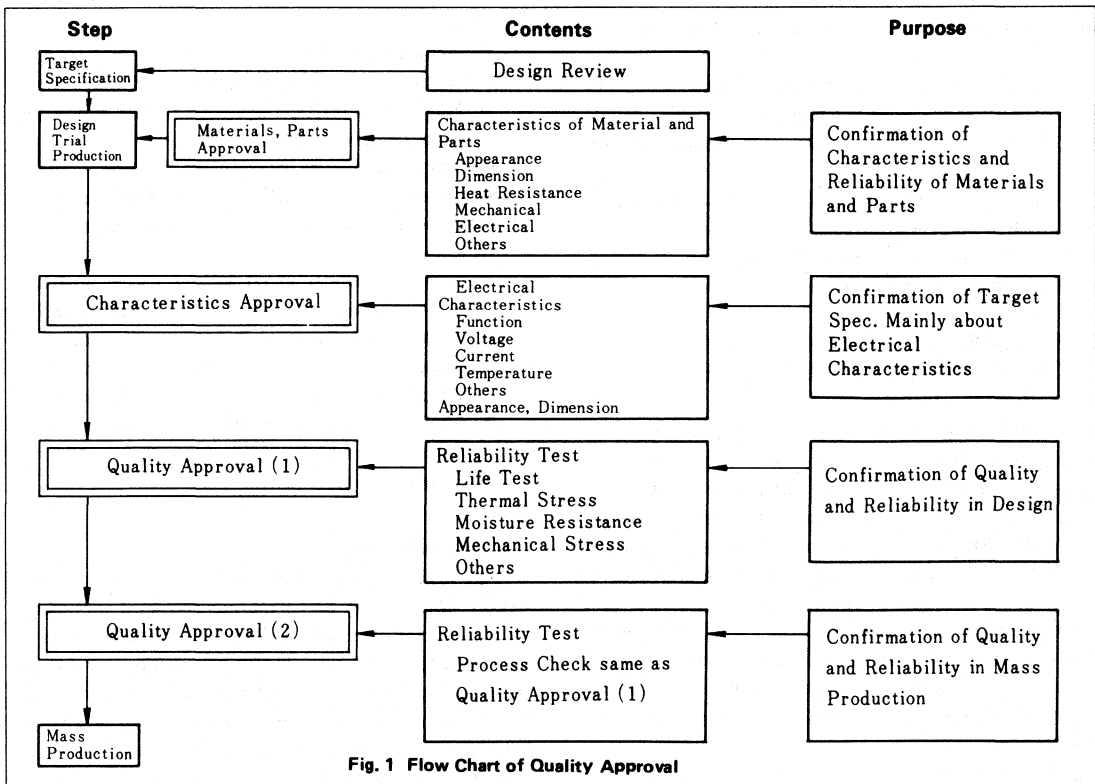

Fig. 1 Flow Chart of Quality Approval

- (1) The third party executes approval objectively from the stand point of customers.
- (2) Fully consider past failure experiences and information from field.
- (3) Approval is needed for design change and work change.
- (4) Intensive approval is executed on parts material and process.
- (5) Study process ability and fluctuation factor, and set up control points at mass production.

Considering the views mentioned above, quality approval shown in Fig. 1 is executed.

3.3 Quality and Reliability Control at Mass Production

For quality assurance of products in mass production, quality control is executed with organic division of functions in manufacturing department, quality assurance department, which are major, and other departments related. The total function flow is shown in Fig. 2. The main points are described below.

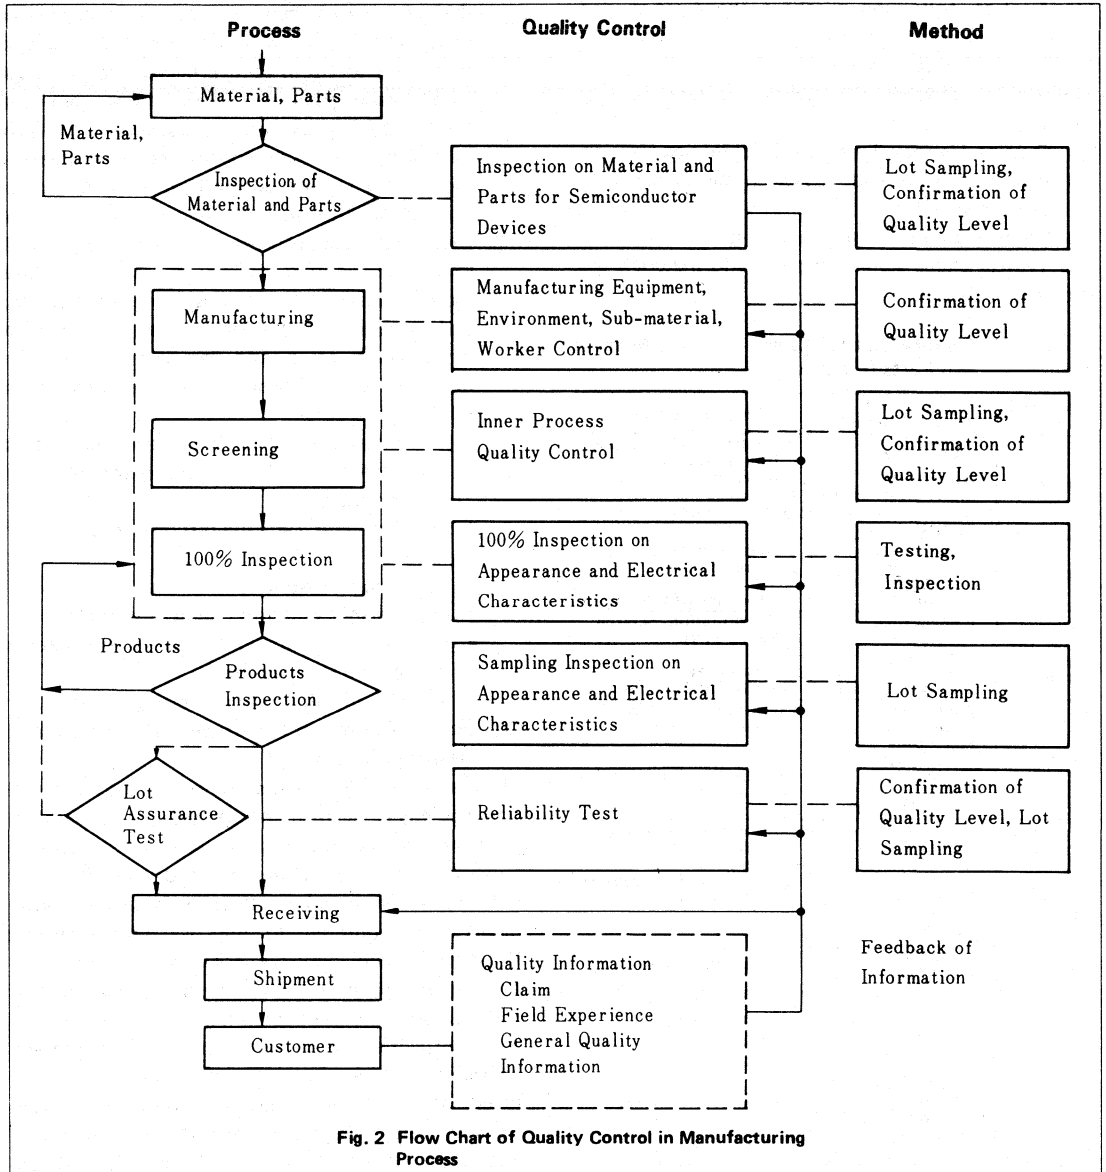

Fig. 2 Flow Chart of Quality Control in Manufacturing Process

3.3.1 Quality Control of Parts and Material

As tendency toward higher performance and higher reliability of semiconductor devices, is going, importance is increasing in quality control of material and parts, which are crystal, lead frame, fine wire for wire bonding, package, to build products, and materials needed in manufacturing process, which are mask pattern and chemicals. Besides quality approval on parts and materials stated in section 3.2, the incoming inspection is, also, key in quality control of parts and materials. The incoming inspection is performed based on incoming inspection specification following purchase specification and drawing, and sampling inspection is executed based on MIL-STD-105D mainly.

The other activities of quality assurance are as follows;

- (1) Outside Vendor Technical Information Meeting
- (2) Approval on outside vendors, and guidance of outside vendors
- (3) Physical chemical analysis and test

The typical check points of parts and materials are shown in Table 1.

● Table 1 Quality Control Check Points of Material and Parts (Example)

Material, Parts	Important Control Items	Point for Check
Wafer	Appearance	Damage and Contamination on Surface
	Dimension Sheet Resistance Defect Density Crystal Axis	Flatness Resistance Defect Numbers
Mask	Appearance	Defect Numbers, Scratch
	Dimension Restoration Gradation	Dimension Level Uniformity of Gradation
Fine Wire for Wire Bonding	Appearance	Contamination, Scratch, Bend, Twist
	Dimension Purity Elongation Ratio	Purity Level Mechanical Strength
Frame	Appearance	Contamination, Scratch
	Dimension Processing Accuracy Plating Mounting Characteristics	Dimension Level Bondability, Solderability Heat Resistance
Ceramic Package	Appearance	Contamination, Scratch
	Dimension Leak Resistance Plating Mounting Characteristics Electrical Characteristics Mechanical Strength	Dimension Level Airtightness Bondability, Solderability Heat Resistance Mechanical Strength
Plastic	Composition	Characteristics of Plastic Material
	Electrical Characteristics Thermal Characteristics Molding Performance Mounting Characteristics	Molding Performance Mounting Characteristics

3.3.2 Inner Process Quality Control

Inner process quality control is performing very important function in quality assurance of semiconductor devices. The following is description about control of semi-final products, final products, manufacturing facilities, measuring equipments, circumstances and sub materials. The manufacturing inner process quality control is shown in Fig. 3 corresponding to the manufacturing process.

(1) Quality Control of Semi-final Products and Final Products

Potential failure factors of semiconductor devices should be removed preventively in manufacturing process. To achieve it, check points are set-up in each process, and products which have potential failure factor are not transfer to the next process. Especially, for high reliability semiconductor devices, manufacturing line is rigidly selected, and tighter inner process quality control is executed – rigid check in each process and each lot, 100% inspection pointed process to remove failure factor caused by manufacturing fluctuation, and execution of screening needed, such as high temperature aging and temperature cycling. Contents of inner process quality control are as follows;

- Condition control on individual equipments and workers, and sampling check of semi-final products.
 - Proposal and carrying-out improvement of work
 - Education of workers
 - Maintenance and improvement of yield
 - Picking-up of quality problems, and execution of countermeasures
 - Transfer of information about quality
- #### (2) Quality Control of Manufacturing Facilities and Measuring Equipment

Manufacturing equipments are extraordinary developing as higher performance devices are needed and improvement of production, and are important factors to determine quality and reliability. In Hitachi, automatization of manufacturing equipments are promoted to improve manufacturing fluctuation, and controls are made to maintain prompt operation of high performance equipments and perform the proper function. As for maintenance inspection for quality control, there are daily inspection which is performed daily based on specification related, and periodical inspection which is performed periodically. At the inspection, inspection points listed in the specification are

checked one by one not to make any omission. As for adjustment and maintenance of measuring equipments, maintenance number, specification are checked one by one to maintain and improve quality.

(3) Quality Control of Manufacturing Circumstances and Sub-materials

Quality and reliability of semiconductor device is highly affected by manufacturing process. Therefore, the controls of manufacturing circumstances — temperature, humidity, dust — and the control of

submaterials — gas, pure water — used in manufacturing process are intensively executed. Dust control is described in more detail below.

Dust control is essential to realize higher integration and higher reliability of devices. In Hitachi, maintenance and improvement of cleanness in manufacturing site are executed with paying intensive attention on buildings, facilities, air-conditioning systems, materials delivered-in, clothes, work, etc., and periodical inspection on floating dust in room, falling dusts and dirtiness of floor.

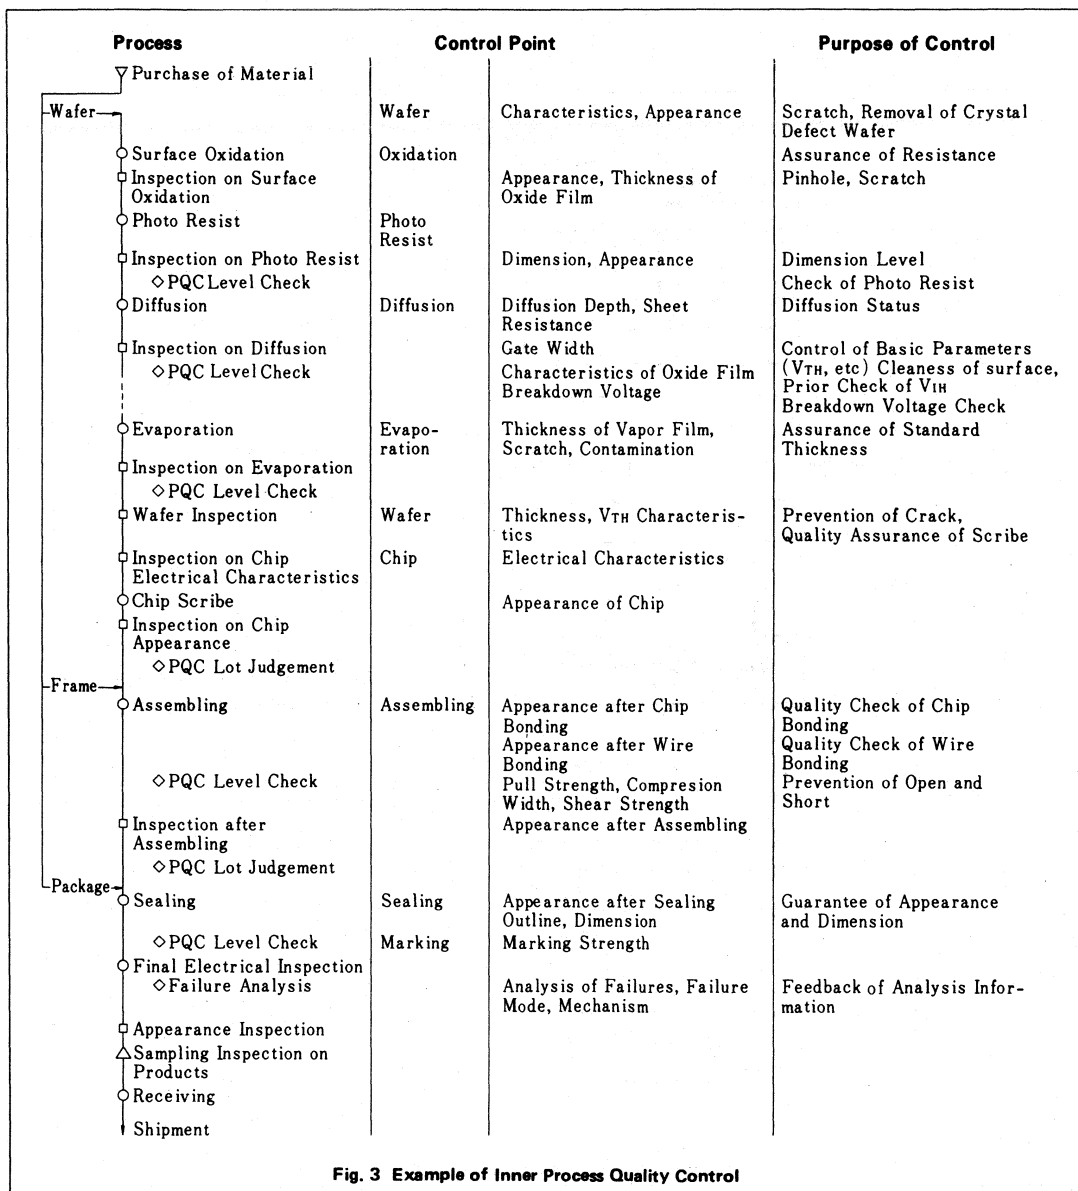

Fig. 3 Example of Inner Process Quality Control

3.3.3 Final Product Inspection and Reliability Assurance

(1) Final Product Inspection

Lot inspection is done by quality assurance department for products which were judged as good products in 100% test, which is final process in manufacturing department. Though 100% of good products is expected, sampling inspection is executed to prevent mixture of failed products by

mistake of work, etc. The inspection is executed not only to confirm that the products meet users' requirement, but to consider potential factors. Lot inspection is executed based on MIL-STD-105D.

(2) Reliability Assurance Tests

To assure reliability of semiconductor devices, periodical reliability tests and reliability tests on individual manufacturing lot required by user are performed.

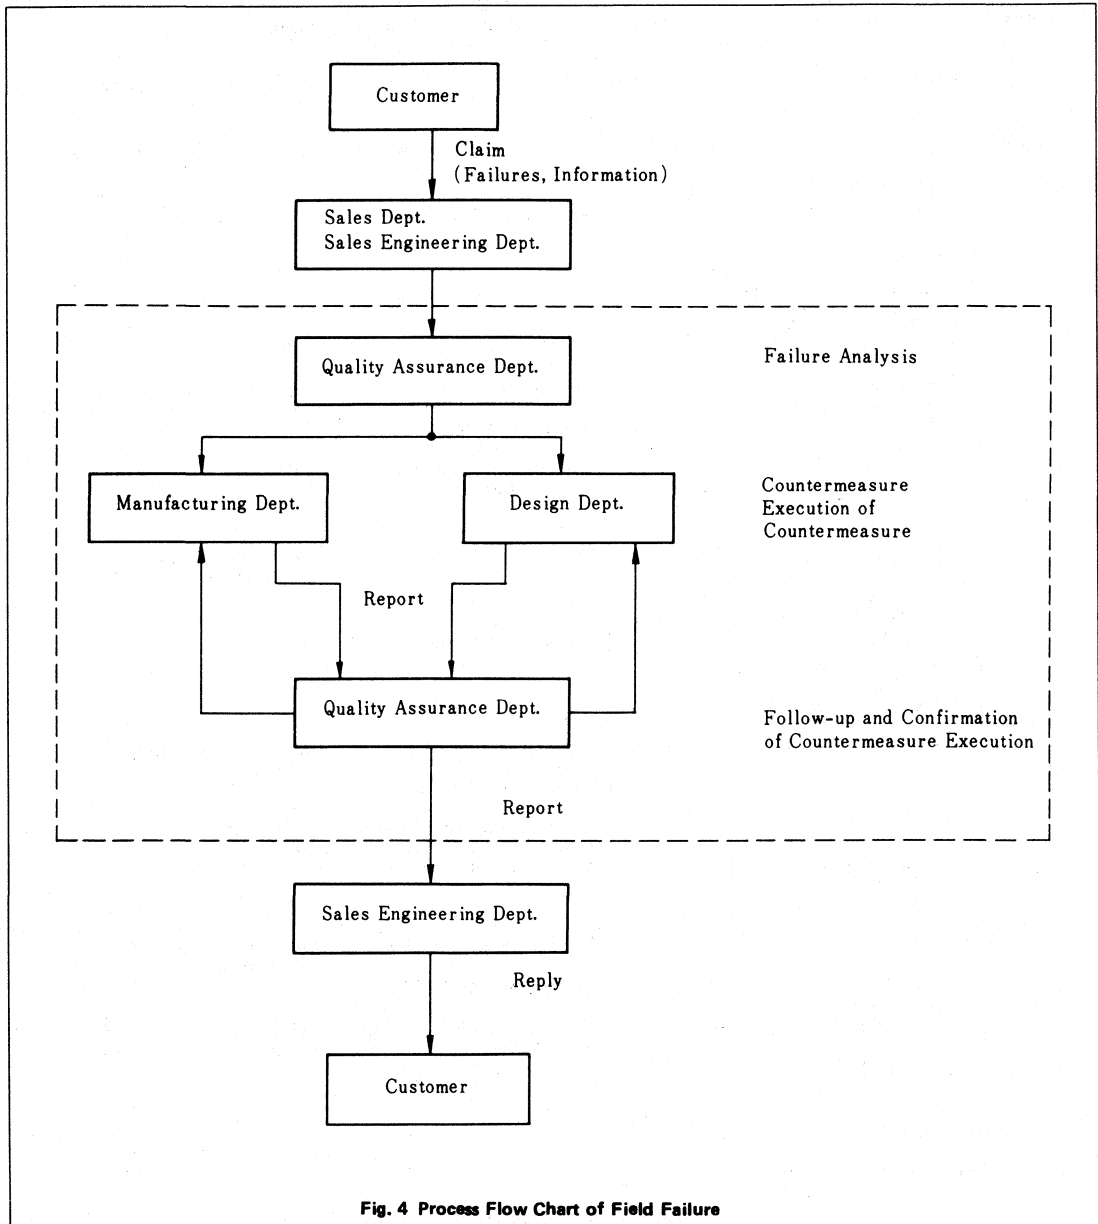

Fig. 4 Process Flow Chart of Field Failure

1. Inspection Method

Compared to conventional core memories, all peripheral circuits such as the decoder circuit, write circuit, read circuit, etc., are contained within the IC memories. As a result, all works of assembling the parts and performing electrical inspection, which had been carried out by core memory manufacturers in the past, have become to be incorporated as works of IC manufacturers. Consequently, the electrical inspection of the memory IC has been faced to a more systematic inspection method and conventional IC inspection facilities have become completely useless. This has led to the development and introduction of a memory tester with pattern generator to generate the inspection pattern of the memory IC at high speed. A function test for such as TTL gates can be performed even by a comparatively simple DC parameter facility. However, when the address input becomes multiplexed as in 16K memory, even the generation of the function test pattern becomes a serious problem. In the memory IC inspection, its quality cannot be judged by only inspecting DC characteristics related to external pins. This is because numbers of transistors, etc., related to the DC characteristics of the pins only amount to 1/1000 of all element numbers within IC memories. The following various address patterns are proposed to inspect whether or not the internal circuits are functioning correctly.

- (1) All "Low", all "High"
- (2) Checker flag
- (3) Stripe pattern
- (4) Marching
- (5) Galloping
- (6) Walking
- (7) Ping-pong

Although there are a lot of address patterns, only representative ones have been listed. These patterns are convenient for checking the mutual interference of bits and sometimes are patterns with maximum power dissipation. Among the above-mentioned patterns, those of (1) to (4) are the so-called N patterns and these patterns are capable of checking IC memories of N bits with several sequences of N at most against the memory IC of N bits. Whereas, those of (5) to (7) are called N² patterns and they need patterns several sequences of N².

A serious problem arises in using the N² patterns in a large-capacity memory, for example, a long period of about 30 minutes becomes necessary to perform inspection of the 16K memory with galloping

pattern. Patterns from (1) (3) are comparatively simple and good methods, but they are not perfect against a failure in the decoder circuit. As the most simple pattern for inspecting the necessary memory function, there is a "Marching" pattern.

2. Marching Pattern

The marching pattern, as its name indicates, is a pattern in which "1"s march into all bits written in "0"s. The addressing method will be explained for a simple 16 bit memory as an example.

- (1) Write "0" for all bits Fig. 1(a)
- (2) Read "0" of 0th address and check that the read data is "0". Hereafter, the meaning of "Read" is "checking and judging the data".
- (3) Write "1" in the 0th address Fig. 1(b)
- (4) Read "0" of 1st address
- (5) Write "1" in 1st address
- (6) Read "0" of nth address
- (7) Write "1" in nth address Fig. 1(c)
- (8) Repeat above procedures (6) and (7) up to the last. Finally, all data will become "1".
- (9) Since all data are "1"s in this condition, replace "0" and "1" after procedure (2) and repeat once more up to procedure (8).

It is understood that 5N address patterns are necessary for the N bit memory in this method.

Fig. 1 Addressing method for 16 bits memory in the Marching pattern

3. Generation of Marching Pattern

The method of generating the marching pattern and displaying failed bits of the memory on the Braun tube will be introduced. Fig. 2 shows the all block diagram. The address pattern is generated by using four synchronous 4 bit counters. All address patterns are shown in Fig. 4. This example, is for 16K bit memory, however, it can be easily understood that A14 which has a half frequency of the maximum address input A13 is the same as the data input.

The A15 signal together with the carrier signal of HD74161 is used to determine the termination of the sequence.

As shown in Fig 2. In the read and write cycles after cleaning all bits addressing is twice the period of clearing. This switching is performed at the gate of

the binary circuit following the reference pulse generating circuit.

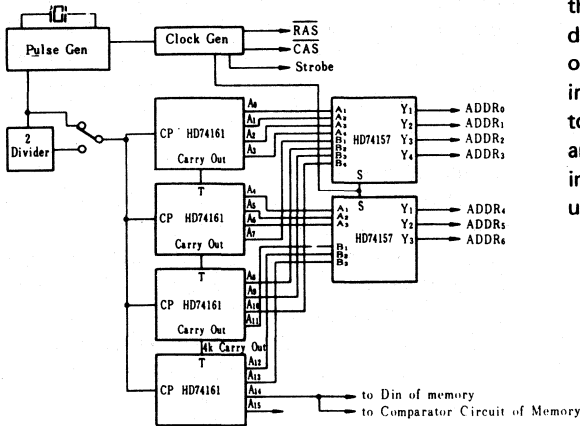

Fig. 2 Marching Pattern Generating Circuit

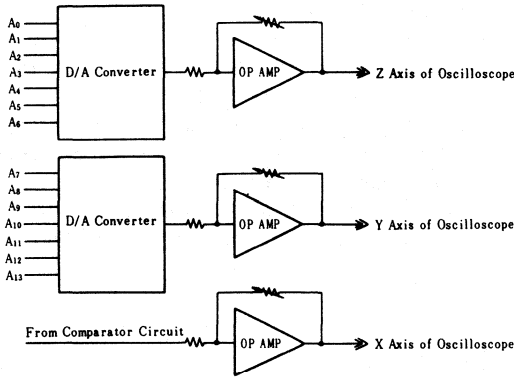

Fig. 3 Fail Bit Map Display Circuit

Fig. 4 Entire Pulse Relations

Input the output of HD74161 is input to the D/A converter and the output of D/A converter is connected to the oscilloscope to display → X-Y matrix. The output of the comparator circuit is connected to the Z axis and performs luminous intensity modulation. In this way, the fail bit map can be displayed on the CRT. Fig. 5 shows an example checking a voltage margin. By changing the

power voltage V_{BB} , the increase and decrease of the failed bits can be well understood. The operation of the memory can be dynamically understood by displaying its operation on the CRT. The operation of the memory IC is extremely complicated differing from other TTLs, etc.. Its operation is not easy to understand by pulse waveform observation with an ordinary oscilloscope. The fail bit map as shown in Fig. 5 is extremely useful. It is capable of visually understanding the operation of memory IC.

(a) $V_{BB} = -0.3V$ X Address

(b) $V_{BB} = -0.1V$ X Address

Fig. 5 Example of Dependency of Fail Bit Map on V_{BB}

Fig. 6 Example of 1 bit solid fail

4. Failure Mode

Generally, failure 70% ~ 90% of failures at users are of those called solid failure. This failure mode has no relation with access time, voltage margin and timing, and is not capable of reading from or writing to certain specified bits and is failure fixed to "0"

or "1". An example of single bit solid failure is shown in Fig. 6. The convenient checker, previously mentioned as simple tester, is sufficiently capable of detecting such failures. Therefore, with the exception of special cases, it can be considered that the necessity of performing high-precision measurements such as those made by memory IC manufacturers is rare.

In the inspection of memory IC at our company, full inspection under the worst conditions are performed so as to guarantee sufficient operations under all power voltage conditions and timing conditions listed in the data sheet.

An extremely accurate memory tester becomes necessary for performing high-precision inspection with 1ns accuracy. Our company is developing IC memory testers to supply memory ICs with excellent characteristics and quality to users and is establishing the system capable of developing further high-efficiency memory ICs.

APPLICATION OF DYNAMIC RAMS

1. Power On

After turning on power to set the memory circuitry, hold for more than 500 μ s and apply eight or more dummy loads before actuating the memory. The dynamic cycle may be either an ordinary memory cycle or a refresh cycle. When power is turned on, power-on current flows which varies with the rise time of V_{CC} and clock conditions, as shown in Fig. 1. If the rise time is 10 μ s or thereabout, the RAM does not operate dynamically and through-current passes to the internal inverter since the potential at the internal circuitry becomes unstable. Nevertheless, this through-current decreases as the operation of the internal circuitry becomes stable. With all this in mind, rise time of not shorter than 100 μ s is recommended for power-up.

Fig. 1 Relationship between standard value of I_{cc} and V_{cc} during power-up

2. Operation Modes (See Fig. 2)

(1) Read Cycle:

First, decide the X address of the memory cell chosen and start with trailing of \overline{RAS} . When the X address has been held by the internal circuitry, change it to Y address. Then, trail \overline{CAS} to take in the Y address. If the \overline{WE} pin is at high level, output will appear on the Dout pin after a certain time.

(2) Write Cycle:

The input at Din is written in the memory cell when \overline{WE} turns to low level before \overline{CAS} .

(3) Read/Modify/Write Cycle:

During this cycle, \overline{CAS} and, then, \overline{WE} are trailed down to low level so that data is read out from and written in the same address with in the same memory cycle.

(4) Page Mode Cycle:

In this cycle, \overline{CAS} is cyclically moved, after taking in the X address through \overline{RAS} , to scan only the Y address. This permits reading out and writing in only one column data at high speed.

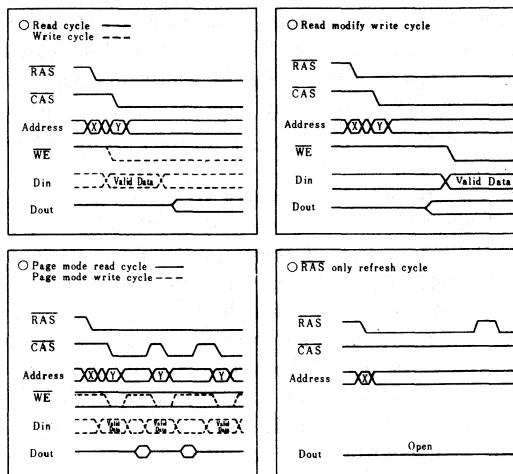

Fig. 2 Operating modes of Dynamic RAMs

2. Data Output

Dout is a TTL-compatible three-state output with two TTL-load fan outs. The output is controlled by the \overline{CAS} signals; it is held while \overline{CAS} is low, while Dout returns to a floating state when \overline{CAS} is high. In the early write cycle, the output becomes a high-impedance one to permit the use as a common I/O terminal.

3. Refreshing

Refreshing is a process of periodical rewriting to make up for the leakage of the charge accumulated in the memory cell. This operation is implemented in the \overline{RAS} only refresh cycle, ordinary read cycle, and so on. Whether 16k- or 64k-bit, all bits can be refreshed by giving a 128-cycle scanning to only the X addresses between A0 and A6. To be more specific, each cycle refreshes 128 bits for the 16k-bit Dynamic RAMs and 512 bits for the 64k-bit RAMs. Especially, the \overline{RAS} only refresh cycle permits such a power-efficient refresh as calls for only approximately 75 percent of the current consumed by the read cycle. With \overline{CAS} fixed at high level, the output is a high-impedance one. The HM4816A has a special function called the hidden refresh which enables holding the output by turning \overline{CAS} to "low" while \overline{RAS} only refresh is on. There are two methods of refreshing: concentrated and deconcentrated refreshing. The former gives a concentrated 128-cycle refresh after operating the memory for a period of 2ms maximum. In contrast, the latter repeats a refreshing cycle every 16 μ s following the initial 16 μ s (=2ms/128) memory operation. A

choice between the two modes calls for a careful consideration about the system's efficiency.

4. Operating Current for Dynamic RAMs

Fig. 3 shows the waveforms of the current applied in various operating modes (HM4864). The mean operating current in each mode equals the value obtained by dividing the integrated result of each waveform by the cycle time. The first peak current in each operating mode appears as a result of the circuit operation during the memory access time. On the other hand, the peak current during standby appear as a result of the precharging operation in each circuit. Having two circuitry operation modes — X and Y. Dynamic RAMs show different peak currents depending upon the operating timing of RAS and CAS. That is, the greatest peak current appears when both X and Y circuits operate simultaneously. The maximum peak current for the HM4864, for example, is approximately 100mA. The current consumed while the memory stands by on the board is expressed in terms of the cycle time dependency shown in Fig. 4. During standby, with a once-in-every 16 μ s refresh, the HM4864 consumes approximately 3mA of current.

Fig. 3 Power supply voltage (HM4864)

Fig. 4 Cycle time dependence of $\overline{\text{RAS}}$ only refresh current (HM4864)

5. Noise

Broadly, noise can be classified into power source noise and input signal noise. With the latter, furthermore, whether it is an overshoot or undershoot must be considered. The overshoot should be

held below the highest input level specified. As to the undershoot, the input-undershoot-induced parasitic transistor effect in the input area is prevented by providing a $-5V V_{BB}$ to the three-way power source and a built-in bias circuit on the substrate. Normally, design should be such that the input undershoot does not exceed the minimum value specified for V_{IL} , at worst. The power source noise can be further classed into low-frequency noise and high-frequency noise as shown in Fig. 5. To assure a stable memory operation, the peak-to-peak power supply voltage in the presence of low- or high-frequency noise should be held below 10 percent of its standard level. Overshoot and undershoot can be reduced by inserting a damping resistance of several tens of ohms in Dynamic RAM series. To prevent the power source noise, it is recommended to provide a condenser of 0.1 μ F or so to each one or two devices.

Fig. 5 Power source noise

PROGRAMMING & ERASING OF PROMS

1. PROGRAMMING & ERASING OF EPROM

1.1 Programming

Information is programmed into the memory cell of an EPROM by applying a high voltage to its drain and gate (Fig. 1 and 2). The high voltage at the drain increases the energy of the electrons in the channel area. When the energy becomes high enough, the electrons become what are known as "hot electrons" that are capable of jumping across the oxide film. Pulled by the high voltage at the gate, the hot electrons are admitted into the floating gate. The electric charge entering the floating gate changes the threshold voltage in the memory element, whereby it is stored as new information. When reading out, voltage is applied as shown in Fig. 3, and "1" and "0" are identified by checking whether or not current flows. Since the drain voltage for read-out is set at about 3V, no erroneous writing takes place. When shipped, all bits of the EPROM are held at logic "1" with all electric charge released (with no information programmed in). By changing the logic 1 to logic 0 through the application of the specified waveform and voltage, the necessary information is programmed in. The higher the V_{pp} voltage and the longer the program pulse width t_{pw} , the more will be the quantity of electrons to be programmed in, as shown in Fig. 4. If the V_{pp} exceeds the rated value, such as by overshoot, the p-n junction of the memory may yield to permanent breakdown. To avoid this, check V_{pp} overshoot by the PROM programmer and take all other possible caution. Also with for the negative-voltage-induced noise at other terminals, since it can touch off a parasitic transistor effect and apparently reduce the yield voltage Hitachi's EPROMs are usually capable of being written and erased more than 100 times, although the number of times is not guaranteed because it is difficult to give an exhaustive inspection prior to shipment. At any rate, 100 times is enough since the frequency of reprogramming in practical application rarely exceeds about 10 times.

Fig. 1 Memory transistor circuit symbols

Fig. 2 Cross section of memory transistor

Fig. 3 Reading out stored information

Fig. 4 Typical Programming Characteristics of EPROMs.

1.2 Erasing

Data stored in the EPROM is erased by releasing the electric charge from the floating gate through the exposure of the memory chip to ultraviolet light. Light has an energy that is inversely proportional to its wavelength. Receiving the energy of the ultraviolet light, the electrons in the floating gate are again turned into hot electrons, which jump across the oxide film into the control gate or substrate. As a result of this process, the stored information is erased. Accordingly, the stored information can not be erased by such lights whose wavelengths are too long to give adequate energy to jump over the barrier of the oxide film. For successful erasing, the wavelength and minimum exposure rate of ultraviolet light are specified as $2,537\text{\AA}$ and 15W sec/cm^2 respectively. This condition is attained by exposing a device to an ultraviolet lamp of $12,000\mu\text{W/cm}^2$ $1.2 \sim 3\text{cm}$ away for approximately 20 minutes. The ultraviolet light transmission rate of the transparent lid is about 70 percent. Any contamination or foreign material at the surface of the capsule lowers the transmission rate, prolonging the erasing time. So such contamination should be recovered by use of alcohol or other solvent that does not damage the package. Fig. 5 shows typical erasure characteristics for EPROM.

Fig. 5 Typical Erasing Characteristics

1.3 Data retention characteristic of EPROM

As a result of writing in, approximately 0.5 to 2.0×10^{-13} coulomb of electrons are accumulated at the floating gate. With the elapse of time, however, these electrons decrease, as a result of which the inversion of stored information can happen. The mechanism of electron dissipation is generally explained as follow:

(1) Data dissipation by heat

The accumulation of electrons at the floating gate is an unbalanced state, so the dissipation of thermally excited electron is unavoidable. Therefore, the data holding time has a close relationship with temperature. Fig. 6 shows typical data retention characteristics. The data retention time is proportional to the reciprocal of absolute temperature.

(2) Data dissipation by ultraviolet light

Ultraviolet rays at a wavelength of not greater than $3,000 \sim 4,000\text{\AA}$ is capable of releasing the electric charge stored in the memory of the EPROM with varying efficiencies. Fluorescent light and sunlight contain some ultraviolet rays, so prolonged exposure to these lights can cause data corruption as a result of electric charge dissipation. Fig. 7 shows examples of the data retention time under an ultraviolet eraser, sunlight and fluorescent lighting. But it should be noted that the data for fluorescent light and sunlight are not definite because of their-varying ultraviolet ray contents. The ultraviolet ray content in sunlight, for example, varies greatly with seasons, weather and the composition of the atmosphere.

Fig. 6 Typical Data Retention Characteristics

Fig. 7 EPROM's data retention time

(3) Data dissipation by voltage

This type of data dissipation occurs while information is being written in. At other memory cells lying on the same word line or data line as the memory cell being programmed, high voltage can cause the dissipation of stored electric charge. Of course, such defects are removed at the factory by pre-shipment inspection. The programming voltage and pulse width should be always kept within the specified range for the same reason.

1.4 EPROM Programmer

The 16K EPROM Programmer stores the program in its internal RAM and writes the program in the EPROM. For this programming, the minimum of 3 functions, the Blank check function prior to programming, the programming function and the Verify function after programming are necessary. As shown in the drawing, there are also programmers provided with a reverse insertion checking function or pin contact checking function prior to the Blank Check. The outline of each block is as follows.

(a) Pin contact check

In the connection test of the ROM pin and the socket, normally checking is performed by detecting the forward current of each EPROM pin. Care is necessary as this forward biased resistance differs according to products of each company.

(b) Reverse insertion check

This check detects the reverse insertion of the device, places the equipment in reset mode and protects the device and equipment.

(c) Blank check

This check is performed prior to programming and checks whether or not it is an erased EPROM or for preventing EPROM reprogramming. Since the output data in the erased condition are "1" (high level), check whether or not data in EPROM are all "1". It will fail-stop even when 1 bit of "0" (low level). Normally, it is designed to provide warning with a lamp or buzzer.

(d) Programming

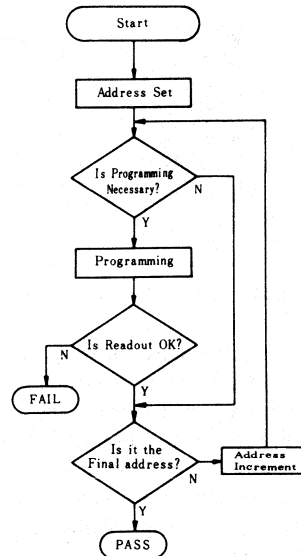

The function of programming the data in the internal RAM of the programmer into EPROM and will fail-stop when programming cannot be made. The normal flow is as shown below. The EPROM data will be read out prior to programming and compared with programming data. If they coincide, programming will be skipped and if they differ, programming will be

performed. Then, read out will be made again and compared with the programming data, and if they coincide, it will progress to the next address.

(e) Verify

This function is for checking after programming completion whether or not the programming is correct when comparing with the data in the internal RAM of the programmer and it performs fail-stop when it does not coincide. Normally, when it fails, together with lighting of the fail lamp, the address and data are displayed.

(f) How to input the program

There are the following methods for inputting the program data to the internal RAM of the programmer. Normally, paper tape input and retypewriter input are options.

Method	Content
Copy input	Input by copying the master ROM.
Manual input	Input by the keyswitch of the front panel. Used for correction or revision of program
Paper tape input	Read the paper tape furnished from the host system with the tape reader
Teletypewriter input	Input with the teletypewriter. Preparation, correction and list preparation of the program can be made.

1.5 Handling EPROM

When brought in contact with a charged human body or rubbed with plastics or dry cloth, the glass window of an EPROM generates static electricity which causes device malfunctions. Typical malfunctions are faulty blanking and write margin setting that give a wrong impression that information has been correctly written in. As already reported at the international conferences concerning the reliability of LSI chips, this is due to the prolonged retention of electric charge (resulting from the static electricity) on the glass window. Such malfunctions can be eliminated by neutralizing the charges through the irradiation of ultraviolet rays for a short time. It is recommended to execute reprogramming after this irradiation since it reduces the electric charges in the floating gate, too. The basic cluntermeasure is to prevent the charging of the window, which can be achieved by the following methods as in the prevention of common static breakdown of ICs.

- (1) Establish a ground for the operator to handle EPROM. Avoid the use of gloves etc. that may develop a static charge.
- (2) Refrain from rubbing the glass window with plastics and other substances that may develop a charge.
- (3) Avoid the use of coolant sprays which contain some ions.
- (4) Use shielding labels (especially those containing conductive substances) that can evenly distribute the established charge.

1.6 Shielding label

When using an EPROM in an environment where ultraviolet exposure can occur, it is advisable to put a shielding label on its glass window to absorb ultraviolet light. Specially prepared shielding labels are

marketed. Metal-loaded labels are particularly effective. In choosing a shielding label, the following points should be carefully checked.

(1) Adhesiveness (mechanical strength)

Avoid repeated attaching and dusting that may reduce the adhesive strength. Ultraviolet erasing and reprogramming are recommended after stripping off an attached label. (When the need arises to change a label, it is advisable to put a new one on the old one since peeling may develop a static charge.)

(2) Allowable temperature range

Use the shielding label in an environment whose temperature falls within the specified allowable temperature range. Beyond the specified temperature range, the paste on the label may harden or stick too fast. When it hardens, the label may come off easily. When it sticks too fast, the paste may remain on the window glass even after the label has been removed.

(3) Damp-proofness

Use the shielding label in an environment whose humidity falls within the specified allowable humidity range. Today there are few shielding labels that can meet all environmental requirements established for the EPROM. So a suitable one must be chosen for each specific application.

2. PROGRAMMING OF BIPOLAR PROMS

2.1 Programming System

The storing system of the Bipolar PROM can be generally classified into 2 systems; the Blown diode system and fuse system.

The latter is a system in which the metal-made fuse is burned off by current (Fig. 5). In the former, Emitter-Base junction is short-circuited by Al, which has penetrated into Base because of current

Fig. 5 Fuse system

pulse applied to E-B junction (Fig. 6). Generally, the blown diode type is considered to be more reliable. A grow back phenomenon, that is, migration and recombination of the metal, is seen in fuse system. HITACHI devices use the blown diode system.

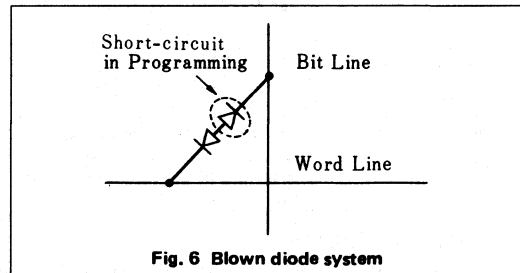

Fig. 6 Blown diode system

2.2 Programming Method

Programming is executed by the conventional programming equipment (PROM writer) using a board suited to the product.

First, check if all bits are programmable (Blank check), next write the pattern you want to program one by one bit. At every application of current pulse, confirm that program is available by sensing output level. And when programming has been completed, apply additional pulse. This process should be performed for all bits into which you want to write, and as you have completed programming, check (Verify) if you have programmed in the same pattern as you intended. If you do not find any mistake, programming has been completed.

For Blank check, Sense and Verify whether output pin level is high (non-programmed) or low (programmed) is checked by sense current (I_s). $V_s - I_s$ characteristic of normal series and S series is shown in Fig. 8 and 9, respectively. Specified value of sense current (I_s) of both normal series and S series is 20 mA, and voltage reference level is 7.5 V.

Fig. 10 and 11 show the relation between program current and program pulse number necessary for 1 bit to be written. With consideration of its influence on breakdown voltage, program current is specified as 130 mA in normal series and as 90 mA in S series.

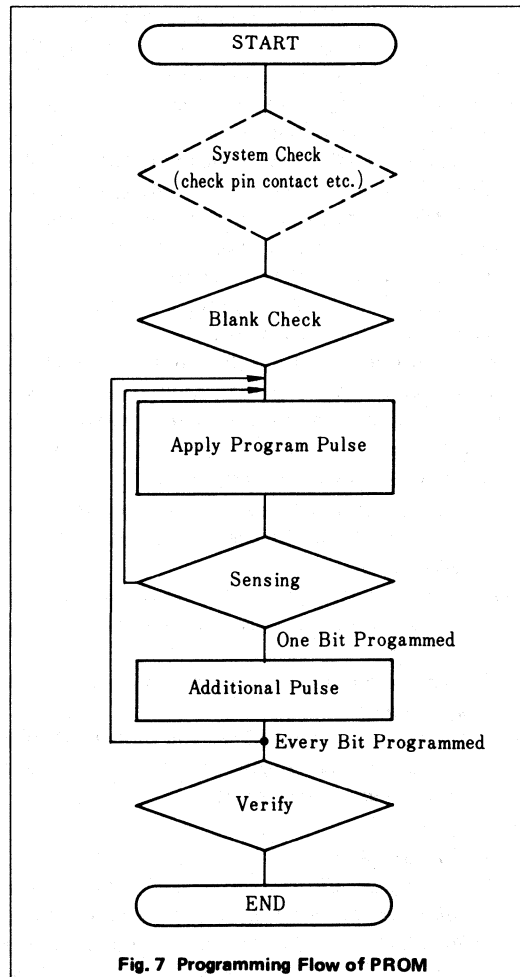

Fig. 7 Programming Flow of PROM

Fig. 8 $V_s - I_s$ Characteristic of Normal Series (HN25089)

Fig. 9 $V_s - I_s$ Characteristic of S Series (HN25169S)

Fig. 10 Program Pulse - I_w Characteristic of Normal Series (HN25089)

Fig. 11 Program Pulse - I_w Characteristic of S Series (HN25169S)

2.3 Programming Characteristics of Hitachi Bipolar PROM

- Small program current
130 mA for normal series, and 90 mA for S series are required for programming. Therefore, there are few bad effects caused by breakdown voltage degradation and parasitic effects.
- Fast programming speed
As seen in Fig. 10 and 11, program pulse for 1 bit memory cell can be mostly written at one time. Consequently, the program time per device is quite short. In case of 8K bit, for example, only 2 or 3 seconds at an average are required.
- High programming yield
Unlike the MOS PROM, the Bipolar PROM cannot be rewritten, once it is written into the memory

cell. Therefore, it does not allow programming and inspection of the product prior to delivery. Due to this, sometimes a defective product (which does not allow programming) might be delivered. Generally, the programming efficiency percentage is 90~95% when programming is performed on the user's side. Special tests such as actually performing programming on the dummy cell in the chip, performing continuity test of all memory cells, etc., are made prior to delivery for minimizing the possibility to deliver defective products.

2.4 Programming

There are two methods in the programming of PROM. That is, the method when programming is made by PROM manufacturer and delivered and the method when programming is made on the user's side. Both these methods and procedures will be explained below.

2.4.1 Programming performed by the PROM manufacturer

As shown in the drawing below, the manufacturer receives the program specification (specification designating the program pattern) from the user, performs writing (Programming) in accordance with the specification and performs delivery. In this case, a special writing fee is charged.

2.4.2 Programming performed by user

In this case, the following three items must be prepared by the user.

1 PROM WRITER (Main unit of programming equipment)

One capable of being used in common with equivalent products of other companies.

2 Performance board (Exclusive board designated by each manufacturer)

Minimum of 1 board for Hitachi PROM.

3 Sockets (sockets suited to product)

Minimum of one socket per product. These sockets are purchased from the PROM WRITER manufacturer.

The relationship among PROM WRITER manufacturer, Hitachi and user is shown in Fig. 12.

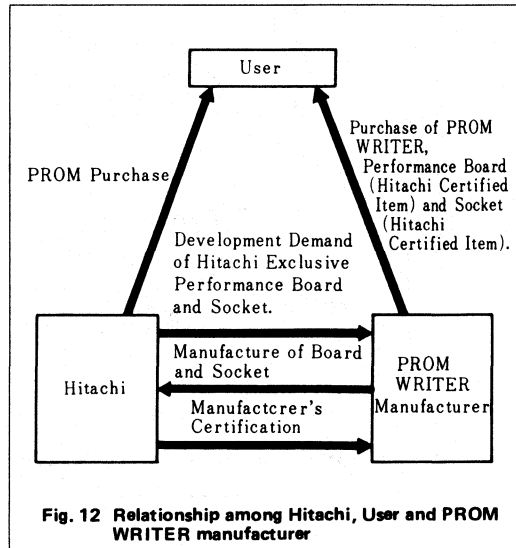

Fig. 12 Relationship among Hitachi, User and PROM WRITER manufacturer

As indicated above, the user purchases the performance board and sockets exclusively for Hitachi products together with purchasing the PROM WRITER.

2.5 Programming Device

There are about ten programming device manufacturers. However, this does not mean that any manufacturer's device will suffice. The reasons are as follows.

- It costs several hundreds of thousands or several million yen to have a programming device manufacturer develop a dedicated board for Hitachi and to qualify it.
- The suitability of the programming device affects the programming efficiency. Therefore, it should be a device of a reliable manufacturer.
- The servicing setup for handling troubles should be consolidated. The setup should be one that judgement can be accurately made on whether it is a writing device trouble or PROM trouble.

Hitachi has prepared a list of recommended manufacturers which meet the above requirements. Please contact our sales engineering staff for information in this regard.

MASK ROM PROGRAMMING INSTRUCTION

The writing of the custom program code into the mask ROM is performed by the CAD system using a large-sized computer. You should submit the data of the ROM code in conformity with the specification explained below by either paper tape, EPROM or magnetic tape. In addition, enter your instructions such as the chip select, customer part number, etc., in the "ROM Specification Identification Sheet" and attach it to the ROM code data.

1. Overall Specification

Since the submitted paper tape, card or magnetic

1.1.3 Parity mode

The presence and type of parity are clearly described in the "ROM Specification Identification Sheet".

There are following modes in the parity system.

- (1) With parity
 - Even parity EVEN
 - Odd parity ODD
- (2) Without parity

1.1.4 Use the 8 unit ASC11 code as the code.

1.2 Specification of Magnetic Tape

1.2.1 Use the following type of magnetic tape which can be netered in a magnetic tape device which is compatible with the IBM magnetic tape device.

- (1) Length 2,400 feet, 1,200 feet or 600 ffeet
- (2) Width 1/2 inch
- (3) Channel 9 channels
- (4) Bit density 800 BPI or 1,600BPI (Clearly state which it is in the "ROM Specification Identification Sheet".)

1.2.2 Use the EBCDIC code as the use code.

1.2.3 Make the format of the magnetic tape as described below.

- (1) No leading tape mark
- (2) No label

tape is fed into the large-size computer as it is, observe the following specifications.

1.1 Specification of Paper Tape

1.1.1 Any color paper tape may be used as long as it is a marketed 1 inch wide paper tape for computers. However, a black color paper tape is recommended.

1.1.2 Take more than 600 frames for the leader and trailer.

- (3) Record size 80 byte/1 record
- (4) Block size 10 records/1 block
- (5) The end of the file should be indicated by 2 successive tape marks (TM).

1.2.4 Ensure that the magnetic tape becomes of 1 roll for each chip. Since extending the single-chip portion over several rools is impermissible, submit by compiling into the single-chip portion for each roll.

2. Data Mode

2.1 HMCS6800 Load Module Mode

This mode is the object mode output from the assembler of HMCS6800.

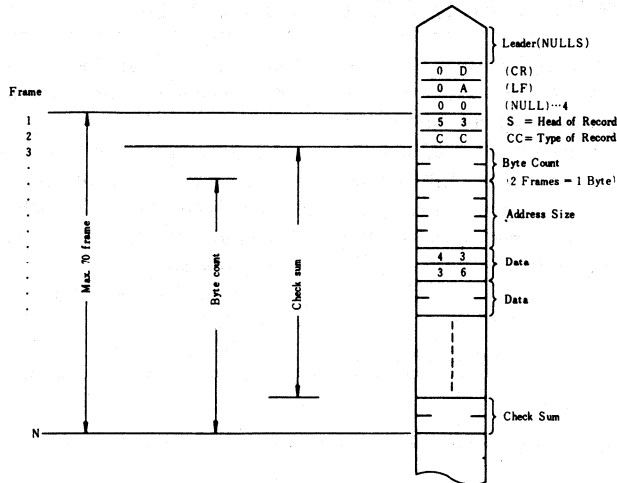

2.1.1 Divide the 8 bit code into the upper and lower 4 bit codes and convert each into hexadecimal notation.

(Example) The code of 1100 0110 becomes as follows under binary notation.

(Upper 4 bits)	(Lower 4 bits)	Bit weight
D ₇ D ₆ D ₅ D ₄	D ₃ D ₂ D ₁ D ₀	(ROM output
1 1 0 0	0 1 1 0	equivalence)

2.1.2 The composition of the load module mode is shown below by taking the case of paper tape as the example. The numbers written in the tape are ASCII code hexadecimal numbers of the data.

(Note) The check sum is a technique which disregards the complement on one of each bit sum of the 8 bits.

2.1.3 The actual load module mode becomes as shown below.

	CC=30	CC=31	CC=39
Frame	Header record	Data record	End of file record
1	Record Start 5 3 S	5 3 S	5 3 S
2	Record Type 3 0 0	3 1 1	3 9 9
3	Byte Count 3 0 0 6	3 1 1 6	3 0 0 3
4		3 6 1 6	3 3 0 3
5	3 0	3 1	3 0
6	3 0	3 1	3 0
7	Address Size 3 0 0000	3 0 1100	3 0 0000
8	3 0	3 0	3 0
9	Data 3 4 48-H	3 9 9 8	4 6 FC (Check Sum)
10	Data 3 4 44-D	3 8 0 2	4 3 3
	Data 3 5 52-R		
	3 2		
N	Check Sum 3 1 1B (Check Sum)	4 1 A8 (Check Sum)	
	4 2	3 8	

S0 indicates the head of the file and S9 indicates the end of the file. The actual data enters following S1. It means that the data starts from the address (hexadecimal) indicated in the address size. The address of the address size of the data recorder is compared with the next data recorder address by

counting in increments of 1 byte of the data and checking whether it is sequential or not. In places where the address is skipped, the data of 00 or FF enters hexadecimally. The printed example of the paper tape of the HMCS6800 load module mode is as shown below.

Example

Header Record	→ S00B000058204558414D504CB5
Data Record	→ S113F0007EF5587EF7897EFAA77EF9C07EF9C47E24
Data Record	→ S112F010FA657EFA8B7EFAA07EF9DC7EFA247E06
End of File Record	→ S9030000FC

2.1.4 The ROM code data are capable of handling the following 4 types of cases. A header recorder is required in front of the data recorder and an end of file recorder at the back of the data recorder.

(1) Case when the data reaches full capacity of ROM

The ROM recorder for 1 chip enters into the data recorder. Since the address of the address size of the data recorder counts the data and checks whether or not it is in a sequential address, it becomes necessary that the address not be skipped. The ROM head address column of the "ROM Specification Identification Sheet" becomes 0.

(2) Case when data is input from en route of ROM

In this case, perform entry by decimal notation in the ROM head address column of the "ROM Specification Identification Sheet" on which ROM address you wish to input the data. The data 00 or FF will enter into the blank address by hexadecimal notation.

(3) Case when data is input by skipping intermediate address

The address of the address size of the data recorder is counted in increments of 1 byte of the data, compared with the next address of the data recorder and checked whether or not it is sequential. The data 00 automatically enters by hexadecimal notation into the ROM code of the skipped address. Therefore, the writing of data as in the following drawing is also possible. In this case, perform entry into the "ROM Specification Identification Sheet" that the ROM head address enters from 0 address for data I and from which address it enters for data II.

(4) Case when the data is less than the full capacity of ROM

In case the data volume is less than the total byte capacity of ROM LSI when the end of file recorder appears, it becomes written as the ROM code as shown in the following drawing.

(Example) Indicates the example of the paper tape when the data recorder is S1141920B6-FC ...

S 1 1 2 B F F 4 4
1 4 9 0 6 C 4 6 6

2.2 BNPF Mode

2.2.1 One word is symbolized by the word start mark B, the bit content represented by 8 characters of P and N, and the BNPF slice composed of successive 10 characters of the work end mark F.

2.2.2 The contents from F of one BNPF slice up to B of the next BNPF slice are ignored.

(Example) The code of 0F by hexadecimal notation is symbolized as shown below (in case of paper tape)

2.2.3 It is necessary to designate the bit pattern (BNPF slice) on all ROM addresses. Therefore, the term of the ROM head address of "ROM Specifica-

tion Identification Sheet" always becomes 0.

- B Indicates start of 1 word.
- N Indicates "0" of 1 bit data.
- P Indicates "1" of 1 bit data.
- F Indicates end of 1 word.

Note 1) Sometimes X is used besides P and N in the display of the word content by the BNPf slice.

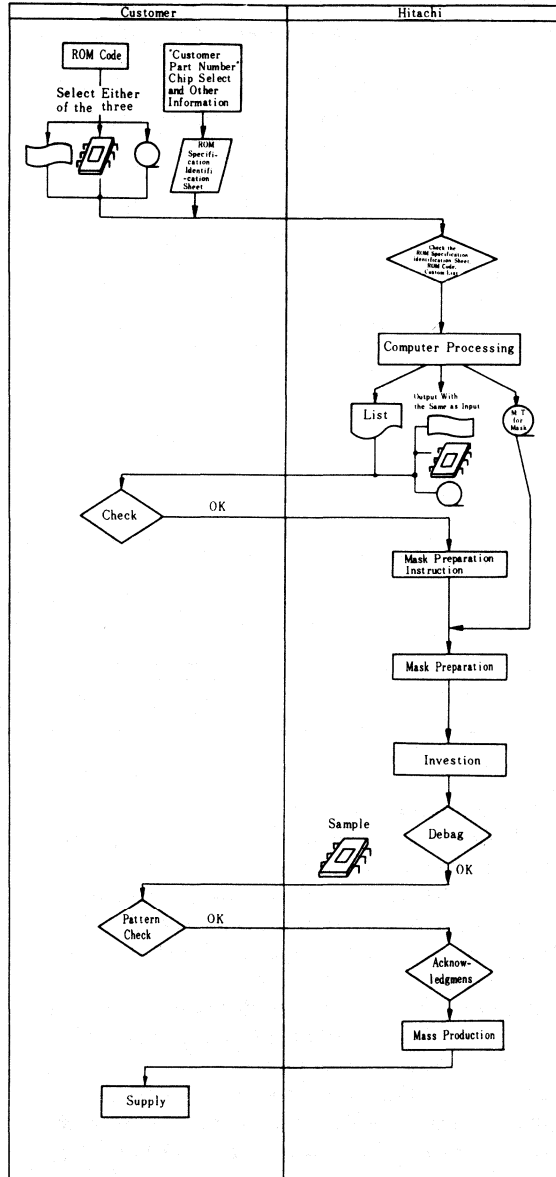

X means that the user is not concerned whether the bit is P or N. However, since it is necessary to decide the P or N for performing tests, Hitachi performs selection of P or N. The results are informed by making entry in the identification table.

Note 2) The contents of the BNPf slice are not only those with the continuation of PN and the form of B*nF can also be used. This means that the content of the slice existing just prior to this word will be repeated for n words from this word.

For example, when B*4F exists at the 10th word, it means that the content of the 9th word will be repeated in the 10th, 11th, 12th and 13th words. (However, it does not necessarily follow that the X content of Note 1 above will be repeated.) n shall start from 1 and be a number below the total addresses of ROM.

Note 3) When a certain block is not used (when an unused ROM address exists), disposition can be made by utilizing Notes 1 and 2.

DATA SHEETS

MOS STATIC RAM

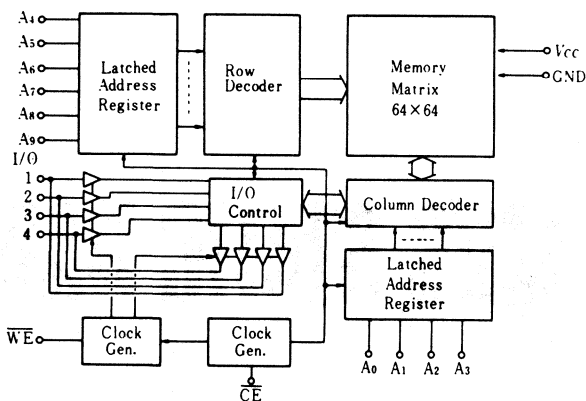

HM4334-3, HM4334-4 HM4334P-3, HM4334P-4

1024-word × 4-bit Static CMOS RAM

FEATURES

- Single 5V Supply
- Low Power Standby and Low Power Operation; Standby: 10μW (typ.)
Operation: 20mW (typ.)
- Access Time; HM4334/P-3: 300 ns (max.) (5V±5%)
HM4334/P-4: 450 ns (max.) (5V±10%)
- Directly TTL Compatible: All inputs and outputs
- Common Data Input and Output using Three-state Outputs
- On Chip Address Register

HM6148, HM6148-6 HM6148P, HM6148P-6

1024-word × 4-bit High Speed CMOS RAM

FEATURES

- Single 5V Supply
- Fast Access Time HM6148/P 70 ns (max.)
HM6148P-6 85 ns (max.)
- Low Power Standby and Low Power Operation; Standby: 100μW (typ)
Operation: 200mW (typ)
- Completely Static RAM; No Clock or Timing Strobe Required
- No Peak Power-On Current
- No Change of t_{ACS} with Short Deselected Time
- Equal Access and Cycle Times
- Directly TTL Compatible; All Inputs and Outputs
- Three State Output
- Common Data Input and Output
- Pin-Out Compatible with Intel 2148

Chip Selection to Output in Low Z*	t_{LZ}	10	—	10	—	ns
Chip Deselection to Output in High Z*	t_{HZ}	0	40	0	40	ns
Chip Selection to Power Up Time	t_{PU}	0	—	0	—	ns
Chip Deselection to Power Down Time	t_{PD}	—	40	—	40	ns

* Transition is measured $\pm 500\text{mV}$ from high impedance voltage with Load B. This parameter is sampled and not 100% tested.

● TIMING WAVEFORM OF READ CYCLE NO.1 ^{(1) (2)}

● TIMING WAVEFORM OF READ CYCLE NO.2 ^{(1) (3)}

- NOTES) 1. \overline{WE} is high for Read Cycle.
 2. Device is continuously selected, $\overline{CS} = V_{IL}$.
 3. Address Valid prior to or coincident with \overline{CS} transition low.

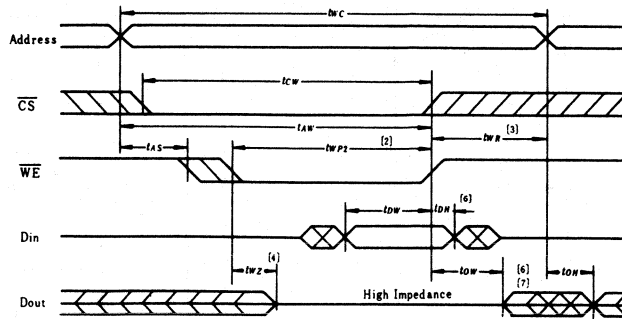

■ WRITE CYCLE

Parameter	Symbol	HM6148/P		HM6148/P-6		Unit
		min	max	min	max	
Write Cycle Time	t_{WC}	70	—	85	—	ns
Chip Selection to End of Write	t_{CW}	50	—	60	—	ns
Address Valid to End of Write	t_{AW}	65	—	80	—	ns
Address Setup Time	t_{AS}	15	—	15	—	ns
Write Pulse Width*	t_{WP1}	50	—	60	—	ns
	t_{WP2}	65	—	80	—	ns
Write Recovery Time	t_{WR}	5	—	5	—	ns
Data Valid to End of Write	t_{DW}	30	—	35	—	ns
Data Hold Time	t_{DH}	5	—	5	—	ns
Write Enabled to Output in High Z**	t_{WZ}	0	35	0	45	ns
Output Active from End of Write**	t_{OW}	0	—	0	—	ns

Notes) * When the \overline{CS} low transition occurs simultaneously with the \overline{WE} low transition or after the \overline{WE} transition. I/O pins remain in a high impedance state. In this case t_{WP1} , in the other case $t_{WP2} (= t_{WZ} + t_{DW})$.

** Transition is measured $\pm 500mV$ from high impedance voltage with Load B. This parameter is sampled and not 100% tested.

● TIMING WAVEFORM OF WRITE CYCLE NO.1(WE CONTROLLED) ⁽¹⁾

● TIMING WAVEFORM OF WRITE CYCLE NO.2(CS CONTROLLED) ⁽¹⁾

Notes)

1. \overline{CS} and \overline{WE} are paced in the WRITE state during low level period (t_W).
2. A write occurs during the overlap of a low \overline{CS} and a low \overline{WE} . (t_{WP})
3. t_{WR} is measured from the earlier of \overline{CS} or \overline{WE} going high to the end of write cycle.
4. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the \overline{CS} low transition occurs simultaneously with the \overline{WE} low transition or after the \overline{WE} transition, the output buffers remain in a high impedance state.
6. If \overline{CS} is low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
7. D_{out} is the same phase of write data of this write cycle.

Data Hold Time	t_{DH}	0	—	0	—	0	—	ns
Write Enabled to Output in High Z*	t_{WZ}	0	10	0	15	0	20	ns
Output Active from End of Write*	t_{OW}	0	—	0	—	0	—	ns

* Transition is measured ± 500 mV from high impedance voltage with Load B.
This parameter is sampled and not 100% tested.

● TIMING WAVEFORM OF WRITE CYCLE NO.1 (\overline{WE} Controlled)

● TIMING WAVEFORM OF WRITE CYCLE NO.2 (\overline{CS} Controlled)

NOTES of Timing Waveform of Write

1. A write occurs during the overlap of a low \overline{CS} and a low \overline{WE} . (t_{WP})
2. t_{WR} is measured from the earlier of \overline{CS} or \overline{WE} going high to the end of write cycle.
3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
4. If the \overline{CS} low transition occurs simultaneously with the \overline{WE} low transition or after the \overline{WE} transition, the output buffers remain in a high impedance state.
5. If \overline{CS} is low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
6. Dout is the same phase of write data of this write cycle.

HM6148HLP-35, HM6148HLP-45, HM6148HLP-55

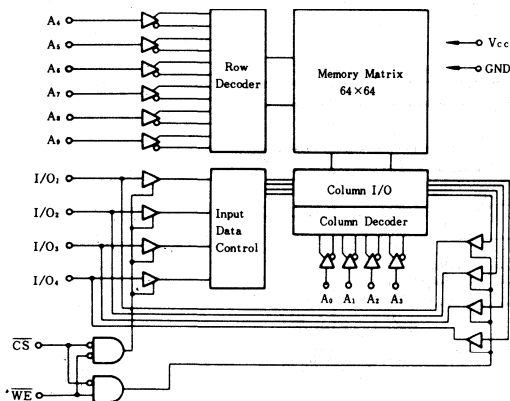

Preliminary

1024-word × 4-bit High Speed Static CMOS RAM

■ FEATURES

- Low Power Standby and Low Power Operation; Standby: 5μW (typ.), Operation: 300mW (typ.)
- Fast Access Time: 35/45/55ns (max)
- Capability of Battery Back Up Operation
- Single 5V Supply
- Completely Static RAM: No Clock or Timing Strobe Required
- No Peak Power-On Current
- No Change of t_{ACS} with Short Deselected Time
- Equal Access and Cycle Time
- Directly TTL Compatible: All Inputs and Outputs
- Three State Output
- Pin-Out Compatible with Intel 2148H

RECOMMENDED DC OPERATING CONDITIONS ($T_a=0$ to $+70^\circ\text{C}$)

Item	Symbol	min	typ	max	Unit
Supply Voltage	V_{CC}	4.5	5.0	5.5	V
	GND	0	0	0	V
Input Voltage	V_{IH}	2.2	—	6.0	V
	V_{IL}	-0.5*	—	0.8	V

* -3.0V (Pulse width 20ns)

DC AND OPERATING CHARACTERISTICS[1] ($T_a=0\sim 70^\circ\text{C}$, $V_{CC}=5V\pm 10\%$, GND=0V)

Parameter	Symbol	Test Conditions	min	typ	max	Unit	Notes
Input Leakage Current	$ I_{LI} $	$V_{CC}=\text{max}$, $V_{in}=\text{GND to } V_{CC}$	—	—	2.0	μA	
Output Leakage Current	$ I_{LO} $	$\overline{\text{CS}}=V_{IH}$, $V_{I/O}=\text{GND to } V_{CC}$	—	—	2.0	μA	
Operating Power Supply Current : DC	I_{CC}	$\overline{\text{CS}}=V_{IL}$, $I_{I/O}=0\text{mA}$	—	35	80	mA	
Operating Power Supply Current : AC	I_{CC1}	min. cycle, $\overline{\text{CS}}=V_{IL}$, $I_{I/O}=0\text{mA}$	—	50	100	mA	[2]
Standby Power Supply Current : DC	I_{SB}	$\overline{\text{CS}}=V_{IH}$	—	5	20	mA	
Standby Power Supply Current(1): DC	I_{SB1}	$\overline{\text{CS}}\geq V_{CC}-0.2\text{V}$, $V_{IN}\leq 0.2\text{V}$ or $V_{IN}\geq V_{CC}-0.2\text{V}$	—	1	50	μA	
Output Low Voltage	V_{OL}	$I_{OL}=8\text{mA}$	—	—	0.4	V	
Output High Voltage	V_{OH}	$I_{OH}=-4.0\text{mA}$	2.4	—	—	V	

Notes) 1. Typical limits are at $V_{CC}=5.0\text{V}$, $T_a=+25^\circ\text{C}$ and specified loading.
 2. 120mA max. for HM6148HLP-35

CAPACITANCE ($T_a=25^\circ\text{C}$, $f=1\text{MHz}$)

Item	Symbol	Test Conditions	typ	max	Unit
Input Capacitance	C_{in}	$V_{in}=0\text{V}$	3	5	pF
Input/Output Capacitance	$C_{I/O}$	$V_{I/O}=0\text{V}$	5	7	pF

Note) This parameter is sampled and not 100% tested.

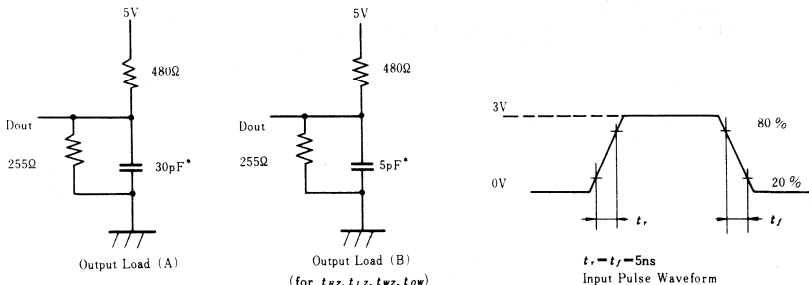

AC CHARACTERISTICS ($V_{CC}=5V\pm 10\%$, $T_a=0$ to $+70^\circ\text{C}$)

RISE FALL TIME

Item	Symbol	min	typ	max	Unit
Input Rise Time	t_r	—	5	100	ns
Input Fall Time	t_f	—	5	100	ns

AC TEST CONDITIONS

- Input pulse levels : GND to 3.0V
- Input rise and fall times : 5ns
- Input and Output timing reference levels : 1.5V
- Output load : See Figure

* Including scope & jig.

■ AC CHARACTERISTICS ($T_a=0$ to 70°C , $V_{CC}=5\text{V}\pm 10\%$, unless otherwise noted.)

● READ CYCLE

Item	Symbol	HM6148HLP-35		HM6148HLP-45		HM6148HLP-55		Unit
		min	max	min	max	min	max

RECOMMENDED DC OPERATING CONDITIONS (0°C ≤ Ta ≤ 70°C)

Parameter	Symbol	min	typ	max	Unit
Supply Voltage	V _{CC}	4.5	5.0	5.5	V
	GND	0	0	0	V
Input High (logic 1) Voltage	V _{IH}	2.0	3.0	6.0	V
Input Low (logic 0) Voltage	V _{IL}	-3.0*	—	0.8	V

* Pulse Width 20ns, DC: -0.5V

DC AND OPERATING CHARACTERISTICS (0°C ≤ Ta ≤ 70°C, V_{CC} = 5V ± 10%, GND = 0V)

Parameter	Symbol	Test Condition	min	typ	max	Unit
Input Leakage Current	I _{LI}	V _{CC} = 5.5V, GND to V _{CC}	—	—	10	μA
Output Leakage Current	I _{LO}	$\overline{CS} = V_{IH}$, V _{out} = 0V ~ V _{CC}	—	—	10	μA
Operating Power Supply Current(1) DC	I _{CC}	$\overline{CS} = V_{IL}$, Output open	—	30	80	mA
Operating Power Supply Current(2) DC	I _{CC1}	$\overline{CS} = V_{IL}$, Minimum Cycle	—	40	80	mA
Standby Power Supply Current(1) DC	I _{SB}	$\overline{CS} = V_{IH}$, V _{CC} = Min to Max	—	8	20	mA
Standby Power Supply Current(2) DC	I _{SB1}	$\overline{CS} \geq V_{CC} - 0.2V$, V _{IN} ≤ 0.2V or V _{IN} ≥ V _{CC} - 0.2V	—	20	800	μA
Output Low Voltage	V _{OL}	I _{OL} = 8mA	—	—	0.40	V
Output High Voltage	V _{OH}	I _{OH} = -4mA	2.4	—	—	V

Note) 1. The operating ambient temperature range is guaranteed with transverse air flow exceeding 400 linear feet minute.
2. Typical limits are at V_{CC} = 5.0V, Ta = 25°C and specified loading.

AC TEST CONDITIONS

- Input pulse levels: GND to 3.0V
- Input rise and fall times: 5 ns
- Input timing reference levels: 1.5V
- Output load: See Figure
- Output timing reference levels: 1.5V (HM6147H/P-35)
0.8 to 2.0V (HM6147H/P-45/55)

* Including scope & jig capacitance

CAPACITANCE (Ta = 25°C, f = 1.0MHz)

Item	Symbol	Conditions	max	Unit
Input Capacitance	C _{in}	V _{in} = 0V	5	pF
Output Capacitance	C _{out}	V _{out} = 0V	6	pF

Note) This parameter is sampled and not 100% tested.

■ AC CHARACTERISTICS ($T_a = 0^\circ\text{C}$ to 70°C , $V_{CC} = 5\text{V} \pm 10\%$, unless otherwise noted.)

● READ CYCLE

Parameter	Symbol	HM6147H/P-35		HM6147H/P-45		HM6147H/P-55		Unit	Notes
		min	max	min	max	min	max		
Read Cycle Time	t_{RC}	35	—	45	—	55	—	ns	(1)

Chip Deselection to Power Down Time	t_{PD}	—	20	—	20	—	20	ns	

● TIMING WAVEFORM OF READ CYCLE NO.1 ⁽⁴⁾ ⁽⁵⁾

● TIMING WAVEFORM OF READ CYCLE NO.2 ⁽⁴⁾ ⁽⁶⁾

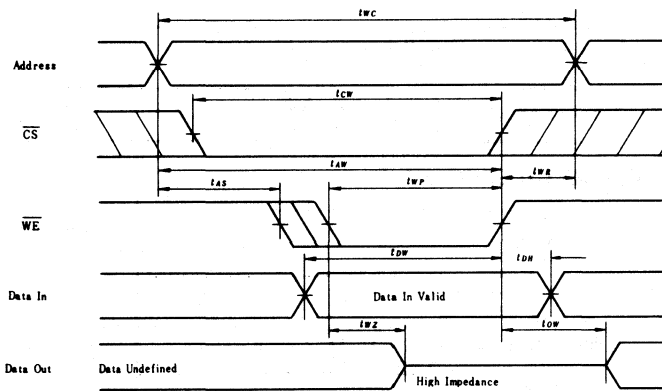

- Notes:
1. All Read Cycle timings are referenced from last valid address to the first transitioning address.
 2. At any given temperature and voltage condition, t_{HZ} max. is less than t_{LZ} min. both for a given device and from device to device.
 3. Transition is measured $\pm 500\text{mV}$ from steady state voltage with specified loading in Load B.
 4. WE is high for READ Cycle.
 5. Device is continuously selected, $\overline{\text{CS}} = V_{IL}$.
 6. Addresses valid prior to or coincident with $\overline{\text{CS}}$ transition low.
 7. This parameter is sampled and not 100% tested.

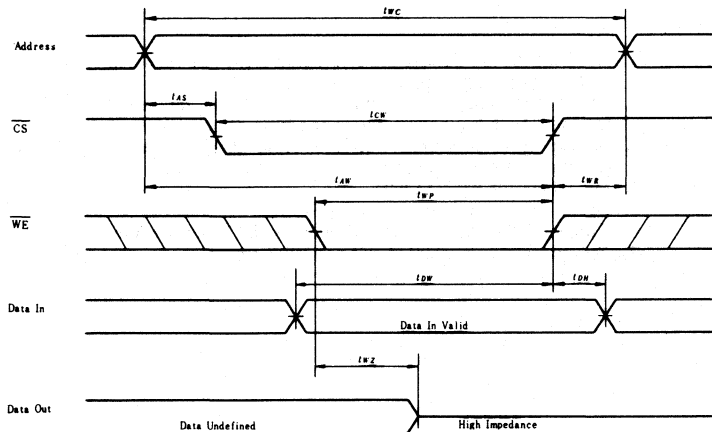

● WRITE CYCLE

Parameter	Symbol	HM6147H/P-35		HM6147H/P-45		HM6147H/P-55		Unit	Notes
		min	max	min	max	min	max		
Write Cycle Time	t_{wc}	35	—	45	—	55	—	ns	(2)
Chip Selection to End of Write	t_{cw}	35	—	45	—	45	—	ns	
Address Valid to End of Write	t_{aw}	35	—	45	—	45	—	ns

4096-word × 1-bit High Speed Static CMOS RAM

FEATURES

- Single 5V Supply and High Density 18 Pin Package
- High Speed: Fast Access Time 35ns/45ns/55ns Max.
- Low Power Standby and Low Power Operation, Standby: 5μW typ., Operation: 150mW typ.
- Completely Static Memory – No Clock nor Timing Strobe Required
- No Peak Power–On Current
- No Change of t_{ACS} with Short Chip Deselect Time
- Equal Access and Cycle Time
- Directly TTL Compatible – All Input and Output
- Separate Data Input and Output: Three State Output
- Plug-In Replacement with Intel 2147H NMOS STATIC RAM
- Capable of Battery Back up Operation

■ TIMING WAVEFORM

● READ CYCLE (1)⁽¹⁾

● READ CYCLE (2)⁽¹⁾⁽²⁾⁽⁴⁾

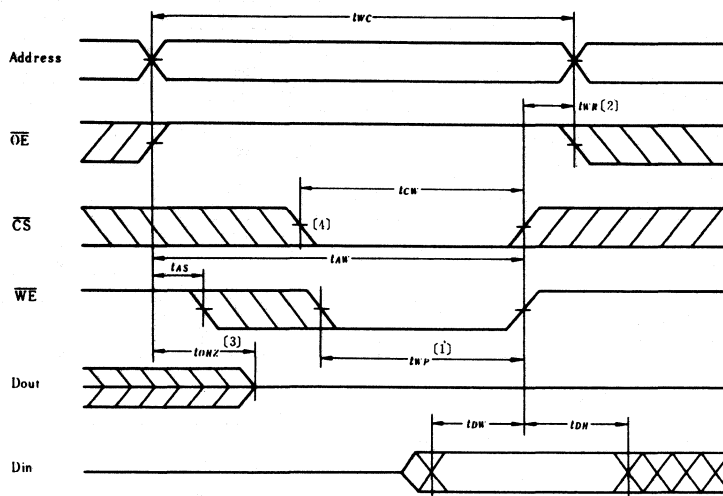

● READ CYCLE (3)⁽¹⁾⁽³⁾⁽⁴⁾

- NOTES: 1. WE is High for Read Cycle.
 2. Device is continuously selected, $\overline{CS} = V_{IL}$.
 3. Address Valid prior to or coincident with CS transition Low.
 4. $\overline{OE} = V_{IL}$.

WRITE CYCLE (1)

● WRITE CYCLE (2) ⁽⁵⁾

- NOTES:**
1. A write occurs during the overlap (t_{WP}) of a low \overline{CS} and a low \overline{WE} .
 2. t_{WR} is measured from the earlier of \overline{CS} or \overline{WE} going high to the end of write cycle.
 3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
 4. If the \overline{CS} low transition occurs simultaneously with the \overline{WE} low transitions or after the \overline{WE} transition, output remain in a high impedance state.
 5. \overline{OE} is continuously low. ($\overline{OE} = V_{IL}$)
 6. D_{out} is the same phase of write data of this write cycle.
 7. D_{out} is the read data of next address.
 8. If \overline{CS} is Low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.

Input/Output Capacitance	$C_{I/O}$	$V_{I/O}=0\text{V}$	5	7	pF

Note) This parameter is sampled and not 100% tested.

■ TIMING WAVEFORM

● READ CYCLE (1) ⁽¹⁾ ⁽⁵⁾

● READ CYCLE (2) ⁽¹⁾ ⁽²⁾ ⁽⁴⁾

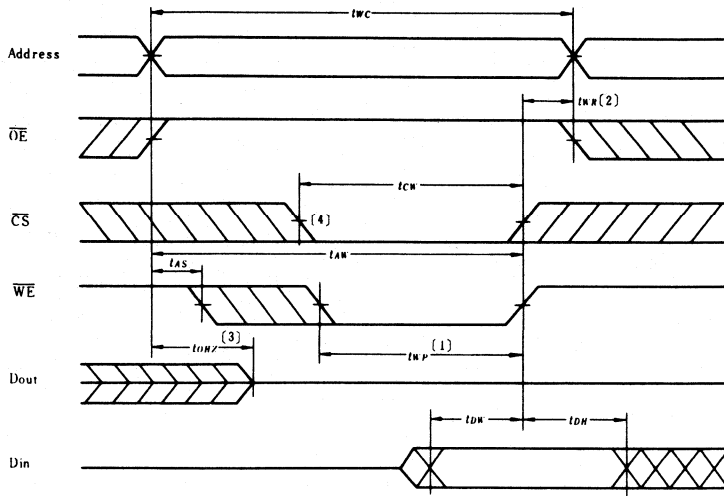

● READ CYCLE (3) ⁽¹⁾ ⁽³⁾ ⁽⁴⁾

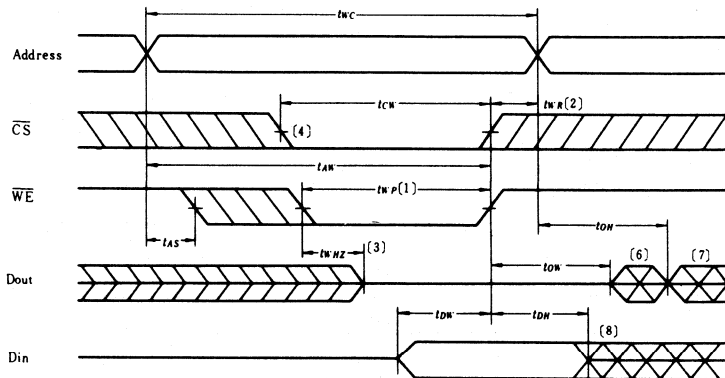

- NOTES:
- \overline{WE} is High for Read Cycle.
 - Device is continuously selected, $\overline{CS} = V_{LL}$.
 - Address Valid prior to or coincident with \overline{CS} transition Low.
 - $\overline{OE} = V_{LL}$.

WRITE CYCLE (1)

● WRITE CYCLE (2) ⁽⁵⁾

- NOTES:
1. A write occurs during the overlap (t_{WP}) of a low \overline{CS} and a low \overline{WE} .
 2. t_{WR} is measured from the earlier of \overline{CS} or \overline{WE} going high to the end of write cycle.
 3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
 4. If the \overline{CS} low transition occurs simultaneously with the \overline{WE} low transitions or after the \overline{WE} transition, output remain in a high impedance state.
 5. \overline{OE} is continuously low. ($\overline{OE} = V_{IL}$)
 6. D_{out} is the same phase of write data of this write cycle.
 7. D_{out} is the read data of next address.
 8. If \overline{CS} is Low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.

HM6116PI-2, HM6116PI-3, HM6116PI-4

— Wide Operating Temperature Range —

2048-word × 8-bit High Speed Static CMOS RAM

FEATURES

- Wide Operating Temperature Range $-40 \sim +85^{\circ}\text{C}$
- Single 5V Supply and High Density 24 Pin Package
- High speed: Fast Access Time 120ns/150ns/200ns (max.)
- Low Power Standby and Standby: 100 μW (typ.)
- Low Power Operation Operation: 180mW (typ.)
- Completely Static RAM: No clock or Timing Strobe Required
- Directly TTL Compatible: All Input and Output
- Pin Out Compatible with Standard 16K EPROM/MASK ROM
- Equal Access and Cycle Time

■ TIMING WAVEFORM

● READ CYCLE (1) ⁽¹⁾

● READ CYCLE (2) ⁽¹⁾⁽²⁾⁽⁴⁾

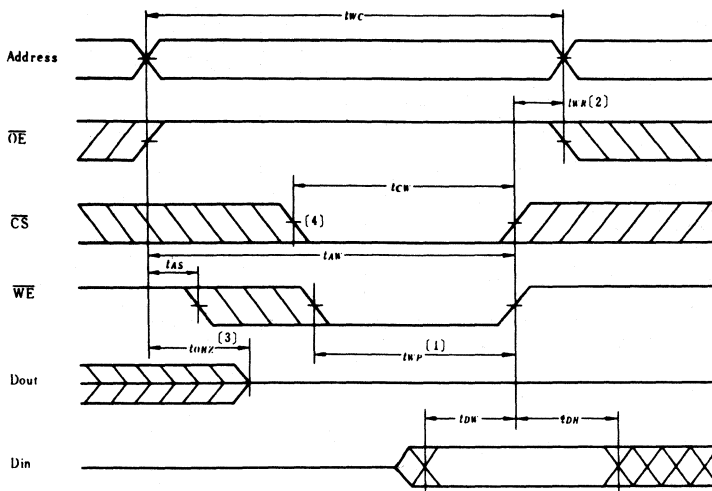

● READ CYCLE (3) ⁽¹⁾⁽³⁾⁽⁴⁾

- NOTES: 1. WE is High for Read Cycle.
 2. Device is continuously selected, $\overline{CS} = V_{IL}$.
 3. Address Valid prior to or coincident with \overline{CS} transition Low.
 4. $\overline{OE} = V_{IL}$.

WRITE CYCLE (1) ⁽¹⁾

● WRITE CYCLE (2) ⁽⁵⁾

- NOTES:
1. A write occurs during the overlap (t_{WP}) of a low \overline{CS} and a low \overline{WE} .
 2. t_{WR} is measured from the earlier of \overline{CS} or \overline{WE} going high to the end of write cycle.
 3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
 4. If the \overline{CS} low transition occurs simultaneously with the \overline{WE} low transitions or after the \overline{WE} transition, output remain in a high impedance state.
 5. \overline{OE} is continuously low. ($\overline{OE} = V_{IL}$)
 6. D_{out} is the same phase of write data of this write cycle.
 7. D_{out} is the read data of next address.
 8. If \overline{CS} is Low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.

2048-word × 8-bit High Speed Static CMOS RAM

FEATURES

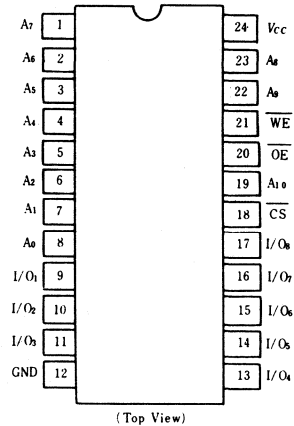

- Single 5V Supply and High Density 24 Pin Package
- High Speed: Fast Access Time 120ns/150ns/200ns (max.)
Low Power Standby and Standby: 20μW (typ.)
- Low Power Operation; Operation: 160mW (typ.)
- Completely Static RAM: No clock nor Timing Strobe Required
- Directly TTL Compatible: All Input and Output
- Pin Out Compatible with Standard 16K EPROM/MASK ROM
- Equal Access and Cycle Time
- Capability of Battery Back up Operation

■ TIMING WAVEFORM

● Read Cycle (1) ⁽¹⁾

● Read Cycle (2) ^{(1), (2), (4)}

● Read Cycle (3) ^{(1), (3), (4)}

- NOTES: 1. \overline{OE} is High for Read Cycle.
 2. Device is continuously selected, $\overline{CS} = V_{IL}$.
 3. Address Valid prior to or coincident with \overline{CS} transition Low.
 4. $\overline{OE} = V_{IL}$.

● Write Cycle (1)

● Write Cycle (2)

- NOTES: 1. A write occurs during the overlap (t_{WP}) of a low \overline{CS} and a low \overline{WE} .
 2. t_{WR} is measured from the earlier of \overline{CS} or \overline{WE} going high to the end of write cycle.
 3. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
 4. If the \overline{CS} low transition occurs simultaneously with the \overline{WE} low transitions or after the \overline{WE}

- transition, output remain in a high impedance state.
 5. \overline{OE} is continuously low. ($\overline{OE} = V_{IL}$)
 6. D_{out} is the same phase of write data of this write cycle.
 7. D_{out} is the read data of next address.
 8. If \overline{CS} is Low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.

HM6116LPI-2, HM6116LPI-3, HM6116LPI-4 — Wide Operating Temperature Range —

2048-word × 8-bit High Speed Static CMOS RAM

■ FEATURES

- Wide Operating Temperature Range $-40 \sim +85^{\circ}\text{C}$
- Single 5V Supply and High Density 24 Pin Package
- High Speed: Fast Access Time 120ns/150ns/200ns (max.)
- Low Power Standby and Standby: $10\mu\text{W}$ (typ.)
Low Power Operation; Operation: 160mW (typ.)
- Completely Static RAM: No clock nor Timing Strobe Required
- Directly TTL Compatible: All Input and Output
- Pin Out Compatible with Standard 16K EPROM/MASK ROM
- Equal Access and Cycle Time
- Capability of Battery Back up Operation

- Single 5V Supply and High Density 24 Pin Package
- High speed: Fast Access Time 150ns/200ns (max.)
- Low Power Standby and Standby: 100μW (type.)
Low Power Operation Operation: 180mW (typ.)
- Completely Static RAM: No clock or Timing Strobe Required
- Directly TTL Compatible: All Input and Output
- Pin Out Compatible with Standard 16K EPROM/MASK ROM
- Equal Access and Cycle Time

 6. D_{out} is the same phase of write data of this write cycle.
 7. D_{out} is the read data of next address.
 8. If \overline{CS} is Low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.

■ LOW V_{cc} DATA RETENTION CHARACTERISTICS ($T_a = 0$ to $+70^\circ\text{C}$)

Item	Symbol	Test Conditions	min	typ	max	Unit
V_{cc} for Data Retention	V_{DR}	$\overline{CS} \geq V_{cc} - 0.2V$	2.0	—	—	V
Data Retention Current	I_{CCDR}^*	$V_{cc} = 3.0V, \overline{CS} \geq 2.8V$	—	—	30	μA
Chip Deselect to Data Retention Time	t_{CDR}	See Retention Waveform	0	—	—	ns
Operation Recovery Time	t_R		t_{RC}^{**}	—	—	ns

* $10 \mu A$ max at $T_a = 0^\circ\text{C}$ to $+40^\circ\text{C}$. V_{IL} min = $-0.3V$

** t_R = Read Cycle Time.

● Low V_{cc} Data Retention Waveform

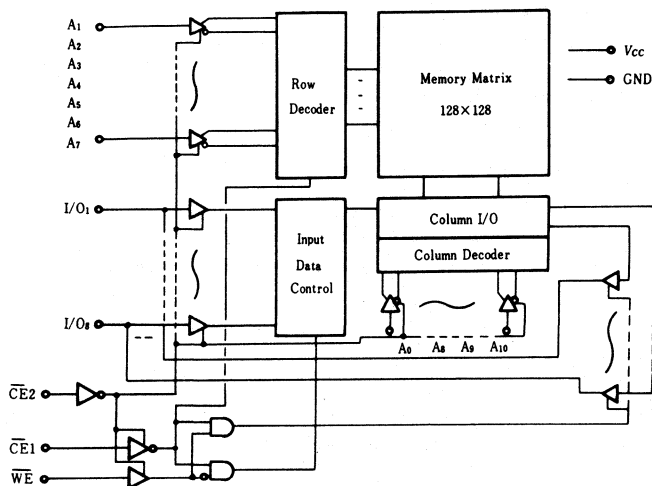

HM6117P-3, HM6117P-4

2048-word × 8-bit High Speed Static CMOS RAM

FEATURES

- Single 5V Supply and High Density 24 pin Package.
- High Speed: Fast Access Time 150ns/200ns (max.)
- Low Power Standby and Standby: 100μW (typ.)
- Low Power Operation: Operation: 200mW (typ.)
- Completely Static RAM: No clock nor Timing Strobe Required
- Directly TTL Compatible: All Input and Output
- Equal Access and Cycle Time

● TIMING WAVEFORM OF WRITE CYCLE

- NOTES: 1. A write occurs during the overlap (t_{WP}) of low \overline{CE}_1 , \overline{CE}_2 and \overline{WE} .
2. t_{AS} is measured from the address changes to the beginning of the write.
3. t_{WR} is measured from the earlier of \overline{CE}_1 , \overline{CE}_2 or \overline{WE} going high to the end/of write cycle.
4. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the \overline{CE}_1 or \overline{CE}_2 low transition occurs simultaneously with the \overline{WE} low transitions or after the \overline{WE} low transitions, output remain in a high impedance state.
6. Dout is the same phase of write data of this write cycle.
7. Dout is the read data of next address.
8. If \overline{CE}_1 and \overline{CE}_2 are low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.

LOW V_{CC} DATA RETENTION WAVEFORM

NOTE: 1. \overline{CE}_2 controls Address buffer, \overline{WE} buffer, \overline{CE}_1 buffer and D_{IN} buffer. If \overline{CE}_2 controls data retention mode, V_{IN} level (address, \overline{WE} , \overline{CE}_1 , $D_{I/O}$) can be in the high impedance state. If \overline{CE}_1 controls data retention mode, V_{IN} level (address, \overline{WE} , \overline{DE}_2 , $D_{I/O}$) must be $V_{IN} \geq V_{CC} - 0.2\text{V}$ or $V_{IN} \leq 0.2\text{V}$.

HM6117LFP-3, HM6117LFP-4

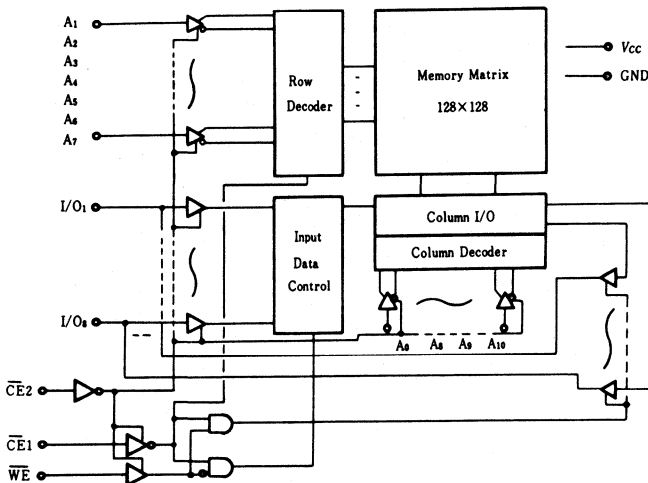

2048-word × 8-bit High Speed Static CMOS RAM

FEATURES

- High Density Small-sized Packaged
- Projection Area Reduced to One-Thirds of Conventional DIP
- Thickness Reduced to a Half of Conventional DIP
- Single 5V Supply
- High Speed: Fast Access Time 150ns/200ns max.
- Low Power Standby and Low Power Operation;
Standby: 10μW (typ.) Two Chip Enable Input for Battery Back up
Operation: 180mW (typ.)
- Completely Static RAM: No clock nor Timing Strobe Required
- Directly TTL Compatible: All Input and Output
- Equal Access and Cycle Time
- Capability of Battery Back up Operation

Output Hold from Address Change	t_{OH}	15	—	15	—	ns

●TIMING WAVEFORM OF READ CYCLE (Notes 1)

NOTES: 1. \overline{WE} is High for Read Cycle.

●WRITE CYCLE

Item	Symbol	HM6117LFP-3		HM6117LFP-4		Unit
		min	max	min	max	
Write Cycle Time	t_{WC}	150	—	200	—	ns
Chip Enable (\overline{CE}_1) to End of Write	t_{CW1}	100	—	120	—	ns
Chip Enable (\overline{CE}_2) to End of Write	t_{CW2}	110	—	130	—	ns
Address Set Up Time	t_{AS}	20	—	20	—	ns
Address Valid to End of Write	t_{AW}	130	—	150	—	ns
Write Pulse Width	t_{WP}	100	—	120	—	ns
Write Recovery Time	t_{WR}	15	—	15	—	ns
Write to Output in High Z	t_{WNZ}	0	60	0	70	ns
Data to Write Time Overlap	t_{DW}	50	—	60	—	ns
Data Hold from Write Time	t_{DH}	20	—	20	—	ns
Output Active from End of Write	t_{OW}	10	—	10	—	ns

●TIMING WAVEFORM OF WRITE CYCLE

- NOTES: 1 A write occurs during the overlap (t_{WP}) of low \overline{CE}_1 , \overline{CE}_2 and \overline{WE} .
2. t_{AS} is measured from the address changes to the beginning of the write.
3. t_{WR} is measured from the earlier of \overline{CE}_1 , \overline{CE}_2 or \overline{WE} going high to the end/of write cycle.

4. During this period, I/O pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the \overline{CE}_1 or \overline{CE}_2 low transition occurs simultaneously with the \overline{WE} low transitions or after the \overline{WE} transitions, output remain in a high impedance state.

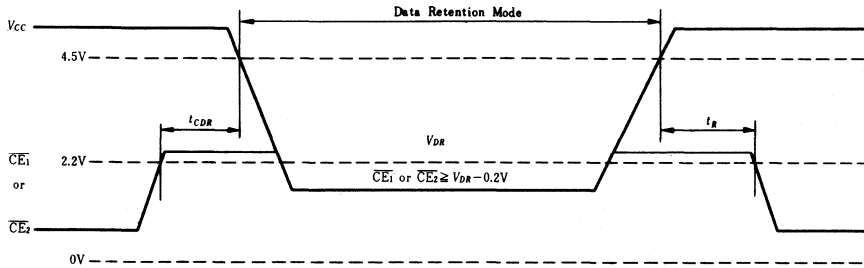

6. Dout is the same phase of write data of this write cycle.
7. Dout is the read data of next address.
8. If \overline{CE}_1 and \overline{CE}_2 are low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.

■ **LOW V_{CC} DATA RETENTION CHARACTERISTICS** ($T_a=0^{\circ}\text{C}$ to $+70^{\circ}\text{C}$)

Item	Symbol	Test Condition	min	typ	max	Unit
V_{CC} for Data Retention	V_{DR1}	$\overline{CE}_1 \geq V_{CC}-0.2\text{V}$, $V_{IN} \geq V_{CC}-0.2\text{V}$ or $V_{IN} \leq 0.2\text{V}$	2.0	—	—	V
V_{CC} for Data Retention	V_{DR2}	$\overline{CE}_2 \geq V_{CC}-0.2\text{V}$	2.0	—	—	V
Data Retention Current	I_{CCDR1}	$V_{CC}=3.0\text{V}$, $\overline{CE}_1 \geq 2.8\text{V}$, $V_{IN} \geq 2.8\text{V}$ or $V_{IN} \leq 0.2\text{V}$	—	—	30*	μA
Data Retention Current	I_{CCDR2}	$V_{CC}=3.0\text{V}$, $\overline{CE}_2 \geq V_{CC}-0.2\text{V}$	—	—	30*	μA
Chip Deselect to Data Retention Time	t_{CDR}	See Retention Waveform	0	—	—	ns
Operation Recovery Time	t_R		t_{RC}^{**}	—	—	ns

* $10\mu\text{A}$ max at $T_a=0^{\circ}\text{C}$ to $+40^{\circ}\text{C}$, V_{IL} min = -0.3V
 ** t_{RC} —Read Cycle Time

● **LOW V_{CC} DATA RETENTION WAVEFORM**

NOTE: 1. \overline{CE}_2 controls Address buffer, \overline{WE} buffer, \overline{CE}_1 buffer and $D_{I/O}$ buffer. If \overline{CE}_2 controls data retention mode, V_{IN} level (address, \overline{WE} , \overline{CE}_1 , $D_{I/O}$) can be in the high impedance state. If \overline{CE}_1 controls data retention mode, V_{IN} level (address, \overline{WE} , \overline{CE}_2 , $D_{I/O}$) must be $V_{IN} \geq V_{CC}-0.2\text{V}$ or $V_{IN} \leq 0.2\text{V}$.

• WRITE CYCLE (1) ($\overline{\text{OE}}$ clock)

• WRITE CYCLE (2) ($\overline{\text{OE}}$ Low Fix)

- NOTES: 1) A write occurs during the overlap of a low $\overline{\text{CS1}}$, a high $\overline{\text{CS2}}$ and a low $\overline{\text{WE}}$. A write begins at the latest transition among $\overline{\text{CS1}}$ going low, $\overline{\text{CS2}}$ going high and $\overline{\text{WE}}$ going low. A write ends at the earliest transition among $\overline{\text{CS1}}$ going high, $\overline{\text{CS2}}$ going low and $\overline{\text{WE}}$ going high. t_{WP} is measured from the beginning of write to the end of write.
- 2) t_{CW} is measured from the later of $\overline{\text{CS1}}$ going low or $\overline{\text{CS2}}$ going high to the end of write.
- 3) t_{AS} is measured from the address valid to the beginning of write.
- 4) t_{WR} is measured from the end of write to the address change.
 t_{WR1} applies in case a write ends at $\overline{\text{CS1}}$ or $\overline{\text{WE}}$ going high.
 t_{WR2} applies in case a write ends at $\overline{\text{CS2}}$ going low.
- 5) During this period, I/O pins are in the output state, therefore the input signals of opposite phase to the outputs must not be applied.
- 6) If $\overline{\text{CS1}}$ goes low simultaneously with $\overline{\text{WE}}$ going low or after $\overline{\text{WE}}$ going low, the outputs remain in high impedance state.
- 7) t_{DN} is in the same phase of written data of this cycle.
- 8) t_{DN} is the read data of the new address.
- 9) If $\overline{\text{CS1}}$ is low and $\overline{\text{CS2}}$ is high during this period, I/O pins are in the output state. Therefore, the input signals of opposite phase to the outputs must not be applied to them.

HM6264LP-10, HM6264LP-12 HM6264LP-15

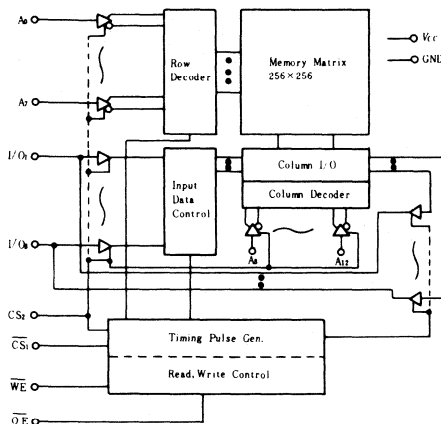

8192-word x 8-bit High Speed Static CMOS RAM

■ FEATURES

- Fast access Time 100ns/120ns/150ns (max.)
- Low Power Standby Standby: 0.01mW (typ.)
- Low Power Operation Operating: 200mW (typ.)
- Capability of Battery Back-up Operation
- Single +5V Supply
- Completely Static Memory. . . . No clock or Timing Strobe Required
- Equal Access and Cycle Time
- Common Data Input and Output, Three State Output
- Directly TTL Compatible: All Input and Output
- Standard 28pin Package Configuration
- Pin Out Compatible with 64K EPROM HN482764

	I_{CCDR2}	$V_{CC} = 3.0V, CS2 \leq 0.2V$	-	1	50*	μA
Chip Deselect to Data Retention Time	t_{CDR}	See Retention Waveform	0	-	-	ns
Operation Recovery Time	t_R		t_{RC}^{**}	-	-	ns

* V_{IL} min = -0.3V

** t_{RC} = Read Cycle Time

● **LOW V_{CC} DATA RETENTION WAVEFORM (1) ($\overline{CS1}$ Controlled)**

● **LOW V_{CC} DATA RETENTION WAVEFORM (2) ($CS2$ Controlled)**

NOTE: CS_2 controls Address buffer, \overline{WE} buffer, $\overline{CS_1}$ buffer and Din buffer. If CS_2 controls data retention mode, V_{in} level (Address, \overline{WE} , $\overline{CS_1}$, I/O) can be in the high impedance state. If $\overline{CS_1}$ controls data retention mode, CS_2 must be $CS_2 \geq V_{CC} - 0.2V$ or $CS_2 \leq 0.2V$. The other inputs level (address, \overline{WE} , I/O) can be in the high impedance state.

MOS DYNAMIC RAM

HM4716A-1, HM4716A-2, HM4716A-3, HM4716A-4, HM4716AP-1, HM4716AP-2, HM4716AP-3, HM4716AP-4

16384-word × 1-bit Dynamic Random Access Memory

The HM4716A is a 16,384 word by 1 bit MOS random access memory circuit fabricated with HITACHI's double poly N-channel silicon gate process for high performance and high functional density. The HM4716A uses a single transistor dynamic storage cell and dynamic control circuitry to achieve high speed and low power dissipation. Multiplexed address inputs permit the HM4716A to be packaged in a standard 16 pin DIP on 0.3 inch centers. This package size provides high system bit densities and is compatible with widely available automated testing and insertion equipment. The HM4716A is designed to facilitate upgrading of the 16-pin 4K RAM. However, the data output latch incorporated in the present 4K design is not appropriate for 16K RAM's. This new generation of memory products (16K RAM's) requires a slightly modified output stage to allow more system flexibility. Instead of the conventional latch, the HM4716A output is controlled by the Column Address Strobe (\overline{CAS}). Data out of the HM4716A will remain valid from the access time from the Column Address Strobe until \overline{CE} goes into precharge logic 1). However, in early write cycles (\overline{W} active low before \overline{CE} goes low), the data output will remain in the high impedance (open-circuit) state throughout the entire cycle. This type of output operation results in some very significant system implications.

1. Common I/O Operation

If all write operation are handled in the "early write" mode, then data in can be connected directly to data-out on a printed circuit board.

2. Data Output Control

Data will remain valid at the output during a read cycle from TCELOV until \overline{CE} returns to precharge.

This allows data to be valid from one cycle up until a new memory cycle begins.

3. Two Methods of Chip Selection

Both \overline{CE} and/or \overline{RE} can be decoded for chip selection.

4. Refresh

Refreshing can be accomplished every 2 ms by either of the two following methods:

- (1) normal read or write cycles on 128 addresses, A0 to A6.
- (2) \overline{RE} only cycles on 128 addresses, A0 to A6.

A write cycle will refresh stored data on all bits of the selected row except the bit which is addressed.

\overline{RE} only refreshes results in a substantial reduction in operating power.

5. Page Mode Operation

The HM4716A is designed for page mode operation.

NOTES

- All voltages referenced to VSS, VBB must be applied before and removed after other supply voltage.
- Current depend on cycle rate: maximum current is measured at the fastest cycle rate.
- ICC depends upon output loading. The VCC supply is connected to the output buffer only.
- Output voltage will swing from VSS to VCC when activated with no current loading. For purposes of maintaining data in standby mode, VCC may be reduced to VSS without affecting refresh operations or data retention. However, the VOH (min) specification is not guaranteed in this mode.
- ICC2, ICC3 and IOL consists of leakage current only.
- AC measurements assume TT = 5ns.
- VIHC (min) or VIH (min) and VIL (max) are reference levels for measuring timing of input signals. Also, transition times are measured between VIHC or VIH and VILS.
- Assumes that TRELCEL = TRELCEL (max.) If TRELCEL is greater than the maximum recommended value shown in this table, TRELQV exceeds the value shown.
- Assumes that TRELCEL = TRELCEL (max).
- Measured with a load circuit equivalent to 2TTL loads and 100pF (in case of HM4716A-2:1 TTL and 50pF). And VSS + 0.8V, VSS + 2.0V are the reference level for measuring timing of Q.
- TCEHQZ (max) defines the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
- Operation with the TRELCEL (max) limit insures that TRELQC (max) can be met TRELCEL (max) is specified as a reference point only; if TRELCEL is greater than the specified TRELCEL (max) limit, then access time is controlled exclusively by TCELQV.
- These parameters are reference to $\overline{\text{CE}}$ leading edge in early write cycles and to $\overline{\text{W}}$ leading edge in delayed write or read-modify-write cycles.
- TWLCEL, TCELWL and TRELWL are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only: if TWLCEL = TWLCEL (min), the cycle is an early write and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if TCELWL = TCELWL (min) and TRELWL will contain data read from the selected cell; if neither of the above sets of conditions is satisfied the condition of the data out (at access time) is indeterminate.
- Capacitance measured with Boonton Meter or effective capacitance measuring methods.)
- $\overline{\text{CE}} = \text{VIHC}$ to disable Q.

■ ELECTRICAL CHARACTERISTICS AND RECOMMENDED AC OPERATING CONDITIONS

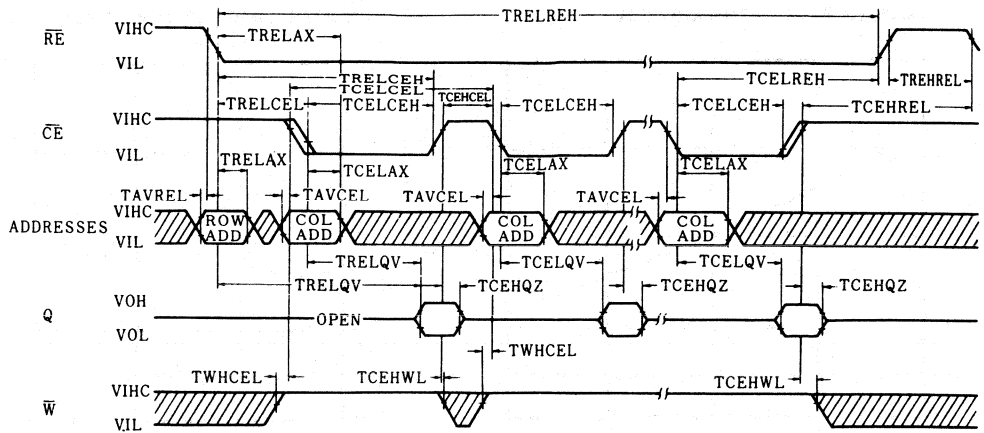

($T_a = 0$ to $+70^\circ\text{C}$, $V_{DD} = 12\text{V} \pm 10\%$, $V_{CC} = 5\text{V} \pm 10\%$, $V_{SS} = 0\text{V}$, $V_{BB} = -5\text{V} \pm 10\%$)

APPLICATION INFORMATION

• READ CYCLE;

A read cycle begins with addresses stable and a negative going transition of \overline{RE} . The time delay between the stable address and the start of \overline{RE} -on is controlled by parameter TAVREL.

Following the time when \overline{RE} reaches its low level, the row address must be held stable long enough to be captured.

This controlling parameter is TRELAX. Following this interval, the address can be changed from row address to column address.

When the column address is stable, \overline{CE} can be turned on. The leading edge of \overline{CE} is controlled by parameter TRELCEL.

The basic limit on the \overline{CE} leading edge is that \overline{CE} cannot start until the column address is stable, and this is controlled by parameter TAVCEL.

The column address must be held stable long enough to be captured.

The controlling parameter is TCELAX. Note that TRELCEL(max) is not an operating limit of the HM4716A though its specification is listed on the data sheets. If \overline{CE} becomes on later than TRELCEL(max), the access time from \overline{RE} will be increased by the time which TRELCEL exceeds TRELCEL(max).

Following the time when \overline{CE} reaches its low level, the data-out pin remains in a high impedance state until a valid data appears. This parameter is TCELQV-access time from \overline{CE} . The access time from \overline{RE} -TRELQV is the time from \overline{RE} -on to valid Q. The minimum value of TRELQV is derived as the sum of TRELCEL(max) and TCELQV. The selected output data is held valid internally until \overline{CE} becomes high, and then Q pin becomes high impedance. This parameter is TECHQZ.

• WRITE CYCLE;

A write cycle is performed by bringing \overline{W} low before or during \overline{CE} -on.

Two different write cycles can be defined as:

Write cycle — Write data are available at the beginning of the \overline{CE} -on so that the write operation starts at the beginning. In this mode, D and \overline{W} signal times are not in any critical path for determining cycle time.

Following the time when \overline{W} reaches its low level, \overline{W} must be held stable long enough to be captured. This \overline{W} -on pulse duration is called TWLWH.

The time required to capture write data in a latch is called TWLDX.

This cycle is called an "early write"

Read Write cycle — This cycle starts as a read cycle, but as soon as the device specification is met, a write cycle is initiated. \overline{W} and D are delayed until after Q. This cycle is called a "delayed write". A "Read-modify-write" cycle is a variation of this operation. In this mode, D and \overline{W} become critical path signals for determining cycle time.

• CLOCK-OFF TIMING;

\overline{RE} and \overline{CE} must stay on for Q stabilized to valid data. In the case of \overline{CE} , this is controlled by parameter TCELCEH (min). In the case of \overline{RE} , this controlled by parameter TCELREH(min).

Following the end of \overline{RE} , \overline{CE} must stay off long enough to precharge internal circuits. The only parameter of concern is TREHREL.

Normally \overline{CE} is not required to be off for a minimum time of TCEHREL.

However, in a page mode memory operation, there is a TCEHCEL(min) specification to control the \overline{CE} -off time.

• DATA OUTPUT;

Q is three-state TTL compatible with a fan-out of two standard TTL loads.

When \overline{CE} is high, Q is in a high impedance state. When \overline{CE} is low, valid data appears after TCELQV at a read cycle and Q is not valid at an early-write cycle.

• REFRESH;

Refresh of the HM4716A is accomplished by performing A memory cycle at each of the 128 row addresses within each two millisecond time interval.

Any cycle in which \overline{RE} signal occurs refreshes the entire selected row.

\overline{RE} -only refresh results in substantial reduction in operating power.

This reduction in power is reflected in the IDD3 specification.

• PAGE MODE;

Page mode operation allows faster successive memory operations at multiple column locations of the same row address with increased speed.

This is done by strobing the row address into the chip and maintaining \overline{RE} at a logic low throughout all successive \overline{CE} memory cycles in which the row address is latched. As the time normally required for strobing a new row address is eliminated, access and cycle times can be decreased and the operating power is reduced. These are reflected in the TCELQV, TCEHCEL, IDD4 specifications.

HM4816A-3, HM4816A-3E, HM4816A-4, HM4816A-7, HM4816AP-3, HM4816AP-3E, HM4816AP-4, HM4816AP-7

16384-word by 1-bit Dynamic Random Access Memory

The HM4816A is a new generation MOS dynamic RAM circuit organized as 16,384 words by 1 bit. As a state-of-the-art MOS memory device, the HM4816A (16K RAM) incorporates advanced circuit techniques designed to provide wide operating margins, both internally and to the system user, while achieving performance levels in speed and power.

The use of dynamic circuitry throughout, including sense amplifiers, assures that power dissipation is minimized without any sacrifice in speed or operating margin. These factors combine to make the HM4816A a truly superior RAM product. Multiplexed address inputs permits the HM4816A to be packaged in standard 16-pin DIP. Non-critical clock timing requirements allow use of the multiplexing technique while maintaining high performance.

■ FEATURES

- Single 5V supply
 - Low power standby and operation
(Standby: 11mW max., operation: 150mW max.)
- Fast access time & cycle time

	HM4816A-3 HM4816AP-3	HM4816A-3E HM4816AP-3E	HM4816A-4 HM4816AP-4	HM4816A-7 HM4816AP-7
Maximum Access Time (ns)	100	105	120	150
Read, Write Cycle (ns)	235	200	270	320
Read-Modify-Write Cycle (ns)	285	235	320	410

- Directly TTL compatible: All inputs & outputs
- Output data controlled by $\overline{\text{CAS}}$ and unlatched at end of cycle to allow two dimensional chip selection and extended page boundary.
- Common I/O capability using "easy write" operation.
- Read modify write, $\overline{\text{RAS}}$ only refresh and page mode capability
- Only 128 refresh cycle required every 2ms
- Compatible with Intel 2118-3/-4/-7

● READ-MODIFY-WRITE CYCLE

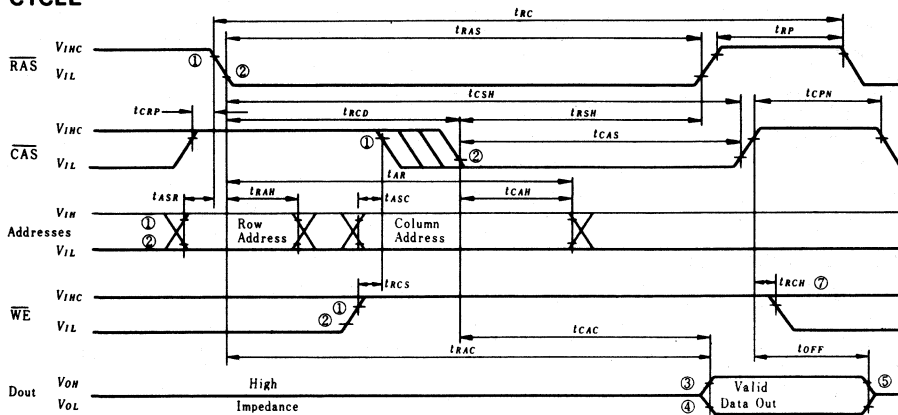

Read-Modify-Write Cycle Time	t_{RWC}	285	—	235	—	320	—	410	—	ns	
RMW Cycle RAS Pulse Width	t_{RRW}	165	10000	155	10000	190	10000	265	10000	ns	
RMW Cycle CAS Pulse Width	t_{CRW}	105	10000	110	10000	120	10000	185	10000	ns	
RAS to WE Delay	t_{RWD}	100	—	105	—	120	—	150	—	ns	9
CAS to WE Delay	t_{CWD}	55	—	60	—	65	—	80	—	ns	9

Notes:

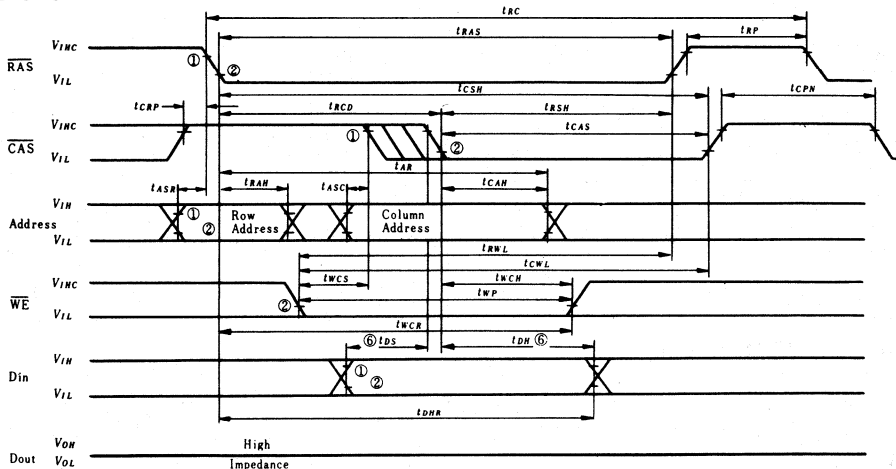

1. All voltages referenced to V_{SS}
2. Eight cycles are required after power-up or prolonged periods (greater than 2ms) of RAS inactivity before proper device operation is achieved. Any 8 cycles which perform refresh are adequate for this purposes.
3. AC Characteristics assume $t_T=5ns$
4. Assume that $t_{RCD} \leq t_{RCD}(\max.)$ If t_{RCD} is greater than $t_{RCD}(\max.)$ then t_{RAC} will increase by the amount that t_{RCD} exceeds $t_{RCD}(\max.)$
5. Load = 2 TTL Loads and 100pF
6. Assumes $t_{RCD} \geq t_{RCD}(\max.)$
7. $t_{RCD}(\max.)$ is specified as a reference point only. If t_{RCD} is less than $t_{RCD}(\max.)$ access time is t_{RAC} . If t_{RCD} is greater than $t_{RCD}(\max.)$ access time is $t_{RCD} + t_{CAC}$.
8. t_T is measured between $V_{IH}(\min.)$ and $V_{IL}(\max.)$
9. t_{WCS} , t_{CWD} and t_{RWD} are specified as reference points only. If $t_{WCS} \geq t_{WCS}(\min.)$ the cycle is an early write cycle and the data out pin will remain high impedance throughout the entire cycle. If $t_{CWD} \geq t_{CWD}(\min.)$ and $t_{RWD} \geq t_{RWD}(\min.)$, the cycle is a read-modify-write cycle and the data out will contain the data read from the selected address if neither of the above conditions is satisfied, the condition on the data out is indeterminate.

HM4864-2, HM4864-3 HM4864P-2, HM4864P-3

65536-word × 1-bit Dynamic Random Access Memory

The HM4864 is a 65,536-words by 1-bit, MOS random access memory circuit fabricated with HITACHI's double-poly N-channel silicon gate process for high performance and high functional density. The HM4864 uses a single transistor dynamic storage cell and dynamic control circuitry to achieve high speed and low power dissipation.

Multiplexed address inputs permit the HM4864 to be packaged in a standard 16 pin DIP on 0.3 inch centers.

This package size provides high system bit densities and is compatible with widely available automated testing and insertion equipment. System oriented features include single power supply of +5V with $\pm 10\%$ tolerance, direct interfacing capability with high performance logic families such as Schottky TTL, maximum input noise immunity to minimize "false triggering" of the inputs, on-chip address and data registers which eliminate the need for interface registers, and two chip select methods to allow the user to determine the appropriate speed/power characteristics of this memory system. The HM4864 also incorporates several flexible timing/operating modes.

In addition to the usual read, write, and read-modify-write cycles, the HM4864 is capable of delayed write cycles, page-mode operation and $\overline{\text{RAS}}$ -only refresh.

Proper control of the clock inputs ($\overline{\text{RAS}}$, $\overline{\text{CAS}}$, and $\overline{\text{WE}}$) allows common I/O capability, two dimensional chip selection, and extended page boundaries (when operating in page mode).

FEATURES

- Recognized industry standard 16-pin configuration
- 150ns access time, 270ns cycle time (HM4864-2, HM4864P-2)
- 200ns access time, 335ns cycle time (HM4864-3, HM4864P-3)
- Single power supply of +5V $\pm 10\%$ with a built-in V_{BB} generator
- Low Power; 330 mW active, 20 mW standby (max)
- The inputs TTL compatible, low capacitance, and protected against static charge
- Output data controlled by $\overline{\text{CAS}}$ and unlatched at end of cycle to allow two dimensional chip selection and extended page boundary
- Common I/O capability using "early write" operation
- Read-Modify-Write, $\overline{\text{RAS}}$ -only refresh, and Page-mode capability
- 128 refresh cycle

NOTES

- AC measurements assume $t_T = 5\text{ns}$.
- 8 cycles are required after power-on or prolonged periods (greater than 2ms) of $\overline{\text{RAS}}$ inactivity before proper device operation is achieved. Any 8 cycles which perform refresh are adequate for this purpose.
- V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
- Assumes that $t_{RCD} \leq t_{RCD}(\text{max})$. If t_{RCD} is greater than the maximum recommended value shown in this table t_{RAC} exceeds the value shown.
- Assumes that $t_{RCD} \geq t_{RCD}(\text{max})$.
- Measured with a load circuit equivalent to 2TTL loads and 100 pF.
- $t_{OFF}(\text{max})$ defines the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
- Operation with the $t_{RCD}(\text{max})$ limit insures that

$t_{RAC}(\text{max})$ can be met, $t_{RCD}(\text{max})$ is specified as a reference point only; if t_{RCD} is greater than the specified $t_{RCD}(\text{max})$ limit, then access time is controlled exclusively by t_{CAC} .

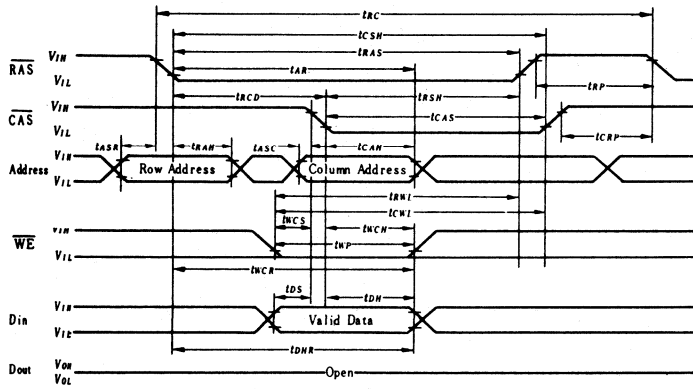

- These parameters are reference to $\overline{\text{CAS}}$ leading edge in early write cycles and to $\overline{\text{WE}}$ leading edge in delayed write or read-modify-write cycles.
- t_{WCS} , t_{CWD} and t_{RWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only: if $t_{WCS} \geq t_{WCS}(\text{min})$, the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if $t_{CWD} \geq t_{CWD}(\text{min})$ and $t_{RWD} \geq t_{RWD}(\text{min})$ the cycle is a read/write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied the condition of the data out (at access time) is indeterminate.

APPLICATION INFORMATION

POWER ON

An initial pause of 500 μs is required after power-up and a minimum of eight (8) initialization cycle, (any combination of cycles containing a RAS clock such as RAS-only refresh) must follow an initial pause.

The V_{CC} current (I_{CC}) requirement of the HM4864 during power on is, however, dependent upon the input levels (\overline{RAS} , \overline{CAS}) and the rise time of V_{CC} , as shown in Fig. 1.

READ CYCLE

A read cycle begins with addresses stable and a negative going transition of \overline{RAS} . The time delay between the stable address and the start of \overline{RAS} -on is controlled by parameter t_{ASR} . Following the time when \overline{RAS} reaches its low level, the row address must be held stable long enough to be captured. This controlling parameter is t_{RAH} . Following this interval, the address can be changed from row address to column address. When the column address is stable, \overline{CAS} can be turned on. The leading edge of \overline{CAS} is controlled by parameter t_{RCD} . The basic limit on the \overline{CAS} leading edge is that \overline{CAS} can not start until the column address is stable, and this is controlled by parameter t_{ASC} . The column address must be held stable long enough to be captured. The controlling parameter is t_{CAH} . Note that t_{RCD} (max) is not an operating limit of the HM4864 though its specification is listed on the data sheets. If \overline{CAS} becomes on later than t_{RCD} (max), the access time from \overline{RAS} will be increased by the time which t_{RCD} exceeds t_{RCD} (max).

Following the time when \overline{CAS} reaches its low level, the data-out pin remains in a high impedance state until a valid data appears. This parameter is t_{CAC} -access time from \overline{CAS} . The access time from \overline{RAS} - t_{RAC} -is the time from \overline{RAS} -on to valid Dout.

The minimum value of t_{RAC} is derived as the sum of t_{RCD} (max) and t_{CAC} .

The selected output data is held valid internally until \overline{CAS} becomes high, and then Dout pin becomes high impedance. This parameter is t_{OFF} .

Fig.1 I_{CC} vs. V_{CC} during power up.

● WRITE CYCLE

A write cycle is performed by bringing \overline{WE} low before or during \overline{CAS} -on.

Two different write cycles can be defined as;

Write cycle—Write data are available at the beginning of the \overline{CAS} -on so that the write operation starts at the beginning. In this mode, $Dout$ and \overline{WE} signal times are not in any critical path for determining cycle time.

Following the time when \overline{WE} reaches its low level, \overline{WE} must be held stable long enough to be captured. This \overline{WE} -on pulse duration is called t_{WP} . The time required to capture write data in a latch is called t_{DH} . This cycle is called an "early write".

Read Write cycle—This cycle starts as a read cycle, but as soon as the device specification is met, a write cycle is initiated.

\overline{WE} and Din are delayed until after $Dout$. This cycle is called a "delayed write". A "Read-modify-write" cycle is a variation of this operation. In this mode, Din and \overline{WE} become critical path signals for determining cycle time.

● CLOCK-OFF TIMING

\overline{RAS} and \overline{CAS} must stay on for $Dout$ stabilized to valid data. In the case of \overline{CAS} , this is controlled by parameter t_{CAS} (min).

In the case of \overline{RAS} , this is controlled by parameter t_{CAS} (min). Following the end of \overline{RAS} , \overline{CAS} must stay off long enough to precharge internal circuits. The only parameter of concern is t_{RP} . Normally \overline{CAS} is not required to be off for minimum time of t_{CRP} . However, in a page mode memory operation, there is a t_{CP} (min) specification to control the \overline{CAS} -off time.

● DATA OUTPUT

$Dout$ is three-state TTL compatible with a fan-out of two standard TTL loads.

When \overline{CAS} is high, $Dout$ is in a high impedance state. When \overline{CAS} is low, valid data appears after t_{CAC} at a read cycle, and $Dout$ is not valid as an early-write cycle.

● REFRESH

Refresh of the HM4864 is accomplished by performing a memory cycle at each of the 128 row addresses within each two millisecond time interval. A0 to A6 are refresh address pin compatible with standard 16K RAM (HM4716A, HM4816A). During refresh, either V_{IL} or V_{IH} is permitted for A7. Any cycle in which \overline{RAS} signal occurs refreshes the entire selected row. \overline{RAS} -only refresh results in substantial reduction in operating power. This reduction in power is reflected in the I_{CC3} specification.

● PAGE MODE

Page mode operation allows faster successive memory operations at multiple column locations of the same row address with increased speed.

This is done by strobing the row address into the chip and maintaining \overline{RAS} at a logic low throughout all successive \overline{CAS} memory cycles in which the row address is latched. As the time normally required for strobing a new row address is eliminated, access and cycle times can be decreased and the operating power is reduced. These are specifications.

HM4864CC-2, HM4864CC-3

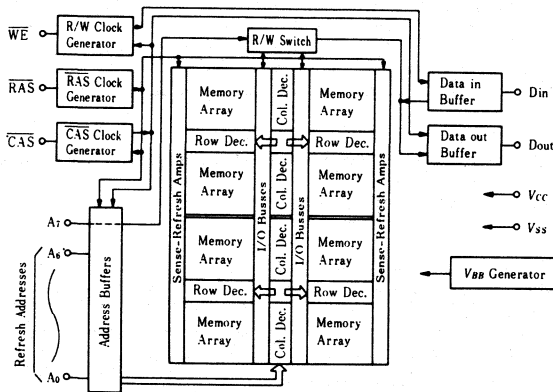

65536-word × 1-bit Dynamic Random Access Memory

FEATURES

- 18-pin Leadless Chip Carrier
- 150ns access time, 270ns cycle (HM4864CC-2)
200ns access time, 335ns cycle (HM4864CC-3)
- Single power supply of 5V ± 10% with a built-in V_{BB} generator
- Low power: 330mW active, 20mW standby (max)
- The inputs TTL compatible, low capacitance, and protected against static charge.
- Output data controlled by $\overline{\text{CAS}}$ and unlatched at end of cycle to allow two dimensional chip selection and extended page boundary.
- Common I/O capability using "early write" operation
- Read-Modify-Write, $\overline{\text{RAS}}$ -only Refresh, and Page-mode capability
128 refresh cycle

NOTES

- AC measurements assume $t_T = 5\text{ns}$.
- 8 cycles are required after power-on or prolonged periods (greater than 2ms) of $\overline{\text{RAS}}$ inactivity before proper device operation is achieved. Any 8 cycles which perform refresh are adequate for this purpose.
- V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
- Assumes that $t_{RCD} \leq t_{RCD}(\text{max})$. If t_{RCD} is greater than the maximum recommended value shown in this table t_{RAC} exceeds the value shown.
- Assumes that $t_{RCD} \geq t_{RCD}(\text{max})$.
- Measured with a load circuit equivalent to 2TTL loads and 100 pF.
- $t_{OFF}(\text{max})$ defines the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
- Operation with the $t_{RCD}(\text{max})$ limit insures that

$t_{RAC}(\text{max})$ can be met, $t_{RCD}(\text{max})$ is specified as a reference point only; if t_{RCD} is greater than the specified $t_{RCD}(\text{max})$ limit, then access time is controlled exclusively by t_{CAC} .

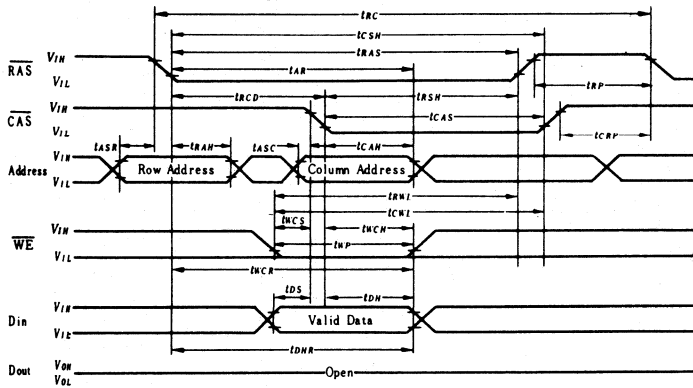

- These parameters are reference to $\overline{\text{CAS}}$ leading edge in early write cycles and to $\overline{\text{WE}}$ leading edge in delayed write or read-modify-write cycles.
- t_{WCS} , t_{CWD} and t_{RWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only: if $t_{WCS} \geq t_{WCS}(\text{min})$, the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if $t_{CWD} \geq t_{CWD}(\text{min})$ and $t_{RWD} \geq t_{RWD}(\text{min})$ the cycle is a read/write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied the condition of the data out (at access time) is indeterminate.

Wide Operating Temperature Range

65536-word × 1-bit Dynamic Random Access Memory

The HM4864 is a 65,536-words by 1-bit, MOS random access memory circuit fabricated with HITACHI's double-poly N-channel silicon gate process for high performance and high functional density. The HM4864 uses a single transistor dynamic storage cell and dynamic control circuitry to achieve high speed and low power dissipation.

Multiplexed address inputs permit the HM4864 to be packaged in a standard 16 pin DIP on 0.3 inch centers.

This package size provides high system bit densities and is compatible with widely available automated testing and insertion equipment. System oriented features include single power supply of +5V with $\pm 10\%$ tolerance, direct interfacing capability with high performance logic families such as Schottky TTL, maximum input noise immunity to minimize "false triggering" of the inputs, on-chip address and data registers which eliminate the need for interface registers, and two chip select methods to allow the user to determine the appropriate speed/power characteristics of this memory system. The HM4864 also incorporates several flexible timing/operating modes.

In addition to the usual read, write, and read-modify-write cycles, the HM4864 is capable of delayed write cycles, page-mode operation and RAS-only refresh.

Proper control of the clock inputs ($\overline{\text{RAS}}$, $\overline{\text{CAS}}$, and $\overline{\text{WE}}$) allows common I/O capability, two dimensional chip selection, and extended page boundaries (when operating in page mode).

FEATURES

- Wide Operating Temperature Range

HM4864I-2/-3	-40 ~ +85°C
HM4864K-2/-3	-55 ~ +85°C

- Recognized industry standard 16-pin configuration
- 150ns access time, 270ns cycle time (HM4864I-2, HM4864K-2)
- 200ns access time, 335ns cycle time (HM4864I-3, HM4864K-3)
- Single power supply of +5V $\pm 10\%$ with a built-in V_{BB} generator
- Low Power; 330 mW active. 22 mW standby (max)
- The inputs TTL compatible, low capacitance, and protected against static charge
- Output data controlled by $\overline{\text{CAS}}$ and unlatched at end of cycle to allow two dimensional chip selection and extended page boundary
- Common I/O capability using "early write" operation
- Read-Modify-Write, $\overline{\text{RAS}}$ -only refresh, and Page-mode capability
- 128 refresh cycle

Notes

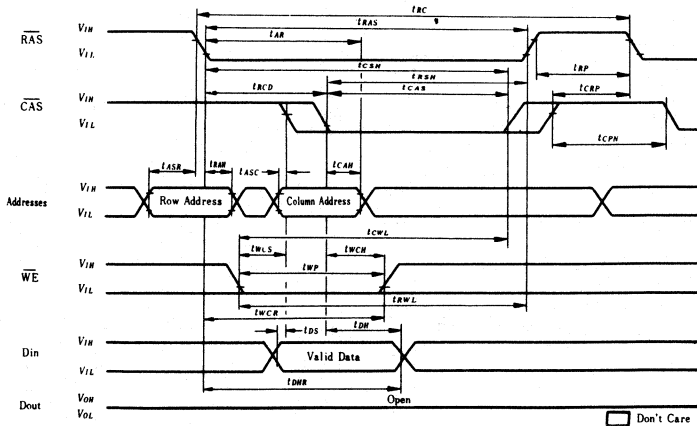

1. AC measurements assume $t_T = 5\text{ns}$.
2. Assumes that $t_{RCD} \leq t_{RCD}(\text{max})$. If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} exceeds the value shown.
3. Measured with a load circuit equivalent to 2TTL loads and 100pF.
4. Assumes that $t_{RCD} \geq t_{RCD}(\text{max})$.
5. $t_{OFF}(\text{max})$ defines the time at which the output achieves the open circuit condition and is not reference to output voltage levels.
6. $V_{IH}(\text{min})$ and $V_{IL}(\text{max})$ are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
7. Operation with the $t_{RCD}(\text{max})$ limit insures that $t_{RAC}(\text{max})$ can be met, $t_{RCD}(\text{max})$ is specified as a reference point only, if t_{RCD} is greater than the specified $t_{RCD}(\text{max})$ limit, then access time is controlled exclusively by t_{CAC} .
8. t_{WCS} , t_{CWD} and t_{RWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only; if $t_{WCS} \geq t_{WCS}(\text{min})$, the cycle is an early write cycle and the data output pin will remain open circuit (high impedance) throughout the entire cycle; if $t_{CWD} \geq t_{CWD}(\text{min})$ and $t_{RWD} \geq t_{RWD}(\text{min})$ the cycle is a read-write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied the condition of the data out (at access time) is indeterminate.
9. These parameters are referenced to $\overline{\text{CAS}}$ leading edge in early write cycles and to $\overline{\text{WE}}$ leading edge in delayed write or read-modify-write cycles.
10. An initial pause of 100 μs is required after power-up followed by a minimum of 8 initialization cycles.

HM4864ACG-12, HM4864ACG-15, HM4864ACG-20

Preliminary

65536-word × 1-bit Dynamic Random Access Memory

FEATURES

- 18-pin Leadless Chip Carrier
- Single 5V ($\pm 10\%$)
- On chip substrate bias generator
- Low Power: 250mW active, 18mW standby
- High speed: Access Time 120/150/200ns (max)
- Common I/O capability using early write operation
- Page mode capability
- Output data controlled by CAS
- TTL compatible
- 128 refresh cycles/2ms
- Hidden refresh capability

RFSH Precharge Time	t_{FI}	90	—	100	—	120	—	ns	

- Notes)
1. AC measurements assume $t_T = 5\text{ns}$.
 2. An initial pause of $100\mu\text{s}$ is required after power-up followed by a minimum of 8 initialization of cycles.
 3. $V_{IH}(\text{min})$ and $V_{IL}(\text{max})$ are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
 4. Assumes that $t_{RCD} = t_{RCD}(\text{max})$. If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} exceeds the value shown.
 5. Assumes that $t_{RCD} = t_{RCD}(\text{max})$.
 6. Measured with a load circuit equivalent to 2TTL loads and 100pF .
 7. $t_{OFF}(\text{max})$ defines the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.
 8. Operation with the $t_{RCD}(\text{max})$ limit insures that $t_{RAC}(\text{max})$ can be met, $t_{RCD}(\text{max})$ is specified as a reference point only, if t_{RCD} is greater than the specified $t_{RCD}(\text{max})$ limit, then access time is controlled exclusively by t_{CAC} .
 9. These parameters are referenced to $\overline{\text{CAS}}$ leading edge in early write cycles and to $\overline{\text{WRITE}}$ leading edge in delayed write or read-modify-write cycles.
 10. t_{WCS} , t_{CWD} and t_{RWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only; if $t_{WCS} = t_{WCS}(\text{min})$, the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if $t_{CWD} = t_{CWD}(\text{min})$ and $t_{RWD}(\text{min})$ the cycle is a read/write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied the condition of the data out (at access time) is indeterminate.

Notes

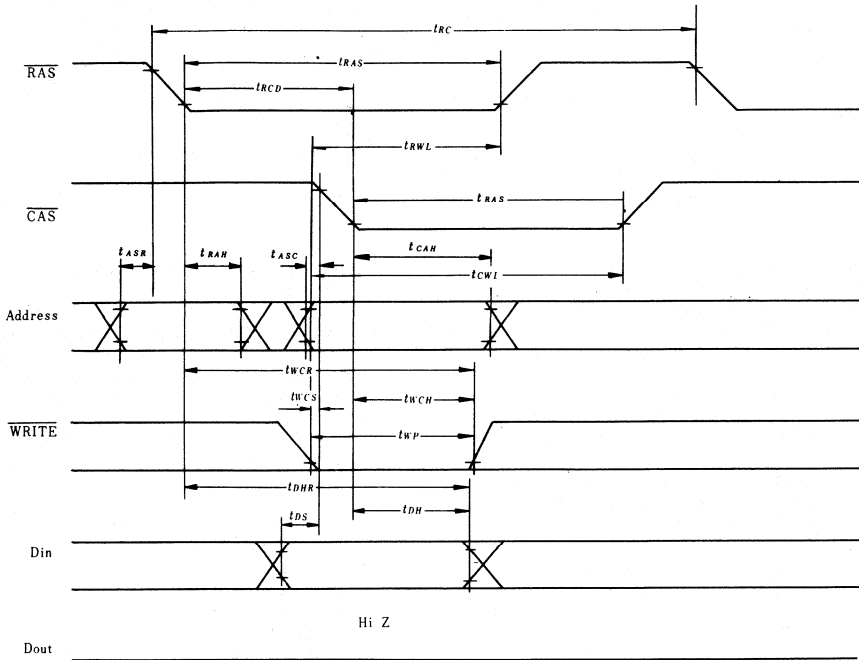

- AC measurements assume $t_T = 5ns$.
- Assumes that $t_{RCD} \leq t_{RCD} (max)$. If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} exceeds the value shown.
- Measured with a load circuit equivalent to 2TTL loads and 100pF.
- Assumes that $t_{RCD} \geq t_{RCD} (max)$.
- t_{OFF} (max) defines the time at which the output achieves the open circuit condition and is not reference to output voltage levels.
- V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} and V_{IL} .
- Operation with the t_{RCD} (max) limit insures that t_{RAC} (max) can be met, t_{RCD} (max) is specified as a reference point only, if t_{RCD} is greater than the specified t_{RCD} (max) limit, then access time is controlled exclusively by t_{CAC} .
- t_{WCS} , t_{CWD} and t_{RWD} are not restrictive operating parameters. They are included in the data sheet is electrical characteristics only; if $t_{WCS} \geq t_{WCS} (min)$, the cycle is an early write cycle and the data output pin will remain open circuit (high impedance) throughout the entire cycle; if $t_{CWD} \geq t_{CWD} (min)$ and $t_{RWD} \geq t_{RWD} (min)$ the cycle is a read-write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied the condition of the data out (at access time) is indeterminate.
- These parameters are referenced to \overline{CAS} leading edge in early write cycles and to \overline{WE} leading edge is delayed write or read-modify-write cycles.
- An initial pause of 100 μs is required after power-up followed by a minimum of 8 initialization cycles.
- Minimum of 8 CAS before RAS refresh cycle is required before using internal refresh counter.

HM50257-12, HM50257-15, — Preliminary HM50257-20

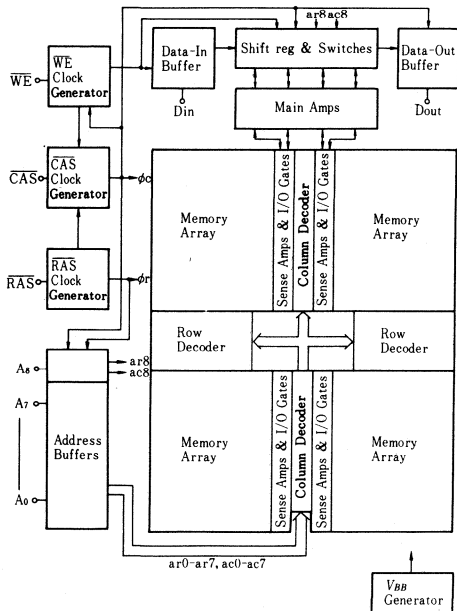

262144-word × 1-bit Dynamic Random Access Memory

■ FEATURES

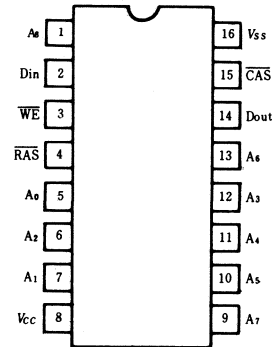

- Industry standard 16-pin DIP
- Single 5V (±10%)
- On chip substrate bias generator
- Low Power: 350mW active, 20mW standby
- High speed: Access Time 120ns/150ns/200ns (max.)
- Common I/O capability using early write operation
- Nibble mode capability
- Indefinite Dout hold using $\overline{\text{CAS}}$ control
- TTL compatible
- 256 refresh cycles (4ms)
- 3 Variations of refresh; $\overline{\text{RAS}}$ only refresh, $\overline{\text{CAS}}$ before $\overline{\text{RAS}}$ refresh, Hidden refresh

■ BLOCK DIAGRAM

■ ABSOLUTE MAXIMUM RATINGS

- Voltage on any pin relative to V_{SS} -1V to +7V
 Operating temperature, T_a (Ambient) 0°C to +70°C
 Storage temperature -65°C to +150°C
 Power dissipation 1W
 Short circuit output current 50mA

■ RECOMMENDED DC OPERATING CONDITIONS ($T_a=0$ to +70°C)

Parameter	Symbol	min	typ	max	Unit	Note
Supply Voltage	V_{CC}	4.5	5.0	5.5	V	1
Input High Voltage	V_{IH}	2.4	—	6.5	V	1
Input Low Voltage	V_{IL}	-1.0	—	0.8	V	1

Note 1) All voltages referenced to V_{SS} .

Note)

The specifications of this device are subject to change without notice. Please contact your nearest Hitachi Sales Dept. regarding specifications.

■ DC ELECTRICAL CHARACTERISTICS ($T_a=0$ to $+70^\circ\text{C}$, $V_{CC}=5\text{V}\pm 10\%$, $V_{SS}=0\text{V}$)

Parameter	Symbol	HM50257-12		HM50257-15		HM50257-20		Unit	Notes
		min	max	min	max	min	max		
Operating Current (RAS, CAS Cycling: $t_{RC}=\text{min}$)	I_{CC1}	—	83	—	70	—	55	mA	1
Stand by Current (RAS = V_{IH} , Dout = High Impedance)	I_{CC2}	—	4.5	—	4.5	—	4.5	mA	
Refresh Current (RAS only Refresh, $t_{RC}=\text{min}$)	I_{CC3}	—	62	—	53	—	42	mA	
Standby Current (RAS = V_{IH} , Dout Enable)	I_{CC5}	—	10	—	10	—	10	mA	1
Refresh Current (CAS before RAS Refresh, $t_{RC}=\text{min}$)	I_{CC6}	—	69	—	58	—	45	mA	
Input leakage ($0 < V_{in} < 7\text{V}$)	I_{LI}	-10	10	-10	10	-10	10	μA	
Output leakage ($0 < V_{out} < 7\text{V}$)	I_{LO}	-10	10	-10	10	-10	10	μA	
Output levels High ($I_{out} = -5\text{mA}$)	V_{OH}	2.4	V_{CC}	2.4	V_{CC}	2.4	V_{CC}	V	
Output levels Low ($I_{out} = 4.2\text{mA}$)	V_{OL}	0	0.4	0	0.4	0	0.4	V	

Notes) 1. I_{CC} depends on output loading condition when the device is selected I_{CC} max, is specified at the output open condition.

■ CAPACITANCE ($V_{CC}=5\text{V}\pm 10\%$, $T_a=25^\circ\text{C}$)

Parameter	Symbol	typ	max	Unit	Notes
Input Capacitance	Address, Data-In	C_{I1}	—	5	pF
	Clocks, Data-Out	C_{I2}	—	7	

Notes) 1. Capacitance measured with Boonton Meter or effective capacitance measuring method.
2. CAS = V_{IH} to disable Dout.

MOS MASK ROM

HN61364P, HN61364FP

8192-word x 8-bit Mask Programmable Read Only Memory

The HN61364P/FP is a mask-programmable, byte-organized memory designed for use in bus-organized systems.

To facilitate use, the device operates from a single power supply, has compatibility with TTL, and requires no clocks or refreshing because of static operation.

The active level of the CS, OE₀ ~ OE₂ inputs and the memory content are defined by the user. The Chip Select input deselected the output and puts the chip in a powerdown mode.

■ FEATURES

- Fully Static Operation
- Automatic Power Down
- Single +5V Power Supply
- Three-state Data Output for OR-ties
- Mask Programmable Chip Select and Output Enable
- TTL Compatible
- Maximum Access Time; 250ns
- Low Power Standby and Low Power Operation; Standby 5μW (typ), Operation 50mW (typ)
- Pin Compatible with EPROM

HN61366P

8192-word × 8-bit Mask Programmable Read Only Memory

The HN61366P is a mask-programmable, byte-organized memory designed for use in bus-organized systems.

To facilitate use, the device operates from a single power supply, has compatibility with TTL, and requires no clocks or refreshing because of static operation.

The active level of the OE input and the memory content are defined by the user.

■ FEATURES

- Fully Static Operation
- Single +5V power supply
- Three-State Data Output for OR-Ties
- Mask Programmable Output Enable
- TTL Compatible
- Maximum Access Time; 250ns
- Low Power Operation; 50mW (typ.)
- Pin Compatible with EPROM

HN43128P

16384 × 8-bit or 32768 × 4-bit CMOS Mask Programmable Read Only Memory

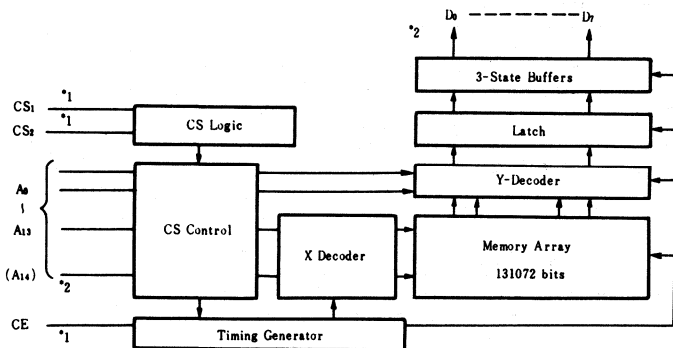

The Hitachi HN43128P is a mask programmable, 16384x8-bit or 32768x4-bit CMOS read only memory. It operates from a single power supply and is compatible with TTL and DTL. Low power consumption makes this memory well-suited for battery-operation or hand-held personal computers. Memory expansion can be implemented through two chip select inputs. Either active "High" or active "Low" of chip select inputs and a chip enable input is defined at mask level. The organization of 8 bit or 4 bit is designed by the user.

■ FEATURES

- Mask-programmable for either 4-bit or 8-bit organization.
- Three-state outputs, can be wired-OR.
- Two mask programmable chip select terminals facilitate memory expansion.
- A single 5V power supply ($\pm 10\%$).
- Low power consumption: Operation 3mW (typ.), Standby 3 μ W (typ.)
- TTL compatible
- Access time: 6.5 μ s (max)

■ BLOCK DIAGRAM

MOS PROM

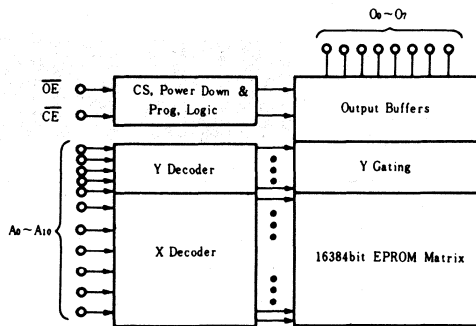

HN462716, HN462716G

2048-word × 8-bit U.V. Erasable and Electrically Programmable Read Only Memory

The HN462716 is a 2048 word by 8 bit erasable and electrically programmable ROMs. This device is packaged in a 24-pin, dual-in-line package with transparent lid. The transparent lid allows the user to expose the chip to ultraviolet light to erase the bit pattern, whereby a new pattern can then be written into the device.

- Single Power Supply +5V ±5%
- Simple Programming Program Voltage: +25V DC
Programs with One 50ms Pulse
- Static No Clocks Required
- Inputs and Outputs TTL Compatible During Both Read and Program Modes
- Fully Decoded-on Chip Address Decode
- Access Time 450ns Max.
- Low Power Dissipation . . 555mW Max. Active Power
161mW Max. Standby Power
- Three State Output OR- Tie Capability
- Interchangeable with Intel 2716

Notes : V_{CC} must be applied simultaneously or before V_{PP} and removed simultaneously or after V_{PP} .

* : t_{DF} defines the time at which the output achieves the open circuit condition and is not referenced to output voltage levels.

● SWITCHING CHARACTERISTICS

Test Conditions

Input Pulse Level: 0.8V to 2.2V

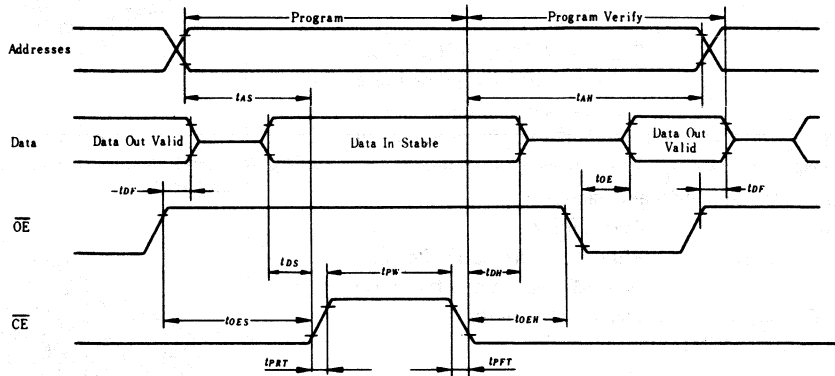

Input Rise and Fall Times: ≤ 20 ns

Output Load: 1 TTL Gate + 100 pF

Reference Level for Measuring Timing:

Inputs: 1V and 2V, Outputs: 0.8V and 2V

● PROGRAMMING WAVEFORMS

● ERASE

Erasure of HN462716 is performed by exposure to ultraviolet light with a wavelength of 2537Å, and all the output data are changed to "1" after this erasure procedure.

The minimum integrated dose (i.e., UV intensity x exposure time) for erasure is $15W \cdot sec/cm^2$

■ DEVICE OPERATION

● READ MODE

Dataout is available 450ns (t_{ACC}) from addresses with \overline{OE} low or 120ns (t_{OE}) from \overline{OE} with addresses stable.

● DESELECT MODE

The outputs may be OR-tied together with the other HN462716s. When HN462716s are deselected, the \overline{OE} inputs must be at high TTL level.

● POWER DOWN MODE

Power down is achieved with \overline{CE} high TTL level. In this mode the outputs are in a high impedance state.

● PROGRAMMING

Initially, and after each erasure, all bits of the HN462716 are in the "High" state (Output High). Data is introduced by selectively programming "low" into the desired bit locations. In the programming mode, V_{pp} power supply is at 25V and \overline{OE} input is at high TTL level. Data to be programmed are presented 8-bits in parallel, to the data output lines (O0 to O7).

The addresses and inputs are at TTL levels.

After the address and data setup, a 50 ms, active high program pulse is applied to the \overline{CE} input. The \overline{CE} is at TTL level.

The HN462716 must not be programmed with a DC signal applied to the \overline{CE} input.

● PROGRAM VERIFY

The HN462716 has a program verify mode. A verify should be performed on the programmed bits to determine that they were correctly programmed. In this mode V_{pp} is at 25V.

● PROGRAM INHIBIT

Programming of multiple HN462716s in parallel with different data is easily accomplished by using this mode. Except for \overline{CE} , all like inputs of the parallel HN462716s may be common.

A TTL program pulse applied to a HN462716's \overline{CE} input will program that HN462716. A low level \overline{CE} inhibits the other HN462716s from being programmed.

HN462532, HN462532G

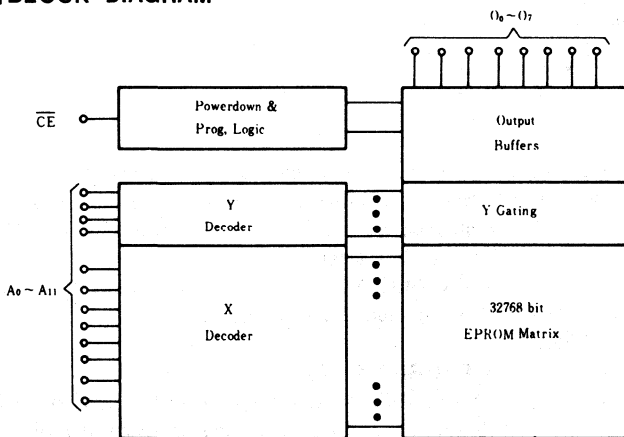

4096-word × 8-bit U. V. Erasable and Programmable Read Only Memory

The HN462532 is a 4096 word by 8 bit erasable and electrically programmable ROM. This device is packaged in a 24-pin, dual-in-line package with transparent lid. The transparent lid allows the user to expose the chip to ultraviolet light to erase the bit pattern, whereby a new pattern can then be written into the device.

FEATURES

- Single Power Supply +5V ±5%

● SWITCHING CHARACTERISTICS

● ERASE

Erasure of HN462732 is performed by exposure to Ultra-violet light of 2537A, and all the output data are changed to "1" after this procedure.

The minimum integrated dose (i.e., UV intensity x exposure time) for erasure is $15W \cdot sec/cm^2$

HN482732AG-20, HN482732AG-25, HN482732AG-30

4096-word × 8-bit U. V. Erasable and Programmable Read Only Memory

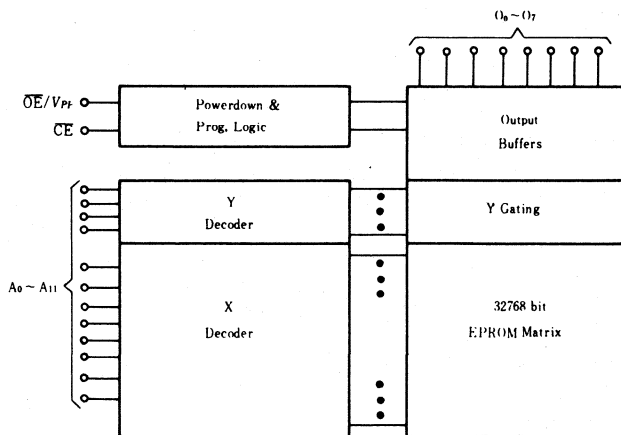

The HN482732A is a 4096-word by 8-bit erasable and electrically programmable ROM. This device is packaged in a 24 pin dual-in-line package with transparent lid.

The transparent lid on the package allow the memory content to be erased with ultraviolet light.

FEATURES

- Single Power Supply +5V ±5%
- Simple Programming Program Voltage: +21V D.C.
Program with one 50ms Pulse
- Static No clocks Required
- Inputs and Outputs TTL Compatible During Both Read and Program Mode
- Access Time HN482732AG-20 200ns (max)
HN482732AG-25 250ns (max)
HN482732AG-30 300ns (max)
- Absolute Max. Rating of Vpp Pin . . . 26.5V
- Low Stand-by Current 35mA (max)
- Compatible with Intel 2732A

Preliminary

16384-Word x 8-bit UV Erasable and Programmable Read Only Memory

The HN4827128 is a 16384 word by 8 bit erasable and electrically programmable ROM. This device is packaged in a dual-in-line package with transparent lid. The transparent lid allows the user to expose the chip to ultraviolet light to erase the bit pattern, whereby a new pattern can then be written into the device.

FEATURES

- Single Power Supply +5V ± 5%
- Simple Programming Program Voltage: +21V DC
Program with One 50ms Pulse
- Static No Clocks Required
Inputs and Outputs TTL Compatible During Both Read and Program Mode.
- Access Time 250ns/300ns/450ns
- Absolute Max. Rating of Vpp Pin 26.5V
- Low Stand-by Current 35mA
- High Performance Programming Available
- Compatible with INTEL 27128

- Reference Level for Measuring Timing: Input; 1V and 2V
Output; 0.8V and 2V

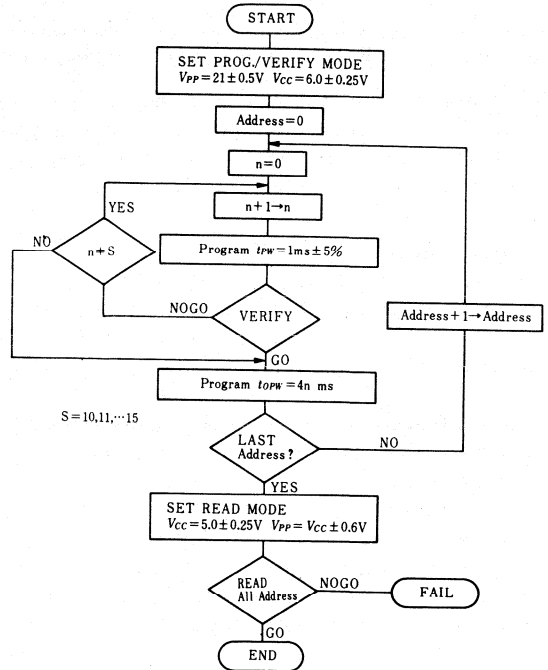

ERASE

Erase of HN4827128 is performed by exposure to ultraviolet light of 2537Å and all the output data are changed to "1" after this erasure procedure. The minimum integrated dose (i.e. UV intensity x exposure time) for erasure is 15 W·sec/cm².

■ HIGH PERFORMANCE PROGRAMMING

This device can be applied the High Performance Programming algorithm shown in following flow chart. This algorithm allows to obtain faster programming time without any voltage stress to the device nor deterioration in reliability of programmed data.

High Performance Programming Flowchart

● AC PROGRAMMING CHARACTERISTICS ($T_a = 25^\circ\text{C} \pm 5^\circ\text{C}$, $V_{CC} = 6\text{V} \pm 0.25\text{V}$, $V_{PP} = 21\text{V} \pm 0.5\text{V}$)

HN48016P

2048-word × 8-bit Electrically Erasable and Programmable ROM

This device operates from a single power supply and features fast single address location programming. All the words are erased by one TTL level pulse. Erasing the bit pattern and programming new pattern can be made within 42 seconds.

■ FEATURES

- Single Power Supply +5V ±5%
- Simple Programming Program voltage: +25V D.C.
Program with one 20ms pulse.
- Electrically Erasing Erase Voltage: +25V D.C.
Erase all words with one 200ms pulse.
- Fully Static No clocks required.
- Inputs and Outputs TTL compative during read, program and erase mode.
- Fully Decoded On-Chip Address Decode.
- Access Time 350ns Max.
- Low Power Dissipation 300mW Max.
- Three State Output OR-Tie Capability
- Pin-out Compatible with Intel 2716.

■ POWER SUPPLY SEQUENCE PRECAUTIONS

To protect the written data, power supply to the HN48016P should be turned on and off in the following order:

● Power On-Off Order and Input Level Limitation for $\overline{\text{CS}}$ and PGM Terminals

Table 1 shows the relationship between the order in which power supply for the HN48016P should be turned on and off and the input levels of the $\overline{\text{CS}}$ and PGM terminals.

- (1) For the 5V V_{PP} and V_{CC} , there is no limitation as to the order in which power is turned on and off the state of the input terminals $\overline{\text{CS}}$ and PGM.
- (2) When turning on and off power supply for the 25V V_{PP} , keep V_{CC} at between 4.5V and 7V, and PGM at "Low."
- (3) When turning on and off power supply for the 5V V_{CC} while V_{PP} equals $25V \pm 1V$ (this being a rare case for the HN48016P), make sure to keep PGM at "Low."

Fig. 1 shows the timing order in which power is turned on and off.

● Table 1. Power On-Off Order for HN48016P

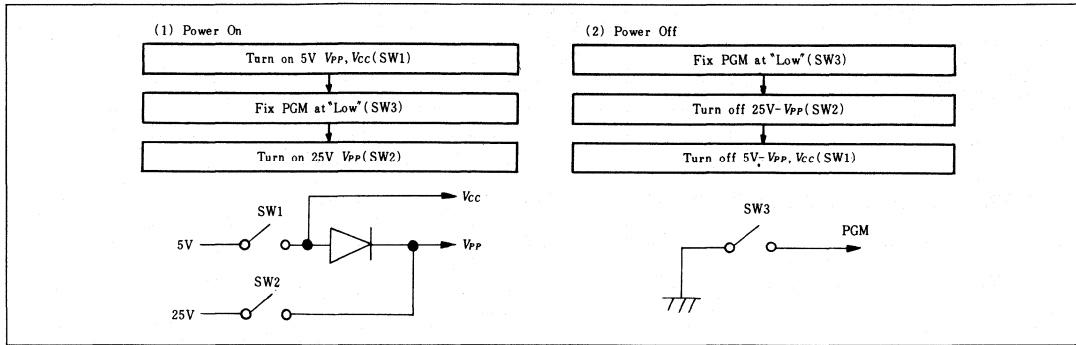

Input Level		Power On-Off	
PGM	$\overline{\text{CS}}$	5V- V_{PP} - V_{CC}	25V- V_{PP}
V_{IL}	V_{IL}	Possible	Possible only when $V_{CC}=4.5\sim 7V^{*2}$
V_{IL}	V_{IH}		
V_{IH}	V_{IL}	Possible	impossible ^{*2}
V_{IH}	V_{IH}		

Note 1. If Power for the 25V V_{PP} were turned on or off while $V_{CC} = -0.3V$ to $+4.5V$, the data holding characteristic would probably deteriorate.

Note 2. If the 25V V_{PP} were operated to choose a "write" or "erase" mode while PGM = " V_{IH} ," contents of ROM would probably change.

● Example of Standard Power Supply Sequence

The following is an example of standard power supply sequence:

● Inter-mode Timing

The HN48016P has six operating modes, 5V Vpp read-out, non-selected, 25V Vpp write, write check, write inhibit, and erase. To protect the written data, keep the terminal PGM at "Low" for a period of 10μs before and after turning the terminal Vpp from 5V to 25V and vice versa.

The following describes the inter-mode timing for a system that uses the HN48016P.

● Readout → Write → Readout

Before turning the terminal Vpp to 25V, keep the terminal PGM at "Low" for a period of 10μs minimum (as indicated by tvs). After the terminal Vpp has been turned to 25V, keep the terminal CS at "Low" for a period of 10μs minimum (as indicated by tps). Before turning the terminal Vpp to 5V, keep the terminal CS at "Low" for a period of 10μs minimum (as indicated by tps). After the terminal Vpp has been turned to 5V, keep the terminal PGM at "Low" for a period of 10μs minimum (as indicated by tvh).

● Readout → Erase → Readout

This timing sequence is shown in Fig. 3. After turning the terminal Vpp to 25V, keep the terminal PGM at "Low" for a period of 10μs minimum (as indicated by tes). Keep the terminal PGM at "Low" for a period of 10μs minimum (as indicated by teH) before turning the terminal Vpp to 5V, as well.

● Erase → Write → Erase

This timing sequence is shown in Fig. 4. Before turning the terminal CS to "High (write mode)," keep the terminal PGM at "Low" for a period of 10μs minimum (as indicated by tep).

Before turning from "write" to "erase," keep the terminal CS at "Low" for a period of 10μs minimum (as indicated by tpe).

Fig. 1. Power on-off timing sequence.

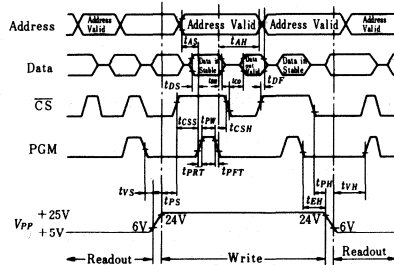

Fig. 2. "Readout → Write → Readout" timing

Fig. 3. "Readout → Erase → Readout" timing.

Fig. 4. "Erase → Write → Erase" timing.

BIPOLAR RAM

HM10414, HM10414-1

256-word × 1-bit Fully Decoded Random Access Memory

The HM10414 is ECL 10K compatible, 256-word × 1-bit, read write, random access memory developed for high speed systems such as scratch pad and control/buffer storages.

The fabrication process uses the Hitachi's low capacitance, oxide isolation method with double metalization.

The HM10414 is encapsulated in cerdip-16pin package, compatible with Fairchild's F10414.

- Fully compatible with 10K ECL level
- Address access time: HM10414: 10ns (max.)
HM10414-1: 8ns (max.)
- Write pulse width: 6ns (min.)
- Three chip select pins
- Output obtainable by wired-OR (open emitter)

HM2112, HM2112-1

1024-word × 1-bit Fully Decoded Random Access Memory

The HM2112 is an ECL compatible, 1024-word × 1-bit, read/write, random access memory developed for application to scratch pads, control and buffer memories, etc. which require high speeds.

■ FEATURES

- Level 10k ECL Compatible
- Construction 1024-word by 1-bit
- Address Access Time HM2112 10ns (max.)
HM2112-1 8ns (max.)
- Chip Select Access Time 5ns (max.)
- Power Consumption 0.8mW/bit (typ)
- Output Obtainable by Wired-OR (open emitter)
- Fully Pin Compatible with F10415

HM10422

256-word × 4-bit Fully Decoded Random Access Memory

The HM10422 is ECL 10K compatible, 256-word × 4-bit, read write, random access memory developed for high speed systems such as scratch pads and control buffer storages.

Four active Low Block Select lines are provided to select each block independently.

The fabrication process is the Hitachi's low capacitance, oxide isolation method with double metalization.

The HM10422 is encapsulated in cerdip-24 pin package, compatible with Fairchild's F10422.

(DG-24A)

FEATURES

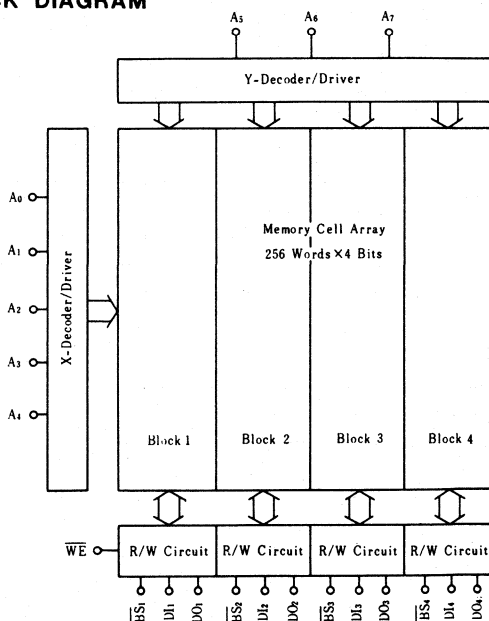

- 256-word × 4 bit organization.
- Fully compatible with 10K ECL level
- Address access time: 10ns (max)
- Write pulse width: 6ns (min)
- Power dissipation: 0.8mW/bit
- Output obtainable by wired-OR (open emitter)

HM10470-15

4096-word × 1-bit Fully Decoded Random Access Memory

The HM10470 is ECL 10K compatible, 4096-words x 1-bit, read/write, random access memory developed for high speed systems such as scratch pads and control/buffer storages.

The fabrication process uses the Hitachi's low capacitance, oxide isolation method with double metalization.

The HM10470 is encapsulated in cerdip-18 pin package, compatible with Fairchild's F10470.

FEATURES

- 4096-word x 1-bit organization
- Fully compatible with 10K ECL level
- Address access time: 15ns (max)
- Write pulse width: 15ns (min)
- Low power dissipation: 0.2 mW/bit
- Output obtainable by wired-OR (open emitter)

HM100415, HM100415CC

1024-word × 1-bit Fully Decoded Random Access Memory

The HM100415 is a 1024-word x 1-bit, read/write random access memory developed for application to scratch pads, control and buffer storages which require very high speeds.

The HM100415 is compatible with the HD100K families and includes on-chip voltage and temperature compensation for improved noise margin. This memory is encapsulated in cerdip-16pin package.

FEATURES

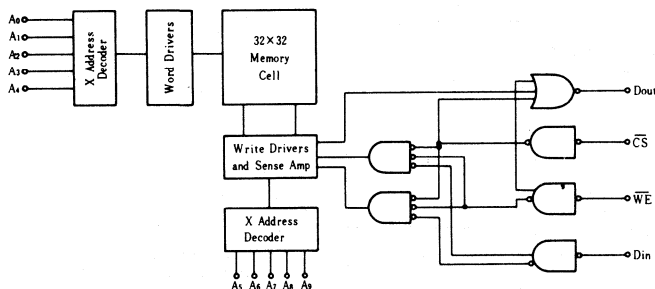

- Level 100K ECL Compatible
- Organization 1024-word by 1-bit
- Address Access Time 10ns (max)
- Chip Select Access Time 5ns (max.)
- Power Consumption 0.6mW/bit (typ)
- Output Obtainable by Wired-OR (open emitter)
- Compatible with Fairchild F100415.

HM100422, HM100422F HM100422CC

256-word × 4-bit Fully Decoded Random Access Memory

The HM100422 is ECL 100K compatible, 256-word x 4-bit, read write, random access memory developed for high speed system such as scratch pads and control/buffer storages.

Four active Low Block Select lines are provided to select each block independently.

The fabrication process is the Hitachi's low capacitance, oxide isolation method with double metalization.

The HM100422 is encapsulated in cerdip-24pin package, or 24pin flat package compatible with Fairchild's F100422.

FEATURES

- 256-word x 4-bit organization
- Fully compatible with 100K ECL level
- Address access time: 10ns (max.)
- Minimum write pulse width: 6ns (min.)
- Low power dissipation: 0.8mW/bit
- Output obtainable by wired-OR (open emitter)

HM2504, HM2504-1

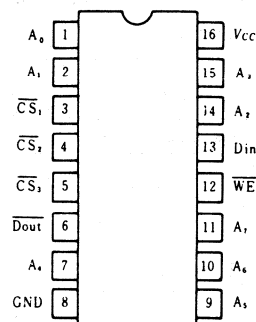

256-word × 1-bit Fully Decoded Random Access Memory

The HM2504 Series item is a TTL compatible, 256-word × 1-bit, read/write random access memory developed for application to buffer memories, control memories, high-speed main memories, etc. This is a fully decoded, read/write random access memory perfectly compatible with the TTL logic family, designed as an open collector output type for simplicity of expansion.

- Level TTL compatible
- Construction 256-word × 1 bit
- Read access time HM2504: 55ns (max)
HM2504-1: 45ns (max.)
- Chip select access time 30ns (max.)
- Power consumption 1.8mW/bit (typ)
- Output Open collector

1024-word × 1-bit Fully Decoded Random Access Memory

The HM2510 Series item is a 1024-word × 1-bit read/write random access memory developed for application to buffer memories, control memories, high-speed main memories, etc. It is a fully decoded, read write, random access memory perfectly compatible with TTL logic families, designed as an open collector output type for simplicity of expansion.

- Level TTL compatible
- Construction 1024-word × 1 bit
- Read access time HM2510: 70ns (max.)
HM2510-1: 45ns (max.)
HM2510-2: 35ns (max.)
- Chip select access time HM2510: 40ns (max.)
HM2510-1: 30ns (max.)
HM2510-2: 25ns (max.)
- Power consumption 0.5mW/bit
- Output Open collector

PROGRAMMING INFORMATION

Hitachi's sophisticated Fine Emitter technology and programming pulse method enables higher programmability and faster programming time ordinary PROMs, for the highest reliability.

Fast programming time of typically $7.5\mu\text{s}/\text{bit}$ is achieved with a fine emitter cell which requires less programming energy; thus, negligible thermal stress. Further, Hitachi advanced technology allows very high programmability.

To assure that the element is programmed properly an additional four programming pulses are applied immediately after a sense pulse indicates conduction in the programmed (one programming pulse: Series) bit. This high reliability feature virtually eliminates aluminum migration in the programmed cell.

One extra row and one extra column of test cells, plus additional circuitry built into the PROM chip, allow improved factory testing of DC, AC and programming characteristics. These test cells and test circuitry provide enhanced correlation between programmed and unprogrammed circuits in order to guarantee high programmability and reliability.

PROGRAMMED CELL (CROSS SECTION)

The device is manufactured with outputs low (positive logic "zero") in all storage cells. To make an output high at a particular cell, a junction must be changed from a blocking state to a conducting state. This procedure is called programming.

A logic "one" can be permanently programmed into a selected bit location. The desired bit for programming is selected using ten address inputs to turn on transistors Q1 and Q2. By taking either (or both) chip enable inputs high, the chip is disabled and transistor Q3 is held off. Then, a train of programming pulses applied to the desired output flows through the junction into transistor Q1. This programming current changes the junction to the conducting state. The pulse train is stopped as soon as the sensed voltage indicates that the selected bit is in the logic in state.

An additional 4 programming pulses (1 programming pulse: S-series) are required to ensure that the bit is fully programmed, and to achieve high reliability. One output must be programmed at a time, since the internal decoding circuit is capable of sinking only one unit of programming current at time.

INTERNAL PROGRAMMING CIRCUIT

■ HITACHI PROMS AND PROGRAMMING CURRENT

Memory Size	Organization	Output	N-Series	S-Series
4k	1k×4	O.C.	HN25044 (50ns max)	—
		3 S	HN25045 (50ns max)	—

		3 S	HN25089 (60ns max) HN25089L(100ns max)	HN25089S(50ns max)
16k	2k×8	O.C.	—	HN25168S(60ns max)
		3 S	—	HN25169S(60ns max)
Programming Current			130mA(typ)	90mA(typ)

Note) O.C. : Open Collector Output
3 S : Three State Output

Hitachi's PROM has two families in accordance with the program specifications. They are usually discriminated by the suffix of the model name. For the S-series PROM, the production technique established for the N-series PROM is further improved to attain very small memory cell area and chip area as well as high performance.

HN25044, HN25045

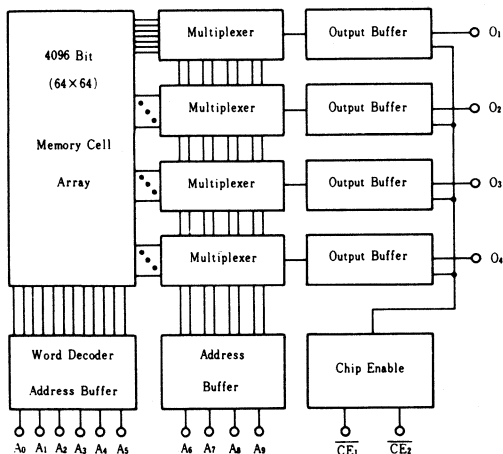

1024-word × 4-bit Programmable Read Only Memory

The HITACHI HN25044 and HN25045 are high speed electrically programmable, fully decoded TTL Bipolar 4096 bit read only memories organized at 1024 words by 4 bits with on-chip address decoding and two chip enable inputs. The HN25044 and HN25045 are fabricated with logic level "zeros" (low); logic level "ones" (high) can be electrically programmed in the selected bit locations. The same address inputs are used for both programming and reading.

■ FEATURES

- 1024 words x 4 bits organization (fully decoded)
- TTL Compatible inputs and outputs
- Fast read access time; 30 ns typ. (50 ns max.)
- Medium power consumption; 500 mW typ.
- Two Chip enable inputs for memory expansion
- Open collector outputs (HN25044)/Three-state outputs (HN25045)
- Standard cerdip 18-pin package

HN25084, HN25085

2048-word × 4-bit Programmable Read Only Memories

The HITACHI HN25084 and HN25085 are high speed electrically programmable, fully decoded TTL Bipolar 8192 bit read only memories organized as 2048 word by 4 bit with on-chip address decoding and one chip enable input. The HN25084 and HN25085 are fabricated with logic level "zeros" (low); logic level "ones" (high) can be electrically programmed in the selected bit locations. The same address inputs are used for both programming and reading.

■ FEATURES

- 2048 word × 4 bit organization (fully decoded)
- TTL compatible inputs and outputs
- Fast read access time: 40 ns typ. (60 ns max)
- Medium power consumption: 550 mW typ.
- One chip enable input for memory expansion
- Open collector outputs (HN25084)/Three-state outputs (HN25085)
- Standard cerdip 18-pin dual in-line package

■ OPERATION

● Programming

A logic one can be permanently programmed into a selected bit location by using programming equipment. First, the desired word is selected by the ten address inputs in TTL level. The device is disabled by bringing \overline{CE} to a logic "one". Then a train of high current programming pulses is applied to the desired output. After the sensed voltage indicates that the selected bit is in the logic "one" state, an additional pulse train is applied, then is stopped.

● Reading

To read the memory the device is enabled by bringing \overline{CE} to a logic "zero". The outputs then correspond to the data programmed in the selected word.

■ TYPICAL WAVEFORMS

HN25084S, HN25085S

2048-word × 4-bit Programmable Read Only Memories

The HITACHI HN25084S and HN25085S are high speed electrically programmable, fully decoded TTL Bipolar 8192 bit read only memories organized as 2048 words by 4 bits with on-chip address decoding and one chip enable input. The HN25084S and HN25085S are fabricated with logic level "zeros" (low); logic level "ones" (high) can be electrically programmed in the selected bit locations. The same address inputs are used for both programming and reading.

■ FEATURES

- 2048 words × 4 bits organization (fully decoded)
- TTL compatible inputs and outputs
- Fast read access time: 25 ns typ. (50 ns max)
- Medium power consumption: 550 mW typ.
- One chip enable input for memory expansion
- Open collector outputs (HN25084S)/Three-state outputs (HN25085S)
- Standard cerdip 18-pin dual in-line package.

■ OPERATION

● Programming

A logic one can be permanently programmed into a selected bit location by using programming equipment. First, the desired word is selected by the ten address inputs in TTL level. The device is disabled by bringing \overline{CE} to a logic "one". Then a train of high current programming pulses is applied to the desired output. After the sensed voltage indicates that the selected bit is in the logic "one" state, an additional pulse train is applied, then is stopped.

● Reading

To read the memory the device is enabled by bringing \overline{CE} to a logic "zero". The outputs then correspond to the data programmed in the selected word.

HN25168S, HN25169S

2048-word × 8-bit Programmable Read Only Memories

The HITACHI HN25168S and HN25169S are high speed electrically programmable, fully decoded TTL Bipolar 16384 bit read only memories organized as 2048 words by 8 bits with on-chip address decoding and three chip enable inputs. The HN25168S and HN25166S are fabricated with logic level "zeros" (low); logic level "ones" (high) can be electrically programmed in the selected bit locations. The same address inputs are used for both programming and reading.

FEATURES

- 2048 words × 8 bits organization (fully decoded)
- TTL compatible inputs and outputs
- Fast read access time: 40 ns typ. (60 ns max)
- Medium power consumption: 600 mW typ.
- Three chip enable inputs for memory expansion.
- Open collector outputs (HN25168S)/Three-state outputs (HN25169S)
- Standard cerdip 24-pin dual in-line package

OPERATION

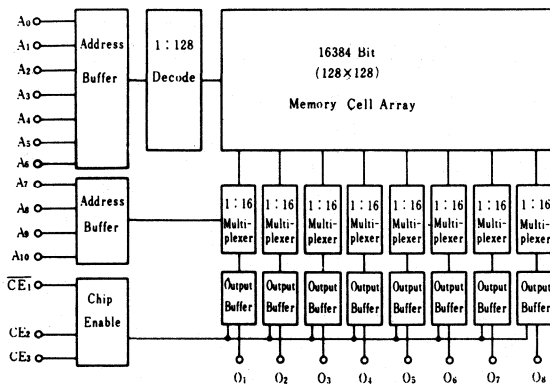

Programming

A logic one can be permanently programmed into a selected bit location by using programming equipment. First, the desired word is selected by the eleven address inputs in TTL level. The device is disabled by bringing CE1 to as logic "one" or CE2 and/or CE3 to a logic "zero". Then a train of high current programming pulses is applied to the desired output. After the sensed voltage indicates that the selected bit is in the logic one state, an additional pulse is applied, then is stopped.

Reading

To read the memory the device is enabled by bringing CE1 to a logic "zero", CE2 and CE3 to a logic "one". The outputs then correspond to the data programmed in the selected word.

MEMORY SUPPORT CIRCUITS

HD2912

Quadruple TTL-to-MOS Clock Drivers

The HD2912, a clock driver for the MOS memory, has basically the NAND function. Its input is a TTL level and its output becomes an N MOS clock input level. It operates on two power supplies – V_{CC} (5V) and V_{DD} (12V). It anticipates taking as its load a maximum of ten units of 4K-bit N MOS memories and can drive a load capacity of 400 pF at high speed.

- TTL-MOS level converter circuit
- Switching time: 50 ns (max.)
- Load capacity drivable: 600pF
- Mounted with 4 circuits
- Applicable temperature: 0 to 70°C

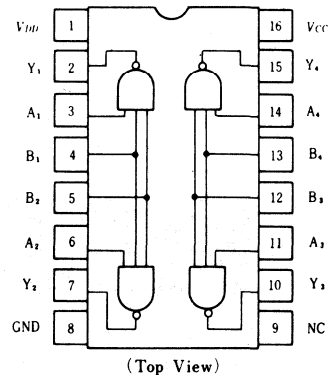

■ ABSOLUTE MAXIMUM RATINGS

Item	Symbol	HD2912	Unit
Supply Voltage	V_{CC}^*	7.0	V
	V_{DD}^*	18.0	V
Input Voltage	$V_{i\alpha}^*$	5.5	V
Load Capacitance	C_L^{**}	600	pF
Power Dissipation	P_T^{***}	800	mW
Operating Temperature	T_{opr}	0 to +70	°C
Storage Temperature	T_{stg}	-65 to +150	°C

ITEMS REQUIRING CARE WHEN USING THE HD2912

When measuring or mounting the HD2912, consider the following.

1. At the time of "H" level output, if a short circuit occurs between the output terminal and the other terminal (the GND terminal or input terminal), the element will breakdown.
2. When measuring the input/output characteristic of the circuit, do not place the input level in the vicinity of the threshold voltage (about 1.5V) for more than 10 seconds. If this caution is neglected, the element may breakdown.
3. If its load capacity is less than a certain value (100pF), sometimes this element cannot fully provide its function. Take note of this fact when designing a system.
4. When mounting this element, it is recommended providing the output terminal with a damping resistor (R_D) or a diode terminating circuit.

HD2916

Quadruple TTL-to-NMOS Clock Drivers

The HD2916, a clock driver for the MOS memory, basically possesses a NAND function. Its Input is a TTL level and its output becomes N MOS clock input level. It operates on two power supplies – V_{CC} (5V) and V_{DD} (12V). Assuming that a maximum of five units of 4K-bit N MOS memories may be connected, it is designed to drive a load capacity of 200pF at high speeds.

FEATURES

- TTL-MOS level converter
- Switching time: 50 ns (max.)
- Average power consumption: 600mW (max.)
- Load capacity drivable: 300pF
- Mounted with 4 circuits
- Applicable temperature: 10 to 65°C

THE HD2916**

When measuring or mounting the HD2916, consider the following:

1. At the time of "H" level output, if a short circuit occurs between the output terminal and the other terminal (the GND terminal or input terminal), the element will breakdown.
2. When measuring the input/output characteristic of the circuit, do not place the input level in the vicinity of the threshold voltage (about 1.5V) for more than 10 seconds. If this caution is neglected, the element may breakdown.

HD2923

Quadruple ECL to TTL Drivers

The HD2923 is a monolithic, high speed Quadruple ECL to TTL Driver which accepts ECL input signals. It provides high output current suitable for driving the TTL clock inputs or other address multiplexing inputs of N-channel MOS memories such as the HM4816A of MK4116. Power supply requirements are ground, +5.0 Volts and -5.2 Volts. The HD2923 requires no particular power supply sequencing in order to assure standby mode of memories, because the outputs are always "high" at applying the power. Propagation delay is 10ns MAX.

The HD2923 is fabricated by means of HITACHI's Schottky Bipolar technology to assure high performance over the 0°C to 75°C ambient temperature range.

FEATURES

- High Speed $t_{pd} = 10\text{ns MAX.}$ (50% to 2.2V dc out or to +1.0V dc out, 200pF Load)
- Low Power 250mW typ. (DC)
- 10K ECL Compatible Inputs
- Pin Compatibility MC10125 or HD10125
