## Low Dropout Positive Voltage Regulators

- 800mA
- 2.5V, 3.0V and 3.3V Output

The IMP37 series of Low Dropout (LDO) three-terminal voltage regulators feature guaranteed low dropout voltages at currents up to 0.8A. The IMP37 regulator family dropout voltage is guaranteed to be 0.95V or lower at 0.8A. At 100mA, the maximum dropout voltage is 0.8V. Compared with "1117" type LDOs, the IMP37 has a 20% lower dropout voltage.

Three fixed output voltages are offered: 2.5V, 3.0V and 3.3V. Output voltages are factory trimmed to within 1% of the nominal value.

In addition to low dropout voltages, the IMP37 family features greatly reduced quiescent operating current. The 75 $\mu$ A maximum specification represents an over 100 times improvement over competitive devices.

Devices are short circuit protected, and a thermal protection circuit shuts the regulator off should the junction temperature exceed 165°C.

The IMP37 is available in low-profile plastic SOT-223 and TO-263 packages and are pin compatible with fixed "1117" devices.

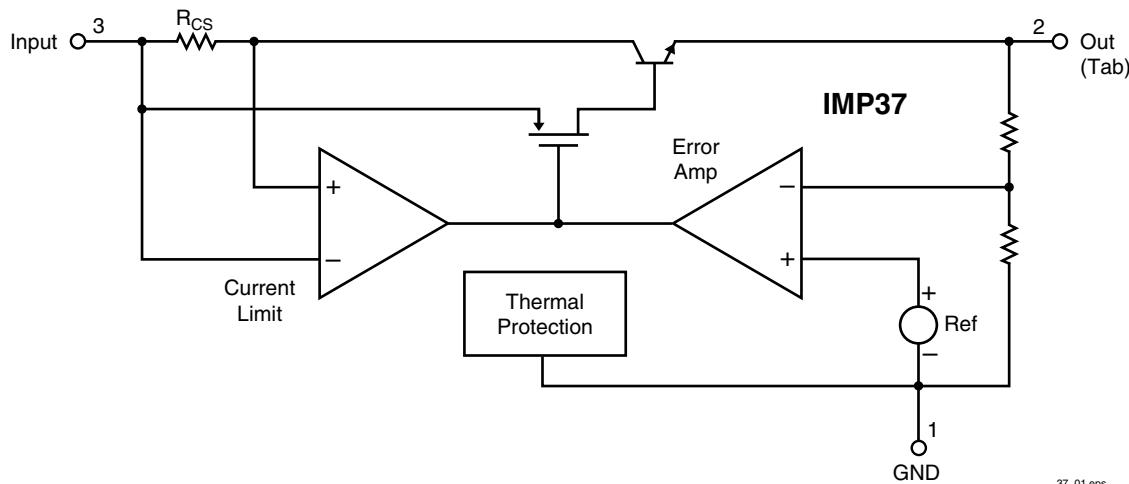

### Key Features

- ◆ Low Dropout Voltage
  - 0.8V maximum at 100mA
  - 0.95V maximum at 800mA
  - 20% lower dropout voltage than "1117" LDO regulators
- ◆ Guaranteed Low Dropout Voltage at Multiple Current Levels
- ◆ 1% Trimmed 2.5V, 3.0V and 3.3V Outputs
- ◆ Reduced Quiescent Current: 75 $\mu$ A Maximum
- ◆ Short Circuit and Thermal Protection
- ◆ Space Saving SOT-223 Surface Mount Package
- ◆ "1117" Pin Compatible

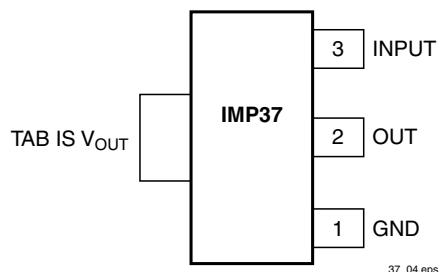

### Applications

- ◆ High-efficiency linear power supplies
- ◆ Post regulator for switching supplies
- ◆ 5V to 3.3V linear regulators
- ◆ USB hubs
- ◆ Battery chargers
- ◆ Routers, ISDN/DSL modems

- Notes: 1. See thermal regulation specification for changes in output voltage due to heating effects. Load regulation and line regulation are measured with low duty cycle pulse testing to maintain a constant junction temperature.
2. Dropout voltage is specified over the full output current range. Dropout voltage is defined as the minimum input/output differential measured at the specified output current.
3. Minimum load current is defined as the minimum output current required to maintain regulation.

## Application Information

The IMP37 voltage regulator ICs offer self-protection features which include short-circuit current protection and automatic thermal shutdown (for junction temperature above 165°C).

### Circuit Stability

Like all regulators, an output filter capacitor is required for circuit stability. Besides smoothing the output, the output capacitor "completes" the regulator's frequency compensation. The ESR of the output capacitor should be less than 0.5Ω. Low ESR capacitors are preferred.

*Table 1* shows recommended minimum capacitance values for both aluminum and tantalum capacitors. Larger values of output capacitance do not cause stability problems.

**Table 1. Recommended Output Bypass Capacitors**

Output Bypass Capacitor (ESR < 0.5Ω)
10µF Tantalum, 100µF Aluminum

An input bypass capacitor is recommended. A 10µF or larger tantalum capacitor is suitable for most applications.

### Thermal Management

The maximum operating junction temperature for the IMP37 devices is 150°C. The junction temperature can be calculated when the power dissipation and ambient temperature are known with this equation:  $T_J = T_A + (P_D \times \Theta_{JA})$ .

The thermal resistance from junction-to-ambient ( $\Theta_{JA}$ ) is the sum of the three thermal resistances:

$$\Theta_{JA} = \Theta_{JT} + \Theta_{TS} + \Theta_{SA}$$

Where  $\Theta_{JT}$  = Junction-to-Tab thermal resistance

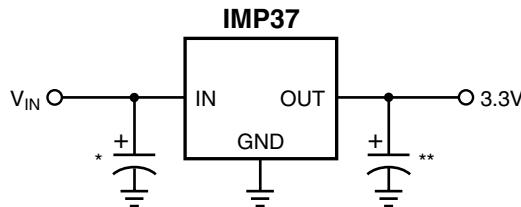

$\Theta_{TS}$  = Tab-to-Heat Sink thermal resistance

$\Theta_{SA}$  = Heat Sink-to-Air thermal resistance

**Table 2. Thermal Resistance of Packages**

Package Type	Thermal Resistance
	Junction to Tab, $\Theta_{JT}$
SOT-223	15°C/W
TO-263	10°C/W

The IMP37 series devices have thermal limiting circuitry to protect the device from over current. For continuous operation, the maximum junction temperature rating must not be exceeded.
