Warnings

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies Office.

Infineon Technologies Components may only be used in life-support devices or systems with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system, or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body, or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

Features

- Single-wire transceiver, suitable for **LIN** protocol
- Compatible to LIN specification 1.2, 1.3 and 2.0
- Compatible to ISO 9141 functions
- Transmission rate up to 20 kBaud
- Very low current consumption in stand-by mode
- Wake-up from Bus
- Short circuit proof to ground and battery
- Overtemperature protection

P-DSO-8-3, -6, -7, -8, -9

Description

The single wire transceiver TLE 6258-2 is a monolithic integrated circuit in a P-DSO-8-3 package. It works as an interface between the protocol controller and the physical bus. The TLE 6258-2 is especially suitable to drive the bus line in LIN systems in automotive and industrial applications. Further it can be used in standard ISO9141 systems.

In order to reduce the current consumption the TLE 6258-2 offers a stand-by mode. A wake-up caused by a message on the bus sets the RxD output low until the device is switched to normal operation mode.

The IC is based on the Smart Power Technology SPT® which allows bipolar and CMOS control circuitry in accordance with DMOS power devices existing on the same monolithic circuit.

The TLE 6258-2 is designed to withstand the severe conditions of automotive applications.

Application Information

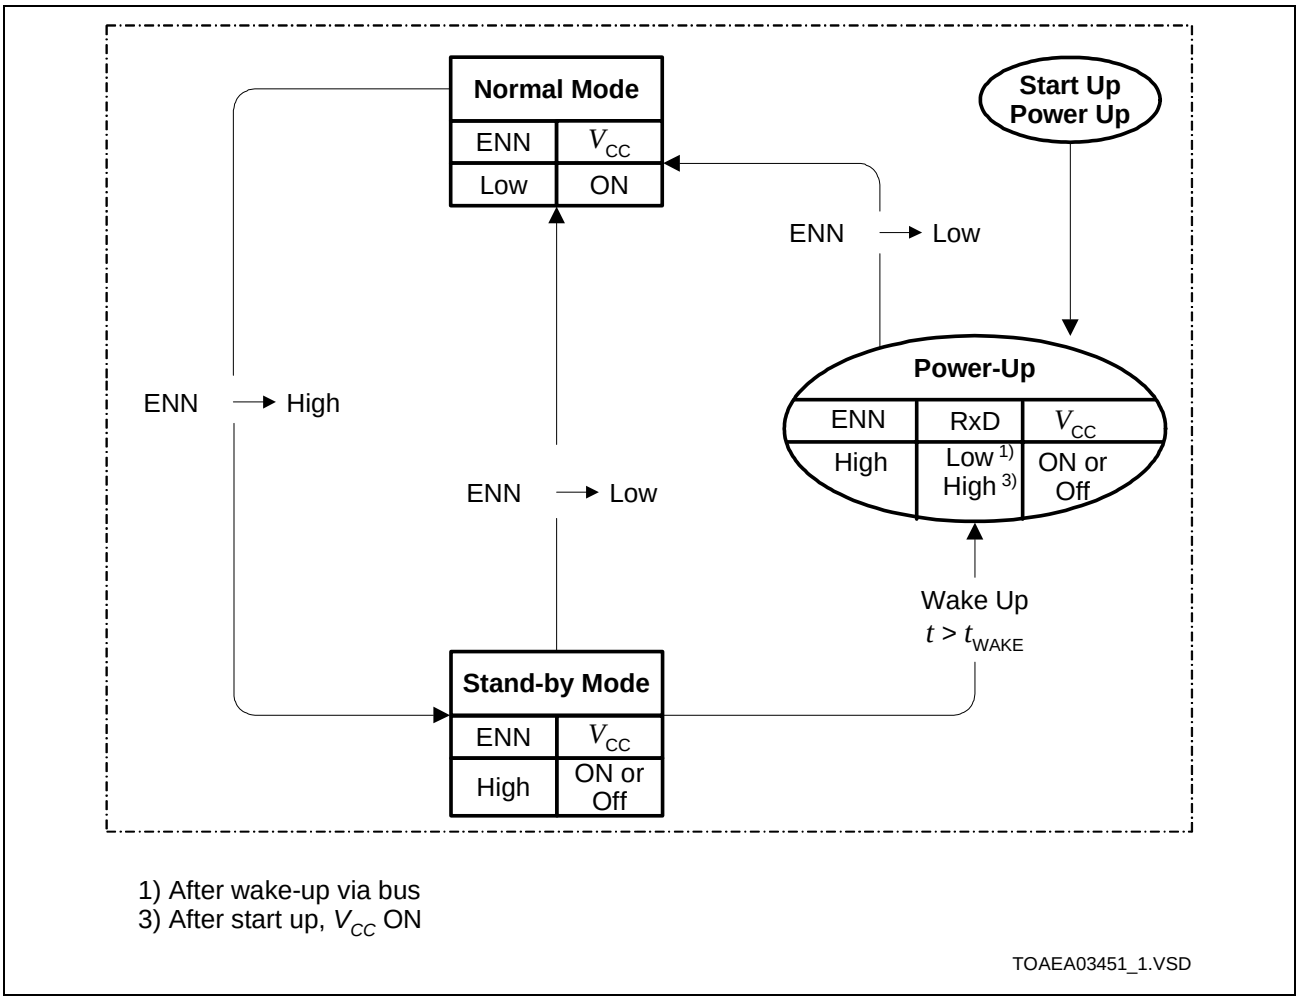

Figure 3 State Diagram

For fail safe reasons the TLE 6258-2 has already a pull-up resistor of 30 kΩ implemented. To achieve the required timings for the dominant to recessive transition of the bus signal an additional external termination resistor of 1 kΩ is required. It is recommended to place this resistor in the master node. To avoid reverse currents from the bus line into the battery supply line in case of an unpowered node, it is recommended to place a diode in series to the external pull-up. For small systems (low bus capacitance) the EMC performance of the system is supported by an additional capacitor of at least 1 nF in the master node (see **Figure 6**).

In order to reduce the current consumption the TLE 6258-2 offers a stand-by mode. This mode is selected by switching the Enable Not (ENN) input high (see **Figure 3**). In the stand-by mode a wake-up caused by a message on the bus is indicated by setting the RxD output low. When entering the normal mode this wake-up flag is reset and the RxD output is released to transmit the bus data.
