

XoftWare* 960 Embedded X Window System Terminal Software

- Complete X Terminal Software
- X11 Release 5
- X Test Suite-Compliant
- Optimized For the i960® Processor Family
- Tailored For Embedded X Terminal Designs
- Complete Networking Software
- Boot Code Available in ROM
- Engineering and User Documentation Services

XoftWare* is a complete i960 processor X terminal software solution for OEM terminal and computer vendors. Developed and marketed by AGE. XoftWare is a member of the XoftWare Family, the leading independent, high-performance X terminal software solution.

All software components required to build an X terminal are supplied. This includes the X11R5 server, XoftNet* networking software, boot ROM software, and configuration menu software. Also available are AGE's engineering and product documentation services.

XoftWare is optimized for the i960 RISC microprocessor family to permit implementation of fast, efficient, and cost-effective hardware designs. This allows OEMs to reduce the cost of an X Window System terminal without sacrificing performance or functionality.

Optimizations are designed to efficiently function with the i960 Sx, Kx and Cx processor families members. Some algorithms are specifically tuned for the i960 Cx processor's on-chip RAM and super-scalar operations.

The large existing AGE software base significantly reduces implementation effort and risk when using the i960 processor in an X Window System server embedded environment. The core XoftWare technology developed at AGE has been successfully tested in the engineering departments of many of the largest computer and terminal companies worldwide.
