

ISL85033DUALEVAL1Z Wide VIN Dual Standard Buck Regulator With 3A/3A Output Current

Description

The ISL85033DUALEVAL1Z kit is intended for use by individuals with requirements for Point-of-Load applications sourcing from 4.5V to 28V. The ISL85033DUALEVAL1Z evaluation board is used to demonstrate the performance of the ISL85033 wide VIN dual standard buck regulator with 3A/3A output current converter.

The ISL85033 is offered in a 4mmx4mm 28 Ld TQFN package with 1mm maximum height. The complete converter occupies 6.25cm² area.

Key Features

- Wide Input Voltage Range from 4.5V to 28V
- Adjustable Output Voltage with Continuous Output Current up to 3A
- Current Mode Control
- Adjustable Switching Frequency from 300kHz to 2MHz
- Independent Power-Good Detection
- Selectable In-Phase or Out-of-Phase PWMs Switching Operation
- Independent, Sequential, Ratiometric or Absolute Tracking Between Outputs
- Internal 2ms Soft-start Time
- Overcurrent and Hiccup Mode Short Circuit Protection, Thermal Overload Protection, UVLO
- Boot Undervoltage Detection
- Channels are Out-of-phase, Reducing Voltage Ripple and Component Size

Recommended Equipment

The following materials are recommended to perform testing:

- 0V to 30V Power Supply with at least 7A source current capability or 5V battery
- Electronic Loads capable of sinking current up to 7A
- Digital Multimeters (DMMs)
- 100MHz quad-trace oscilloscope
- Signal generator

Quick Setup Guide

1. Ensure that the circuit is correctly connected to the supply and loads prior to applying any power.
2. Connect the bias supply to VIN1, the plus terminal to VIN1 and the negative return to GND2.
3. Verify that the position is ON for S1 and S2.
4. Turn on the power supply.
5. Verify the output voltage is 5V for V_{OUT1} and 3.3V for V_{OUT2}.

Evaluating the Other Output Voltage

The ISL85033DUALEVAL1Z kit outputs are preset to 5V for V_{OUT1} and 3.3V for V_{OUT2}; however, output voltages can be adjusted from 0.8V to 5V. The output voltage programming resistor, R3 (or R14 in Channel 2), will depend on the desired output voltage of the regulator and the value for the feedback resistor R2 (R16 respectively), as shown in Equation 1.

$$R3 = (V_{OUT1} - V_{FB}) \cdot R2 / V_{FB} \quad (EQ. 1)$$

$$R14 = (V_{OUT2} - V_{FB}) \cdot R16 / V_{FB}$$

If the output voltage desired is 0.8V, then R3 (R14 respectively) is shorted. The value for R2 (R16 respectively) is typically between 1k and 10k. Please note that if V_{OUT} is less than 2.5V, the switching frequency and compensation must be changed for 300kHz operation due to minimum on-time limitation. Please refer to the data sheet for further information ([FN6676](#)).

Frequency Control

ISL85033 has an FS pin that controls the frequency of operation. Programmable frequency allows for optimization between efficiency and external component size. Default switching frequency is 500kHz when FS is tied to VCC (R9 = 0). By removing R9 and connecting R10 to ground, the switching frequency could be changed from 300kHz (R10 = 383k) to 2MHz (R10 = 40.2k). Please refer to the data sheet ([FN6676](#)) for calculating the value of R10. Do not leave this pin floating.

Application Note 1574

Disabling/enabling Function

The ISL85033 evaluation board contains S1, S2 switches to enable or disable each of the channels, thus allowing low quiescent current state. Table 1 details this function.

TABLE 1. SWITCH SETTINGS

S1	S2	ON/OFF CONTROL
ON	OFF	Enable V _{OUT1} ; Disable V _{OUT2}
OFF	ON	Disable V _{OUT1} ; Enable V _{OUT2}
ON	ON	Enable V _{OUT1} ; Enable V _{OUT2}
OFF	OFF	Disable V _{OUT1} ; Disable V _{OUT2}

If EN1 or EN2 are floating, then the outputs will start in the sequencing described in the data sheet section on output sequencing and also summarized in Table 2.

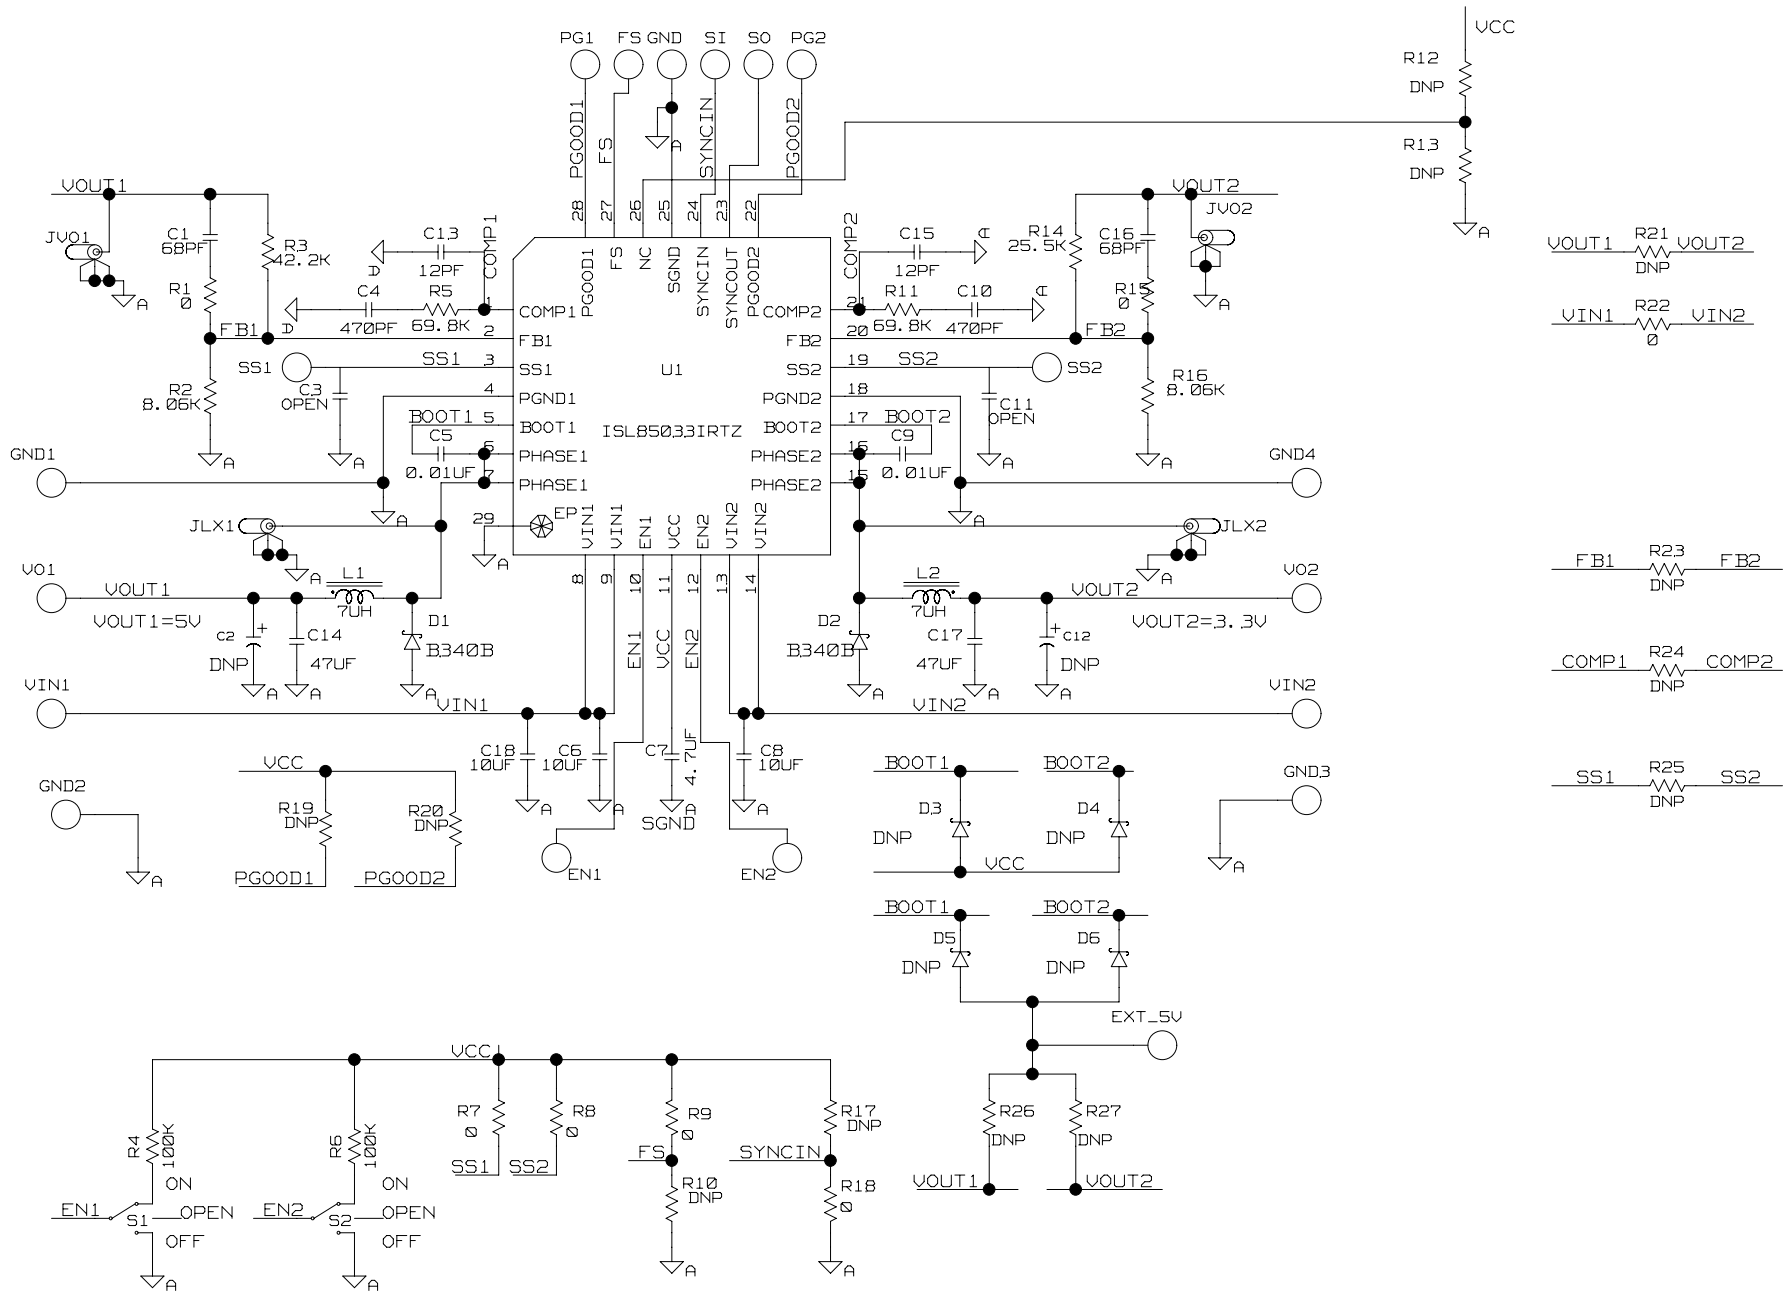

TABLE 2.

EN1	EN2	V _{OUT1}	V _{OUT2}	NOTE
High	Floating	First	After V _{OUT1} > 90%	
Floating	High	After V _{OUT2} > 90%	First	
High	High	Same time as V _{OUT2}	Same time as V _{OUT1}	
Floating	Floating			Not Allowed

SYNC Control

The ISL85033 evaluation board has an SI pin that allows external synchronization frequency to be applied. Default board configuration has R18 = 0 to GND, which defaults to the internal selected switching frequency. Removing R18 allows the synchronization to be external between 600kHz to 4MHz. Do not leave this pin floating.
