

High Performance Microprocessor with Memory Management and Protection

March 1997

Features

- **This Circuit is Processed in Accordance to MIL-STD-883 and is Fully Conformant Under the Provisions of Paragraph 1.2.1.**
- **Compatible with NMOS 80286/883**
- **Static CMOS Design for Low Power Operation**
 - ICCSB = 5mA Maximum
 - ICCOP = 185mA Maximum (80C286-10/883)
 - ICCOP = 220mA Maximum (80C286-12/883)
- **Large Address Space**
 - 16 Megabytes Physical
 - 1 Gigabyte Virtual per Task
- **Integrated Memory Management, Four-Level Memory Protection and Support for Virtual Memory and Operating Systems**
- **Two 80C86 Upward Compatible Operating Modes**
 - 80C286/883 Real Address Mode
 - Protected Virtual Address Mode
- **Compatible with 80287 Numeric Data Co-Processor**

Description

The Intersil 80C286/883 is a static CMOS version of the NMOS 80286 microprocessor. The 80C286/883 is an advanced, high-performance microprocessor with specially optimized capabilities for multiple user and multi-tasking systems. The 80C286/883 has built-in memory protection that supports operating system and task isolation as well as program and data privacy within tasks. The 80C286/883 includes memory management capabilities that map 230 (one gigabyte) of virtual address space per task into 2^{24} bytes (16 megabytes) of physical memory.

The 80C286/883 is upwardly compatible with 80C86 and 80C88 software (the 80C286/883 instruction set is a superset of the 80C86/80C88 instruction set). Using the 80C286/883 real address mode, the 80C286/883 is object code compatible with existing 80C86 and 80C88 software. In protected virtual address mode, the 80C286/883 is source code compatible with 80C86 and 80C88 software but may require upgrading to use virtual address as supported by the 80C286/883's integrated memory management and protection mechanism. Both modes operate at full 80C286/883 performance and execute a superset of the 80C86 and 80C88 instructions.

The 80C286/883 provides special operations to support the efficient implementation and execution of operating systems. For example, one instruction can end execution of one task, save its state, switch to a new task, load its state, and start execution of the new task. The segment-not-present exception and restartable instructions.

Absolute Maximum Ratings

Supply Voltage +8.0V
 Input, Output or I/O Voltage Applied. GND -1.0V to $V_{CC} + 1.0V$
 Storage Temperature Range -65°C to +150°C
 Junction Temperature. +175°C
 Lead Temperature (Soldering 10s). +300°C
 ESD Classification Class 1

Thermal Information

Thermal Resistance (Typical)
 PGA Package θ_{JA} 35°C/W θ_{JC} 6°C/W
 Gate Count 22,500 Gates

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTE:

1. θ_{JA} is measured with the component mounted on an evaluation PC board in free air.

Operating Conditions

Operating Voltage Range. +4.5V to +5.5V
 Operating Temperature Range. -55°C to +125°C

NOTES:

2. I_{BHL} should be measured after lowering V_{IN} to GND and then raising to 1.0V on the following pins: 36-51, 66, 67.
3. I_{BHH} should be measured after raising V_{IN} to V_{CC} and then lowering to 3.0V on the following pins: 4-6, 36-51, 66-68.
4. I_{CCSB} should be tested with the clock stopped in phase two of the processor clock cycle. $V_{IN} = V_{CC}$ or GND, $V_{CC} = 5.5V$, outputs unloaded.
5. I_{CCOP} measured at 10MHz for the 80C286-10/883 and 12.5MHz for the 80C286-12/883. $V_{IN} = 2.4V$ or $0.4V$, $V_{CC} = 5.5V$, outputs unloaded.
6. I_{SH} should be measured after raising V_{IN} to V_{CC} and then lowering to 0V on pins 53 and 54.

NOTES:

1. The modified timing is due to the CMDLY signal being active.
2. 82C254 and 82C288 Timing Waveforms are shown for reference only, and no guarantee is implied.

FIGURE 2. MAJOR CYCLE TIMING

Waveforms (Continued)

NOTES:

1. PCLK indicates which processor cycle phase will occur on the next CLK. PCLK may not indicate the correct phase until the first cycle is performed.
2. These inputs are asynchronous. The setup and hold times shown assure recognition for testing purposes.

FIGURE 3. 80C286/883 ASYNCHRONOUS INPUT SIGNAL TIMING

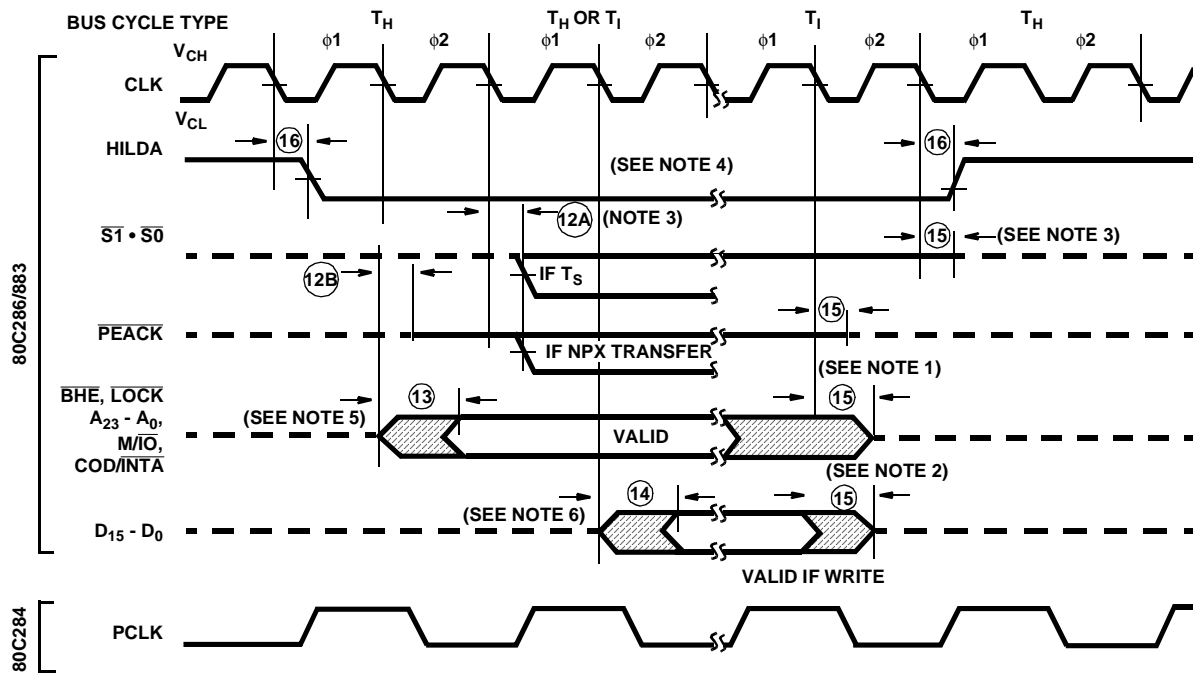

NOTE:

1. When RESET meets the setup time shown, the next CLK will start or repeat $\phi 1$ of a processor cycle.

FIGURE 4. 80C286/883 RESET INPUT TIMING AND SUBSEQUENT PROCESSOR CYCLE PHASE

Waveforms (Continued)

NOTES:

1. These signals may not be driven by the 80C286/883 during the time shown. The worst case in terms of latest float time is shown.
2. The data bus will be driven as shown if the last cycle before T_I in the diagram was a write T_C .
3. The 80C286/883 puts its status pins in a high impedance logic one state during T_H .
4. For HOLD request set up to HLDA, refer to Figure 8.
5. \overline{BHE} and \overline{LOCK} are driven at this time but will not become valid until T_S .
6. The data bus will remain in a high impedance state if a read cycle is performed.

FIGURE 5. EXITING AND ENTERING HOLD

Waveforms (Continued)

NOTES:

1. \overline{PEACK} always goes active during the first bus operation of a processor extension data operand transfer sequence. The first bus operation will be either a memory read at operand address or I/O read at port address 00FA(H).
2. To prevent a second processor extension data operand transfer, the worst case maximum time (shown above) is $3 \times (1) - 12A_{MAX} - (4)_{MIN}$. The actual, configuration dependent, maximum time is: $3 \times (1) - 12A_{MAX} - (4)_{MIN} + N \times 2 \times (1)$. N is the number of extra T_c states added to either the first or second bus operation of the processor extension data operand transfer sequence.

FIGURE 6. 80C286/883 PEREQ/PEACK TIMING FOR ONE TRANSFER ONLY

NOTES:

1. Setup time for $\overline{RESET} \uparrow$ may be violated with the consideration that $\phi 1$ of the processor clock may begin one system CLK period later.
2. Setup and hold times for $\overline{RESET} \downarrow$ must be met for proper operation, but $\overline{RESET} \downarrow$ may occur during $\phi 1$ or $\phi 2$.
3. The data bus is only guaranteed to be in a high impedance state at the time shown.
