

OBSOLETE PRODUCT  
POSSIBLE SUBSTITUTE PRODUCT  
INTERSIL PART NUMBER HI3026, HI3246

March 2003

## 8-Bit, 140 MSPS, Flash A/D Converter

**Features**

- Differential Linearity Error ..... ±0.5 LSB
- Integral Linearity Error ..... ±0.5 LSB
- Integral Linearity Compensation Circuit
- Low Input Capacitance ..... 21pF
- Wide Analog Input Bandwidth ..... 150MHz
- Low Power Consumption ..... 790mW
- Internal 1/2 Frequency Divider Circuit (With Reset Function)
- CLK/2 Clock Output Pin
- Compatible with ECL, PECL and TTL Digital Input Levels
- 1:2 Demultiplexed Output
- Direct Replacement for Sony CXA3026A

**Applications**

- RGB Graphics Processing (LCD, PDP)
- Digital Oscilloscopes
- Digital Communications (QPSK, QAM)
- Magnetic Recording (PRML)

**Description**

The HI3026A is an 8-bit, high-speed, flash analog-to-digital converter optimized for high speed, low power, and ease of use. With a 140 MSPS encode rate capability and full-power analog bandwidth of 150MHz, this component is ideal for applications requiring the highest possible dynamic performance.

To minimize system cost and power dissipation, only a +5V power supply is required. The HI3026A's clock input interfaces directly to TTL, ECL, or PECL logic and will operate with single-ended inputs. The user may select 16-bit demultiplexed output or 8-bit single-channel digital outputs. The demultiplexed mode interleaves the data through two 8-bit channels at 1/2 the clock rate. Operation in demultiplexed mode reduces the speed and cost of external digital interfaces, while allowing the A/D converter to be clocked to the full 140 MSPS conversion rate.

Fabricated with an advanced bipolar process, the HI3026A is provided in a space-saving 48-lead MQFP surface mount plastic package and is specified over the -20°C to 75°C temperature range.

**Part Number Information**

FIGURE 3. ECL AND PECL SWITCHING LEVEL

**Pin Descriptions**

PIN NO	SYMBOL	I/O	TYPICAL VOLTAGE LEVEL	EQUIVALENT CIRCUIT	DESCRIPTION
3, 10	AGND		GND		Analog Ground. Separated from the digital ground.
5, 8	AV <sub>CC</sub>		+5V (Typ)		Analog Power Supply. Separated from the digital power supply.
20, 29 32, 41	DGND1 DGND2		GND		Digital Ground.
19, 30 31, 42	DV <sub>CC1</sub> DV <sub>CC2</sub>		+5V (Typ)		Digital Power Supply.

**Pin Descriptions** (Continued)

PIN NO	SYMBOL	I/O	TYPICAL VOLTAGE LEVEL	EQUIVALENT CIRCUIT	DESCRIPTION
12	DGND3		+5V (Typ) (With a Single Power Supply)		Digital Power Supply. Ground for ECL input. +5V for PECL and TTL input.
			GND (With Dual Power Supplies)		
1	DVEE3		GND (With a Single Power Supply)		Digital Power Supply. -5V for ECL input. Ground for PECL and TTL Input
			-5V (Typ) (With Dual Power Supplies)		
16, 17, 18	NC				No Connect pin. Not connected with the internal circuits.
13	CLK/E	I	ECL/PECL		Clock Input.
14	CLKN/E	I			CLK/E Complementary Input. When left open, this pin goes to the threshold potential. Only CLK/E can be used for operation, but complementary input is recommended to attain fast and stable operation.
48	RESETN/E	I			Reset Input. When the input is set to low level, the built-in CLK frequency divider circuit can be reset.
47	RESET/E	I			RESETN/E Complementary Input. When left open, this pin goes to the threshold voltage. Only RESETN/E can be used for operation.
15	CLK/T	I			Clock Input.
46	RESETN/T	I	TTL		Reset Input. When left open, this input goes to high level. When the input is set to low level, the built-in CLK frequency divider circuit can be reset.
44	INV	I			Data Output Polarity Inversion Input. When left open, this input goes to high level. (See Table 1, I/O Correspondence Table.)

### Notes On Operation

- The HI3026A is a high-speed A/D converter which is capable of TTL, ECL and PECL level clock input. Characteristic impedance should be properly matched to ensure optimum performance during high-speed operation.
- The power supply and grounding have a profound influence on converter performance. The power supply and grounding method are particularly important during high-speed operation. General points for caution are as follows:
  - The ground pattern should be as large as possible. It is recommended to make the power supply and ground

patterns wider at an inner layer using a multi-layer board.

- To prevent interference between AGND and DGND and between AV<sub>CC</sub> and DV<sub>CC</sub>, make sure the respective patterns are separated. To prevent a DC offset in the power supply pattern, connect the AV<sub>CC</sub> and DV<sub>CC</sub> lines at one point each via a ferrite-bead filter. Shorting the AGND and DGND patterns in one place immediately under the A/D converter improves A/D converter performance.
- Ground the power supply pins (AV<sub>CC</sub>, DV<sub>CC1</sub>, DV<sub>CC2</sub>, DV<sub>EE3</sub>) as close to each pin as possible with a 0.1μF or larger ceramic chip capacitor. (Connect the AV<sub>CC</sub> pin to the AGND pattern and the DV<sub>CC1</sub>, DV<sub>CC2</sub>, DV<sub>EE3</sub> pins to the DGND pattern.)
- The digital output wiring should be as short as possible. If the digital output wiring is long, the wiring capacitance will increase, deteriorating the output slew rate and resulting in reflection to the output waveform since the original output slew rate is quite fast.
- The analog input pin V<sub>IN</sub> has an input capacitance of approximately 21pF. To drive the A/D converter with proper frequency response, it is necessary to prevent performance deterioration due to parasitic capacitance or parasitic inductance by using a large capacity drive circuit, keeping wiring as short as possible, and using chip parts for resistors and capacitors, etc.
- The V<sub>RT</sub> and V<sub>RB</sub> pins must have adequate bypass to protect them from high-frequency noise. Bypass them to AGND with approximately 1μF tantal capacitor and, 0.1μF capacitor as short as possible.
- When the digital input level is ECL or PECL level, \*\*\*/E pins should be used and \*\*\*/T pins left open. When the digital input level is TTL, \*\*\*/T pins should be used and III/E pins left open.

### Test Circuits

FIGURE 4. CURRENT CONSUMPTION MEASUREMENT CIRCUIT

FIGURE 5. INTEGRAL LINEARITY ERROR/DIFFERENTIAL LINEARITY ERROR MEASUREMENT CIRCUIT

**Test Circuits** (Continued)

FIGURE 6. ERROR RATE MEASUREMENT CIRCUIT

FIGURE 7. SAMPLING DELAY/APERTURE JITTER MEASUREMENT CIRCUIT

NOTE: Where  $\sigma$  (LSB) is the deviation of the output codes when the largest slew rate point is sampled at the clock which has exactly the same frequency as the analog input signal, the aperture jitter,  $t_{AJ}$  is:  

$$t_{AJ} = \left( \frac{\sigma/\Delta V}{\Delta t} \right) = \sigma \left( \frac{256}{2} \times 2\pi f \right).$$

FIGURE 8. APERTURE JITTER MEASUREMENT METHOD

**Operating Modes**

The HI3026A has two types of operating modes which are selected with Pin 45 (SELECT).

TABLE 2. OPERATING MODE TABLE

OPERATING MODE	SELECT	MAXIMUM CONVERSION RATE	DATA OUTPUT	CLOCK OUTPUT
DMUX Mode	V <sub>CC</sub>	140 MSPS	Demultiplexed Output 70 Mbps	The input clock is $1/2$ frequency divided and output at 70MHz.
Straight Mode	GND	100 MSPS	Straight Output 100 Mbps	The input clock is inverted and output at 100MHz.

**DMUX Mode (See Application Circuits, Figures 18, 19, 20)**

Set the SELECT pin to  $V_{CC}$  for this mode. In this mode, the clock frequency is divided by 2 in the IC, and the data is output after being demultiplexed by this  $1/2$  frequency divided clock. The  $1/2$  frequency divided clock, which has adequate setup time and hold time for the output data, is output from the CLKOUT pin.

When using multiple HI3026A units in parallel in this mode, differences in the start timing of the  $1/2$  frequency divided clock may cause operation as shown in the figure below. As a

countermeasure, the HI3026A is equipped with a function which resets the  $1/2$  frequency divided clock. When resetting this clock, the RESET pulse must be input to the RESET pin. See the Timing Charts for the RESET pulse input timing. The A/D converter can operate at  $f_C$  (Min) = 140 MSPS in this mode.

**Straight Mode (See Application Circuits, Figures 21, 22, 23)**

Set the SELECT pin to GND for this mode. In this mode, data output can be obtained in accordance with the clock frequency applied to the A/D converter for applications which use the

clock applied to the A/D converter as the system clock.

The A/D converter can operate at  $f_C$  (Min) = 100 MSPS in this mode.

#### Digital Input Level and Supply Voltage Settings

The logic input level for the HI3026A supports ECL, PECL and TTL levels.

The power supplies ( $DV_{EE3}$ ,  $DGND3$ ) for the logic input block must be set to match the logic input (CLK and RESET signals) level.

TABLE 3. LOGIC INPUT LEVEL AND POWER SUPPLY SETTINGS

DIGITAL INPUT LEVEL	$DV_{EE3}$	$DGND3$	SUPPLY VOLTAGE	APPLICATION CIRCUITS (FIGURE)
ECL	-5V	0V	$\pm 5V$	(18) (21)
PECL	0V	+5V	+5V	(19) (22)
TTL	0V	+5V	+5V	(20) (23)
