## GENERAL DESCRIPTION

The DS33Z11 design kit is an easy-to-use evaluation board for the DS33Z11 Ethernet transport-over-serial link device. The DS33Z11DK is intended to be used with a resource card for the serial link. The serial link resource cards are complete with transceiver, transformers, and network connections. Dallas' ChipView software is provided with the design kit, giving point-and-click access to configuration and status registers from a Windows®-based PC. On-board LEDs indicate receive loss-of-signal, queue overflow, Ethernet link, Tx/Rx, and interrupt status.

*Windows is a registered trademark of Microsoft Corp.*

## ORDERING INFORMATION

PART	DESCRIPTION
DS33Z11DK	DS33Z11 demo card, T3/E3, T1/E1 (SCT/LIU) resource card included

## FEATURES

- Demonstrates Key Functions of DS33Z11 Ethernet Transport Chipset
- Includes Resource Card with DS21348 LIU, DS2155 T1E1 SCT, and DS3170 T3E3 SCT, Transformers, BNC and RJ48 Network Connectors and Termination
- Provides Support for Hardware and Software Modes
- On-Board MMC2107 Processor and ChipView Software Provide Point-and-Click Access to the DS33Z11, DS2155, and DS3170 Register Sets
- All DS33Z11 Interface Pins are Easily Accessible for External Data Source/Sink
- LEDs for Loss-of-Signal, Queue Overflow, Ethernet Link, Tx/Rx, and Interrupt Status
- Easy-to-Read Silk Screen Labels Identify the Signals Associated with All Connectors, Jumpers, and LEDs

## DESIGN KIT CONTENTS

- DS33Z11DK Main Board
- Single-Port Serial Card with DS2155 T1/E1 SCT, DS21348 T1/E1 LIU, and DS3170 T3/E3 SCT
- CD\_ROM
  - ChipView Software and Manual
  - DS33Z11DK Data Sheet
  - Configuration Files

---

## COMPONENT LIST

[Table 1](#) shows the component list for the DS33Z44 and DS33Z11/DS33Z41 design kits and resource cards. This BOM contains the part listing for five boards. These boards are the DS33Z11DK, DS33Z44DK, DS21458RC, DS3174RC, and DS2155-DS21348-DS3170RC. Each reference designator is only used once. For example, U18 only appears on the DS33Z11DK and is not used on any of the other boards. See [Table 2](#).

**Table 1. Component List (Decoupling Caps Not Shown)**

DESIGNATION	QTY	DESCRIPTION	SUPPLIER	PART
U18	1	ELITE 10/100 ETHERNET TRANSPORT OVER SERIAL LINK 14X14 CSBGA 169 PIN	Dallas Semiconductor	DS33Z11

## SYSTEM FLOORPLAN

## PC BOARD ERRATA

- Silk screen for the serial resource card has VCC and ground indicators pointing the wrong direction for configuration switches SW27, SW28, and SW32. This should be corrected with an adhesive label.
- Signal descriptions for JTAG connector are incorrect on the quad T1E1 card. This should be corrected with an adhesive label.

## FILE LOCATIONS

This design kit relies upon several supporting files, which are provided on the CD and are available as a zip file from the Maxim website at [www.maxim-ic.com/DS33Z11DK](http://www.maxim-ic.com/DS33Z11DK).

All locations are given relative to the top directory of the CD/zip file.

- DS33Z11 register definition files and configuration files:
  - `.\cfg_demo_gui\DS33Z11_cfg_demo_gui\DS33Z11.def`
  - `.\DS33Z11_cfg_demo_gui\SU_LI_PORT1.def`
  - `.\DS33Z11_cfg_demo_gui\basic_config.mfg`
- DS2155 register definition files and configuration files:
  - `.\DS33Z11_cfg_demo_gui\te1_ds2155\DS2155.def`
  - `.\DS33Z11_cfg_demo_gui\te1_ds2155\te1_gapclk_crc4_hdb3_nocas.ini`
- DS3170 register definition files and configuration files:
  - `.\DS33Z11_cfg_demo_gui\te3_ds3170\ds3170_evbrd.def`
  - `.\DS33Z11_cfg_demo_gui\te3_ds3170\ds3_p1.def`
  - ..... 6 other low level def files ....
  - `.\DS33Z11_cfg_demo_gui\te3_ds3170\70_t3_sct_needscoaxlb.mfg`

## BASIC OPERATION

### Powering Up the Design Kit

- Attach resource card to main board.
- Connect PCB 3.3V and GND banana plugs to power supply. At power-up the system should draw less than 1A.
- Set switches for software mode as described in [Table 2](#) (short description follows).
  - Top bank all low (DCEDTE ..... SCANEN)
  - A2, A1, A0 in mid position, ScanTri low (right-hand side)
  - Bottom Bank all high (AFCS, FULLDS, H1OS)

### General

- Upon power-up, the processor FPGA Status LEDs (DS43 green) will be lit. Interrupt LEDs (DS44 red) will not be lit. DS33Z11 Queue overflow LEDs (DS39 red) will not be lit. PHY LINK LED (DS06 green) should be lit if the Ethernet is connected.

Following are several basic system initializations.

### Basic DS33Z11 Initialization (Used for All Quick Setups)

This section covers four basic methods for configuring the Z11. Any one of these initializations can be used with the following Quick Setup examples:

1. Upon power-up, the on-board device driver provides a basic configuration for the DS33Z11. This enables traffic to pass from the Ethernet port to the serial port. Consult the device driver documentation for further details. Device driver behavior is dependant upon jumper settings, which are detailed in Table 2.
2. Register-Based Configuration. Launch ChipView.exe and select *Register View*. When prompted for a definition file, pick the file named **DS33Z11.def**. After the definition file loads, go to the File menu and select **File→Memory Config File→Load .MFG file**. When prompted, select the file named **basic\_config.mfg**.
3. Hardware Mode. Set switches as described in the section for powering up the design kit, then change the following: HWMODE←3.3V, A0←3.3VV, A1←3.3V, A2←0V. This sets the part for LSB first, scrambling off, HDLC encapsulated. At this point traffic will pass from the Ethernet port to the serial port. In this mode broadcast frames are not passed (i.e., ping).
4. EEPROM mode is available with the DK, but is beyond the scope of this manual.

### Quick Setup #1 (Device Driver + CPLD Loopback)

- On the serial resource card install jumpers J30, J31, J33. This places the card in CPLD loopback as described in
- [Table 3](#).
- Complete the hardware configuration and one of the basic DS33Z11 configurations as described in the previous section.
- Using a patch cable, connect the Ethernet connector to an ordinary PC, or network test equipment. This should cause the link LED to turn on.
- At this point any packets sent to the DS33Z11 are echoed back. Incoming packets (i.e., ping) should cause the RX LED to blink, after which the TX LED should also blink.
- To interact with the device driver select from the drop down menu:
  - Tools→Plugins→Load Plugins. When asked if DLLs have already registered select yes
  - Select Tools→Plugins→DS33Z44/11/41 Device Driver Demo
  - A new form called 'Zchip Configuration' pops up.
  - Preload basic configuration for the GUI by selecting File→Load Settings (in the 'Zchip Configuration' form). Select the file named 'basic\_Config.eset'

### Quick Setup #2 (DS21348 T1E1)

- On the serial resource card install jumper J30 (do not install J31 and J33). This places the card in DS21348 mode, with TCLK ←Osc Y03 as described in
- [Table 3](#).
- Complete the hardware configuration and one of the basic DS33Z11 configurations as previously described.
- Using a patch cable, connect the Ethernet connector to an ordinary PC, or network test equipment. This should cause the link LED to turn on.
- Set DS21348 configuration switches SW27, SW28, and SW32 in the ON position, and make the following changes:
  - Switch SW32: RT1, L2 and L1 OFF.
  - Switch SW28: PBTS OFF.
  - Switch SW27: WR\_NRZ, HBE and L0 OFF.
- Place a loopback connector at the DS21348 network side; RLOS LED DS28 should go out.
- At this point any packets sent to the DS33Z11 are echoed back. Incoming packets (i.e., ping) should cause the RX LED to blink, after which the TX LED should also blink.

### Quick Setup #3 (DS2155 T1E1)

- On the aerial resource card install jumper J31 (do not install J30 and J33). This places the serial card in DS2155 mode.
- Complete the hardware configuration and one of the basic DS33Z11 configurations as previously described.
- Using a patch cable, connect the Ethernet connector to an ordinary PC, or network test equipment. This should cause the link LED to turn on.
- Launch ChipView.exe (or use existing session if its already open) and select *Register View*. When prompted for a definition file pick the file named **DS2155.def**. After the definition file loads, go to the File menu and select File→Reg Ini File→Load Ini File. When prompted, pick the file named **e1\_gapclk\_crc4\_hdb3\_nocas.ini**.
- Place a loopback connector at the DS2155 network side; RLOS LED DS35 should go out.
- At this point any packets sent to the DS33Z11 are echoed back. Incoming packets (i.e. ping) should cause the RX LED to blink, after which the TX LED should also blink.

### Quick Setup #4 (DS3170 T3E3)

- On the serial resource card install jumper J33 (do not install J30 and J31). This places the card in DS3170 mode.
- Complete the hardware configuration and one of the basic DS33Z11 configurations as previously described.
- Using a patch cable, connect the Ethernet connector to an ordinary PC, or network test equipment. This should cause the link LED to turn on.
- Launch ChipView.exe (or use existing session if its already open) and select *Register View*. When prompted for a definition file pick the file named **ds3170\_evbrd.def**. After the definition file loads, go to the File menu and select File→Memory Config File→Load .MFG file. When prompted, select the file named **70\_t3\_sct\_needscoaxlb.mfg**.
- Place a loopback connector at the DS3170 network side.
- At this point any packets sent to the DS33Z11 are echoed back. Incoming packets (i.e., ping) should cause the RX LED to blink, after which the TX LED should also blink.

## CONFIGURATION SWITCHES AND JUMPERS

The DS33Z11DK has several configuration switches, banana plugs, oscillators, and jumpers. [Table 2](#) provides a description of these signals, given in order of appearance on the PC board (going from left to right, top to bottom).

**Table 2. Main Board PC Board Configuration**

SILK SCREEN REFERENCE	FUNCTION	BASIC SETTING		DESCRIPTION
		SW MODE	HW MODE	
J45.9 + J45.10	Reserved	Not installed	—	This jumper is not for use with the DS33Z11 design kit. Pin J45.10 has been removed to prevent accidental installation.
J45.7 + J45.8	Enable device driver	User decision	—	When installed the device driver will configure the DS33Z11 and the transceiver during power-up.
J45.5 + J45.6	Enable callbacks	User decision	—	When installed the driver will respond to interrupts.
GROUND (banana plug)	Power supply ground	—	—	System Ground. Always connected to power supply.
VDD 3.3V (banana plug)	Power supply VDD	—	—	System VDD. Always connected to power supply.
OnCe	BDM	—	—	Debug connector for processor
DCEDTES (3pos switch)	DS33Z11 mode pin; DTE/DCE selection	Low	Low	Low for DTE
RMII/MII (3pos switch)	DS33Z11 mode pin	Low	Low	High for RMII, low for MII
CKPHA (3pos switch)	DS33Z11 mode pin	Low	Low	SPI EEPROM hardware mode configuration switch
MODEC0 (3pos switch)	DS33Z11 mode pin	High	Low	Software mode selected
MODEC1 (3pos switch)	DS33Z11 mode pin	Low	Low	Software mode selected
HWMODE (3pos switch)	DS33Z11 mode pin	Low	Low	Hardware/software mode (software mode selected)
SCANMO (3pos switch)	DS33Z11 mode pin	Low	Low	Set low for normal operation
SCANEN (3pos switch)	DS33Z11 mode pin	Low	Low	Set low for normal operation
....testpoints....	DS33Z11 testpoints	—	—	Processor bus, JTAG and LAN side testpoints for Zchip
Z-RESET (button)	DS33Z11 reset	—	—	System reset
A2, A1, A0 (3 pos switches)	DS33Z11/SPI pins	Mid position	Mid position	Address pin/EEPROM config switch. Set to mid position to allow connection to processor.
SDRAM CLOCK	DS33Z11 SDRAM clock	Installed	installed	100MHz oscillator to drive SDRAM clock
MII CLOCK	PHY MII clock	Installed	installed	25MHz oscillator to drive SDRAM clock
spi_cs, spi_ck, spi_miso, spi_mosi	—	—	—	SPI signals (for EEPROM memory)
....testpoints.....	DS33Z11 testpoints	—	—	DS33Z11 serial port testpoints
AFCS	DS33Z11 mode pin	HW mode only	High	Set high to enable auto flow control.
FULLDS	DS33Z11 mode pin	HW mode only	High	Set high to enable full duplex.

SILK SCREEN REFERENCE	FUNCTION	BASIC SETTING		DESCRIPTION
		SW MODE	HW MODE	
H10S	DS33Z11 mode pin	HW mode only	High	Set high to config for 100Mb
GROUND/VDD (banana plug)	Power supply ground/3.3V	—	—	Redundant connection to system power. Use plugs at either top or bottom of board.
VDD 3.3V (banana plug)	Power supply VDD	—	—	Redundant connection to system power. Use plugs at either top or bottom of board.

**Table 3. Serial Reference Card Jumper Settings**

JUMPER SETTINGS	MODE	COMMENT
J30 Off, J31 Off, J33 Off	DS21348 Loop Timing	DS21348 TCLK is driven by DS21348 RCLK. This requires that the T1E1 device on the far end has its TCLK set to its local oscillator.
J30 Installed, J31 Off, J33 Off	DS21348 Source Timing	DS21348 TCLK is driven by Oscillator Y03. This requires that the T1E1 device on the far end has its TCLK set to its RCLK.
J30 Off, J31 Installed, J33 Off	DS2155 T1E1	TCLK source is determined by a register setting in the DS2155.
J30 Off, J31 Off, J33 Installed	DS3170 T3E3	TCLK source is determined by a register setting in the DS3170.
J30 Installed, J31 Installed, J33 Installed	CPLD loopback	CPLD loopback makes the following connections: Zrser ← Ztser, Ztden ← 3.3V, Zrden ← 3.3V, Ztclki ← OscY03, Zrclki ← OscY03

## ADDRESS MAP (ALL CARDS)

Motorola resource card address space begins at 0x81000000. All offsets given below are relative to the beginning of the daughter card address space (shown previously).

**Table 4. Overview of Daughter Card Address Map**

OFFSET	DEVICE	DESCRIPTION
0X0000 to 0X0087	FPGA	Processor board identification
0X1000 to 0X1FFF	DS33Z11	DS33Z11. Uses CS_X1.
0X2000 to 0X2FFF	DS2155	T1E1 portion of single T1E1–T3E3 WAN card. Uses CS_X2.
0X3000 to 0X3FFF	DS3170	T3E3 portion of single T1E1–T3E3 WAN card. Uses CS_X3.

Registers in the DS33Z11, DS2155, and DS3170 can be easily modified using the ChipView host-based user-interface software with the definition files previously mentioned.

### DS33Z11 INFORMATION

For more information about the DS33Z11, consult the DS33Z11 data sheet available on our website at [www.maxim-ic.com/DS33Z11](http://www.maxim-ic.com/DS33Z11).

### DS33Z11DK INFORMATION

For more information about the DS33Z11DK, including software downloads, consult the DS33Z11DK data sheet available on the our website at [www.maxim-ic.com/DS33Z11DK](http://www.maxim-ic.com/DS33Z11DK).

### TECHNICAL SUPPORT

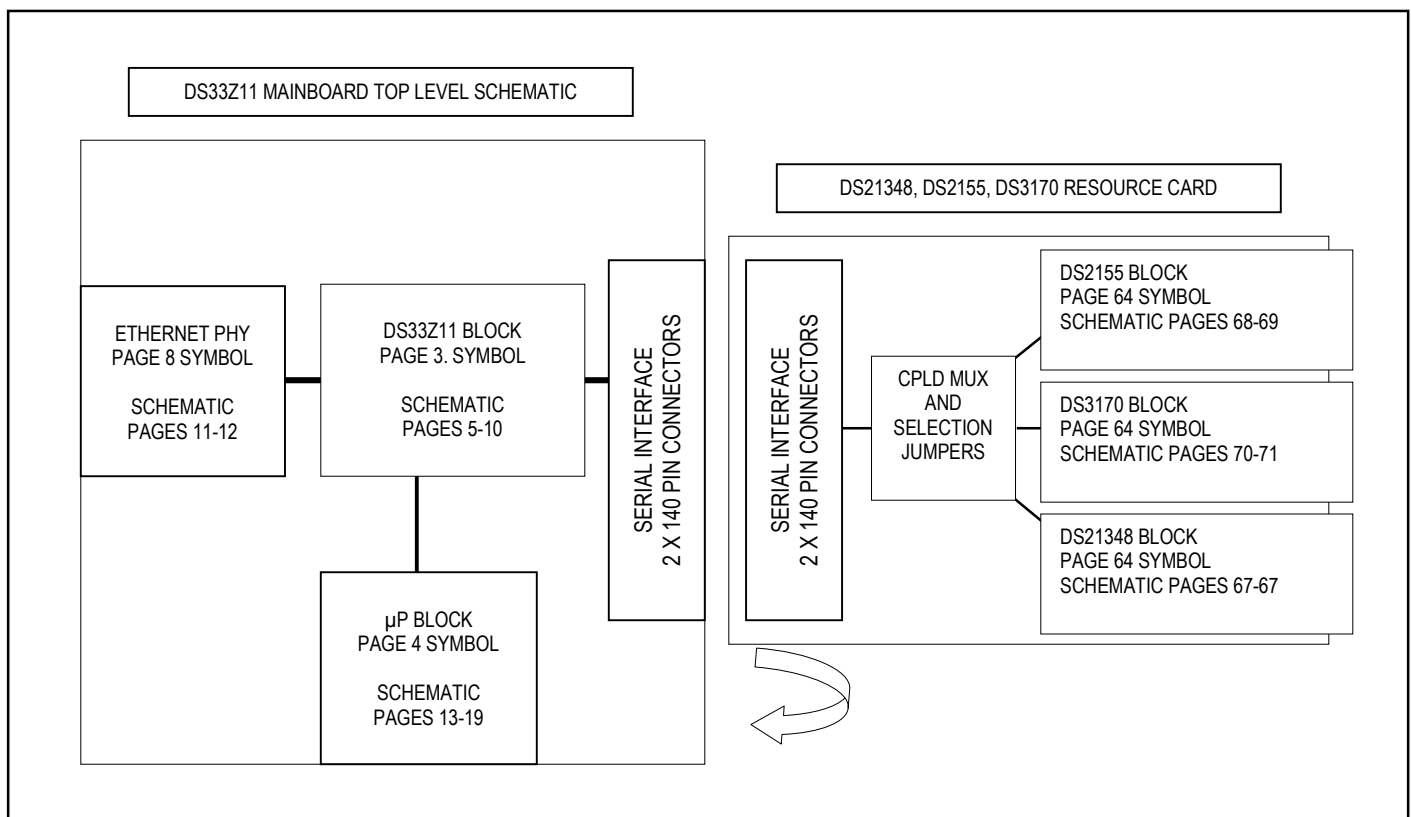

For additional technical support, please e-mail your questions to [telecom.support@dalsemi.com](mailto:telecom.support@dalsemi.com).

## SCHEMATICS

The DS33Z11DK schematics are featured in the following pages. As this is a hierarchical schematic some explanation is in order. The main board is composed of three hierarchical blocks: the processor block, the DS33Z11 block, and an Ethernet block inside the DS33Z11 block, which is a nested hierarchy block. The serial card consists of three hierarchy blocks, one for each of the DS21348, DS2155, and DS3170. These blocks are connected by the CPLD, which connects to the 140-pin AV bus, which snaps into the main board.

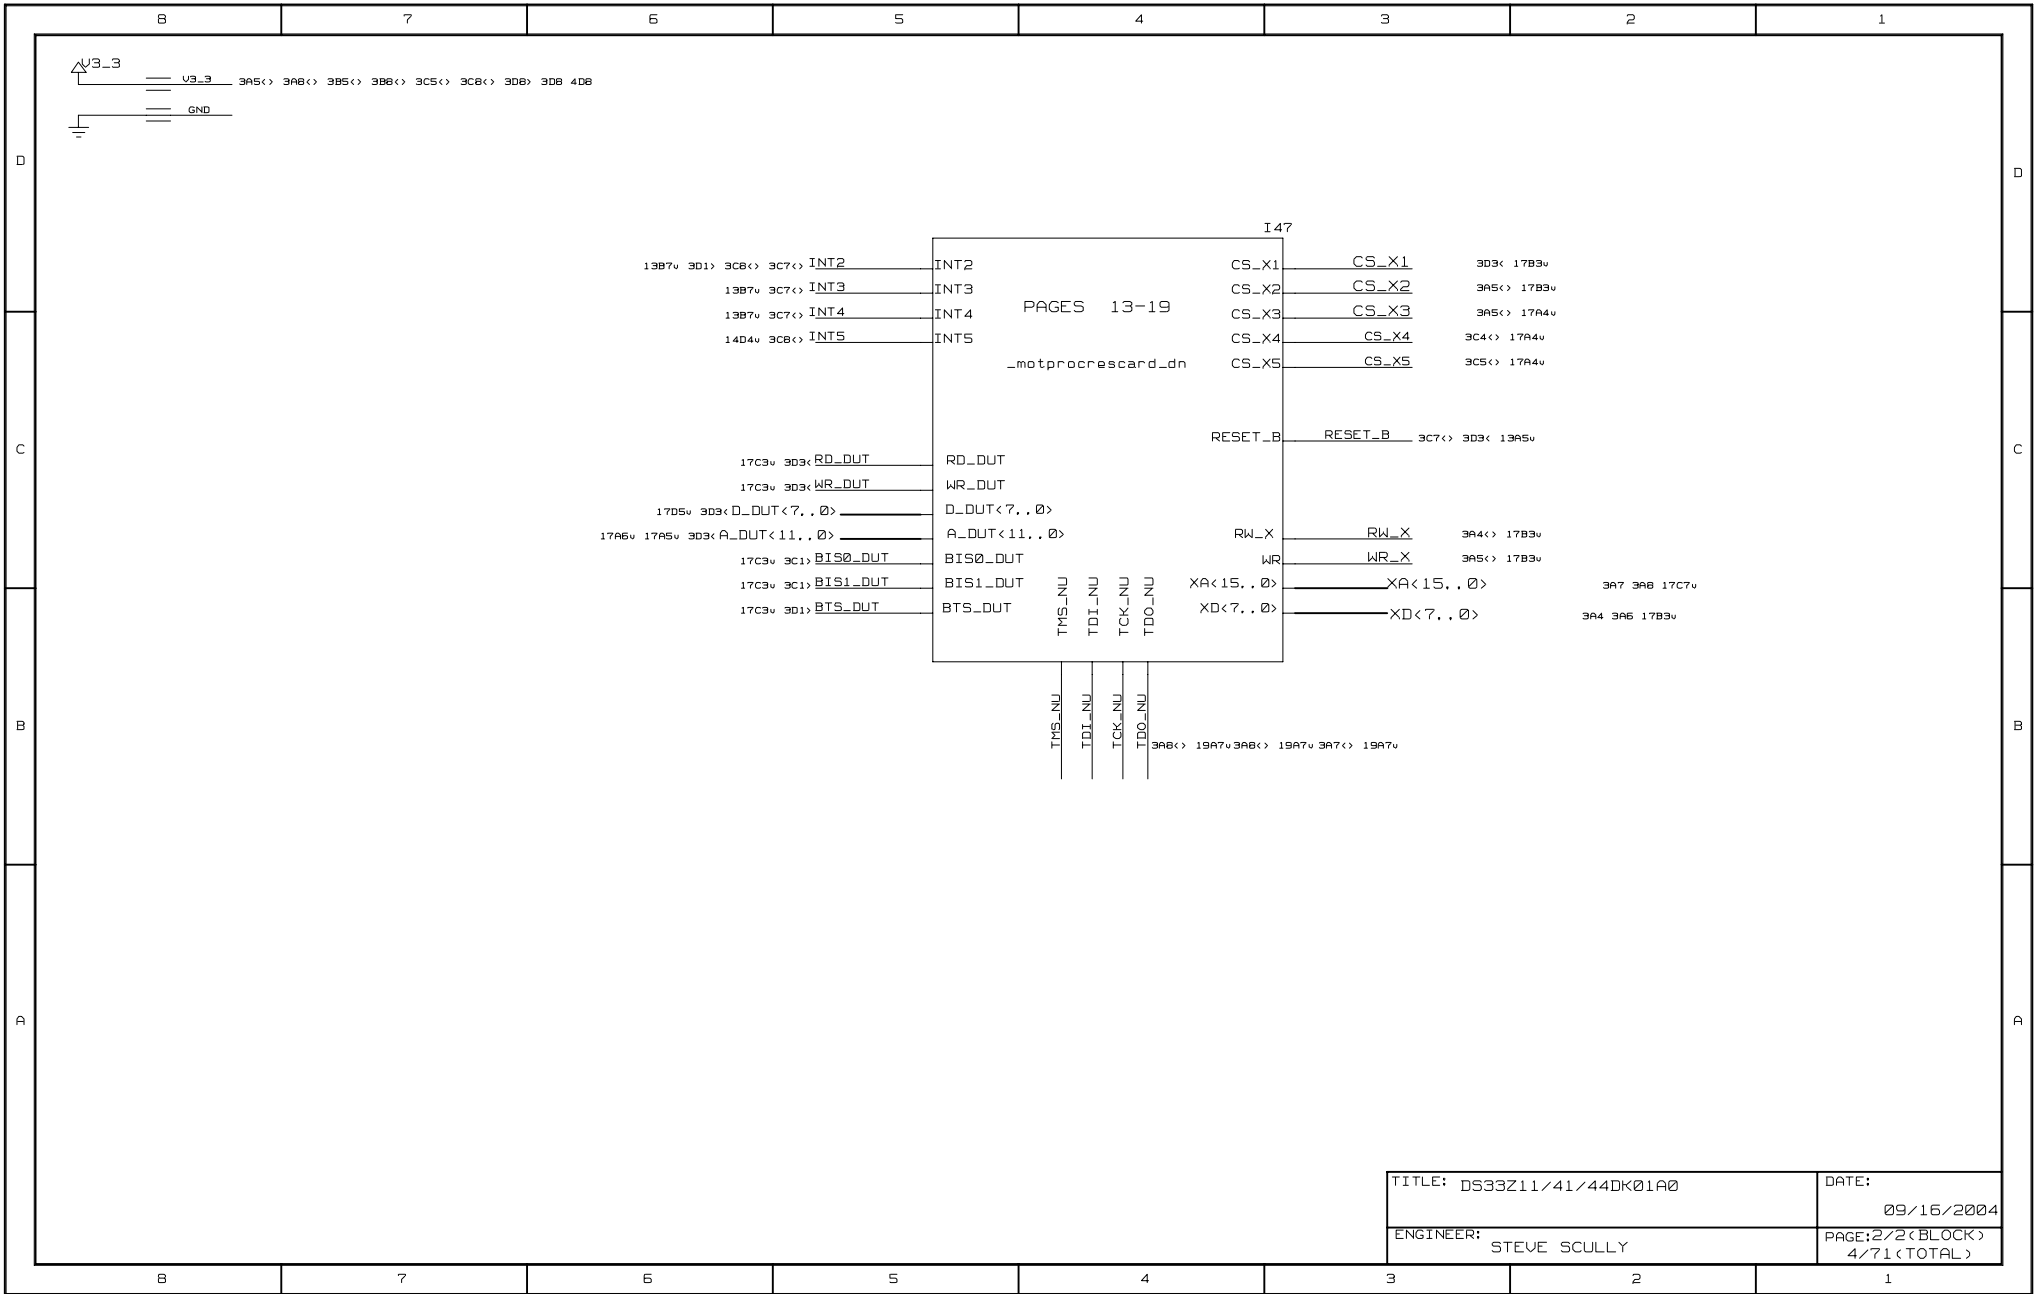

All signals inside a hierarchy block are local, with exception for  $V_{CC}$  and ground. In-port and out-port connectors are used to allow signals inside a hierarchy block to become accessible as pins on the hierarchy blocks symbol. From here blocks are wired together as if they were ordinary components. The system diagram is shown again below, with schematic page numbers given for each functional block.

This system contained other hierarchy blocks that are not shown (primarily quad-port serial cards and the DS33Z44 mainboard). Due to this page numbers will not be continuous and some gaps in numbering will be seen when referring to the total page count. However, page numbers inside any given hierarchy block will be continuous.
