

MAX1535A Evaluation Kit/ MAX1535A Evaluation System

Evaluate: MAX1535A

General Description

The MAX1535A evaluation kit (EV kit) is an efficient, multichemistry battery charger. It uses the Intel System Management Bus (SMBus™) to control the battery regulation voltage, charger current output, and input current-limit set point.

The MAX1535A EV kit can charge one, two, three, or four series Li+ cells with a current up to 8A.

The MAX1535A evaluation system (EV system) consists of a MAX1535A EV kit and the Maxim SMBUSMON board. The MAX1535A EV kit includes Windows® 95-/98-/2000-/XP-compatible software to provide a user-friendly interface.

Features

- ◆ 0.5% Battery Voltage Accuracy
- ◆ 3% Battery Charge-Current Accuracy
- ◆ Input Current-Limiting Set Point through SMBus Command
- ◆ Up to 8A Battery Charge Current
- ◆ Automatic Selection of System Power Source
- ◆ +8V to +25V Input Voltage Range
- ◆ Charges Li+, NiCd, NiMH Battery Chemistries
- ◆ SMBus-Compatible 2-Wire Serial Interface
- ◆ Includes Windows 95-/98-/2000-/XP-Compatible Software and Demo PC Board
- ◆ Fully Assembled and Tested

MAX1535A Evaluation Kit/ MAX1535A Evaluation System

Quick Start

Recommended Equipment

- DC source to supply the input current to the charger. This source must be capable of supplying a voltage greater than the battery-voltage set point and have sufficient current rating.
- Voltmeter
- Smart battery
- Computer running Windows 95, 98, 2000, or XP
- 9-pin serial extension cable
- SMBUSMON board

Procedure

The MAX1535A EV kit is a fully assembled and tested board. Follow the steps below to verify board operation.

Do not turn on the power supply until all connections are completed. Observe all precautions on the battery manufacturer's data sheet.

- 1) Set the VPP jumper on the SMBUSMON board to VCC5.
- 2) Carefully connect the boards by aligning the 20-pin connector of the MAX1535A EV kit with the 20-pin header of the SMBUSMON board. Gently press them together.
- 3) Connect a cable from the computer's serial port to the SMBUSMON interface board. Use a straight-through 9-pin female-to-male cable.
- 4) Install the software by running the **INSTALL.EXE** program. The install program copies the files and creates icons for them in the Windows 95/98/2000/XP start menu. An uninstall program is included with the software. Click on the UNINSTALL icon to remove the EV kit software from the hard drive.
- 5) Connect power to the SMBUSMON board.
- 6) Connect the input-current supply across the ADAPTER_IN and PGND pads.
- 7) Connect a smart battery to connector J2.
- 8) Turn on the power supply.
- 9) Start the MAX1535A EV kit software.
- 10) Verify current is being delivered to the battery.

Detailed Description of Software

The MAX1535A program provides easy access to the MAX1535A registers. It is also capable of reading the registers of a smart battery and monitoring SMBus traffic.

Upon execution of the program, the software enables the MAX1535A smart-charger command panel (Figure 1),

after which any of the allowed SMBus commands can be sent to the MAX1535A. Refer to the MAX1535A data sheet for more information regarding the allowed SMBus commands.

Smart-Charger Command Panel

ChargeVoltage()

To issue the ChargeVoltage() command to the MAX1535A, enter the desired voltage, in millivolts, into the Charging Voltage edit field and select the adjacent **Write** button.

ChargeCurrent()

To issue the ChargeCurrent() command to the MAX1535A, enter the desired current, in milliamps, into the Charging Current edit field and select the adjacent **Write** button.

Auto Rewrite Checkboxes

The MAX1535A needs to receive a ChargeVoltage() or ChargeCurrent() command every 175s (typ); otherwise, the MAX1535A times out and terminates charging. Usually, a smart battery sends these necessary commands. However, when not using a smart battery with the MAX1535A EV kit, select either (or both) of the Auto Rewrite checkboxes located directly under the Charging Current and Charging Voltage edit fields. This generates a ChargeVoltage() or ChargeCurrent() command at the selected time interval located on the Timer panel.

ChargerMode()

To issue the ChargerMode() command to the MAX1535A, select a combination of checkboxes in the Charger Mode panel of commands. Each checkbox represents a bit in the ChargerMode() command word. Select the checkboxes next to the bits for which the software should write a 1, unselect the checkboxes for a 0. Send the command by selecting the **Write** button.

ChargerStatus()

Charger status is shown in the Charger Status panel. Each of the bits in the ChargerStatus() command word are shown individually with a short description of the bit.

By default, the status is automatically read once every two seconds. Disable this feature by unselecting the Active Read: Charger checkbox located on the Timer panel. Change the refresh time by entering a new value into the Timer Interval edit box and select the **Set Interval** button. When Auto Refresh is disabled, issue a ChargerStatus() command by selecting the **Read** button on the Charger Status panel.

MAX1535A Evaluation Kit/ MAX1535A Evaluation System

ChargerSpecInfo()

ChargerSpecInfo() returns the Charger Specification (0x0002) from the MAX1535A. This command is available through the *Other Bitmapped Charger Registers* panel. Select Charger Spec Info by picking it from the pulldown list located directly under the *Other Bitmapped Charger Registers* label. Issue a ChargerSpecInfo() command by selecting the **Read** button. The returned hexadecimal value is shown at the bottom of the panel.

AlarmWarning()

Alarm Warning is shown on the *Other Bitmapped Charger Registers...* panel (Figure 2). Select Alarm Warning by picking it from the pulldown list located directly under the *Other Bitmapped Charger Registers* label. Each of the bits in the AlarmWarning() command word are shown individually with a short description of the bit and a checkbox. Select the checkboxes next to the bits for which the software should write a 1; unselect the checkboxes for a 0. Send the command to the MAX1535A by selecting the **Write** button.

InputCurrent()

Input Current is shown on the *Other Bitmapped Charger Register* panel (Figure 2). Select Input Current by picking it from the pulldown list located directly under the *Other Bitmapped Charger Registers* label. Each of the bits in the InputCurrent() command word are shown individually with a short description of the bit and a checkbox. Select the checkboxes next to the bits for which the software should write a 1; unselect the checkboxes for a 0. Send the command to the MAX1535A by selecting the **Write** button.

Note: The default input-current-limit setting at POR is 256mA. All codes requesting input current greater than 11.004A result in an input-current overrange, limiting the input current to 11.004A.

ManufacturerID()

ManufacturerID() returns the Manufacturer ID (0x004D) from the MAX1535A. This command is available through the *Other Bitmapped Charger Registers* panel (Figure 2). Select Manufacturer ID by picking it from the pulldown list located directly under the *Other Bitmapped Charger Registers* label. Issue a ManufacturerID() command by selecting the **Read** button. The returned hexadecimal value is shown at the bottom of the panel.

DeviceID()

DeviceID() returns the Device ID (0x0006) from the MAX1535A. This command is available through the *Other Bitmapped Charger Registers* panel (Figure 2). Select Device ID by picking it from the pulldown list located directly under the *Other Bitmapped Charger Registers* label. Issue a DeviceID() command by selecting the **Read** button. The returned hexadecimal value is shown at the bottom of the panel.

Smart-Battery Command Panel

The software is capable of reading the registers of a smart battery. The smart battery page of the software is shown in Figure 3. The software only reads the registers selected with checkmarks. By default, the registers are automatically read once every two seconds. Disable this feature by unselecting the Active Read: Battery checkbox located on the Timer panel. Change the refresh time by entering a new value into the Timer Interval edit box and select the **Set Interval** button. When Auto Refresh is disabled, read the battery by selecting the **Refresh** button.

— Detailed Description of Hardware

The MAX1535A includes all the functions necessary to charge a smart battery. The EV kit is capable of charging with a maximum current of 8.064A and a maximum voltage of 19.2V. For more information on the operation of the MAX1535A, refer to the *Detailed Description* section of the MAX1535A data sheet.

Connecting a Smart Battery

The MAX1535A EV kit includes a 5-pin smart battery connector. To connect a smart battery to the EV kit, turn off power to the EV kit and connect the battery, making sure to correctly orient the connectors.

Evaluating the MAX1535A Above 25V

To evaluate the MAX1535A with an input voltage greater than 25V (up to 28V), capacitors C1, C2, C13, and C14 must be replaced with higher voltage-rating parts. Any capacitors that were installed in locations C11, C12, C19, and C20 must also meet the higher voltage rating.

MAX1535A Evaluation Kit/ MAX1535A Evaluation System

Evaluate: MAX1535A

The screenshot shows the 'MAX1535A Evaluation Kit' software interface. The main window is titled 'MAX1535A Evaluation Kit' and has a menu bar with 'File', 'Logging', 'Interface', 'Script', and 'Help'. Below the menu bar, there are tabs for 'System Overview', 'Generic Smart Battery (0x16)', 'MAX1535A Smart Charger (0x12)', 'SMBus Interface', 'SMBus Scripting', and 'SMBus Traffic'. The 'MAX1535A Smart Charger (0x12)' tab is active, showing 'Smart Battery described in file: BATTERY.INI'.

The main area is titled 'Smart Battery Settings' and contains a grid of 23 settings, each with a checked checkbox, a label, a value field, and a unit. The settings are:

<input checked="" type="checkbox"/> 0x00 Manufacturer Access	0xFF10	<input checked="" type="checkbox"/> 0x10 Full Charge Capacity	1770 mAh
