

10-Port SPI-Interfaced I/O Expander with Overvoltage and Hot-Insertion Protection

MAX7317

General Description

The MAX7317 serial-interfaced peripheral provides microprocessors with 10 I/O ports rated to 7V. Each port can be individually configured as either an open-drain output, or an overvoltage-protected Schmitt input.

The MAX7317 supports hot insertion. All port pins remain high impedance in power-down ($V+ = 0V$) with up to 8V asserted on them.

The MAX7317 is available in 16-pin thin QFN and QSOP packages and operates in the $-40^{\circ}C$ to $+125^{\circ}C$ range.

For a similar part with constant-current outputs and 8-bit PWM controls, refer to the MAX6966/MAX6967 data sheet.

Applications

Portable Equipment
Cellular Phones
White Goods
Industrial Controllers
Automotive
System Monitoring

Typical Application Circuit

Features

- ◆ High-Speed, 26MHz SPI™-/QSPI™-/MICROWIRE™-Compatible Serial Interface
- ◆ 2.25V to 3.6V Operation
- ◆ I/O Port Inputs are Overvoltage Protected to 7V
- ◆ I/O Port Outputs are 7V-Rated Open Drain
- ◆ I/O Ports Support Hot Insertion
- ◆ 0.7μA (typ), 1.9μA (max) Standby Current
- ◆ Tiny 3mm x 3mm, 0.8mm High Thin QFN Package
- ◆ $-40^{\circ}C$ to $+125^{\circ}C$ Temperature Range

ABSOLUTE MAXIMUM RATINGS

Voltage (with respect to GND)		Continuous Power Dissipation (T _A = +70°C)
V+	-0.3V to +4V	16-Pin Thin QFN
SCLK, DIN, CS, DOUT	-0.3V to (V+ + 0.3V)	(derate 14.7mW/°C above +70°C).....
P_	-0.3V to +8V	16-Pin QSOP (derate 8.3mW/°C above +70°C).....
DC Current into P_24mA	Operating Temperature Range
DC Current into DOUT	10mA	(T _{MIN} to T _{MAX})
Total GND Current	200mA	Junction Temperature
		Storage Temperature Range
		Lead Temperature (soldering, 10s)

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(Typical Operating Circuit, V+ = 2.25V to 3.6V, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at V+ = 3.3V, T_A = +25°C.) (Note 1)

Typical Operating Characteristics

($T_A = +25^\circ\text{C}$, unless otherwise noted.)

Pin Description

PIN		NAME	FUNCTION
QSOP	QFN		
1	15	SCLK	Serial-Clock Input. On SCLK's rising edge, data shifts into the internal shift register. On SCLK's falling edge, data is clocked out of DOUT. SCLK is active only while $\overline{\text{CS}}$ is low.
2	16	$\overline{\text{CS}}$	Chip-Select Input. Serial data is loaded into the shift register while $\overline{\text{CS}}$ is low. The most recent 16 bits of data latch on $\overline{\text{CS}}$'s rising edge.
3-7, 9-13	1-5, 7-11	P0-P9	I/O Ports. P0 to P9 can be configured as open-drain, current-sink outputs rated at 20mA maximum, or as CMOS inputs, or as open-drain outputs. Loads should be connected to a supply voltage no higher than 7V.
8	6	GND	Ground
14	12	DOUT	Serial-Data Output. The data into DIN is valid at DOUT 15.5 clock cycles later. Use this pin to daisy-chain several devices or allow data readback. Output is push-pull.
15	13	DIN	Serial-Data Input. Data from DIN loads into the internal 16-bit shift register on SCLK's rising edge.
16	14	V+	Positive Supply Voltage. Bypass V+ to GND with a 0.047 μF ceramic capacitor.
—	PAD	Exposed pad	Exposed Pad on Package Underside. Connect to GND.

10-Port SPI-Interfaced I/O Expander with Overvoltage and Hot-Insertion Protection

Detailed Description

The MAX7317 is a general-purpose input/output (GPIO) peripheral that provides 10 I/O ports, P0 to P9, controlled through a high-speed SPI-compatible serial interface. The 10 I/O ports can be used as inputs or open-drain outputs in any combination. Ports withstand 7V independent of the MAX7317's supply voltage whether used as inputs or outputs.

Figure 1 shows the I/O port structure of the MAX7317.

Register Structure

The MAX7317 contains 10 internal registers, addressed as 0x00–0x09, which control the peripheral (Table 2). Two further addresses, 0x0E and 0x0F, do not store data but return the port input status when read. Four virtual addresses, 0x0A–0x0D, allow more than one register to be written with the same data to simplify software. The RAM register provides 1 byte of memory that can be used for any purpose. The no-op address, 0x20, causes no action when written or read, and is used as a dummy register when accessing one MAX7317 out of multiple cascaded devices.

Initial Power-Up

On power-up, all control registers are reset (Table 2). Power-up status sets I/O ports P0 to P9 high impedance, and puts the device into shutdown mode.

RAM Register

The RAM register provides a byte of memory that can be used for any purpose.

GPIO Port Direction Configuration

The 10 I/O ports P0 through P9 can be configured to any combination of inputs and outputs. Ports withstand 7V independent of the MAX7317's supply voltage, whether used as inputs or outputs. Configure a port as an input by setting its output register to 0x01, which sets the port output high impedance (Table 4).

Input Port Registers

Reading an input port register returns the logic levels at the I/O port pins. The input port registers are read only. A write to an input port register is ignored.

Output Registers

The MAX7317 uses one 8-bit register to control each output port (Table 4). Each port can be configured as an input or open-drain output. Write 0x00 to the output register to set the port as a logic-low output, or 0x01 to set the port as a logic-high output or logic input.

The 10 registers, 0x00 through 0x09, control an I/O port each (Table 4). Four pseudo-register addresses, 0x0A through 0x0D, allow groups of outputs to be set to the

same value with a single command by writing the same data to multiple output registers.

Serial Interface

The MAX7317 communicates through an SPI-compatible 4-wire serial interface. The interface has three inputs: clock (SCLK), chip select (\overline{CS}), and data in (DIN), and one output, data out (DOUT). \overline{CS} must be low to clock data into or out of the device, and DIN must be stable when sampled on the rising edge of SCLK. DOUT is stable on the rising edge of SCLK.

SCLK and DIN can be used to transmit data to other peripherals. The MAX7317 ignores all activity on SCLK and DIN except when \overline{CS} is low.

Note that the SPI protocol expects DOUT to be high impedance when the MAX7317 is not being accessed; DOUT on the MAX7317 is never high impedance. Go to www.maxim-ic.com/an1879 for ways to convert the MAX7317 to tri-state, if required.

Control and Operation Using the 4-Wire Interface

Controlling the MAX7317 requires sending a 16-bit word. The first byte, D15 through D8, is the command, and the second byte, D7 through D0, is the data byte (Table 5).

10-Port SPI-Interfaced I/O Expander with Overvoltage and Hot-Insertion Protection

Connecting Multiple MAX7317s to the 4-Wire Bus

Multiple MAX7317s can be interfaced to a common SPI bus by connecting DIN inputs together, SCLK inputs

together, and providing an individual \overline{CS} per the MAX7317 device (Figure 2). This connection works regardless of the configuration of DOUT/OSC, but does not allow the MAX7317s to be read.

MAX7317

10-Port SPI-Interfaced I/O Expander with Overvoltage and Hot-Insertion Protection

Alternatively, MAX7317s can be daisy-chained by connecting the DOUT of one device to the DIN of the next, and driving SCLK and \overline{CS} lines in parallel (Figure 3). This connection allows the MAX7317s to be read. Data at DIN propagates through the internal shift registers and appears at DOUT 15.5 clock cycles later, clocked out on the falling edge of SCLK. When sending commands to daisy-chained MAX7317s, all devices are accessed at the same time. An access requires $(16 \times n)$ clock cycles, where n is the number of MAX7317s connected together. The serial interface speed (maximum SCLK) is limited to 10MHz when multiple devices are daisy-chained due to the DOUT propagation delay and DIN setup time.

The MAX7317 is written to using the following sequence (Figure 5):

- 1) Take SCLK low.
- 2) Take \overline{CS} low. This enables the internal 16-bit shift register.
- 3) Clock 16 bits of data into DIN, D15 first to D0 last, observing the setup and hold times. Bit D15 is low, indicating a write command.
- 4) Take \overline{CS} high (either while SCLK is still high after clocking in the last data bit, or after taking SCLK low).
- 5) Take SCLK low (if not already low).

If fewer or greater than 16 bits are clocked into the MAX7317 between taking \overline{CS} low and taking \overline{CS} high again, the MAX7317 stores the last 16 bits received, including the previous transmission(s). The general case is when n bits (where $n > 16$) are transmitted to the MAX7317. The last bits comprising bits {n-15} to {n}, are retained, and are parallel loaded into the 16-bit latch as bits D15 to D0, respectively (Figure 6).

Reading Device Registers

Any register data within the MAX7317 can be read by sending a logic high to bit D15. The sequence is:

- 1) Take SCLK low.
- 2) Take \overline{CS} low. This enables the internal 16-bit shift register.
- 3) Clock 16 bits of data into DIN, D15 first to D0 last. D15 is high, indicating a read command and bits D14 through D8 contain the address of the register to read. Bits D7 to D0 contain dummy data, which is discarded.
- 4) Take \overline{CS} high (either while SCLK is still high after clocking in the last data bit, or after taking SCLK low). Positions D7 through D0 in the shift register are now loaded with the register data addressed by bits D15 through D8.
- 5) Take SCLK low (if not already low).
- 6) Issue another read or write command, and examine the bit stream at DOUT; the second 8 bits are the contents of the register addressed by bits D14 through D8 in step 3.

Applications Information

Hot Insertion

The I/O ports P0–P9 remain high impedance with up to 8V asserted on them when the MAX7317 is powered down ($V_+ = 0V$). The MAX7317 can therefore be used in hot-swap applications.

SPI Routing Considerations

The MAX7317's SPI interface is guaranteed to operate at 26Mbps on a 2.5V supply, and on a 3.3V supply typically operates at 35Mbps. This means that transmission line issues should be considered when the interface connections are longer than 100mm, particularly with higher supply voltages. Avoid running long adjacent tracks for SCLK, DIN, and CS without interleaving GND traces; otherwise, the signals may cross-couple, giving false clock or chip-select transitions. Ringing may manifest itself as communication issues, often intermittent, typically due to double clocking caused by ringing at the SCLK input. Fit a 1kΩ to 10kΩ parallel termination resistor to either GND or V_+ at the DIN, SCLK, and CS inputs to damp ringing for moderately long interface runs. Use line-impedance-matching terminations when making connections between boards.

Output-Level Translation

The open-drain output architecture allows the ports to level translate the outputs to higher or lower voltages than the MAX7317 supply. An external pullup resistor can be used on any output to convert the high-impedance logic-high condition to a positive voltage level. The resistor can be connected to any voltage up to 7V. When using a pullup on a constant-current output, select the resistor value to sink no more than a few hundred μA in logic-low condition. This ensures that the current sink output saturates close to GND. For interfacing CMOS inputs, a pullup resistor value of 220kΩ is a good starting point. Use a lower resistance to

improve noise immunity in applications where power consumption is less critical, or where a faster rise time is needed for a given capacitive load.

Power-Supply Considerations

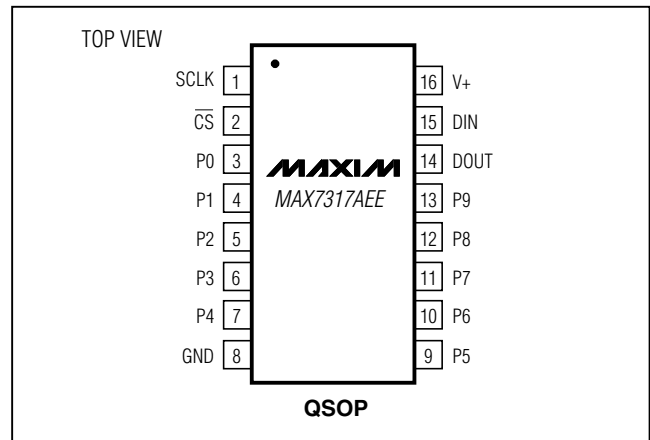

The MAX7317 operates with a power-supply voltage of 2.25V to 3.6V. Bypass the power supply to GND with a 0.047 μF ceramic capacitor as close to the device as possible. For the QFN version, connect the underside exposed pad to GND.

NOTES:

- DIMENSIONING & TOLERANCING CONFORM TO ASME Y14.5M-1994.
- ALL DIMENSIONS ARE IN MILLIMETERS. ANGLES ARE IN DEGREES.
- N IS THE TOTAL NUMBER OF TERMINALS.
- THE TERMINAL #1 IDENTIFIER AND TERMINAL NUMBERING CONVENTION SHALL CONFORM TO JEDEC 95-1 SPP-012. DETAILS OF TERMINAL #1 IDENTIFIER ARE OPTIONAL, BUT MUST BE LOCATED WITHIN THE ZONE INDICATED. THE TERMINAL #1 IDENTIFIER MAY BE EITHER A MOLD OR MARKED FEATURE.
- DIMENSION b APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.20 mm AND 0.25 mm FROM TERMINAL TIP.
- ND AND NE REFER TO THE NUMBER OF TERMINALS ON EACH D AND E SIDE RESPECTIVELY.
- DEPOPULATION IS POSSIBLE IN A SYMMETRICAL FASHION.
- COPLANARITY APPLIES TO THE EXPOSED HEAT SINK SLUG AS WELL AS THE TERMINALS.
- DRAWING CONFORMS TO JEDEC MO220 REVISION C.
