

The DW9241 has been specifically developed for the Personal Communications market, where the 1st I.F. stage filter is typically in the 60 to 80MHz range.

The filter is realised on ST-Quartz, using Uni-directional Transducer technology, which provides excellent insertion loss, and temperature stability.

The unique design obviates the need for distinct Roof & Channel filters, usually required to achieve a low shape factor, with maximum bandwidth. The filters can be used in single or cascade format, and are available in a low profile, leadless, surface mount package, which is compatible with most modern manufacturing techniques.
