

The SP8714 is a switchable divide by 32/33, 64/65 programmable divider which is guaranteed to operate up to 2100MHz. It will operate from a supply of 2.7V to 5.25V and requires typically 6.8mA (including the output current). It also features a power down facility for battery economy.

The RF inputs are internally biased and should be capacitively coupled to the signal source. The output is designed to interface with CMOS synthesisers.

#### NOTES

- All electrical testing is performed at +85°C.
- Typical values are measured at +25°C and  $V_{CC} = +5V$ .
- Modulus Control and Ratio Select are high impedance inputs which can be driven directly by standard CMOS outputs.
- Modulus control is latched at the end of the previous cycle.
- See Figure 4.
- See Figure 8.
- These parameters are not tested but are guaranteed by design.
- The ratio select pin is not intended to be switched dynamically.

**OPERATING NOTES**

The RF inputs are biased internally and are normally coupled to the signal source with suitable capacitors.

The output stage has a novel design and is intended to drive a CMOS synthesiser input. External pull-down resistors or circuits are not required. The SP8714 is not suitable for driving TTL or similar devices.

The device will operate down to DC frequencies for non-sinusoidal signals provided that the input slew rate is better than 100V/ $\mu$ s.

POWER DOWN (pin 7) is connected internally to a pull-up resistor. If the battery economy facility is not used, pin 7 should be connected to  $V_{EE}$ .
