

The SL6679 is an advanced Direct Conversion FSK Data Receiver for operation up to 450 MHz. The device integrates all functions to convert a binary FSK modulated RF signal into a demodulated data stream.

Adjacent channel rejection is provided using tuneable gyrator filters. RF and audio AGC functions assist operation when large interfering signals are present and an automatic frequency control (AFC) function is provided to extend centre frequency acceptance.

FEATURES

- Very Low Power Operation from Single Cell
- Superior Sensitivity
- Operation at 512, 1200 and 2400 Baud
- On Chip 1 Volt Regulator
- 1mm Height Miniature Package
- Automatic Frequency Control Function
- Programmable Post Detection Filter
- AGC Detection Circuitry
- Power Down Function
- Battery Strength Indicator

APPLICATIONS

- Pagers, including Credit Card, PCMCIA and Watch Pagers
- Low Data Rate Receivers, e.g. Security Systems

ORDERING INFORMATION

- SL6679/KG/TP1N** 1mm TQFP device, baked and dry packed, supplied in trays
- SL6679/KG/TP1Q** 1mm TQFP device, baked and dry packed, supplied in tape and reel

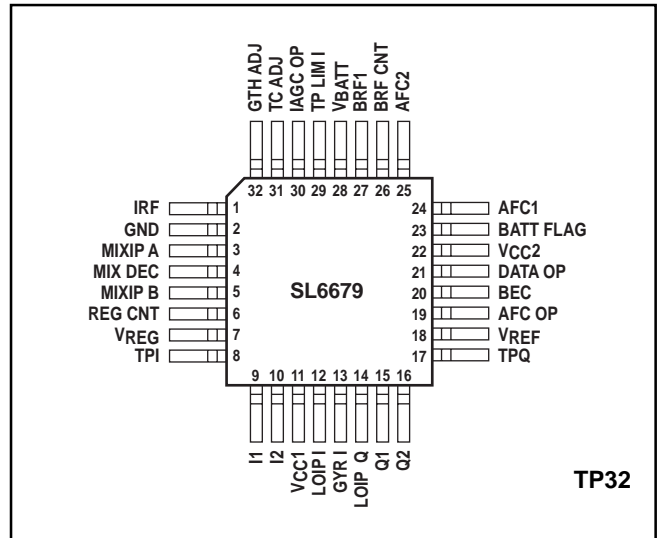

Fig. 1 Pin identification diagram (top view). See Table 1 for pin descriptions

ABSOLUTE MAXIMUM RATINGS

Storage temperature	-55°C to +150°C
Operating temperature	-10°C to +55°C
Maximum voltage on any pin w.r.t. any other pin, subject to the following conditions:	+4V
Current, pin 3 (MIXIP), pin 5 (MIXPB), pin 12 (LOIP I) and pin 14 (LOIPB)	<5ma
Most negative voltage on any pin	-0.5V w.r.t. gnd

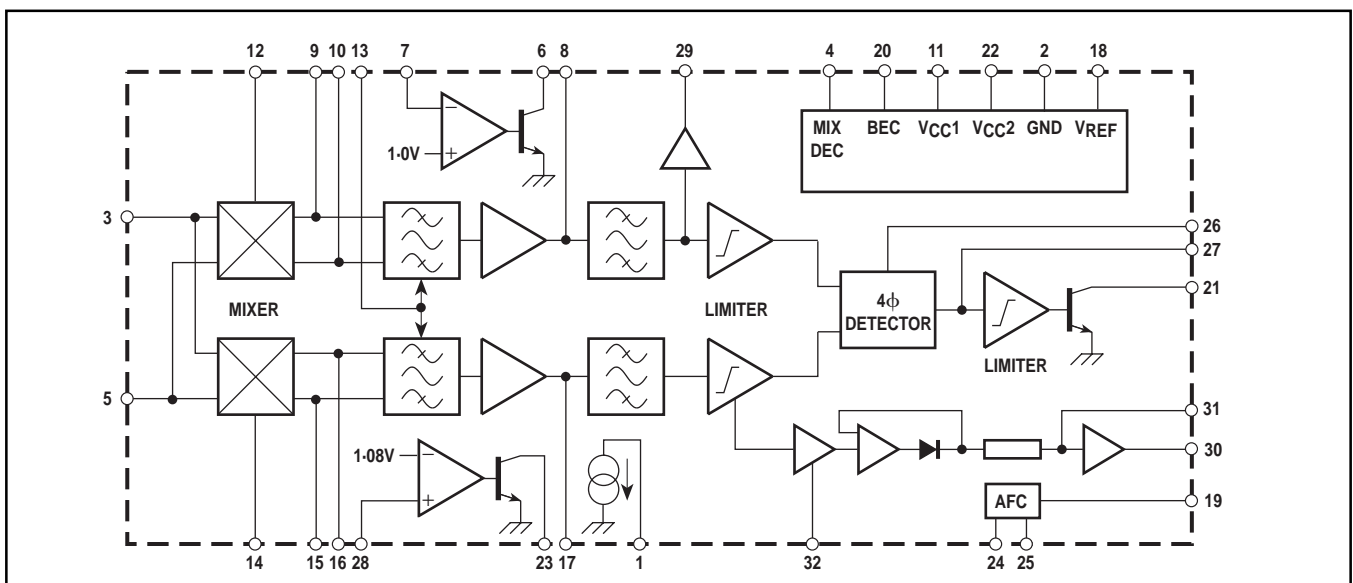

Fig. 2 Block diagram of SL6679

Pin number	Pin name	Pin description
1	IRF	LNA current source
2	GND	Ground
3	MIXIP A	Mixer input A
4	MIX DEC	Mixer biasing decouple
5	MIXIP B	Mixer input B
6	REG CNT	1V regulator control external PNP drive
7	VREG	1V regulator output voltage
8	TPI	I channel pre-yrator filter test point.
9	I1	Mixer output, I channel
10	I2	Mixer output, I channel
11	VCC1	Positive supply 1
12	LOIP I	LO input channel I
13	GYRI	Gyrator current adjust pin
14	LOIP Q	LO input channel Q
15	Q1	Mixer output, Q channel
16	Q2	Mixer output, Q channel
17	TPQ	Q channel pre-yrator filter test point
18	VREF	Reference voltage
19	AFC OP	AFC output
20	BEC	Battery economy control
21	DATA OP	Data output pin
22	VCC2	Positive supply 2
23	BATT FLAG	Battery flag output
24	AFC1	AFC characteristic defining pin
25	AFC2	AFC characteristic defining pin
26	BRF CNT	Bit rate filter control
27	BRF1	Bit rate filter 1, output from detector
28	VBATT	Battery flag input voltage
29	TP LIM I	I channel limiter (post gyrator filter) test point, output only
30	IAGC OP	Audio AGC output current
31	TC ADJ	Audio AGC time constant adjust
32	GTH ADJ	Audio AGC gain and threshold adjust. RSSI signal indicator

RECEIVER CHARACTERISTICS (450MHz)

Receiver Characteristics (450MHz) are guaranteed over the following range of operating conditions unless otherwise stated. Characteristics are not tested but are guaranteed by characterisation test or design. All measurements made using the characterisation circuit Fig. 5. See Application Note AN137 for details of test method.

$T_{AMB} = -10^{\circ}\text{C}$ to $+55^{\circ}\text{C}$, $V_{CC1} = 1.04\text{V}$ to 2.0V , $V_{CC2} = 2.3\text{V}$ to 3.2V , $V_{CC1} < V_{CC2} - 0.8\text{V}$, carrier frequency = 450MHz , BER = 1 in 30, AFC open loop. LNA gain set such that an RF signal of -73dBm at the LNA input, offset from the LO by 4kHz , gives a typical IF signal level of 300mV p-p at TPI and TPQ. LNA noise figure $< 2\text{dB}$

Characteristic	Value			Units	Conditions	
	Min.	Typ.	Max.			
Sensitivity		-128		dBm	512bps, $\Delta f = 4.5\text{kHz}$	
		-126	-122	dBm	1200bps, $\Delta f = 4.0\text{kHz}$

1MHz Blocking		75		dB	512bps, $\Delta f = 4.5\text{kHz}$	
	67	75	78	dB	1200bps, $\Delta f = 4.0\text{kHz}$	
	65	73	76	dB	2400bps, $\Delta f = 4.5\text{kHz}$. LO = -15dBm	
Mark:space amplitude modulation acceptance	20	23		dB	2400bps, R14 = 120k Ω (Fig. 5), room temperature only. See Note.	

NOTE

The mark:space amplitude acceptance is the maximum amplitude ratio which can occur (for example due to Simulcast conditions) with 2400bps, using a POCSAG decoder with R14 = 120k Ω to achieve an 80% call rate and the lower amplitude set at a sensitivity of +20dB. the maxima and minima of the amplitude modulation correspond to the positive and negative (or vice versa) frequency shifts of the FSK modulation.

OPERATION OF SL6679

Low Noise Amplifier

To achieve optimum performance it is necessary to incorporate a Low Noise RF Amplifier at the front end of the receiver. This is easily biased using the on-chip voltages and current source provided. All voltages and current sources used for bias of the RF amplifier, receiver and mixers should be RF decoupled using 1nF capacitors. The receiver also requires a stable Local Oscillator at the required channel frequency.

Local Oscillator

The Local Oscillator signal is applied to the device in phase quadrature. This can be achieved with the use of two RC networks operating at their $-3\text{dB}/45^\circ$ transfer characteristic. The RC characteristics for I and Q channels are combined to give a full 90° phase differential between the LO ports of the device. Each LO port also requires an equal level of drive from the oscillator. This is achieved by forming the two RC networks into a power divider.

Gyrator Filters

The on-chip filters include an adjustable gyrator filter. This may be adjusted by changing the value of the resistor connected between pin 13 and GND. This allows adjustment of the filters' cutoff frequency and allows for compensation for possible process variations.

Audio AGC (Fig. 3)

The Audio AGC consists of a current sink which is controlled by the audio (baseband) signal. It has three parameters that may be controlled by the user. These are the attack (turn on) time, decay (duration) time and threshold level. The attack time is simply determined by the value of the external capacitor connected to TCADJ. The external capacitor is in series with an internal $100\text{k}\Omega$ resistor and the time constant of this circuit dictates the attack time of the AGC.

$$\text{i.e. } t_{\text{ATTACK}} = 100\text{k}\Omega \times C18$$

The decay time is determined by the external resistor connected in parallel with the capacitor CTC. The decay time is simply

$$t_{\text{DECAY}} = R17 \times C18$$

When a large audio (baseband) signal is incident on the input to the AGC circuit, the variable current source is turned on. This causes a voltage drop across R13. The voltage potential between V_{REF} and the voltage on pin 31 causes a current to flow in pin 30. This charges up C18 through the $100\text{k}\Omega$ internal resistor. As the voltage across the capacitor increases, a current source is turned on and this sinks current from pin 32. The current sink on pin 32 can be used to drive

the external AGC circuit by causing a PIN diode to conduct, reducing the signal to the RF amplifier.

RF AGC

The RF AGC is an automatic gain control loop that protects the mixer's RF inputs, Pins 3 and 5, from large out of band RF signals. The loop consists of an RF received signal strength indicator which detect the signal at the inputs of the mixers. This RSSI signal is then used to control the LNA current source (pin 1).

Regulator

The on-chip regulator should be used in conjunction with a suitable PNP transistor to achieve regulation. As the transistor forms part of the regulator feedback loop the transistor should exhibit the following characteristics:

$$H_{\text{FE}} > 100 \text{ for } V_{\text{CE}} = 0.1\text{V}$$

If no external transistor is used, the maximum current sourcing capability of the regulator is limited to $30\mu\text{A}$.

Automatic Frequency Control (Fig. 4)

The Automatic Frequency Control consists of a detection circuit which gives a current output at AFC OP whose magnitude and sign is a function of the difference between the local oscillator (f_{LO}) and carrier frequencies (f_{C}). This output current is then filtered by an off-chip integrating capacitor. The integrator's output voltage is used to control a voltage control crystal oscillator. This closes the AFC feedback loop giving the automatic frequency control function. For an FSK modulated incoming RF carrier, the AFC OP current's polarity is positive, i.e. current is sourced for $f_{\text{LO}} < f_{\text{C}} < f_{\text{LO}} + 4\text{kHz}$ and negative, i.e. current is sunk, for $f_{\text{LO}} > f_{\text{C}} > f_{\text{LO}} - 4\text{kHz}$. The magnitude of the AFC OP current is a function of frequency offset and the transmitted data's bit stream. If the carrier frequency, (f_{C}), equals the local oscillator frequency, (f_{LO}) then the magnitude of the current is zero.

BIT RATE FILTER CONTROL

The logic level on pin 26 controls the cutoff frequency of the 1st order bit rate for a given bit rate filter capacitor at pin 27. This allows the cutoff frequency to be changed between f_{C} , $2f_{\text{C}}$ and $0.43f_{\text{C}}$ through the logic level on pin 26. This function is achieved by changing the value of the current in the 4ϕ detector's output stage. A logic zero (0V to 0.1V) on pin 26 gives a cutoff frequency of f_{C} a logic one ($V_{\text{CC2}} - 0.3\text{V}$ to V_{CC2}) gives a cut off frequency of $2f_{\text{C}}$ and an open circuit at pin 26 gives a cutoff frequency of $0.43f_{\text{C}}$.

Table 4 Component list for 450MHz characterisation board

TYPICAL DC PARAMETERS (FIGS. 6 TO 8)

Fig. 6 Typical I_{CC1} and I_{CC2} v. supply and temperature

Fig. 7 Typical V_{REF} and V_{REG} v. supply and temperature

Conditions

Standard Mitel characterisation board (Fig. 5)
 I_{CC1} includes IRF LNA current (typ. $500\mu A$) but does not include the regulator load current
 The Audio AGC and RF AGC are both inactive
 I_{CC2} is measured with BATTFLAG and DATAS OP high, $f_C = 282MHz$
 V_{BATT} connected to V_{CC1}

Fig. 8 Typical I_{RF} v. supply and temperature

Fig. 9 Typical battery flag trigger voltage (V_{BATTFLAG} = V_{CC}/2) v. supply and temperature

TYPICAL AC PARAMETERS (FIGS. 10 TO 13)

Fig. 10 Typical sensitivity v. supply and temperature

Fig. 11 Typical IP3 and adjacent channel v. supply and temperature

Fig. 12 Typical deviation acceptance v. supply and temperature

Fig. 13 Typical centre frequency acceptance and 1MHz blocking v. supply and temperature

PACKAGE DETAILS

Dimensions are shown thus: mm (in).

HEADQUARTERS OPERATIONS

MITEL SEMICONDUCTOR
