Low-power D-type flip-flop; positive-edge trigger; 3-state

Rev. 01 — 14 November 2006

Product data sheet

1. General description

The 74AUP1G374 is a high-performance, low-power, low-voltage, Si-gate CMOS device, superior to most advanced CMOS compatible TTL families.

Schmitt trigger action at all inputs makes the circuit tolerant to slower input rise and fall times across the entire V_{CC} range from 0.8 V to 3.6 V. This device ensures a very low static and dynamic power consumption across the entire V_{CC} range from 0.8 V to 3.6 V.

This device is fully specified for partial power-down applications using I_{OFF} .

The I_{OFF} circuitry disables the output, preventing the damaging backflow current through the device when it is powered down.

The 74AUP1G374 provides the single D-type flip-flop with 3-state output. The flip-flop will store the state of data input (D) that meet the set-up and hold times requirements on the LOW-to-HIGH CP transition. When pin \overline{OE} is LOW, the contents of the flip-flop is available at the (Q) output. When pin \overline{OE} is HIGH, the output goes to the high-impedance OFF-state. Operation of input pin \overline{OE} does not affect the state of the flip-flop.

[1] All typical values are measured at nominal V_{CC}.[2] t_{pd} is the same as t_{PLH} and t_{PHL}.[3] t_{en} is the same as t_{PZH} and t_{PZL}.[4] t_{dis} is the same as t_{PHZ} and t_{PLZ}.[5] C_{PD} is used to determine the dynamic power dissipation (P_D in μ W).

$$P_D = C_{PD} \times V_{CC}^2 \times f_i \times N + \Sigma(C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f_i = input frequency in MHz;f_o = output frequency in MHz;C_L = output load capacitance in pF;V_{CC} = supply voltage in V; $\Sigma(C_L \times V_{CC}^2 \times f_o)$ = sum of the outputs;

N = number of inputs switching.

Measurement points are given in [Table 9](#).

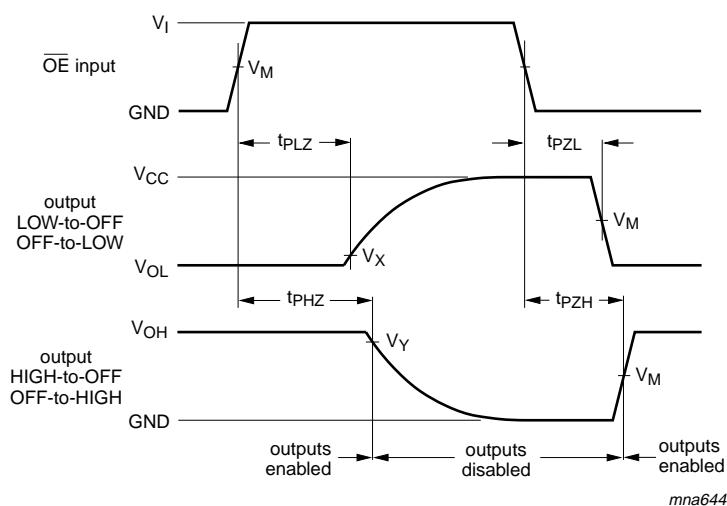

The shaded areas indicate when the input is permitted to change for predictable output performance.

Logic levels: V_{OL} and V_{OH} are typical output voltage drop that occur with the output load.

Definitions for test circuit:

R_L = Load resistance.

C_L = Load capacitance including jig and probe capacitance.

R_T = Termination resistance should be equal to the output impedance Z_o of the pulse generator.

V_{EXT} = External voltage for measuring switching times.
