16 Volt Digitally Programmable Potentiometer (DPP™) with 128 Taps and an Increment Decrement Interface

Description

The CAT5133 is a high voltage Digital Programmable Potentiometer (DPP) integrated with EEPROM memory and control logic to operate in a similar manner to a mechanical potentiometer. The DPP consists of a series of resistive elements connected between two externally accessible end points. The tap points between each resistive element are connected to the wiper outputs with CMOS switches. A 7-bit wiper control register (WCR) independently controls the wiper tap switches for the DPP. Associated with the control register is a 7-bit nonvolatile memory data register (DR) used for storing the wiper settings. Changing the value of the wiper control register or storing that value into the nonvolatile memory is performed via a 3-input Increment–Decrement interface.

The CAT5133 comes with 2 voltage supply inputs: V_{CC} (digital supply voltage) input and V+ (analog bias supply) input. Providing separate Digital and Analog inputs allow the potentiometer terminals to be as much as 10 volts above V_{CC} and 16 volts above ground.

The CAT5133 can be used as a potentiometer or as a two terminal, variable resistor. It is designed for circuit level or system level adjustments in a wide variety of applications.

On power-up, the contents of the nonvolatile data register (DR) are transferred to the wiper control register (WCR) and the wiper is positioned to that location. The CAT5133 is shipped with the DR programmed to position 64.

Features

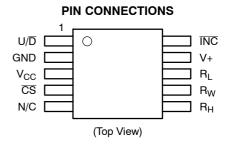

- Single Linear DPP with 128 Taps
- End-to-End Resistance of 10 k Ω , 50 k Ω or 100 k Ω
- 2-wire Interface
- Fast Up/Down Wiper Control Mode
- Non-volatile Wiper Setting Storage
- Automatic Wiper Setting Recall at Power-up
- Digital Supply Range (V_{CC}): 2.7 V to 5.5 V
- Analog Supply Range (V+): +8 V to +16 V
- Low Standby Current: 15 μA
- 100 Year Wiper Setting Memory
- Industrial Temperature Range: -40°C to +85°C
- 10-pin MSOP Package
- These Devices are Pb–Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- LCD Screen Adjustment
- Volume Control
- Mechanical Potentiometer Replacement
- Gain Adjustment
- Line Impedance Matching
- VCOM Settings Adjustment

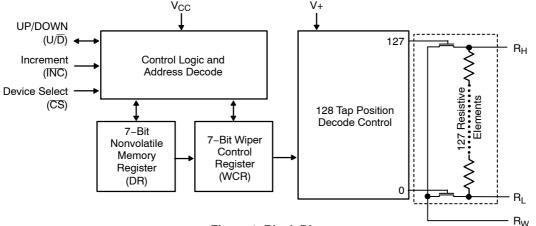

Figure 1. Block Diagram

Pin	Name	Function
1	U/D	Up/Down Data Input – Determines the direction of movement of the wiper
2	GND	Ground
3	V _{CC}	Logic Supply Voltage (2.7 V to 5.5 V)
4	CS	Chip Select – The chip is selected when the input is low.
5	N/C	No Connect
6	R _H	High Reference Terminal for the Potentiometer
7	R _W	Wiper Terminal for the Potentiometer
8	RL	Low Reference Terminal for the Potentiometer
9	V ₊	Analog Bias Voltage Input (+8.0 V to +16.0 V)
10	INC	Increment Input - Moves the wiper in the direction determined by the Up/Down input on each negative edge

Table 1. PIN DESCRIPTIONS

Device Operation

The CAT5133 operates like a digitally controlled potentiometer with R_H and R_L equivalent to the high and low terminals and R_W equivalent to the mechanical potentiometer's wiper. There are 128 available tap positions including the resistor end points, R_H and R_L . There are 127 resistor elements connected in series between the R_H and R_L terminals. The wiper terminal is connected to one of the 128 taps and controlled by three inputs, \overline{INC} , U/\overline{D} and \overline{CS} . These inputs control a 7-bit up/down counter whose output is decoded to select the wiper position. The selected wiper position can be stored in nonvolatile memory using the \overline{INC} and \overline{CS} inputs.

With \overline{CS} set LOW the CAT5133 is selected and will respond to the U/ \overline{D} and \overline{INC} inputs. HIGH to LOW transitions on \overline{INC} will increment or decrement the wiper (depending on the state of the U/ \overline{D} input and 7-bit counter). The wiper, when at either fixed terminal, acts like its mechanical equivalent and does not move beyond the last position. The value of the counter is stored in nonvolatile memory whenever \overline{CS} transitions HIGH while the \overline{INC} input is also HIGH. When the CAT5133 is powered-down; the last stored wiper counter position is maintained in the nonvolatile memory. When power is restored, the contents of the memory are recalled and the counter is set to the value stored.

With \overline{INC} set low, the CAT5133 may be de-selected and powered down without storing the current wiper position in nonvolatile memory. This allows the system to always power up to a preset value stored in nonvolatile memory.

INC	CS	U/D	Operation
High to Low	Low	High	Wiper toward H
High to Low	Low	Low	Wiper toward L
High	Low to High	х	Store Wiper Position
Low	Low to High	х	No Store, Return to Standby
Х	High	Х	Standby

Table 2. OPERATION MODES

Power-On and Potentiometer Characteristics

The CAT5133 is a 128–position, digital controlled potentiometer. When applying power to the CAT5133, V_{CC} must be supplied prior to or simultaneously with V+. At the same time, the signals on R_H, R_W and R_L terminals should not exceed V+. If V+ is applied before V_{CC} , the electronic switches of the DPP are powered in the absence of the switch control signals, that could result in multiple switches being turned on. This causes unexpected wiper settings and possible current overload of the potentiometer.

When V_{CC} is applied, the device turns on at the mid-point wiper location (64) until the wiper register can be loaded with the nonvolatile memory location previously stored in the device. After the nonvolatile memory data is loaded into the wiper register the wiper location will change to the previously stored wiper position.

At power-down, it is recommended to turn-off first the signals on R_H , R_W and R_L , followed by V+ and, after that, V_{CC} , in order to avoid unexpected transitions of the wiper and uncontrolled current overload of the potentiometer.

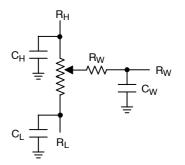

Figure 2. Potentiometer Equivalent Circuit

The end-to-end nominal resistance of the potentiometer has 128 contact points linearly distributed across the total resistor. Each of these contact points is addressed by the 7 bit wiper register which is decoded to select one of these 128 contact points.

Each contact point generates a linear resistive value between the 0 position and the 127 position. These values can be determined by dividing the end-to-end value of the potentiometer by 127. The 10 k Ω potentiometer has a resistance of ~79 Ω between each wiper position. However in addition to the ~79 Ω for each resistive segment of the potentiometer, a wiper resistance offset must be considered. Table 3 shows the effect of this value and how it would appear on the wiper terminal.

This offset will appear in each of the CAT5133 end-to-end resistance values in the same way as the 10 k Ω example. However resistance between each wiper position for the 50 k Ω version will be ~395 Ω and for the 100 k Ω version will be ~790 Ω .

Position	Typical $\textbf{R}_{\textbf{W}}$ to $\textbf{R}_{\textbf{L}}$ Resistance for 10 k Ω DPP			Position	Typical R _W to R _H Resista	ince for 10 k Ω DPP
0	70 Ω or	0 Ω + 70 Ω		00	10,070 Ω or	10,000 Ω + 70 Ω
01	149 Ω or	79 Ω + 70 Ω		64	5,047 Ω or	4,977 Ω + 70 Ω
63	5,047 Ω or	4,977 Ω + 70 Ω		126	149 Ω or	79 Ω + 70 Ω
127	10,070 Ω or	10,000 Ω + 70 Ω		127	70 Ω or	0 Ω + 70 Ω

Table 3. POTENTIOMETER RESISTANCE AND WIPER RESISTANCE OFFSET EFFECTS

Table 4. ABSOLUTE MAXIMUM RATINGS

Parameters	Ratings	Units
Temperature Under Bias	-55 to +125	°C
Storage Temperature	-65 to +150	°C
Voltage on any U/D, $\overline{INC},$ & \overline{CS} Pins with Respect to V_{CC} (Note 2)	-0.3 to +V _{CC} + 0.3	V
Voltage on $R_{H},R_{L},\&R_{W}$ Pins with Respect to V_{CC}	V+	V
V _{CC} with Respect to Ground	-0.3 to +6.0	V
V+ with respect to Ground	-0.3 to +16.5	V
Wiper Current	±6	mA
Lead Soldering temperature (10 seconds)	+300	°C

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

2. Latch-up protection is provided for stresses up to 100 mA on the digital from -0.3 V to V_{CC} + 0.3 V.

Recommended Operating Conditions

 $V_{CC} = +2.7 \text{ V}$ to +5.5 V V + = +8.0 V to +16.0 VOperating Temperature Range: -40°C to +85°C

fc	Frequency Response	R _{POT} = 50 kΩ		0.4		MHz

3. This parameter is tested initially and after a design or process change that affects the parameter.

4. Absolute linearity is utilized to determine actual wiper voltage versus expected voltage as determined by wiper position when used as a potentiometer. 5. Relative linearity is utilized to determine the actual change in voltage between two successive tap positions when used as a potentiometer. 6. LSB = $(R_{HM} - R_{LM})/127$; where R_{HM} and R_{LM} are the highest and lowest measured values on the wiper terminal. 7. n = 1, 2, ..., 127.

8. V⁺ @ R_H; 0 V @ R_L; V_W measured @ R_W, with no load.

9. Contact factory for availability on this version of the CAT5133.

DETAIL A

Example of Ordering Information (Note 17)

15. All packages are RoHS-compliant (Lead-free, Halogen-free).

16. The standard lead finish is NiPdAu.

17. The device used in the above example is a CAT5133ZI-10-GT3 (MSOP, Industrial Temperature range, 10 kΩ, NiPdAu, Tape & Reel, 3,000/Reel).

18. For additional package and temperature options, please contact your nearest ON Semiconductor Sales office.

19. For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.
