

LV8774Q

Bi-CDMOS LSI

PWM Constant-Current Control Stepper Motor Driver

ON Semiconductor®

<http://onsemi.com>

Overview

The LV8774 is a 2-channel H-bridge driver IC, and can drive a stepper motor or two brushed DC motors.

A stepper motor driver supports micro-step drive with 1/16-step resolution, and two brushed motor drivers support forward, reverse, brake, and standby functions. It is ideally suited for driving brushed DC motors and stepper motors used in office equipment and amusement applications.

Function

- Single-channel PWM current control stepper motor driver (or two DC motor driver)
- BiCDMOS process IC
- Low on resistance (upper side : 0.3Ω ; lower side : 0.25Ω ; total of upper and lower : 0.55Ω ; Ta = 25°C, IO = 2A)
- Micro-step mode can be set to Full-step, Half-step, Quarter-step , or 1/16-step
- Excitation step proceeds only by step signal input with stepper motor
- Motor current selectable in four steps
- Output short-circuit protection circuit (selectable from latch-type or auto-reset-type)
- Unusual condition warning output pins
- No control power supply required

VQFN44L (6x6)

Specifications

Absolute Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage	VM max	VM, VM1, VM2	36	V
Output peak current	IO peak	Tw ≤ 10ms, duty 20%, Per 1ch	2.5	A
Output current	IO max	Per 1ch	2	A
Logic input voltage	VIN	ATT1, ATT2, EMM, RST/BLK, STEP/DC22, FR/DC21, MD2/DC12, MD1/DC11, DM, OE, ST	-0.3 to +6	V
MONI/EMO input voltage	Vmoni/Vemo		-0.3 to +6	V
Allowable power dissipation	Pd max	*	3.60	W
Operating temperature	Topr		-20 to +85	°C
Storage temperature	Tstg		-55 to +150	°C

*Specified circuit board : 57.0mmx57.0mmx1.6mm, glass epoxy 4-layer board, with backside mounting.

Caution 1) Absolute maximum ratings represent the value which cannot be exceeded for any length of time.

Caution 2) Even when the device is used within the range of absolute maximum ratings, as a result of continuous usage under high temperature, high current, high voltage, or drastic temperature change, the reliability of the IC may be degraded. Please contact us for the further details.

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

ORDERING INFORMATION

See detailed ordering and shipping information on page 28 of this data sheet.

LV8774Q

Recommended Operating Conditions at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage range	VM	VM, VM1, VM2	9 to 32	V
Logic input voltage	V _{IN}	ATT1, ATT2, EMM, RST/BLK, STEP/DC22, FR/DC21, MD2/DC12, MD1/DC11, DM, OE, ST	0 to 5.5	V
VREF input voltage range	VREF		0 to 3	V

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

Electrical Characteristics at Ta = 25°C, VM = 24V, VREF = 1.5V

Cautions

- 1) The data for the case with the back side mounted shows the values when 90% or more of the Exposed Die-Pad is wet.
- 2) For the set design, employ the derating design with sufficient margin.
Stresses to be derated include the voltage, current, junction temperature, power loss, and mechanical stresses such as vibration, impact, and tension.
Accordingly, the design must ensure these stresses to be as low or small as possible.
The guideline for ordinary derating is shown below :
 - (1)Maximum value 80% or less for the voltage rating
 - (2)Maximum value 80% or less for the current rating
 - (3)Maximum value 80% or less for the temperature rating
- 3) After the set design, be sure to verify the design with the actual product.
Confirm the solder joint state and verify also the reliability of solder joint for the Exposed Die-Pad, etc.
Any void or deterioration, if observed in the solder joint of these parts, causes deteriorated thermal conduction, possibly resulting in thermal destruction of IC.

Description of operation

1. Input Pin Function

Each input terminal has the function to prevent the flow of the current from an input to a power supply. Therefore, Even if a power supply (VM) is turned off in the state that applied voltage to an input terminal, the electric current does not flow into the power supply.

1-1) Chip enable function

This IC is switched between standby and operating mode by setting the ST pin. In standby mode, the IC is set to power-save mode and all logic is reset. In addition, the internal regulator circuit and charge pump circuit do not operate in standby mode.

ST	Mode	Internal regulator	Charge pump
Low or Open	Standby mode	Standby	Standby
High	Operating mode	Operating	Operating

1-2) Drive mode switching pin function

The IC drive mode is switched by setting the DM pin. In STM mode, stepper motor channel 1 can be controlled by the CLK-IN input. In DCM mode, DC motor channel 2 or stepper motor channel 1 can be controlled by parallel input. Stepper motor control using parallel input is Full-step or Half-step full torque.

DM	Drive mode	Application
Low or Open	STM mode	Stepper motor channel 1 (CLK-IN)
High	DCM mode	DC motor channel 2 or stepper motor channel 1 (parallel)

2. STM mode (DM = Low or Open)

2-1) STEP pin function

Input		Operating mode
ST	STP	
Low	*	Standby mode
High		Excitation step proceeds
High		Excitation step is kept

2-2) Excitation mode setting function

MD1	MD2	Micro-step resolution (Excitation mode)	Initial position	
			Channel 1	Channel 2
Low	Low	Full step(2 phase excitation)	100%	-100%
High	Low	Half step(1-2 phase excitation)	100%	0%
Low	High	Quarter step (W1-2 phase excitation)	100%	0%
High	High	1/16 step(4W1-2 phase excitation)	100%	0%

This is the initial position of each excitation mode in the initial state after power-on and when the counter is reset.

2-3) Position detection monitoring function

The MONI position detection monitoring pin is of an open drain type. When the excitation position is in the initial position, the MONI output is placed in the ON state. (Refer to "2-12.Examples of current waveforms in each micro-step mode.")

2-4) Setting constant-current control reference current

This IC is designed to automatically exercise PWM constant-current chopping control for the motor current by setting the output current. Based on the voltage input to the VREF pin and the resistance connected between RF and GND, the output current that is subject to the constant-current control is set using the calculation formula below :

$$I_{OUT} = (VREF/5)/RF \text{ resistance}$$

* The above setting is the output current at 100% of each excitation mode.

The voltage input to the VREF pin can be switched to four-step settings depending on the statuses of the two inputs, ATT1 and ATT2. This is effective for reducing power consumption when motor holding current is supplied.

Attenuation function for VREF input voltage

ATT1	ATT2	Current setting reference voltage attenuation ratio
Low	Low	100%
High	Low	80%
Low	High	50%
High	High	20%

The formula used to calculate the output current when using the function for attenuating the VREF input voltage is given below.

$$I_{OUT} = (VREF/5) \times (\text{attenuation ratio})/RF \text{ resistance}$$

Example : At VREF of 1.5V, a reference voltage setting of 100% [(ATT1, ATT2) = (L, L)] and an RF resistance of 0.3Ω, the output current is set as shown below.

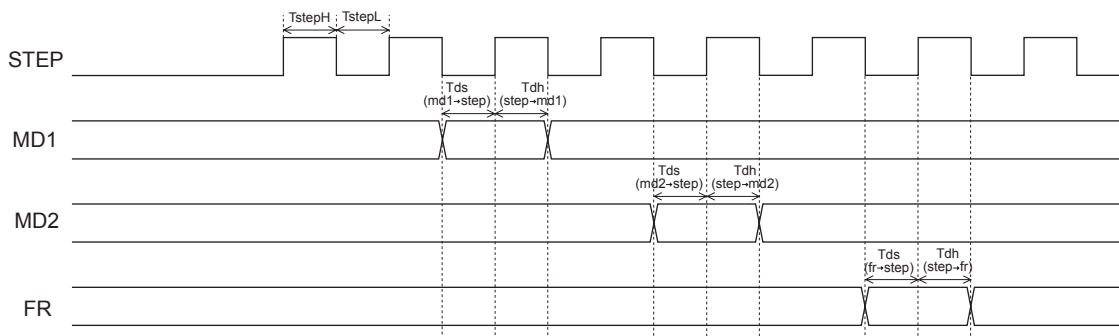

$$I_{OUT} = 1.5V/5 \times 100\%/0.3\Omega = 1.0A$$

If, in this state, (ATT1, ATT2) is set to (H, H), IOOUT will be as follows :

$$I_{OUT} = 1.0A \times 20\% = 200mA$$

In this way, the output current is attenuated when the motor holding current is supplied so that power can be conserved.

2-5) Input Timing

TstepH/TstepL : Clock H/L pulse width (min 500ns)
 Tds : Data set-up time (min 500ns)
 Tdh : Data hold time (min 500ns)

2-6) Blanking period

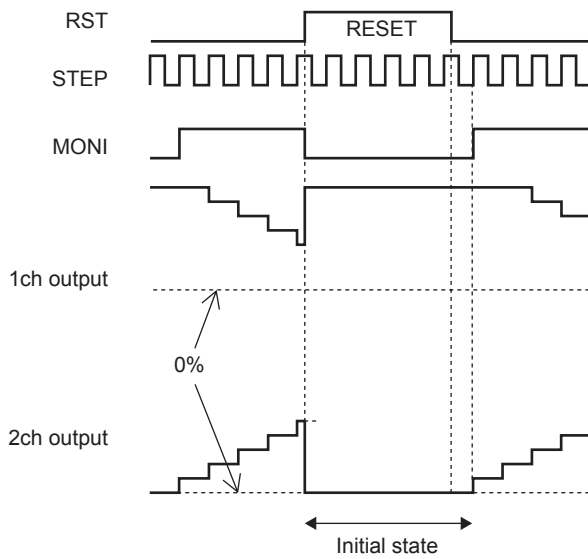

During normal operation switching transient noise from the parasitic diode may flow to the current sensing resistance, resulting in erroneous detection. To prevent this erroneous detection, a blanking period is provided to prevent the noise from being received.

In the stepper motor driver mode (DM = Low or Open) of this IC, the blanking time is fixed at approximately 1μs.

In the DC motor driver mode (DM = High), the blanking time can be switched to one of two levels using the RST/BLK pin. (Refer to "Blanking time switching function.")

2-7) Reset function

RST	Operating mode
Low	Normal operation
High	Reset state

When the RST pin is set to High, the excitation position of the output is forcibly set to the initial state, and the MONI output is placed in the ON state. When RST is then set to Low, the excitation position is advanced by the next STEP input.

2-8) Output enable function

OE	Operating mode
Low	Output ON
High	Output OFF

When the OE pin is set High, the output is forced OFF and goes to high impedance. The internal logic circuits remain operating, and the excitation position proceeds when the STEP signal is inputted.

2-9) Forward/reverse switching function

FR	Operating mode
Low	Clockwise (CW)
High	Counter-clockwise (CCW)

The internal D/A converter proceeds by one bit at the rising edge of the input STEP pulse.
 In addition, CW and CCW mode are switched by setting the FR pin.
 In CW mode, the channel 2 current phase is delayed by 90° relative to the channel 1 current.
 In CCW mode, the channel 2 current phase is advanced by 90° relative to the channel 1 current.

2-10) Chopping frequency setting

For constant-current control, this IC performs chopping operations at the frequency determined by the capacitor (Cchop) connected between the CHOP pin and GND.
 The chopping frequency is set as shown below by the capacitor (Cchop) connected between the CHOP pin and GND.

$$F_{chop} = I_{chop} / (C_{chop} \times V_{tchop} \times 2) \text{ (Hz)}$$

I_{chop} : Capacitor charge/discharge current, typ 10μA

V_{tchop} : Charge/discharge hysteresis voltage ($V_{tup} - V_{tdown}$), typ 0.5V

For instance, when Cchop is 200pF, the chopping frequency will be as follows :

$$F_{chop} = 10\mu A / (200pF \times 0.5V \times 2) = 50kHz$$

LV8774Q

2-11) Output current vector locus (one step is normalized to 90 degrees)

Setting current ratio in each micro-step mode

STEP	1/16 step (%)		Quarter step (%)		Half step (%)		Full step (%)	
	Channel 1	Channel 2	Channel 1	Channel 2	Channel 1	Channel 2	Channel 1	Channel 2
00	100	0	100	0	100	0		
01	100	10						
02	98	20						
03	96	29

016	0	100	0	100	0	100		

LV8774Q

2-12) Examples of current waveforms in each micro-step mode

Full step (CW mode)

Half step (CW mode)

LV8774Q

Quarter step (CW mode)

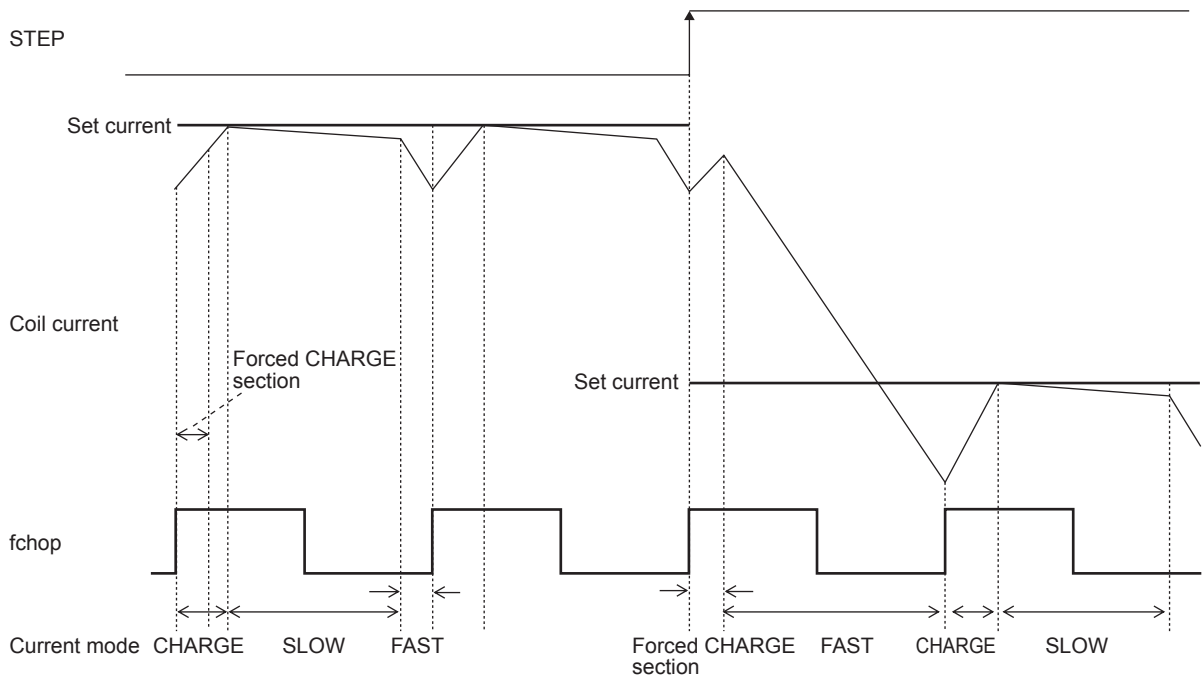

1/16 step (CW mode)

2-13) Current control operation specification
 (Sine wave increasing direction)

(Sine wave decreasing direction)

For current mode control, the operation sequence is as described below :

- At rise of chopping frequency, the CHARGE mode begins. (During blanking time the CHARGE mode is forced regardless of the magnitude of the coil current (ICOIL) and set current (IREF).)
- The coil current (ICOIL) and set current (IREF) are compared in this blanking time.

When $(ICOIL < IREF)$

the winding is charged until $ICOIL \geq IREF$, then changed to the SLOW DECAY mode, and finally to the FAST DECAY mode for approximately $1\mu s$.

When $(ICOIL \geq IREF)$

the FAST DECAY mode begins immediately. The coil current is attenuated in the FAST DECAY for one cycle.

Above operations are repeated. Normally, the SLOW (+FAST) DECAY mode continues in the sine wave increasing direction, then entering the FAST DECAY mode till the current is attenuated to the set level, followed by the SLOW DECAY mode.

3. DCM Mode (DM=High)

3-1) DCM mode output control logic

Parallel input		Output		Mode
DC11 (21)	DC12 (22)	OUT1 (2) A	OUT1 (2) B	
Low	Low	OFF	OFF	Standby
High	Low	High	Low	CW (Forward)
Low	High	Low	High	CCW (Reverse)
High	High	Low	Low	Brake

3-2) Blanking time switching function

BLK	Blanking time
Low	2 μ s
High	3 μ s

3-3) Output enable function

OE	Operating mode
Low	Output ON
High	Output OFF

When the OE pin is set High, the output is forced OFF and goes to high impedance. When the OE pin is set Low, output conforms to the control logic.

3-4) Current limit reference voltage setting function

By setting a current limit, this IC automatically exercises shorted braking control to ensure that the motor current cannot exceed this limit.

(Current limit control time chart)

The limit current is set as calculated on the basis of the voltage input to the VREF pin and the resistance between the RF pin and GND using the formula given below.

$$I_{limit} = (VREF/5) / RF \text{ resistance}$$

The voltage applied to the VREF pin can be switched to any of the four setting levels depending on the statuses of the two inputs, ATT1 and ATT2.

Function for attenuating VREF input voltage

ATT1	ATT2	Current setting reference voltage attenuation ratio
Low	Low	100%
High	Low	80%
Low	High	50%
High	High	20%

The formula used to calculate the output current when using the function for attenuating the VREF input voltage is given below.

$$I_{limit} = (VREF/5) \times (\text{attenuation ratio}) / RF \text{ resistance}$$

Example : At VREF of 1.5V, a reference voltage setting of 100% [(ATT1, ATT2) = (L, L)] and an RF resistance of 0.3Ω, the output current is set as shown below.

$$I_{limit} = 1.5V/5 \times 100\%/0.3\Omega = 1.0A$$

If, in this state, (ATT1, ATT2) has been set to (H, H), I_{limit} will be as follows :

$$I_{limit} = 1.0A \times 20\% = 200mA$$

LV8774Q

3-5) Examples of current waveform in each micro-step mode with stepper motor parallel input control Full step (CW mode)

Half step full torque (CW mode)

4. Output short-circuit protection function

This IC incorporates an output short-circuit protection circuit that, when the output has been shorted by an event such as shorting to power or shorting to ground, sets the output to the standby mode and turns on the warning output in order to prevent the IC from being damaged. In the stepper motor driver (STM) mode (DM = Low), this function sets the output to the standby mode for both channels by detecting the short-circuiting in one of the channels. In the DC motor driver mode (DM = High), channels 1 and 2 operate independently. (Even if the output of channel 1 has been short-circuited, channel 2 will operate normally.)

4-1) Output short-circuit protection mode switching function

Output short-circuit protection mode of IC can be switched by the setting of EMM pin.

EMM	State
Low or Open	Latch method
High	Auto reset method

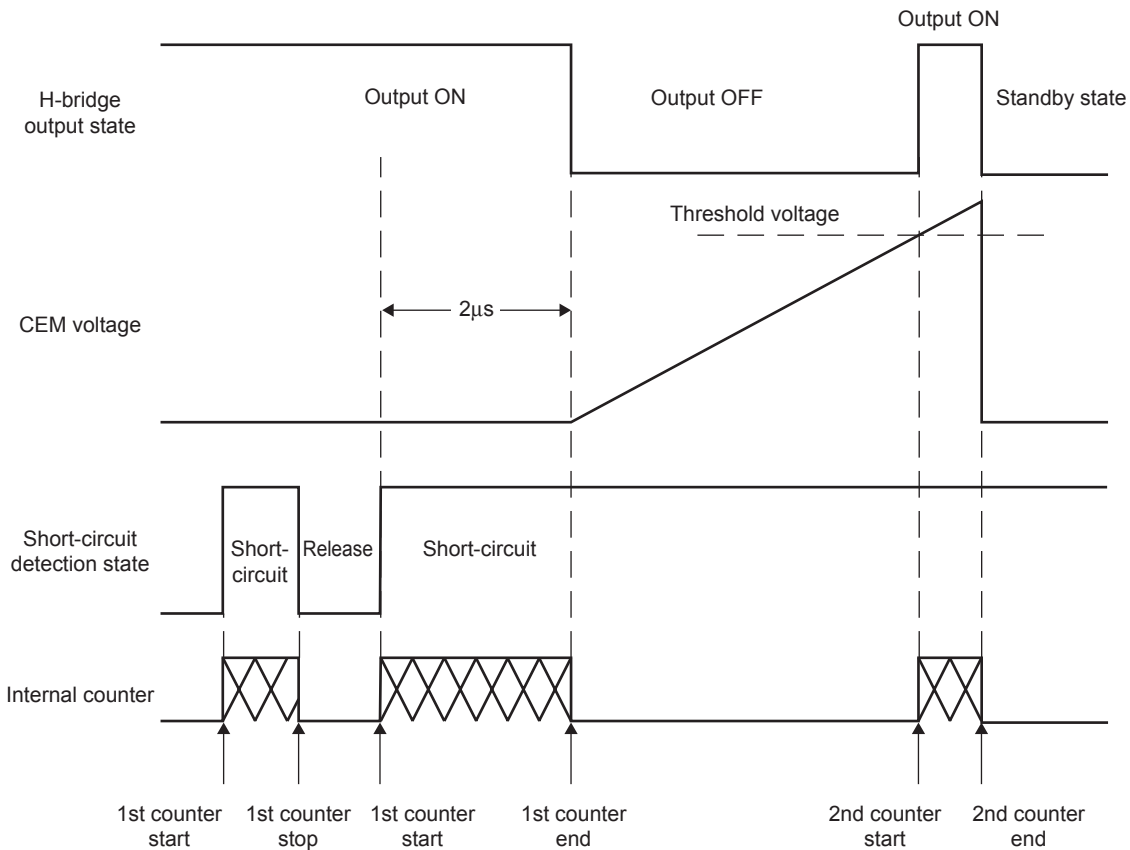

4-2) Latch type

In the latch mode, when the output current exceeds the detection current level, the output is turned OFF, and this state is held.

The detection of the output short-circuited state by the IC causes the output short-circuit protection circuit to be activated.

When the short-circuited state continues for the period of time set using the internal timer (approximately 2 μ s), the output in which the short-circuiting has been detected is first set to OFF. After this, the output is set to ON again as soon as the timer latch time (Tcem) described later has been exceeded, and if the short-circuited state is still detected, all the outputs of the channel concerned are switched to the standby mode, and this state is held.

This state is released by setting ST to low.

4-3) Auto reset type

In the automatic reset mode, when the output current exceeds the detection current level, the output waveform changes to the switching waveform.

As with the latch system, when the output short-circuited state is detected, the short-circuit protection circuit is activated. When the operation of the short-circuit detection circuit exceeds the timer latch time (T_{cem}) described later, the output is changed over to the standby mode and is reset to the ON mode again in 2ms (typ). In this event, if the over current mode still continues, the switching mode described above is repeated until the over current mode is canceled.

4-4) Unusual condition warning output pins (EMO, MONI)

The LV8774 is provided with the EMO pin which notifies the CPU if the protection circuit detects an unusual condition of the IC. This pin is of the open-drain output type and when an unusual condition is detected, the EMO output is placed in the ON (EMO = Low) state.

In the DC motor driver mode (DM = High), the MONI pin also functions as a warning output pin.

The functions of the EMO pin and MONI pin change function as shown below depending on the state of the DM pin.

When the DM is low (STM mode) :

EMO : Unusual condition warning output pin

MONI : Excitation initial position detection monitoring

When the DM is high (DCM) mode) :

EMO : Channel 1 warning output pin

MONI : Channel 2 warning output pin

The EMO (MONI) pin is also placed in the ON state when one of the following conditions occurs.

1. Shorting-to-power, shorting-to-ground, or shorting-to-load occurs at the output pin and the output short-circuit protection circuit is activated.
2. The IC junction temperature rises and the thermal protection circuit is activated.

Unusual condition	DM = L (STM mode)		DM = H (DCM mode)	
	EMO	MONI	EMO	MONI
Channel 1 short-circuit detected	ON	-	ON	-
Channel 2 short-circuit detected	ON	-	-	ON
Overheating condition detected	ON	-	ON	ON

4-5) Timer latch time (T_{cem})

The time taken for the output to be set to OFF when the output has been short-circuited can be set using capacitor C_{cem} , connected between the CEM pin and GND. The value of capacitor C_{cem} is determined by the formula given below.

Timer latch : T_{cem}

$$T_{cem} \approx C_{cem} \times V_{t_{cem}} / I_{cem} \text{ [sec]}$$

$V_{t_{cem}}$: Comparator threshold voltage, typ 1V

I_{cem} : CEM pin charge current, typ 10 μ A

5. Thermal shutdown function

The thermal shutdown circuit is included, and the output is turned off when junction temperature T_j exceeds 180°C and the abnormal state warning output is turned on at the same time.

When the temperature falls below the hysteresis level, output is driven again (automatic restoration)

The thermal shutdown circuit doesn't guarantee protection of the set and the destruction prevention of IC, as it operates at a temperature that is higher than the rating ($T_{jmax}=150^\circ\text{C}$) of the junction temperature

$$TTSD = 180^\circ\text{C (typ)}$$

$$\Delta TSD = 40^\circ\text{C (typ)}$$

6. Charge Pump Circuit

When the ST pin is set High, the charge pump circuit operates and the VG pin voltage is boosted from the VM voltage to the $VM + VREG5$ voltage.

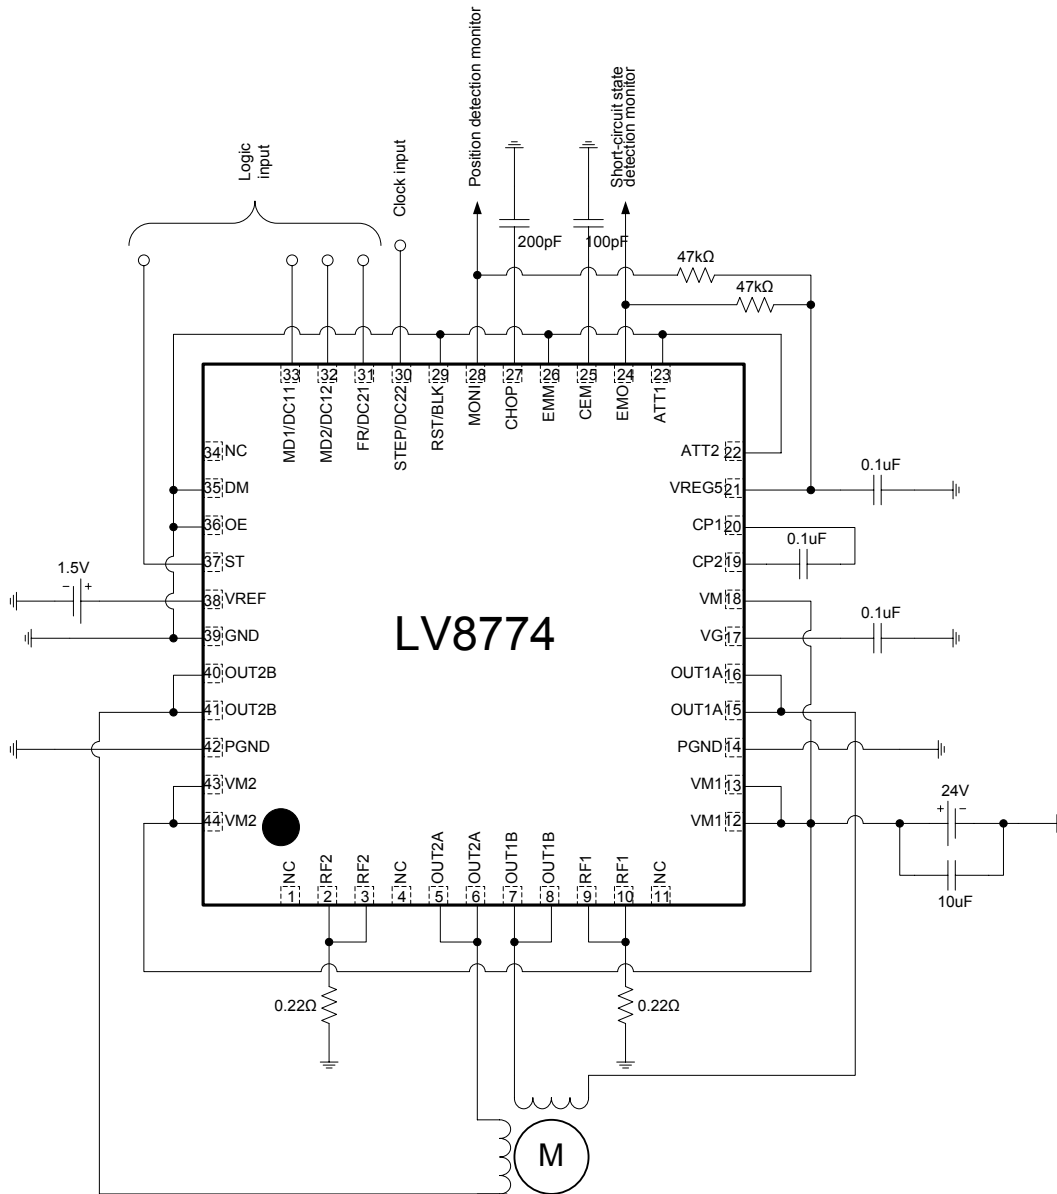

If the VG pin voltage is not boosted to $VM+4V$ or more, the output pin cannot be turned on. Therefore it is recommended that the drive of motor is started after the time has passed tONG or more.

VG Pin Voltage Schematic View

Application Circuit Example

- Stepper motor driver circuit (DM = Low)

The formulae for setting the constants in the example of the application circuit above are as follows :

Constant current (100%) setting

When $V_{REF} = 1.5V$

$$I_{OUT} = V_{REF} / 5 / R_F \text{ resistance} \\ = 1.5V / 5 / 0.22\Omega = 1.36A$$

Chopping frequency setting

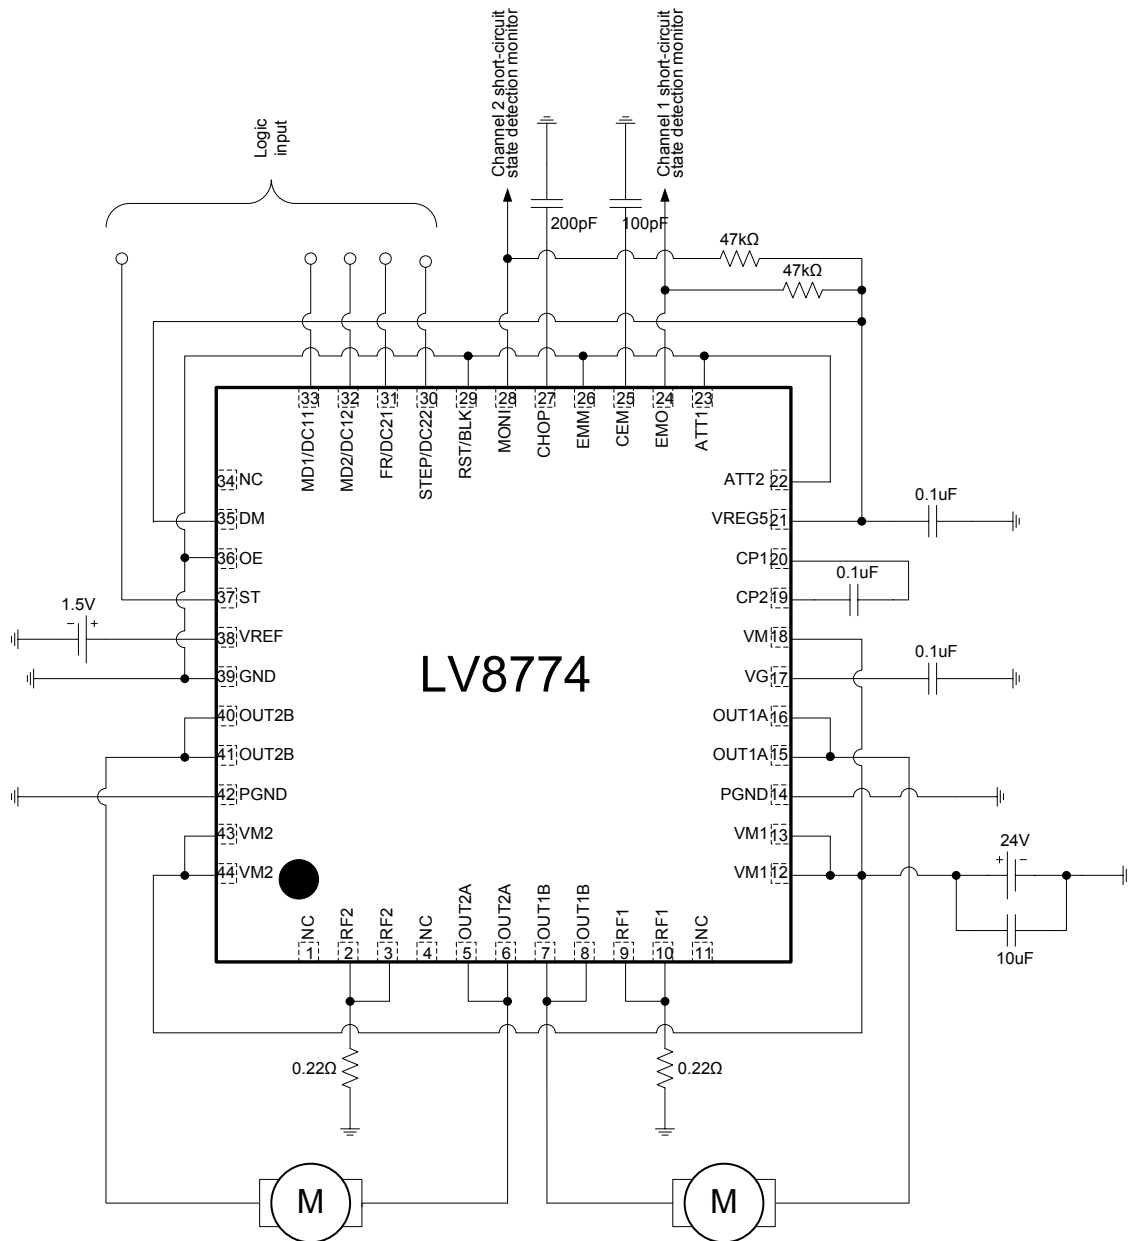

$$F_{chop} = I_{chop} / (C_{chop} \times V_{tchop} \times 2) \\ = 10\mu A / (200pF \times 0.5V \times 2) = 50kHz$$

Timer latch time when the output is short-circuited

$$T_{cem} = C_{cem} \times V_{tcem} / I_{cem} \\ = 100pF \times 1V / 10\mu A = 10\mu s$$

LV8774Q

- DC motor driver circuit (DM = High, and the current limit function is in use.)

The formulae for setting the constants in the example of the application circuit above are as follows :

Constant current limit (100%) setting

When $V_{REF} = 1.5V$

$$I_{limit} = V_{REF} / 5 / R_F \text{ resistance} \\ = 1.5V / 5 / 0.22\Omega = 1.36A$$

Chopping frequency setting

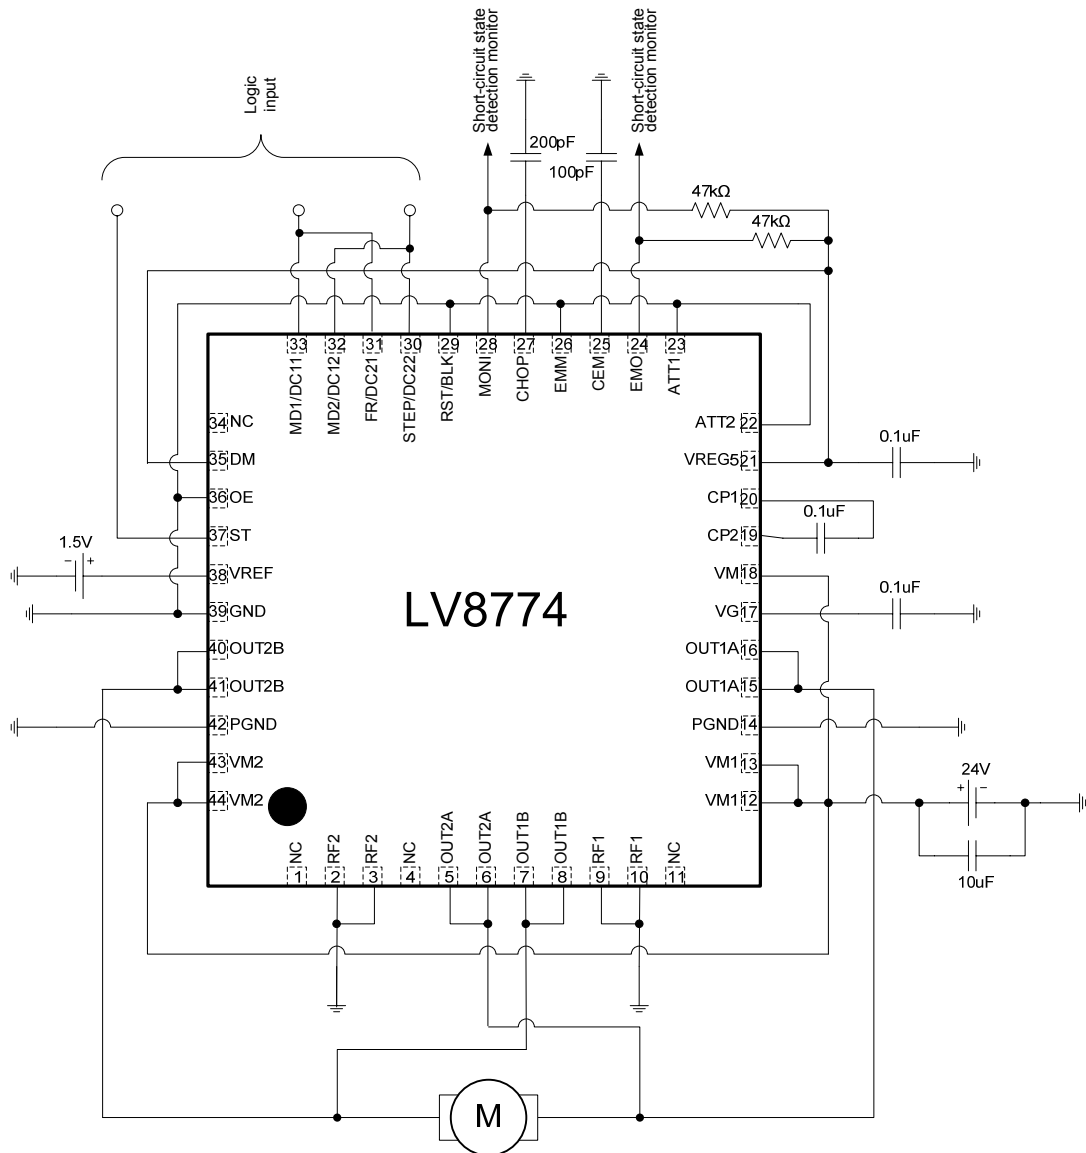

$$f_{chop} = I_{chop} / (C_{chop} \times V_{tchop} \times 2) \\ = 10\mu A / (200pF \times 0.5V \times 2) = 50kHz$$

Timer latch time when the output is short-circuited

$$T_{cem} = C_{cem} \times V_{tcem} / I_{cem} \\ = 100pF \times 1V / 10\mu A = 10\mu s$$

LV8774Q

- High current DC motor driver circuit (DM = High, and the current limit function cannot be used.)

LV8774Q can drive a large current DC motor by connecting two H-bridges to parallel.

$I_{\text{max}} = 4\text{A}$

$I_{\text{peak}} = 5\text{A}$ ($t_w \leq 10\text{ms}$, duty 20%)

When it connects two H-bridges to parallel, LV8774Q cannot use the internal PWM constant current control function. Please connect the RF1 pin and RF2 pin to GND.

ORDERING INFORMATION

Device	Package	Shipping (Qty / Packing)
LV8774Q-AH	VQFN44L (6mm x 6mm) (Pb-Free / Halogen Free)	1000 / Tape & Reel
