MC100EPT26

3.3V 1:2 Fanout Differential LVPECL/LVDS to LVTTL Translator

ON Semiconductor®

http://onsemi.com

Description

The MC100EPT26 is a 1:2 Fanout Differential LVPECL/LVDS to LVTTL translator. Because LVPECL (Positive ECL) or LVDS levels are used only +3.3 V and ground are required. The small outline 8–lead package and the 1:2 fanout design of the EPT26 makes it ideal for applications which require the low skew duplication of a signal in a tightly packed PC board.

The V_{BB} output allows the EPT26 to be used in a single−ended input mode. In this mode the V_{BB} output is tied to the $\overline{D0}$ input for a non−inverting buffer or the D0 input for an inverting buffer. If used, the V_{BB} pin should be bypassed to ground with > 0.01 μF capacitor. For a single−ended direct connection, use an external voltage reference source such as a resistor divider. Do not use V_{BB} for a single−ended direct connection or port to another device.
