Analog Multiplexers/ Demultiplexers with Injection Current Effect Control with LSTTL Compatible Inputs

Automotive Customized

This device is pin compatible to standard HC405x and MC1405xB analog mux/demux devices, but feature injection current effect control. This makes them especially suited for usage in automotive applications where voltages in excess of normal logic voltage are common.

The injection current effect control allows signals at disabled analog input channels to exceed the supply voltage range without affecting the signal of the enabled analog channel. This eliminates the need for external diode/ resistor networks typically used to keep the analog channel signals within the supply voltage range.

The devices utilize low power silicon gate CMOS technology. The Channel Select and Enable inputs are compatible with standard CMOS or LSTTL outputs.

Features

- Injection Current Cross−Coupling Less than 1mV/mA (See Figure 6)
- Pin Compatible to HC405x and MC1405xB Devices
- Power Supply Range (V_{CC} − GND) = 4.5 to 5.5 V
- In Compliance With the Requirements of JEDEC Standard No. 7A
- Chip Complexity: 154 FETs or 36 Equivalent Gates
- These are Pb−Free Devices*

MAXIMUM RATINGS

Symbol	Parameter		Value	Unit
V_{CC}	Positive DC Supply Voltage	(Referenced to GND)	−0.5 to + 7.0	V
V_{in}	DC Input Voltage (Any Pin)	(Referenced to GND)	−0.5 to V_{CC} + 0.5	V
I	DC Current, Into or Out of Any Pin		± 25	mA
P_D	Power Dissipation in Still Air,	SOIC Package† TSSOP Package†	500 450	mW
T_{stg}	Storage Temperature Range		−65 to + 150	°C
T_L	Lead Temperature, 1 mm from Case for 10 Seconds SOIC or TSSOP Package		260	°C

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high−impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range GND ≤ (V_{in} or V_{out}) ≤ V_{CC}.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter		Min	Max	Unit
V_{CC}	Positive DC Supply Voltage	(Referenced to GND)	4.5	5.5	V
V_{in}	DC Input Voltage (Any Pin)	(Referenced to GND)	GND	V_{CC}	V

*For voltage drops across switch greater than 1.2 V (switch on), excessive V_{CC} current may be drawn; i.e., the current out of the switch may contain both V_{CC} and switch input components. The reliability of the device will be unaffected unless the Maximum Ratings are exceeded.
