## Multiple-Phase Controller with SVID Interface for Desktop and Notebook CPU Applications

The NCP81143 Multi-Phase buck solution is optimized for Intel VR12.5 compatible CPUs with user configurations of 3/2/1 phases this controllers combines true differential voltage sensing, differential inductor DCR current sensing, input voltage feed-forward, and adaptive voltage positioning to provide accurately regulated power for both Desktop and Notebook applications. The control system is based on Dual-Edge pulse-width modulation (PWM) combined with DCR current sensing providing the fastest initial response to dynamic load events at reduced system cost. They have the capability to shed to single phase during light load operation and can auto frequency scale in light load conditions while maintaining excellent transient performance.

The NCP81143 offers two internal MOSFET drivers with a single external PWM signal. High performance operational error amplifiers are provided to simplify compensation of the system. Patented Dynamic Reference Injection further simplifies loop compensation by eliminating the need to compromise between closed-loop transient response and Dynamic VID performance. Patented Total Current Summing provides highly accurate digital current monitoring.

### Features

- NCP81143 and Meets Intel® VR12.5 specifications
- Current Mode Dual Edge Modulation for Fastest Initial Response to Transient Loading
- High Performance Operational Error Amplifier
- Digital Soft Start Ramp
- Dynamic Reference Injection
- Accurate Total Summing Current Amplifier
- Dual High Impedance Differential Voltage and Total Current Sense Amplifiers
- Phase-to-Phase Dynamic Current Balancing
- “Lossless” DCR Current Sensing for Current Balancing
- True Differential Current Balancing Sense Amplifiers for Each Phase
- Adaptive Voltage Positioning (AVP)
- Switching Frequency Range of 200 kHz –1 MHz
- Vin range 4.5 V to 25 V
- Startup into Pre-Charged Loads While Avoiding False OVP
- Power Saving Phase Shedding
- Vin Feed Forward Ramp Slope
- Over Voltage Protection (OVP) & Under Voltage Protection (UVP)
- Over Current Protection (OCP)
- VR-RDY Output with Internal Delays
- These are Pb-Free Devices

### Applications

- Desktop & Notebook Processors

ON Semiconductor®

## NCP81143 SINGLE ROW PIN DESCRIPTIONS

| Pin No. | Symbol    | Description   |
|---------|-----------|---|
| 1       | ENABLE    | Logic input. Logic high enables both outputs and logic low disables both outputs  |
| 2       | VR_HOT#   | Thermal logic output for over temperature   |
| 3       | SDIO      | Serial VID data interface   |
| 4       | ALERT#    | Serial VID ALERT#.  |
| 5       | SCLK      | Serial VID clock  |
| 6       | VR_RDY    | Open drain output. High indicates that the output is regulating   |
| 7       | ROSC      | A resistance from this pin to ground programs the oscillator frequency  |
| 8       | TSENSE    | Temp Sense input for the multiphase converter   |
| 9       | INT_SEL   | An input pin to adjust programmable integrator setting. During start up it is used to program INT_SEL with a resistor to ground |
| 10      | BST1      | High-Side bootstrap supply for phase 1.   |
| 11      | HG1       | High side gate driver output for phase 1  |
| 12      | SW1       | Current return for high side gate driver 1  |
| 13      | LG1       | Low-Side gate driver output for phase 1   |
| 14      | PGND      | Power Ground for gate drivers   |
| 15      | PVCC      | Power Supply for gate drivers   |
| 16      | LG3       | Low-Side gate driver output for phase 3   |
| 17      | SW3       | Current return for high side gate driver 3  |
| 18      | HG3       | High side gate driver output for phase 3  |
| 19      | BST3      | High-Side bootstrap supply for phase 3  |
| 20      | PWM2/IMAX | Phase 2 PWM output. Also as ICC_MAX Input Pin. During start up it is used to program ICC_MAX with a resistor to ground          |
| 21      | DRON      | Bidirectional gate drive enable output  |

## NCP81143 SINGLE ROW PIN DESCRIPTIONS

| Pin No. | Symbol    | Description  |
|---------|-----------|--|
| 22      | CSP1      | Non-inverting input to current balance sense amplifier for phase 1   |
| 23      | CSP2      | Non-inverting input to current balance sense amplifier for phase 2   |
| 24      | CSP3      | Non-inverting input to current balance sense amplifier for phase 3   |
| 25      | CSREF     | Total output current sense amplifier reference voltage input   |
| 26      | CSSUM     | Inverting input of total current sense amplifier   |
| 27      | CSCOMP    | Output of total current sense amplifier  |
| 28      | ILIM      | Over current shutdown threshold setting. Resistor to CSCOMP to set threshold   |
| 29      | IOUT      | Total output current monitor.  |
| 30      | VRMP      | Feed-forward input of $V_{in}$ for the ramp slope compensation. The current fed into this pin is used to control the ramp of PWM slope |
| 31      | COMP      | Output of the error amplifier and the inverting inputs of the PWM comparators  |
| 32      | FB        | Error amplifier voltage feedback   |
| 33      | DIFFOUT   | Output of the differential remote sense amplifier  |
| 3       | VSN       | Inverting input to differential remote sense amplifier   |
| 35      | VSP       | Non-inverting input to the differential remote sense amplifier   |
| 36      | VCC       | Power for the internal control circuits. A decoupling capacitor is connected from this pin to ground                                   |
| 37      | FLAG /GND | Analog Ground  |

# NCP81143

**Figure 6. State Diagram**

# NCP81143

## General

The NCP81143 is a three phase dual edge modulated multiphase PWM controller, with a serial SVID control interface. The NCP81143 is optimized to meet Intel's VR12.5 Specifications. It is designed to work in notebook, desktop, and server applications.

The NCP81143 has two integrated drivers and one external PWM signal. Internally, there are 2 PWM signals: PWM1/3, DRV1 is driven by PWM1, DRV3 is driven by PWM3, and the third phase has a PWM output, PWM2, to drive an external driver such as the NCP81151.

| Phase | PWM Output   |
|-------|--------------|
| 3     | Internal PWM |
| 2     | External PWM |
| 1     | Internal PWM |

## Serial VID interface (SVID)

The Serial VID Interface (SVID Interface) is a three wire digital interface used to transfer power management information between the CPU (Master) and the NCP81143. The 3 wires are clock (SCLK), data (SDIO) and ALERT#. The SCLK is unidirectional and generated by the master. The SDIO is bi-directional, used for transferring data from the CPU to the NCP81143 and from the NCP81143 to the CPU.

SCLK, SDIO and ALERT# should be pulled high to CPU I/O voltage V<sub>tt</sub> (which is typically 1.0 to 1.1 V) using 55 Ω Resistors.

## BOOT VOLTAGE PROGRAMMING

The Boot voltage for the NCP81143 is configured to 1.7 V. The V<sub>boot</sub> value can be read back over the SVID interface in registers (0x26).

## INT\_SEL

The remote Sense Amplifier output is applied to a Type III compensation network formed by the error amplifier and external tuning components. The non-inverting input of the error amplifier is connected to the same reference voltage used to bias the Remote sense amplifier output. The integrating function of the Type III feedback compensation is performed internally and does not require external capacitor CF1.

Figure 7. Type III Compensation

Initial tuning should be based on the traditional TYPE III compensation. When ideal Type III component values have been determined, the closest setting for the internal integrator is given by the following equation :

$$\text{INT\_SETTING} = 4.83 \times 10^{-12} \times R_F \times R_{in1} \times C_{F1}$$

R<sub>F</sub> & R<sub>in1</sub> in ohms  
C<sub>F1</sub> in nF

Optimization of the traditional Type 3 compensation should be rechecked until the closest Type 3 C<sub>F1</sub> equivalent is found in order to determine if readjustment of other component values are required. The Type III C<sub>F1</sub> value that is equivalent to the integrator setting is given by the following equation:

$$C_{f1}(\text{nF}) = 2.07 \times 10^5 \times \text{INT\_Setting} / (R_F \times R_{in1})$$

For further explanation on the integrator setting and operation please refer to application note.

## Boost Capacitor Refresh Mode

The NCP81143 include a boost capacitor refresh mode which aids the correct operation of inactive phase when exiting low power states. The mode is used where phases are shed in PS1,2 and 3 modes; in these cases it is possible that the drivers boost capacitor voltage,  $V_{bst}$ , may drop below 1.7 V. If this occurs the Boost capacitor charge will not be able to meet the gate source requirements for the first firing of the high side MOSFET when returning to PS0 power state. For further information on the operation of the boost capacitor refresh mode please see application note.

**Figure 8. Boost Cap Refresh**

**Remote Sense Amplifier**

A high performance high input impedance true differential amplifier is provided to accurately sense the output voltage of the regulator. The VSP and VSN inputs should be connected to the regulator’s output voltage sense points. The remote sense amplifier takes the difference of the output voltage with the DAC voltage and adds the droop voltage to

$$V_{DIFFOUT} = (V_{VSP} - V_{VSN}) + (1.3\text{ V} - V_{DAC}) + (V_{DROOP} - V_{CSREF})$$

This signal then goes through a standard error compensation network and into the inverting input of the error amplifier. The non-inverting input of the error amplifier is connected to the same 1.3 V reference used for the differential sense amplifier output bias.

**High Performance Voltage Error Amplifier**

A high performance error amplifier is provided for high bandwidth transient performance. A standard type II compensation circuit is normally used to compensate the system.

**Differential Current Feedback Amplifiers**

Each phase has a low offset differential amplifier to sense that phase current for current balance. The inputs to the CSNx and CSPx pins are high impedance inputs. It is recommended that any external filter resistor RCSN does not exceed 10 kΩ to avoid offset issues with leakage current. It is also recommended that the voltage sense element be no less than 0.5 mΩ for accurate current balance. Fine tuning of this time constant is generally not required. The individual phase current is summed into the PWM comparator feedback this way current is balanced via a current mode control approach.

$$R_{CSN} = \frac{L_{PHASE}}{C_{CSN} * DCR}$$

Figure 9. Differential Current Feedback

**Total Current Sense Amplifier**

The NCP81143 uses a patented approach to sum the phase currents into a single temperature compensated total current signal. This signal is then used to generate the output voltage droop, total current limit, and the output current monitoring functions. The total current signal is floating with respect to CSREF. The current signal is the difference between CSCOMP and CSREF. The Ref(n) resistors sum the signals from the output side of the inductors to create a low impedance virtual ground. The amplifier actively filters and gains up the voltage applied across the inductors to recover the voltage drop across the inductor series resistance (DCR). Rth is placed near an inductor to sense the temperature of the inductor. This allows the filter time constant and gain to be a function of the Rth NTC resistor and compensate for the change in the DCR with temperature.

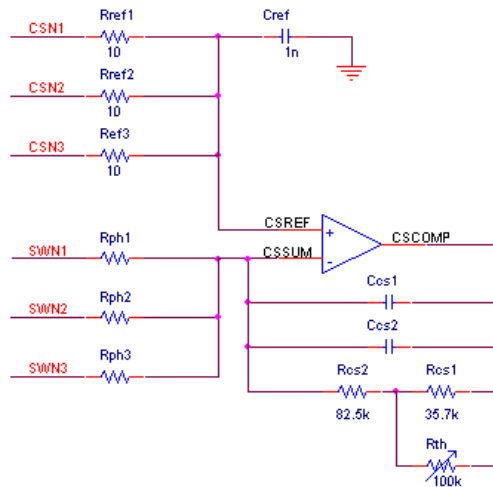

Figure 10. Total Current Sense

# NCP81143

The DC gain equation for the current sensing:

$$V_{\text{CSCOMP-CSREF}} = \frac{R_{\text{cs2}} + \frac{R_{\text{cs1}} \cdot R_{\text{th}}}{R_{\text{cs1}} + R_{\text{th}}}}{R_{\text{ph}}} * (I_{\text{outTotal}} * \text{DCR})$$

Set the gain by adjusting the value of the R<sub>ph</sub> resistors. The DC gain should be set to the output voltage droop. If the voltage from CSCOMP to CSREF is less than 100 mV at ICCMAX then it is recommend increasing the gain of the CSCOMP amp. This is required to provide a good current signal to offset voltage ratio for the ILIMIT pin. When no droop is needed, the gain of the amplifier should be set to provide ~100 mV across the current limit programming resistor at full load. The values of R<sub>cs1</sub> and R<sub>cs2</sub> are set based on the 100k NTC and the temperature effect of the inductor and should not need to be changed. The NTC should be placed near the closest inductor. The output voltage droop should be set with the droop filter divider.

The pole frequency in the CSCOMP filter should be set equal to the zero from the output inductor. This allows the circuit to recover the inductor DCR voltage drop current signal. C<sub>cs1</sub> and C<sub>cs2</sub> are in parallel to allow for fine tuning of the time constant using commonly available values. It is best to fine tune this filter during transient testing.

$$F_z = \frac{\text{DCR}@25^\circ\text{C}}{2 * \text{PI} * L_{\text{Phase}}}$$

## Programming the Current Limit

The current limit thresholds are programmed with a resistor between the ILIMIT and CSCOMP pins. The ILIMIT pin mirrors the voltage at the CSREF pin and mirrors the sink current internally to IOUT (reduced by the IOUT Current Gain) and the current limit comparators. The 100% current limit trips if the ILIMIT sink current exceeds 10 μA for 50 μs. The 150% current limit trips with minimal delay if the ILIMIT sink current exceeds 15 μA. Set the value of the current limit resistor based on the CSCOMP–CSREF voltage as shown below.

$$R_{\text{LIMIT}} = \frac{R_{\text{cs2}} + \frac{R_{\text{cs1}} \cdot R_{\text{th}}}{R_{\text{cs1}} + R_{\text{th}}} * (I_{\text{outLIMIT}} * \text{DCR})}{10\mu} \quad \text{or} \quad R_{\text{LIMIT}} = \frac{V_{\text{CSCOMP-CSREF@ILIMIT}}}{10\mu}$$

## Programming DAC Feed-Forward Filter

The DAC feed-forward implementation is realized by having a filter on the VSN pin. Programming R<sub>vsn</sub> sets the gain of the DAC feed-forward and C<sub>vsn</sub> provides the time constant to cancel the time constant of the system per the following equations. C<sub>out</sub> is the total output capacitance and R<sub>out</sub> is the output impedance of the system.

Figure 11. DAC Feed-Forward

## Programming DROOP

The signals CSCOMP and CSREF are differentially summed with the output voltage feedback to add precision voltage droop to the output voltage.

Figure 12. Droop

# NCP81143

## Programming IOOUT

The IOOUT pin sources a current in proportion to the ILIMIT sink current. The voltage on the IOOUT pin is monitored by the internal A/D converter and should be scaled with an external resistor to ground such that a load equal to ICCMAX generates a 2 V signal on IOOUT. A pull-up resistor from 5 V V<sub>CC</sub> can be used to offset the IOOUT signal positive if needed. Below equation relates to the NCP81143 only:

$$R_{IOOUT} = \frac{2.0 \text{ V} * R_{LIMIT}}{10 * \frac{R_{cs2} + \frac{R_{cs1} * R_{th}}{R_{cs1} + R_{th}}}{R_{ph}} * (I_{out\_ICCMAX} * DCR)}$$

## Programming ICC\_MAX

A resistor to Ground is monitored on startup and this sets the ICC\_MAX value. 10 µA is sourced from these pins to generate a voltage on the program resistor. The register value can be determined from the equation below. The resistor value should be no less than 10k.

$$ICC\_MAX = \frac{R * 10 \mu\text{A} * 256 \text{ A}}{2 \text{ V}}$$

## Programming TSENSE

A temperature sense inputs are provided. A precision current is sourced out the output of the TSENSE pin to generate a voltage on the temperature sense network. The voltage on the temperature sense input is sampled by the internal A/D converter. A 100k NTC similar to the VISHAY ERT-J1VS104JA should be used. Rcomp1 is mainly used for noise. See the specification table for the thermal sensing voltage thresholds and source current.

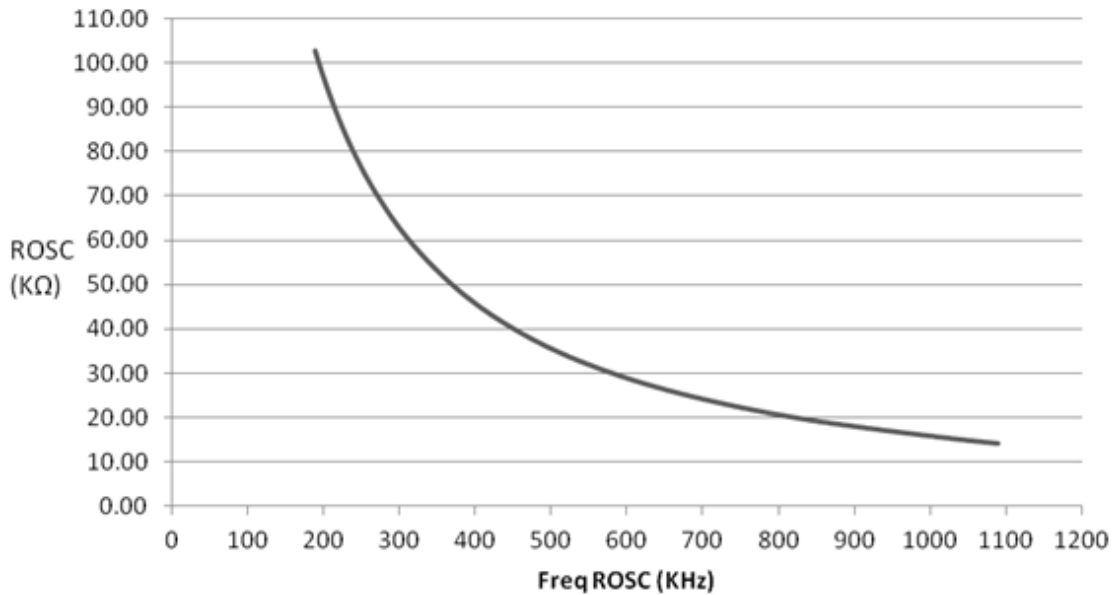

Figure 13. TSENSE

## Precision Oscillator

A programmable precision oscillator is provided. The clock oscillator serves as the master clock to the ramp generator circuit. This oscillator is programmed by a resistor to ground on the ROOSC pin. The oscillator frequency range is between 220 kHz/phase to 1 MHz/phase. The ROOSC pin provides approximately 2 V out and the source current is mirrored into the internal ramp oscillator. The oscillator frequency is approximately proportional to the current flowing in the ROOSC resistor.

# NCP81143

**Figure 14. NCP81143 Operating Frequency vs. Rosc**

The oscillator generates triangle ramps that are 0.5~2.5 V in amplitude depending on the VRMP pin voltage to provide input voltage feed forward compensation.

### Programming the Ramp Feed-Forward Circuit

The ramp generator circuit provides the ramp used by the PWM comparators. The ramp generator provides voltage feed-forward control by varying the ramp magnitude with respect to the VRMP pin voltage. The VRMP pin also has a 4 V UVLO function. The VRMP UVLO is only active after the controller is enabled. The VRMP pin is high impedance input when the controller is disabled.

The PWM ramp time is changed according to the following,

$$V_{RAMPpk\leftarrow pkPP} = 0.1 * V_{VRMP}$$

**Figure 15. Ramp Feed-Forward**

### PWM Comparators

The noninverting input of the comparator for each phase is connected to the summed output of the error amplifier (COMP) and each phase current ( $I_L * DCR * \text{Phase Balance Gain Factor}$ ). The inverting input is connected to the oscillator ramp voltage with a 1.3 V offset. The operating input voltage range of the comparators is from 0 V to 3.0 V and the output of the comparator generates the PWM output.

During steady state operation, the duty cycle is centered on the valley of the sawtooth ramp waveform. The steady state duty cycle is still calculated by approximately  $V_{out}/V_{in}$ . During a transient event, the controller will operate in a hysteretic mode with the duty cycles pull in for all phases as the error amp signal increases with respect to all the ramps.

### Phase Detection Sequence

During start-up, the number of operational phases and their phase relationship is determined by the internal circuitry monitoring the CSP outputs. Normally, NCP81143 operates as a 3-phase V<sub>CORE</sub> PWM controller.

## NCP81143

**Figure 16. 3 Phase Mode**

Pulling CSP2 high to VCC configures the NCP81143 to operate in 2 phase mode.

**Figure 17. 2 Phase Mode**

Pulling CSP3 and CSP2 high to VCC configures the NCP81143 to operate in 1 phase mode.

**Figure 18. 1 Phase Mode**

The PWM outputs are logic-level devices intended for driving fast response external gate drivers such as the NCP81151. As each phase is monitored independently, operation approaching 100% duty cycle is possible. In addition, more than one PWM output can be on at the same time to allow overlapping phases.

**PROTECTION FEATURES**

**Under voltage Lockouts**

There are several under voltage monitors in the system. Hysteresis is incorporated within the comparators. NCP81143 monitors the 5 V  $V_{CC}$  supply. The gate driver monitors both the gate driver  $V_{CC}$  and the BST voltage. When the voltage on the gate driver is insufficient it will pull DRON low and prevents the controller from being enabled. The gate driver will hold DRON low for a minimum period of time to allow the controller to hold off its startup sequence. In this case the PWM is set to the MID state to begin soft start.

**Figure 19. Gate Driver UVLO Restart**

**Soft Start**

Soft start is implemented internally. A digital counter steps the DAC up from zero to the target voltage based on the predetermined rate in the spec table. The PWM signals will start out open with a test current to collect data on phase count and for setting internal registers. After the configuration data is collected, if the controller is enabled the PWMs will be set to 2.0 V MID state to indicate that the drivers should be in diode mode. DRON will then be asserted. As the DAC ramps the PWM outputs will begin to fire. Each phase will move out of the MID state when the first PWM pulse is produced. When the controller is disabled the PWM signal will return to the MID state.

Figure 20. Soft-Start

**Over Current Latch- Off Protection**

The NCP81143 compares a programmable current-limit set point to the voltage from the output of the current-summing amplifier. The level of current limit is set with the resistor from the ILIM pin to CSCOMP. The current through the external resistor connected between ILIM and CSCOMP is then compared to the internal current limit current  $I_{CL}$ . If the current generated through this resistor into the ILIM pin ( $I_{lim}$ ) exceeds the internal current-limit threshold current ( $I_{CL}$ ), an internal latch-off counter starts, and the controller shuts down if the fault is not removed after 50  $\mu s$  (shut down immediately for 150% load current) after which the outputs will remain disabled until the  $V_{CC}$  voltage or EN is toggled.

The voltage swing of CSCOMP cannot go below ground. This limits the voltage drop across the DCR through the current balance circuitry. An inherent per-phase current limit protects individual phases if one or more phases stop functioning because of a faulty component. The over-current limit is programmed by a resistor on the ILIM pin. The resistor value can be calculated by the following equations,

Equation related to the NCP81143:

$$R_{ILIM} = \frac{I_{LIM} * DCR * R_{CS} / R_{PH}}{I_{CL}}$$

Where  $I_{CL} = 10 \mu A$

Figure 21.  $I_{lim}$  Resistor

**Under Voltage Monitor**

The output voltage is monitored at the output of the differential amplifier for UVLO. If the output falls more than 300 mV below the DAC-DROOP voltage the UVLO comparator will trip sending the VR\_RDY signal low. The 300 mV limit can be reprogrammed using the VR\_Ready\_Low Limit register.

**Over Voltage Protection**

The output voltage is also monitored at the output of the differential amplifier for OVP. During normal operation, if the output voltage exceeds the DAC voltage by 400 mV, the VR\_RDY flag goes low, and the output voltage will be ramped down to 0 V. At the same time, the high side gate drivers are all turned off and the low side gate drivers are all turned on. The part will stay in this mode until the V<sub>CC</sub> voltage or EN is toggled. The part will stay in the mode until the V<sub>CC</sub> voltage or EN is toggled.

Figure 22. OVP Behavior at Startup

Figure 23. OVP During Normal Operation Mode

# NCP81143

**Figure 24. OVP During Normal Operation Mode**

During start up, the OVP threshold is set to 2.9 V. This allows the controller to start up without false triggering the OVP

## ORDERING INFORMATION

| Device        | Package            | Shipping†          |
|---------------|--------------------|--------------------|
| NCP81143MNTXG | QFN36<br>(Pb-Free) | 5000 / Tape & Reel |

†For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specifications Brochure, BRD8011/D.

# NCP81143

## PACKAGE DIMENSIONS

QFN36 5x5, 0.4P  
CASE 485CC  
ISSUE O

**NOTES:**

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSIONS: MILLIMETERS.
3. DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.15 AND 0.30mm FROM THE TERMINAL TIP.
4. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

| MILLIMETERS |      |      |
|-------------|------|------|
| DIM         | MIN  | MAX  |
| A           | 0.80 | 1.00 |
| A1          | ---  | 0.05 |
| A3          | 0.20 | REF  |
| b           | 0.15 | 0.25 |
| D           | 5.00 | BSC  |
| D2          | 3.40 | 3.60 |
| E           | 5.00 | BSC  |
| E2          | 3.40 | 3.60 |
| e           | 0.40 | BSC  |
| K           | 0.35 | REF  |
| L           | 0.30 | 0.50 |
| L1          | ---  | 0.15 |
