

NCV891130

1.2 A, 2 MHz Low- I_Q Dual-Mode Step-Down Regulator for Automotive

The NCV891130 is a Dual Mode regulator intended for Automotive, battery-connected applications that must operate with up to a 45 V input supply. Depending on the output load, it operates either as a PWM Buck Converter or as a Low Drop-Out Linear Regulator, and is suitable for systems with low noise and Low Quiescent Current requirements often encountered in automotive driver information systems. A reset pin (with fixed delay) simplifies interfacing with a microcontroller.

The NCV891130 also provides several protection features expected in automotive power supply systems such as current limit, short circuit protection, and thermal shutdown. In addition, the high switching frequency produces low output voltage ripple even when using small inductor values and an all-ceramic output filter capacitor – forming a space-efficient switching regulator solution.

Features

- 30 μ A I_Q in Light Load Condition
- 1.2 A Maximum Output Current in PWM Mode
- Internal N-channel Power Switch
- V_{IN} Operating Range 3.7 V to 36 V
- Withstands Load Dump to 45 V
- Logic Level Enable Pin can be Tied to Battery
- Fixed Output Voltage of 5.0 V, 4.0 V or 3.3 V
- 2 MHz Free-running Switching Frequency
- $\pm 2\%$ Output Voltage Accuracy
- NCV Prefix for Automotive Requiring Site and Control Changes
- These Devices are Pb-Free and are RoHS Compliant

Typical Applications

- Audio
- Infotainment
- Instrumentation
- Safety-Vision Systems

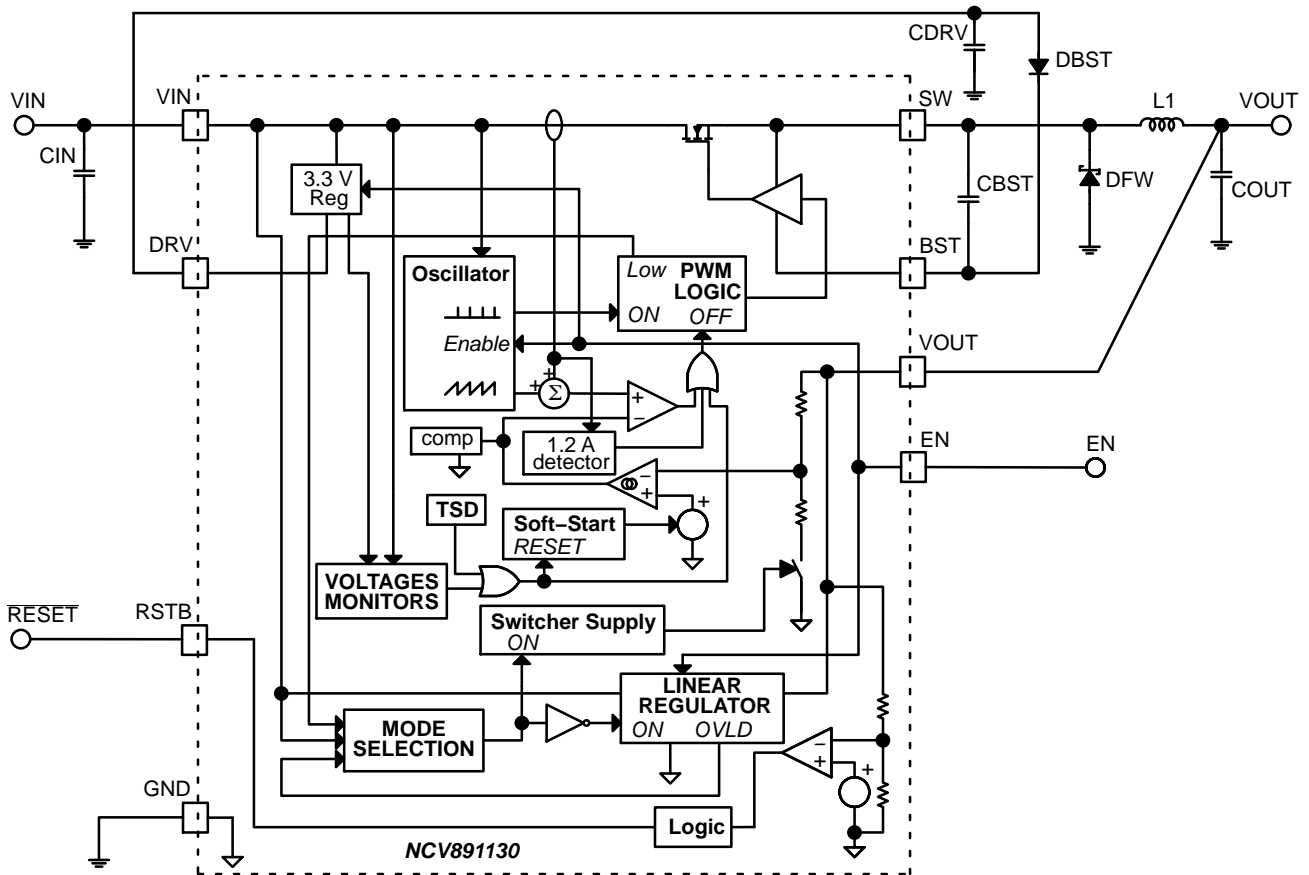

Figure 2. Simplified Block Diagram

Table 1. PIN FUNCTION DESCRIPTION

Pin No.	Pin Name	Description
1	VIN	Input voltage from battery. Place an input filter capacitor in close proximity to this pin.
2	DRV	Output voltage to provide a regulated voltage to the Power Switch gate driver.
3	RSTB	Reset function. Open drain output, pulling down to ground when the output voltage is out of regulation.
4	GND	Battery return, and output voltage ground reference.
5	EN	This TTL compatible Enable input allows the direct connection of Battery as the enable signal. Grounding this input stops switching and reduces quiescent current draw to a minimum.
6	VOUT	Output voltage feedback and LDO output. Feedback of output voltage used for regulation, as well as LDO output in LDO mode.
7	BST	Bootstrap input provides drive voltage higher than VIN to the N-channel Power Switch for minimum switch R _{ds(on)} and highest efficiency.
8	SW	Switching node of the Regulator. Connect the output inductor and cathode of the freewheeling diode to this pin.
EPAD		Connect to Pin 4 (electrical ground) and to a low thermal resistance path to the ambient temperature environment.

Table 2. ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Min/Max Voltage VIN		-0.3 to 45	V
Max Voltage VIN to SW		45	V
Min/Max Voltage SW		-0.7 to 40	V
Min Voltage SW – 20 ns		-3.0	V
Min/Max Voltage EN		-0.3 to 40	V
Min/Max Voltage VIN to EN		-1.5 to 45	V
Min/Max Voltage BST		-0.3 to 43	V
Min/Max Voltage BST to SW		-0.3 to 3.6	V
Min/Max Voltage on RSTB		-0.3 to 6	V
Min/Max Voltage VOUT		-0.3 to 18	V
Min/Max Voltage DRV		-0.3 to 3.6	V
Thermal Resistance, SOIC8–EP Junction–to–Ambient (Note 1)	R _{θJA}	30	°C/W
Storage Temperature range		-55 to +150	°C
Operating Junction Temperature Range	T _J	-40 to +150	°C
ESD withstand Voltage (Note 2)	Human Body Model VESD	2.0	kV
Moisture Sensitivity	MSL	Level 2	
Peak Reflow Soldering Temperature (Note 3)		260	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

APPLICATION INFORMATION

Hybrid Low-Power Mode

A high-frequency switch-mode regulator is not very efficient in light load conditions, making it difficult to achieve low Iq requirements for sleep-mode operation. To remedy this, the NCV891130 includes a low-Iq linear regulator that turns on at light load, while the PWM regulator turns off, ensuring a high-efficiency low-power operation. Another advantage of linear mode is the tight regulation free of voltage ripple usually associated with low-Iq switchers in light load conditions.

At initial start-up the NCV891130 always runs in PWM converter mode, regardless of the output current, and goes through a soft start. It then stays in PWM mode if the output current is high enough. If the output current is low, the NCV891130 transitions to Linear Regulator mode, after a 300 μs period during which it assesses the level of output current. Note that the Reset signal needs to be high before the IC starts to look at the output current level.

It stays in this low-power mode until the output current exceeds the $I_{LINtoSW}$ limit: it then transitions to PWM converter mode. This transition happens in less than 2 μs, so that the transient response is not affected by the mode change.

Once the NCV891130 has transitioned to switcher mode, it cannot go back to low-Iq mode before a 500 μs blanking period has elapsed, after which it starts looking at the output current level.

If the NCV891130 is in Low-Iq Linear Regulator mode in normal battery range, it will transition to switcher mode when V_{IN} increases above $V_{LINtoSW(HV)}$, regardless of the output current. Similarly, if the NCV891130 is in PWM mode and V_{IN} is higher than V_{FLDUB} it will not transition to Low-Iq Linear mode even if the output current becomes lower than I_{NtoL} .

At low input voltage, the NCV891130 stays in low-Iq mode down to $V_{LINtoSW(LV)}$ if it entered this mode while in normal battery range. However it may not enter low-Iq mode below 8 V depending on the charge of the bootstrap capacitor (see Bootstrap section and typical characteristics curves for details).

Figures 29 and 30 show a mode transition for a large load transient, while Figures 31 and 32 show a transition on a small load transient.

Figure 33. $V_{IN} = 13$ V, $V_{OUT} = 5$ V, 20 mA to 70 mA Load Transient – LDO Mode Only (no transition)

Input Voltage

An Undervoltage Lockout (UVLO) circuit monitors the input, and can inhibit switching and reset the Soft-start circuit if there is insufficient voltage for proper regulation. Depending on the output conditions (voltage option and loading), the NCV891130 may lose regulation and run in drop-out mode before reaching the UVLO threshold: refer to the Minimum V_{in} calculation tool for details. When the input voltage drops low enough that the part cannot regulate because it reaches its maximum duty cycle, the switching frequency is divided down by up to 4 (down to 500 kHz). This helps lowering the minimum voltage at which the regulator loses regulation.

An overvoltage monitoring circuit automatically terminates switching if the input voltage exceeds V_{OVSTP} (see Figure 34), but the NCV891130 can withstand input voltages up to 45 V.

To avoid skipping switching pulses and entering an uncontrolled mode of operation, the switching frequency is reduced by a factor of 2 when the input voltage exceeds the V_{IN} Frequency Foldback threshold (see Figure 34). Frequency reduction is automatically terminated when the input voltage drops back below the V_{IN} Frequency Foldback threshold. This also helps to limit the power lost in switching and generating the drive voltage for the Power Switch.

Figure 34. NCV891130 Switching Frequency Profile vs. Input Voltage

Soft-Start

Upon being enabled or released from a fault condition, and after the DRV voltage is established, a soft-start circuit ramps the switching regulator error amplifier reference voltage to the final value. During soft-start, the average switching frequency is lower until the output voltage approaches regulation.

Slope Compensation

A fixed slope compensation signal is generated internally and added to the sensed current to avoid increased output voltage ripple due to bifurcation of inductor ripple current at duty cycles above 50%. The fixed amplitude of the slope

compensation signal requires the inductor to be greater than a minimum value, depending on output voltage, in order to avoid sub-harmonic oscillations. The recommended inductor values are 2.2 or 3.3 μ H, although higher values are possible.

Current Limiting

Due to the ripple on the inductor current, the average output current of a buck converter is lower than the peak current setpoint of the regulator. Figure 35 shows – for a 2.2 μ H inductor – how the variation of inductor peak current with input voltage affects the maximum DC current the NCV891130 can deliver to a load.

Figure 35. NCV891130 Load Current Capability with a 2.2 μ H Inductor

Short Circuit Protection

During severe output overloads or short circuits, the NCV891130 automatically reduces its switching frequency. This creates duty cycles small enough to limit the peak current in the power components, while maintaining the ability to automatically reestablish the output voltage if the overload is removed.

In more severe short-circuit conditions where the inductor current is still too high after the switching frequency has fully folded back, the regulator enters a hiccup mode that further reduces the power dissipation and protects the system.

RESET Function

The RSTB pin is pulled low when the output voltage falls below 7.5% of the nominal regulation level, and floats when the output is properly regulated. A pull-up resistor tied to the output is needed to generate a logic high signal on this open drain pin. The pin can be left unconnected when not used.

When the output voltage drops out of regulation, the pin goes low after a short noise-filtering delay (t_{filter}). It stays low for a 16 ms delay time after the output goes back to regulation, simplifying the connection to a micro-controller.

The RSTB pin is also pulled low immediately in case of VIN overvoltage, Thermal shutdown, VIN UVLO or DRV UVLO.

Feedback Loop

All components of the feedback loop (output voltage sensing, error amplifier and compensation) are integrated inside the NCV891130, and are optimized to ensure regulation and sufficient phase and gain margin for the recommended conditions of operation.

Recommended conditions and components:

- Input: car battery
- Output: 3.3 V, 4 V or 5 V, with output current up to 1.2 A
- Output capacitor: one to three parallel ceramic 10 μ F capacitors
- Inductor: 2.2 μ H to 3.3 μ H

With these operating conditions and components, the open loop transfer function has a phase margin greater than 50°, as can be seen in Figure 36.

NCV891130

Figure 36. Bode Plot of the Open Loop Transfer Function of a Buck Converter using the NCV891130 for $V_{in} = 13\text{ V}$, $V_{out} = 3.3\text{ V}$, $I_{out} = 1.2\text{ A}$, $C_{out} = 3 \times 10\ \mu\text{F}$ and $L = 2.2\ \mu\text{H}$

For more details and for effect of component values other than the recommended ones, please refer to the design spreadsheet provided on the www.onsemi.com NCV891130 page.

The total open loop transfer function (from output voltage sensing at the NCV891130 VOUT pin to output voltage) can be modeled using the following equation:

$$G_{Loop}(s) = G_{LO} \cdot \frac{1 + \frac{s}{1.48 \times 10^5}}{\left(1 + \frac{s}{1.26 \times 10^3}\right) \cdot \left(1 + \frac{s}{1.85 \times 10^6}\right)} \cdot \frac{1 + \frac{s}{\omega_z}}{1 + \frac{s}{\omega_p}} \cdot \frac{1}{1 + \frac{s}{\omega_n \cdot Q_p} + \frac{s^2}{\omega_n^2}}$$

With:

$$G_{LO} = \frac{2.1 \times 10^3}{I_{OUT} + \frac{V_{OUT}}{L \cdot F_{sw}} \cdot \left[\left(1 + \frac{2.0 \times 10^6 \cdot L}{V_{IN} - V_{OUT}}\right) \cdot (1 - D) - 0.5 \right]}$$

$$\omega_z = \frac{1}{R_{ESR(C_{OUT})} \cdot C_{OUT}}$$

$$\omega_p = \frac{I_{OUT}}{V_{OUT} \cdot C_{OUT}} + \frac{\left(1 + \frac{2.0 \times 10^6 \cdot L}{V_{IN} - V_{OUT}}\right) \cdot (1 - D) - 0.5}{L \cdot C_{OUT} \cdot F_{sw}}$$

$$\omega_n = \pi \cdot F_{sw}$$

$$Q_p = \frac{1}{\pi \cdot \left[\left(1 + \frac{2.0 \times 10^6 \cdot L}{V_{IN} - V_{OUT}}\right) \cdot (1 - D) - 0.5 \right]}$$

This equation is used in the design spreadsheet provided on the www.onsemi.com NCV891130 page.

NCV891130

Bootstrap

At the DRV pin an internal regulator provides a ground-referenced voltage to an external capacitor (C_{DRV}), to allow fast recharge of the external bootstrap capacitor (C_{BST}) used to supply power to the power switch gate driver. If the voltage at the DRV pin goes below the DRV UVLO Threshold V_{DRVSTB} switching is inhibited and the Soft-start circuit is reset, until the DRV pin voltage goes back up above V_{DRVSTT} .

The NCV891130 permanently monitors the bootstrap capacitor, and always ensures it stays charged no matter what the operating conditions are. As a result, the additional charging current for the bootstrap capacitor may prevent the regulator from entering Low-Iq mode at low input voltage. Practically, the 5 V output version does not enter Low-Iq mode for input voltages below 8 V, and the 4 V version for input voltages below 6.5 V (see typical characteristics curves for details).

Enable

The NCV891130 is designed to accept either a logic level signal or battery voltage as an Enable signal. However if voltages above 40 V are expected, EN should be tied to VIN through a 10 k Ω resistor in order to limit the current flowing into the overvoltage protection of the pin.

Bootstrap

At the DRV pin an internal regulator provides a ground-referenced voltage to an external capacitor (C_{DRV}), to allow fast recharge of the external bootstrap capacitor (C_{BST}) used to supply power to the power switch gate driver. If the voltage at the DRV pin goes below the DRV UVLO Threshold V_{DRVSTB} switching is inhibited and the

Soft-start circuit is reset, until the DRV pin voltage goes back up above V_{DRVSTT} .

The NCV891130 permanently monitors the bootstrap capacitor, and always ensures it stays charged no matter what the operating conditions are. As a result, the additional charging current for the bootstrap capacitor may prevent the regulator from entering Low-Iq mode at low input voltage. Practically, the 5 V output version does not enter Low-Iq mode for input voltages below 8 V, and the 4 V version for input voltages below 6.5 V (see typical characteristics curves for details).

Enable

The NCV891130 is designed to accept either a logic level signal or battery voltage as an Enable signal. However if voltages above 40 V are expected, EN should be tied to VIN through a 10 k Ω resistor in order to limit the current flowing into the overvoltage protection of the pin.

EN low induces a shutdown mode which shuts off the regulator and minimizes its supply current to 9 μ A typical by disabling all functions.

Upon enabling, voltage is established at the DRV pin, followed by a soft-start of the switching regulator output.

Thermal Shutdown

A thermal shutdown circuit inhibits switching, resets the Soft-start circuit, and removes DRV voltage if internal temperature exceeds a safe level. Switching is automatically restored when temperature returns to a safe level.

Exposed Pad

The exposed pad (EPAD) on the back of the package must be electrically connected to the electrical ground (GND pin) for proper, noise-free operation.

ISSUE B

- NOTES:
1. DIMENSIONS AND TOLERANCING PER ASME Y14.5M, 1994.
 2. DIMENSIONS IN MILLIMETERS (ANGLES IN DEGREES).
 3. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.08 MM TOTAL IN EXCESS OF THE "b" DIMENSION AT MAXIMUM MATERIAL CONDITION.
 4. DATUMS A AND B TO BE DETERMINED AT DATUM PLANE H.

DIM	MILLIMETERS	
	MIN	MAX
A	1.35	1.75
A1	0.00	0.10
A2	1.35	1.65
b	0.31	0.51
b1	0.28	0.48
c	0.17	0.25
c1	0.17	0.23
D	4.90 BSC	
E	6.00 BSC	
E1	3.90 BSC	
e	1.27 BSC	
L	0.40	1.27
L1	1.04 REF	
F	2.24	3.20
G	1.55	2.51
h	0.25	0.50
θ	0°	8°

SOLDERING FOOTPRINT

ON Semiconductor and the are registered trademarks of Semiconductor Components Industries, LLC (SCILLC) or its subsidiaries in the United States and/or other countries. SCILLC owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of SCILLC's product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. SCILLC reserves the right to make changes without further notice to any products herein. SCILLC makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does SCILLC assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. "Typical" parameters which may be provided in SCILLC data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. SCILLC does not convey any license under its patent rights nor the rights of others. SCILLC products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SCILLC product could create a situation where personal injury or death may occur. Should Buyer purchase or use SCILLC products for any such unintended or unauthorized application, Buyer shall indemnify and hold SCILLC and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that SCILLC was negligent regarding the design or manufacture of the part. SCILLC is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
