DATA HANDBOOK SYSTEM

Our Data Handbook System is a comprehensive source of information on electronic components, subassemblies and materials; it is made up of three series of handbooks each comprising several parts.

ELECTRON TUBES

BLUE

SEMICONDUCTORS AND INTEGRATED CIRCUITS

RED

COMPONENTS AND MATERIALS

GREEN

The several parts contain all pertinent data available at the time of publication, and each is revised and reissued periodically.

Where ratings or specifications differ from those published in the preceding edition they are pointed out by arrows. Where application information is given it is advisory and does not form part of the product specification.

If you need confirmation that the published data about any of our products are the latest available, please contact our representative. He is at your service and will be glad to answer your inquiries.

This information is furnished for guidance, and with no guarantee as to its accuracy or completeness; its publication conveys no licence under any patent or other right, nor does the publisher assume liability for any consequence of its use; specifications and availability of goods mentioned in it are subject to change without notice; it is not to be reproduced in any way, in whole or in part without the written consent of the publisher.

ELECTRON TUBES (BLUE SERIES)

This series consists of the following parts, issued on the dates indicated.

Part 1a	Transmitting tubes for communication Tubes for r.f. heating Types PE05/25 – TBW15/25	December 1975
Part 1b	Transmitting tubes for communication Tubes for r.f. heating Amplifier circuit assemblies	January 1976
Part 2	Microwave products Communication magnetrons Magnetrons for microwave heating Klystrons Travelling-wave tubes Isolators, Circulators	May 1976
	Diodes Triodes T-R switches Microwave semiconductor devices	
Part 3	Special Quality tubes Miscellaneous devices	January 1975
Part 4	Receiving tubes	March 1975
Part 5a	Cathode-ray tubes	August 1976
Part 5b	Camera tubes Image intensifier tubes	May 1975
Part 6	Products for nuclear technology Channel electron multipliers Neutron tubes	January 1977
	Geiger-Müller tubes	
Part 7a	Gas-filled tubes Thyratrons Industrial rectifying tubes	March 1977
	Ignitrons High-voltage rectifying tubes	
Part 7b	Gas-filled tubes Segment indicator tubes Indicator tubes	March 1977
	Switching diodes Dry reed contact units	
Part 8	TV picture tubes	May 1977
Part 9	Photomultiplier tubes Phototubes (diodes)	June 1976

SEMICONDUCTORS AND INTEGRATED CIRCUITS (RED SERIES)

This series consists of the following parts, issued on the dates indicated.

Part 1a	Rectifier diodes, thyristors, triacs		March 1976
	Rectifier diodes	Rectifier stacks	
	Voltage regulator diodes ($> 1,5$ W)	Thyristors	
	Transient suppressor diodes	Triacs	
Part 1b	Diodes		October 1975
	Small signal germanium diodes	Voltage regulator diodes ($< 1,5$ W)	
	Small signal silicon diodes	Voltage reference diodes	
	Special diodes	Tuner diodes	
Part 2	Low-frequency transistors		December 1975
Part 3	High-frequency and switching transistors		April 1976
Part 4a	Special semiconductors		June 1976
	Transmitting transistors	Dual transistors	
	Microwave devices	Microminiature devices for thick- and thin-film circuits	
	Field-effect transistors		
Part 4b	Devices for optoelectronics		July 1976
	Photosensitive diodes and transistors	Photocouplers	
	Light emitting diodes	Infrared sensitive devices	
	Displays	Photoconductive devices	
Part 5a	Professional analogue integrated circuits		November 1976
Part 5b	Consumer integrated circuits		March 1977
	Radio - Audio		
	Television		
Part 6	Digital integrated circuits		May 1976
	LOCMOS HE family		
	GZ family		

COMPONENTS AND MATERIALS (GREEN SERIES)

This series consists of the following parts, issued on the dates indicated.

Part 1	Functional units, Input/output devices, Peripheral devices		November 1975
	High noise immunity logic FZ/30-Series	Circuit blocks 90-Series	
	Circuit blocks 40-Series and CSA70	Input/output devices	
	Counter modules 50-Series	Hybrid integrated circuits	
	NORbits 60-Series, 61-Series	Peripheral devices	
Part 2a	Resistors		February 1976
	Fixed resistors	Negative temperature coefficient thermistors (NTC)	
	Variable resistors	Positive temperature coefficient thermistors (PTC)	
	Voltage dependent resistors (VDR)	Test switches	
	Light dependent resistors (LDR)		
Part 2b	Capacitors		April 1976
	Electrolytic and solid capacitors	Ceramic capacitors	
	Paper capacitors and film capacitors	Variable capacitors	
Part 3	Radio, Audio, Television		January 1977
	FM tuners	Components for black and white television	
	Loudspeakers	Components for colour television	
	Television tuners and aerial input assemblies		
Part 4a	Soft ferrites		October 1976
	Ferrites for radio, audio and television	Ferroxcube potcores and square cores	
	Beads and chokes	Ferroxcube transformer cores	
Part 4b	Piezoelectric ceramics, Permanent magnet materials		December 1976
Part 5	Ferrite core memory products		July 1975
	Ferroxcube memory cores	Core memory systems	
	Matrix planes and stacks		
Part 6	Electric motors and accessories		April 1977
	Small synchronous motors	Miniature direct current motors	
	Stepper motors		
Part 7	Circuit blocks		September 1971
	Circuit blocks 100 kHz-Series	Circuit blocks for ferrite core memory drive	
	Circuit blocks 1-Series		
	Circuit blocks 10-Series		
Part 8	Variable mains transformers		February 1977
Part 9	Piezoelectric quartz devices		March 1976
Part 10	Connectors		November 1975

General section

LIST OF SYMBOLS

Symbols denoting electrodes/elements and electrode/element connections

Heater	f
Cathode	k
Grid	g
Grids are distinguished by means of an additional numeral; the electrode nearest to the cathode having the lowest number.	
External conductive coating; rim-band	m
Fluorescent screen	ℓ
Tube pin which must not be connected externally	i.c.
Tube pin which may be connected externally	n.c.

Symbols denoting voltages

Unless otherwise stated, the reference point for electrode voltages is the cathode.

Symbol for voltage, followed by a subscript denoting the relevant electrode/element	V
Heater voltage	V _f
Peak-to-peak value of a voltage	V _{pp}
Peak value of a voltage	V _p
Grid 1 voltage for visual extinction of focused raster (grid drive service)	V _{GR}
Cathode voltage for visual extinction of focused raster (cathode drive service)	V _{KR}

Symbols denoting currents

- Remark I The positive electrical current is opposite to the direction of the electron current.
- Remark II The symbols quoted represent the average value of the current, unless otherwise stated.

Symbol for current followed by a subscript denoting the relevant electrode	I
Heater current	I _f

Symbols denoting powers

Dissipation of the fluorescent screen	W _ℓ
Grid dissipation	W _g

Symbols denoting capacitances

See IEC Publication 100

Symbols denoting resistances and impedances

Symbol for resistance followed by a subscript for the relevant electrode pair. When only one subscript is given the second electrode is the cathode.	R
Symbol for impedance followed by a subscript for the relevant electrode pair. When only one subscript is given the second electrode is the cathode.	Z

Symbols denoting various quantities

Luminance	B
Frequency	f
Magnetic field strength	H

GENERAL OPERATIONAL RECOMMENDATIONS T.V. PICTURE TUBES

GENERAL OPERATIONAL RECOMMENDATIONS

T.V. PICTURE TUBES

1. INTRODUCTION

Equipment design should be based on the characteristics as stated in the data sheets.

Where deviations from these general recommendations are permissible or necessary, statements to that effect will be made.

If applications are considered not referred to in the data sheets of the relevant tube type extra care should be taken with circuit design to avoid that the tube is overloaded due to unfavourable operating conditions.

2. SPREAD IN TUBE CHARACTERISTICS

The spread in tube characteristics is the difference between maximum and minimum values. Values not qualified as maximum or minimum are nominal ones. It is evident that average or nominal values, as well as spread figures, may differ according to the number of tubes of a certain type that are being checked. No guarantee is given for values of characteristics in settings substantially differing from those specified in the data sheets.

3. SPREAD AND VARIATION IN OPERATING CONDITIONS

The operating conditions of a tube are subject to spread and/or variation.

3.1 Spread. Spread in an operating condition is a permanent deviation from an average condition due to, e.g., component value deviations. The average condition is found from such a number individual cases taken at random that an increase of the number will have a negligible influence.

3.2 Variation. Variation in an operating condition is non-permanent (occurs as a function of time), e.g., due to supply voltage fluctuations. The average value is calculated over a period such that a prolongation of that period will have negligible influence.

4. LIMITING VALUES

4.1 Limiting values are in accordance with the applicable rating system as defined by I.E.C. publication 134.

Reference may be made to one of the following 3 rating systems.

4.1.1 Absolute maximum rating system. Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.

The equipment manufacturer should design so that, initially and throughout life, no absolute maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply voltage variation, equipment components spread and variation, equipment control adjustment, load variations, signal variation, environmental conditions, and spread or variations in characteristics of the device under considerations and of all other electronic devices in the equipment.

- 4.1.2 Design-maximum rating system. Design-maximum ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device* of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking responsibility for the effects of changes in operating conditions due to variations in the characteristics of the electronic device under consideration.

The equipment manufacturer should design so that, initially and throughout life, no design-maximum value for the intended service is exceeded with a bogey device under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, variation in characteristics of all other devices in the equipment, equipment control adjustment, load variation, signal variation and environmental conditions.

- 4.1.3 Design-centre rating system. Design-centre ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device* of a specified type as defined by its published data, and should not be exceeded under average conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device in average applications, taking responsibility for normal changes in operating conditions due to rated supply-voltage variation, equipment component spread and variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations or spread in the characteristics of all electronic devices.

The equipment manufacturer should design so that, initially, no design-centre value for the intended service is exceeded with a bogey electronic device* in equipment operating at the stated normal supply-voltage.

Note*. A bogey tube is a tube whose characteristics have the published nominal values for the type. A bogey tube for any particular application can be obtained by considering only those characteristics which are directly related to the application.

- 4.2 If the tube data specify limiting values according to more than one rating system the circuit has to be designed so that none of these limiting values is exceeded under the relevant conditions.
- 4.3 In addition to the limiting values given in the individual data sheets the directives in the following paragraphs should be observed.

5. HEATER CIRCUIT

Any deviation from the nominal heater voltage (in case of parallel connection) or from the nominal heater current (in case of series connection) has a detrimental effect on tube performance and life, and should therefore be kept at a minimum. Such deviations may be caused by:

- a) Mains voltage fluctuations.
- b) Spread in the characteristics of components such as transformers, resistors capacitors etc.

Designers of heater circuits are strongly recommended to bear this in mind when dealing with equipment to be used in areas where the actual mains voltage is likely to differ from the nominal value.

5.1 Parallel connection

The maximum deviation of the heater voltage should not exceed $\pm 15\%$ (design maximum value).

This condition will be fulfilled when the mains voltage fluctuates by $\pm 10\%$ and a ordinary transformer (see below) is used.

5.2 Series connection

The maximum deviation of the heater current should not exceed $\pm 8\%$ (design maximum value).

When a small number of tubes with large differences in the heater voltage is used in series connection combined with a series resistor or a series capacitor, the maximum permitted deviation of the heater current may be exceeded.

To avoid this, certain restrictions must be imposed on the composition of the heater chain; the maximum part of the supply voltage that can be eliminated, and the tolerances of the voltage dropper in series with the heaters.

A number of circuits for $I_f = 300 \text{ mA}$ will be described in detail below.

V_s = source voltage (mains voltage or mains voltage stepped down via a transformer)

V_{R_s} = voltage drop over series resistor

$V_{ftot.}$ = $V_{f1} + V_{f2} + V_{f3} \dots \dots \dots + V_{fmin.} + \dots \dots \dots + V_{fn.}$

$V_{fmin.}$ = lowest individual heater voltage of all tubes in the chain

R_s = series resistor

Voltage source

The following spreads have been taken into account for the source voltage:

- Mains voltage spread $\pm 10\%$ either or not combined with the voltage spread caused by a transformer with a permanent deviation from the nominal value of $\pm 1\%$ and with a spread of $\pm 2\%$ (ordinary, well made transformer).

The following circuits are allowed:

5.2.1 Supply directly from a voltage source ($V_s = V_{ftot.}$)

- No restrictions.

5.2.2 Supply from a voltage source via a 5% series resistor ($V_s = V_{R_s} + V_{ftot.}$)

a. One single tube: permitted if $\frac{V_{R_s}}{V_{ftot.}} \leq 2$

b. Heater chain consisting of 2 or more tubes:

the maximum permitted ratio $\frac{V_{R_s}}{V_{ftot.}}$ can be read from diagram number 1 as follows:

Determine $\frac{V_{fmin.}}{V_{ftot.}}$ of the heater chain. Draw a vertical line through the corresponding point in the diagram. Draw a horizontal line through the point of intersection of this vertical line with the line which indicates the total number of tubes in the chain. The point of intersection of this horizontal line with the vertical axis gives the maximum permitted ratio between the series resistor and the sum of the heater voltages of all tubes in the chain.

5.2.3 Supply from a voltage source via a series diode ($\frac{V_s}{\sqrt{2}} = V_{ftot.}$)

- No restrictions.

5.2.4 Supply from a voltage source via a series diode and a series resistor

$$\frac{V_s}{\sqrt{2}} = V_{ftot.} + V_{R_s}$$

In the above formula $V_{ftot.}$ and V_{R_s} are RMS values and the maximum permitted ratio $\frac{V_{R_s}}{V_{ftot.}}$ can be read from diagram number 1 (see 5.2.2).

For calculation of R_s divide the required V_{R_s} (RMS) by the nominal heater current: $R_s = \frac{V_{R_s}}{0.3}$

Remark to 5.2.3 and 5.2.4:

When series diodes are applied, the D.C. component of the resulting heater voltage should preferably be negative with respect to the cathodes of the tubes.

5.2.5 Supply from a voltage source via a series capacitor

a. One single 300 mA tube; permitted if

$$\frac{V_{ftot.}}{V_s} \geq 0.50 \text{ when 5\% paper capacitors are applied.}$$

b. $\frac{V_{ftot.}}{V_s} \geq 0.70$ when 10% metallized polycarbonate capacitors are applied.

c. Heater chain consisting of 2 tubes or more; permitted if $\frac{V_{ftot.}}{V_s}$

$$\frac{V_{ftot.}}{V_s} \geq 0.6 \text{ when 5\% paper capacitors are applied.}$$

$$\frac{V_{ftot.}}{V_s} \geq 0.8 \text{ when 10\% metallized polycarbonate capacitors are applied.}$$

5.3 Stand-by (instant -on circuits)

In order to maintain reliability during life, it is recommended to reduce the heater voltage of the tubes during stand-by operation to $\leq 75\%$ of the nominal value.

Note

If other designs for the heater supply circuit are wanted than the configurations described above it is strongly recommended to contact the tube manufacturer.

Diagram No. 1

6. CATHODE TO HEATER VOLTAGE

The voltage between cathode and heater should be as low as possible and never exceed the limiting value given on the data sheets of the individual tubes. The values given under "Limiting values" relate to that side of the heater where the voltage between cathode and heater is greatest. The voltage between cathode and heater may be D.C., A.C., or a combination of both voltages. Unless otherwise stated, the maximum values quoted for the voltage between cathode and heater indicate the maximum permissible value (D.C. component). If an A.C. voltage, or an combination of D.C. and A.C. voltages, is applied the peak value may be twice the rated V_{kf} ; however, unless otherwise stated, the peak value shall never exceed 315 V. The D.C. component is not allowed to exceed the published value.

Unless otherwise stated, the V_{kf} max. holds for both polarities of the voltage; however, a positive cathode is usually the most favourable in view of insulation during life.

In order to avoid excessive hum the A.C. component of the heater to cathode voltage should be as low as possible and never exceed $20V_{rms}$ (mains frequency).

7. INTERMEDIATE ELECTRODES (between cathode and final accelerator)

In no circumstances should the tube be operated without a D.C. connection between each electrode and the cathode. The total effective impedance between each electrode and the cathode should never exceed the published maximum value. However, no electrode should be connected directly to a high energy source such as the hot line. When such a connection is required, it should be made via a series resistor of not less than 1 k Ω .

8. ELECTRODE VOLTAGES

All electrode voltages are given with respect to cathode.
For cathode drive service the reference point is grid No. 1

8.1 Grid No. 1 cut-off voltage

Generally curves showing the limits of grid No. 1 cut-off voltage for specific values of the first accelerator voltage are included in the data. The brightness control should be so dimensioned that it can handle any tube within the limits shown, at the appropriate first accelerator voltage.

The published limits are determined at an ambient illumination level of 10 lux with the aid of a focused raster. Because the brightness of a focused spot is in general greater than that of a raster, the visual cut-off voltage determined with the aid of a spot will be more negative by about 5 V.

8.2 Grid No. 2 voltage

For each individual tube the grid No. 2 voltage can be adjusted so that the beam current is cut off at a fixed value within the published range of the grid No. 1 voltage.

In the data, graphs are included giving the relationship between the grid No. 2 voltage and the grid No. 1 cut-off voltage.

8.3 Focusing electrode voltage

Individual tubes will have satisfactory focus over the entire screen at some value within the published range of the focusing voltage.

If centre-focusing is desired this range will shift in the negative direction.

9. LUMINESCENT SCREEN

To prevent permanent damage to the screen material care should be taken

- a. not to operate the tube with a stationary picture at high beam currents for extended periods
- b. not to operate the tube with a stationary or slowly moving spot except at extremely low beam currents
- c. to choose the time constants of the grid No. 1 the grid No. 2 and the time bases supply line circuits such that sufficient beam current is maintained to discharge the e.h.t. capacitance before deflection has ceased after equipment has been switched off.

10. EXTERNAL CONDUCTIVE COATING

The external conductive coating must be connected to the chassis. The capacitance of this coating to the final accelerating electrode may be used to provide smoothing for the e.h.t. supply.

The coating is not a perfect conductor and in order to reduce radiation caused by the line time base it may be necessary to make multiple connections to the coating. See also 12.

11. METAL RIMBAND

An appreciable capacitance exist between the metal rimband and the internal conductive coating of the tube; its value is quoted in the individual data sheets. To avoid electric shocks, a D.C. connection should be provided between the metal band and the rest of the receiver. In receivers where the chassis can be connected directly to the mains there is a risk of electric shock if acces is made to the metal band. To reduce the shock to the safe limit, it is suggested that a $2\text{ M}\Omega$ resistor capable of handling the peak voltages be inserted between the metal band and the point of contact with the external conductive coating. This safety arrangement will provide the necessary insulation from the mains but in the event of flash-over high voltages will be induced on the metal band. It is therefore recommended that the $2\text{ M}\Omega$ resistor be bypassed by a 4.7 nF capacitor capable of withstanding the peak voltage determined by the voltage divider formed by this capacitor and the capacitance of the metal rimband to the internal conductive coating.

The 4.7 nF capacitor also serves to reduce the radiation from the band.

12. FLASH-OVER

Picture tubes, in common with other high voltage devices, are prone to internal flash-over. During a breakdown arcing occurs between an electrode connected to the e.h.t. capacitor and an electrode terminated in a pin on the base of the tube. The resulting transient currents and voltages may be of sufficient magnitude to cause damage to the tube itself and to various components on the chassis. Arcing terminates when the e.h.t. capacitor is discharged.

During the subsequent recharging period an additional load is imposed on the e.h.t. generator.

It is of vital importance to provide protective circuits with spark gaps, particularly when semiconductor devices are employed. The spark gaps must be connected as follows:

No other connections between the outer conductive coating and the chassis are permissible.

Additional information available on request.

13. HANDLING

The precautions taken in manufacture reduce the possibility of spontaneous implosion to a minimum but any additional stress due to mishandling considerably increases the risk of implosion: such an implosion may occur immediately or may be delayed. Care should be taken not to scratch or bump any part of the bulb, particularly the screen to cone area, as this will appreciably reduce the strength of the bulb and may lead to implosion.

When a tube is not in its equipment or original packing and is placed screen downwards, it should be placed on a soft pad of suitable material free from abrasive substances. Stresses on the neck should be avoided.

If the transportation method uses the lugs it is necessary to employ at least two lugs in the lifting of the tube. The lift should be made in such a way that the applied forces are equally distributed between the lugs.

The maximum force that may be applied to one lug, at any angle, shall not exceed twice the weight of the tube.

The tube should not be subjected to accelerations higher than 30 g.

Before removing the tube from the equipment the capacitance C_{am} should be discharged via a resistor of approx. 50 k Ω .

The manufacturers notify all concerned that they do not accept any responsibility for any damage or injury sustained in any manner in connection with the picture tube, neither is any condition or warranty given or to be implied.

14. MOUNTING

Unless otherwise specified on the data sheets for individual tubes there are no restrictions on the position of mounting.

The tube socket should not be rigidly mounted but should have flexible leads and be allowed to move freely.

The weight of the socket and possible additional circuitry should not be more than 80 g. With tubes with a 7-pin miniature base the socket may not be used for mounting components.

Tubes having all-glass bases must not be soldered direct into the wiring. It is very desirable that tubes should not be exposed to strong electrostatic and magnetic fields.

In front of the face of a mono-panel T.V. picture tube a protecting screen of transparent material should be placed. The screen should be of adequate strength to withstand the effects of an implosion of the tube.

Tubes having integral protection do not require a protective screen.

15. DIMENSIONS

In designing the equipment the tolerances given on the dimensional drawings should be considered. Under no circumstances should the equipment be designed a round dimensions taken from individual tubes.

16. REFERENCE LINE

The reference line indicated on the tube outline drawing is determined by means of a gauge.

Drawings of these gauges are given in this book.

17. CORNER CUTTING OR NECK SHADOWING

Corner cutting is caused by a direct interception of the deflected electron beam before it is reaching the screen and results in a non-scanned corner of the raster. It may be avoided by applying an appropriate deflection unit.

18. RASTER CENTRING

To centre the raster on the screen it is recommended that either a magnetic field just behind the deflection coils (viewed from the screen) be used or a direct current be passed through the deflection coils.

The centring device should provide a shift to allow for non-centrality of the spot with respect to the geometric centre of the screen, in addition the centring device should provide the shift needed to allow for non-centrality of the visible raster (i.e. to compensate for line blanking and also time base non-linearity, if any) and the earth magnetic field.

The use of a too strong centring magnetic field should be avoided; this may result in raster distortion and even corner cutting.

TYPE DESIGNATION

PRO-ELECTRON TYPE DESIGNATION CODE

Single letter, group of figures, hyphen, group of figures, letter or letter group.

The first letter indicates the prime application of the tube:

A - Television display tube for domestic application.

M - Television display tube for professional application-direct view.

First group of figures: Diameter or diagonal of the face in cm.

Second group of figures: Development or design number.

Final letter or letter group: Properties of the phosphor screen.

The first letter denotes the colour of the fluorescence, the second letter, if any, other specific differences in screen properties.

W - White screen for T V display tubes.

X - Three-colour screen for T.V. display tubes.

Example

A66-410X

SMALL-BUTTON NEO EIGHTAR BASE

IEC67-I-31
JEDEC B7-208

Dimensions in mm

- 1) Base-pin positions are held to tolerances such that the base will fit a flat-plate gauge having a thickness of 9,53 and eight equally spaced holes of $1,40 \pm 0,01$ diameter located on a $15,24 \pm 0,01$ diameter circle. The gauge is also provided with a centre hole to provide 0,25 diametric clearance for the lug and key. Pin fit in the gauge shall be such that the entire length of pins will, without undue force, pass into and disengage from the gauge.
- 2) This dimension may vary within the limits shown around the periphery of any individual pin.

7 PIN MINIATURE BASE WITH PUMPING STEM

Dimensions of this base are within the JEDEC E7-91 dimensions

- 1) Base-pin and pumping stem positions are held to tolerances such that entire length of pins and stem will without undue force pass into and disengage from a flat-plate gauge having a thickness of 6,35 mm and eight holes with diameters of $1,27 \pm 0,013$ mm so located on a $9,525 \pm 0,013$ mm diameter circle that the distance along the chord between any two adjacent hole centres is $3,645 \pm 0,013$ mm and a centre hole of $5,97 + 0,025$ mm being chamfered at the top over 1,52 mm with an angle of 45 degrees.
- 2) This dimension around the periphery of any individual pin may vary within the limits shown.

Mounting position: any

Net mass : approx. 10 kg

Base : 12 pin base IEC 67-I-47a, type 2

Anode contact : small cavity contact J1-21, IEC 67-III-2

Magnetic shielding, degaussing: The tube is provided with an internal magnetic shield. The internal magnetic shield and the shadow-mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts. For proper degaussing an initial m. m. f. of 200 ampere-turns is required in each of the coils. This m. m. f. has to be gradually decreased by appropriate circuitry. To prevent beam landing disturbances by line-frequency currents induced in the degaussing coils, these coils should be shunted by a capacitor of sufficiently high value. In the steady state, no significant m. m. f. should remain in the coils ($\leq 0,2$ A. t.). To ease the mounting of the coils, the rimband is provided with rectangular holes.

NOTES TO OUTLINE DRAWINGS (see pages 4, 5, and 6)

- 1) This ridge can be used as an orientation for the deflection unit.
- 2) Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
- 3) To clean this area, wipe only with a soft lintless cloth.
- 4) The displacement of any lug with respect to the plane through the three other lugs is max. 2 mm.
- 5) Minimum space to be reserved for mounting lug.
- 6) The position of the mounting screw in the cabinet must be within a circle of 8 mm diameter drawn around the true geometrical positions, i. e. the corners of a rectangle of 401 mm x 311 mm.
- 7) Co-ordinates for radius $R = 15,2$ mm: $x = 166,2$ mm, $y = 118,8$ mm.
- 8) Distance from point z to any hardware.
- 9) Maximum dimensions in plane of lugs.
- 10) Centring ring for the deflection unit.
- 11) The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. The bottom circumference of base will fall within a circle concentric with the tube axis and having a diameter of 55 mm.
- 12) Minimum distance between glass and rimband in plane of centre line of the apertures.

1) Absolute maximum rating system.

2) The X-ray dose rate remains below the acceptable value of 0, 5 mR/h, measured with ionization chamber when the tube is used within its limiting values.

Continued on page 9.

REMARKS

With the high voltage used with this tube (max. 27,5 kV) internal flash-overs may occur. These may destroy the cathode(s) of the tube. Therefore it is necessary to provide protective circuits, using spark gaps.

The spark gaps must be connected as follows:

No other connections between the outer conductive coating and the chassis are permissible. Additional information available on request.

During shipment and handling the tube should not be subjected to accelerations greater than 350 m/s^2 (35 g) in any direction

CONTOUR GAUGE

- 3) During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
- 4) Operation of the tube at lower voltages impairs the luminance and resolution.
- 5) 1500 μA permitted provided a current limiting circuit is used.
- 6) During an equipment warm-up period not exceeding 15 s V_{kf} is allowed to rise to 385 V. Between 15 s and 45 s after switching on a decrease in V_{kf} proportional with time from 385 V to 250 V is permissible.

BEAM CORRECTIONS

When the tube is used with the deflection unit AT1085 the following corrections should be applied:

Maximum required horizontal displacement of the electron beams with respect to the phosphor stripes by the purifying magnet of the multi-pole unit AT1081 ¹⁾ 45 μm

Static convergence deviations must be corrected by a static multi-pole unit AT1081 providing adjustable four-pole and six-pole fields centred around the tube axis

Maximum required compensation for static convergence
 4-pole device: red-to-blue (in any direction) 4,5 mm
 6-pole device: red and blue to green (in any direction) 2,3 mm

North-South raster shape correction circuitry is not required.

To obtain a symmetrical shape for the horizontal lines at the upper part and the lower part of the screen, the unit AT1081 comprises an additional dipole correction magnet giving a displacement of the beam in the centre of the screen in vertical direction of maximum ± 3,5 mm

Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction 4 mm

With respect to dynamic convergence the display system, consisting of picture tube A47-500X and deflection unit AT1085, is inherently self-converging. However, a small fixed correction of 2.6 mm ²⁾ is required on the horizontal axis and also small corrections should be made to compensate for tolerances and asymmetries in the tube and deflection unit combination.

For this purpose two types of dynamic four-pole fields can be used. One is generated by additional windings on the yoke ring of the deflection unit, and energized by adjustable currents synchronized with scanning. The other type is generated by adjustable balancing currents through the deflection coils.

Compensation to be provided by these corrections:

- horizontal red-to-blue distance at the ends of the horizontal axis in opposite directions (line symmetry) 3) 0 ± 1,5 mm
- horizontal red-to-blue distance at the ends of the vertical axis in opposite directions (field symmetry) 4) 0 ± 1,5 mm
- vertical red-to-blue distance at the ends of the horizontal axis in opposite directions (line balance) 5) 0 ± 1,0 mm
- vertical red-to-blue distance at the ends of the horizontal axis in equal directions (line balance parabola) 6) 0 ± 0,5 mm
- vertical red-to-blue distance at the top of the vertical axis (field balance top) 7) 0 ± 1,0 mm
- vertical red-to-blue distance at the bottom of the vertical axis (field balance bottom) 8) 0 ± 1,0 mm

Notes see page 11.

Notes

- 1) Purity adjustment in vertical direction is not required.
- 2) This correction is made by feeding a fixed parabolic current of line frequency through the additional four-pole windings on the deflection unit.
- 3) This correction is made by feeding a sawtooth current of line frequency through the additional four-pole windings on the deflection unit.
- 4) This correction is made by feeding a sawtooth current of field frequency through the additional four-pole windings on the deflection unit.
- 5) This correction is made by unbalancing the line deflection coil halves.
- 6) This correction is made by feeding a parabolic current of line frequency through the line deflection coil halves.
- 7) This correction is made by unbalancing the field deflection coil halves during the first half of the field scan.
- 8) This correction is made by unbalancing the field deflection coil halves during the second half of the field scan.

Application information available on request.

1) Absolute max. rating system.

2) The X-ray dose rate remains below the acceptable value of 0,5 mr/h, measured with ionization chamber when the tube is used within its limiting values.

Continued on page 9.

REMARKS

With the high voltage used with this tube (max. 27,5 kV) internal flash-overs may occur. These may destroy the cathode(s) of the tube. Therefore it is necessary to provide protective circuits, using sparks gaps. The spark gaps must be connected as follows :

No other connections between the outer conductive coating and the chassis are permissible. Additional information available on request.

During shipment and handling the tube should not be subjected to accelerations greater than 350 m/s^2 (35 g) in any direction.

CONTOUR GAUGE

- 3) During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
- 4) Operation of the tube at lower voltages impairs the luminance and resolution.
- 5) 1500 μA permitted provided a current limiting circuit is used.
- 6) During an equipment warm-up period not exceeding 15 s V_{kf} is allowed to rise to 385 V. Between 15 s and 45 s after switching on a decrease in V_{kf} proportional with time from 385 V to 250 V is permissible.

BEAM CORRECTIONS

When the tube is used with the deflection unit AT1085 the following corrections should be applied:

Maximum required horizontal displacement of the electron beams with respect to the phosphor stripes by the purifying magnet of the multi-pole unit AT1081 ¹⁾ 45 μm

Static convergence deviations must be corrected by a static multi-pole unit AT1081 providing adjustable four-pole and six-pole fields centred around the tube axis

Maximum required compensation for static convergence
 4-pole device: red to blue (in any direction) 5 mm
 6-pole device: red and blue to green (in any direction) 2,5 mm

North-South raster shape correction circuitry is not required.

To obtain a symmetrical shape for the horizontal lines at the upper part and the lower part of the screen, the unit AT1081 comprises an additional dipole correction magnet giving a displacement of the beam in the centre of the screen in vertical direction of maximum ±4 mm

Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction 4,5 mm

With respect to dynamic convergence the display system, consisting of picture tube A51-500X and deflection unit AT1085, is inherently self-converging. However, a small fixed correction of 1,3 mm ²⁾ is required on the horizontal axis and also small corrections should be made to compensate for tolerances and asymmetries in the tube and deflection unit combination (using a recommended circuit).

For this purpose two types of dynamic magnetic four-pole fields can be used. One is generated by additional windings on the yoke ring of the deflection unit, and energized by adjustable currents synchronized with scanning.

The other type is generated by adjustable balancing currents through the deflection coils.

Compensation to be provided by these corrections:

- horizontal red-to-blue distance at the ends of the horizontal axis in opposite directions (line symmetry) 3) 0 ± 1,5 mm
- horizontal red-to-blue distance at the ends of the vertical axis in opposite directions (field symmetry) 4) 0 ± 1,5 mm
- vertical red-to-blue distance at the ends of the horizontal axis in opposite directions (line balance) 5) 0 ± 1,0 mm
- vertical red-to-blue distance at the ends of the horizontal axis in equal directions (line balance parabola) 6) 0 ± 0,5 mm
- vertical red-to-blue distance at the top of the vertical axis (field balance top) 7) 0 ± 1,0 mm
- vertical red-to-blue distance at the bottom of the vertical axis (field balance bottom) 8) 0 ± 1,0 mm

Notes see page 11.

Notes

- 1) Purity adjustment in vertical direction is not required.
- 2) This correction is made by feeding a fixed parabolic current of line frequency through the additional four-pole windings on the deflection unit.
- 3) This correction is made by feeding a sawtooth current of line frequency through the additional four-pole windings on the deflection unit.
- 4) This correction is made by feeding a sawtooth current of field frequency through the additional windings on the deflection unit.
- 5) This correction is made by unbalancing the line deflection coil halves.
- 6) This correction is made by feeding a parabolic current of line frequency through the line deflection coil halves.
- 7) This correction is made by unbalancing the field deflection coil halves during the first half of the field scan.
- 8) This correction is made by unbalancing the field deflection coil halves during the second half of the field scan.

Application information available on request.

Anode contact: IEC67-III-2, J1-21

110° COLOUR TELEVISION TUBE

Obsolete type.

Replacement type A56-140X.

A circuit modification may be necessary to compensate for the 170 mA lower heater current of the A56-410X.

110° COLOUR TELEVISION PICTURE TUBE

Three-gun temperature compensated shadow-mask rectangular colour television tube with electrostatic focus, magnetic deflection and convergence, metal-backed three-colour phosphor dot screen and internal magnetic shield. A high white luminance is obtained at near unity current ratio. Being temperature compensated, the shadow-mask makes for optimum field purity and good uniformity during warm-up. The design is such that minimum occurrence of the moiré effect is ensured. The tube has a reinforced envelope and therefore no separate safety screen is necessary. The tube features a quick heating cathode; typically, a legible picture will appear within approx. 5 s.

QUICK REFERENCE DATA

CONVERGENCE magnetic

1) If the heater is supplied from a mains transformer designed for tube type A56-140X, the source impedance should not exceed 0,6 Ω to ensure that the heater voltage of the A56-410X is not exceeded.

If the heater is supplied from a line time base designed for tube type A56-140X, the series impedance, if any, should match the lower heater current of the quick-heating tube.

MECHANICAL DATA

Overall length		387,3 to 400,3	mm
Neck diameter		36,5	mm
Diagonal	} of bulb	max. 566,2	mm
Horizontal axis		max. 486,3	mm
Vertical axis		max. 381,8	mm

diagonal		min. 533	mm
horizontal axis		min. 447	mm
vertical axis		min. 337	mm

Mounting position : any

Net weight : approx. 14,5 kg

Base : 12 pin base IEC 67-I-47a, type 2

Anode contact : Small cavity contact J1-21, IEC 67-III-2

Magnetic shielding, degaussing: The tube is provided with an internal magnetic shield. The internal magnetic shield and the shadow-mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering left and right cone parts. For proper degaussing an initial m.m.f. of 450 ampere-turns is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate circuitry. After decreasing to 10 A.t. or less, sudden switch off is permissible. In the steady state, no significant m.m.f. should remain in the coils (< 0,5 A.t.). To ease the mounting of the coils, the rimband is provided with rectangular holes.

NOTES TO OUTLINE DRAWING (see pages 4, 5, and 6)

- 1) Reference line, determined by the plane of the upper edge of the flange of the reference line gauge, when the gauge is resting on the cone.
- 2) The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. Bottom circumference of base will fall within a circle concentric with the tube axis and having a diameter of 55 mm.
- 3) Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
- 4) To clean this area, wipe only with a soft lintless cloth.
- 5) The displacement of any lug with respect to the plane through the three other lugs is max. 2 mm.
- 6) Minimum space to be reserved for mounting lug.
- 7) The position of the mounting screw in the cabinet must be within a circle of 9,5 mm diameter drawn around the true geometrical positions, i.e. the corners of a rectangle of 476,5 mm x 370 mm.
- 8) Coordinates for radius $R = 15,95$ mm: $x = 203,95$ mm, $y = 145,52$ mm.
- 9) Distance from point z to any hardware.
- 10) Maximum dimensions in plane of lugs.

	max.	0,85	1,15	2,00

EQUIPMENT DESIGN VALUES (continued)

Required centring, measured at the centre of the screen in any direction	max.	11	mm
Correction that must be supplied by purifying magnet to compensate for mis-register in any direction	max.	100	μm
Lateral distance between blue spot and the converged red and green spots	max.	4,5	mm (in both directions)
Radial convergence displacement excluding effects of dynamic convergence (each gun) ⁵⁾	max.	7	mm (in both directions)

- 1) This range of V_{g2} has to be used when in circuit design fixed values for cut-off of the three guns are used.
- 2) This range of V_{g1} has to be used when in circuit design fixed values for V_{g2} of the three guns are used.
- 3) To produce black/white pictures a bluish white point would be preferable. This white point corresponds virtually with the white point of current black/white picture tubes.
- 4) This point is a compromise between white point D and the white point $x = 0,265$, $y = 0,290$ given in order to enable good rendition of colour and black and white pictures with one white point.
- 5) Dynamic convergence to be effected by currents of approximately parabolic waveshape through the convergence coils synchronized with scanning.
- 6) To produce colour pictures with the best possible quality, this white point should be used when the transmission system is based on this point. (Point D).

LIMITING VALUES (Each gun if applicable)

(Design centre rating system unless otherwise specified)

Final accelerator voltage	$V_{a, g5, g4}$	max.	27,5	kV ¹⁾²⁾³⁾
		min.	20	kV ¹⁾⁴⁾
Average current for three guns	I_a	max.	1000	μA ⁵⁾
Grid no.3 (focusing electrode) voltage	V_{g3}	max.	6000	V
Grid no.2 voltage, peak, including video signal voltage	V_{g2p}	max.	1000	V
Grid no.1 voltage,		negative	$-V_{g1}$	max. 400 V
		negative, operating cut-off	$-V_{g1}$	max. 200 V
		positive	V_{g1}	max. 0 V
		positive peak	V_{g1p}	max. 2 V
Cathode to heater voltage,		positive	V_{kf}	max. 250 V ⁶⁾
		positive peak	$V_{kf,p}$	max. 300 V
		negative	$-V_{kf}$	max. 135 V
		negative peak	$-V_{kf,p}$	max. 180 V

1) Absolute max. rating system.

2) The X-ray dose rate remains below the acceptable value of 0,5 mr/h, measured with ionization chamber when the tube is used within its limiting values.

3) For optimal operating conditions the final accelerator voltage has to be stabilized. Therefore its absolute maximum value can be approached in actual operation and for this reason this value is given instead of the design centre value. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.

4) Operation of the tube at lower voltages impairs luminance and resolution and may have a detrimental effect on colour purity.

5) 1500 μA permitted provided a current limiting circuit is used.

6) During an equipment warm-up period not exceeding 15 s V_{kf} is allowed to rise to 385V. Between 15 s and 45 s after switching on a decrease in V_{kf} proportional with time from 385 V to 250 V is permissible.

REMARKS

With the high voltage used with this tube (max. 27, 5 kV) internal flash-overs may occur. These may destroy the cathode(s) of the tube. Therefore it is necessary to provide protective circuits, using spark gaps.

The spark gaps must be connected as follows:

No other connections between the outer conductive coating and the chassis are permissible. Additional information is given in Application Information 258, available on request.

During shipment and handling the tube should not be subjected to accelerations greater than 35 g in any direction.

Cathode to heater voltage, positive	V_{kf}	max.	250	V 6)
positive peak	V_{kfp}	max.	300	V 1)
negative	$-V_{kf}$	max.	135	V
negative peak	$-V_{kfp}$	max.	180	V 1)

1) Absolute max. rating system.

2) The X-ray dose rate remains below the acceptable value of 0, 5 mR/h, measured with ionization chamber when the tube is used within its limiting values.

REMARKS

With the high voltage used with this tube (max. 27,5 kV) internal flash-overs may occur. These may destroy the cathode(s) of the tube. Therefore it is necessary to provide protective circuits, using spark gaps.

The spark gaps must be connected as follows:

No other connections between the outer conductive coating and the chassis are permissible. Additional information available on request.

During shipment and handling the tube should not be subjected to accelerations greater than 350 m/s^2 (35 g) in any direction.

CONTOUR GAUGE

- 3) During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.
- 4) Operation of the tube at lower voltages impairs the luminance and resolution.
- 5) 1500 μA permitted provided a current limiting circuit is used.
- 6) During an equipment warm-up period not exceeding 15 s V_{kf} is allowed to rise to 385 V. Between 15 s and 45 s after switching on a decrease in V_{kf} proportional with time from 385 V to 250 V is permissible.

BEAM CORRECTIONS

When the tube is used with the deflection unit AT1083/01 the following corrections should be applied:

Maximum required horizontal displacement of the electron beams with respect to the phosphor stripes by the purifying magnet of the multi-pole unit AT1081 ¹⁾	45 μ m
Static convergence deviations must be corrected by a static multi-pole unit AT1081 providing adjustable four-pole and six-pole fields centred around the tube axis	
Maximum required compensation for static convergence	
4-pole device: red-to-blue (in any direction)	5,5 mm
6-pole device: red and blue to green (in any direction)	2,8 mm

North-South raster shape correction circuitry is not required.

To obtain a symmetrical shape for the horizontal lines at the upper part and the lower part of the screen, the unit AT1081 comprises an additional dipole correction magnet giving a displacement of the beam in the centre of the screen in vertical direction of maximum ± 4,5 mm

Maximum centring error in any direction after colour purity, static convergence, and horizontal centre line correction 4,5 mm

With respect to dynamic convergence the display system, consisting of picture tube A56-500X and deflection unit AT1083/01, is inherently self-converging. However, small corrections should be made to compensate for tolerances and asymmetries in the tube and deflection unit combination.

For this purpose two types of dynamic magnetic four-pole fields can be used.

One is generated by additional windings on the yoke ring of the deflection unit, and energized by adjustable currents synchronized with scanning.

The other type is generated by adjustable balancing currents through the deflection coils.

Compensation to be provided by these corrections:

- horizontal red-to-blue distance at the ends of the horizontal axis in opposite directions (line symmetry)	2)	0 ± 1,5 mm
- horizontal red-to-blue distance at the ends of the vertical axis in opposite directions (field symmetry)	3)	0 ± 1,5 mm
- vertical red-to-blue distance at the ends of the horizontal axis in opposite directions (line balance)	4)	0 ± 1,0 mm
- vertical red-to-blue distance at the ends of the horizontal axis in equal directions (line balance parabola)	5)	0 ± 0,6 mm
- vertical red-to-blue distance at the top of the vertical axis (field balance top)	6)	0 ± 1,2 mm
- vertical red-to-blue distance at the bottom of the vertical axis (field balance bottom)	7)	0 ± 1,2 mm

Notes

- 1) Purity adjustment in vertical direction is not required.
- 2) This correction is made by feeding a sawtooth current of line frequency through the additional four-pole windings on the deflection unit.
- 3) This correction is made by feeding a sawtooth current of field frequency through the additional four-pole windings on the deflection unit.
- 4) This correction is made by unbalancing the line deflection coil halves.
- 5) This correction is made by feeding a parabolic current of line frequency through the line deflection coil halves.
- 6) This correction is made by unbalancing the field deflection coil halves during the first half of the field scan.
- 7) This correction is made by unbalancing the field deflection coil halves during the second half of the field scan.

Application information available on request.

Vertical axis }	$\leq 435,3$	mm
Useful screen diagonal	$\geq 617,8$	mm
horizontal axis	≥ 518	mm
vertical axis	≥ 390	mm

Base : 12-pin base IEC 67-I-47a, JEDEC B12-246

Anode contact: Small cavity contact IEC 67-III-2, J1-21

110° COLOUR TELEVISION TUBE

Obsolete type.

Replacement type A66-410X.

A circuit modification may be necessary to compensate for the 170 mA lower heater current of the A66-410X.

110° COLOUR TELEVISION PICTURE TUBE

Three-gun temperature-compensated shadow-mask rectangular colour television tube with electrostatic focus, magnetic deflection and convergence, metal-backed three-colour phosphor dot screen and internal magnetic shield. A high white luminance is obtained at near unity current ratio. Being temperature compensated, the shadow-mask makes for optimum field purity and good uniformity during warm-up. The design is such that minimum occurrence of the moiré effect is ensured. The tube has a reinforced envelope and therefore no separate safety screen is necessary. Typically, a legible picture will appear within 5 s.

QUICK REFERENCE DATA

TEMPERATURE-COMPENSATED SHADOW-MASK

DESIGNED FOR MINIMUM MOIRÉ EFFECT

HIGH WHITE LUMINANCE AT UNITY CURRENT RATIO

Face diagonal	66	cm
Deflection angle	110	deg
Neck diameter	36,5	mm

HEATING : indirect by a.c. or d.c. ; parallel supply

Heater voltage	V_f	6, 3	V
Heater current	I_f	730	mA ¹⁾

For maximum cathode life it is recommended that the heater supply be regulated at 6,3 V.

For heating time as a function of source impedance see graph page 13 below.

CAPACITANCES

Final accelerator to external conductive coating	$C_{a, g3, g4/m}$	max. 2100 min. 1600	pF pF
Final accelerator to metal rimband	$C_{a, g3, g4/m'}$	500	pF
Grid no.1 of any gun to all other electrodes	C_{g1}	7	pF
Cathodes of all guns (connected in parallel) to all other electrodes	C_k	15	pF
Cathode of any gun to all other electrodes	C_{kR}, C_{kG}, C_{kB}	5	pF
Grid no.3 (focusing electrode) to all other electrodes	C_{g3}	7	pF

FOCUSING electrostatic (bi-potential)

DEFLECTION magnetic

Diagonal deflection angle	110 °
Horizontal deflection angle	97 °
Vertical deflection angle	77 °

CONVERGENCE magnetic

¹⁾ If the heater is fed from a mains transformer designed for tube type A66-140X, the source impedance should not exceed 0,6 Ω to ensure that the heater voltage of the A66-410X is not exceeded.

If the heater is fed from a line time base designed for tube type A66-140X, the series impedance, if any, should match the lower heater current of the quick-heating tube.

MECHANICAL DATA

Overall length		425, 1 to 438, 1 mm
Neck diameter		36, 5 mm
Diagonal	} of bulb	max. 657, 6 mm
Horizontal axis		max. 556, 4 mm
Vertical axis		max. 435, 3 mm
Useful screen		
diagonal		min. 617, 8 mm
horizontal axis		min. 518 mm
vertical axis		min. 390 mm

Mounting position: any

Net weight : approx. 20 kg

Base : 12 pin base JEDEC B12-246

Anode contact : Small cavity contact J1-21, IEC 67-III-2

Magnetic shielding, degaussing: The tube is provided with an internal magnetic shield. The internal magnetic shield and the shadow-mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering left and right cone parts. For proper degaussing an initial m.m.f. of 500 ampere-turns is required in each of the coils. This m.m.f. has to be gradually decreased by appropriate circuitry. After decreasing to 10 A.t. or less, sudden switch off is permissible. In the steady state, no significant m.m.f. should remain in the coils (< 0,5 A.t.). To ease the mounting of the coils, the rimband is provided with rectangular holes.

NOTES TO OUTLINE DRAWING (see pages 4, 5, and 6)

- 1) Reference line, determined by the plane of the upper edge of the flange of the reference line gauge, when the gauge is resting on the cone.
- 2) The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. Bottom circumference of base will fall within a circle concentric with the tube axis and having a diameter of 55 mm.
- 3) Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
- 4) To clean this area, wipe only with a soft lintless cloth.
- 5) The displacement of any lug with respect to the plane through the three other lugs is max. 2 mm.
- 6) Minimum space to be reserved for mounting lug.
- 7) The position of the mounting screw in the cabinet must be within a circle of 9,5 mm diameter drawn around the true geometrical positions, i. e. the corners of a rectangle of 549 mm x 422 mm.
- 8) Coordinates for radius R = 18,2 mm: x = 236,6 mm, y = 168,9 mm.
- 9) Distance from point z to any hardware.
- 10) Maximum dimensions in plane of lugs.
- 11) Dimension a = 30,0 mm on diagonal, 28,4 mm on major axis, 18,8 mm on minor axis.

EQUIPMENT DESIGN VALUES (continued)

Required centring, measured at the centre of the screen in any direction	max.	12	mm
Correction that must be supplied by purifying magnet to compensate for mis-register in any direction	max.	100	μm
Lateral distance between blue spot and the converged red and green spots	max.	5	mm (in both directions)
Radial convergence displacement excluding effects of dynamic convergence (each gun) ⁵⁾	max.	8	mm (in both directions)

¹⁾ This range of V_{g2} has to be used when in circuit design fixed values for cut-off of the three guns are used.

²⁾ This range of V_{g1} has to be used when in circuit design fixed values for V_{g2} of the three guns are used.

³⁾ To produce black/white pictures a bluish white point would be preferable. This white point corresponds virtually with the white point of current black/white picture tubes.

⁴⁾ This point is a compromise between white point D and the white point $x = 0,265$ $y = 0,290$, given in order to enable good rendition of colour and black and white pictures with one white point.

⁵⁾ Dynamic convergence to be effected by currents of approximately parabolic waveshape through the convergence coils synchronized with scanning.

⁶⁾ To produce colour pictures with the best possible quality, this white point should be used when the transmission system is based on this point. (Point D).

LIMITING VALUES (Each gun if applicable)
(Design centre rating system unless otherwise specified)

Final accelerator values	$V_a, g5, g4$	max. 27,5 kV 1) 2) 3) min. 20 kV 1) 4)
Average current for three guns	I_a	max. 1000 μA 5)
Grid No. 3 (focusing electrode) voltage	V_{g3}	max. 6000 V
Grid No. 2 voltage, peak, including video signal voltage	V_{g2p}	max. 1000 V
Grid No. 1 voltage,		
negative,	$-V_{g1}$	max. 400 V
negative, operating cut-off	$-V_{g1}$	max. 200 V
positive	V_{g1}	max. 0 V
positive peak	V_{g1p}	max. 2 V
Cathode to heater voltage,		
positive	V_{kf}	max. 250 V 6)
positive peak	V_{kfp}	max. 300 V
negative	$-V_{kf}$	max. 135 V
negative peak	$-V_{kfp}$	max. 180 V

1) Absolute max. rating system.

2) The X-ray dose rate remains below the acceptable value of 0,5mr/h, measured with ionization chamber when the tube is used within its limiting values.

3) For optimal operating conditions the final accelerator voltage has to be stabilized. Therefore its absolute maximum value can be approached in actual operation and for this reason this value is given instead of the design centre value. During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.

4) Operation of the tube at lower voltages impairs brightness and resolution and may have a detrimental effect on colour purity.

5) 1500 μA permitted provided a current limiting circuit is used.

6) During an equipment warm-up period not exceeding 15 s V_{kf} is allowed to rise to 385 V. Between 15 s and 45 s after switching on a decrease in V_{kf} proportional with time from 385 V to 250 V is permissible.

REMARKS

With the high voltage used with this tube (max. 27,5 kV) internal flash-overs may occur. These may destroy the cathode(s) of the tube. Therefore it is necessary to provide protective circuits, using spark gaps.

The spark gaps must be connected as follows:

No other connections between the outer conductive coating and the chassis are permissible.

Additional information is given in Application Information 258, available on request.

During shipment and handling the tube should not be subjected to accelerations greater than 35 g in any direction.

110° IN-LINE GUN COLOUR TELEVISION TUBE

The tube has a three-in-line gun, a slotted shadow mask, and phosphors arranged in vertical stripes. The system of tube and deflection unit AT1080 is inherently self-converging; only minor corrections are needed to compensate for tolerances and asymmetries. The shadow-mask is optimized for minimum moiré. The tube features a quick-heating cathode, an internal magnetic shield, and a very short overall length.

QUICK REFERENCE DATA

Deflection angle	110	deg
Face diagonal	66	cm
Overall length	41	cm
Inherently self-converging system with deflection unit AT1080		
Quick-heating cathode	with a typical tube a picture will appear within 5 s	
Heating	6,3 V,	730 mA
Magnetic shield	internal	
Envelope	reinforced suitable for push-through	
Focusing	bi-potential	

SCREEN

Metal-backed vertical phosphor stripes Red : Europium activated rare earth
Green: Sulphide type
Blue : Sulphide type

Centre-to-centre distance of identical
colour phosphor stripes 0,8 mm

Light transmission of face glass 52,5 %

HEATING: indirect by a.c. (preferably mains or line frequency) or d.c.

Heater voltage	V_f	6,3 V
Heater current	I_f	730 mA

For maximum cathode life it is recommended that the heater supply be regulated at 6,3V.
 For heating time as a function of source impedance see graph page 14.

CAPACITANCES

Final accelerator to external conductive coating	$C_{a, g5, g4/m}$	< 2000 pF > 1500 pF
Final accelerator to metal rimband	$C_{a, g5, g4/m'}$	300 pF
Grid no. 1 of a gun to all other electrodes

MECHANICAL DATA

Overall length	405,1 to 418,1 mm
Neck diameter	36,5 ^{+1,6} _{-0,4} mm
Diagonal	≅ 664,5 mm
→ Width	≅ 564 mm
Height	≅ 442,5 mm
} of bulb	
Useful screen	
diagonal	≅ 617,8 mm
horizontal axis	≅ 518 mm
vertical axis	≅ 390 mm

Mounting position: any

Net mass : approx. 20 kg

Base : 12 pin base IEC67-I-47a, type 2

Anode contact : Small cavity contact J1-21, IEC 67-III-2

Magnetic shielding, degaussing: The tube is provided with an internal magnetic shield. The internal magnetic shield and the shadow-mask with its suspension system may be provided with an automatic degaussing system, consisting of two coils covering top and bottom cone parts. For proper degaussing an initial m. m. f. of 300 ampere-turns is required in each of the coils. This m. m. f. has to be gradually decreased by appropriate circuitry. To prevent beam landing disturbances by line-frequency currents induced in the degaussing coils, these coils should be shunted by a capacitor of sufficiently high value. In the steady state, no significant m. m. f. should remain in the coils ($\leq 0,3$ A. t.). To ease the mounting of the coils, the rimband is provided with rectangular holes.

NOTES TO OUTLINE DRAWINGS (see pages 4, 5, and 6)

- 1) This ridge can be used as an orientation for the deflection unit.
- 2) Configuration of outer conductive coating may be different, but will contain the contact area as shown in the drawing.
- 3) To clean this area, wipe only with a soft lintless cloth.
- 4) The displacement of any lug with respect to the plane through the three other lugs is max. 2 mm.
- 5) Minimum space to be reserved for mounting lug.
- 6) The position of the mounting screw in the cabinet must be within a circle of 9,5 mm diameter drawn around the true geometrical positions, i. e. the corners of a rectangle of 549 mm x 422 mm.
- 7) Co-ordinates for radius $R = 18,2$ mm: $x = 236,6$ mm, $y = 168,9$ mm.
- 8) Distance from point z to any hardware.
- 9) Maximum dimensions in plane of lugs.
- 10) Centring ring for the deflection unit.
- 11) The socket for this base should not be rigidly mounted; it should have flexible leads and be allowed to move freely. Bottom circumference of base will fall within a circle concentric with the tube axis and having a diameter of 55 mm.
- 12) Minimum distance between glass and rimband in plane of the apertures.

positive peak	V_{kfp}	max.	300 V 1)
negative	$-V_{kf}$	max.	135 V
negative peak	$-V_{kfp}$	max.	180 V 1)

1) Absolute max. rating system.

2) The X-ray dose rate remains below the acceptable value of 0, 5 mR/h measured with ionization chamber when the tube is used within its limiting values.

REMARKS

With the high voltage used with this tube (max. 27,5 kV) internal flash-overs may occur. These may destroy the cathode(s) of the tube. Therefore it is necessary to provide protective circuits, using spark gaps.

The spark gaps must be connected as follows:

No other connections between the outer conductive coating and the chassis are permissible. Additional information available on request.

During shipment and handling the tube should not be subjected to accelerations greater than 350 m/s² (35 g) in any direction.

CONTOUR GAUGE

3) During adjustment on the production line this value is likely to be surpassed considerably. It is therefore strongly recommended to first make the necessary adjustments for normal operation without picture tube.

4) Operation of the tube at lower voltages impairs the luminance and resolution.

5) 1500 µA permitted provided a current limiting circuit is used.

6) During an equipment warm-up period not exceeding 15 s V_{kf} is allowed to rise to 385 V. Between 15 s and 45 s after switching on a decrease in V_{kf} proportional with time from 385 V to 250 V is permissible.

BEAM CORRECTIONS

When the tube is used with the deflection unit AT1080 the following corrections should be applied:

Maximum required horizontal displacement of the electron beams with respect to the phosphor stripes by the purifying magnet of the multi-pole unit AT1081 1) 45 μ m

Static convergence deviations must be corrected by a static multi-pole unit AT1081 providing adjustable four-pole and six-pole fields centred around the tube axis

Maximum required compensation for static convergence
 4-pole device: red to blue (in any direction) 6 mm
 6-pole device: red and blue to green (in any direction) 3 mm

North-South raster shape correction circuitry is not required.

To obtain symmetrical shape for the horizontal lines at the upper part and the lower part of the screen, the unit AT1081 comprises an additional dipole correction magnet giving a displacement of the beam in the centre of the screen in vertical direction of maximum $\pm 5,5$ mm

Maximum centring error in any direction after colour-purity, static convergence, and horizontal centre line correction 5 mm

With respect to dynamic convergence the display system, consisting of picture tube A66-500X and deflection unit AT1080, is inherently self-converging. However, a small systematic correction is required on the vertical axis and also small corrections should be made to compensate for tolerances and asymmetries in the tube and deflection unit combination (using a recommended circuit).

For this purpose two types of dynamic magnetic four-pole fields can be used. One is generated by additional windings on the yoke ring of the deflection unit, and energized by adjustable currents synchronized with scanning. The other type is generated by adjustable balancing currents through the deflection coils.

Compensation to be provided by these corrections:

- horizontal red-to-blue distance at the ends of the horizontal axis in opposite directions (line symmetry) 2) 0 \pm 2 mm
- horizontal red-to-blue distance at the top of the vertical axis (field symmetry top) 3) 3,5 \pm 1,5 mm
- horizontal red-to-blue distance at the bottom of the vertical axis (field symmetry bottom) 3) 3,5 \pm 1,5 mm
- vertical red-to-blue distance at the ends of the horizontal axis in opposite directions (line balance) 4) 0 \pm 1,5 mm
- vertical red to blue distance at the ends of the horizontal axis in equal directions (line balance parabola) 5) 0 \pm 0,7 mm
- vertical red-to-blue distance at the top of the vertical axis (field balance top) 6) 0 \pm 1,5 mm
- vertical red-to-blue distance at the bottom of the vertical axis (field balance bottom) 7) 0 \pm 1,5 mm

Notes

- 1) Purity adjustment in vertical direction is not required.
- 2) This correction is made by feeding a sawtooth current of line frequency through the additional four-pole windings on the deflection unit.
- 3) This correction is made by feeding a rectified sawtooth current of field frequency through the additional four-pole windings on the deflection unit.
- 4) This correction is made by unbalancing the line deflection coil halves.
- 5) This correction is made by feeding a parabolic current of line frequency through the line deflection coil halves.
- 6) This correction is made by unbalancing the field deflection coil halves during the first half of the field scan.
- 7) This correction is made by unbalancing the field deflection coil halves during the second half of the field scan.

Application information available on request.

Spot cut-off design chart (cathode drive), V_{g3} adjusted for focus, $V_a, g5, g4 = 20$ to $27, 5$ kV

Spot cut-off design chart (grid drive), V_{g3} adjusted for focus, $V_a, g5, g4 = 20$ to $27, 5$ kV

Cathode heating time to attain a certain percentage of the cathode current at equilibrium conditions.

Typical cathode drive characteristics

$V_{a, g5, g4}$ = 20 kV to 27,5 kV
 V_{g3} adjusted for focus
 V_{g2} (each gun) adjusted to provide spot cut-off for desired fixed V_k

a = spot cut-off = 75 V
 b = spot cut-off = 100 V
 c = spot cut-off = 150 V
 d = spot cut-off = 200 V

---- zero bias point

7Z60077.1

Typical grid drive characteristics

$V_{a, g5, g4} = 20 \text{ kV to } 27,5 \text{ kV}$

V_{g3} adjusted for focus

V_{g2} (each gun) adjusted to provide spot cut-off for desired fixed V_{g1}

---- zero bias point

a = spot cut-off = -75 V

b = spot cut-off = -100 V

c = spot cut-off = -150 V

d = spot cut-off = -200 V

CAPACITANCES

Final accelerator to external conductive coating	$C_{a, g3, g5/m}$	< 900 pF > 450 pF
Final accelerator to metal band	$C_{a, g3, g5/m'}$	150 pF
Cathode to all	C_k	3 pF
Grid no. 1 to all	C_{g1}	7 pF

FOCUSING electrostatic

DEFLECTION magnetic

Diagonal deflection angle	110°
Horizontal deflection angle	99°
Vertical deflection angle	80°

PICTURE CENTRING MAGNET

Field intensity perpendicular to the tube axis adjustable from 0 to 800 A/m (0 to 10 Oe).
Maximum distance between centre of field of this magnet and reference line : 47 mm.

TYPICAL OPERATING CONDITIONS

Grid drive service

Final accelerator voltage	$V_{a, g3, g5}$	12 to 15	kV
Focusing electrode voltage	V_{g4}	0 to 350	V ¹⁾
Grid no. 2 voltage	V_{g2}	250	V
Grid no. 1 voltage for visual extinction of focused raster	V_{GR}	-35 to -69	V

Cathode drive service

Voltages are specified with respect to grid no. 1

Final accelerator voltage	$V_{a, g3, g5}$	12 to 15	kV
Focusing electrode voltage	V_{g4}	0 to 350	V ¹⁾
Grid no. 2 voltage	V_{g2}	250	V
Cathode voltage for visual extinction of focused raster	V_{KR}	32 to 58	V

¹⁾ Individual tubes will have optimum focus within this range. In general an acceptable picture will be obtained with a fixed focus voltage.

LIMITING VALUES (Design max. rating system)

→ Final accelerator voltage	$V_{a,g3,g5}$	max.	17 kV*)
		min.	9 kV
Grid No. 4 voltage			
positive	V_{g4}	max.	500 V
negative	$-V_{g4}$	max.	50 V
Grid No. 2 voltage	V_{g2}	max.	350 V
		min.	200 V
Grid No. 2 to grid No. 1 voltage	$V_{g2/g1}$	max.	450 V
Cathode to grid No. 1 voltage

positive	I_{g4}	max.	25 μ A
negative	$-I_{g4}$	max.	25 μ A
Grid No. 2 current			
positive	I_{g2}	max.	5 μ A
negative	$-I_{g2}$	max.	5 μ A

MAXIMUM CIRCUIT VALUES

Resistance between cathode and heater	$R_{k/f}$	max.	1 M Ω
Impedance between cathode and heater	$Z_{k/f}$ (50 Hz)	max.	0,1 M Ω
Grid No. 1 circuit resistance	R_{g1}	max.	1,5 M Ω
Grid No. 1 circuit impedance	Z_{g1} (50 Hz)	max.	0,5 M Ω

*) The X-ray dose rate remains below the acceptable value of 0,5 mR/h, measured with ionization chamber when the tube is used within its limiting values, according to IEC 65.

***) Maximum pulse duration 22% of a cycle but max. 1,5 ms.

7Z10615.1

Final accelerator voltage as a function of cathode voltage

Final accelerator voltage as a function of grid no. 1 voltage

$$\frac{\Delta V_{KR}}{\Delta V_{a, g3, g5}} = 0,3 \times 10^{-3}$$

Limits of cathode cut-off voltage as a function of grid no. 2 voltage

Cathode heating time to attain a certain percentage of the cathode current at equilibrium condition.

TV PICTURE TUBE

31 cm (12 in), 110°, rectangular direct vision picture tube with integral protection for black and white TV. The 20 mm neck diameter ensures a low deflection energy. A special feature of this tube is its short cathode heating time.

QUICK REFERENCE DATA			
Face diagonal	31	cm	(12 in)
Deflection angle	110°		
Overall length	max. 233	mm	
Neck diameter	20	mm	
Heating	11 V, 140	mA	
Grid no. 2 voltage	130	V	
Final accelerator voltage	12 to 15	kV	
Quick heating cathode	with a typical tube a legible picture will appear within 5 s.		

SCREEN

Metal-backed phosphor

Luminescence	white		
Light transmission of face glass	≈	50	%
Useful diagonal	≥	295	mm
Useful width	≥	257	mm
Useful height	≥	195	mm

HEATING

Indirect by a. c. or d. c. ; parallel supply

Heater voltage	V_f	11	V
Heater current	I_f	140	mA
Limits (Absolute max. rating system) of r. m. s. heater voltage	V_f	max.	12,7 V*)
		min.	9,3 V

For heating time as a function of source impedance see page 10.

*) This limit also applies during equipment warming-up. Use of the tube in a series heater chain is not allowed.

MECHANICAL DATA

Dimensions in mm

Notes see page 4

Mounting position : any

Net mass : approx. 2,8 kg

Base : JEDEC E7-91

The socket for this base should not be mounted rigidly, it should have flexible leads and be allowed to move freely.

NOTES TO OUTLINE DRAWINGS

1. The reference line is determined by the plane of the upper edge of the flange of the reference line gauge when the gauge is resting on the cone (Gauge G).
2. The configuration of the external conductive coating may be different, but covers the contact area shown in the drawing.
The external conductive coating must be earthed.
3. End of guaranteed contour. The maximum neck and cone contour is given by the reference line gauge G.
4. This area must be kept clean.
5. Recessed cavity contact IEC 67-III-2.
6. The displacement of any lug with respect to the plane through the three other lugs is max. 2 mm.
7. The mounting screws in the cabinet must be situated inside a circle of 7 mm diameter drawn around the true geometrical positions, i.e. at the corners of a rectangle of 267,5 mm x 204,4 mm.
8. Electrical contact between the metal band and the mounting lugs is guaranteed.
9. Distance from reference point Z to any hardware.

$$\frac{\Delta V_{KR}}{\Delta V_{a,g3,g5}} = 0,3 \times 10^{-3}$$

Limits of cathode cut-off voltage as a function of grid no. 2 voltage.

Cathode heating time to attain a certain percentage of the cathode current at equilibrium condition.

TV PICTURE TUBE

44 cm (17 in), 110°, rectangular direct vision picture tube with integral protection for black-and-white TV.

QUICK REFERENCE DATA	
Face diagonal	44 cm
Deflection angle	110°
Overall length	284,5 mm
Neck diameter	28,6 mm
Heating	6,3 V, 300 mA
Grid no. 2 voltage	400 V
Final accelerator voltage	20 kV

SCREEN

Metal-backed phosphor

Luminescence

white

Light transmission of face glass

≈ 48 %

Useful diagonal

≈ 413 mm

Useful width

≈ 346 mm

Useful height

≈ 270 mm

HEATING

Indirect by a. c. or d. c.; series or parallel supply

Heater current

I_f 300 mA

Heater voltage

V_f 6,3 V

If the tube is connected in a series heater chain the surge heater voltage must not exceed an r. m. s. value of 9,5 V when the supply is switched on.

MECHANICAL DATA

Dimensions in mm

Notes see page 5.

Dimensions in mm

Mounting position: any

Base : neo eightar 7 pin JEDEC B7-208, B8H, IEC-67-I-31a

Net mass : approx. 6 kg

The bottom circumference of the base wafer will fall within a circle concentric with the tube axis and having a diameter of 40 mm.

The socket for the base should not be rigidly mounted: it should have flexible leads and be allowed to move freely.

Notes see page 5

NOTES TO OUTLINE DRAWINGS

1. Small cavity contact IEC-67-III-2.
2. The metal rim-band must be earthed. The hole of 3 mm dia in each lug is provided for this purpose.
3. Spherical face-plate.
4. End of guaranteed contour. The maximum contour from reference line towards screen is given by the reference line gauge C (18, 13 mm).
5. The configuration of the external conductive coating may be different but contains the contact area as shown in the drawing.
The external conductive coating must be earthed.
6. This area must be kept clean.
7. Minimum space to be reserved for mounting lug.
8. The mounting screws in the cabinet must be situated inside a circle of 7,5 mm diameter drawn around the true geometrical positions i.e. at the corners of a rectangle of 363,5 mm x 288,5 mm.
9. The displacement of any lug with respect to the plane through the other three lugs is max. 2 mm.
10. Max. curvatures of the outside rim-band are nominal bulb radius + 4 mm.
11. Distance from reference point Z to any hardware.

Useful height	≈	270 mm

HEATING

Indirect by a. c. or d. c.		
Heater voltage	V_f	11 V
Heater current	I_f	140 mA
Limits (Absolute max. rating system) of r. m. s. heater voltage measured in any 20 ms		
	V_f	max. 12,7 V *)
		min. 9,3 V

For heating time as a function of source impedance see page 10.

*) This limit also applies during equipment warming-up. Use of the tube in a series heater chain is not allowed.

Notes see page 5.

Mounting position: any

Net mass: approx. 6 kg

Base: JEDEC E7-91

The socket for the base should not be mounted rigidly, it should have flexible leads and be allowed to move freely.

NOTES TO OUTLINE DRAWING

1. The reference line is determined by the plane of the upper edge of the flange of the reference line gauge when the gauge is resting on the cone (gauge G).
2. The configuration of the external conductive coating may be different, but covers the contact area shown in the drawing.
The external conductive coating must be earthed.
3. End of guaranteed contour. The maximum neck and cone contour is given by the reference line gauge G.
4. This area must be kept clean.
5. Recessed cavity contact IEC67-III 2.
6. Minimum space to be reserved for mounting lug.
7. The mounting screws in the cabinet must be situated inside a circle of 7,5 mm drawn around the true geometrical positions i. e. at the corners of a rectangle of 363,5 mm x 288,5 mm.
8. The displacement of any lug with respect to the plane through the three other lugs is max. 2 mm.
9. The metal rim-band must be earthed. The hole of 3 mm dia in each lug is provided for this purpose. Electrical contact between the metal band and mounting lugs is guaranteed.
10. Max. curvatures of the outside rim-band are: nominal bulb radius + 4 mm.
11. Distance from reference point Z to any hardware.

***) Maximum pulse duration 22% of a cycle but maximum 1,5 ms.

Final accelerator current as a function of cathode voltage

Cathode drive

$V_{a, g_3, g_5} = 20\text{ kV}$

$$\frac{\Delta V_{KR}}{\Delta V_{a, g3, g5}} = 0,75 \times 10^{-3}$$

Limits of cathode cut-off voltage as a function of grid no. 2 voltage

7Z72392

Cathode heating time to attain a certain percentage of the cathode current at equilibrium condition.

TV PICTURE TUBE

50 cm (20 in), 110°, rectangular direct vision picture tube with integral protection for black-and-white TV.

QUICK REFERENCE DATA	
Face diagonal	50 cm (20 in)
Deflection angle	110°
Overall length	312,5 mm
Neck diameter	28,6 mm
Heating	6,3 V, 300 mA
Grid no. 2 voltage	400 V
Final accelerator voltage	20 kV

SCREEN

Metal-backed phosphor

Luminescence	white
Light transmission of face glass	≈ 45 %
Useful diagonal	≈ 473 mm
Useful width	≈ 394 mm
Useful height	≈ 308 mm

HEATING

Indirect by a. c. or d. c. ; series or parallel supply

Heater current	I_f	300	mA
Heater voltage	V_f	6,3	V

If the tube is connected in a series heater chain the surge heater voltage must not exceed an r. m. s. value of 9,5 V when the supply is switched on.

MECHANICAL DATA

Dimensions in mm

Notes see page 5

Mounting position: any

Base : neo eightar 7 pin JEDEC B7-208, B8H, IEC67-1-31a

Net mass : approx. 8,5 kg

The bottom circumference of the base wafer will fall within a circle concentric with the tube axis and having a diameter of 40 mm.

The socket for the base should not be rigidly mounted: it should have flexible leads and be allowed to move freely.

Notes see page 5

NOTES TO OUTLINE DRAWINGS

1. Small cavity contact IEC67-III-2.
2. The metal rim-band must be earthed. The holes of 3 mm dia in each lug are provided for this purpose.
3. Spherical face-plate.
4. End of guaranteed contour. The maximum neck-and-cone contour is given by the reference line gauge C (18, 13 mm).
5. The configuration of the external conductive coating may be different but contains the contact area as shown in the drawing.
The external conductive coating must be earthed.
6. This area must be kept clean.
7. Minimum space to be reserved for mounting lug.
8. The mounting screws in the cabinet must be situated inside a circle of 8 mm diameter drawn around the true geometrical position i. e. at the corners of a rectangle of 414 mm x 331 mm.
9. The displacement of any lug with respect to the plane through the other three lugs is max. 2 mm.
10. Max. curvatures of the outside rim-band are: nominal bulb radius +4 mm.
11. Distance from reference point Z to any hardware.

CAPACITANCES

Final accelerator to external conductive coating	$C_{a, g3, g5/m}$	< 2500 pF > 1500 pF	
Final accelerator to metal band	$C_{a, g3, g5/m'}$	350 pF	←
Cathode to all	C_k	5 pF	
Grid no. 1 to all	C_{g1}	7 pF	

FOCUSING electrostatic

DEFLECTION magnetic

Diagonal deflection angle	110°
Horizontal deflection angle	98°
Vertical deflection angle	81°

PICTURE CENTRING MAGNET

Field intensity perpendicular to the tube axis adjustable from 0 to 800 A/m (0 to 10 Oe).
Maximum distance between centre of field of this magnet and reference line: 57 mm.

TYPICAL OPERATING CONDITIONS

Grid drive service

Final accelerator voltage	$V_{a, g3, g5}$	20 kV
Focusing electrode voltage	V_{g4}	0 to 400 V*)
Grid no. 2 voltage	V_{g2}	400 V
Grid no. 1 voltage for visual extinction of focused raster	V_{GR}	-40 to -77 V

Cathode drive service

Voltages are specified with respect to grid no. 1

Final accelerator voltage	$V_{a, g3, g5}$	20 kV
Focusing electrode voltage	V_{g4}	0 to 400 V*)
Grid no. 2 voltage	V_{g2}	400 V
Cathode voltage for visual extinction of focused raster	V_{KR}	36 to 66 V

*) Individual tubes will have optimum focus within this range. In general an acceptable picture will be obtained with a fixed focus voltage.

LIMITING VALUES (Design max. rating system)

→ Final accelerator voltage at $I_a, g_3, g_5 = 0$	V_a, g_3, g_5	max.	23 kV*)
		min.	12 kV
Grid no. 4 voltage,			
positive	V_{g4}	max.	1000 V
negative	$-V_{g4}$	max.	500 V
Grid no. 2 voltage	V_{g2}	max.	700 V****)
		min.	350 V
Grid no. 2 to grid no. 1 voltage	$V_{g2/g1}$	max.	850 V
Grid no. 1 voltage			
positive	V_{g1}	max.	0 V
positive peak	V_{g1p}	max.	2 V
negative	$-V_{g1}$	max.	200 V
negative peak	$-V_{g1p}$	max.	400 V**)
Cathode-to-heater voltage,			
positive	$V_{k/f}$	max.	250 V
positive peak	$V_{k/fp}$	max.	300 V
negative	$-V_{k/f}$	max.	200 V
positive during equipment warm-up period not exceeding 15 s	$V_{k/f}$	max.	450 V****)

*) The X-ray dose rate remains below the acceptable value of 0,5 mR/h, measured with ionization chamber when the tube is used within its limiting values, according to IEC 65.

***) Maximum pulse duration 22% of a cycle but maximum 1,5 ms.

****) At $V_{g1/k} = 0$ V.

*****) Between 15 s and 45 s after switching on a decrease in k/f voltage from 450 V to 250 V, linearly proportional with time, is permissible.

CIRCUIT DESIGN VALUES

Grid no. 4 current,

positive	I_{g4}	max.	25	μA
negative	$-I_{g4}$	max.	25	μA

Grid no. 2 current

positive	I_{g2}	max.	5	μA
negative	$-I_{g2}$	max.	5	μA

MAXIMUM CIRCUIT VALUES

Resistance between cathode and heater	$R_{k/f}$	max.	1	$M\Omega$
Impedance between cathode and heater	$Z_{k/f}(50 \text{ Hz})$	max.	0,1	$M\Omega$
Grid no. 1 circuit resistance	R_{g1}	max.	1,5	$M\Omega$
Grid no. 1 circuit impedance	$Z_{g1}(50 \text{ Hz})$	max.	0,5	$M\Omega$

Final accelerator current as a function of grid no. 1 voltage.

Final accelerator current as a function of cathode voltage.

$$\frac{\Delta V_{GR}}{\Delta V_{a,g3,g5}} = 0,15 \times 10^{-3}$$

Limits of grid no. 1 cut-off voltage as a function of grid no. 2 voltage.

$$\frac{\Delta V_{KR}}{\Delta V_{a, g3, g5}} = 0,15 \times 10^{-3}$$

Limits of cathode cut-off voltage as a function of grid no. 2 voltage.

TV PICTURE TUBE

61 cm (24 in), 110°, rectangular direct vision picture tube with integral protection for black and white TV. A special feature of this tube is its short cathode heating time.

QUICK REFERENCE DATA	
Face diagonal	61 cm
Deflection angle	110°
Overall length	max. 370 mm
Neck diameter	28,6 mm
Heating	6,3 V, 240 mA
Grid no. 2 voltage	130 V
Final accelerator voltage	20 kV
Quick heating cathode	with a typical tube a legible picture will appear within 5 s.

SCREEN

Metal-backed phosphor

Luminescence		white
Light transmission of face glass	≈	42 %
Useful diagonal	≥	577,5 mm
Useful width	≥	481 mm
Useful height	≥	375 mm

HEATING

Indirect by a. c. or d. c. .

Heater voltage	V_f	6,3 V
Heater current	I_f	240 mA
Limits (Absolute max. rating system) of r. m. s. heater voltage measured in any 20 ms	V_f	max. 7,3 V *) min. 5,3 V

For heating time as a function of source impedance see page 11.

*) This limit also applies during equipment warming-up. Use of the tube in a series heater chain is not allowed.

MECHANICAL DATA

Dimensions in mm

MECHANICAL DATA (continued)

Dimensions in mm

For notes see page 5

Mounting position : any

Base : neo eightar 7 pin JEDEC B7-208, B8H, IEC-67-I-31a

Net mass : approx. 13,5 kg

The bottom circumference of the base wafer will fall within a circle concentric with the tube axis and having a diameter of 40 mm.

The socket for the base should not be rigidly mounted: it should have flexible leads and be allowed to move freely.

NOTES TO OUTLINE DRAWINGS

1. Small cavity contact IEC 67-III-2.
2. The metal rim-band must be earthed. The holes of 3 mm dia in each lug are provided for this purpose.
3. Spherical face plate.
4. End of guaranteed contour. The maximum contour from reference line towards screen is given by the reference line gauge C (18, 13 mm).
5. The configuration of the external conductive coating may be different but contains the contact area as shown in the drawing.
The external conductive coating must be earthed.
6. This area must be kept clean.
7. Minimum space to be reserved for mounting lug.
8. The mounting screws in the cabinet must be situated inside a circle of 8 mm diameter drawn around the true geometrical position; i.e. at the corners of a rectangle of 496 x 392 mm.
9. The displacement of any lug with respect to the plane through the other three lugs is max. 2 mm.
10. The max. outer contour of the tube with the rim-band is determined by adding 5 mm to the nominal bulb dimensions.
11. Distance from reference point Z to any hardware.

MAXIMUM CONE CONTOUR DRAWING

FOCUSING electrostatic

DEFLECTION magnetic

Diagonal deflection angle	110°
Horizontal deflection angle	98°
Vertical deflection angle	81°

PICTURE CENTRING MAGNET

Field intensity perpendicular to the tube axis adjustable from 0 to 800 A/m (0 to 10 Oe).
Maximum distance between centre of field of this magnet and reference line: 57 mm.

TYPICAL OPERATING CONDITIONS

Cathode drive service

Voltages are specified with respect to grid no. 1

Final accelerator voltage	$V_{a, g3, g5}$	20 kV
Focusing electrode voltage	V_{g4}	0 to 130 V ¹⁾
Grid no. 2 voltage	V_{g2}	130 V
Cathode voltage for visual extinction of focused raster	V_{KR}	42 to 62 V

¹⁾ Because of the flat focus characteristic it is sufficient to choose a focusing voltage between 0 and 130 V (e.g. two taps, 0 V and 130 V).
The optimum focus voltage of individual tubes may vary between -100 V and +200 V.

LIMITING VALUES (Design max. rating system)

→ Final accelerator voltage at $I_{a, g3, g5} = 0$	$V_{a, g3, g5}$	max. min.	23 kV*) 12 kV
Grid no. 4 voltage, positive	V_{g4}	max.	1000 V
negative	$-V_{g4}$	max.	500 V
Grid no. 2 voltage	V_{g2}	max. min.	200 V**) 80 V
Cathode to grid no. 1 voltage positive	$V_{k/g1}$	max.	200 V
positive peak	$V_{k/g1p}$	max.	400 V***)
negative	$-V_{k/g1}$	max.	0 V
negative peak	$-V_{k/g1p}$	max.	2 V
Cathode-to-heater voltage	V_{kf}	max.	200 V

CIRCUIT DESIGN VALUES

Grid no. 4 current positive	I_{g4}	max.	25 μ A
negative	$-I_{g4}$	max.	25 μ A
Grid no. 2 current positive	I_{g2}	max.	5 μ A
negative	$-I_{g2}$	max.	5 μ A

MAXIMUM CIRCUIT VALUES

Resistance between cathode and heater	$R_{k/f}$	max.	1 M Ω
Impedance between cathode and heater	$Z_{k/f}$ (50 Hz)	max.	0,1 M Ω
Grid no. 1 circuit resistance	R_{g1}	max.	1,5 M Ω
Grid no. 1 circuit impedance	Z_{g1} (50 Hz)	max.	0,5 M Ω

*) The X-ray dose rate remains below the acceptable value of 0,5 mR/h, measured with ionization chamber when the tube is used within its limiting values, according to IEC 65.

***) At $V_{k/g1} = 0$ V.

****) Maximum pulse duration 22% of a cycle but maximum 1,5 ms.

Final accelerator current as a function of cathode voltage.

Cathode drive

$V_{a,g3,g5} = 20$ kV

$$\frac{\Delta V_{KR}}{\Delta V_{a,g3,g5}} = 0,75 \times 10^{-3}$$

Limits of cathode cut-off voltage as a function of grid no. 2 voltage.

Cathode heating time to attain a certain percentage of the cathode current at equilibrium condition.
