DEVICE DATA

# DATA HANDBOOK SYSTEM

Our Data Handbook System is a comprehensive source of information on electronic components, sub-assemblies and materials; it is made up of four series of handbooks each comprising several parts.

| | |
|---|---|
| ELECTRON TUBES | BLUE |
| SEMICONDUCTORS | RED |
| INTEGRATED CIRCUITS | PURPLE |
| COMPONENTS AND MATERIALS | GREEN |

The several parts contain all pertinent data available at the time of publication, and each is revised and reissued periodically.

Where ratings or specifications differ from those published in the preceding edition they are pointed out by arrows. Where application information is given it is advisory and does not form part of the product specification.

If you need confirmation that the published data about any of our products are the latest available, please contact our representative. He is at your service and will be glad to answer your inquiries.

May 1980

# ELECTRON TUBES (BLUE SERIES)

The blue series of data handbooks is comprised of the following parts:

**T1** **Tubes for r.f. heating**

**T2** **Transmitting tubes for communications**

**T3** **Klystrons, travelling-wave tubes, microwave diodes**

**ET3** **Special Quality tubes, miscellaneous devices** (will not be reprinted)

**T4** **Magnetrons**

**T5** **Cathode-ray tubes**
Instrument tubes, monitor and display tubes, C.R. tubes for special applications

**T6** **Geiger-Müller tubes**

**T7** **Gas-filled tubes**
Segment indicator tubes, indicator tubes, dry reed contact units, thyratrons, industrial rectifying tubes, ignitrons, high-voltage rectifying tubes, associated accessories

**T8** **Picture tubes and components**
Colour TV picture tubes, black and white TV picture tubes, colour monitor tubes for data graphic display, monochrome monitor tubes for data graphic display, components for colour television, components for black and white television and monochrome data graphic display

**T9** **Photo and electron multipliers**
Photomultiplier tubes, phototubes, single channel electron multipliers, channel electron multiplier plates

**T10** **Camera tubes and accessories, image intensifiers**

**T11** **Microwave components and assemblies**

January 1982

# SEMICONDUCTORS (RED SERIES)

The red series of data handbooks is comprised of the following parts:

**S1** **Diodes**
Small-signal germanium diodes, small-signal silicon diodes, voltage regulator diodes(< 1,5 W), voltage reference diodes, tuner diodes, rectifier diodes

**S2** **Power diodes, thyristors, triacs**
Rectifier diodes, voltage regulator diodes (> 1,5 W), rectifier stacks, thyristors, triacs

**S3** **Small-signal transistors**

**S4** **Low-frequency power transistors and hybrid IC modules**

**S5** **Field-effect transistors**

**S6** **R.F. power transistors and modules**

**S7** **Microminiature semiconductors for hybrid circuits**

**S8** **Devices for optoelectronics**
Photosensitive diodes and transistors, light-emitting diodes, displays, photocouplers, infrared sensitive devices, photoconductive devices.

**S9** Taken into handbook T11 of the blue series

**S10** **Wideband transistors and wideband hybrid IC modules**

January 1982

# INTEGRATED CIRCUITS (PURPLE SERIES)

The purple series of data handbooks is comprised of the following parts:

IC1 **Bipolar ICs for radio and audio equipment**

IC2 **Bipolar ICs for video equipment**

IC3 **ICs for digital systems in radio, audio and video equipment**

IC4 **Digital integrated circuits**
LOCMOS HE4000B family

IC5 **Digital integrated circuits — ECL**
ECL10 000 (GX family), ECL100 000 (HX family), dedicated designs

IC6* **Professional analogue integrated circuits**

IC7 **Signetics bipolar memories**

IC8 **Signetics analogue circuits**

IC9 **Signetics TTL logic**

* This handbook will be available later this year.

# COMPONENTS AND MATERIALS (GREEN SERIES)

The green series of data handbooks is comprised of the following parts:

C1 **Assemblies for industrial use**
PLC modules, PC20 modules, HNIL FZ/30 series, NORbits 60-, 61-, 90-series, input devices, hybrid ICs, peripheral devices

C2 **Television tuners, video modulators, surface acoustic wave filters**

C3 **Loudspeakers**

C4 **Ferroxcube potcores, square cores and cross cores**

C5 **Ferroxcube for power, audio/video and accelerators**

C6 **Electric motors and accessories**
Permanent magnet synchronous motors, stepping motors, direct current motors

C7 **Variable capacitors**

C8 **Variable mains transformers**

C9 **Piezoelectric quartz devices**
Quartz crystal units, temperature compensated crystal oscillators, compact integrated oscillators, quartz crystal cuts for temperature measurements

C10 **Connectors**

C11 **Non-linear resistors**
Voltage dependent resistors (VDR), light dependent resistors (LDR), negative temperature coefficient thermistors (NTC), positive temperature coefficient thermistors (PTC)

C12 **Variable resistors and test switches**

C13 **Fixed resistors**

C14 **Electrolytic and solid capacitors**

C15 **Film capacitors, ceramic capacitors**

C16 **Piezoelectric ceramics, permanent magnet materials**

December 1982

# SELECTION GUIDE BY FUNCTION

| type number | description | package code | pins |
|---|---|---|---|
| **Vision i.f. circuits** | | | |
| *Economical circuits* | | | |
| TDA2540 | i.f. amplifier and demodulator; n-p-n tuners | SOT-38 | 16 |
| TDA2540Q | i.f. amplifier and demodulator; n-p-n tuners | SOT-58 | 16 |
| TDA2541 | i.f. amplifier and demodulator; p-n-p tuners | SOT-38 | 16 |
| TDA2541Q | i.f. amplifier and demodulator; p-n-p tuners | SOT-58 | 16 |
| TDA2542 | i.f. amplifier and demodulator; for E and L standards; p-n-p tuners | SOT-38 | 16 |
| TDA2542Q | i.f. amplifier and demodulator; for E and L standards; p-n-p tuners | SOT-58 | 16 |
| TDA2544 | i.f. amplifier and demodulator; MOS tuners | SOT-38 | 16 |
| TDA2544Q | i.f. amplifier and demodulator; MOS tuners | SOT-58 | 16 |
| TDA2548 | i.f. amplifier and demodulator; p-n-p tuners | SOT-38 | 16 |
| TDA2548Q | i.f. amplifier and demodulator; p-n-p tuners | SOT-58 | 16 |
| TDA2549 | i.f. amplifier and demodulator; for multistandard TV receivers | – | – |
| *High-performance circuits* | | | |
| TDA3540 | i.f. amplifier and demodulator; n-p-n tuners | SOT-38 | 16 |
| TDA3540Q | i.f. amplifier and demodulator; n-p-n tuners | SOT-58 | 16 |
| TDA3541 | i.f. amplifier and demodulator; p-n-p tuners | SOT-38 | 16 |
| TDA3541Q | i.f. amplifier and demodulator; p-n-p tuners | SOT-58 | 16 |
| **Colour decoding circuits** | | | |
| TBA540 | reference combination | SOT-38 | 16 |
| TBA540Q | reference combination | SOT-58 | 16 |
| TCA640 | chrominance amplifier for SECAM or PAL/SECAM decoders | SOT-38 | 16 |
| TCA650 | chrominance demodulator for SECAM or PAL/SECAM decoders | SOT-38 | 16 |
| TCA660B | contrast, saturation and brightness control circuit for colour difference and luminance signals | SOT-38 | 16 |
| TDA2510 | chrominance combination | SOT-38 | 16 |
| TDA2510Q | chrominance combination | SOT-58 | 16 |
| TDA2520 | colour demodulator combination | SOT-38 | 16 |
| TDA2520Q | colour demodulator combination | SOT-58 | 16 |
| TDA2522 | colour demodulator combination | SOT-38 | 16 |

## SELECTION GUIDE BY FUNCTION (continued)

| type number | description | package code | pins |
|---|---|---|---|
| **Colour decoding circuits** (continued) | | | |
| TDA2522Q | colour demodulator combination | SOT-58 | 16 |
| TDA2523 | colour demodulator combination | SOT-38 | 16 |
| TDA2523Q | colour demodulator combination | SOT-58 | 16 |
| TDA2524 | colour demodulator combination | SOT-38 | 16 |
| TDA2525 | colour demodulator combination | SOT-38 | 16 |
| TDA2530 | RGB matrix preamplifier | SOT-38 | 16 |
| TDA2530Q | RGB matrix preamplifier | SOT-58 | 16 |
| TDA2532 | RGB matrix preamplifier | SOT-38 | 16 |
| TDA2532Q | RGB matrix preamplifier | SOT-58 | 16 |
| TDA2560 | luminance and chrominance control combination | SOT-38 | 16 |
| TDA2560Q | luminance and chrominance control combination | SOT-58 | 16 |
| TDA3500 | video control combination | SOT-117 | 28 |
| TDA3501 | video control combination | SOT-117 | 28 |
| TDA3505 | video control combination with automatic cut-off control | SOT-117 | 28 |
| TDA3510 | PAL decoder | SOT-101A | 24 |
| TDA3520 | SECAM decoder | SOT-117 | 28 |
| TDA3560 | PAL decoder | SOT-117 | 28 |
| TDA3561A | PAL decoder | SOT-117 | 28 |
| TDA3562A | PAL/NTSC decoder | SOT-117 | 28 |
| TDA3563 | NTSC decoder | SOT-117 | 28 |
| TDA3570 | NTSC decoder | – | 28 |
| TDA3590 | SECAM processor circuit | SOT-101B | 24 |
| TDA3590A | SECAM processor circuit (improved TDA3590) | SOT-101B | 24 |
| TDA3591 | SECAM processor circuit | SOT-101B | 24 |
| **Vertical deflection circuits** | | | |
| TDA2652 | vertical deflection circuit; 20AX; 30AX | SOT-69C | 16 |
| TDA2653 | vertical deflection circuit; PIL-S4; 30AX | SOT-69C | 16 |
| TDA2653A | vertical deflection circuit; PIL-S4; 30AX | SOT-141B | 13 |
| TDA2654 | vertical deflection circuit; monochrome, 110°; tiny-vision colour, 90° | SOT-110B | 9 |
| TDA2655A | vertical deflection circuit; colour, 90° | SOT-150 | 12 |
| TDA2655B | vertical deflection circuit; colour and monochrome, 90° | SOT-150 | 12 |
| TDA3650 | vertical deflection circuit | SOT-141B | 13 |
| TDA3651 | vertical deflection circuit | SOT-110B | 9 |
| TDA3651A | vertical deflection circuit | SOT-131B | 9 |
| TDA3651AQ | vertical deflection circuit | SOT-157B | 9 |
| TDA3652 | vertical deflection circuit | SOT-131B | 9 |
| TDA3652Q | vertical deflection circuit | SOT-157B | 9 |

| type number | description | package code | pins |
|---|---|---|---|
| **Sync processors; horizontal; vertical** | | | |
| TBA720A | horizontal oscillator circuit | SOT-38 | 16 |
| TBA720AQ | horizontal oscillator circuit | SOT-58 | 16 |
| TBA890 | signal processing circuit | SOT-38 | 16 |
| TBA890Q | signal processing circuit | SOT-58 | 16 |
| TBA920 | horizontal combination | SOT-38 | 16 |
| TBA920Q | horizontal combination | SOT-58 | 16 |
| TBA920S | horizontal combination | SOT-38 | 16 |
| TDA2571A | horizontal synchronization and vertical 625 divider system | SOT-38 | 16 |
| TDA2571AQ | horizontal synchronization and vertical 625 divider system | SOT-58 | 16 |
| TDA2575A | horizontal synchronization and vertical 625 divider system | SOT-38 | 16 |
| TDA2575AQ | horizontal synchronization and vertical 625 divider system | SOT-58 | 16 |
| TDA2576A | horizontal oscillator combination with vertical 625 divider system | SOT-38 | 16 |
| TDA2577A | synchronization circuit with vertical oscillator and driver stages | SOT-102HE | 18 |
| TDA2578A | synchronization circuit with vertical oscillator and driver stages | SOT-102HE | 18 |
| TDA2593 | horizontal combination | SOT-38 | 16 |
| TDA2594 | horizontal combination with transmitter identification | SOT-102DS | 18 |
| TDA2595 | horizontal combination with transmitter identification and protection circuits | SOT-102CS | 18 |
| TDA3571B | sync combination with transmitter identification and vertical 625 divider system | SOT-102A | 18 |
| TDA3576B | sync combination with transmitter identification and vertical 625 divider system | SOT-102HE4 | 18 |
| **Sound circuits** | | | |
| TBA120U | sound i.f. amplifier/demodulator for TV | VO-36 | 14 |
| TBA750C | limiter/amplifier | SOT-38 | 16 |
| TBA750CQ | limiter/amplifier | SOT-58 | 16 |
| TDA1028 | signal sources switch (2 x four channels) | SOT-38 | 16 |
| TDA1029 | signal sources switch (4 x two channels) | SOT-38 | 16 |
| TDA1512 | 12 to 20 W hi-fi audio power amplifier | SOT-131B | 9 |
| TDA1512Q | 12 to 20 W hi-fi audio power amplifier | SOT-157B | 9 |
| TDA1520 | 20 W hi-fi audio power amplifier | SOT-131A | 9 |
| TDA1524 | stereo-tone volume control circuit | SOT-102CS | 18 |
| TDA2543 | AM sound i.f. circuit for French standard | SOT-102CS | 18 |
| TDA2545 | quasi-split-sound circuit | SOT-38 | 16 |
| TDA2546 | quasi-split-sound circuit with 5,5 MHz demodulation | SOT-102CS | 18 |
| TDA2611A | 5 W audio power amplifier | SOT-110B | 9 |
| TDA2791 | TV sound combination; volume, treble, bass | SOT-38 | 16 |
| TDA2795 | TV stereo/dual sound identification decoder | SOT-102DS | 18 |
| TDA3800 | stereo/dual TV sound processing circuit | SOT-117 | 28 |

SELECTION GUIDE BY FUNCTION (continued)

| type number | description | package code | pins |
|---|---|---|---|
| **Video recorder circuits** | | | |
| TDA2721 | colour sub-carrier oscillator and mixer (video recorders) | SOT-38 | 16 |
| TDA2730 | FM limiter/demodulator (video recorders) | SOT-38 | 16 |
| TDA2740 | amplifier and drop-out identification circuit (video recorders) | SOT-38 | 16 |
| TDA3700A | PAL synchronization processor (video recorders) | SOT-117 | 28 |
| TDA3710 | chrominance signal/mixer (video recorders) | SOT-117 | 28 |
| TDA3771 | video processor (video recorders) | SOT-102CS | 18 |
| TDA3780 | frequency modulator (video recorders) | SOT-102CS | 18 |
| **Miscellaneous** | | | |
| SAA5030 | videotex/video processor | SOT-101A | 24 |
| TDA0820T | double balanced modulator/demodulator | SOT-108A (SO-14) | 14 |
| TDA2581 | control circuit for SMPS | SOT-38 | 16 |
| TDA2581Q | control circuit for SMPS | SOT-58 | 16 |
| TDA2582 | control circuit for PPS | SOT-38 | 16 |
| TDA2582Q | control circuit for PPS | SOT-58 | 16 |
| TDA2640 | SMPS drive circuit | SOT-38 | 16 |
| TDA2640Q | SMPS drive circuit | SOT-58 | 16 |
| TDA3047 | infrared receiver | – | – |
| TDA3048 | infrared receiver | – | – |
| TDA4500 | small signal combination IC for monochrome TV | SOT-117 | 28 |
| TEA1002 | PAL colour encoder and video summer | SOT-102CS | 18 |

# NUMERICAL INDEX

| type number | description | package code | pins |

# PRO ELECTRON TYPE DESIGNATION CODE FOR INTEGRATED CIRCUITS

This type nomenclature applies to semiconductor monolithic, semiconductor multi-chip, thin-film, thick-film and hybrid integrated circuits.

A basic number consists of:

*THREE LETTERS FOLLOWED BY A SERIAL NUMBER*

**FIRST AND SECOND LETTER**

1. DIGITAL FAMILY CIRCUITS

   The FIRST TWO LETTERS identify the FAMILY (see note 1).

2. SOLITARY CIRCUITS

   The FIRST LETTER divides the solitary circuits into:

   S : Solitary digital circuits
   T : Analogue circuits
   U : Mixed analogue/digital circuits

   The SECOND LETTER is a serial letter without any further significance except 'H' which stands for hybrid circuits.

3. MICROPROCESSORS

   The FIRST TWO LETTERS identify microprocessors and correlated circuits as follows:

   MA : { Microcomputer / Central processing unit
   MB : Slice processor (see note 2)
   MD : Correlated memories
   ME : Other correlated circuits (interface, clock, peripheral controller, etc.)

4. CHARGE-TRANSFER DEVICES AND SWITCHED CAPACITORS

   The FIRST TWO LETTERS identify the following:

   NH : Hybrid circuits
   NL : Logic circuits
   NM : Memories
   NS : Analogue signal processing, using switched capacitors
   NT : Analogue signal processing, using CTDs
   NX : Imaging devices
   NY : Other correlated circuits

**Notes**

1. A logic family is an assembly of digital circuits designed to be interconnected and defined by its basic electrical characteristics (such as: supply voltage, power consumption, propagation delay, noise immunity).
2. By 'slice processor' is meant: a functional slice of microprocessor.

### THIRD LETTER

It indicates the operating ambient temperature range.
The letters A to G give information about the temperature:

A : temperature range not specified
B : 0 to + 70 °C
C : −55 to + 125 °C
D : −25 to + 70 °C
E : −25 to + 85 °C
F : −40 to + 85 °C
G : −55 to + 85 °C

If a circuit is published for another temperature range, the letter indicating a narrower temperature range may be used or the letter 'A'.

Example: the range 0 to + 75 °C can be indicated by 'B' or 'A'.

### SERIAL NUMBER

This may be either a 4-digit number assigned by Pro Electron, or the serial number (which may be a combination of figures and letters) of an existing company type designation of the manufacturer.

To the basic type number may be added:

*A VERSION LETTER*

Indicates a minor variant of the basic type or the package. Except for 'Z', which means customized wiring, the letter has no fixed meaning. The following letters are recommended for package variants:

C : for cylindrical
D : for ceramic DIL
F : for flat pack
L : for chip on tape
P : for plastic DIL
Q : for QIL
T : for miniature plastic (mini-pack)
U : for uncased chip

Alternatively a TWO LETTER SUFFIX may be used instead of a single package version letter, if the manufacturer (sponsor) wishes to give more information.

*FIRST LETTER*: General shape

C : Cylindrical
D : Dual-in-line (DIL)
E : Power DIL (with external heatsink)
F : Flat (leads on 2 sides)
G : Flat (leads on 4 sides)
K : Diamond (TO-3 family)
M : Multiple-in-line (except Dual-, Triple-, Quadruple-in-line)
Q : Quadruple-in-line (QIL)
R : Power QIL (with external heatsink)
S : Single-in-line
T : Triple-in-line

*SECOND LETTER*: Material

C : Metal-ceramic
G : Glass-ceramic (cerdip)
M : Metal
P : Plastic

A hyphen precedes the suffix to avoid confusion with a version letter.

# RATING SYSTEMS

The rating systems described are those recommended by the International Electrotechnical Commission (IEC) in its Publication 134.

## DEFINITIONS OF TERMS USED

*Electronic device.* An electronic tube or valve, transistor or other semiconductor device.

Note
This definition excludes inductors, capacitors, resistors and similar components.

*Characteristic.* A characteristic is an inherent and measurable property of a device. Such a property may be electrical, mechanical, thermal, hydraulic, electro-magnetic, or nuclear, and can be expressed as a value for stated or recognized conditions. A characteristic may also be a set of related values, usually shown in graphical form.

*Bogey electronic device.* An electronic device whose characteristics have the published nominal values for the type. A bogey electronic device for any particular application can be obtained by considering only those characteristics which are directly related to the application.

*Rating.* A value which establishes either a limiting capability or a limiting condition for an electronic device. It is determined for specified values of environment and operation, and may be stated in any suitable terms.

Note
Limiting conditions may be either maxima or minima.

*Rating system.* The set of principles upon which ratings are established and which determine their interpretation.

Note
The rating system indicates the division of responsibility between the device manufacturer and the circuit designer, with the object of ensuring that the working conditions do not exceed the ratings.

## ABSOLUTE MAXIMUM RATING SYSTEM

Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, which should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.

The equipment manufacturer should design so that, initially and throughout life, no absolute maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply voltage variation, equipment component variation, equipment control adjustment, load variations, signal variation, environmental conditions, and variations in characteristics of the device under consideration and of all other electronic devices in the equipment.

## DESIGN MAXIMUM RATING SYSTEM

Design maximum ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking responsibility for the effects of changes in operating conditions due to variations in the characteristics of the electronic device under consideration.

The equipment manufacturer should design so that, initially and throughout life, no design maximum value for the intended service is exceeded with a bogey device under the worst probable operating conditions with respect to supply voltage variation, equipment component variation, variation in characteristics of all other devices in the equipment, equipment control adjustment, load variation, signal variation and environmental conditions.

## DESIGN CENTRE RATING SYSTEM

Design centre ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device of a specified type as defined by its published data, and should not be exceeded under normal conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device in average applications, taking responsibility for normal changes in operating conditions due to rated supply voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations in the characteristics of all electronic devices.

The equipment manufacturer should design so that, initially, no design centre value for the intended service is exceeded with a bogey electronic device in equipment operating at the stated normal supply voltage.

# PACKAGE OUTLINES

# PACKAGE OUTLINES

In this chapter the package outlines are given for the following types, except for those marked with an asterisk which are included in the device data sheet.

| type number | package code | description |
|---|---|---|
| SAA5030 | SOT-101A | 24-lead dual in-line; plastic with internal heat spreader (SOT-101A) |
| TBA120U | VO-36 | 14-lead dual in-line; plastic (VO-36) |
| TBA540 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TBA540Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TBA720A | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TBA720AQ | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TBA750C | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TBA750CQ | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TBA890 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TBA890Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TBA920 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TBA920Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TBA920S | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TCA640 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TCA650 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TCA660B | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA0820T | SOT-108A | 14-lead mini-pack; plastic (SO-14; SOT-108A) |
| TDA1028 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA1029 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA1512 | SOT-131B | 9-lead single in-line; plastic power (SOT-131A, B) |
| TDA1512Q | SOT-157B | 9-lead single in-line; plastic power (SOT-157B) |
| TDA1520 | SOT-131A | 9-lead single in-line; plastic power (SOT-131A, B) |
| TDA1524 | SOT-102CS | 18-lead dual in-line; plastic (SOT-102CS) |
| TDA2510 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2510Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2520 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2520Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2522 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2522Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2523 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2523Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2524 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2525 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2530 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2530Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2532 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2532Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2540 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2540Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2541 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |

| type number | package code | description |
|---|---|---|
| TDA2541Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2542 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2542Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2543 | SOT-102CS | 18-lead dual in-line; plastic (SOT-102CS) |
| TDA2544 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2544Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2545 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2546 | SOT-102CS | 18-lead dual in-line; plastic (SOT-102CS) |
| TDA2548 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2548Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2549 | – | not yet determined |
| TDA2560 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2560Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2571A | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2571AQ | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2575A | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2575AQ | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2576A | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2577A | SOT-102HE | 18-lead dual in-line; plastic (SOT-102HE) |
| TDA2578A | SOT-102HE | 18-lead dual in-line; plastic (SOT-102HE) |
| TDA2581 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2581Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2582 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2582Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2593 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2594 | SOT-102DS | 18-lead dual in-line; plastic (SOT-102DS) |
| TDA2595 | SOT-102CS | 18-lead dual in-line; plastic (SOT-102CS) |
| TDA2611A | SOT-110B | 9-lead single in-line; plastic (SOT-110B) |
| TDA2640 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2640Q | SOT-58 | 16-lead quadruple in-line; plastic (SOT-58) |
| TDA2652 | SOT-69C | 16-lead dual in-line; plastic power (SOT-69C) |
| TDA2653 | SOT-69C | 16-lead dual in-line; plastic power (SOT-69C) |
| TDA2653A | SOT-141B | 13-lead SIL-bent-to-DIL; plastic power (SOT-141B) |
| TDA2654 | SOT-110B | 9-lead single in-line; plastic (SOT-110B) |
| TDA2655A | SOT-150 | 12-lead dual in-line; plastic with metal cooling fin (SOT-150) |
| TDA2655B | SOT-150 | 12-lead dual in-line; plastic with metal cooling fin (SOT-150) |
| TDA2721 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2730 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2740 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2791 | SOT-38 | 16-lead dual in-line; plastic (SOT-38) |
| TDA2795 | SOT-102DS | 18-lead dual in-line; plastic (SOT-102DS) |
| TDA3047 | – | not yet determined |
| TDA3048 | – | not yet determined |
| TDA3500 | SOT-117 | 28-lead dual in-line; plastic (SOT-117) |
| TDA3501 | SOT-117 | 28-lead dual in-line; plastic (SOT-117) |

| type number | package code | description |
|---|---|---|
| TDA3505 | SOT-117 | 28-lead dual in-line; plastic (SOT-117) |

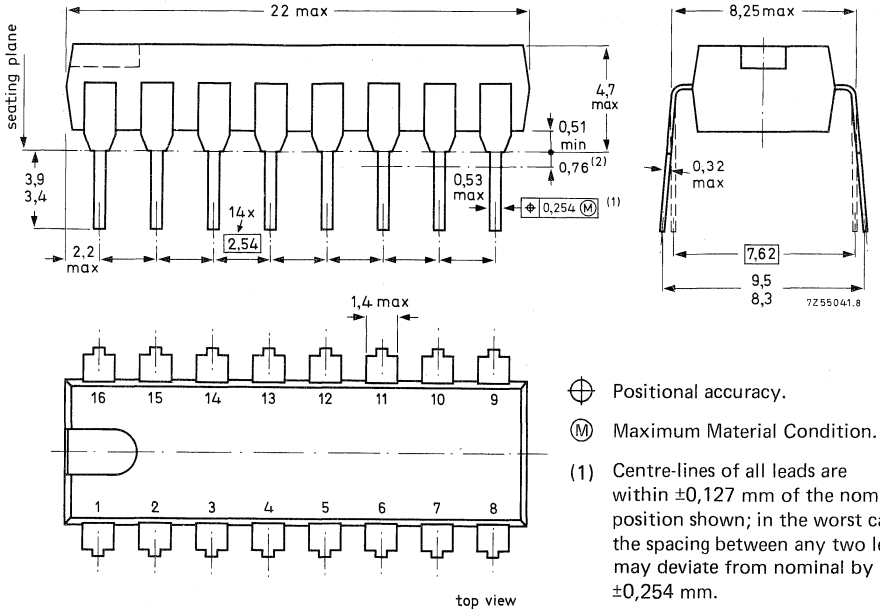
# 16-LEAD DUAL IN-LINE; PLASTIC (SOT-38)



⊕ Positional accuracy.

Ⓜ Maximum Material Condition.

(1) Centre-lines of all leads are within ±0,127 mm of the nominal position shown; in the worst case, the spacing between any two leads may deviate from nominal by ±0,254 mm.

(2) Lead spacing tolerances apply from seating plane to the line indicated.

**Dimensions in mm**

## SOLDERING

**1. By hand**

Apply the soldering iron below the seating plane (or not more than 2 mm above it).
If its temperature is below 300 °C it must not be in contact for more than 10 seconds; if between 300 °C and 400 °C, for not more than 5 seconds.

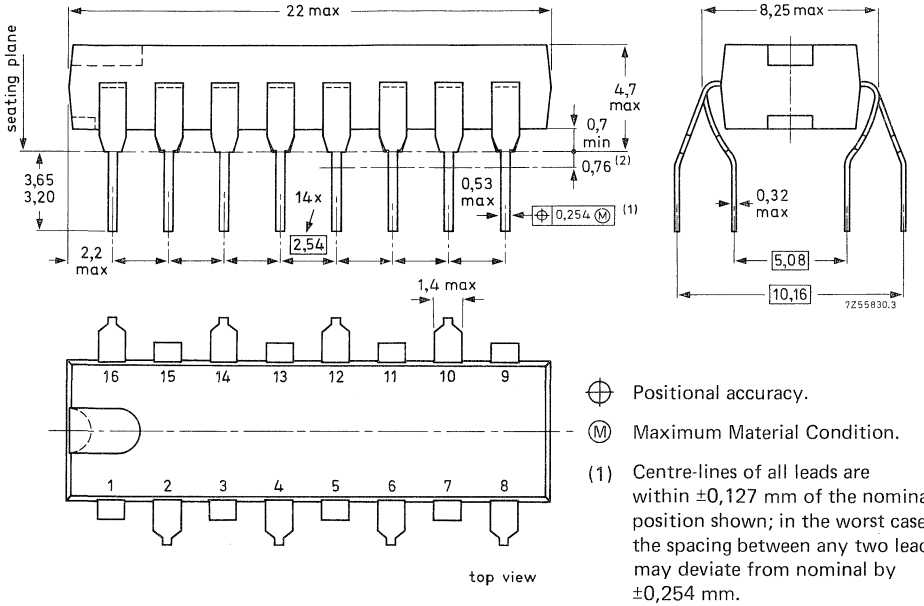
**2. By dip or wave**

The maximum permissible temperature of the solder is 260 °C; this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.
The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified storage maximum. If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

**3. Repairing soldered joints**

The same precautions and limits apply as in (1) above.

# 16-LEAD QUADRUPLE IN-LINE; PLASTIC (SOT-58)



⊕ Positional accuracy.

Ⓜ Maximum Material Condition.

(1) Centre-lines of all leads are within ±0,127 mm of the nominal position shown; in the worst case, the spacing between any two leads may deviate from nominal by ±0,254 mm.

(2) Lead spacing tolerances apply from seating plane to the line indicated.

**Dimensions in mm**

## SOLDERING

### 1. By hand

Apply the soldering iron below the seating plane (or not more than 2 mm above it).
If its temperature is below 300 °C it must not be in contact for more than 10 seconds; if between 300 °C and 400 °C, for not more than 5 seconds.

### 2. By dip or wave

The maximum permissible temperature of the solder is 260 °C; this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.
The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified storage maximum. If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

### 3. Repairing soldered joints

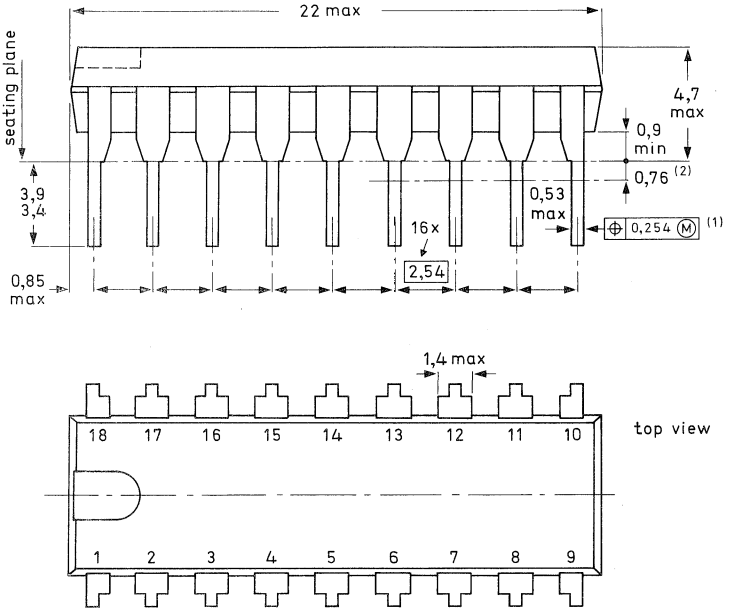
# 18-LEAD DUAL IN-LINE; PLASTIC (SOT-102HE)



⊕ Positional accuracy.

Ⓜ Maximum Material Condition.

(1) Centre-lines of all leads are within ±0,127 mm of the nominal position shown; in the worst case, the spacing between any two leads may deviate from nominal by ±0,254 mm.

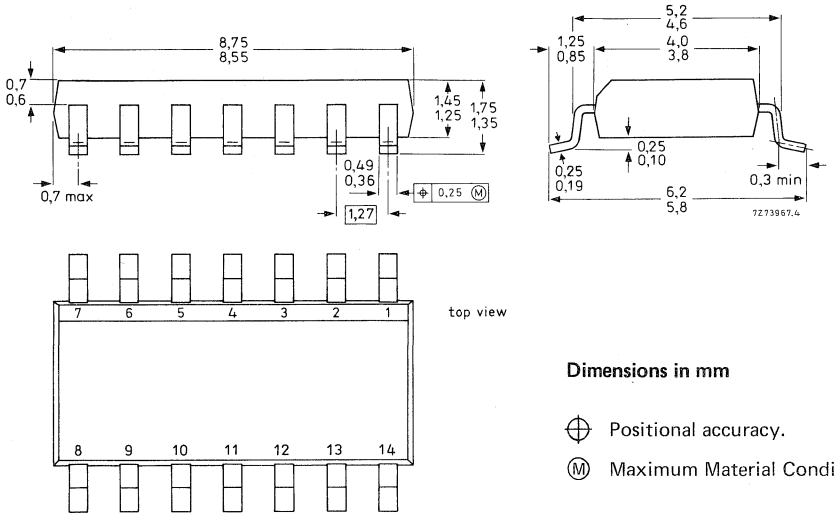
(2) Lead spacing tolerances apply from seating plane to the line indicated.

**Dimensions in mm**

## SOLDERING

See page 5 of this chapter (SOT-38).

# 14-LEAD MINI-PACK; PLASTIC (SO-14; SOT-108A)



**Dimensions in mm**

⊕ Positional accuracy.

Ⓜ Maximum Material Condition.

## SOLDERING

### The reflow solder technique

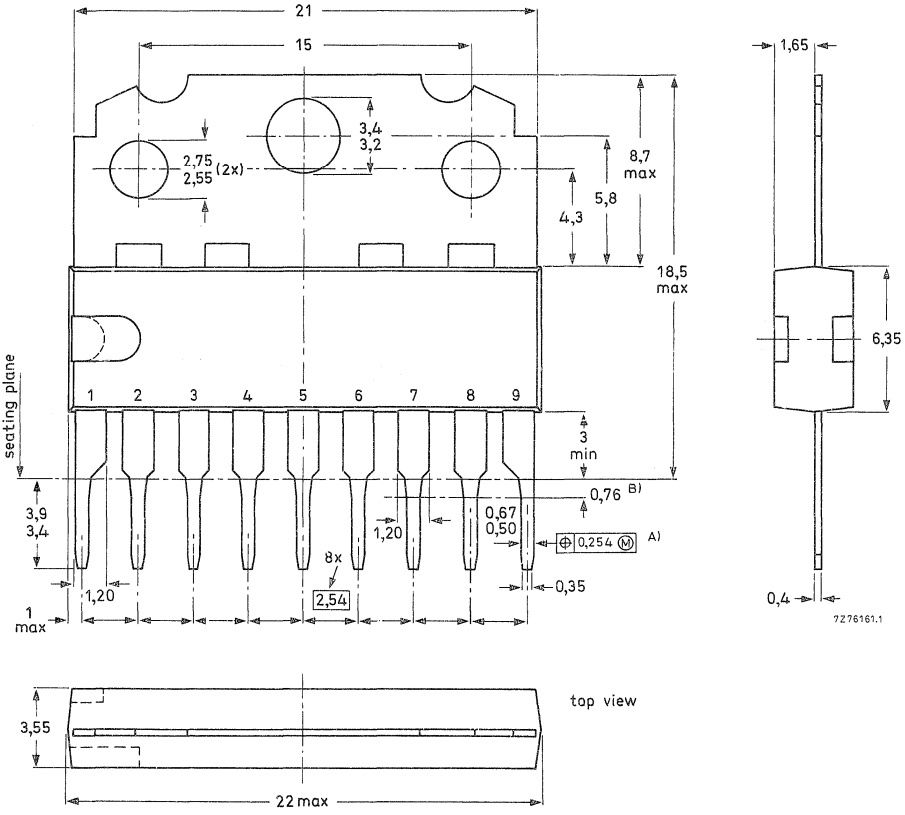
The preferred technique for mounting miniature components on hybrid thick or thin-film circuits is reflow soldering. Solder is applied to the required areas on the substrate by dipping in a solder bath or, more usually, by screen printing a solder paste. Components are put in place and the solder is reflowed by heating.

Solder pastes consist of very finely powdered solder and flux suspended in an organic liquid binder. They are available in various forms depending on the specification of the solder and the type of binder used. For hybrid circuit use, a tin-lead solder with 2 to 4% silver is recommended. The working temperature of this paste is about 220 to 230 °C when a mild flux is used.

For printing the paste onto the substrate a stainless steel screen with a mesh of 80 to 105 μm is used for which the emulsion thickness should be about 50 μm. To ensure that sufficient solder paste is applied to the substrate, the screen aperture should be slightly larger than the corresponding contact area.

The contact pins are positioned on the substrate, the slight adhesive force of the solder paste being sufficient to keep them in place. The substrate is heated to the solder working temperature preferably by means of a controlled hot plate. The soldering process should be kept as short as possible: 10 to 15 seconds is sufficient to ensure good solder joints and evaporation of the binder fluid.
After soldering, the substrate must be cleaned of any remaining flux.

# 9-LEAD SINGLE IN-LINE; PLASTIC (SOT-110B)



**Dimensions in mm**

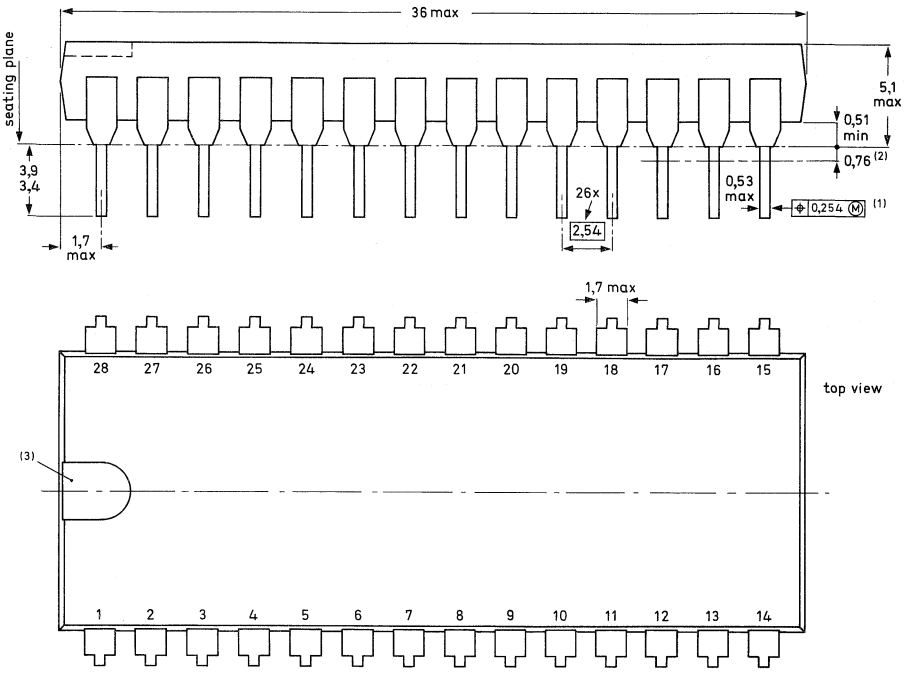
⊕ Positional accuracy.

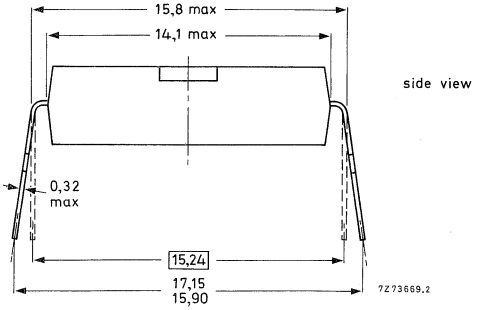
Ⓜ Maximum Material Condition.

A Centre-lines of all leads are within ±0,127 mm of the nominal position shown; in the worst case, the spacing between any two leads may deviate from nominal by ±0,254 mm.

B Lead spacing tolerances apply from seating plane to the line indicated.

# 28-LEAD DUAL IN-LINE; PLASTIC (WITH INTERNAL HEAT SPREADER) (SOT-117)





⊕ Positional accuracy.

Ⓜ Maximum Material Condition.

### SOLDERING

**1. By hand**

Apply the soldering iron below the seating plane (or not more than 2 mm above it).
If its temperature is below 300 °C it must not be in contact for more than 10 seconds; if between 300 °C and 400 °C, for not more than 5 seconds.

**2. By dip or wave**

The maximum permissible temperature of the solder is 260 °C; this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.
The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified storage maximum. If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

**3. Repairing soldered joints**

The same precautions and limits apply as in (1) above.

DEVICE DATA

# TELETEXT VIDEO PROCESSOR

The SAA5030 is a monolithic bipolar integrated circuit used for teletext video processing. It is one of a package of four circuits to be used in teletext tv data systems. The SAA5030 extracts data and data clock information from the television composite video signal and feeds this to the Acquisition and Control circuit SAA5040. A 6 MHz crystal controlled phase locked oscillator is incorporated which drives the Timing Chain circuit SAA5020. An adaptive sync separator is also provided which derives line and field sync pulses from the input video in order to synchronise the timing chain.

## QUICK REFERENCE DATA

| Output current | | – | – | 3 | mA |
| **Line reset and signal presence detectors** | | | | | |
| Schmitt trigger threshold on pin 2 to inhibit line reset output at pin 3 (syncs coincident) | | – | 6.2 | – | V |
| Schmitt trigger threshold on pin 2 to permit line reset output at pin 3 (syncs non-coincident) | | – | 7.8 | – | V |
| Line reset output $V_{OL}$ ($I_3$ = 20 μA) | | – | – | 0.5 | V |
| Line reset output $V_{OH}$ ($-I_3$ = 100 μA) | | 2.4 | – | – | V |
| Signal presence Schmitt trigger threshold on pin 2 below which the circuit accepts the input signal | | – | 6.0 | – | V |
| Signal presence Schmitt trigger threshold on pin 2 above which the input signal is rejected. | | – | 6.3 | – | V |

Notes

1. This is measured with the dual polarity buffer external resistor connected to give negative-going syncs. The measurement is made after adjustment of the potential divider at pin 14 for optimum delay.
2. The teletext data input contains binary elements as a two level NRZ signal shaped by a raised cosine filter. The bit rate is 6.9375 M bit/s. The use of odd parity for the 8-bit bytes ensures that there are never more than 14-bit periods between each data transition.
3. This is measured by replacing the clock coil with a small value resistor.
4. This must be measured with the clock coil tuned and using a clock-cracker signal into pin 16. The clock-cracker is a teletext waveform consisting of only one data transition in each byte.
5. With the external resistor connected to the ground rail, syncs are positive-going centred on +2.3 V. With the resistor connected to the supply rail, syncs are negative-going centred on +9.7 V.
6. When the composite sync is being delivered, the level is substantially the same as that at the video input.

## APPLICATION DATA

**The function is quoted against the corresponding pin number**

Pin No.

1. **Signal presence time constant**

   A capacitor and a resistor connected in parallel between this pin and supply determine the delay in operation of the signal presence detector.

2. **Line reset time constant**

   A capacitor between this pin and supply integrates current pulses from the coincidence detector; the resultant level is used to determine whether to allow FLR pulses (see pin 3).

3. **Fast line reset output (FLR)**

   Positive-going sync pulses are produced at this output if the coincidence detector shows no coincidence between the syncs separated from the incoming video and the $\overline{CBB}$ waveform from the timing chain circuit SAA5020. These pulses are sent to the timing chain circuit and are used to reset its counters, so as to effect rapid lock-up of the phase locked loop.

4. **Ground (0 V)**

5. **Sandcastle input ($\overline{PL}$ and $\overline{CBB}$)**

   This input accepts a sandcastle waveform which is formed from $\overline{PL}$ and $\overline{CBB}$ from the timing chain SAA5020. PL is obtained by slicing the waveform at 2.5 V, and this, together with separated sync, are inputs to the phase detector which forms part of the phase locked loop. When the loop has locked up, the edges of $\overline{PL}$ are nominally 2 $\mu$s before and 2 $\mu$s after the leading edge of separated line syncs.
   CBB is obtained by slicing the waveform at 5 V, and is used to prevent the data slicer being offset by the colour burst.

6. **6 MHz output (F6)**

   This is the output of the crystal oscillator (see pins 8 and 9), and is taken to the timing chain circuit SAA5020 via a series capacitor.

7. **Phase detector time constant**

   The integrating components for the phase detector of the phase locked loop are connected between this pin and supply.

APPLICATION DATA (continued)

8, 9. **6 MHz crystal**

A 6 MHz crystal in series with a trimmer capacitor is connected between these pins. It forms part of an oscillator whose frequency is controlled by the voltage on pin 7, which forms part of the phase locked loop.

10. **Picture On input (PO)**

The PO signal from the acquisition and control circuits SAA5040 Series is fed to this input and is used to determine whether the input video (pin 16) or the $\overline{\text{AHS}}$ waveform (pin 11) appears at pin 12.

11. **After hours sync ($\overline{\text{AHS}}$)**

A composite sync waveform $\overline{\text{AHS}}$ is generated in the timing chain circuit SAA5020 and is used to synchronise the tv (see pin 10).

12. **Sync output to tv**

Either the input video of $\overline{\text{AHS}}$ is available at this output dependent on whether the PO signal is HIGH or LOW. In addition either signal may be positive-going or negative-going, dependent on whether the load resistor at this output is connected to ground or supply.

13. **Field sync output (FS)**

A pulse, derived from the input video by the field sync separator, which is used to reset the line counter in the timing chain circuit SAA5020.

14. **Field sync separator timing**

A capacitor and adjusting network is connected to this pin and forms the integrator of the field sync separator.

15. **Sync separator capacitor**

A capacitor connected to this pin forms part of the adaptive sync separator.

16. **Composite video input (VI)**

The composite video is fed to this input via a coupling capacitor.

17. **Supply voltage (+12 V)**

18. **Clock output**

The regenerated clock, after extraction from the teletext data, is fed out to the acquisition and control circuits SAA5040 Series via a series capacitor.

19. **Data output**

The teletext data is sliced off the video waveform, squared up and latched within the SAA5030. The latched output is fed to the acquisition and control circuits SAA5040 Series via a series capacitor.

20. **Clock decoupling**

A 1 nF capacitor between pin 20 and ground is required for clock decoupling.

21. **Clock regenerator coil**

A high-Q parallel tuned circuit is connected between this pin and an external potential divider. The coil is part of the clock regeneration circuit (see pin 22).

APPLICATION DATA (continued)

22. **Clock pulse timing capacitor**

Short pulses are derived from both edges of data with the aid of a capacitor connected to this pin. The resulting pulses are fed, as a current, into the clock coil connected to pin 21. Resulting oscillations are limited and taken to the acquisition and control circuits SAA5040 Series via pin 18.

23, 24 **Peak detector capacitors**

The teletext data is sliced with an automatic data slicer whose slicing level is the mid-point of two peak detectors working on the video signal. Storage capacitors are connected to these pins for the negative and positive peak detectors.

# SOUND I.F. AMPLIFIER/DEMODULATOR FOR TV

The TBA120U is an i.f. amplifier with a symmetrical FM demodulator and an a.f. amplifier with adjustable output voltage. The a.f. amplifier is also provided with an output for volume control and an input for VCR operation.

The input and output of the TBA120U are especially designed for LC-circuits, but the input can also be used with a ceramic filter.

# REFERENCE COMBINATION

The TBA540 is an integrated reference oscillator circuit for colour television receivers incorporating an automatic phase and amplitude controlled oscillator employing a quartz crystal, together with a half-line frequency synchronous demodulator circuit. The latter compares the phases and amplitude of the swinging burst ripple and the PAL flip-flop waveform, and generates appropriate a.c.c., colour killer and identification signals. The use of synchronous demodulation for these functions permits a high standard of noise immunity.

| QUICK REFERENCE DATA | | | | |
|---|---|---|---|---|
| Supply voltage | $V_{3-16}$ | nom. | 12 | V |
| Total current drain | $I_3$ | typ. | 33 | mA |

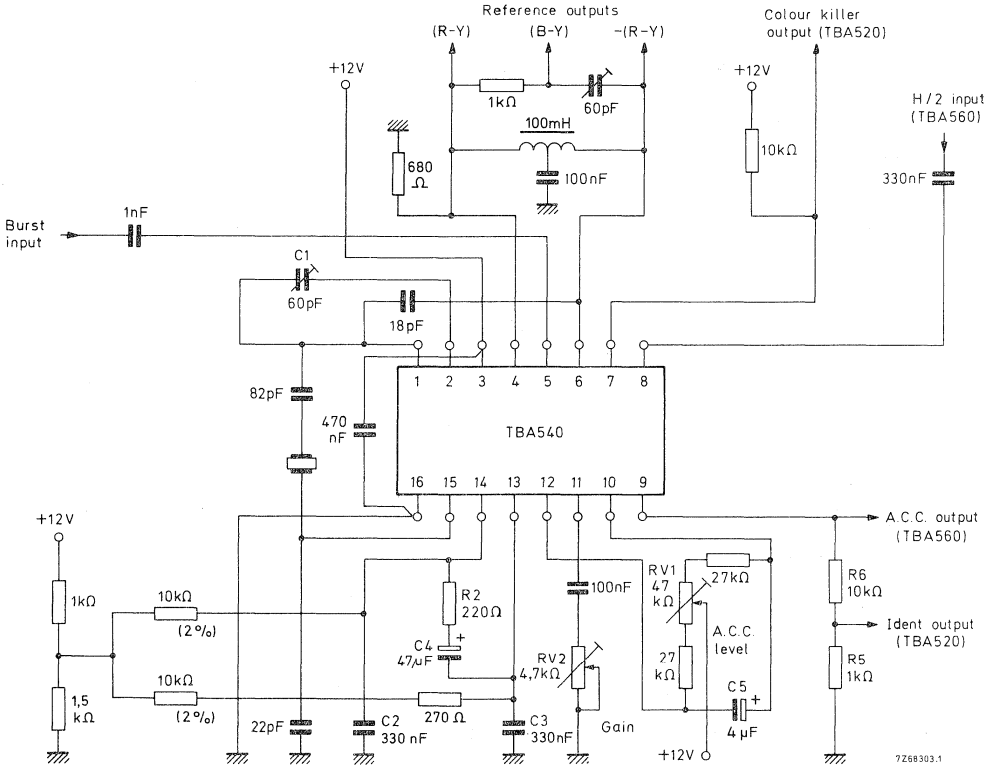
3. Supply voltage (12 V)
4. Reference waveform output
5. Burst waveform input
6. Reference waveform input
7. Colour killer output
8. P.A.L. flip-flop square wave input
9. A.C.C. output
10. A.C.C. level setting (see also pin 12)
11. A.C.C. gain setting
12. A.C.C. level setting (see also pin 10)
13. D.C. control points for
14. oscillator phase control loop
15. Oscillator feedback input
16. Earth (negative supply)

## APPLICATION INFORMATION



**APPLICATION INFORMATION** (continued)

The function is quoted against the corresponding pin number

1. Oscillator feedback output
The crystal receives its energy from this pin. The input impedance is approximately 2 kΩ in parallel with 5 pF.

2. Reactance control stage feedback
This pin is fed internally with a sinewave derived from the reference input (pin 6) and controlled in amplitude by the internal reactance control circuit. The phase of the feedback from pin 2 to the crystal via C1 is such that the value of C1 is effectively increased. Pin 2 is held internally at a very low impedance therefore the tuning of the crystal is controlled automatically by the amplitude of the feedback waveform and its influence on the effective value of C1.

3. Positive 12 V supply
The maximum voltage must not exceed 13.2 V.

4. Reference waveform output
This pin is driven internally by the regenerated subcarrier waveform in R-Y phase. An output amplitude of nominally 1.5 V peak-to-peak is produced at low impedance. No d.c. load to earth is required. A d.c. connection between pins 4 and 6 is, however, necessary via the bifilar coupling inductor. The function of this inductor is to produce, on pin 6, a signal of equal amplitude and opposite phase (-(R-Y)) to that on pin 4. A centre tap on the inductor, connected to earth via a d.c. blocking capacitor, is therefore necessary.

5. Burst waveform input
A burst waveform amplitude of 1 V peak-to-peak is required to be a.c.-coupled to this pin. The amplitude of the burst will normally be controlled by the adjustment and operation of the a.c.c. circuit. The input impedance at this pin is approximately 1 kΩ and a threshold level of 0.7 V must be exceeded before the burst signal becomes effective. A d.c. bias of 400 mV is internally derived for pin 5 The absolute level of the tip of the burst at pin 5 will normally reach 1.25 V (1.5 V peak-to-peak burst amplitude). Under abnormal conditions the burst amplitude should not be allowed to exceed 3 V peak-to-peak and a limiting condition will be reached in the i.c. which inhibits the performance of the phase lock loop.

**APPLICATION INFORMATION** (continued)

6. Reference waveform input
This pin requires a reference waveform in the -(R-Y) phase, derived from pin 4 via a bifilar transformer (see pin 4), to drive the internal balanced reactance control stage. A d.c. connection between pins 4 and 6 must be made via the transformer.

7. Colour killer output
This pin is driven from the collector of an internal switching transistor and requires an external load resistor (typical 10 kΩ) connected to +12 V. The unkilled and killed voltages on this pin are then +12 V and < 250 mV respectively. (The voltage on pin 9 at which switching of the colour killer output on pin 7 occurs is nominally +2.5 V

8. P.A.L. flip-flop square wave input
A 2.5 V peak-to-peak square wave derived from the P.A.L. flip-flop (in the TBA520 demodulator i.c.) is required at this pin, a.c.-coupled via a capacitor. The input impedance is about 3.3 kΩ.

9. A.C.C. output
An emitter follower provides a low impedance output potential which is negative-going with a rising burst input amplitude. With zero input signal the d.c. potential produced at pin 9 is set to be +4 V (RV1) The appearance of a burst signal on pin 5 will cause the potential on pin 9 to go in a negative direction in the event that the P.A.L. flip-flop is identified to be in the correct phase. The range of potential over which full a.c.c. control is excercised at pin 9 is determined by the control characteristics of the a.c.c. amplifier i.e. for the TBA560 from 1 V to 0.2 V. The potential at pin 9 will fall to a value within this range as the burst input signal is stabilised at 1.5 V peak-to-peak. The latter condition is achieved by correct adjustment of RV2. If, however, the P.A.L. flip-flop phase is wrong the potential on pin 9 will move positively. The potential divider R5, R6 will then operate a P.A.L. switch cut-off function in the TBA520 demodulator i.c. The switching of the colour killer output at pin 7 is designed to occur as the potential on pin 9 moves past +2.5 V.

10. A.C.C. level setting
The network connected between pins 10 and 12 balances the a.c.c. circuit and RV1 is adjusted to give +4 V on pin 9 with no burst input signal to pin 5. C5 provides filtering.

11. A.C.C. gain control
RV2 is adjusted to give the correct amplitude of burst signal on pin 5 (1.5 V peak-to-peak) under a.c.c. control;

12. See pin 10.

13. See pin 14.

**APPLICATION INFORMATION** (continued)

14. D.C. control points in reference control loop
Pins 13 and 14 are connected to opposite sides of a differential amplifier circuit and are brought out for the purposes d.c. balancing of the reactance stage and the connection of the bandwidth-determining filter network. The conventional double time constant filter networks are R2, C2, R3, C3 and $R_4$, $C_4$. The d.c. potentials on these pins are nominally +7,2 V.

15. Oscillator feedback input
The input impedance at this pin is nominally 3.5 kΩ in parallel with 5 pF. No d.c. connection is required on this pin. The voltage in the i.c. between pin 15 and pin 1 is nominally 4.7 times.

16. Negative supply (earth)

PERFORMANCE AND COMMENTS

Initial adjustment

(a) Remove burst signal.

(b) Short-circuit pins 13-14. Adjust oscillator to correct frequency by C1. Remove short circuit.

(c) Set the a.c.c. level adjustment RV1, to give +4 V on pin 9.

(d) Apply burst signal.

(e) Adjust a.c.c. gain, RV 2, to give a burst amplitude of 1.5 V peak-to-peak on pin 5.

Phase lock loop performance (with crystal type 4322 152 0110)

(a) Phase difference between reference and burst signals for ±400 Hz deviation of crystal frequency, ± $10^{o}$.

(b) Typical holding range, ± 600 Hz.

(c) Typical pull-in range, ± 300 Hz.

(d) Temperature coefficient of oscillator frequency, i.c. only, 2 Hz/$^{o}$C.

# LINE OSCILLATOR CIRCUIT

This circuit has been designed for use as line-oscillator and reactance stage in colour and monochrome t.v. receivers.
The circuit consists of a Miller-integrator-oscillator followed by a pulse shaping circuit, which delivers a positive pulse of 8 V and adjustable width. The available output current is in excess of 60 mA. Finally a supply voltage take-over switch for starting purposes is built in. The TBA720A can co-operate with the TBA890.

| QUICK REFERENCE DATA | | | |

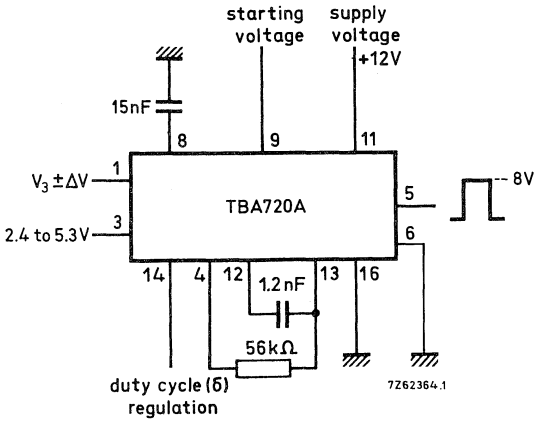
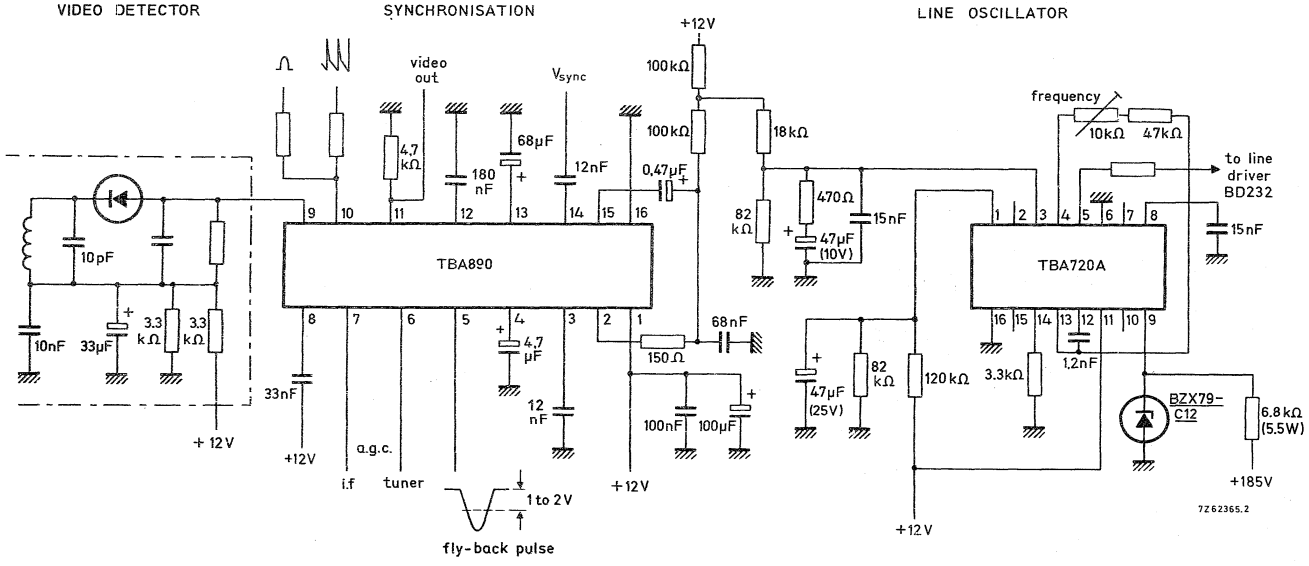
Test set-up



## APPLICATION INFORMATION

The TBA720A with the TBA890 or TBA900 in a receiver with transistorized line deflection.



**APPLICATION INFORMATION** (continued)

Notes

1. The TBA720A is intended to drive a line deflection circuit equipped with transistors.
2. The duty cycle $\delta$ can be adjusted by connecting a resistor between pin 14 and ground or the supply.
3. The oscillation frequency can be set between 10 kHz and 25 kHz by connecting a resistor between pins 4 and 13, and a capacitor between pins 12 and 13.
4. At a nominal oscillation frequency of 15,625 kHz, the frequency deviation is limited to $\pm$1,3 kHz to safeguard the line timebase output circuits.
5. Besides the oscillator, the TBA720A incorporates a reactance stage and a supply voltage take-over switch for starting purposes (pin 9). The latter can be used to advantage if the 12 V supply is derived from the line flyback pulse.
6. Pins 2, 7, 10 and 15 should not be connected.

# LIMITER/AMPLIFIER

The TBA750C is a limiter/amplifier with f.m. detector, d.c. volume control and a.f. preamplifier. It is intended for 4,5 MHz, 5,5 MHz or 10,7 MHz. The limiter/amplifier is a four-stage differential amplifier that gives very good noise and interference suppression. The detector is of the balanced type. The d.c. volume control stage has excellent control characteristics with a control range of more than 80 dB. The a.f. preamplifier can drive a triode-pentode output stage or a class-A push-pull transistor output stage.

L1 = 18 µH; $Q_{L1}$ = 36

L2 = 2,2 µH; $Q_{L2}$ = 21

L3 = 0,84 µH; $Q_{L3}$ = 22

**Note**

$Q_{L1}$, $Q_{L2}$ and $Q_{L3}$ are the loaded Q-factors.

The transfer ratio of the input bandpass filter: $\frac{V_2}{V_1} = 0{,}54$.

The peak-to-peak bandwidth of the detector S-curve is 300 kHz.

# TELEVISION SIGNAL PROCESSING CIRCUIT

The TBA890 is a silicon monolithic integrated signal processing circuit for monochrome and colour television receivers.
It combines the following functions:
- video pre-amplifier with emitter-follower output and short circuit protection.
- blanking facility for the video amplifier.
- gated a.g.c. detector supplying the a.g.c. voltages for the vision i.f. amplifier and tuner.
- noise cancelling circuit in the a.g.c. and sync separator circuits.
- sync separator.
- automatic horizontal phase detector
- vertical sync pulse separator.

The circuit is designed for receivers equipped with tubes or transistors in the deflection and video output stages.
The control stages in the i.f. amplifier and the tuner have to be equipped with n-p-n transistors. The circuit is developed for signals with negative modulation.

| QUICK REFERENCE DATA | | | | |
|---|---|---|---|---|
| Supply voltage | $V_P$ | typ. | 12 | V |
| Ambient temperature | $T_{amb}$ | typ. | 25 | °C |

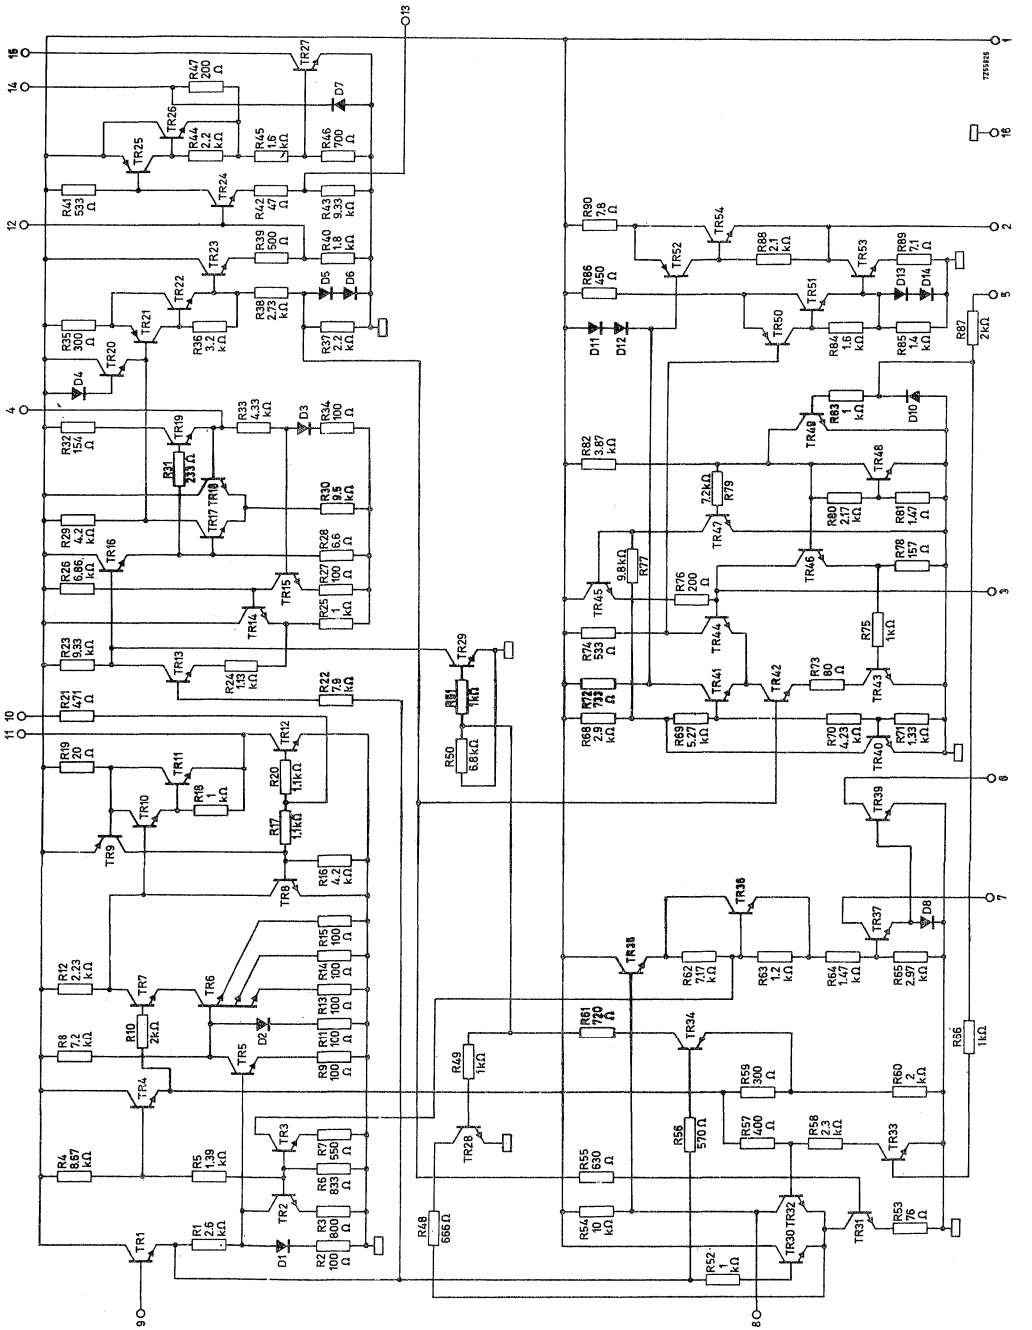
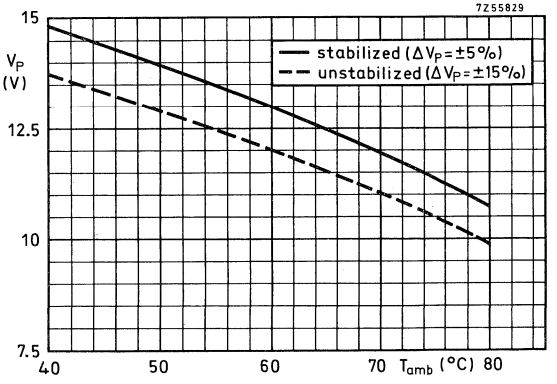
**PACKAGE OUTLINES**

TBA890 : 16-lead DIL; plastic (SOT-38).
TBA890Q: 16-lead QIL; plastic (SOT-58).



**RATINGS** Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | | | |
|---|---|---|---|---|---|
| Supply voltage | $V_P$ | max. | | 20 | V[1)] |
| Power dissipation | $P_{tot}$ | max. | | 700 | mW |
| Temperatures | | | | | |
| Storage temperature | $T_{stg}$ | −55 | to | +125 | °C |
| Operating ambient temperature | $T_{amb}$ | -25 | to | +80 | °C |



Maximum allowable nominal supply voltage as a function of the maximum ambient temperature.

1) Allowed only while receiver is warming up.

## CHARACTERISTICS

Supply voltage range $V_P$ See curves on page 3

The following characteristics are measured in the circuit on p. 7 at $T_{amb}$ = 25 °C; $V_P$ = 12 V.

Video amplifier

| | | | | |
|---|---|---|---|---|
| Input resistance | $R_{9-16}$ | > | 30 | kΩ |
| Input capacitance | $C_{9-16}$ | < | 3 | pF |
| Bandwidth (3 dB) | B | > | 5 | MHz |
| Linearity (m) | | > | 0.9 | |
| Rise time and fall time at the output | $t_r$; $t_f$ | < | 50 | ns |
| Voltage gain | $G_v$ | typ. | 7 | dB |
| Video input voltage (peak-to-peak value) | $V_{9-16(p-p)}$ | typ. | 2.7 | V 1) |
| D.C. bias video detector voltage | $V_{bias}$ | typ. | 6 | V 2) |
| Video output voltage (peak-to-peak value) | $V_{11-16(p-p)}$ | typ. | 6 | V 1) |
| Black level at the output | $V_{11-16}$ | typ. | 5 | V 3) |
| Available video output current (peak value) | $I_{11M}$ | ≤ | 30 | mA 4) |

Tolerances on the video output voltages

| | | | | |
|---|---|---|---|---|
| I.C. processing spreads | $\pm\Delta V_{11-16}$ | < | 420 | mV 5) |
| Temperature drift | $-\Delta V_{11-16}$ | typ. | 1.8 | mV/°C |
| Spreads over a.g.c. expansion (entire range) | $\pm\Delta V_{11-16}$ | < | 100 | mV 6) |
| Supply voltage | $\frac{\Delta V_{11-16}}{\Delta V_P}$ | typ. | 0.5 | |

1) Signal with negative going sync.; this value is obtained only when the input signal meets the C.C.I.R. standard.

2) A voltage divider with 5% tolerance resistors is required between pin 9 and supply terminal.

3) Only valid if the video signal is in accordance with the C.C.I.R. standard.

4) The total load on pin 11 must be such that the d.c. output current $I_{11} \leq 15$ mA.

5) The spreads of the voltage divider for the bias of the video detector of ± 5% is included in this figure.

6) Variation about a nominal condition, the i.f. being fully controlled and the tuner uncontrolled.

**CHARACTERISTICS** (continued)

| | | | | |
|---|---|---|---|---|
| **Tolerances on the black level at the output** | | | | |
| I.C. processing spreads | $\pm\Delta V_{11\text{-}16}$ | < | 420 | mV[1] |
| Temperature drift | $-\Delta V_{11\text{-}16}$ | typ. | 1.7 | mV/°C |
| Spreads over a.g.c. expansion (entire range) | $\pm\Delta V_{11\text{-}16}$ | < | 130 | mV[2] |
| Supply voltage | $\frac{\Delta V_{11\text{-}16}}{\Delta V_P}$ | typ. | 0.4 | |
| **Video blanking** | | | | |
| Input voltage (peak-to-peak value) | $V_{10\text{-}16(p\text{-}p)}$ | | 1 to 5 | V |
| Input resistance | $R_{10\text{-}16}$ | typ. | 1 | kΩ |
| Output voltage during blanking | $V_{11\text{-}16}$ | < | 500 | mV |
| **A.G.C. circuit** | | | | |
| Range of control voltage i.f. amplifier | $V_{7\text{-}16}$ | | 1 to 12 | V[3] |
| Range of control voltage tuner | $V_{6\text{-}16}$ | | 0.3 to 12 | V[3] |
| Signal expansion for full control of i.f. amplifier and tuner | | typ. | 0.5 | dB |
| Current i.f. control point | $I_7$ | < | 20 | mA |
| Current tuner control point | $I_6$ | < | 20 | mA |
| Current i.f. control point for tuner take-over | $I_7$ | see note 4 | | |
| Keying input pulse (peak-to-peak value) | $V_{5\text{-}16(p\text{-}p)}$ | see note 5 | | |
| Input resistance | $R_{5\text{-}16}$ | typ. | 2 | kΩ |

1) The spreads of the voltage divider for the bias of the video detector of ± 5% is included in this figure (pin 9).

2) Variation about a nominal condition, the i.f. being fully controlled and the tuner uncontrolled.

3) Positive going at increasing input signal.

4) This value depends on the ratio between the external impedances on pins 6 and 7. With equal impedances the current of the i.f. control point at tuner take-over will be about 16% from its maximum value (minimum control voltage).

5) Negative going pulse is required. The voltage during scan should be between 1 V and 2 V.

**CHARACTERISTICS** (continued)

| | | | | |
|---|---|---|---|---|
| Horizontal synchronization circuit | | | | |
| Sync. separator | | | see note 1 | |
| Output voltage range of phase detector | $V_{2-16}$ | | 2 to 10 | V [2] |
| Control steepness | $S_\varphi$ | typ. | 2.5 | V/μs [3] |
| Phase deviation between front edge sync. pulse and front edge flyback pulse | $\varphi_0$ | typ. | 1.5 | μs |
| Variation $\varphi_0$ caused by internal spreads | $\pm\Delta_{\varphi 0}$ | typ. | 0.3 | μs [4] |
| Output voltage range as a frequency detector | $V_{2-16}$ | | 4 to 8 | V [5] |
| Vertical synchronization circuit | | | | |
| Output voltage vertical sync. pulse generator | $V_{14-16}$ | typ. | 11 | V |
| Output impedance | $R_{14-16}$ | typ. | 2 | kΩ |

1) The sync. pulse is sliced about 25% below top sync. level. A sliding bias circuit makes the slicing level independent of the signal strength.

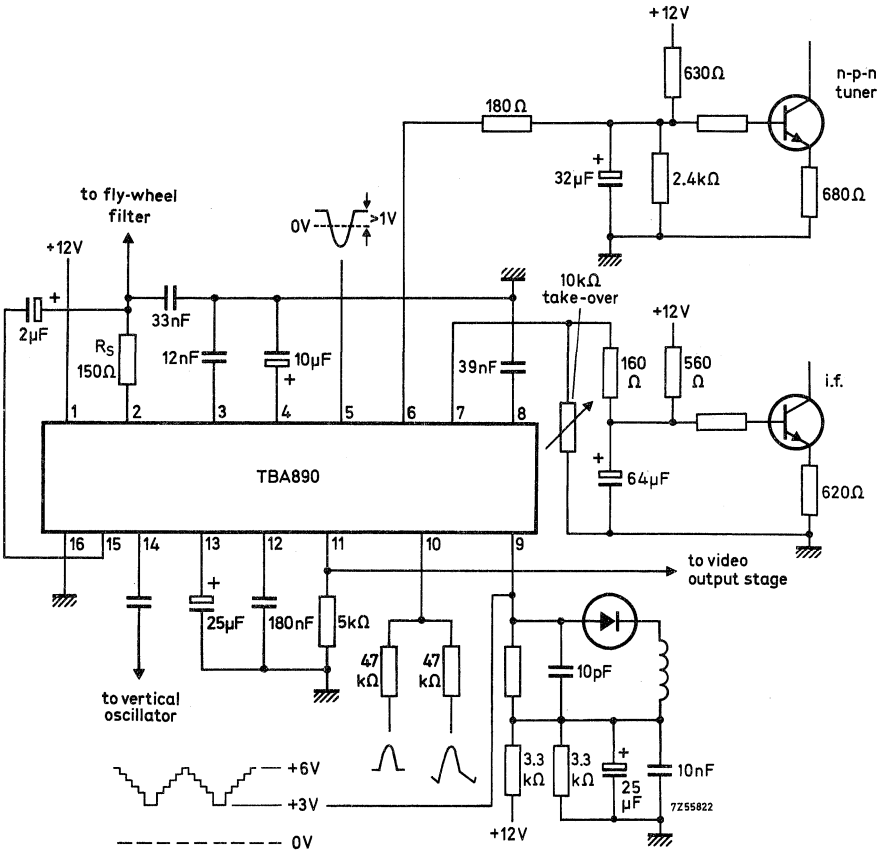
2) Nominal voltage 6 V.

3) Higher values of this control steepness can be obtained by changing $R_S$ (see circuit on page 7). For example $R_S$ = 56 Ω, $S_\varphi$ = 5 V/μs and $R_S$ = 0, $S_\varphi$ = ≥25 V/μs.

4) In addition to this figure ± 7% of the retrace time of the sawtooth generated on pin 3 has to be added to find the total spreads of $\varphi_0$.
This value of ± 7% is obtained only when the tolerance of the capacitor connected to pin 3 does not exceed ± 10%.

5) Nominal voltage 6 V.
The load impedance on pin 2 of the circuit on page 7 is about 50 kΩ.
When a higher impedance is used (tube equipped reactance stage) values from 2 V to 10 V can be reached.

## APPLICATION INFORMATION



# HORIZONTAL COMBINATION

The TBA920 is a monolithic integrated circuit intended for television receivers with transistor-thyristor-or tube equipped output stages.
It combines the following functions:
- noise gated sync separator
- line oscillator
- phase comparison between sync pulse and oscillator
- loopgain and time constant switching (also for video recorder applications)
- phase comparison between line-flyback pulse and oscillator
- output stage for drive a variety of line output stages

**QUICK REFERENCE DATA**

| | | | | |
|---|---|---|---|---|
| Supply voltage | $V_{1-16}$ | nom. | 12 | V |
| Ambient temperature | $T_{amb}$ | | 25 | °C |

| Total power dissipation | $P_{tot}$ | max. | 600 | mW [1] |
| Temperatures | | | | |
| Storage temperature | $T_{stg}$ | | −55 to +125 | °C |
| Operating ambient temperature | $T_{amb}$ | | −20 to +60 | °C |

**CHARACTERISTICS** at $V_{1-16}$ = 12 V; $T_{amb}$ = 25 °C

Measured in circuit on page 6 (CCIR standard).

| | | | | |
|---|---|---|---|---|
| Current consumption at $I_2 = 0$ | $I_1$ | typ. | 36 | mA |
| **Required input signals** | | | | |
| Video signal | | | | |
| Input voltage (positive going sync) peak-to-peak value | $V_{i(p-p)}$ | typ. | 3 | V |
| | | | 1 to 7 | V |
| Input current during sync pulse (peak value) | $I_{8M}$ | typ. | 100 | μA |
| Noise gating (pin 9) | | | | |
| Input voltage (peak value) | $V_{9-16M}$ | > | 0,7 | V |
| Input current (peak value) | $I_{9M}$ | > | 30 | μA |
| | | < | 10 | mA |
| Input resistance | $R_{9-16}$ | typ. | 200 | Ω |

1) 800 mW permissible while tubes are heating up.

**CHARACTERISTICS** (continued)

Flyback pulse (pin 5)

| | | | | | |
|---|---|---|---|---|---|
| Input voltage (peak value) | $V_{5-16M}$ | typ. | ±1 | V | |
| Input current (peak value) | $I_{5M}$ | > | 50 | μA | |
| | | typ. | 1 | mA | |
| Input resistance | $R_{5-16}$ | typ. | 400 | Ω | |
| Pulse duration at 15625 Hz | $t_5$ | > | 10 | μs | |

**Delivered output signals**

Composite sync pulses (positive; pin 7)

| | | | | | |
|---|---|---|---|---|---|
| Output voltage (peak-to-peak value) | $V_{7-16(p-p)}$ | typ. | 10 | V | |
| Output resistance | | | | | |
| at leading edge of pulse (emitter follower) | $R_{7-16}$ | ≈ | 50 | Ω | |
| at trailing edge | $R_{7-16}$ | typ. | 2, 2 | kΩ | |
| Additional external load resistance | $R_{7-16(ext)}$ | > | 2 | kΩ | |

Driver pulse (pin 2)

| | | | | | |
|---|---|---|---|---|---|
| Output voltage (peak-to-peak value) | $V_{2-16(p-p)}$ | typ. | 10 | V | |
| Average output current | $I_{2(AV)}$ | < | 20 | mA | |
| Peak output current | $I_{2M}$ | < | 200 | mA | |
| Output resistance (low ohmic) | $R_{2-16}$ | typ. | 2,5 or 15 | Ω | [1] |
| Output pulse duration when synchronised | $t_2$ | | 12 to 32 | μs | [2] |
| Permissible delay between leading edge of output pulse and flyback pulse at $t_5$ = 12 μs | $t_{o\ tot}$ | | 0 to 15 | μs | |
| Supply voltage at which output pulses are obtained | $V_{1-16}$ | > | 4 | V | |

[1] Depends on switch position and polarity output current. $R_{2-16}$ = 2, 5 Ω is valid for $V_{2-16}$ = +10, 5 V and a load between pins 2 and 16 (e.g. an external resistor).

[2] The output pulse duration is adjusted by shifting the leading edge ($V_{3-16}$ from 6 V to 8 V). The pulse duration is a result of delay in the line output device and the action of the second control loop in the TBA920.
For a line output stage with a BU108 high voltage transistor the resulting duration is about 22 μs, and in such a way that the line output transistor is switched on again about 8 μs after the middle of the line flyback pulse. This pulse duration must be taken into account when designing the driver stage and driver transformer as this way of driving the line output device differs from the usual, i.e. a driver duty cycle of about 50%.

**CHARACTERISTICS** (continued)

Oscillator

| | | | | | |
|---|---|---|---|---|---|
| Frequency; free running ($R_{15-16}$ = 3,3 kΩ) | $f_o$ | | 15 625 | Hz | 1) |
| Spread of frequency at nominal values of peripheral components | $\frac{\Delta f_o}{f_o}$ | < | ±5 | % | 2) |
| Frequency change when decreasing the supply down to minimum 4 V | $\left\|\frac{\Delta f_o}{f_o}\right\|$ | < | 10 | % | |
| Frequency control sensitivity | $\frac{\Delta f_o}{\Delta I_{15}}$ | typ. | 16,5 | Hz/μA | |
| Adjustment range of network in circuit on page 6 | $\frac{\Delta f_o}{f_o}$ | typ. | ±10 | % | |
| Influence of supply voltage on frequency at $V_P$ = 12 V | $\frac{\delta f_o}{f_o} \Big/ \frac{\delta V_P}{V_{Pnom}}$ | < | 5 | % | |

Control loop 1 (between sync pulse and oscillator)

| | | | | | |
|---|---|---|---|---|---|
| Control voltage range | $V_{12-16}$ | | 0,8 to 5,5 | V | |
| Control current (peak values) | | | | | |
| at $V_{10-16}$ > 4,5 V; $V_{6-16}$ > 1,5 V | $I_{12M}$ | typ. | ±2 | mA | |
| at $V_{10-16}$ < 2 V; $V_{6-16}$ > 1,5 V | $I_{12M}$ | typ. | ±6 | mA | |
| Loopgain of APC system | | | | | |
| a. Time coincidence between sync pulse and flyback pulse or $V_{10-16}$ > 4,5 V | $\frac{\Delta f}{\Delta t}$ | typ. | 1 | kHz/μs | |
| b. No time coincidence or $V_{10-16}$ < 2 V | $\frac{\Delta f}{\Delta t}$ | typ. | 3 | kHz/μs | |
| Catching and holding range | $\Delta f$ | typ. | ±1 | kHz | 3) |

1) The oscillator frequency can be changed for other t.v. standards by an appropriate value of $C_{14-16}$.

2) Exclusive external components tolerances.

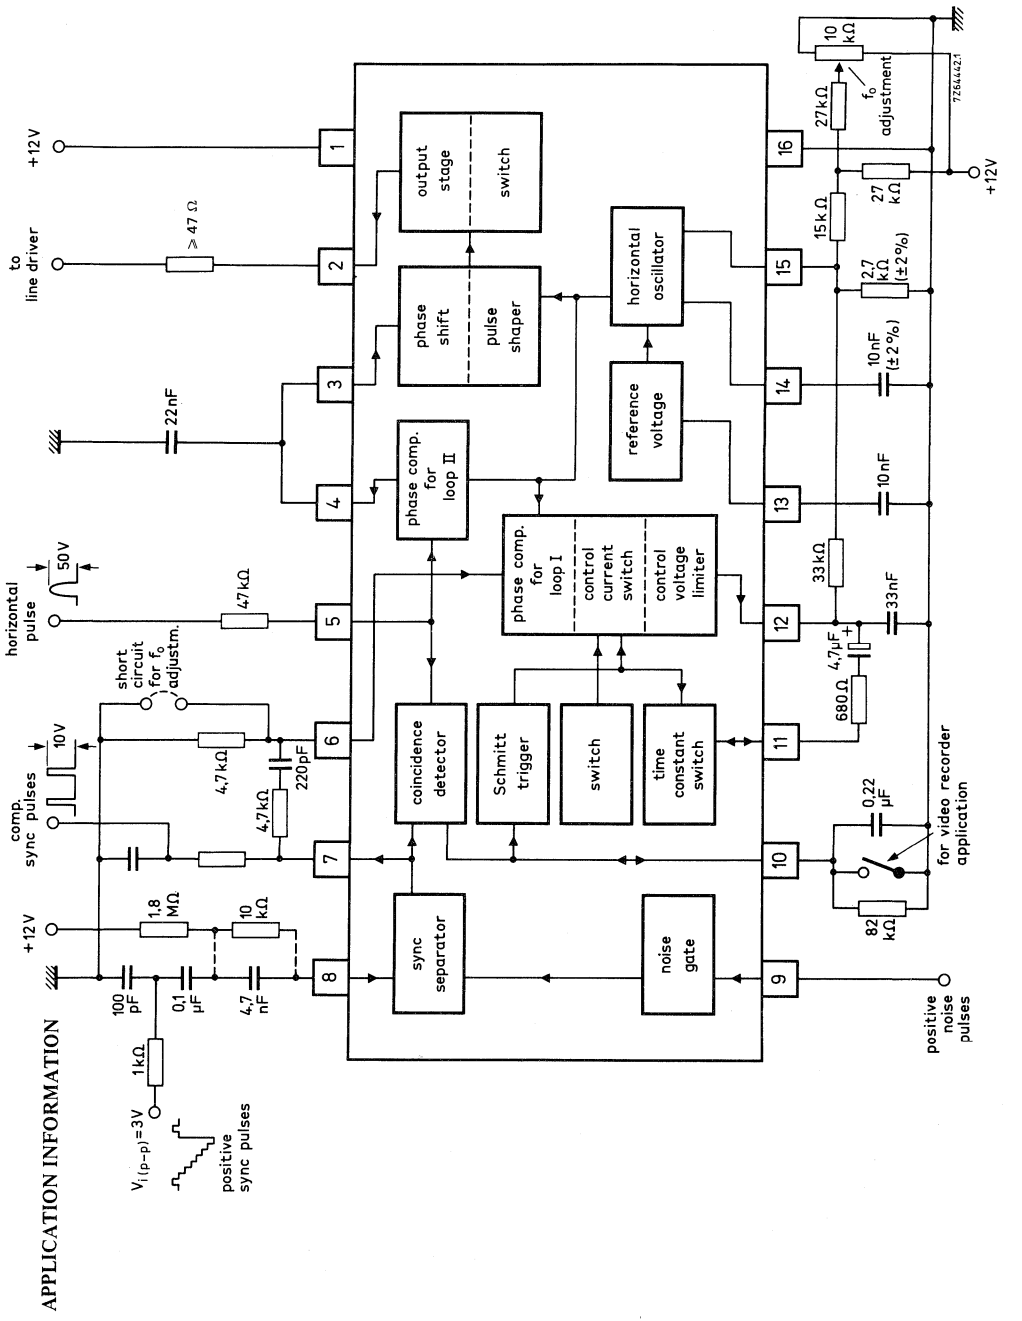
3) Adjustable with $R_{12-15}$.

**CHARACTERISTICS** (continued)

| | | | | | |
|---|---|---|---|---|---|
| Pull-in time for $\Delta f/f_o = \pm 3\%$ ($\Delta f$ = 470 Hz) | t | ≈ | 20 | ms | 1) |
| Switch-over from large control sensitivity to small control sensitivity after catching | t | ≈ | 20 | ms | 1) |
| Control loop II (between flyback pulse and oscillator) | | | | | |
| Permissible delay between leading edge of output pulse (pin 2) and leading edge of flyback pulse | $t_{d\ tot}$ | | 0 to 15 | µs | |
| Static control error | $\frac{\Delta t}{\Delta t_d}$ | < | 0,5 | % | 2) |
| Output current during flyback pulse (peak value) | $I_{4M}$ | typ. | ±0,7 | mA | |
| Overall phase relation | | | | | |
| Phase relation between leading edge of sync pulse and middle of flyback pulse | t | typ. | 4,9 | µs | 3) |
| Tolerance of phase relation | $\lvert\Delta t\rvert$ | < | 1 | µs | 4) |
| Voltage for $T_2$ = 12 to 32 µs | $V_{3\text{-}16}$ | | 6 to 8 | V | |
| Adjustment sensitivity | $\frac{\Delta T2}{\Delta V_{3\text{-}16}}$ | typ. | 10 | µs/V | |
| Input current | $I_3$ | < | 2 | µA | |
| External switch-over of parameters (loop filter and loop gain) of control loop I (e.g. for video recorder application) see note 5. | | | | | |
| Required switch-over voltage | | | | | |
| at $R_{11\text{-}16}$ = 150 Ω | $V_{10\text{-}16}$ | > | 4,5 | V | |
| at $R_{11\text{-}16}$ = 2 kΩ | $V_{10\text{-}16}$ | < | 2 | V | |
| Required switch-over current | | | | | |
| at $R_{11\text{-}16}$ = 150 Ω; $V_{10\text{-}16}$ = 4,5 V | $I_{10}$ | typ. | 80 | µA | 5) |
| at $R_{11\text{-}16}$ = 2 kΩ; $V_{10\text{-}16}$ = 2 V | $I_{10}$ | typ. | 120 | µA | |

1) See application information circuit on page 6.
2) The control error is the remaining error in reference to the nominal phase position between leading edge of the sync pulse and the middle of the flyback pulse caused by a variation in delay of the line output stage.
3) This phase relation assumes a luminance delay line with a delay of 500 ns between the input of the sync separator and the drive to the picuture tube. If the sync separator is inserted after the luminance delay line or if there is no delay line at all (black-and-white sets), then the phase relation is achieved at $C_{5\text{-}16}$ = 560 pF.
4) The adjustment of the overall phase relation and consequently the leading edge of the output pulse at pin 2 occurs automatically by the control loop II or by applying a d.c. voltage to pin 3.
5) With sync pulses at pin 7 and 8; without RC network at pin 10.

## APPLICATION INFORMATION

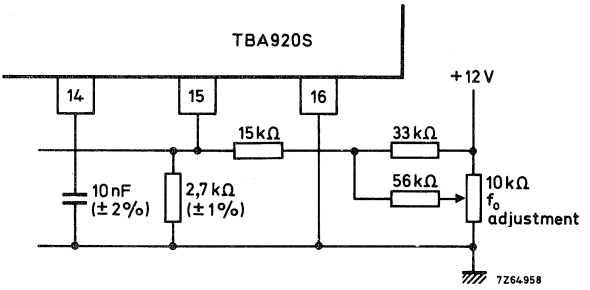


# HORIZONTAL COMBINATION

The TBA920S is identical to the TBA920, except for the following data:

Oscillator

| | | | | |
|---|---|---|---|---|
| Spread of frequency at $R_{15-16} = 3,3\ k\Omega$; $C_{14-16} = 10\ nF$ | $\frac{\Delta f_o}{f_o}$ | < | 1,5 | % |
| Adjustment range of frequency (in network below) | $\frac{\Delta f_o}{f_o}$ | typ. | ±5 | % |

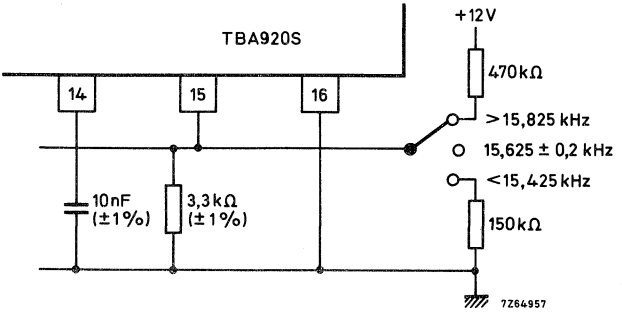


Note: The above network is the only part that differs from the circuit given on page 6 of TBA920 data.

Overall phase relation

| | | | | |
|---|---|---|---|---|
| Tolerance of phase relation between leading edge of sync pulse and middle of flyback pulse | $\lvert\Delta t\rvert$ | < | 0,4 | µs |

Other circuit possibilities for oscillator frequency adjustment



# CHROMINANCE AMPLIFIER FOR SECAM OR PAL/SECAM DECODERS

The TCA640 is an integrated chrominance amplifier for either a SECAM decoder or a double standard PAL/SECAM decoder.
Switching of the standard is performed internally, controlled by an external applied d.c. signal.
In addition to the chrominance amplifier the circuit also incorporates a 7,8 kHz flip-flop and an identification circuit for SECAM.
For PAL identification the circuit included in the TBA540 should be used.
Furthermore, the TCA640 incorporates a blanking circuit, a burst gating circuit and a colour killer detector.

**QUICK REFERENCE DATA**

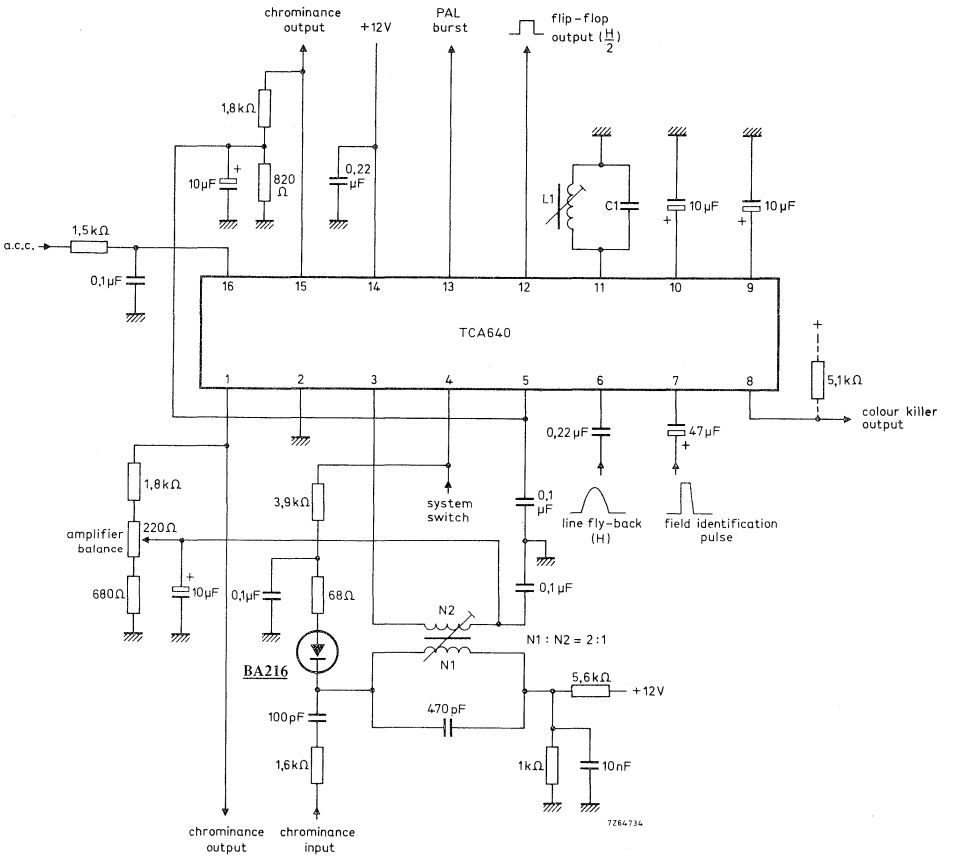
| Output resistance | | $R_{11-2}$ | | | 2 to 2,9 | kΩ |
| Flip-flop signal | | | | | | |
| peak-to-peak value | | $V_{12-2(p-p)}$ | | | 2,5 to 3,5 | V |
| Colour killer | killed | $V_{8-2}$ | | < | 0,5 | V |
| | | $I_8$ | | < | 10 | mA |
| | unkilled | $V_{8-2}$ | | | $V_{14-2}$ | V |
| | | $I_8$ | | < | 10 | μA |
| Bandwidth of chrominance amplifier (−1 dB) | | | | | | |
| at a carrier frequency of 4,2 MHz | | | | > | ±1 | MHz |
| Blanking | | | | | | |
| burst rejection | | | PAL | > | 40 | dB |
| rejection identification lines with field identification | | | SECAM | > | 40 | dB |

[1]) Over the a.c.c. control range the phase difference varies less than 2,5°.

[2]) The burst is kept constant at 1 V peak-to-peak by automatic gain control.

## APPLICATION INFORMATION



### Pinning

1. Chrominance output
2. Earth (negative supply)
3. Chrominance input
4. System switch input
5. Chrominance input
6. Line fly-back pulse input
7. Field identification pulse input
8. Colour killer output
9. Identification integrating
10. capacitor (SECAM)
11. Identification tank circuit (SECAM)
12. Flip-flop output
13. Burst output (PAL)
14. Supply voltage (12 V)
15. Chrominance output
16. A.C.C. input

**APPLICATION INFORMATION** (continued)

**The function is quoted against the corresponding pin number**

1. Chrominance output (in conjunction with pin 15)

   A balanced output is available at pins 1 and 15.
   At SECAM reception a limited signal of 2 V peak-to-peak is available, starting from an input voltage of 15 mV peak-to-peak.
   At PAL reception the output signal is 500 mV peak-to-peak for a burst signal of 1 V peak-to-peak.
   An external d.c. network is required which provides negative feedback to pin 3. The same holds for the feedback from pin 15 to pin 5.
   The figures for input and output signals are based on a 100% saturated colour bar signal.

2. Negative supply (earth)

3. Chrominance input (in conjunction with pin 5)

   The input signal is derived from a bandpass filter which provides the required "bell" shape bandpass for the SECAM signal and a flat bandpass for the PAL signal.
   The input signal can be supplied either in a balanced mode or single ended. Both inputs (pins 3 and 5) require a d.c. potential of about 2,5 V obtained from a resistive divider connected to output pins 1 and 15. The figures for the input signals are based on a 100% saturated colour bar signal and a burst-to-chrominance ratio of 1:3 of the input signal (PAL).

4. System switch input

   Between 7 V and the supply voltage, the gain of the chrominance amplifier is controlled by the a.c.c. voltage at pin 16.
   The chrominance amplifier then provides linear amplification required for the PAL signal.
   Between 0 V and 1 V the chrominance amplifier operates as a limiter for the SECAM signal.

5. Chrominance input (see pin 3)

6. Line fly-back pulse input (in conjunction with pin 11)

   Positive going pulses provide

   - blanking of the chrominance signal at the outputs (pins 1 and 15).
   - burst gating for both PAL and SECAM.
     The carrier signal present during the second half of the back porch of the SECAM signal is gated. It provides line identification when the circuit $L_1C_1$ (see circuit on page 6) is tuned to 4,25 MHz (at $C_1$ = 470 pF).
   - trigger signal for the flip-flop.

7. Field identification pulse input (in conjunction with pin 11)

   Like the line fly-back pulses, positive going identification pulses provide blanking and burst gating.
   To operate the TCA640 on the identification lines (SECAM) in the field blanking period the circuit $L_1C_1$ (see circuit on page 6) should be tuned to 3,9 MHz and the capacitor $C_1$ should be increased to 1 nF. The field fly-back pulse should be shaped so that its amplitude exceeds 4 V during the identification lines.

APPLICATION INFORMATION (continued)

8. Colour killer output

This pin is driven from the collector of an internal switching transistor and requires an external load resistor connected to the supply voltage. The killer is operative when the a.c.c. voltage exceeds the threshold, when the SECAM chrominance signal at the input is below the limiting level or when the flip-flop operates in the wrong phase.

9. Identification integrating capacitor (SECAM)

10. Identification integrating capacitor (SECAM)

11. Identification detector tank circuit (see pins 6 and 7)

12. Flip-flop output

A square wave of 7,8 kHz with an amplitude of 3 V is available at this pin.
An external load resistor is not required.

13. Burst output (PAL)

A 1 V peak-to-peak burst (kept constant by the a.c.c. system) is produced here.

14. Supply voltage (12 V)

Correct operation occurs within the range 10,2 to 13,2 V.
The power dissipation must not exceed 625 mW at 65 °C ambient temperature.

15. Chrominance output (see pin 1)

16. A.C.C. input

With the system switch input (pin 4) connected for PAL operation, a negative going potential gives a 26 dB range of a.c.c. starting at + 1,2 V
During SECAM operation, the voltage at the input should not exceed + 0,5 V, otherwise the SECAM identification circuit and the colour killer become inoperative.

# CHROMINANCE DEMODULATOR FOR SECAM OR PAL/SECAM DECODERS

The TCA650 is an integrated synchronous demodulator for both the SECAM and PAL chrominance signals.
Switching of the standard is performed internally, controlled by an external applied d.c. signal.
In addition to the synchronous demodulator, which delivers colour difference signals, the circuit also incorporates:

- a PAL matrix, used for adding the delayed and non-delayed signals to obtain separately the (R-Y) and (B-Y) components of the chrominance signal.
- a PAL switch, which reverses the phase of the (R-Y) component of the chrominance signal on alternating lines.
- a SECAM switch, which performs the separation of the $D_R$ and $D_B$ components of the chrominance signal by switching the delayed and non-delayed signals.
- a SECAM limiter.

| QUICK REFERENCE DATA | | | | | | |
|---|---|---|---|---|---|---|
| Supply voltage | | $V_{14-2}$ | nom. | 12 | | V |

| Output signal (peak-to-peak value) | $V_{13-2(p-p)}$<br>$V_{15-2(p-p)}$ | | 1,6 [2] to 2,2 | V |
| Output impedance | $\lvert Z_{13-2}\rvert$<br>$\lvert Z_{15-2}\rvert$ | | < 100 | Ω |

[1]) When a stabilized power supply of ≤ 12 V is applied, $T_{amb}$ is max. 75 °C.

[2]) At an input voltage of 0,15 V; at an input voltage > 0,2 V the figure is 1,7 V.

**CHARACTERISTICS** (continued)

Demodulator

Chrominance input signal amplitude

| | | | | |
|---|---|---|---|---|
| PAL: (B-Y); peak-to-peak value | $V_{9-2(p-p)}$ | typ. | 0,22 | V |
| (R-Y); peak-to-peak value | $V_{11-2(p-p)}$ | typ. | 0,28 | V |
| SECAM: peak-to-peak value | $V_{9-2(p-p)}$ / $V_{11-2(p-p)}$ | | 1,5 to 3 | V |
| Input impedance | $\lvert Z_{9-2}\rvert$ / $\lvert Z_{11-2}\rvert$ | > | 1 | kΩ |

Reference input signal amplitude

| | | | | |
|---|---|---|---|---|
| PAL: peak-to-peak value | $V_{6-2(p-p)}$ / $V_{7-2(p-p)}$ | | 0,5 to 1,5 | V |
| SECAM: peak-to-peak value | $V_{5-2(p-p)}$ / $V_{8-2(p-p)}$ | | 0,18 [1] to 1,5 | V |
| Input impedance | $\lvert Z_{5-2}\rvert$; $\lvert Z_{7-2}\rvert$ / $\lvert Z_{6-2}\rvert$; $\lvert Z_{8-2}\rvert$ | | 0,75 to 1,25 | kΩ |

Colour difference output signal

| | | | | |
|---|---|---|---|---|
| (R-Y); peak-to-peak value | $V_{12-2(p-p)}$ | | 0,99 to 1,21 | V [2] |
| (B-Y); peak-to-peak value | $V_{10-2(p-p)}$ | | 1,32 to 1,62 | V [2] |
| Output impedance | $\lvert Z_{10-2}\rvert$ / $\lvert Z_{12-2}\rvert$ | | 2,4 to 4,2 | kΩ |

Diaphotie at SECAM operation

| | | | | |
|---|---|---|---|---|
| Diaphotie of the total circuit at frequencies corresponding to saturated green $D_R$ = 4,72 MHz and $D_B$ = 4,04 MHz | | < | −40 | dB |

Square wave input

| | | | | |
|---|---|---|---|---|
| peak-to-peak value | $V_{16-2(p-p)}$ | | 2,5 to 3,5 | V |
| Input impedance | $\lvert Z_{16-2}\rvert$ | > | 3,8 | kΩ |

System switch input [3]

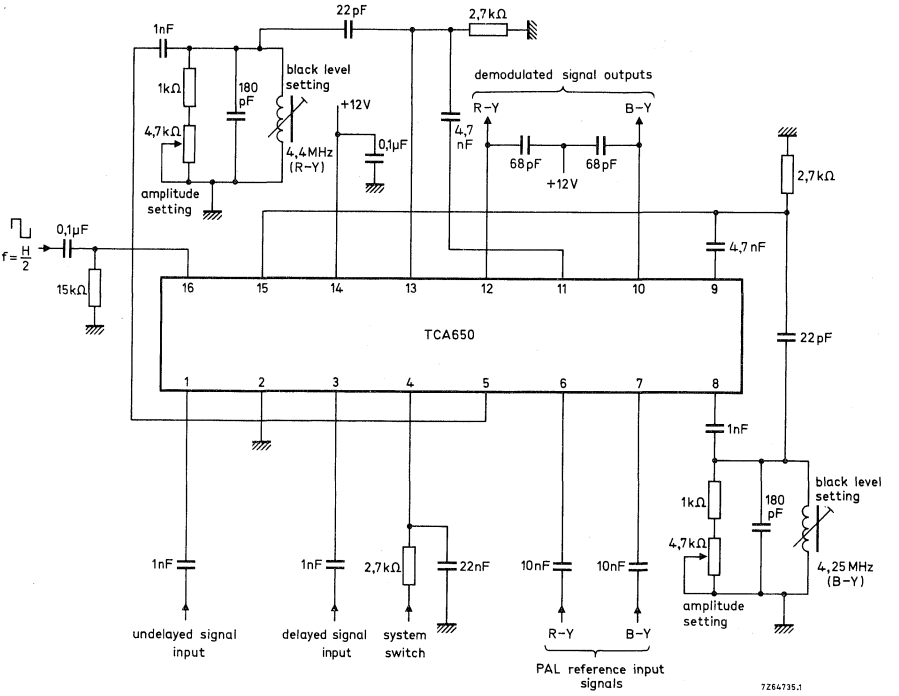
| | | |
|---|---|---|
| PAL: | 7 to $V_{14-2}$ | V |
| SECAM: | 0 to 1 | V |

[1]) Limiting starts at the quoted value.

[2]) The peak-to-peak clipping level for PAL is about 4,7 V for (B-Y) and 3 V for (R-Y). The discriminator characteristic allows a maximum peak-to-peak output signal of 3,6 V for (B-Y) and 2,4 V for (R-Y) (SECAM).

[3]) The switching signal is applied to pin 4 via a resistor of 2,7 kΩ (±10%).

## APPLICATION INFORMATION



### Pinning

1. Chrominance input
2. Earth (negative supply)
3. Chrominance input
4. System switch input
5. Reference (R-Y) input SECAM
6. Reference (R-Y) input PAL
7. Reference (B-Y) input PAL
8. Reference (B-Y) input SECAM

10. Colour difference (B-Y) output
11. Chrominance (R-Y), $D_R$ input
12. Colour difference (R-Y) output
13. Chrominance (R-Y), $D_R$ output
14. Supply voltage (12 V)
15. Chrominance (B-Y), $D_B$ output
16. Square wave input

**APPLICATION INFORMATION** (continued)

**The function is quoted against the corresponding pin number**

1. Chrominance input

   The blanked composite chrominance signal from pin 1 of the TCA640 is applied to this input via a resistive divider.

2. Negative supply (earth)

3. Chrominance input

   The blanked composite chrominance signal from pin 15 of the TCA640 is applied to this input via a delay-line, which has a delay time of 64 µs.

4. System switch input

   The control voltage for switching the standard is applied to this input via a resistor of 2,7 kΩ (± 10%). A decoupling capacitor of at least 10 nF is recommended. Between 7 V and the supply voltage the circuit operates in the PAL mode, whereas between 0 V and 1 V the mode SECAM is selected.

5. Reference input for the (R-Y) demodulator

   The SECAM reference signal is applied to this pin. The reference signal is obtained from pin 11 via a tank circuit. The tank circuit is tuned such that the level at the (R-Y) output (pin 12) during black ($f_o$ = 4,4 MHz) equals the level during blanking (no signal). The output voltage amplitude at pin 12 can be adjusted by damping the tank circuit.

6. Reference input for the (R-Y) demodulator

   A PAL reference signal having (R-Y) phase is applied to this pin.

7. Reference input for the (B-Y) demodulator

   A PAL reference signal having (B-Y) phase is applied to this pin.

8. Reference input for the (B-Y) demodulator

   The SECAM reference signal is applied to this pin. The reference signal is obtained from pin 15 via a tank circuit. The tank circuit is tuned such that the level at the (B-Y) output (pin 10) during black ($f_o$ = 4,25 MHz) equals the level during blanking (no signal). The output voltage amplitude at pin 10 can be adjusted by damping the tank circuit.

9. Chrominance input to the (B-Y), $D_B$ demodulator

   The output signal of pin 15 is applied via a coupling capacitor of 4,7 nF.

10. Output of the (B-Y) demodulator

    The output signal of the balance demodulator contains an r.f. ripple of twice the chrominance frequency to be filtered by a $\pi$ filter. At SECAM the required de-emphasis circuit should be applied.

11. Chrominance input to the (R-Y), $D_R$ demodulator

    The output signal of pin 13 is applied via a coupling capacitor of 4,7 nF.

**APPLICATION INFORMATION** (continued)

12. Output of the (R-Y) demodulator

See pin 10.

13. Chrominance (R-Y), $D_R$ output

The (R-Y) component of the chrominance signal ($D_R$ component at SECAM) is present at this pin.
The signal is applied to the input of the (R-Y) demodulator (pin 11) and to the tank circuit for the SECAM reference signal.
The emitter follower output should be loaded with a 2,7 kΩ resistor to obtain an output impedance of <100 Ω.

14. Supply voltage (12 V)

Correct operation occurs within the range 10,2 to 13,2 V.
The power dissipation must not exceed 510 mW at 65 °C ambient temperature.

15. Chrominance (B-Y), $D_B$ output

The (B-Y) component of the chrominance signal ($D_B$ component at SECAM) is present at this pin.
The signal is applied to the input of the (B-Y) demodulator (pin 9) and to the tank circuit for the SECAM reference signal.
The emitter follower output should be loaded with a 2,7 kΩ resistor to obtain an output impedance of <100 Ω.

16. Square wave input

A square wave with an amplitude of 3 V drives the PAL switch or the SECAM permutator.
The square wave is available at pin 12 of the TCA640.

# CONTRAST, SATURATION AND BRIGHTNESS CONTROL CIRCUIT FOR COLOUR DIFFERENCE AND LUMINANCE SIGNALS

The TCA660B is an integrated circuit performing the control functions of contrast, saturation and brightness in colour television receivers.
Contrast is controlled by three tracking electronic potentiometers; one for the luminance signal and the other two for the (R-Y) and (B-Y) colour difference signals.
In addition two tracking electronic potentiometers provide the saturation control of the colour difference signals.
Brightness is controlled by varying the black level of the luminance signal at the output.
An inverting amplifier is also included for matrixing the (G-Y) signal from the (R-Y) and (B-Y) colour difference signals.

| QUICK REFERENCE DATA | | | | | |
|---|---|---|---|---|---|
| Supply voltage | $V_{13-4}$ | nom. | 12 | V | |
| Supply current | $I_{13}$ | nom. | 35 | mA | |
| Luminance input current (black-to-white positive video signal) | $I_{16}$ | typ. | 0,7 | mA | |

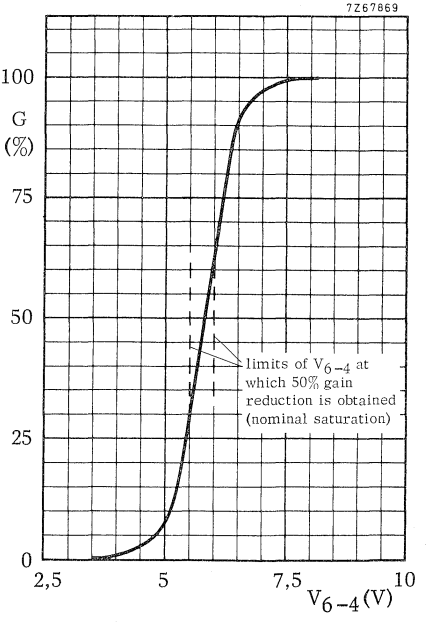
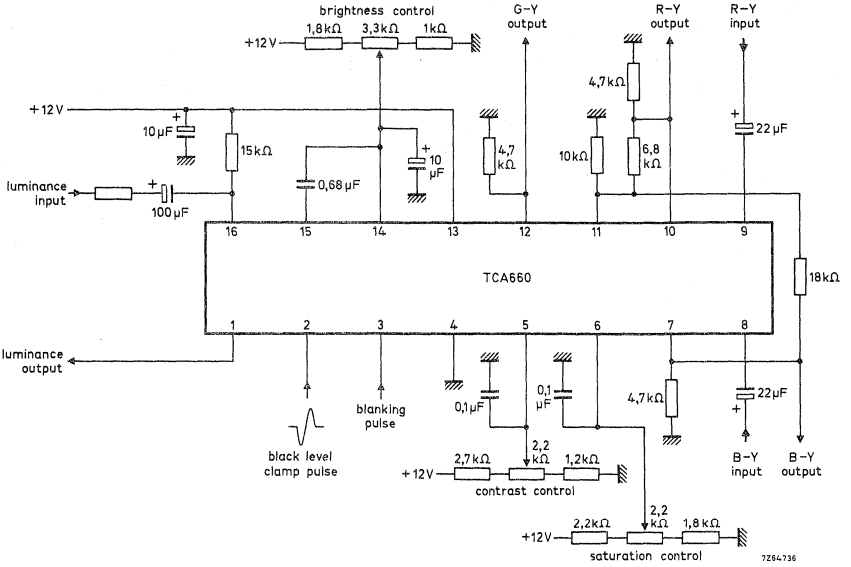
Contrast control of luminance amplifier



Saturation control of chrominance amplifier

## APPLICATION INFORMATION



### Pinning

1. Luminance signal output
2. Black level clamp pulse input
3. Blanking pulse input
4. Earth (negative supply)
5. Contrast control input
6. Saturation control input
7. (B-Y) signal output
8. (B-Y) signal input
9. (R-Y) signal input
10. (R-Y) signal output
11. (G-Y) signal input
12. (G-Y) signal output
13. Supply voltage (12 V)
14. Brightness control input
15. Black level clamp capacitor
16. Luminance signal input

**APPLICATION INFORMATION** (continued)

**The function is quoted against the corresponding pin number**

1. Luminance signal output

   A positive video signal of 3 V peak-to-peak is available at nominal contrast setting. The black level is clamped internally on the back porch.
   By means of the brightness control the black level can be varied between 2,2 V and 5,2 V. The blanking level of the output signal will assume a value of 3,0 to 3,4 V.

2. Black level clamp pulse input

   A positive pulse with a peak value between +1 V and +12 V will clamp the black level of the video signal to a nominal level of 4,2 V. The pulse may only be present during the back porch and should have a duration of about 3 µs.

3. Blanking pulse input

   Two modes operation can be selected by the choice of the amplitude of the pulse applied:

   - blanking

   - black level reinsertion

   Blanking of the luminance output signal is obtained when the peak value of the pulse ranges from −1,5 to −10 V. An artificial black level of nominally +4,2 V is inserted in the luminance output signal during the blanking period when the peak value of the pulse ranges from +2 to +12 V.
   During scan the amplitude at pin 3 should remain between +0,7 V and −0,7 V to avoid blanking.

4. Negative supply (earth)

5. Contrast control input

   The contrast curve is given on page 4. To avoid damaging of the circuit by flash-over pulses, picked-up by the leads, it is recommended that a capacitor of 100 nF be connected between this pin and earth.

6. Saturation control input

   The control curve is given on page 4. To avoid damaging of the circuit by flash-over pulses, picked-up by the leads, it is recommended that a capacitor of 100 nF be connected between this pin and earth.

7. (B-Y) signal output

   The amplitude of this signal is controlled by the contrast setting and the saturation setting simultaneously. At nominal contrast and nominal saturation setting an amplitude of 1,6 V peak-to-peak is obtained at an input amplitude of 0,9 V peak-to-peak. The average level is typically 6,1 V.

8. (B-Y) signal input

   The signal has to be a.c. coupled to the input.
   To cope with the variation of picture contents an input voltage margin of ±0,8 V is provided, whereas the input signal has a typical value of ±0,45 V for a saturated colour bar signal.

**APPLICATION INFORMATION** (continued)

9. (R-Y) signal input

The signal has to be a.c. coupled to the input.
To cope with the variation of picture contents an input voltage margin of ± 0, 8 V is provided, whereas the input signal has a typical value of ± 0, 35 V for a saturated colour bar input.

10. (R-Y) signal output

The amplitude of this signal is controlled by the contrast setting and saturation setting simultaneously. At nominal contrast and nominal saturation setting an amplitude of 1, 25 V peak-to-peak is obtained at an input amplitude of 0, 7 V peak to peak.
The average level is typically 6, 1 V.

11. (G-Y) signal input

The (G-Y) signal is obtained by matrixing a part of the (R-Y) and (B-Y) signals in a resistor network. The input may range from 1 to 6, 5 V.
An average level of typical 5, 9 V is required to produce an average output level of 6, 1 V.
The gain of the inverter stage is typically 1.

12. (G-Y) signal output

An inverted signal with an amplitude of maximum 1 V peak-to-peak is available at this pin.

13. Supply voltage (12 V)

Correct operation occurs within the range 10, 2 to 13, 2 V.
The power dissipation must not exceed 600 mW at 65 °C ambient temperature.

14. Brightness control input

The black level of the luminance output signal tracks the potential applied to this pin.
A typical value for setting the brightness control is 5, 7 V, for which a black level of 4, 2 V is obtained.
It is recommended that a capacitor of at least 10 µF be connected between this pin and earth.

15. Black level clamp capacitor

The level of the back porch of the luminance output signal is stored in an external capacitor of about 0, 68 µF; the latter to be connected between pins 14 and 15.

16. Luminance signal input

A positive luminance signal of 0, 7 mA peak-to-peak between black and white level drives the luminance amplifier.
A black level of about 0, 3 mA is recommended. For a.c. coupling a bias resistor to the supply line is required to bias the amplifier properly.
The resistance depends on the signal amplitude e.g.: 15 kΩ is recommended for a input signal of 0, 7 mA peak-to-peak.

# DOUBLE BALANCED MODULATOR/DEMODULATOR

The TDA0820T is a monolithic integrated circuit for use at frequencies up to 650 MHz.
Typical applications are:

- modulator
- mixer
- switch/chopper
- a.m. synchronous demodulator
- f.m. quadrature demodulator
- phase comparator
- differential amplifier

The circuit is arranged to offer very flexible circuit design possibilities. The excellent matching and temperature tracking of the transistors in the circuit allow the use of circuit techniques which are not available when using discrete devices.

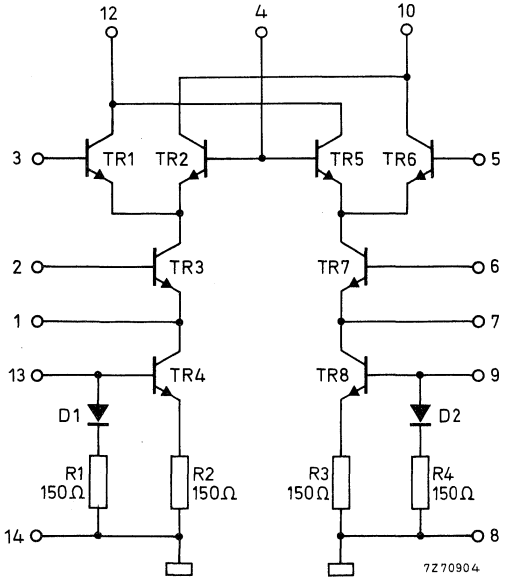


Fig. 1 Circuit diagram.

## PACKAGE OUTLINE

14-lead mini-pack; plastic (SO-14; SOT-108A).

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | |
|---|---|---|---|
| Supply voltage range | $V_{10-8}$; $V_{10-14}$; $V_{12-8}$; $V_{12-14}$ | 0 to 13,2 | V |
| **Voltages** (each transistor) | | | |
| Collector-substrate voltage (open base) and emitter) | $V_{CSO}$ | max. 15 | V |
| Collector-base voltage (open emitter) | $V_{CBO}$ | max. 12 | V |
| Collector-emitter voltage (open base) | $V_{CEO}$ | max. 10 | V |
| Emitter-base voltage (open collector) | $V_{EBO}$ | max. 5 | V |
| **Currents** (each transistor) | | | |
| Emitter current | $I_E$ | max. 10 | mA |
| Base current | $I_B$ | max. 10 | mA |
| Total power dissipation when mounted on a printed-circuit board | $P_{tot}$ | max. 250 | mW |
| Storage temperature | $T_{stg}$ | −55 to + 125 | °C |
| Operating ambient temperature | $T_{amb}$ | 0 to + 70 | °C |

## THERMAL RESISTANCE

| | | | |
|---|---|---|---|
| From junction to ambient | $R_{th\ j\text{-}a}$ | = 220 | K/W |

## CHARACTERISTICS

$V_{10-8} = V_{10-14} = V_{12-8} = V_{12-14} = 12$ V; $T_{amb} = 25$ °C; measured in Fig. 2

# SIGNAL-SOURCES SWITCH

The TDA1028 is a quadruple operational amplifier connected as an impedance converter. Each amplifier has 2 switchable inputs which are protected by clamping diodes. The input currents are independent of the switch position and the outputs are short-circuit protected.

The device is intended as an electronic four-channel signal-sources switch in a.f. amplifiers.

## QUICK REFERENCE DATA

| | | | | |
|---|---|---|---|---|
| Supply voltage range (pin 9) | $V_P$ | | 6 to 23 | V |
| Operating ambient temperature | $T_{amb}$ | | −30 to + 80 | °C |
| Supply voltage (pin 9) | $V_P$ | typ. | 20 | V |
| Current consumption (pins 4, 5, 12, 13 unloaded) | $I_g$ | typ. | 2,9 | mA |
| Maximum input signal handling (r.m.s. value) | $V_{i(rms)}$ | typ. | 6 | V |
| Voltage gain | $G_v$ | typ. | 1 | |

# 12 TO 20 W HI-FI AUDIO POWER AMPLIFIER

The TDA1512 is a monolithic integrated hi-fi audio power amplifier designed for asymmetrical power supplies for mains-fed apparatus.
Special features are:

- Thermal protection
- Low intermodulation distortion
- Low transient intermodulation distortion
- Built-in output current limiter
- Low input offset voltage
- Output stage with low cross-over distortion
- Single in-line (SIL) power package

## QUICK REFERENCE DATA

# 20 W HI-FI AUDIO POWER AMPLIFIER

The TDA1520 is a monolithic integrated hi-fi audio power amplifier designed for asymmetrical or symmetrical power supplies for mains-fed apparatus.
Special features are:

- Thermal protection
- Very low intermodulation distortion
- Very low transient intermodulation distortion
- Built-in output current limiter
- Low input offset voltage
- Output stage with low cross-over distortion
- Single in-line (SIL) power package
- A.C. short-circuit protected

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage range | $V_P$ | 15 to 40 | V |
| Total quiescent current at $V_P$ = 33 V | $I_{tot}$ | typ. 45 | mA |

# STEREO-TONE VOLUME CONTROL CIRCUIT

## GENERAL DESCRIPTION

The TDA1524 is a monolithic integrated circuit designed as an active stereo-tone volume control for car radios, TV receivers and mains-fed equipment. It includes functions for bass and treble control, volume control with built-in contour (can be switched off) and balance. All these functions can be controlled by d.c. voltages or by single linear potentiometers.

### Features

- Few external components necessary
- Low noise due to internal gain
- Base emphasis can be increased by an additional filter
- Wide power supply voltage range

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage (pin 3) | $V_P = V_{3\text{-}18}$ | typ. | 12 V |
| Supply current (pin 3) | $I_P = I_3$ | typ. | 35 mA |
| Maximum input signal with d.c. feedback (r.m.s. value) | $V_{i(rms)}$ | typ. | 3 V |
| Maximum output signal with d.c. feedback (r.m.s. value) | $V_{o(rms)}$ | typ. | 3 V |
| Volume control range | $G_v$ | | −80 to +21,5 dB |
| Bass control range at 40 Hz | $\Delta G_v$ | typ. | ±15 dB |
| Treble control range at 16 kHz | $\Delta G_v$ | typ. | ±15 dB |
| Total harmonic distortion | THD | max. | 0,5 % |
| Output noise voltage (r.m.s. value) | $V_{no(rms)}$ | max. | 100 μV |
| Cross-talk attenuation at $G_v$ = −20 to +21,5 dB | $\alpha_{ct}$ | typ. | 60 dB |
| Tracking between channels at $G_v$ = −20 to +21,5 dB | $\Delta G_v$ | max. | 2,5 dB |
| Ripple rejection at 100 Hz | $\alpha_{100}$ | typ. | 50 dB |
| Supply voltage range (pin 3) | $V_P = V_{3\text{-}18}$ | | 7,5 to 16,5 V |
| Operating ambient temperature range | $T_{amb}$ | | −30 to + 80 °C |

# CHROMINANCE COMBINATION

The TDA2510 is an integrated chrominance amplifier circuit for colour television receivers incorporating the following functions:

- chrominance amplifier with a.c c.
- control voltage amplifier
- burst separator
- colour killer and colour killer voltage detector
- linear electronic potentiometer for saturation control
- Schmitt trigger for colour killer
- chrominance delay line driver stage
- colour burst output stage

| QUICK REFERENCE DATA | | | |
|---|---|---|---|
| Supply voltage | $V_{1-16}$ | typ. | 12 V |
| Input signal (colour bars) peak-to-peak value | $V_{2-16(p-p)}$ | typ. | 100 mV |
| Output signal (colour bars) peak-to-peak value | $V_{7-16(p-p)}$ | typ. | 0,5 V |
| Burst signal output peak-to-peak value | $V_{8-16(p-p)}$ | typ. | 0,5 V |

**PACKAGE OUTLINES**

TDA2510 : 16-lead DIL; plastic (SOT-38).
TDA2510Q : 16-lead QIL; plastic (SOT-58).

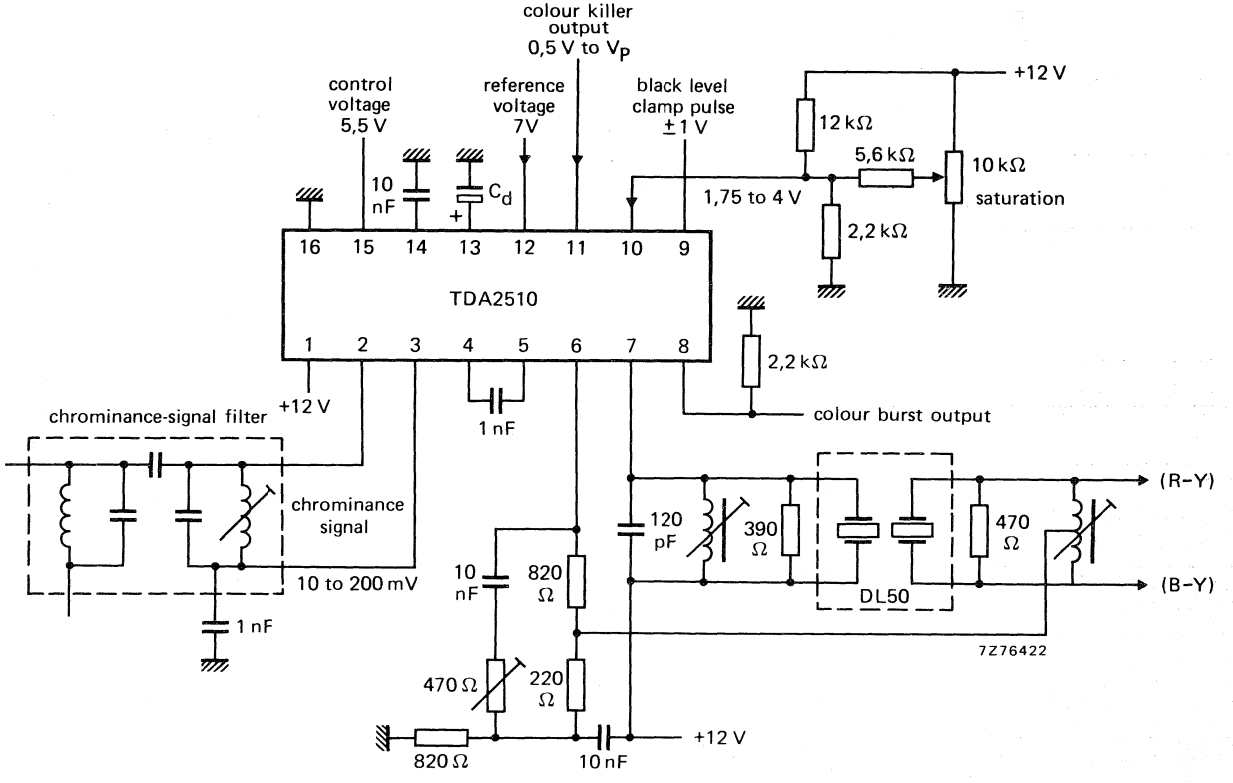
## APPLICATION INFORMATION



# COLOUR DEMODULATOR COMBINATION

The TDA2520 is an integrated synchronous demodulator combination for colour television receivers incorporating the following functions:

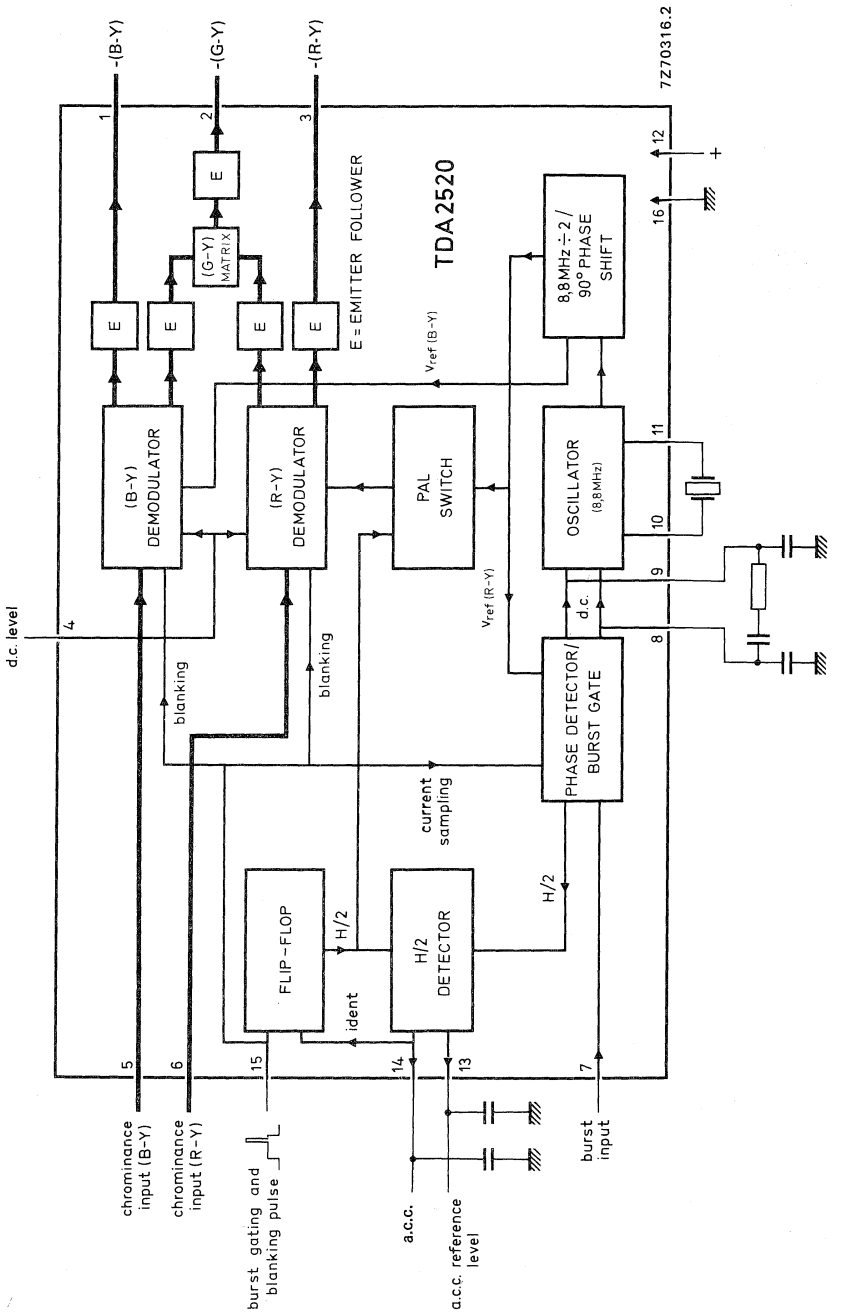
- 8,8 MHz oscillator followed by a divider giving two 4,4 MHz signals used as reference signals
- keyed burst phase detector for optimum noise behaviour
- a stage to obtain chrominance signal control (a.c.c.) and an a.c.c. reference level
- a colour killer and identification signal detector
- two synchronous demodulators for the (B-Y) and (R-Y) signals
- temperature compensated emitter follower outputs
- PAL switch
- PAL flip-flop
- integrated capacitors in the symmetrical demodulators reduce unwanted carrier-signals at the outputs.

| QUICK REFERENCE DATA | | | | | |
|---|---|---|---|---|---|
| Supply voltage | | $V_{12-16}$ | typ. | 12 | V |
| Supply current | | $I_{12}$ | typ. | 40 | mA |
| Colour difference output signals peak-to-peak values | -(R-Y) | $V_{3-16(p-p)}$ | > | 2,4 | V |
| | -(G-Y) | $V_{2-16(p-p)}$ | > | 1,35 | V |
| | -(B-Y) | $V_{1-16(p-p)}$ | > | 3 | V |
| Impedance of colour difference signal outputs | | | typ. | 250 | Ω |

## PACKAGE OUTLINES

TDA2520 : 16-lead DIL ; plastic (SOT-38).
TDA2520Q: 16-lead QIL ; plastic (SOT-58).

## BLOCK DIAGRAM



**RATINGS** Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | | |
|---|---|---|---|---|
| Voltage | | | | |
| Supply voltage | $V_{12-16}$ | max. | 14 | V |
| Power dissipation | | | | |
| Total power dissipation | $P_{tot}$ | max. | 600 | mW |
| Temperatures | | | | |
| Storage temperature | $T_{stg}$ | | −20 to +125 | °C |
| Operating ambient temperature | $T_{amb}$ | | −20 to +60 | °C |

**CHARACTERISTICS** at $V_{12-16}$ = 12 V; $T_{amb}$ = 25 °C

**Demodulator part**

| | | | | | |
|---|---|---|---|---|---|
| Ratio of demodulated signals | | | | | |
| | B-Y/R-Y: | $\frac{V_{1-16}}{V_{3-16}}$ | typ. | 1,78 | |
| | G-Y/R-Y: | $\frac{V_{2-16}}{V_{3-16}}$ | typ. | 0,85 | 1) |
| | G-Y/R-Y: | $\frac{V_{2-16}}{V_{3-16}}$ | typ. | 0,17 | 2) |
| Colour difference output signals 3) | | | | | |
| peak-to-peak values | −(R-Y) | $V_{3-16(p-p)}$ | > | 2,4 | V |
| | −(G-Y) | $V_{2-16(p-p)}$ | > | 1,35 | V |
| | −(B-Y) | $V_{1-16(p-p)}$ | > | 3 | V |
| Impedance of colour difference signal outputs | | $\lvert Z_{3-16}\rvert$ | typ. | 250 | Ω |
| | | $\lvert Z_{2-16}\rvert$ | typ. | 250 | Ω |
| | | $\lvert Z_{1-16}\rvert$ | typ. | 250 | Ω |
| H/2 ripple at R-Y output (peak-to-peak value) | | | < | 10 | mV |
| Blanking and keying pulse | | | | | |
| burst keying: active for | | $V_{15-16}$ | > | 7,5 | V |

| | | | | | |
|---|---|---|---|---|---|
| Via pin 14 | | | | | |
| Colour off | $V_{14-4}$ | > | 6 | V | |
| Colour on | $V_{14-4}$ | < | 5,6 | V | |
| Alternatively via pin 16 | | | | | |
| Colour off | $V_{16-4}$ | > | 7 | V | |
| Colour on | $V_{16-4}$ | < | 5 | V | |
| Colour unkill delay | $t_d$ | typ. | 20 | ms/µF | 3) |

1) The amplitude of the burst is kept constant by a.c.c. action, but depends linearly on the keying pulse width.

2) To be established.

3) The delay depends on the value of $C_d$.

# COLOUR DEMODULATOR COMBINATION

The TDA2523 is an integrated synchronous demodulator combination for colour television receivers incorporating the following functions :

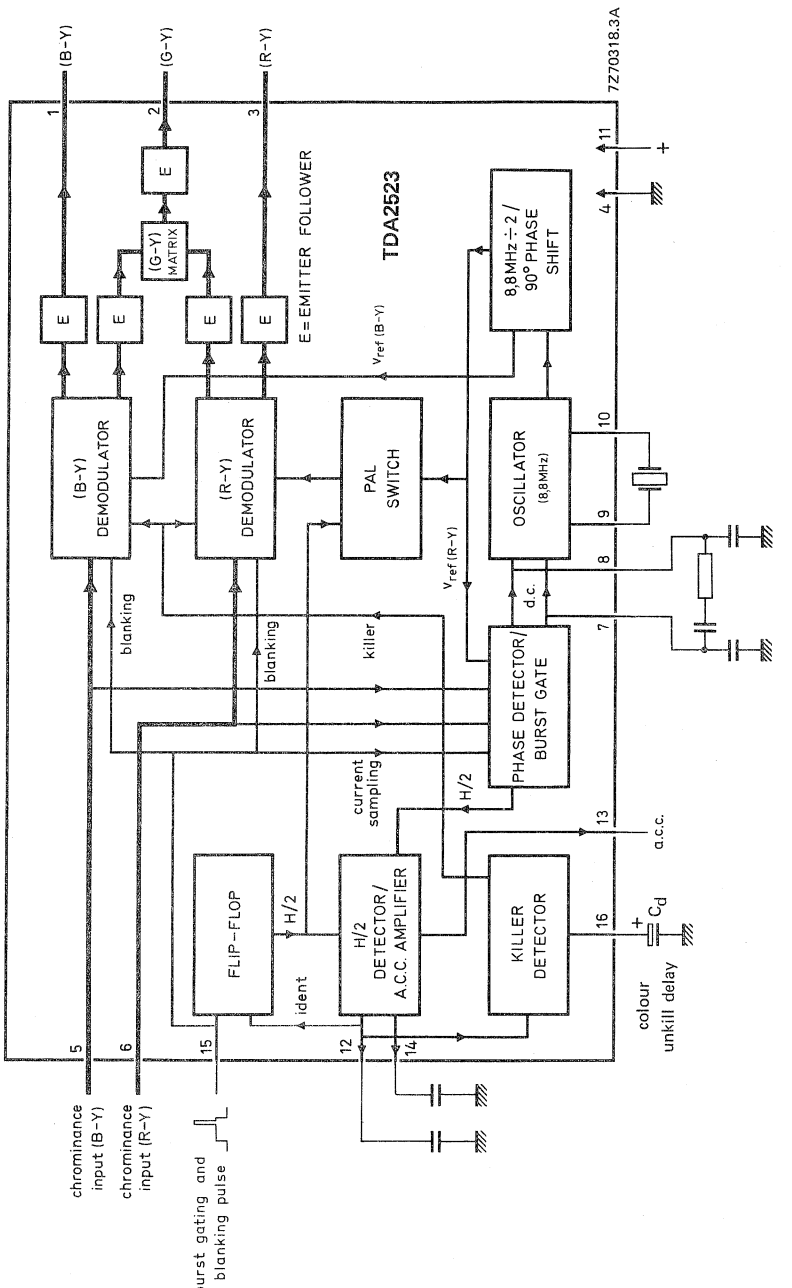
- 8, 8 MHz oscillator followed by a divider giving two 4, 4 MHz signals used as reference signals
- keyed burst phase detector for optimum noise behaviour
- a.c.c. detector and amplifier
- a colour killer
- two synchronous demodulators for the (B-Y) and (R-Y) signals
- temperature compensated emitter follower outputs
- PAL switch and PAL flip-flop with internal identification
- integrated capacitors in the symmetrical demodulators reduce unwanted carrier signals at the outputs

| QUICK REFERENCE DATA | | | | | |
|---|---|---|---|---|---|
| Supply voltage | | $V_{11-4}$ | typ. | 12 | V |
| Supply current | | $I_{11}$ | typ. | 40 | mA |
| Colour difference output signals peak-to-peak values; for the following input signals | (R-Y) | $V_{3-4(p-p)}$ | > | 2, 4 | V |
| | (G-Y) | $V_{2-4(p-p)}$ | > | 1, 35 | V |
| | (B-Y) | $V_{1-4(p-p)}$ | > | 3 | V |
| Chrominance input signal (including burst) peak-to-peak value | R-Y | $V_{6-4(p-p)}$ | | 500 | mV |
| | B-Y | $V_{5-4(p-p)}$ | | 350 | mV |
| Impedance of colour difference signal outputs | | | typ. | 250 | Ω |

**PACKAGE OUTLINES**

TDA2523 : 16-lead DIL ; plastic (SOT-38).
TDA2523Q: 16-lead QIL ; plastic (SOT-58).

## BLOCK DIAGRAM



**RATINGS** Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | | |
|---|---|---|---|---|
| Supply voltage | $V_{11-4}$ | max. | 14 | V |
| Total power dissipation | $P_{tot}$ | max. | 600 | mW |
| Storage temperature | $T_{stg}$ | | −20 to +125 | °C |
| Operating ambient temperature | $T_{amb}$ | | −20 to +60 | °C |

**CHARACTERISTICS** at $V_{11-4}$ = 12 V; $T_{amb}$ = 25 °C

**Demodulator part**

| | | | | | |
|---|---|---|---|---|---|
| Ratio of demodulated signals | | | | | |
| | B-Y/R-Y: | $\frac{V_{1-4}}{V_{3-4}}$ | typ. | 1,78 | |
| | G-Y/R-Y: | $\frac{V_{2-4}}{V_{3-4}}$ | typ. | 0,85 | 1) |
| | G-Y/R-Y: | $\frac{V_{2-4}}{V_{3-4}}$ | typ. | 0,17 | 2) |
| Colour difference output signals peak-to-peak values; for the following input signals | (R-Y) | $V_{3-4(p-p)}$ | > | 2,4 | V |
| | (G-Y) | $V_{2-4(p-p)}$ | > | 1,35 | V |
| | (B-Y) | $V_{1-4(p-p)}$ | > | 3 | V |
| Chrominance input signal (including burst) peak-to-peak value; note 3 | R-Y | $V_{6-4(p-p)}$ | | 500 | mV |
| | B-Y | $V_{5-4(p-p)}$ | | 350 | mV |
| Impedance of colour difference signal outputs | | $\lvert Z_{3-4}\rvert$ | typ. | 250 | Ω |
| | | $\lvert Z_{2-4}\rvert$ | typ. | 250 | Ω |
| | | $\lvert Z_{1-4}\rvert$ | typ. | 250 | Ω |
| H/2 ripple at R-Y output (peak-to-peak value) | | | < | 10 | mV |
| Blanking and keying pulse | | | | | |
| burst keying: active for | | $V_{15-4}$ | > | 7,5 | V |
| inactive for | | $V_{15-4}$ | < | 6,5 | V |
| blanking: active for | | $V_{15-4}$ | > | 2 | V |
| inactive for | | $V_{15-4}$ | < | 1 | V |

1) The demodulators are driven by a chrominance signal of equal amplitude for the (R-Y) and the (B-Y) components. The phase of the (R-Y) chrominance signal equals the phase of the (R-Y) reference signal.
The same holds for the (B-Y) signals.

2) As under note 1, but the phase of the (R-Y) reference signal reversed.

3) Colour bar with 75% saturation.

**CHARACTERISTICS** (continued)

**Reference part**

| | | | | | |
|---|---|---|---|---|---|
| Phase difference between reference and burst signals for ±400 Hz deviation of crystal frequency | | < | ±5° | | |
| Overall holding range with typical crystal | $\Delta f$ | typ. | ±500 | Hz | |
| Burst signal input at keying pulse width of 4 µs (peak-to-peak value) | $V_{5-6(p-p)}$ | typ. | 0,25 | V | 1) |
| Oscillator input resistance | $R_{10-4}$ | typ. | 270 | Ω | |
| Oscillator input capacitance | $C_{10-4}$ | typ. | note 2 | pF | |
| Oscillator output resistance | $R_{9-4}$ | typ. | 200 | Ω | |
| A.C.C. reference voltage | $V_{12-4}$ | typ. | 7 | V | |
| A.C.C. voltage at 0,25 V peak-to-peak burst at correct phase: | $V_{14-4}$ | typ. | 5,5 | V | |
| with zero burst: | $V_{14-4}$ | typ. | 7,0 | V | |
| A.C.C. amplifier output voltage range at $\pm I_{13} < 200$ µA | $V_{13-4}$ | | 0,5 to 5 | V | |

**Colour killer**

| | | | | | |
|---|---|---|---|---|---|
| Via pin 14 | | | | | |
| Colour off | $V_{14-4}$ | > | 6 | V | |
| Colour on | $V_{14-4}$ | < | 5,6 | V | |
| Alternatively via pin 16 | | | | | |
| Colour off | $V_{16-4}$ | > | 7 | V | |
| Colour on | $V_{16-4}$ | < | 5 | V | |
| Colour unkill delay | $t_d$ | typ. | 20 | ms/µF | 3) |

1) The amplitude of the burst is kept constant by a.c.c. action, but depends linearly on the keying pulse width.

2) To be established.

3) The delay depends on the value of $C_d$.

# COLOUR DEMODULATOR COMBINATION

The TDA2524 is an integrated synchronous demodulator combination for PAL colour television receivers incorporating the following functions:

- Two synchronous demodulators for the (B-Y) and (R-Y) signals.
- 8,8 MHz oscillator followed by a divider giving two 4,4 MHz signals used as reference signals.
- A colour killer and identification signal detector.
- A.C.C. detection by peak value rectification.
- Colour unkill delay.
- (G-Y) signal matrix.
- Integrated capacitors to reduce unwanted carrier signals at the outputs.
- PAL flip-flop and PAL switch.
- Flyback blanking in the synchronous demodulators.

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_P = V_{11-4}$ | typ. | 12 V |
| Supply current | $I_P = I_{11}$ | typ. | 42 mA |
| Colour difference output signals; peak-to-peak values | | | |
| (B-Y) signal | $V_{1-4(p-p)}$ | < | 1,9 V |
| (G-Y) signal | $V_{2-4(p-p)}$ | < | 0,9 V |
| (R-Y) signal | $V_{3-4(p-p)}$ | < | 1,5 V |
| Output impedance of colour difference signal outputs | $\lvert Z_{1,2,3-4} \rvert$ | typ. | 250 Ω |

## PACKAGE OUTLINE

16-lead DIL; plastic (SOT-38).

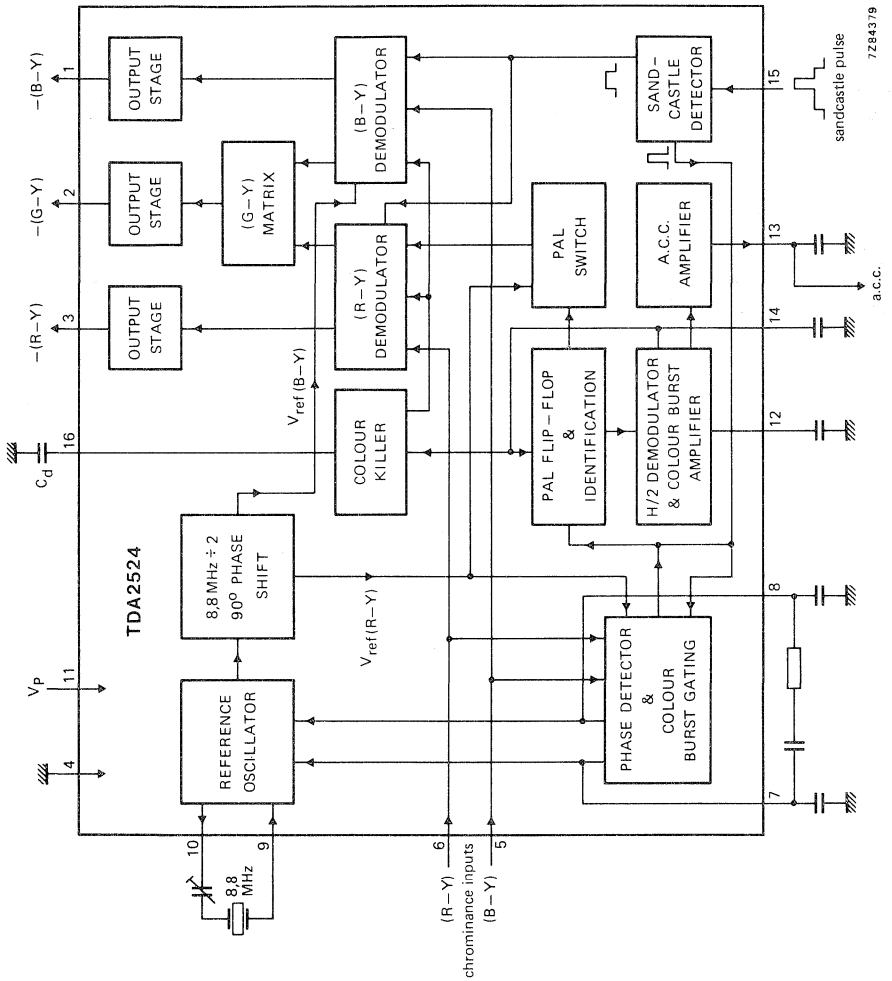


Fig. 1 Block diagram.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | | |
|---|---|---|---|---|
| Supply voltage | $V_P = V_{11-4}$ | max. | 14 | V |
| Voltages with respect to pin 4 | | | | |
| pins 1, 2, 3 | $V_{1,2,3-4}$ | max. | $V_P$ | V |
| pin 13 | $V_{13-4}$ | min. | 0 | V |
| pin 15 | $V_{15-4}$ | | 0 to $V_P$ | V |
| pin 16 | $V_{16-4}$ | | 0 to $V_P$ | V |
| Currents at: | | | | |
| pins 1, 2, 3 | $-I_{1,2,3}$ | max. | 5 | mA |
| pin 9 | $\pm I_9$ | max. | 2 | mA |
| pin 10 | $-I_{10}$ | max. | 5 | mA |
| pin 13 | $I_{13}$ | max. | 2 | mA |
| pin 14 | $\pm I_{14}$ | max. | 2 | mA |
| Total power dissipation | $P_{tot}$ | max. | 800 | mW |
| Storage temperature | $T_{stg}$ | | −20 to + 125 | °C |
| Operating ambient temperature | $T_{amb}$ | | −20 to + 70 | °C |

## CHARACTERISTICS

| | | | | |
|---|---|---|---|---|
| Supply voltage range | $V_P = V_{11-4}$ | | 10,8 to 13,2 | V |

The following characteristics are measured at $V_P$ = 12 V; $T_{amb}$ = 25 °C; unless otherwise specified

| | | | | |
|---|---|---|---|---|
| Supply current | $I_P = I_{11}$ | typ. | 42 | mA |
| **Demodulator part** | | | | |
| Input resistance | $R_{5,6-4}$ | > | 1 | kΩ |
| Input capacitance | $C_{5,6-4}$ | < | 10 | pF |
| (R-Y) signal gain | $G_{(R-Y)}$ | typ. | 2,57 | |
| Ratio of demodulated signals at $V_{5-4} = V_{6-4}$ | $\frac{V_{(B-Y)}}{V_{(R-Y)}}$ | typ. | 1,78 | |
| Matrix for the (G-Y) signal | $V_{(G-Y)} = -0{,}51\,V_{(R-Y)} - 0{,}19\,V_{(B-Y)}$ | | | |
| **Colour difference outputs** | | | | |
| D.C. output voltage | $V_{1,2,3,4}$ | typ. | 5,6 | V |
| Peak-to-peak output voltages | | | | |
| (B-Y) signal | $V_{1-4(p-p)}$ | < | 1,9 | V |
| (G-Y) signal | $V_{2-4(p-p)}$ | < | 0,9 | V |
| (R-Y) signal | $V_{3-4(p-p)}$ | < | 1,5 | V |
| Output impedance | $\lvert Z_{1,2,3-4} \rvert$ | typ. | 250 | Ω |
| Residual 4,4 MHz signal (peak-to-peak value) | $V_{1,2,3-4(p-p)}$ | < | 30 | mV |
| H/2 ripple at (R-Y) output (peak-to-peak value) | $V_{3-4(p-p)}$ | < | 10 | mV |
| Blanking level | $V_{15-4}$ | | 1 to 2 | V |

**CHARACTERISTICS** (continued)

| | | | |
|---|---|---|---|
| **Reference oscillator** | | | |
| Input resistance | $R_{9-4}$ | typ. | 270 Ω |
| Output resistance | $R_{10-4}$ | typ. | 200 Ω |
| Gain | $G_{10-9}$ | > | 2,5 |
| Catching range; depends on RC-circuitry between pins 7 and 8; at R = 680 Ω and C = 15 μF | $\Delta f$ | > | 500 Hz |
| Phase shift between the reference and burst signals at $\Delta f = \pm 400$ Hz | $\varphi$ | typ. | $\pm 5^o$ |
| **A.C.C. part** | | | |
| Reference voltage | $V_{12-4}$ | typ. | 7 V |
| Voltage with respect to pin 14 | | | |
| with colour burst signal $V_{5-6(p-p)} = 0{,}19$ V | $V_{12-14}$ | typ. | 1,5 V |
| without colour burst signal | $V_{12-14}$ | typ. | 0 V |
| Identification ON | $V_{14-12}$ | | 0,2 to 0,6 V |
| A.C.C. range dependent on $V_{14-4}$ | $V_{13-4}$ | | 0,5 to 3,0 V |
| Output current | $-I_{13}$ | | 15 to 50 μA |
| Colour burst keying at | $V_{15-4}$ | | 6,5 to 7,5 V |
| Colour killer voltages | | | |
| colour OFF at | $V_{12-14}$ | typ. | 0,5 V |
| or at | $V_{16-4}$ | > | 5,5 V |
| colour ON at | $V_{12-14}$ | typ. | 1,5 V |
| or at | $V_{16-4}$ | < | 4,0 V |
| Colour unkill delay; depends on $C_d$ (Fig. 1) | $t_d$ | typ. | 24 ms/μF |

# COLOUR DEMODULATOR COMBINATION

The TDA2525 is an integrated synchronous demodulator combination for PAL colour television receivers incorporating the following functions:

- Two synchronous demodulators for the (B-Y) and (R-Y) signals.
- 8,8 MHz oscillator followed by a divider giving two 4,4 MHz signals used as reference signals.
- A colour killer and identification signal detector.
- A.C.C. detection by peak value rectification.
- Colour unkill delay.
- (G-Y) signal matrix.
- Integrated capacitors to reduce unwanted carrier signals at the outputs.
- PAL flip-flop and PAL switch.
- Flyback blanking in the synchronous demodulators.

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_P = V_{11-4}$ | typ. | 12 V |

# RGB MATRIX PREAMPLIFIER

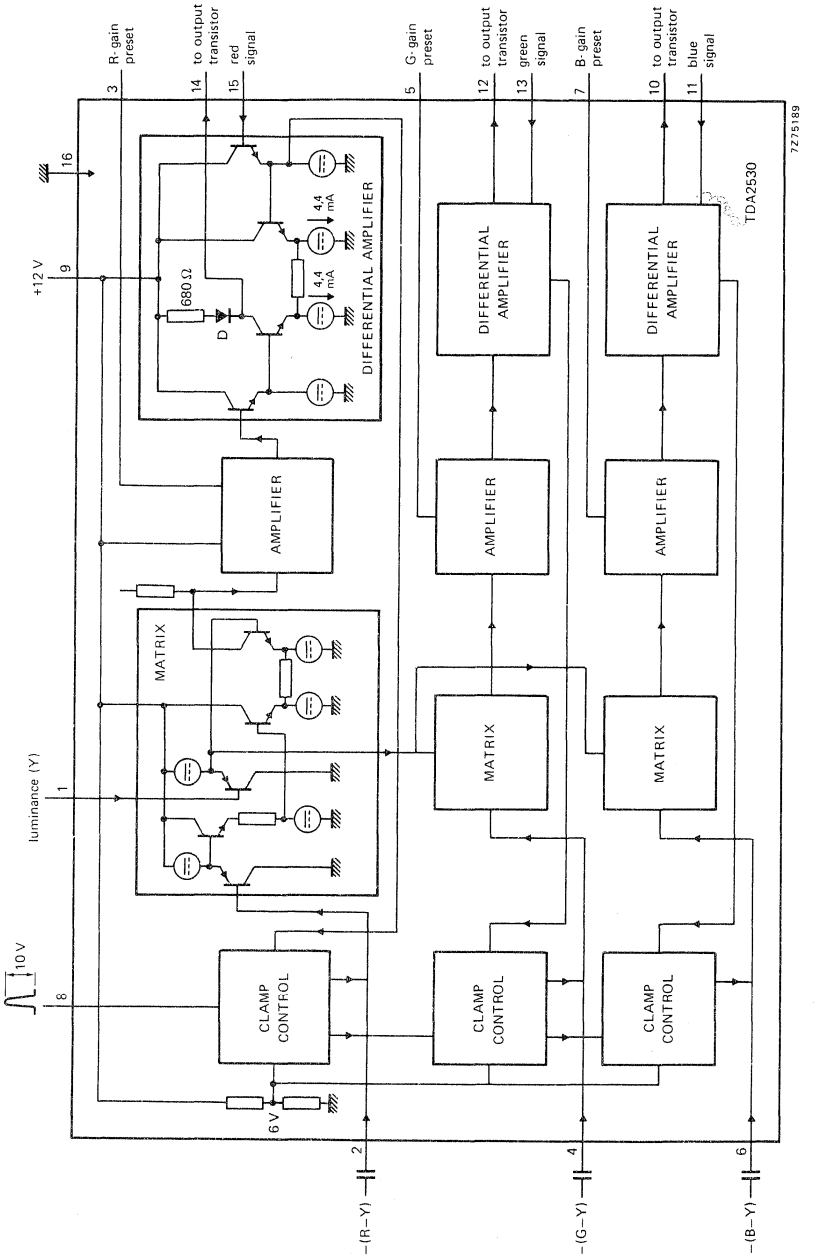
The TDA2530 is an integrated RGB matrix preamplifier for colour television receivers, incorporating a matrix preamplifier for RGB cathode drive of the picture tube with clamping circuits. The three channels have the same layout to ensure identical frequency behaviour.
This integrated circuit has been designed to be driven from the TDA2522 synchronous demodulator and oscillator IC.

| QUICK REFERENCE DATA | | | |
|---|---|---|---|
| Supply voltage | $V_{9-16}$ | typ. | 12 V |
| Operating ambient temperature range | $T_{amb}$ | | −20 to +60 °C |
| Luminance input resistance | $R_{1-16}$ | > | 100 kΩ |
| Input current of colour difference inputs | $I_2, I_4, I_6$ | typ. | 2 μA |
| during clamping | $I_2, I_4, I_6$ | | −0,2 to +0,2 mA |
| Clamping pulse input current | $-I_8$ | < | 20 μA |
| Gain of RGB preamplifiers | G | typ. | 0 dB |
| Gain d.c. adjustment range | ΔG | typ. | ±3 dB |
| Gain of error amplifier (conductance) | | typ. | 20 mA/V |
| Input current of feedback inputs | $I_{11}, I_{13}, I_{15}$ | typ. | 2 μA |
| Output current swing | $I_{10}, I_{12}, I_{14}$ | | −4,4 to +4,4 mA |

**PACKAGE OUTLINES**

TDA2530 : 16-lead DIL; plastic (SOT-38).
TDA2530Q : 16-lead QIL; plastic (SOT-58).

## BLOCK DIAGRAM



**RATINGS** Limiting values in accordance with the Absolute Maximum System (IEC134)

Voltages

| | | | |
|---|---|---|---|
| Supply voltage (pin 9) | $V_P$ ($V_{9-16}$) | max. | 15 V |
| Pin 1 | $V_{1-16}$ | | 0 to $V_P$ |
| Pins 3, 5 and 7 | $V_{3;5;7-16}$ | | 0 to $V_P$ |
| Pins 2, 4 and 6 | $V_{2;4;6-16}$ | | 0 to $V_P$ |
| Pin 8 | $V_{8-16}$ | max. | $V_P$ |
| Pin 10 | $V_{10-16}$ | | $V_{11-16}$ to $V_P$ + 3 V |
| Pin 12 | $V_{12-16}$ | | $V_{13-16}$ to $V_P$ + 3 V |
| Pin 14 | $V_{14-16}$ | | $V_{15-16}$ to $V_P$ + 3 V |
| Pins 11, 13 and 15 | $V_{11;13;15-16}$ | | 0,3 $V_P$ to $V_P$ |

Current

| | | | |
|---|---|---|---|
| Pin 8 | $-I_8$ | max. | 1 mA |

Power dissipation

| | | | |
|---|---|---|---|
| Total power dissipation | $P_{tot}$ | max. | 1 W |

Temperatures

| | | |
|---|---|---|
| Storage temperature | $T_{stg}$ | −20 to +125 °C |
| Operating ambient temperature | $T_{amb}$ | −20 to +60 °C |

**CHARACTERISTICS** at $V_P$ = 12 V; $V_{1-16}$ = 1,5 V; $T_{amb}$ = 25 °C; measured in circuit on page 5.

| | | | |
|---|---|---|---|
| Current consumption | $I_9$ | typ. | 50 mA |
| **Luminance input** | | | |
| Black level | $V_{1-16}$ | typ. | 1,5 V |
| Black-to-white input voltage (peak-to-peak value) | $V_{1-16(p-p)}$ | typ. | 1,0 V |
| Input resistance | $R_{1-16}$ | > | 100 kΩ |
| **Colour difference input** | | | |
| Input signals (peak-to-peak values) R-Y [1] | $V_{2-16(p-p)}$ | typ. | 1,4 V |
| G-Y [1] | $V_{4-16(p-p)}$ | typ. | 0,82 V |
| B-Y [1] | $V_{6-16(p-p)}$ | typ. | 1,78 V |
| Input currents (source resistance 300 Ω max.) | $I_2, I_4, I_6$ | typ. | 2 μA |
| | | < | 4 μA |
| Input currents during clamping | $I_2, I_4, I_6$ | | −0,2 to +0,2 mA |

[1] This prescribed order is not mandatory, as all three channels are identical.

**CHARACTERISTICS** (continued)

**Clamp pulse input for d.c. feedback**

| | | | | |
|---|---|---|---|---|
| Input voltage for clamping: on level | $V_{8-16}$ | | 6,5 to 12 | V |
| off level | $V_{8-16}$ | | 0 to 5,5 | V [1] |
| Input current for clamping: on level | $I_8$ | < | 1 | μA |
| off level | $-I_8$ | < | 20 | μA |

**Feedback input**

| | | | | |
|---|---|---|---|---|
| D.C. level during clamping | $V_{11;13;15-16}$ | typ. | 0,5 $V_P$ | |

**Gain adjustment for colour drive**

| | | | | |
|---|---|---|---|---|
| Adjustment voltage range | $V_{3;5;7-16}$ | | 0 to 10 | V |
| Adjustment voltage for nominal gain | $V_{3;5;7-16}$ | typ. | 5 | V |
| Nominal gain between colour difference inputs, luminance input and colour feedback inputs (pins 11, 13 and 15) | G | typ. | 0 | dB [2] |
| Adjustment range of nominal gain at $\Delta V_{3;5;7-16} = \pm 5$ V | $\Delta G$ | > | ±3 | dB |

**Differential amplifier**

| | | | | |
|---|---|---|---|---|
| Input current of feedback inputs | $I_{11}, I_{13}, I_{15}$ | typ. | 2 | μA |
| Gain of error amplifier (conductance) | | typ. | 20 | mA/V |
| Output current swing | $I_{10}, I_{12}, I_{14}$ | | −4,4 to +4,4 | mA |
| Integrated load resistance | $R_{10;12;14-9}$ | typ. | 680 | Ω [3] |
| Output bias voltage (see application information) | $V_{10;12;14-16}$ | typ. | 8 | V [3] |

**APPLICATION INFORMATION** (see circuit on page 5)

Clamping level ($V_{cl}$) of video output stages, with set clamping level potentiometers in their mid-positions:

$$V_{cl} = V_P \left(1 + \frac{R1}{R2} - \frac{R1}{R3}\right)$$

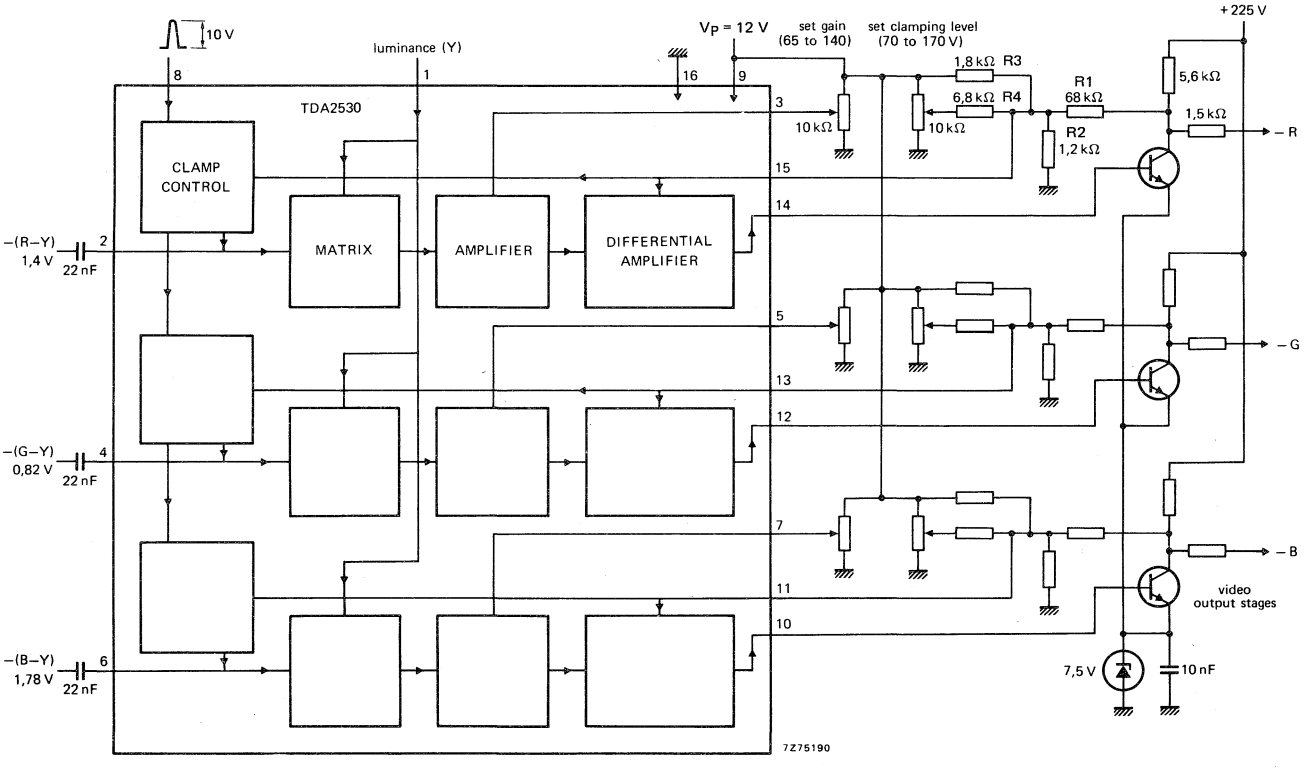
Gain of video output stages: $G = 1 + \frac{R1}{R2} + \frac{R1}{R3} + \frac{R1}{R4}$

1) Switching from clamping on to off occurs at about 6 V.

2) Error signal is assumed to be negligible.

3) The fact that the load resistors have series diodes (D; see block diagram on page 2), means that the resistors can be ignored when $V_{10;12;14} \geq V_P$.
In that case, external load resistors must be chosen such that the nominal current will be 4,4 mA.

## APPLICATION INFORMATION



# RGB MATRIX PREAMPLIFIER

The TDA2532 is an integrated matrix preamplifier for use in conjunction with discrete video amplifiers to provide RGB drive to the cathodes of a colour television picture tube. The integrated circuit incorporates:

- matrix circuits;
- gain control stages, operated by d.c. setting;
- preamplifiers with feedback and integral black-level clamps;
- facilities for video blanking during data display.

The three channels have the same layout to ensure identical frequency behaviour. The integrated circuit has been designed to be driven by the integrated colour demodulator combination type TDA2522.

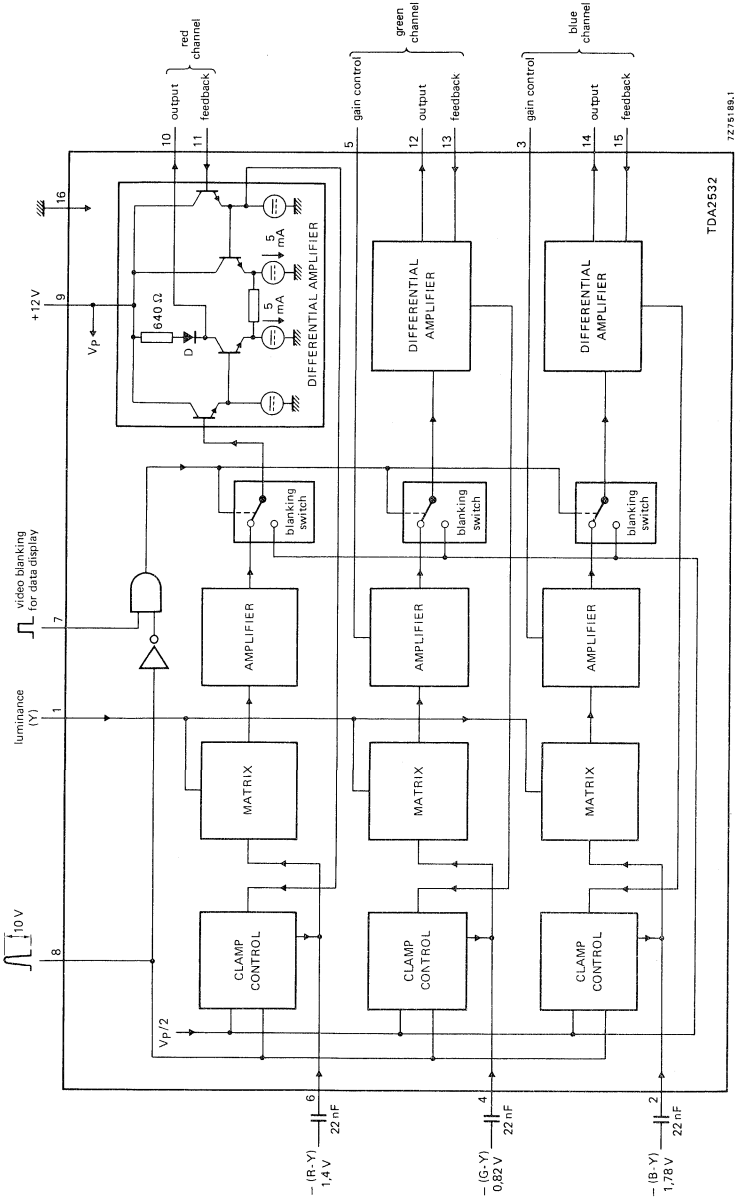
## QUICK REFERENCE DATA

| | | | | |
|---|---|---|---|---|
| Supply voltage | $V_{9\text{-}16}$ | typ. | 12 | V |
| Operating ambient temperature range | $T_{amb}$ | | −25 to + 60 | °C |
| Luminance input resistance | $R_{1\text{-}16}$ | > | 100 | kΩ |
| Input current of colour difference inputs | $I_2$, $I_4$, $I_6$ | typ. | 1 | μA |
| Clamping pulse input current | $-I_8$ | < | 60 | μA |
| Gain of RGB preamplifiers | G | typ. | 0 | dB |
| Gain d.c. adjustment range | ΔG | > | ± 40 | % |
| Gain of error amplifier (transconductance) | | typ. | 20 | mA/V |
| Output current swing | $I_{10}$, $I_{12}$, $I_{14}$ | typ. | ± 3,5 | mA |

## PACKAGE OUTLINES

TDA2532: 16-lead DIL; plastic (SOT-38).
TDA2532Q: 16-lead QIL; plastic (SOT-58).

## BLOCK DIAGRAM



## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | |
|---|---|---|---|
| Supply voltage (pin 9) | $V_P$ (V9-16) | max. | 13,2 V |
| Pin 1 | $V_{1-16}$ | | 0 to $V_P$ |
| Pins 3, 5 | $V_{3;5-16}$ | | 0 to $V_P$ |
| Pins 2, 4 and 6 | $V_{2;4;6-16}$ | | 0 to $V_P$ |
| Pin 7 | $V_{7-16}$ | | −0,5 V to $V_P$ |
| Pin 8 | $V_{8-16}$ | max. | $V_P$ |
| Pin 10 | $V_{10-16}$ | | $V_{11-16}$ to $V_P$ + 3 V |
| Pin 12 | $V_{12-16}$ | | $V_{13-16}$ to $V_P$ + 3 V |
| Pin 14 | $V_{14-16}$ | | $V_{15-16}$ to $V_P$ + 3 V |
| Pins 11, 13 and 15 | $V_{11;13;15-16}$ | | 0,3 $V_P$ to $V_P$ |
| Pin 8 | $-I_8$ | max. | 1 mA |
| Total power dissipation | $P_{tot}$ | max. | 1,1 W |
| Storage temperature | $T_{stg}$ | | −25 to + 125 °C |
| Operating ambient temperature | $T_{amb}$ | | −25 to + 60 °C |

## CHARACTERISTICS

At $V_P$ = 12 V; $V_{1-16}$ = 1,5 V; $T_{amb}$ = 25 °C; measured in circuit on page 6.

| | | | |
|---|---|---|---|
| Current consumption | $I_9$ | typ. | 60 mA |
| **Luminance input** | | | |
| Black level | $V_{1-16}$ | typ. | 1,5 V |
| Black-to-white input voltage (peak-to-peak value) | $V_{1-16\,(p-p)}$ | typ. | 1,0 V |
| Input resistance | $R_{1-16}$ | > | 100 kΩ |
| **Colour difference input** | | | |
| Input signals (peak-to-peak values) R-Y | $V_{6-16\,(p-p)}$ | typ. | 1,4 V |
| for 100% saturated colour bars G-Y | $V_{4-16\,(p-p)}$ | typ. | 0,82 V |
| B-Y | $V_{2-16\,(p-p)}$ | typ. | 1,78 V |
| Input currents (source resistance 300 Ω max.) | $I_2$, $I_4$, $I_6$ | typ. | 1 μA |
| | | < | 3 μA |

CHARACTERISTICS (continued)

| | | | |
|---|---|---|---|
| **Clamp pulse input** | | | |
| Input voltage for clamping | | | |
| on level | $V_{8\text{-}16}$ | | 7,5 to 12 V |
| off level | $V_{8\text{-}16}$ | | 0 to 6,5 V* |
| Input voltage to enable video blanking input | $V_{8\text{-}16}$ | < | 1 V |
| Input voltage to disable video blanking input | $V_{8\text{-}16}$ | | 2 to 12 V |
| Input current for clamping | | | |
| on level | $I_8$ | < | 1 μA |
| off level | $-I_8$ | < | 60 μA |
| Clamp pulse duration | $t_{clamp}$ | > | 3,5 μs |
| **Video blanking input** | | | |
| Input voltage for blanking | | | |
| on level | $V_{7\text{-}16}$ | > | 1,5 V |
| off level | $V_{7\text{-}16}$ | < | 0,5 V |
| **Feedback input** | | | |
| D.C. level during clamping | $V_{11;\ 13;\ 15\text{-}16}$ | | 6 to 6,2 V |
| **Gain adjustment for colour drive** | | | |
| Adjustment voltage range | $V_{3;\ 5\text{-}16}$ | | 0 to 10 V |
| Adjustment voltage for nominal gain | $V_{3;\ 5\text{-}16}$ | typ. | 5 V |
| Nominal gain between colour difference inputs, luminance input and colour feedback inputs (pins 11, 13 and 15) | G | typ. | 0 dB** |
| Adjustment range of nominal gain at $\Delta V_{3;\ 5\text{-}16} = \pm 5$ V | $\Delta G$ | > | ± 40 % |
| **Differential amplifier** | | | |
| Gain of error amplifier (transconductance) | | typ. | 20 mA/V |
| Output current swing | $I_{10}, I_{12}, I_{14}$ | ⩾ | ± 3,5 mA |
| Integrated load resistance | $R_{10;\ 12;\ 14\text{-}9}$ | typ. | 640 Ω ▲ |
| Output bias voltage (see application information) | $V_{10;\ 12;\ 14\text{-}16}$ | typ. | 8 V ▲ |

* Switching from clamping on to off occurs at about 7 V.

** Error signal is assumed to be negligible.

▲ The fact that the load resistors have series diodes (D; see block diagram on page 2), means that the resistors can be ignored when $V_{10;\ 12;\ 14} \geqslant V_P$. In that case, external load resistors must be chosen such that the nominal current will be 3,5 mA.

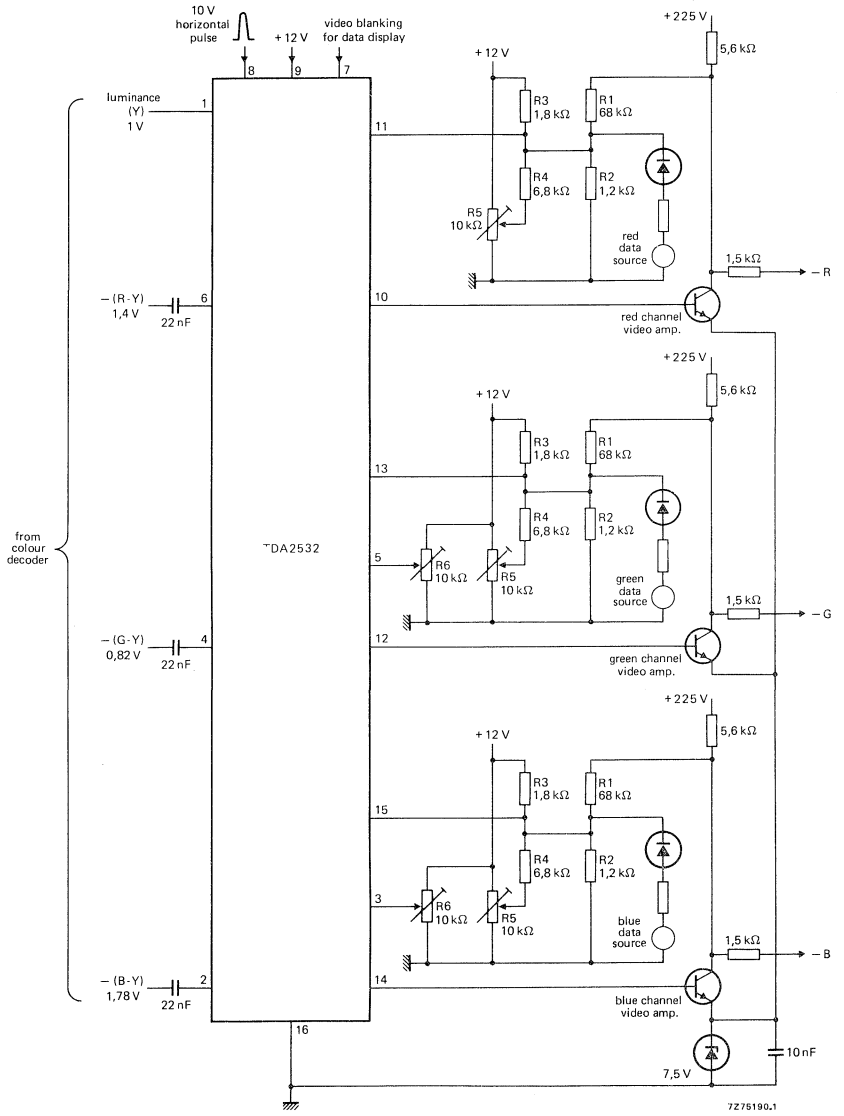
## APPLICATION INFORMATION (see circuit on page 6)

Clamping level ($V_{cl}$) of video output stages, with set clamping level potentiometers in their mid-positions:

$$V_{cl} = 0{,}5\ V_P\ (1 + \frac{R1}{R2} - \frac{R1}{R3}).$$

Gain of video output stages: $G = 1 + \frac{R1}{R2} + \frac{R1}{R3} + \frac{R1}{R4 + 0{,}25\ R5}$.

## APPLICATION INFORMATION



R5 = clamping level adjustment (70 V to 170 V); R6 = gain adjustment (65 to 140).

# TELEVISION I.F. AMPLIFIER AND DEMODULATOR

The TDA2540 is an i.f. amplifier and demodulator circuit for colour and black and white television receivers using n-p-n tuners.
It incorporates the following functions:

- gain-controlled wide-band amplifier, providing complete i.f. gain
- synchronous demodulator
- white spot inverter
- video preamplifier with noise protection
- a.f.c. circuit which can be switched on/off by a d.c. level, e.g. during tuning
- a.g.c. circuit with noise gating
- tuner a.g.c. output (n-p-n tuners)
- VCR switch, which switches off the video output; e.g. for insertion of a VCR playback signal

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_{11\text{-}13}$ | typ. | 12 V |
| Supply current | $I_{11}$ | typ. | 50 mA |
| I.F. input voltage at f = 38,9 MHz (r.m.s. value) | $V_{1\text{-}16\ (rms)}$ | typ. | 100 $\mu$V |
| Video output voltage (white at 10% of top sync) | $V_{12(p\text{-}p)}$ | typ. | 2,7 V |
| I.F. voltage gain control range | $G_v$ | typ. | 64 dB |
| Signal-to-noise ratio at $V_i$ = 10 mV | S/N | typ. | 58 dB |
| A.F.C. output voltage swing for $\Delta f$ = 100 kHz | $\Delta V_{5\text{-}13}$ | typ. | 10 V |

## PACKAGE OUTLINES

TDA2540 : 16-lead DIL; plastic (SOT-38).
TDA2540Q: 16-lead QIL; plastic (SOT-58).

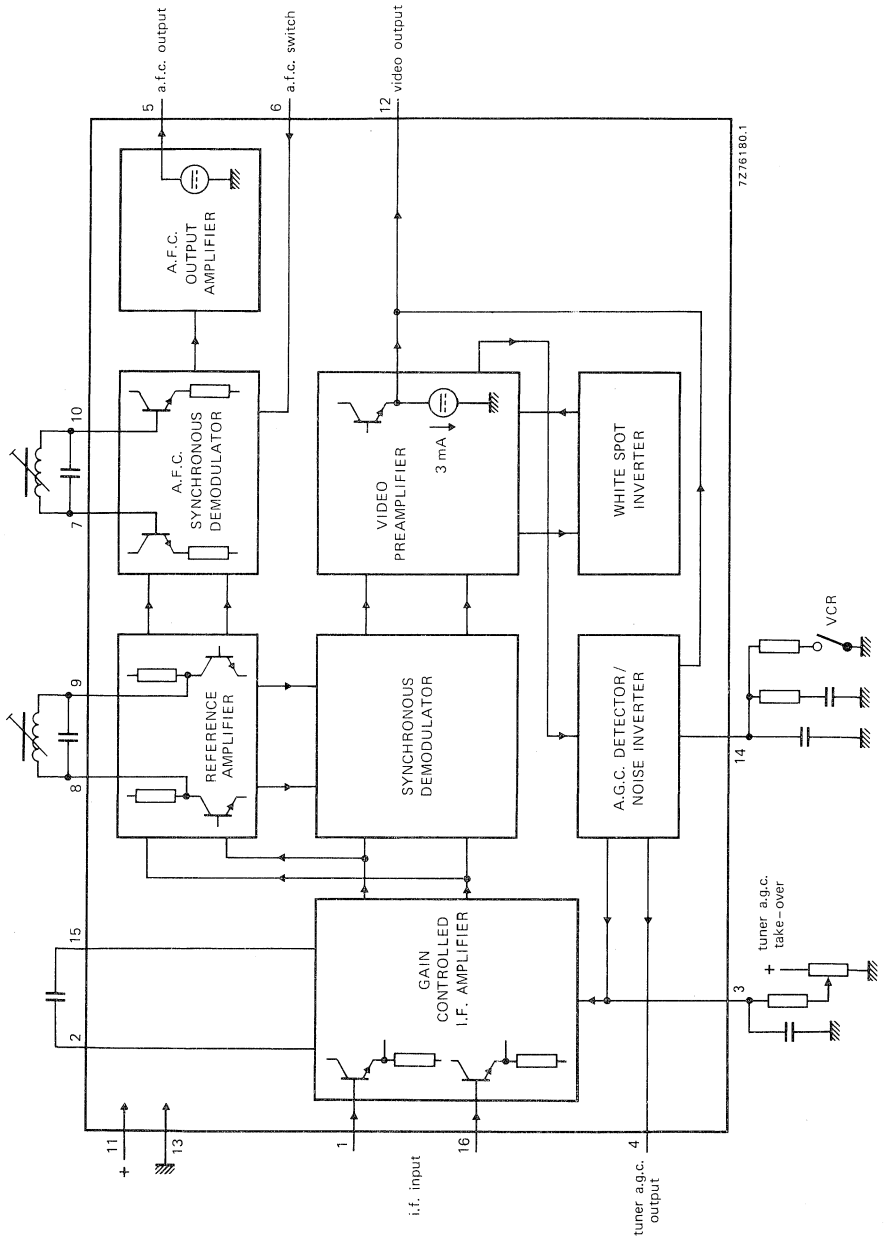


Fig. 1 Block diagram.

# AM SOUND I.F. CIRCUIT FOR FRENCH STANDARD

## GENERAL DESCRIPTION

The TDA2543 is a monolithic integrated AM sound i.f. circuit in television receivers for the French standards L and L'.

The circuit incorporates the following functions:

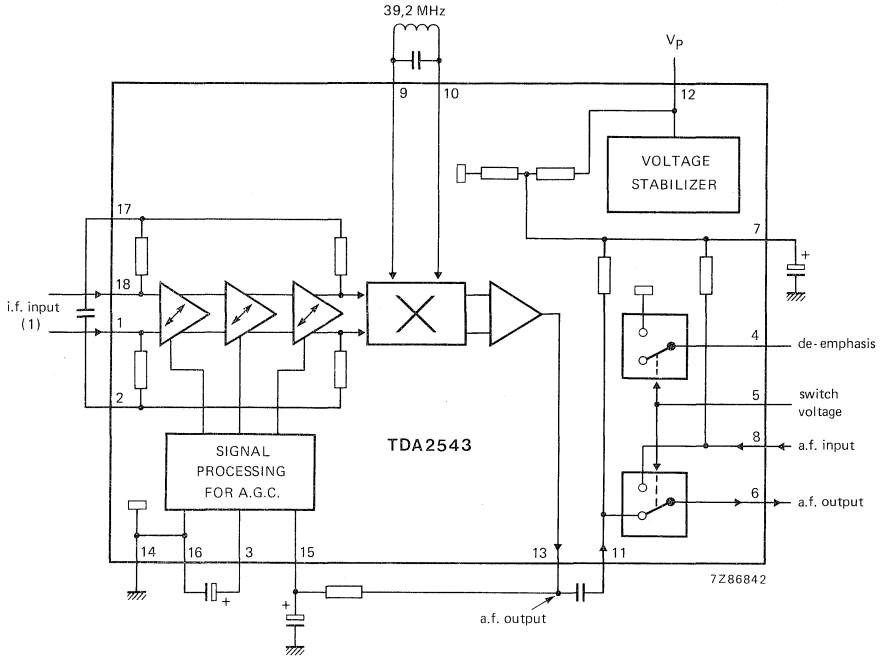
- 3-stage gain controlled i.f. amplifier, providing complete i.f. gain
- Synchronous AM demodulator
- A.G.C. circuit
- Audio input circuit with two external audio inputs and switching facilities to provide for either the demodulated i.f. or an external signal output
- Demodulated i.f. output is available from the input of the switching circuit

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage (pin 12) | $V_{12\text{-}14} = V_P$ | typ. | 12 V |
| Minimum i.f. vision carrier input voltage (r.m.s. value) for an output signal $V_{13\text{-}14(rms)} = 480$ mV | $V_{VC1\text{-}18(rms)}$ | max. | 30 $\mu$V |
| I.F. control range | $\Delta G_V$ | min. | 60 dB |
| A.F. output voltage (r.m.s. value) | $V_{13\text{-}14(rms)}$ | typ. | 680 mV |
| Distortion at $V_{VC1\text{-}18(rms)} = 5$ mV | $d_{tot}$ | max. | 1 % |
| Signal-to-weighted-noise ratio according to CCIR 468 | S + N/N | min. | 50 dB |
| Maximum signal amplitude for the a.f. switch (r.m.s. value) | $V_{8;11\text{-}14(rms)}$ | min. | 2 V |

## PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102CS).



(1) I.F. signal: vision carrier (V.C.) and sound carrier (S.C.).

# TELEVISION I.F. AMPLIFIER AND DEMODULATOR

The TDA2544 is an i.f. amplifier and demodulator circuit for colour and black and white television receivers.
It incorporates the following functions:

- gain-controlled wide-band amplifier, providing complete i.f. gain
- low-level synchronous demodulator
- white spot inverter
- video preamplifier with noise protection
- a.f.c. circuit with balanced output
- a.g.c. circuit with noise gating
- tuner a.g.c. output for control of MOS tuners
- external video switch

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_{11\text{-}13}$ | typ. | 12 V |
| Supply current | $I_{11}$ | typ. | 50 mA |
| I.F. input sensitivity at f = 45,75 MHz (r.m.s. value) | $V_{1\text{-}16(rms)}$ | typ. | 150 $\mu$V |
| Video output voltage (white at 12,5% of top sync) | $V_{12(p\text{-}p)}$ | typ. | 2,6 V |

# TELEVISION I.F. AMPLIFIER AND DEMODULATOR

## GENERAL DESCRIPTION

The TDA2548 is an i.f. amplifier and demodulator circuit for colour and black and white television receivers using p-n-p tuners.
It incorporates the following functions:

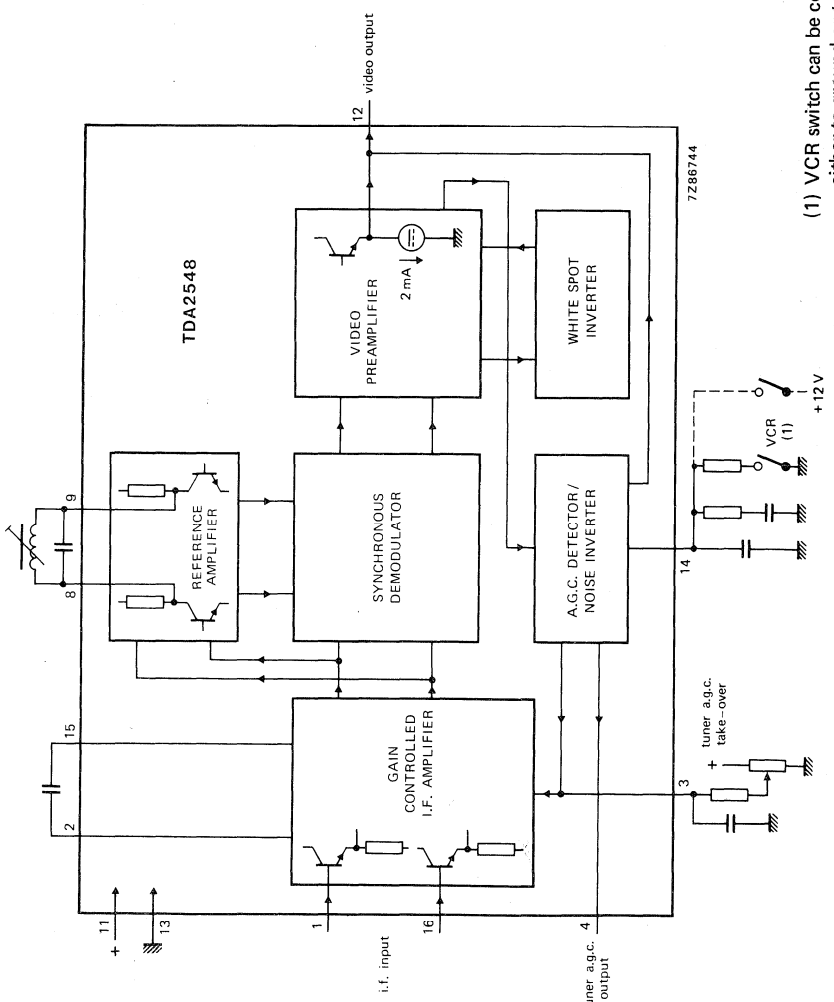
- gain-controlled wide-band amplifier, providing complete i.f. gain
- synchronous demodulator
- white spot inverter
- video preamplifier with noise protection
- a.g.c. circuit with noise gating
- tuner a.g.c. output (p-n-p tuners)
- VCR switch, which switches off the video output; e.g. for insertion of a VCR playback signal.

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_{11\text{-}13}$ | typ. | 12 V |
| Supply current | $I_{11}$ | typ. | 50 mA |
| I.F. input voltage at f = 38,9 MHz (r.m.s. value) | $V_{1\text{-}16(rms)}$ | typ. | 100 μV |
| Video output voltage (white at 10% of top sync) | $V_{12(p\text{-}p)}$ | typ. | 2,7 V |
| I.F. voltage gain control range | $G_v$ | typ. | 64 dB |
| Signal-to-noise ratio at $V_i$ = 10 mV | S/N | typ. | 58 dB |

## PACKAGE OUTLINES

TDA2548 : 16-lead DIL; plastic (SOT-38).
TDA2548Q: 16-lead QIL; plastic (SOT-58).



(1) VCR switch can be connected either to ground or to + 12 V.

Fig. 1 Block diagram.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | |
|---|---|---|---|
| Supply voltage | $V_{11-13}$ | max. | 13,2 V |
| Tuner a.g.c. voltage | $V_{4-13}$ | max. | 12 V |
| Total power dissipation | $P_{tot}$ | max. | 900 mW |
| Storage temperature | $T_{stg}$ | | −55 to + 125 °C |
| Operating ambient temperature | $T_{amb}$ | | −25 to + 60 °C |

## CHARACTERISTICS (measured in Fig. 5)

| | | | |
|---|---|---|---|
| Supply voltage range | $V_{11-13}$ | typ. | 12 V |
| | | | 10,2 to 13,2 V |

The following characteristics are measured at $T_{amb}$ = 25 °C; $V_{11-13}$ = 12 V; f = 38,9 MHz

| | | | |
|---|---|---|---|
| I.F. input voltage for onset of a.g.c. (r.m.s. value) | $V_{1-16(rms)}$ | typ. | 100 μV |
| | | < | 150 μV |

# I.F. AMPLIFIER AND DEMODULATOR FOR MULTISTANDARD TV RECEIVERS

The TDA2549 is an i.f. circuit for positive and negative modulation in colour and black and white television receivers. It contains the following functions:

- Gain-controlled wide-band amplifier providing complete i.f. gain
- Synchronous demodulator for positive and negative modulation
- Video preamplifier with noise protection for negative modulation
- Auxiliary video input (1 V) and output (75 Ω)
- Video switch to select between auxiliary video input signal and demodulated video signal
- A.F.C. circuit with on/off switch and inverter switch
- A.G.C. circuit for positive modulation (mean level) and negative modulation (noise gate)
- A tuner a.g.c. output for MOSFET tuners

# LUMINANCE AND CHROMINANCE CONTROL COMBINATION

The TDA2560 is a monolithic integrated circuit for use in decoding systems of colour television receivers. The circuit consists of a luminance and chrominance amplifier. The luminance amplifier has a low input impedance so that matching of the luminance delay line is very easy.
It also incorporates the following functions:

- d.c. contrast control;
- d.c. brightness control;
- black level clamp;
- blanking;
- additional video output with positive-going sync.

The chrominance amplifier comprises:

- gain controlled amplifier;
- chrominance gain control tracked with contrast control;
- separate d.c. saturation control;
- combined chroma and burst output, burst signal amplitude not affected by contrast and saturation control;
- the delay line can be driven directly by the IC.

2) All figures for the chrominance signals are based on a colour bar signal with 75% saturation: i.e. burst-to-chrominance ratio is 1:2.

3) At a burst signal of 1 V peak-to-peak; see also notes 4 and 5 on page 5.

NOTES

1. The gain of the luminance amplifier can be adjusted, by setting the gain of the contrast control circuit by selection of discrete resistor $R_G$ (see also circuit on page 7). This circuit configuration has been chosen to reduce the spread of the gain to a minimum (main cause of spread is now the spread of the ratio of the delay line matching resistors and the resistor $R_G$). At $R_G$ = 2,7 kΩ the output voltage at nominal contrast (maximum −3 dB) is 3 V black-to-white for an input current of 0,2 mA black-to-white.

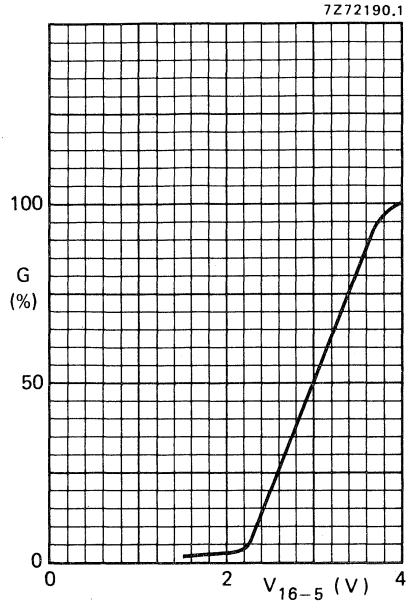
2. This pulse (pin 7) is used for gating of the chrominance amplifier and black level clamping. The latter function is actuated at a +7 V level. The input pulse must have such an amplitude that the clamping circuit is active only during the back porch of the blanking interval. The gating pulse switches the gain of the chroma amplifier to maximum during the flyback time, when the pulse rises above 2,3 V and switches it back to normal setting when the pulse falls below 1 V.

3. This pulse (pin 9) is used for blanking the luminance amplifier. When the pulse exceeds the +2,5 V level the output signal is blanked to a level of about 0 V. When the input exceeds a +6 V level a fixed level of typ. +1,5 V is inserted in the output signal. This level can be used for clamping purposes.

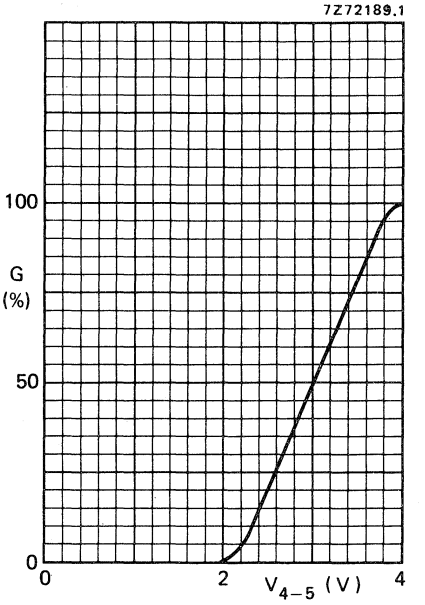
4. The chrominance and burst signal are both available on this pin (6). The burst signal is not affected by the contrast and saturation control and is kept constant by the a.c.c. circuit of the TDA2522. The output of the delay line matrix circuit, which is the input of the TDA2522, is thus automatically compensated for the insertion losses. This means that the output signal of the TDA2560 is determined by the insertion losses of the delay line. At nominal contrast and saturation setting the ratio of burst to chrominance signal at the output is typically identical to that at the input.

5. Nominal contrast is specified as maximum contrast −3 dB. Nominal saturation is specified as maximum saturation −6 dB.

6. A negative-going control voltage gives a decrease in gain.

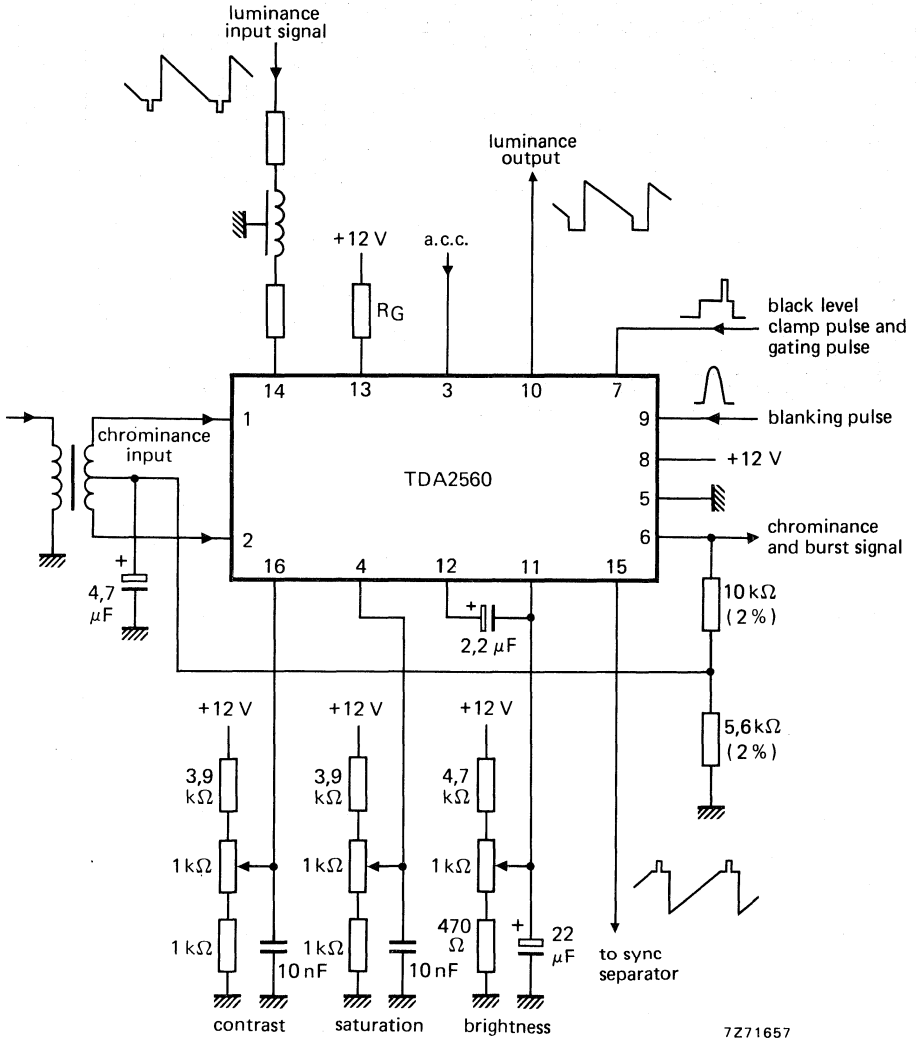


Contrast control of luminance and chrominance amplifier



Saturation control of chrominance amplifier

## APPLICATION INFORMATION



APPLICATION INFORMATION (continued)

**The function is quoted against the corresponding pin number**

1. Balanced chrominance input signal (in conjunction with pin 2)

   This is derived from the chrominance signal bandpass filter, designed to provide a push-pull input. A signal amplitude of at least 4 mV peak-to-peak is required between pins 1 and 2. The chrominance amplifier is stabilized by an external feedback loop from the output (pin 6) to the input (pins 1 and 2). The required level at pins 1 and 2 will be 3 V.
   All figures for the chrominance signals are based on a colour bar signal with 75% saturation: i.e. burst-to-chrominance ratio of input signal is 1 : 2.

2. Chrominance signal input (see pin 1)

3. A.C.C. input

   A negative-going potential, starting at +1,2 V, gives a 40 dB range of a.c.c. Maximum gain reduction is achieved at an input voltage of 500 mV.

4. Chrominance saturation control

   A control range of +6 dB to >−14 dB is provided over a range of d.c. potential on pin 4 from +2 to +4 V. The saturation control is a linear function of the control voltage.

5. Negative supply (earth)

6. Chrominance signal output

   For nominal settings of saturation and contrast controls (max. −6 dB for saturation, and max. −3 dB for contrast) both the chroma and burst are available at this pin, and in the same ratio as at the input pins 1 and 2. The burst signal is not affected by the saturation and contrast controls. The a.c.c. circuit of the TDA2522 will hold constant the colour burst amplitude at the input of the TDA2522. As the PAL delay line is situated here between the TDA2560 and TDA2522 there may be some variation of the nominal 1 V peak-to-peak burst output of the TDA2560, according to the tolerances of the delay line. An external network is required from pin 6 of the TDA2560 to provide d.c. negative feedback in the chroma channel via pins 1 and 2.

7. Burst gating and clamping pulse input

   A two-level pulse is required at this pin to be used for burst gate and black level clamping. The black level clamp is activated when the pulse level is greater than 7 V. The timing of this interval should be such that no appreciable encroachment occurs into the sync pulse on picture line periods during normal operation of the receiver. The burst gate, which switches the gain of the chroma amplifier to maximum, requires that the input pulse at pin 7 should be sufficiently wide, at least 8 µs, at the actuating level of 2,3 V.

**APPLICATION INFORMATION** (continued)

8. +12 V power supply

Correct operation occurs within the range 10 to 14 V. All signal and control levels have a linear dependency on supply voltage but, in any given receiver design, this range may be restricted due to considerations of tracking between the power supply variations and picture contrast and chroma levels.

9. Flyback blanking input waveform

This pin is used for blanking the luminance amplifier. When the input pulse exceeds the +2, 5 V level, the output signal is blanked to a level of about 0 V. When the input exceeds a +6 V level, a fixed level of about 1, 5 V is inserted in the output. This level can be used for clamping purposes.

10. Luminance signal output

An emitter follower provides a low impedance output signal of 3 V black-to-white amplitude at nominal contrast setting having a black level in the range 1 to 3 V. An external emitter load resistor is not required.
The luminance amplitude available for nominal contrast may be modified according to the resistor value from pin 13 to the +12 V supply. At an input bias current $I_{14}$ of 0, 25 mA during black level the amplifier is compensated so that no black level shift more than 10 mV occurs at contrast control. When the input current deviates from the quoted value the black level shift amounts to 100 mV/mA.

11. Brightness control

The black level at the luminance output (pin 10) is identical to the control voltage required at this pin. A range of black level from 1 to 3 V may be obtained.

12. Black level clamp capacitor

13. Luminance gain setting resistor

The gain of the luminance amplifier may be adjusted by selection of the resistor value from pin 13 to +12 V. Nominal luminance output amplitude is then 3 V black-to-white at pin 10 when this resistor is 2, 7 kΩ and the input current is 0, 2 mA black-to-white. Maximum and minimum values of this resistor are 3, 9 kΩ and 1, 8 kΩ.

14. Luminance signal input

A low input impedance in the form of a current sink is obtained at this pin. Nominal input current is 0, 2 mA black-to-white. The luminance signal may be coupled to pin 14 via a d.c. blocking capacitor and, in addition, a resistor employed to give a d.c. current into pin 14 at black level of about 0, 25 mA. Alternatively d.c. coupling from a signal source such as the TDA2540 and TDA2541 may be employed.

**APPLICATION INFORMATION** (continued)

15. Luminance signal output for sync separator purposes

A luminance signal output with positive-going sync is available which is not affected by the contrast control or the value of resistor at pin 13. This voltage is intended for drive of sync separator circuits. The output amplitude is 3, 4 V peak-to-peak when the luminance signal input is 0, 2 mA black-to-white.

16. Contrast control

With 3 V on this pin the gain of the luminance channel is such that 0, 2 mA black-to-white at pin 14 gives a luminance output on pin 10 of 3 V black-to-white. The nominal value of 2, 7 kΩ is then assumed for the resistor from pin 13 to the +12 V supply. The variation of control potential at pin 16 from 2 to 4 V gives −17 to +3 dB gain variation of the luminance channel. A similar variation in the chrominance channel occurs in order to provide correct tracking between the two signals.

# HORIZONTAL SYNCHRONIZATION AND VERTICAL 625 DIVIDER SYSTEM

The TDA2571A is designed in combination with the TDA2581 as a matched pair for switched-mode driven horizontal deflection stages. When supplied with a composite video signal the TDA2571A delivers drive pulses for the TDA2581 and sync pulses for the vertical deflection. The circuit is optimized for a horizontal and vertical frequency ratio of 625.

The circuit incorporates the following functions:

- Horizontal sync separator with sliding bias in such a way that the sync pulse is always sliced between top-sync level and blanking level.
- Noise gate.
- Horizontal phase detector switching to a small time constant during catching. The phase detector is gated when the oscillator is synchronized.
- Horizontal oscillator (31,25 kHz).
- Burst-key pulse generator. This pulse can also be applied as black level clamp pulse.
- Vertical sync pulse separator.
- Automatic vertical synchronization (625 divider system), without delay after channel change.

16. Positive supply (vertical)

## APPLICATION INFORMATION

**The function is quoted against the corresponding pin number**

1. Vertical sync pulse output

   A resistor of about 10 kΩ must be connected between pin 1 and the positive supply line (pin 16; vertical supply).

   The output pulse will come from the 625 divider stage (standard signal) or from the vertical sync pulse separator (non-standard signal), depending on the input signal on pin 2. The standard and non-standard signals are detected automatically.

2. Video input

   The input signal must have negative-going sync pulses. The top-sync level can vary between 1 V and 3,5 V without affecting the sync separator operation.

   The slicing level of the sync separator is fixed at 50%, for the sync pulse amplitude range 0,07 to 1 V. As a consequence the circuit gives a good sync separation down to pulses with an amplitude of 70 mV peak-to-peak (sync pulse compression). For sync pulses in excess of 1 V peak-to-peak the slicing level will increase.

   The noise gate is activated at an input level $< 0,7$ V, thus, when noise gating is required the top-sync level should be chosen close to the minimum level of 1 V. When i.f. circuits with a noise gate are used (e.g. TDA2540; TDA2541) the noise gate of the TDA2571A is not required.

3. Sync separator slicing level output

   The sync separator slicing level is determined on this pin. A slicing level of 50% is obtained by comparing this level with the black level of the video signal, which is detected at pin 4. The capacitor connected to pin 3 must be about 0,47 μF.

4. Black level detector output

   The black level of the input signal is detected on this pin, which is required to obtain good sync separator operation. A capacitor of 47 μF in series with a resistor of 82 Ω has to be connected to this pin. A 5,6 kΩ resistor must be connected between pins 3 and 4.

5. Vertical sync pulse integrator bias network

   The vertical sync pulse is obtained by integrating the composite sync signal in an internal RC-network. An external RC-network is required for the correct biasing of this circuit for various input conditions. Typical values are: R = 56 kΩ; C = 22 μF.

6. Horizontal phase detector output

   The control voltage for the horizontal oscillator is obtained on this pin. The output current is about 2 mA.

7. Reference voltage horizontal frequency control stage

   This pin has two functions. It is used to decouple the reference voltage for the frequency control of the horizontal oscillator (so a good suppression of interference is obtained which may be present on the supply line). This pin is also used to control the reference waveform for the phase detector to the middle of the gating, giving a good noise immunity of the synchronization.

8. Horizontal sync pulse output

   This pulse is obtained from the horizontal oscillator via a divider circuit. The duty factor is 46%. The falling edge of this pulse has a delay of 0,9 $\mu$s with respect to the end of the sync pulse. Because of this phase relationship this pulse can directly drive the TDA2581.

9. Time constant switch

   This pin is used to switch the time constant of the flywheel filter. The pin condition is determined by the coincidence detector (pin 10). During in-sync or when only noise is received pin 9 assumes ground level, which results in a long time constant and good noise immunity.

   During out-of-sync or VCR playback, pin 9 has a high impedance and consequently only the short time constant is available. In this condition a large catching range is obtained.

10. Coincidence detector output

    A 1 $\mu$F capacitor must be connected to this pin. The output voltage depends on the oscillator condition (synchronized or not) and on the video input signal.
    The following output voltages can occur:
    - when in-sync: 0,4 V
    - when out-of-sync: 2,0 V
    - during noise at input: 1,0 V

    When the output voltage $< 1{,}85$ V, the flywheel filter is switched to a long time constant, and the gating of the phase detector is switched-on.

    For a voltage $> 1{,}85$ V, the flywheel filter has a short time constant, and the gating of the phase detector is switched-off. The result is that during noise the flywheel time constant remains long thus preventing large shifts in the frequency of the horizontal oscillator (and screening of the horizontal output transformer).

    The information of the line coincidence detector is fed to the divider circuit so that there is no delay in vertical synchronization after a channel change, or an unsynchronized camera change in the studio. Thus, the divider circuit is reset to direct sync, when line synchronization is lost.

    The time constant value can be switched manually by a resistor (10 k$\Omega$) to + 12 V.

11. Negative supply (ground)

12. Positive supply horizontal oscillator

    Interference and hum on this supply line can affect the oscillator frequency. It is therefore necessary to have a separate decoupling of this pin with respect to pin 16. The current-draw of this pin is typically 33 mA.

13. Burst-key pulse output

    This pulse is composed of two parts. The lower part has an amplitude of 3 V peak-to-peak and a width of 9,1 $\mu$s (for phase relation see Fig. 2). The upper part has a total amplitude in excess of 10 V peak-to-peak and a width of 3,6 $\mu$s. The leading edge of this pulse has a delay of 0,9 $\mu$s with respect to the falling edge of the sync pulse at the input (pin 2).

    This pulse can directly drive the burst gate/black level clamp input of the TDA2560.

**APPLICATION INFORMATION** (continued)

14. RC-network horizontal oscillator

    Stable components should be chosen for good frequency stability. For adjusting the frequency a part of the total resistance must be variable. This part should be as small as possible, because of poor stability of variable carbon resistors.

    The oscillator can be adjusted when pins 7 and 15 are short-circuited.

15. Horizontal oscillator control pin

16. Positive supply sync separator and divider circuit (vertical)

    For this supply only a simple decoupling is required. The current-draw of this pin is typically 17 mA.

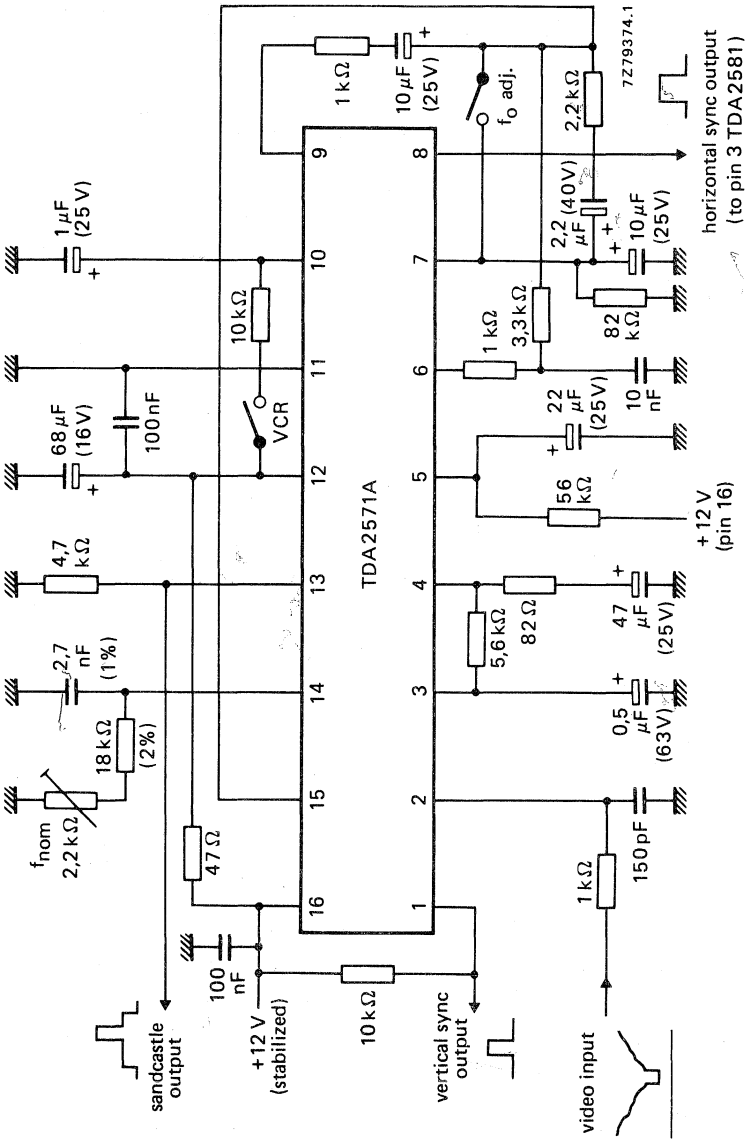

Fig. 3 Typical application circuit diagram; for combination of the TDA2571A with the TDA2581 see Fig. 4.

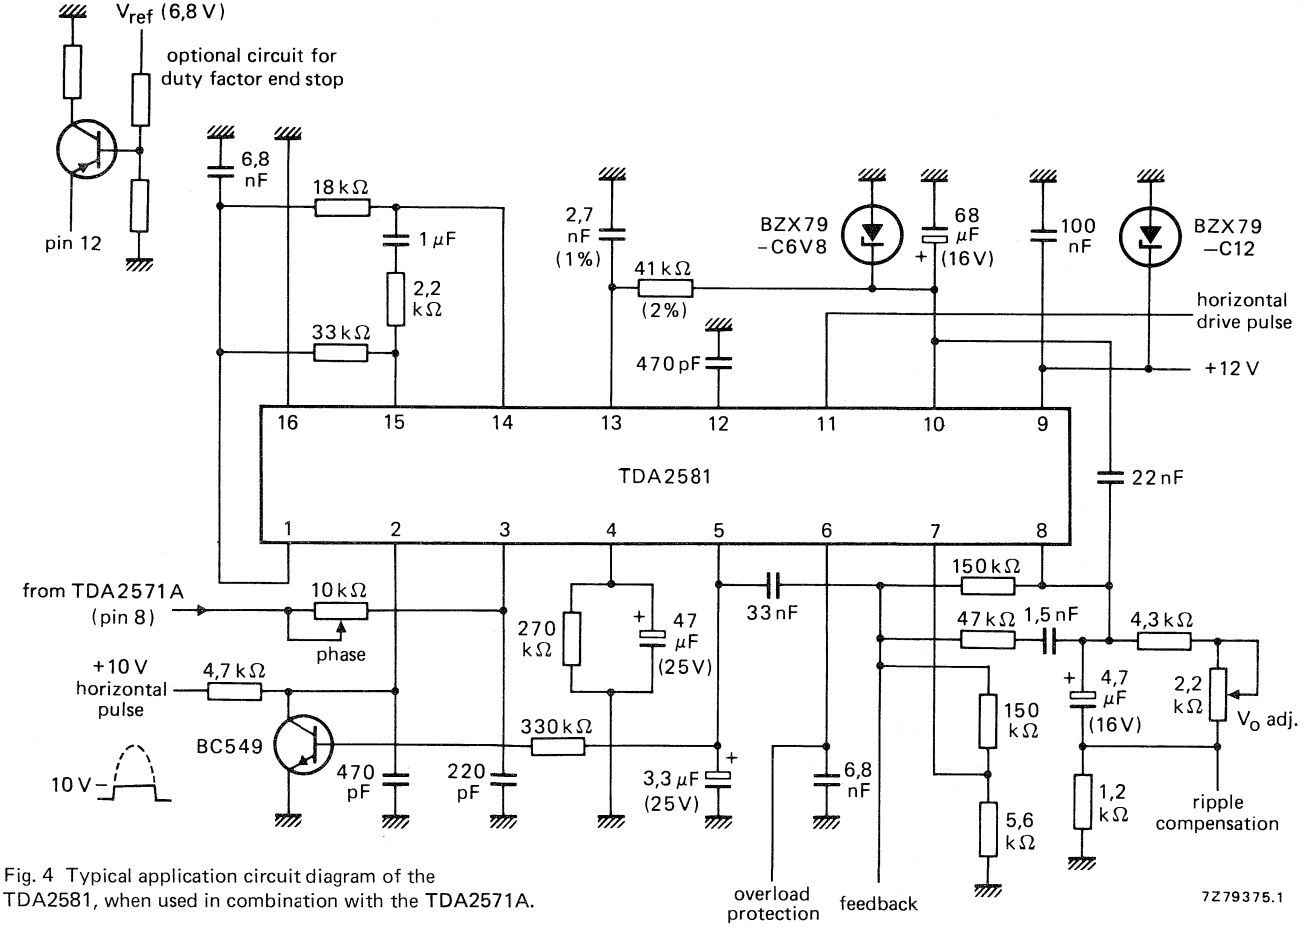

Fig. 4 Typical application circuit diagram of the TDA2581, when used in combination with the TDA2571A.

# HORIZONTAL SYNCHRONIZATION AND VERTICAL 525 DIVIDER SYSTEM

The TDA2575A is designed in combination with the TDA2581 as a matched pair for switched-mode driven horizontal deflection stages. When supplied with a composite video signal the TDA2575A delivers drive pulses for the TDA2581 and sync pulses for the vertical deflection. The circuit is optimized for a horizontal and vertical frequency ratio of 525.

The circuit incorporates the following functions:

- Horizontal sync separator with sliding bias in such a way that the sync pulse is always sliced between top-sync level and blanking level.
- Noise gate.
- Horizontal phase detector switching to a small time constant during catching. The phase detector is gated when the oscillator is synchronized.
- Horizontal oscillator (31,5 kHz).
- Burst-key pulse generator. This pulse can also be applied as black level clamp pulse.
- Vertical sync pulse separator.
- Automatic vertical synchronization (525 divider system), without delay after channel change.

## APPLICATION INFORMATION

**The function is quoted against the corresponding pin number**

1. Vertical sync pulse output

   A resistor of about 10 kΩ must be connected between pin 1 and the positive supply line (pin 16; vertical supply).

   The output pulse will come from the 525 divider stage (standard signal) or from the vertical sync pulse separator (non-standard signal), depending on the input signal on pin 2. The standard and non-standard signals are detected automatically.

2. Video input

   The input signal must have negative-going sync pulses. The top-sync level can vary between 1 V and 3,5 V without affecting the sync separator operation.

   The slicing level of the sync separator is fixed at 50%, for the sync pulse amplitude range 0,07 to 1 V. As a consequence the circuit gives a good sync separation down to pulses with an amplitude of 70 mV peak-to-peak (sync pulse compression). For sync pulses in excess of 1 V peak-to-peak the slicing level will increase.

   The noise gate is activated at an input level $< 0,7$ V, thus, when noise gating is required the top-sync level should be chosen close to the minimum level of 1 V. When i.f. circuits with a noise gate are used (e.g. TDA2540; TDA2541) the noise gate of the TDA2575A is not required.

3. Sync separator slicing level output

   The sync separator slicing level is determined on this pin. A slicing level of 50% is obtained by comparing this level with the black level of the video signal, which is detected at pin 4. The capacitor connected to pin 3 must be about 0,47 μF.

4. Black level detector output

   The black level of the input signal is detected on this pin, which is required to obtain good sync separator operation. A capacitor of 47 μF in series with a resistor of 82 Ω has to be connected to this pin. A 5,6 kΩ resistor must be connected between pins 3 and 4.

5. Vertical sync pulse integrator bias network

   The vertical sync pulse is obtained by integrating the composite sync signal in an internal RC-network. An external RC-network is required for the correct biasing of this circuit for various input conditions. Typical values are: R = 56 kΩ; c = 22 μF.

6. Horizontal phase detector output

   The control voltage for the horizontal oscillator is obtained on this pin. The output current is about 2 mA.

7. Reference voltage horizontal frequency control stage

   This pin has two functions. It is used to decouple the reference voltage for the frequency control of the horizontal oscillator (so a good suppression of interference is obtained which may be present on the supply line). This pin is also used to control the reference waveform for the phase detector to the middle of the gating, giving a good noise immunity of the synchronization.

8. Horizontal sync pulse output

   This pulse is obtained from the horizontal oscillator via a divider circuit. The duty factor is 46%. The falling edge of this pulse has a delay of 0,9 $\mu$s with respect to the end of the sync pulse. Because of this phase relationship this pulse can directly drive the TDA2581.

9. Time constant switch

   This pin is used to switch the time constant of the flywheel filter. The pin condition is determined by the coincidence detector (pin 10). During in-sync or when only noise is received pin 9 assumes ground level, which results in a long time constant and good noise immunity.

   During out-of-sync or VCR playback, pin 9 has a high impedance and consequently only the short time constant is available. In this condition a large catching range is obtained.

10. Coincidence detector output

    A 1 $\mu$F capacitor must be connected to this pin. The output voltage depends on the oscillator condition (synchronized or not) and on the video input signal.
    The following output voltages can occur:
    – when in-sync: 0,4 V
    – when out-of-sync: 2,0 V
    – during noise at input: 1,0 V

    When the output voltage $<$ 1,85 V, the flywheel filter is switched to a long time constant, and the gating of the phase detector is switched-on.

    For a voltage $>$ 1,85 V, the flywheel filter has a short time constant, and the gating of the phase detector is switched-off. The result is that during noise the flywheel time constant remains long thus preventing large shifts in the frequency of the horizontal oscillator (and screening of the horizontal output transformer).

    The information of the line coincidence detector is fed to the divider circuit so that there is no delay in vertical synchronization after a channel change, or an unsynchronized camera change in the studio. Thus, the divider circuit is reset to direct sync, when line synchronization is lost.

    The time constant value can be switched manually by a resistor (10 k$\Omega$) to + 12 V.

11. Negative supply (ground)

12. Positive supply horizontal oscillator

    Interference and hum on this supply line can affect the oscillator frequency. It is therefore necessary to have a separate decoupling of this pin with respect to pin 16. The current-draw of this pin is typically 33 mA.

13. Burst-key pulse output

    This pulse is composed of two parts. The lower part has an amplitude of 3 V peak-to-peak and a width of 9,1 $\mu$s (for phase relation see Fig. 2). The upper part has a total amplitude in excess of 10 V peak-to-peak and a width of 3,6 $\mu$s. The leading edge of this pulse has a delay of 0,9 $\mu$s with respect to the falling edge of the sync pulse at the input (pin 2).

    This pulse can directly drive the burst gate/black level clamp input of the TDA2560.

**APPLICATION INFORMATION** (continued)

14. RC-network horizontal oscillator

    Stable components should be chosen for good frequency stability. For adjusting the frequency a part of the total resistance must be variable. This part should be as small as possible, because of poor stability of variable carbon resistors.

    The oscillator can be adjusted when pins 7 and 15 are short-circuited.

15. Horizontal oscillator control pin

16. Positive supply sync separator and divider circuit (vertical)

    For this supply only a simple decoupling is required. The current-draw of this pin is typically 17 mA.

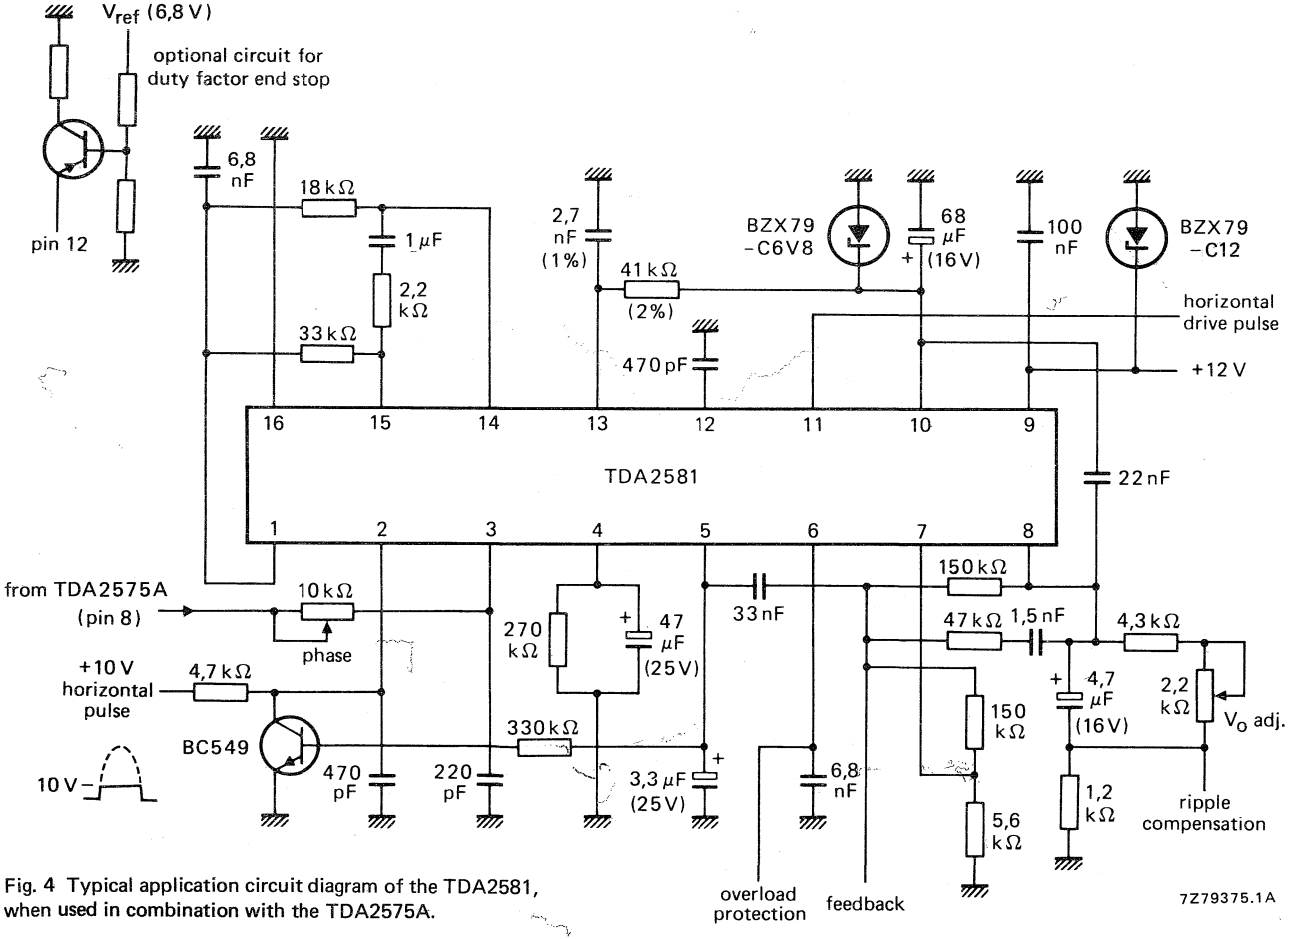

Fig. 4 Typical application circuit diagram of the TDA2581, when used in combination with the TDA2575A.

# HORIZONTAL OSCILLATOR COMBINATION WITH VERTICAL 625 DIVIDER SYSTEM

The TDA2576A is a horizontal oscillator combination intended to be used in various types of transistorized horizontal deflection circuits, e.g. switched-mode driven and power-pack system circuits.

The circuit is optimized for a horizontal and vertical frequency ratio of 625.

The circuit incorporates the following functions:

- Horizontal sync separator with sliding bias in such way that the sync pulse is always sliced between top-sync level and blanking level.
- Noise gate.
- Phase detector which compares the sync pulse with the oscillator voltage; this phase detector is gated.
- Phase detector which compares the line flyback pulse with the oscillator voltage.
- Horizontal oscillator (31,25 kHz).
- Time constant switching of the first control loop (short time constant during catching and reception of VCR signals).
- Burst key pulse generator (sandcastle pulse with three levels).
- Vertical sync pulse separator.
- Very stable vertical synchronization due to the 625 divider system, without delay after channel change.

| Output current | $I_2$ | < | 5 mA |
| Output voltage low at $I_2$ = 5 mA | $V_{2-9}$ | < | 500 mV |
| Duration of output pulse during indirect synchronization | $t_p$ | typ. | 190 μs |
| Duration of output pulse during direct synchronization | $t_p$ | typ. | 160 μs |
| Ratio between basic horizontal oscillator frequency and vertical pulse | | | 625 * |

* When a non-standard sync signal is applied the separated vertical sync pulse of the incoming signal is connected to pin 2; the pulse of the divider circuit is switched off.

## APPLICATION INFORMATION (see also Fig. 2)

**The function is described against the corresponding pin number**

1. Sandcastle output pulse

   This output pulse has three levels. The first and highest level (10 V) is the burst key pulse with a typical duration of 4,0 $\mu$s. The second level for the line blanking is typ. 4,5 V with a pulse duration equal to the line flyback pulse. The third level (typ. 2,5 V) is used for frame blanking and has a duration of typ. 1,34 ms (21 lines). This last pulse is only available with a standard video input signal. Under all other conditions, an external vertical flyback pulse must be applied to this pin. This pulse will be clamped to 2,5 V by means of an internal clamping circuit. The input current is typ. 2 mA.

2. Vertical output pulse

   This pulse is obtained from the divider circuit, the amplitude is in excess of 10 V peak-to-peak. This pulse has a duration of 190 $\mu$s when standard signals are received. The pulse is obtained from the vertical sync pulse integrator during non-standard signals and has a duration of about 160 $\mu$s. It has good stability and accuracy, so it is intended to be used for triggering the vertical oscillator.

3. Vertical sync pulse integrator bias network

   The vertical sync pulse is obtained by integrating the composite sync signal in an internal RC-network. An external capacitor with an internal resistor are required for the correct biasing of this circuit for various input conditions. A typical value for the capacitor is 10 $\mu$F.

4. Video input

   The input signal must have negative-going sync pulses. The top-sync level can vary between 1 V and 3,5 V without affecting the sync separator operation.

   The slicing level of the sync separator is fixed at 50%, for the sync pulse amplitude range 0,1 to 1 V peak-to-peak. As a consequence the circuit gives a good sync separation down to pulses with an amplitude of 100 mV peak-to-peak (sync pulse compression). For sync pulses in excess of 1 V peak-to-peak the slicing level will increase.

   The noise gate is activated at an input level $< 1$ V (typ. 0,7 V), thus, when noise gating is required the top-sync level should be chosen close to the minimum level of 1 V.

5. Sync separator slicing level output

   The sync separator slicing level is determined on this pin. A slicing level of 50% is obtained by comparing this level with the black level of the video signal, which is detected at pin 6. The capacitor connected to pin 5 must be about 1 $\mu$F.

6. Black level detector output

   The black level of the input signal is detected on this pin. A capacitor of 22 $\mu$F in series with a resistor of 33 $\Omega$ has to be connected to this pin. A 4,7 k$\Omega$ resistor must be connected between pins 5 and 6.

7. Horizontal phase detector output and control oscillator input

   The flywheel filter must be connected to this pin. Typical values for the components are a capacitor of 100 nF in parallel with an RC-network of 1 k$\Omega$ and 10 $\mu$F. Furthermore, a resistor of 270 k$\Omega$ should be connected between pins 7 and 12.
   The output current of the phase detector depends on the condition of the coincidence detector. The output current is high when the oscillator is out of sync. The result is a large catching range, and the phase detector is not gated in that condition. The output current is low when the oscillator is synchronized and the phase detector is gated. A good noise immunity is obtained in this case.

8 Coincidence detector output

A 1 $\mu$F capacitor must be connected to this pin. The output voltage depends on the oscillator condition (synchronized or not) and on the video input signal.
The following output voltages can occur:
- when in-sync 1,2 V
- when out-of-sync 2,6 V
- during noise at the input 1,7 V

When the output voltage $< 2,1$ V, the phase detector output current is low and the phase detector is gated. A good noise immunity is obtained in this case. For a voltage $> 2,1$ V, the output current of the phase detector is high and the phase detector is not gated. This results in a large catching range and a high dynamical steepness of the PLL. This latter condition is required during VCR-playback. It can be obtained by connecting pin 8 to the positive supply line via a resistor of 10 k$\Omega$. The information of the line coincidence detector is fed to the divider circuit so that there is no delay in vertical synchronization after a channel change, or an unsynchronized camera change in the studio. Thus, the divider circuit is reset to direct sync, when line synchronization is lost.

9. Negative supply (ground)

10. Horizontal output

This is an open collector output. The collector resistor must be chosen such that sufficient current is supplied to the driver stage. The maximum current is 60 mA. The output stage is designed such that the line output transistor cannot be switched-on during flyback. Switching-on occurs directly after the flyback pulse to avoid linearity errors. The duty factor of the output pulse depends on the delay in the output stage (correction via the second control loop).

11. Control voltage second loop

This voltage controls the start of the output pulse at pin 10 (positive-going edge). The capacitor connected to this pin must have a value of about 22 nF.

12. Reference voltage control loops

The reference voltage must be decoupled by means of a capacitor of about 10 $\mu$F.
It is possible to obtain a phase shift between video and flyback pulse by changing this reference voltage externally. The possible phase shift is $\pm$ 1 $\mu$s.
The required voltage change is $\pm$ 0,6 V.

13. Decoupling internal power supply

The IC has two power supply terminals. The main terminal (pin 16) supplies the output stages, the sync separator and the divider circuit. The specially decoupled supply terminal (pin 13) supplies the horizontal oscillator. This is to avoid coupling of the video signal into the oscillator part. The capacitor connected to pin 13 should have a value of about 22 $\mu$F. The resistor connected between pins 13 and 16 should have a value of about 1 k$\Omega$.

14. Flyback input pulse

The flyback input pulse is required for the second phase control loop and for generating the line blanking pulse in the sandcastle output. The input current should be at least 10 $\mu$A and not exceed 3 mA.

15. RC-network horizontal oscillator

Stable components should be chosen for a good frequency stability. A part of the total resistance must be variable for adjusting the frequency. This part should be as small as possible, because of poor stability of variable carbon resistors.
The oscillator can be adjusted when pins 7 and 12 are short-circuited (see Fig. 2).

16. Positive supply: The supply voltage may vary between 10 V and 13,2 V. The current-draw is 53 mA (typical) and a range of 35 to 70 mA at 12 V.

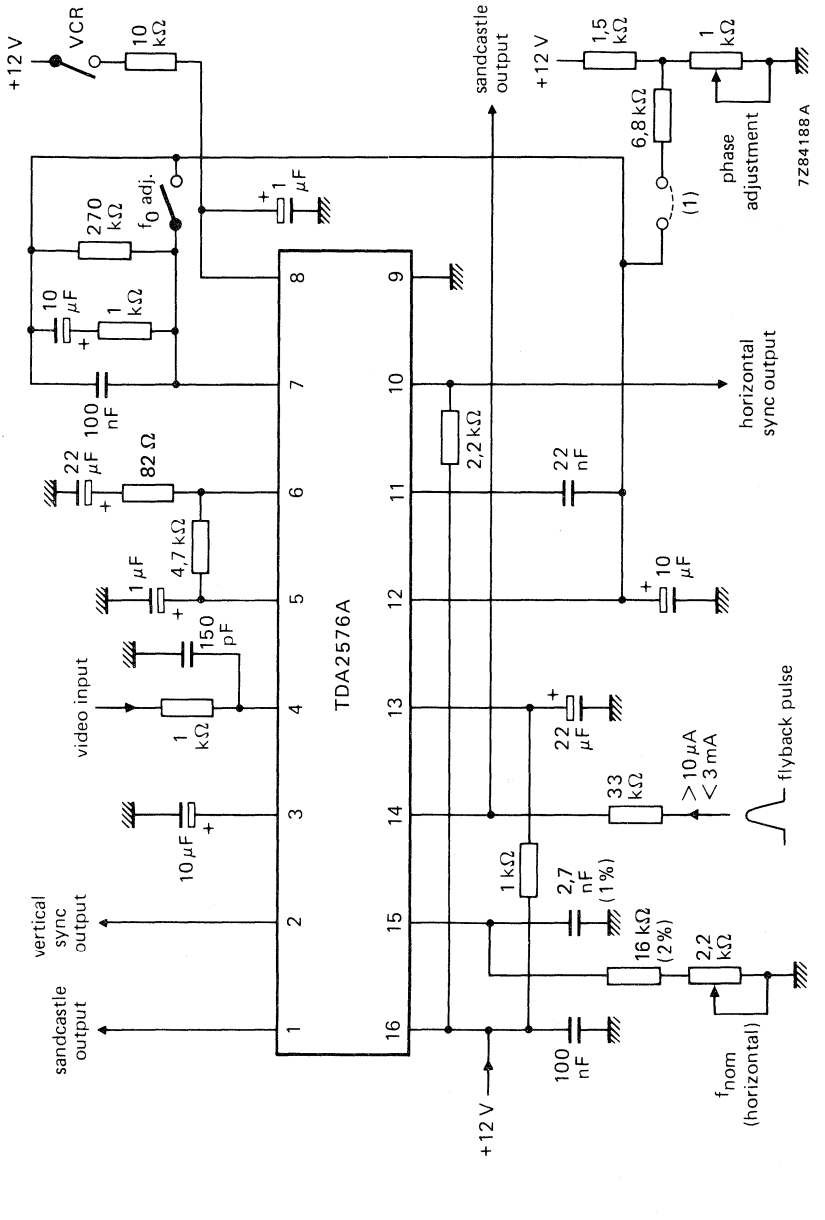

Fig. 2 Application circuit diagram.

(1) Optional circuit for phase adjustment.

# SYNCHRONIZATION CIRCUIT WITH VERTICAL OSCILLATOR AND DRIVER STAGES

## GENERAL DESCRIPTION

The TDA2577A separates the vertical and horizontal sync pulses from the composite TV video signal and uses them to synchronize horizontal and vertical oscillators.

### Features

- Horizontal sync separator and noise inverter
- Horizontal oscillator
- Horizontal output stage
- Horizontal phase detector (sync to oscillator)
- Time constant switch for phase detector (fast time constant during catching)
- Slow time constant for noise only conditions
- Time constant externally switchable (e.g. fast for VCR)
- Inhibit of horizontal phase detector and video transmitter identification circuit during vertical oscillator flyback
- Second phase detector ($\varphi 2$) for storage compensation of horizontal deflection stage
- Sandcastle pulse generator (3-levels)
- Video transmitter identification circuit
- Stabilizer and supply circuit for starting the horizontal oscillator and output stage directly from the mains rectifier
- Duty factor of horizontal output pulse is 50% when flyback pulse is absent
- Vertical sync separator
- Bandgap 6,5 V reference voltage for vertical oscillator and comparator
- Synchronized vertical oscillator/sawtooth generator (synchronization inhibited when no video transmitter is detected)
- Internal circuit for 3% parabolic pre-correction of the oscillator/sawtooth generator. Comparator supplied with pre-corrected sawtooth and external feedback input
- Vertical comparator with internal 3% pre-correction circuit for vertical oscillator/sawtooth generator
- Vertical driver stage
- Vertical blanking pulse generator with external adjustment of pulse duration (50 Hz: 21 lines; 60Hz: 17 lines)
- Vertical guard circuit

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| **Supply** | | | |
| Minimum current required to start horizontal oscillator and output stage (pin 16) | $I_{16}$ | > | 4 mA |
| Main supply voltage (pin 10) | $V_P = V_{10-9}$ | typ. | 12 V |
| Supply current | $I_P = I_{10}$ | typ. | 55 mA |
| **Input signals** | | | |
| Sync pulse input voltage (peak-to-peak value; negative-going) | $V_{5-9(p-p)}$ | 0,15 to 1 | V |
| **Output signals** | | | |
| Horizontal output pulse (open collector) at $I_{11}$ = 40 mA | $V_{11-9}$ | < | 0,5 V |
| Vertical output pulse (emitter-follower) at $I_1$ = 10 mA | $V_{1-9}$ | > | 4 V |

DEVELOPMENT SAMPLE DATA

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | | |
|---|---|---|---|---|
| Start current (pin 16) | $I_{16}$ | max. | 8 | mA |
| Supply voltage (pin 10) | $V_P = V_{10-9}$ | max. | 13,2 | V |
| Total power dissipation | $P_{tot}$ | max. | 1,1 | W |
| Storage temperature range | $T_{stg}$ | | −55 to + 150 | °C |
| Operating ambient temperature range | $T_{amb}$ | | −25 to + 65 | °C |

## THERMAL RESISTANCE

| | | | | |
|---|---|---|---|---|
| From junction to ambient in free air | $R_{th\ j-a}$ | typ. | 50 | K/W |

## CHARACTERISTICS

$I_{16}$ = 5 mA; $V_P$ = 12 V; $T_{amb}$ = 25 °C; unless otherwise specified

| | | | | |
|---|---|---|---|---|
| **Supply** | | | | |
| Supply current at pin 16 | $I_{16}$ | | 4 to 8 | mA |
| Stabilized supply voltage (pin 16) | $V_{16-9}$ | typ. | 8,7 | V |
| | | | 8,0 to 9,5 | V |
| Supply current (pin 10) | $I_{10}$ | typ. | 55 | mA |
| | | < | 70 | mA |
| Supply voltage (pin 10) | $V_P = V_{10-9}$ | typ. | 12 | V |
| | | | 10 to 13,2 | V |
| **Video input** (pin 5) | | | | |
| Top-sync level | $V_{5-9}$ | typ. | 3,1 | V |
| | | | 1,5 to 3,75 | V |
| Sync pulse amplitude (peak-to-peak value) (note 1) | $V_{5-9(p-p)}$ | typ. | 0,6 | V |
| | | | 0,15 to 1 | V |
| Slicing level | | typ. | 50 | % |
| | | | 35 to 65 | % |
| Delay between video input and detector output | $t_1$ | typ. | 0,35 | μs |
| **Noise gate** (pin 5) | | | | |
| Switching level | $V_{5-9}$ | typ. | 0,7 | V |
| | | < | 1 | V |
| **First control loop** (sync to oscillator; pin 8) | | | | |
| Holding range | $\Delta f$ | typ. | ± 800 | Hz |
| Catching range | $\Delta f$ | typ. | ± 800 | Hz |
| | | | ± 600 to 1100 | Hz |
| Control sensitivity video with respect to oscillator, burst key and flyback pulse | | | | |
| for slow time constant | | typ. | 1 | kHz/μs |
| for fast time constant | | typ. | 2,75 | kHz/μs |

DEVELOPMENT SAMPLE DATA

| | | | |
|---|---|---|---|
| **Second control loop** (horizontal output to flyback; pin 14) | | | |
| Control sensitivity; static (see note 2) | $\Delta t_d/\Delta t_o$ | typ. | 400 μs/μs |
| Control range | $t_d$ | | 1 to 50 μs |

| Switching level slow to fast (locking) mute function inactive | $V_{18\text{-}9}$ | typ. | 1,7 V<br>1,5 to 1,9 V |
| Switching level fast to slow (locking) | $V_{18\text{-}9}$ | typ. | 5,0 V<br>4,7 to 5,3 V |
| Switching level for VCR (fast time constant) without mute function | $V_{18\text{-}9}$ | typ. | 8,6 V<br>8,2 to 9,0 V |
| **Video transmitter identification output** (pin 13) | | | |
| Output voltage active (no sync) at $I_{13}$ = 1 mA | $V_{13\text{-}9}$ | > | 10 V |
| | | typ. | 11 V |
| Output voltage active (no sync) at $I_{13}$ = 5 mA | $V_{13\text{-}9}$ | > | 7 V |
| | | typ. | 10 V |
| Output voltage inactive | $V_{13\text{-}9}$ | < | 0,5 V |
| | | typ. | 0,1 V |
| **VCR switching** (pin 13) | | | |
| Input current for fast time constant phase detector $\varphi_1$, with mute function active | $I_{13}$ | typ. | 0,6 mA<br>0,4 to 0,8 mA |
| **Flyback input pulse** (pin 12) | | | |
| Switching level | $V_{12\text{-}9}$ | typ. | 1 V |
| Input current | $I_{12}$ | | 0,2 to 4 mA |
| Input pulse amplitude (peak-to-peak value) | $V_{12\text{-}9(p\text{-}p)}$ | < | 12 V |
| Input resistance | $R_{12\text{-}9}$ | typ. | 2,7 kΩ |
| Delay time of sync pulse (measured in $\varphi_1$) to flyback at switching level; $t_{fl}$ = 12 μs (see also note 2 and Fig. 4) | $t_o$ | typ. | 1,3 μs |

**Duration of vertical blanking pulse** (pin 12)

| | | | |
|---|---|---|---|
| Required input current (negative) | | | |
| for 50 Hz application; 21 lines blanking | $-I_{12}$ | typ. | 0,2 mA |
| | | > 0,15 to < 0,3 | mA |
| for 60 Hz application; 17 lines blanking | $-I_{12}$ | < | 0,1 mA |
| Maximum allowed input current | $-I_{12}$ | < | 0,4 mA |

**Vertical sawtooth generator** (pin 3)

| | | | |
|---|---|---|---|
| Vertical frequency (no sync) | $f_s$ | typ. | 46 Hz |
| Frequency spread ($C_{osc}$ = 680 nF; $R_{osc}$ = 180 kΩ; at + 26 V) | $\Delta f_s$ | < | 4 % |
| Synchronization range | | typ. | 22 % |
| Input current at $V_{3-9}$ = 6 V | $I_3$ | < | 2 μA |
| Frequency shift for $V_P$ = 10 to 13 V | $\Delta f_s$ | < | 0,2 % |
| Temperature coefficient | TC | typ. | $1 \cdot 10^{-4}$ $K^{-1}$ |

**Comparator** (pin 2)

| | | | |
|---|---|---|---|
| Input voltage; d.c. level | $V_{2-9}$ | typ. | 4,4 V |
| | | | 4,0 to 4,8 V |
| a.c. level (peak-to-peak value) | $V_{2-9(p-p)}$ | typ. | 1,6 V |
| Input current at $V_{2-9}$ = 6 V | $I_2$ | < | 2 μA |
| Sawtooth internal pre-correction (parabolic convex) | | typ. | 3 % |

**Vertical output stage; emitter follower** (pin 1)

| | | | |
|---|---|---|---|
| Output voltage at $I_1$ = 10 mA | $V_{1-9}$ | typ. | 3,6 V |
| | | | 3,2 to 5 V |
| Output current | $I_1$ | < | 20 mA |

**Vertical guard circuit**

Activating voltage levels (vertical blanking level is 2,5 V)

| | | | |
|---|---|---|---|
| switching level low | $V_{2-9}$ | typ. | 3 V |
| | | | 2,7 to 3,3 V |
| switching level high | $V_{2-9}$ | typ. | 5,7 V |
| | | | 5,3 to 6,1 V |

**Notes to characteristics**

1. Up to 1 V peak-to-peak the slicing level is constant; at amplitudes exceeding 1 V peak-to-peak the slicing level will increase.
2. $t_d$ = delay between negative transient of horizontal output pulse and the rising edge of the flyback pulse.
   $t_o$ = delay between the rising edge of the flyback pulse and the start of the current in $\varphi_1$ (pin 8).
3. The duration of the flyback pulse is measured at the input switching level, which is about 1 V ($t_{fl}$).
4. Depends on d.c. level at pin 5; value given applicable for $V_{5-9} \approx 5$ V.

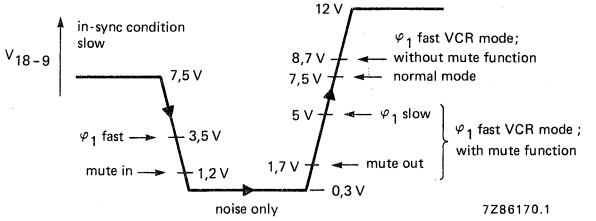

Fig. 3 Voltage levels at pin 18 ($V_{18-9}$).

## APPLICATION INFORMATION

The TDA2577A generates the signal for driving the horizontal deflection output circuit. It also contains a synchronized vertical sawtooth generator for direct drive of the vertical deflection output stage.

The horizontal oscillator and output stage can start operating on a very low supply current ($I_{16} \geqslant 4$ mA), which can be taken directly from the mains rectifier. Therefore, it is possible to derive the main supply (pin 10) from the horizontal deflection output stage. The duty factor of the horizontal output signal is about 65% during the starting-up procedure. After starting-up, the second phase detector ($\varphi_2$) is activated to control the timing of the negative-going edge of the horizontal output signal.

A bandgap reference voltage (6,5 V) is provided for supply and reference of the vertical oscillator and comparator stage.

The slicing level of the horizontal sync separator is independent of the amplitude of the sync pulse at the input. The resistor between pins 6 and 7 determines its value. A 4,7 kΩ resistor gives a slicing level at the middle of the sync pulse. The nominal top sync level at the input is 3,1 V. The amplitude selective noise inverter is activated at a level of 0,7 V.

Good stability is obtained by means of the two control loops. In the first loop, the phase of the horizontal sync signal is compared with a waveform of which the rising edge refers to the top of the horizontal oscillator signal. In the second loop, the phase of the flyback pulse is compared with another reference waveform, the timing of which is such that the top of the flyback pulse is situated symmetrically on the horizontal blanking interval of the video signal. Therefore the first loop can be designed for a good noise immunity, whereas the second loop can be as fast as desired for compensation of switch-off delays in the horizontal output stage.

The first phase detector is gated with a pulse derived from the horizontal oscillator signal. This gating (slow time constant) is switched off during catching. Also, the output current of the phase detector is increased fivefold, during the catching time and VCR conditions (fast time constant). The first phase detector is inhibited during the retrace time of the vertical oscillator.

The in-sync, out-of-sync or no video condition is detected by the video transmitter identification/coincidence detector circuit (pin 18). The voltage on pin 18 defines the time constant and gating of the first phase detector. The relationship between this voltage and the various switching levels is shown in Fig. 3. The complete survey of the switching actions is given in Table 1.

## APPLICATION INFORMATION (continued)

**Table 1** Switching levels at pin 18.

| voltage at pin 18 | first phase detector $\varphi 1$ | | | | mute output at pin 13 | | receiving conditions |
|---|---|---|---|---|---|---|---|
| | time constant | | gating | | | | |
| | slow | fast | on | off | on | off | |
| 7,5 V | X | | X | | | X | video signal detected |
| 7,5 to 3,5 V | X | | X | | | X | video signal detected |
| 3,5 to 1,2 V | | X | | X | | X | video signal detected |
| 1,2 to 0,1 V | X | | X | | X | | noise only |
| 0,1 to 1,7 V | X | * | X | * | X | | new video signal detected |
| 1,7 to 5,0 V | | X | | X | | X | horizontal oscillator locked<br>VCR playback with mute function |
| 5,0 to 7,5 V | X | | X | | | X | horizontal oscillator locked |
| 8,7 V | | X | | X | | X | VCR playback without mute function |

Where: * = 3 vertical periods.

The stability of displayed video information (e.g. channel number), during noise only conditions, is improved by the first phase detector time constant being set to slow.

The average voltage level of the video input on pin 5 during noise only conditions should not exceed 5,5 V otherwise the time constant switch may be set to fast due to the average voltage level on pin 18 dropping below 0,1 V. When the voltage on pin 18 drops below 100 mV a counter is activated which sets the time constant switch to fast, and not gated for 3 vertical periods. This condition occurs when a new video signal is present at pin 5. When the horizontal oscillator is locked the voltage on pin 18 increases. Nominally a level of 5 V is reached within 15 ms (1 vertical period). The mute switching level of 1,2 V is reached within 5 ms ($C_{18}$ = 47 nF). If the video transmitter identification circuit is required to operate under VCR playback conditions the first phase detector can be set to fast by connecting a resistor of 180 kΩ between pin 18 and ground. Also a current of 0,6 mA into pin 13 sets the first phase detector to fast without affecting the mute output function (active HIGH with no video signal detected). For VCR playback without mute function, the first phase detector can be set to fast by connecting a resistor of 1 kΩ to the supply (pin 10).

The supply for the horizontal oscillator (pin 15) and horizontal output stage (pin 11) is derived from the voltage at pin 16 during the start condition. The horizontal output signal starts at a nominal supply current into pin 16 of 3,5 mA, which will result in a supply voltage of about 5,5 V (for guaranteed operation of all devices $I_{16} > 4$ mA). It is possible that the main supply voltage at pin 10 is 0 V during starting, so the main supply of the IC can be taken from the horizontal deflection output stage. The start of the other IC functions depends on the value of the main supply voltage at pin 10. At 5,5 V all IC functions start operating except the second phase detector (oscillator to flyback pulse). The output voltage of the second phase detector at pin 14 is clamped by means of an internally loaded n-p-n emitter follower. This ensures that the duty factor of the horizontal output signal (pin 11) remains at about 65%. The second phase detector will close if the supply voltage at pin 10 reaches 8,8 V. At this value the supply current for the horizontal oscillator and output stage is delivered by pin 10, which also causes the voltage at pin 16 to change to a stabilized 8,7 V. This change switches off the n-p-n emitter follower at pin 14 and activates the second phase detector. The supply voltage for the horizontal oscillator will, however, still be referred to the stabilized voltage at pin 16, and the duty factor of the output signal at pin 12 is at the value required by the delay at the horizontal deflection stage. Thus switch-off delays

in the horizontal output stage are compensated. When no horizontal flyback signal is detected the duty factor of the horizontal output signal is 50%.

Horizontal picture shift is possible by externally charging or discharging the 47 nF capacitor connected to pin 14.

The IC also contains a synchronized vertical oscillator/sawtooth generator. The oscillator signal is connected to the internal comparator (the other side of which is connected to pin 2), via an inverter and amplitude divider stage. The output of the comparator drives an emitter-follower output stage at pin 1. For a linear sawtooth in the oscillator, the load resistor at pin 3 should be connected to a voltage source of 26 V or higher. The sawtooth amplitude is not influenced by the main supply at pin 10. The feedback signal is applied to pin 2 and compared to the sawtooth signal at pin 3. For an economical feedback circuit with less picture bounce the sawtooth signal is internally precorrected by 3% (convex) referred to pin 2. The linearity of the vertical deflection current depends upon the oscillator signal at pin 3 and the feedback signal at pin 2.

Synchronization of the vertical oscillator is inhibited when the mute output is present at pin 13.

To minimize the influence of the horizontal part on the vertical part a 6,5 V bandgap reference source is provided for supply and reference of the vertical oscillator and comparator.

The sandcastle pulse, generated at pin 17, has three different voltage levels. The highest level (11 V) can be used for burst gating and black level clamping. The second level (4,6 V) is obtained from the horizontal flyback pulse at pin 12 and used for horizontal blanking. The third level (2,5 V) is used for vertical blanking and is derived by counting the horizontal frequency pulses. For 50 Hz the blanking pulse duration is 21 lines and for 60 Hz it is 17 lines. The blanking pulse duration is set by the negative voltage value of the horizontal flyback pulse at pin 12.

The IC also incorporates a vertical guard circuit, which monitors the vertical feedback signal at pin 2. If this level is below 3 V or higher than 5,8 V, the guard circuit will insert a continuous level of 2,5 V into the sandcastle output signal. This will result in complete blanking of the screen if the sandcastle pulse is used for blanking in the TV set.

DEVELOPMENT SAMPLE DATA

# SYNCHRONIZATION CIRCUIT WITH VERTICAL OSCILLATOR AND DRIVER STAGES

## GENERAL DESCRIPTION

The TDA2578A separates the vertical and horizontal sync pulses from the composite TV video signal and uses them to synchronize horizontal and vertical oscillators.

### Features

- Horizontal sync separator and noise inverter
- Horizontal oscillator
- Horizontal output stage
- Horizontal phase detector (sync to oscillator)
- Time constant switch for phase detector (fast time constant during catching)
- Slow time constant for noise only conditions
- Time constant externally switchable (e.g. fast for VCR)
- Inhibit of horizontal phase detector and video transmitter identification circuit during vertical oscillator flyback
- Second phase detector ($\varphi_2$) for storage compensation of horizontal deflection stage
- Sandcastle pulse generator (3-levels)
- Video transmitter identification circuit
- Stabilizer and supply circuit for starting the horizontal oscillator and output stage directly from the mains rectifier
- Duty factor of horizontal output pulse is 50% when flyback pulse is absent
- Vertical sync separator
- Bandgap 6,5 V reference voltage for vertical oscillator and comparator
- Synchronized vertical oscillator/sawtooth generator (synchronization inhibited when no video transmitter is detected)
- Internal circuit for 6% parabolic pre-correction of the oscillator/sawtooth generator. Comparator supplied with pre-corrected sawtooth and external feedback input
- Vertical driver stage
- Vertical blanking pulse generator
- 50/60 Hz detector
- 50/60 Hz identification output
- Automatic amplitude adjustment for 60 Hz
- Automatic adjustment of blanking pulse duration (50 Hz: 21 lines; 60 Hz: 17 lines)
- Vertical guard curcuit

## QUICK REFERENCE DATA

| Delay time of sync pulse (measured in $\varphi_1$) to flyback at switching level; $t_{fl}$ = 12 µs (see also note 2 and Fig. 4) | $t_o$ | typ. | 1,3 | µs |

**Vertical sawtooth generator** (pin 3)

| | | | | |
|---|---|---|---|---|
| Vertical frequency (no sync) | $f_s$ | typ. | 46 | Hz |
| Frequency spread ($C_{osc}$ = 680 nF; $R_{osc}$ = 180 kΩ; at + 26 V) | $\Delta f_s$ | < | 4 | % |
| Synchronization range (note 6) | | typ. | 33 | % |
| Input current at $V_{3-9}$ = 6 V | $I_3$ | < | 3 | μA |
| Frequency shift for $V_P$ = 10 to 13 V | $\Delta f_s$ | < | 0,2 | % |
| Temperature coefficient | TC | typ. | $1 \cdot 10^{-4}$ | $K^{-1}$ |

**Comparator** (pin 2)

| | | | | |
|---|---|---|---|---|
| Input voltage; d.c. level | $V_{2-9}$ | typ. | 4,4 | V |
| | | | 4,0 to 4,8 | V |
| a.c. level (peak-to-peak value) | $V_{2-9(p-p)}$ | typ. | 0,8 | V |
| Input current at $V_{2-9}$ = 6 V | $I_2$ | < | 2 | μA |
| Sawtooth internal pre-correction (parabolic convex) | | typ. | 6 | % |

**Vertical output stage; emitter follower** (pin 1)

| | | | | |
|---|---|---|---|---|
| Output voltage at $I_1$ = 10 mA | $V_{1-9}$ | typ. | | V |
| | | | 3,2 to 5 | V |
| Output current | $I_1$ | < | 20 | mA |

**Vertical guard circuit**

| | | | | |
|---|---|---|---|---|
| Activating voltage levels (vertical blanking level is 2,5 V) | | | | |
| switching level low | $V_{2-9}$ | typ. | 3,35 | V |
| | | | 3,0 to 3,7 | V |
| switching level high | $V_{2-9}$ | typ. | 5,15 | V |
| | | | 4,75 to 5,55 | V |

**Notes to characteristics**

1. Up to 1 V peak-to-peak the slicing level is constant; at amplitudes exceeding 1 V peak-to-peak the slicing level will increase.
2. $t_d$ = delay between positive transient of horizontal output pulse and the rising edge of the flyback pulse.
   $t_o$ = delay between the rising edge of the flyback pulse and the start of the current in $\varphi_1$ (pin 8).
3. The duration of the flyback pulse is measured at the input switching level, which is about 1 V ($t_{fl}$).
4. Depends on d.c. level at pin 5; value given applicable for $V_{5-9} \approx 5$ V.
5. For 60 Hz a p-n-p emitter clamp is activated.
6. When $f_o$ = 46 Hz the 50/60 Hz detector switches over to 60 Hz; video input signal at pin 5 ≈ 55 Hz.

DEVELOPMENT SAMPLE DATA

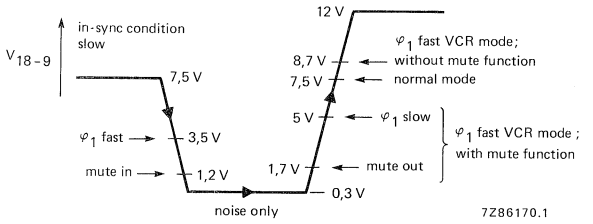

Fig. 3 Voltage levels at pin 18 ($V_{18-9}$).

## APPLICATION INFORMATION

The TDA2578A generates the signal for driving the horizontal deflection output circuit. It also contains a synchronized vertical sawtooth generator for direct drive of the vertical deflection output stage.

The horizontal oscillator and output stage can start operating on a very low supply current ($I_{16} \geqslant 4$ mA), which can be taken directly from the mains rectifier. Therefore, it is possible to derive the main supply (pin 10) from the horizontal deflection output stage. The duty factor of the horizontal output signal is about 65% during the starting-up procedure. After starting-up, the second phase detector ($\varphi_2$) is activated to control the timing of the positive-going edge of the horizontal output signal.

A bandgap reference voltage (6,5 V) is provided for supply and reference of the vertical oscillator and comparator stage.

The slicing level of the horizontal sync separator is independent of the amplitude of the sync pulse at the input. The resistor between pins 6 and 7 determines its value. A 4,7 kΩ resistor gives a slicing level at the middle of the sync pulse. The nominal top sync level at the input is 3,1 V. The amplitude selective noise inverter is activated at a level of 0,7 V.

Good stability is obtained by means of the two control loops. In the first loop, the phase of the horizontal sync signal is compared with a waveform of which the rising edge refers to the top of the horizontal oscillator signal. In the second loop, the phase of the flyback pulse is compared with another reference waveform, the timing of which is such that the top of the flyback pulse is situated symmetrically on the horizontal blanking internal of the video signal. Therefore the first loop can be designed for a good noise immunity, whereas the second loop can be as fast as desired for compensation of switch-off delays in the horizontal output stage.

The first phase detector is gated with a pulse derived from the horizontal oscillator signal. This gating (slow time constant) is switched off during catching. Also, the output current of the phase detector is increased fivefold, during the catching time and VCR conditions (fast time constant). The first phase detector is inhibited during the retrace time of the vertical oscillator.

The in-sync, out-of-sync or no video condition is detected by the video transmitter identification/coincidence detector circuit (pin 18). The voltage on pin 18 defines the time constant and gating of the first phase detector. The relationship between this voltage and the various switching levels is shown in Fig. 3. The complete survey of the switching actions is given in Table 1.

**Table 1** Switching levels at pin 18.

| voltage at pin 18 | first phase detector $\varphi_1$ | | | | mute output at pin 13 | | receiving conditions |
|---|---|---|---|---|---|---|---|
| | time constant | | gating | | | | |
| | slow | fast | on | off | on | off | |
| 7,5 V | X | | X | | | X | video signal detected |
| 7,5 to 3,5 V | X | | X | | | X | video signal detected |
| 3,5 to 1,2 V | | X | | X | | X | video signal detected |
| 1,2 to 0,1 V | X | | X | | X | | noise only |
| 0,1 to 1,7 V | X | * | X | * | X | | new video signal detected |
| 1,7 to 5,0 V | | X | | X | | X | horizontal oscillator locked<br>VCR playback with mute function |
| 5,0 to 7,5 V | X | | X | | | X | horizontal oscillator locked |
| 8,7 V | | X | | X | | X | VCR playback without mute function |

Where: * = 3 vertical periods.

## APPLICATION INFORMATION (continued)

The stability of displayed video information (e.g. channel number), during noise only conditions, is improved by the first phase detector time constant being set to slow.

The average voltage level of the video input on pin 5 during noise only conditions should not exceed 5,5 V otherwise the time constant switch may be set to fast due to the average voltage level on pin 18 dropping below 0,1 V. When the voltage on pin 18 drops below 100 mV a counter is activated which sets the time constant switch to fast, and not gated for 3 vertical periods. This condition occurs when a new video signal is present at pin 5. When the horizontal oscillator is locked the voltage on pin 18 increases. Nominally a level of 5 V is reached within 15 ms (1 vertical period). The mute switching level of 1,2 V is reached within 5 ms ($C_{18}$ = 47 nF). If the video transmitter identification circuit is required to operate under VCR playback conditions the first phase detector can be set to fast by connecting a resistor of 180 kΩ between pin 18 and ground (see Fig. 7).

The supply for the horizontal oscillator (pin 15) and horizontal output stage (pin 11) is derived from the voltage at pin 16 during the start condition. The horizontal output signal starts at a nominal supply current into pin 16 of 3,6 mA, which will result in a supply voltage of about 5,5 V (for guaranteed operation of all devices $I_{16} > 4$ mA). It is possible that the main supply voltage at pin 10 is 0 V during starting, so the main supply of the IC can be taken from the horizontal deflection output stage. The start of the other IC functions depends on the value of the main supply voltage at pin 10. At 5,5 V all IC functions start operating except the second phase detector (oscillator to flyback pulse). The output voltage of the second phase detector at pin 14 is clamped by means of an internally loaded n-p-n emitter follower. This ensures that the duty factor of the horizontal output signal (pin 11) remains at about 65%. The second phase detector will close if the supply voltage at pin 10 reaches 8,8 V. At this value the supply current for the horizontal oscillator and output stage is delivered by pin 10, which also causes the voltage at pin 16 to change to a stabilized 8,7 V. This change switches off the n-p-n emitter follower at pin 14 and activates the second phase detector. The supply voltage for the horizontal oscillator will, however, still be referred to the stabilized voltage at pin 16, and the duty factor of the output signal at pin 12 is at the value required by the delay at the horizontal deflection stage. Thus switch-off delays in the horizontal output stage are compensated. When no horizontal flyback signal is detected the duty factor of the horizontal output signal is 50%.

Horizontal picture shift is possible by externally charging or discharging the 47 nF capacitor connected to pin 14.

The IC also contains a synchronized vertical oscillator/sawtooth generator. The oscillator signal is connected to the internal comparator (the other side of which is connected to pin 2), via an inverter and amplitude divider stage. The output of the comparator drives an emitter-follower output stage at pin 1. For a linear sawtooth in the oscillator, the load resistor at pin 3 should be connected to a voltage source of 26 V or higher. The sawtooth amplitude is not influenced by the main supply at pin 10. The feedback signal is applied to pin 2 and compared to the sawtooth signal at pin 3. For an economical feedback circuit with less picture bounce the sawtooth signal is internally pre-corrected by 6% (convex) referred to pin 2. The linearity of the vertical deflection current depends upon the oscillator signal at pin 3 and the feedback signal at pin 2.

Synchronization of the vertical oscillator is inhibited when the mute output is present at pin 13.

To minimize the influence of the horizontal part on the vertical part a 6,7 V bandgap reference source is provided for supply and reference of the vertical oscillator and comparator.

The sandcastle pulse, generated at pin 17, has three different voltage levels. The highest level (11 V) can be used for burst gating and black level clamping. The second level (4,6 V) is obtained from the horizontal flyback pulse at pin 12 and used for horizontal blanking. The third level (2,5 V) is used for vertical blanking and is derived by counting the horizontal frequency pulses. For 50 Hz the blanking pulse duration is 21 lines and for 60 Hz it is 17 lines. The blanking pulse duration and sawtooth amplitude is automatically adjusted via the 50/60 Hz detector.

The IC also incorporates a vertical guard circuit, which monitors the vertical feedback signal at pin 2. If this level is below 3,35 V or higher than 5,15 V, the guard circuit will insert a continuous level of 2,5 V into the sandcastle output signal. This will result in complete blanking of the screen if the sandcastle pulse is used for blanking in the TV set.

DEVELOPMENT SAMPLE DATA

# CONTROL CIRCUIT FOR SMPS

The TDA2581 is a monolithic integrated circuit for controlling switched-mode power supplies (SMPS) which are provided with the drive for the horizontal deflection stage.

The circuit features the following:
- Voltage controlled horizontal oscillator.
- Phase detector.
- Duty factor control for the positive-going transient of the output signal.
- Duty factor increases from zero to its normal operation value.
- Adjustable maximum duty factor.
- Over-voltage and over-current protection with automatic re-start after switch-off.
- Counting circuit for permanent switch-off when n-times over-current or over-voltage is sensed.
- Protection for open-reference voltage.
- Protection for too low supply voltage.
- Protection against loop faults.
- Positive tracking of duty factor and feedback voltage when the feedback voltage is smaller than the reference voltage minus 1,5 V.

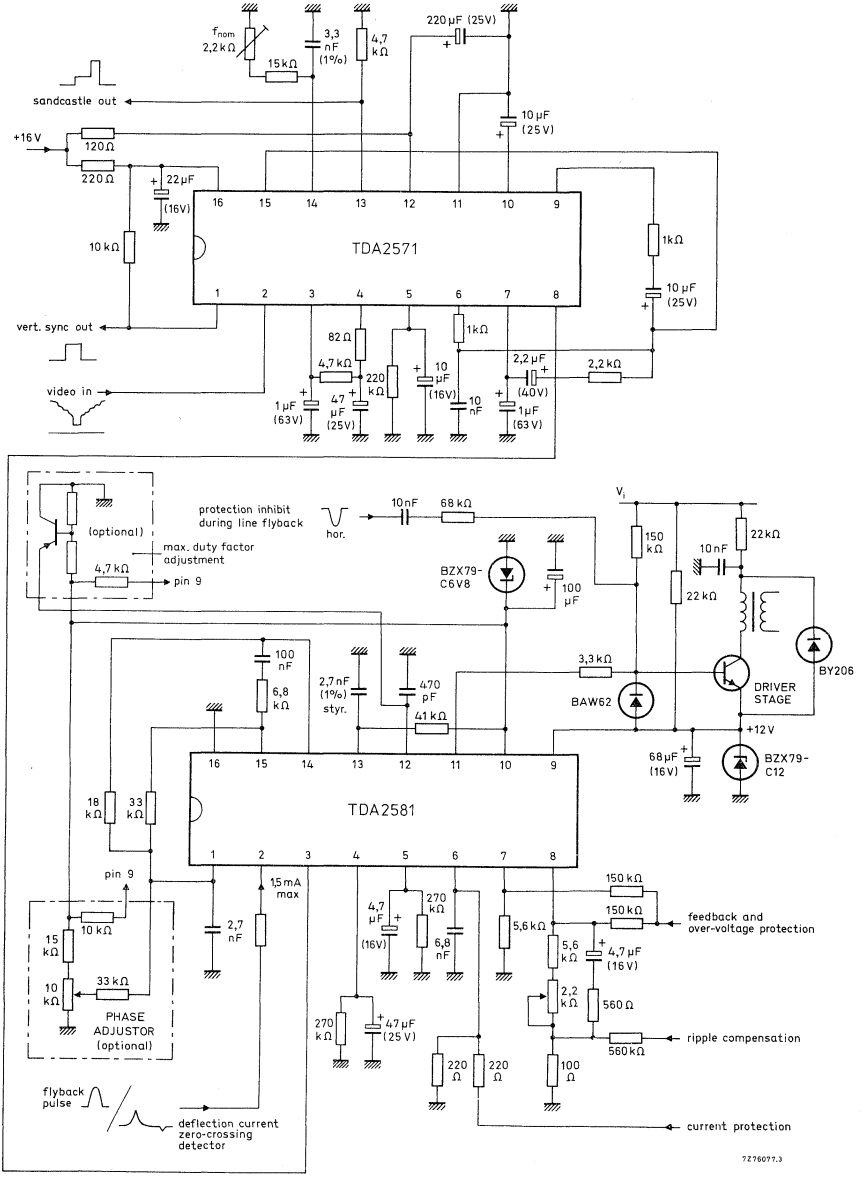
## APPLICATION INFORMATION



The TDA2571 and TDA2581 controlling an SMPS driver stage.

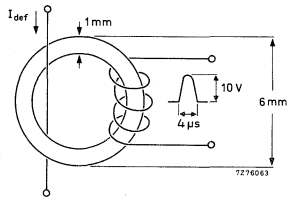
**The function is quoted against the corresponding pin number**

1. Phase detector output

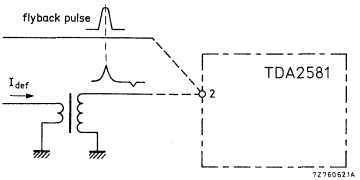
The output circuit consists of a bidirectional current source which is active for the time that the signal on pin 2 exceeds 1 V.
The current values are chosen such that the correct phase relation is obtained when the reference signal on pin 3 is delivered by the TDA2571.
With a resistor of 18 kΩ and a capacitor of 2,7 nF the control steepness is 0,55 V/μs.

2. Flyback pulse input

The signal applied to pin 2 is normally a flyback pulse with a duration of about 12 μs. However, the phase detector system also accepts a signal derived by differentiating the deflection current by means of a small toroidal core (pulse duration > 3 μs).



(a)



(b)

The toroidal transformer in (a) is for obtaining a pulse representing the mid-flyback from the deflection current. The connection of the picture phase information is shown in (b).

3. Reference frequency input

The input circuit can be driven directly by the square-wave output voltage from pin 8 of the TDA2571.
The negative-going transient switches the current source connected to pin 1 from positive to negative.
The input circuit is made such that a differentiated signal of the square-wave from the TDA2571 is also accepted (this enables mains isolation). The input circuit switching level is about 3 V and the input impedance is about 10 kΩ.

4. Re-start count capacitor/remote control input

*Counting*

An external capacitor (C4 = 47 μF) is connected between pins 4 and 16. This capacitor controls the characteristics of the protection circuits as follows.
If the protection circuits are required to operate, e.g. over-current at pin 6, the duty factor will be set to zero thus turning off the power supply.
After a short interval (determined by the time constant on pin 5) the power supply will be restarted via the slow start circuit.
If the fault condition has cleared, then normal operation will be resumed. If the fault condition is persistent, the duty factor of the pulses is again reduced to zero and the protection cycle is repeated.

The number of times this action is repeated (n) for a persisting fault condition is now determined by: n = C4/C5.

## APPLICATION INFORMATION (continued)

*Remote control input*

For this application the capacitor on pin 4 has to be replaced by a resistor with a value between 4,7 and 18 kΩ. When the externally applied voltage $V_{4\text{-}16} > 5{,}8$ V, the circuit switches off; switching on occurs when $V_{4\text{-}16} < 4{,}5$ V and the normal starting-up procedure is followed. Pin 4 is internally connected to an emitter-follower, with an emitter voltage of 1,5 V.

5. Slow start and transfer characteristics for low feedback voltages

*Slow start*

An external shunt capacitor (C5 = 4,7 μF) and resistor (R5 = 270 kΩ) are connected between pins 5 and 16. The network controls the rate at which the duty factor increases from zero to its steady-state value after switch-on. It provides protection against surges in the power transistor.

*Transfer characteristic for low feedback voltages*

The duty factor transfer characteristic for low feedback voltages can be influenced by R5. The transfer for three different resistor values is given in the graph on page 10.

6. Over-current protection input

A voltage proportional to the current in the power switching device is applied to the integrated circuit between pins 6 and 16. The circuit trips on both positive and negative polarity.

7. Over-voltage protection input

When the voltage applied to this pin exceeds the threshold level, the protection circuit will operate. When this function is not used, pin 7 should be connected to pin 16.

8. Feedback voltage input

The control loop input is applied to pin 8. This pin is internally connected to one input of a differential amplifier, functioning as an amplitude comparator, the other input of which is connected to the reference source on pin 10.
Under normal operating conditions, the voltage on pin 8 will be about equal to the reference voltage on pin 10. For further information refer to the graphs on pages 10 and 11.

9. 12 V positive supply

The maximum voltage that may be applied is 14 V. Where this is derived from an unstabilized supply rail, a regulator diode (12 V) should be connected between pins 9 and 16 to ensure that the maximum voltage does not exceed 14 V. When the voltage on this pin falls below a minimum of 8,6 V (typically 9,4 V), the protection circuit will switch-off the power supply.

10. Reference input

An external reference diode must be connected between this pin and pin 16.
The reference voltage must be between 5,6 and 7,5 V. The IC delivers about 1 mA into the external regulator diode. When the external load on the regulator diode approaches this current, replenishment of the current can be obtained by connecting a suitable resistor between pins 9 and 10.

11. Output

An external resistor determines the output current fed into the base of the driver transistor. The output circuit uses an n-p-n transistor with 3 series-connected clamping diodes to the internal 12 V supply rail. This provides a low impedance in the "ON" state, that is with the drive transistor turned-off.

12. Maximum duty factor adjustment/smoothing

*Maximum duty factor adjustment*

Pin 12 is connected to the output voltage of the amplitude comparator ($V_{10\text{-}8}$). This voltage is internally connected to one input of a differential amplifier, the other input of which is connected to the sawtooth voltage of the horizontal oscillator. A low voltage on pin 12 results in a low duty factor. This enables the maximum duty factor to be adjusted by limiting the voltage by connecting pin 12 to the emitter of a p-n-p transistor used as a voltage source.
The graph on page 10 plots the maximum duty factor as a function of the voltage applied to pin 12.
If some spread is acceptable the maximum duty factor can also be limited by connecting a resistor from pin 12 to pin 16. A resistor of 12 kΩ limits the maximum duty factor to about 50%.
This application also reduces the total IC gain.

*Smoothing*

Any double pulsing of the IC due to circuit layout can be suppressed by connecting a capacitor of about 470 pF between pins 12 and 16.

13. Oscillator timing network

The timing network comprises a capacitor between pins 13 and 16, and a resistor between pin 13 and the reference voltage on pin 10.
The charging current for the capacitor (C13) is derived from the voltage reference diode connected to pin 10 and discharged via an internal resistor of about 330 Ω.

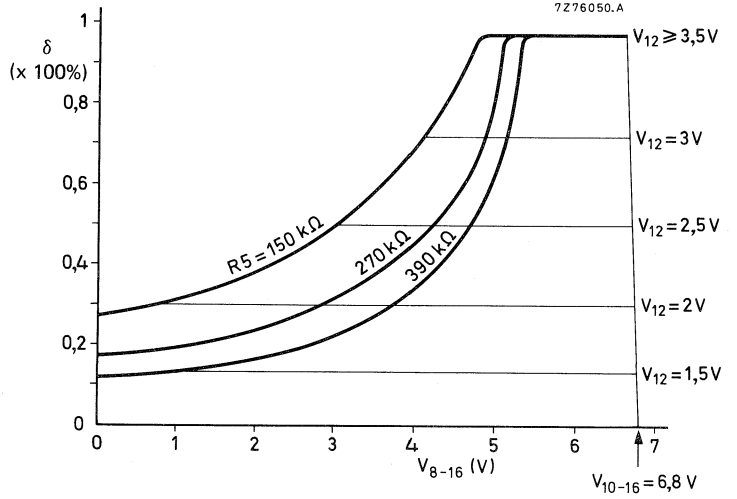
14. Reactance stage reference voltage

This pin is connected to an emitter follower which determines the nominal reference voltage for the reactance stage (1,5 V for reference voltage $V_{10\text{-}16}$ = 6,7 V). Free-running frequency is obtained when pins 14 and 15 are short-circuited.

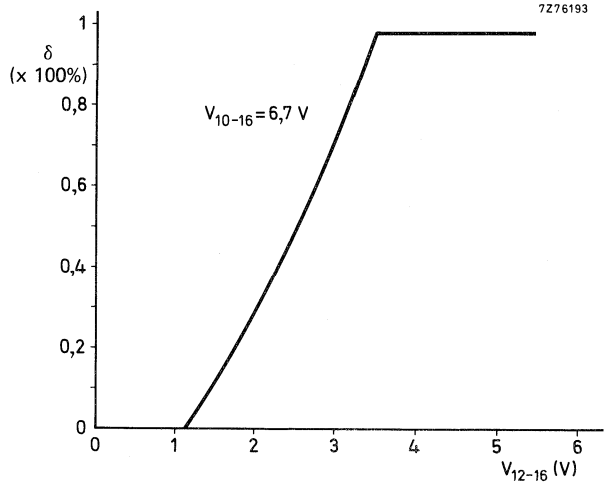
15. Reactance stage input

The output voltage of the phase detector (pin 1) is connected to pin 15 via a resistor. The voltage applied to pin 15 shifts the upper level of the voltage sensor of the oscillator thus changing the oscillator frequency and phase. The time constant network is connected between 14 and 15.
Control sensitivity is typically 4,5 kHz/V.

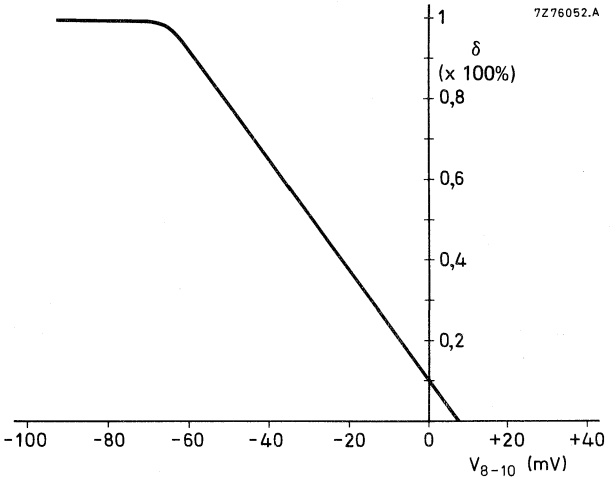
16. Negative supply (ground)



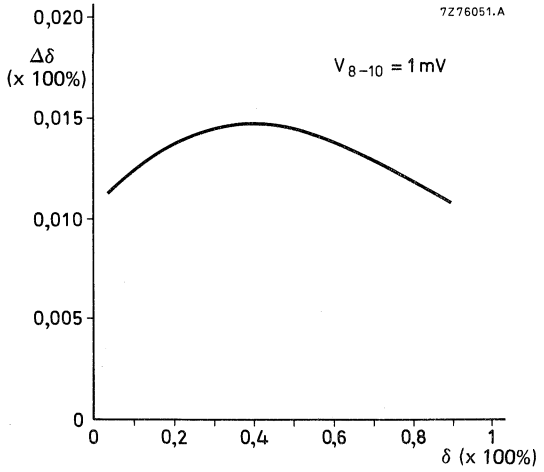
Duty factor of output pulses as a function of $V_{8-16}$ with R5 as a parameter, and with $V_{12}$ as a limiting value; $V_{10-16}$ = 6,8 V.



Maximum duty factor limitation as a function of $V_{12-16}$.



Duty factor of output pulses as a function of error amplifier input ($V_{8\text{-}10}$).



Change in duty factor of output pulses for a 1 mV error amplifier input change ($V_{8\text{-}10}$) as a function of initial duty factor.

# CONTROL CIRCUIT FOR POWER SUPPLIES

The TDA2582 is a monolithic integrated circuit for controlling power supplies which are provided with the drive for the horizontal deflection stage.
The circuit features the following:

- Voltage controlled horizontal oscillator.
- Phase detector.
- Duty factor control for the negative-going transient of the output signal.
- Duty factor increases from zero to its normal operation value.
- Adjustable maximum duty factor.
- Over-voltage and over-current protection with automatic re-start after switch-off.
- Counting circuit for permanent switch-off when n-times over-current or over-voltage is sensed.
- Protection for open-reference voltage.
- Protection for too low supply voltage.
- Protection against loop faults.
- Positive tracking of duty factor and feedback voltage when the feedback voltage is smaller than the reference voltage minus 1,5 V.
- Normal and 'smooth' remote ON/OFF possibility.

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_{9\text{-}16}$ | typ. | 12 V |
| Supply current | $I_9$ | typ. | 14 mA |
| **Input signals** | | | |

## APPLICATION INFORMATION

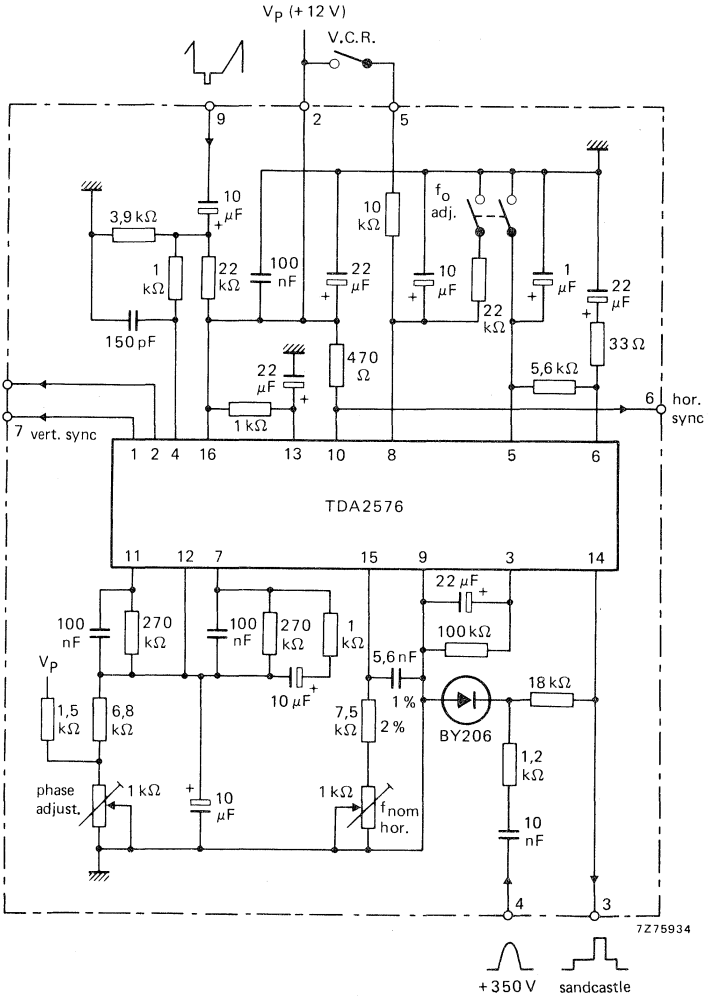

Fig. 3a.

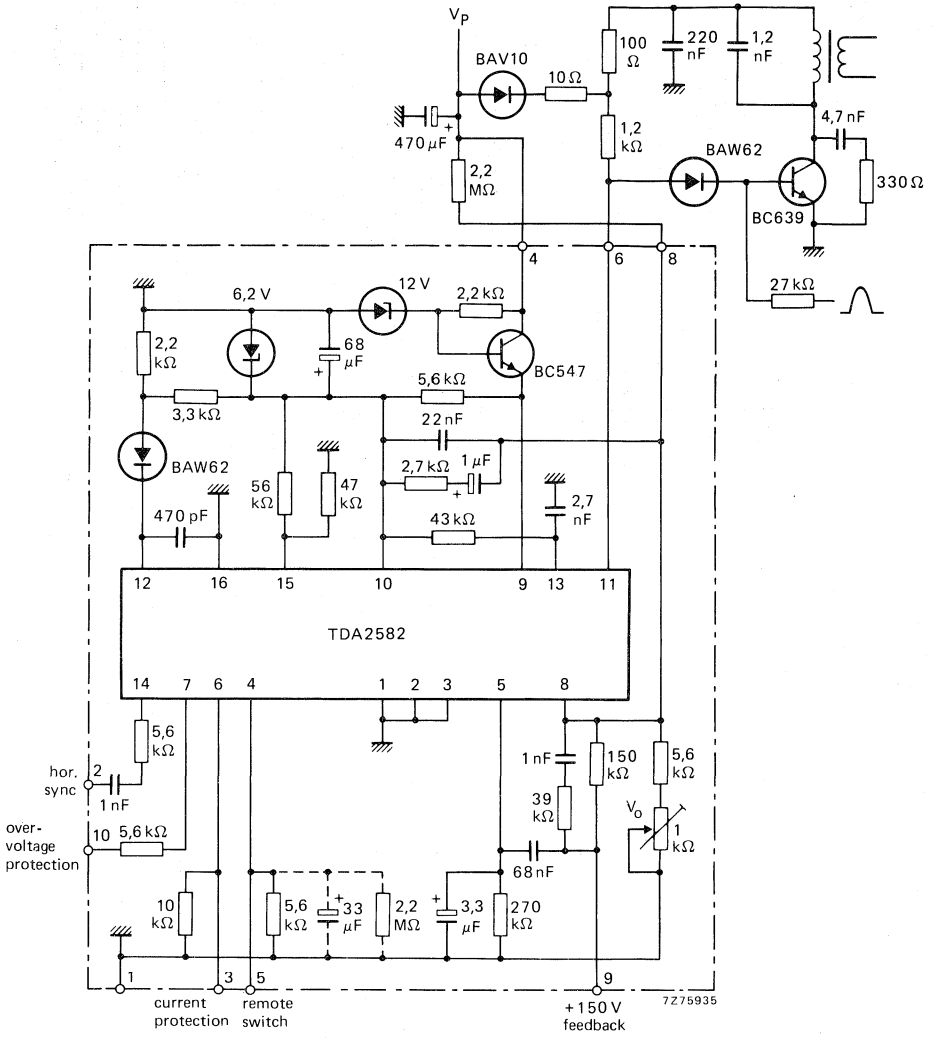

Fig. 3b.

Lead 6 (pin 10) of circuit TDA2576 connected to lead 2 (pin 14) of circuit TDA2582.

## APPLICATION INFORMATION

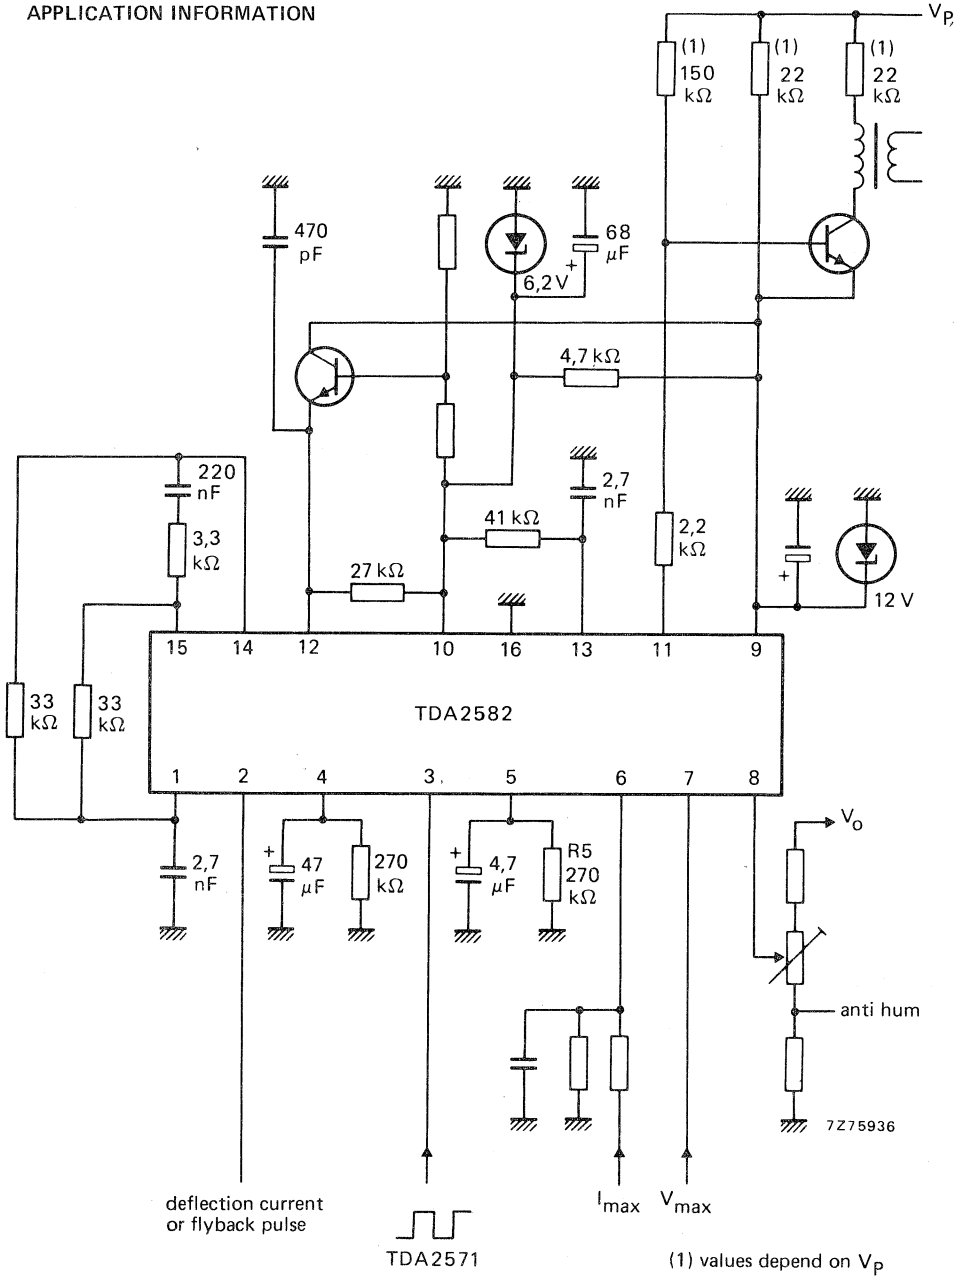

Fig. 4 Circuit diagram.

**The function is described against the corresponding pin number**

**1. Phase detector output**

The output circuit consists of a bidirectional current source which is active for the time that the signal on pin 2 exceeds 1 V.
The current values are chosen such that the correct phase relation is obtained when the output signal of the TDA2571 is applied to pin 3.
With a resistor of 2 x 33 kΩ and a capacitor of 2,7 nF the control steepness is 0,55 V/μs (Fig. 4).

**2. Flyback pulse input**

The signal applied to pin 2 is normally a flyback pulse with a duration of about 12 μs. However, the phase detector system also accepts a signal derived by differentiating the deflection current by means of a small toroidal core (pulse duration > 3 μs).

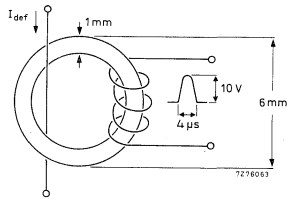

Fig. 5a.

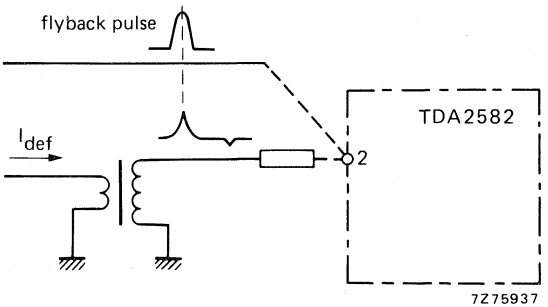

Fig. 5b.

The toroidal transformer in Fig. 5a is for obtaining a pulse representing the mid-flyback from the deflection current. The connection of the picture phase information is shown in Fig. 5b.

**3. Reference frequency input**

The input circuit can be driven directly by the square-wave output voltage from pin 8 of the TDA2571.
The negative-going transient switches the current source connected to pin 1 from positive to negative.
The input circuit is made such that a differentiated signal of the square-wave from the TDA2571 is also accepted (this enables mains isolation). The input circuit switching level is about 3 V and the input impedance is about 8 kΩ.

**4. Re-start count capacitor/remote control input**

*Counting*

An external capacitor (C4 = 47 μF) is connected between pins 4 and 16. This capacitor controls the characteristics of the protection circuits as follows.
If the protection circuits are required to operate, e.g. over-current at pin 6, the duty factor will be set to zero thus turning off the power supply.
After a short interval (determined by the time constant on pin 5) the power supply will be restarted via the slow start circuit.
If the fault condition has cleared, then normal operation will be resumed. If the fault condition is persistent, the duty factor of the pulses is again reduced to zero and the protection cycle is repeated.
The number of times this action is repeated (n) for a persisting fault condition is now determined by: n = C4/C5.

APPLICATION INFORMATION (continued)

*Remote control input*

For this application the capacitor on pin 4 has to be replaced by a resistor with a value between 4,7 and 18 kΩ. When the externally applied voltage $V_{4\text{-}16} > 5{,}6$ V, the circuit switches off; switching on occurs when $V_{4\text{-}16} < 4{,}5$ V and the normal starting-up procedure is followed. Pin 4 is internally connected to an emitter-follower, with an emitter voltage of 1,5 V.

**5. Slow start and transfer characteristics for low feedback voltages**

*Slow start*

An external shunt capacitor (C5 = 4,7 μF) and resistor (R5 = 270 kΩ) are connected between pins 5 and 16. The network controls the rate at which the duty factor increases from zero to its steady-state value after switch-on. It provides protection against surges in the power transistor.

*Transfer characteristic for low feedback voltages*

The duty factor transfer characteristic for low feedback voltages can be influenced by R5. The transfer for three different resistor values is given in Fig. 7.

*'Smooth' remote ON/OFF*

The ON/OFF information should be applied to pin 5 via a high ohmic resistor, a high OFF-level gives a slow rising voltage at pin 5, which results in a slowly decreasing duty factor.

**6. Over-current protection input**

A voltage proportional to the current in the power switching device is applied to the integrated circuit between pins 6 and 16. The circuit trips on both positive and negative polarity. When the tripping level is reached, the output pulse is immediately blocked and the starting circuit is activated again.

**7. Over-voltage protection input**

When the voltage applied to this pin exceeds the threshold level the protection circuit will operate. The tripping level is about the same as the reference voltage on pin 10.

**8. Feedback voltage input**

The control loop input is applied to pin 8. This pin is internally connected to one input of a differential amplifier, functioning as an amplitude comparator, the other input of which is connected to the reference source on pin 10.
Under normal operating conditions, the voltage on pin 8 will be about equal to the reference voltage on pin 10. For further information refer to the Figs 7 and 8.

**9. 12 V positive supply**

The maximum voltage that may be applied is 14 V. Where this is derived from an unstabilized supply rail, a regulator diode (12 V) should be connected between pins 9 and 16 to ensure that the maximum voltage does not exceed 14 V. When the voltage on this pin falls below a minimum of 8,6 V (typically 9,4 V), the protection circuit will switch-off the power supply.

**10. Reference input**

An external reference diode must be connected between this pin and pin 16.
The reference voltage must be between 5,6 and 6,6 V. The IC delivers about 1 mA into the external regulator diode. When the external load on the regulator diode approaches this current, replenishment of the current can be obtained by connecting a suitable resistor between pins 9 and 10. A higher reference voltage value up to 7,5 V is allowed when use is made of a duty factor limiting resistor $< 27$ kΩ between pins 12 and 16.

**11. Output**

An external resistor determines the output current fed into the base of the driver transistor. The output circuit uses an n-p-n transistor with 3 series-connected clamping diodes to the internal 12 V supply rail. This provides a low impedance in the "ON" state, that is with the drive transistor turned-off.

**12. Maximum duty factor adjustment/smoothing**

*Maximum duty factor adjustment*

Pin 12 is connected to the output voltage of the amplitude comparator ($V_{10\text{-}8}$). This voltage is internally connected to one input of a differential amplifier, the other input of which is connected to the sawtooth voltage of the horizontal oscillator. A high voltage on pin 12 results in a low duty factor. This enables the maximum duty factor to be adjusted by limiting the voltage by connecting pin 12 to the emitter of an n-p-n transistor used as a voltage source.
Fig. 9 plots the maximum duty factor as a function of the voltage applied to pin 12. If some spread is acceptable the maximum duty factor can also be limited by connecting a resistor from pin 12 to pin 16. A resistor of 12 kΩ limits the maximum duty factor to about 50%. This application also reduces the total IC gain.

*Smoothing*

Any double pulsing of the IC due to circuit layout can be suppressed by connecting a capacitor of about 470 pF between pins 12 and 16.

**13. Oscillator timing network**

The timing network comprises a capacitor between pins 13 and 16, and a resistor between pin 13 and the reference voltage on pin 10.
The charging current for the capacitor (C13) is derived from the voltage reference diode connected to pin 10 and discharged via an internal resistor of about 330 Ω.

**14. Reactance stage reference voltage**

This pin is connected to an emitter follower which determines the nominal reference voltage for the reactance stage (1,4 V for reference voltage $V_{10\text{-}16} = 6{,}1$ V). Free-running frequency is obtained when pins 14 and 15 are short-circuited.

**15. Reactance stage input**

The output voltage of the phase detector (pin 1) is connected to pin 15 via a resistor. The voltage applied to pin 15 shifts the upper level of the voltage sensor of the oscillator thus changing the oscillator frequency and phase. The time constant network is connected between 14 and 15. Control sensitivity is typically 5 kHz/V.

**16. Negative supply (ground)**

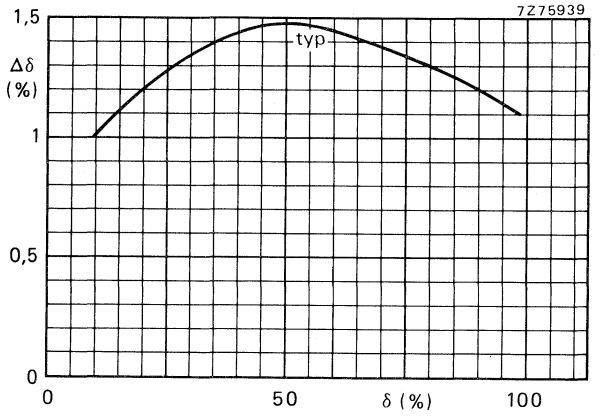

Fig. 6 Duty factor change as a function of initial duty factor; at 1 mV error amplifier input change; $\Delta V_{8\text{-}10(p\text{-}p)} = 1$ mV.

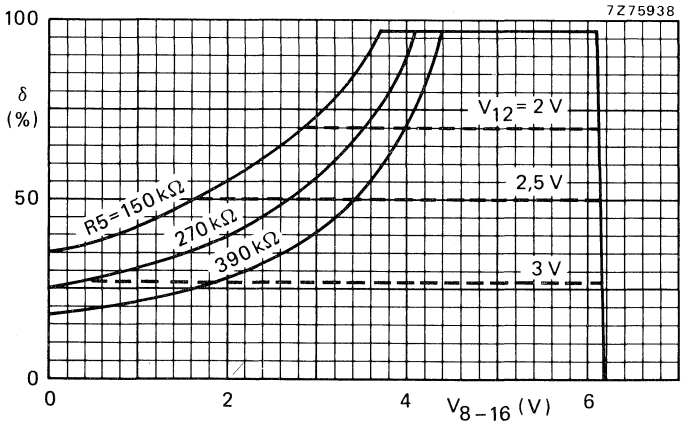

Fig. 7 Duty factor of output pulses as a function of feedback input voltage ($V_{8\text{-}16}$) with R5 as a parameter and $V_{12\text{-}16}$ as a limiting value; $V_{10\text{-}16} = 6{,}1$ V.

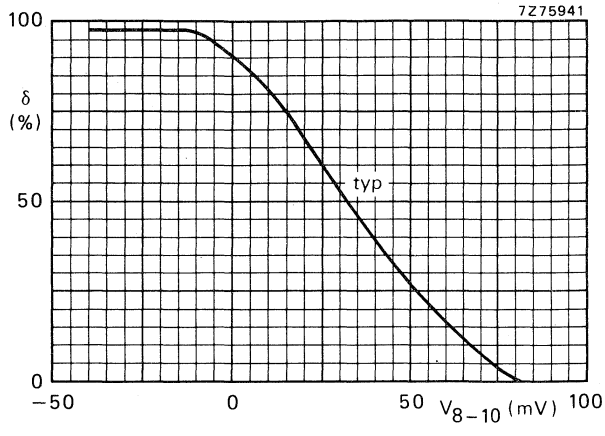

Fig. 8 Duty factor of output pulses as a function of error amplifier input ($V_{8-10}$); $V_{10-16}$ = 6,1 V.

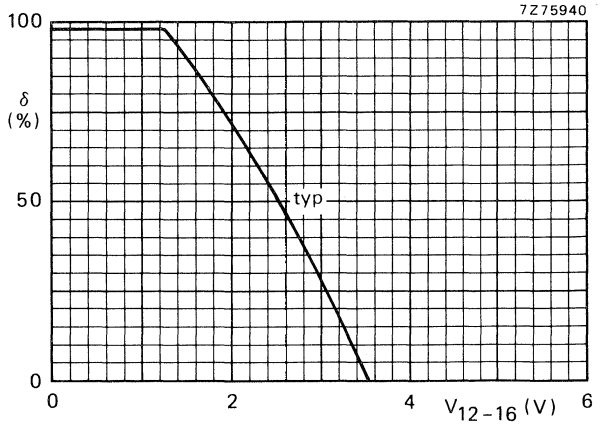

Fig. 9 Maximum duty factor limitation as a function of the voltage applied to pin 12; $V_{10-16}$ = 6,1 V.

# HORIZONTAL COMBINATION

The TDA2593 is a monolithic integrated circuit intended for use in colour television receivers in combination with TDA2510, TDA2520, TDA2560 as well as with TDA3500, TDA3510 and TDA3520. The circuit incorporates the following functions:

- horizontal oscillator based on the threshold switching principle
- phase comparison between sync pulse and oscillator voltage ($\varphi_1$)
- internal key pulse for phase detector ($\varphi_1$) (additional noise limiting)
- phase comparison between line flyback pulse and oscillator voltage ($\varphi_2$)
- larger catching range obtained by coincidence detector ($\varphi_3$; between sync and key pulse)
- switch for changing the filter characteristic and the gate circuit (VCR-operation)
- sync separator
- noise separator
- vertical sync separator and output stage
- colour burst keying and line flyback blanking pulse generator
- phase shifter for the output pulse
- output pulse duration switching
- output stage with separate supply voltage for direct drive of thyristor deflection circuits
- low supply voltage protection

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_{1\text{-}16}$ | typ. | 12 V |
| Supply current | $I_1$ | typ. | 30 mA |
| **Input signals** | | | |
| Sync separator input voltage (peak-to-peak value) | $V_{9\text{-}16(p\text{-}p)}$ | | 3 to 4 V |
| Noise separator input voltage (peak-to-peak value) | $V_{10\text{-}16(p\text{-}p)}$ | | 3 to 4 V |
| Pulse duration switch input voltage | | | |
| at t = 7 $\mu$s (thyristor driving) | $V_{4\text{-}16}$ | | 9,4 to $V_{1\text{-}16}$ V |
| at t = 14 $\mu$s + $t_d$ (transistor driving) | $V_{4\text{-}16}$ | | 0 to 3,5 V |
| at t = 0 (input 4 open or $V_{3\text{-}16}$ = 0) | $V_{4\text{-}16}$ | | 5,4 to 6,6 V |
| **Output signals** | | | |
| Vertical sync output pulse (peak-to peak value) | $V_{8\text{-}16(p\text{-}p)}$ | typ. | 11 V |
| Burst gating output pulse (peak-to-peak value) | $V_{7\text{-}16(p\text{-}p)}$ | typ. | 11 V |
| Line drive pulse (peak-to-peak value) | $V_{3\text{-}16(p\text{-}p)}$ | typ. | 10,5 V |

## PACKAGE OUTLINE

16-lead DIL; plastic (SOT-38).

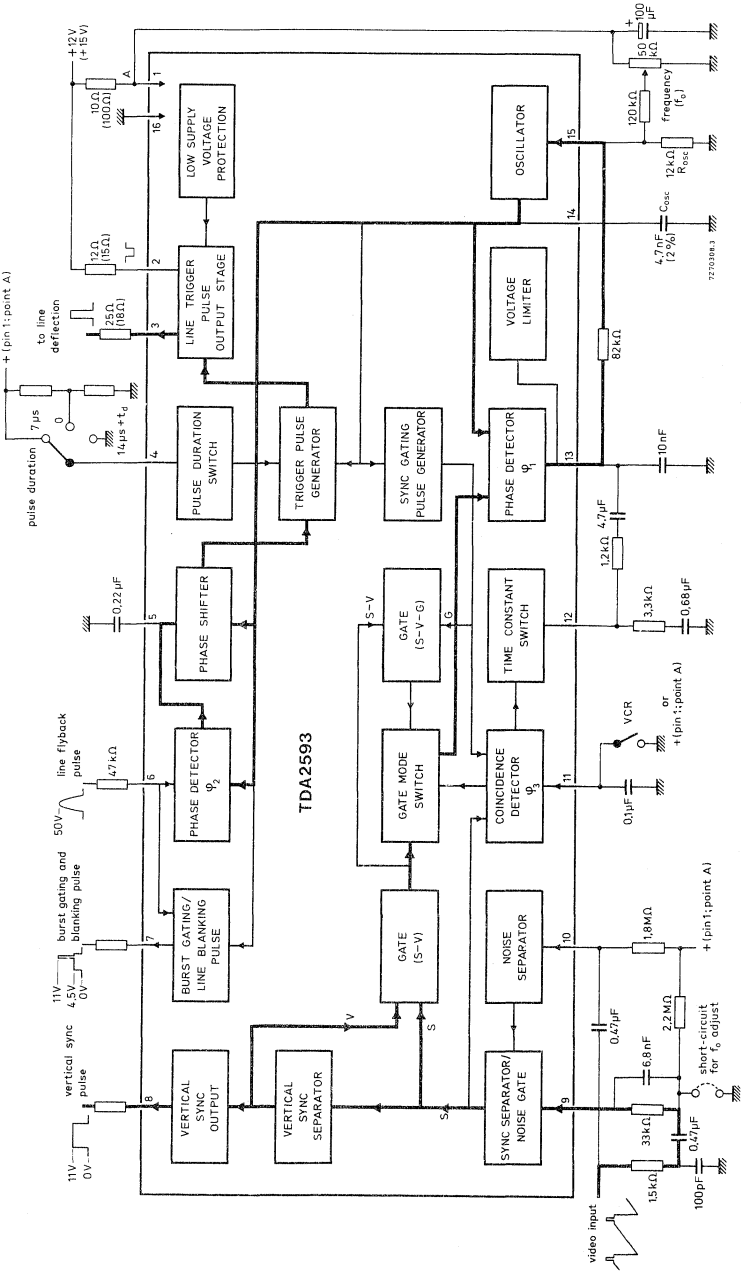

Fig. 1 Block diagram.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | |
|---|---|---|---|
| Supply voltage | | | |
| at pin 1 (voltage source) | $V_{1-16}$ | max. | 13,2 V |
| at pin 2 | $V_{2-16}$ | max. | 18 V |
| Voltages | | | |
| Pin 4 | $V_{4-16}$ | max. | 13,2 V |
| Pin 9 | $\pm V_{9-16}$ | max. | 6 V |
| Pin 10 | $\pm V_{10-16}$ | max. | 6 V |
| Pin 11 | $V_{11-16}$ | max. | 13,2 V |
| Currents | | | |
| Pins 2 and 3 (thyristor driving) (peak value) | $I_{2M}, -I_{3M}$ | max. | 650 mA |
| Pins 2 and 3 (transistor driving) (peak value) | $I_{2M}, -I_{3M}$ | max. | 400 mA |
| Pin 4 | $I_4$ | max. | 1 mA |
| Pin 6 | $\pm I_6$ | max. | 10 mA |
| Pin 7 | $-I_7$ | max. | 10 mA |
| Pin 11 | $I_{11}$ | max. | 2 mA |
| Total power dissipation | $P_{tot}$ | max. | 800 mW |
| Storage temperature | $T_{stg}$ | | −25 to + 125 °C |
| Operating ambient temperature | $T_{amb}$ | | −20 to + 70 °C |

## CHARACTERISTICS at $V_{1-16}$ = 12 V; $T_{amb}$ = 25 °C; measured in Fig. 1

**Sync separator**

| | | | |
|---|---|---|---|
| Input switching voltage | $V_{9-16}$ | typ. | 0,8 V |
| Input keying current | $I_9$ | | 5 to 100 μA |
| Input leakage current at $V_{9-16}$ = −5 V | $I_9$ | < | 1 μA |
| Input switching current | $I_9$ | ⩽ | 5 μA |
| Switch off current | $I_9$ | > | 100 μA |
| | | typ. | 150 μA |
| Input signal (peak-to-peak value) | $V_{9-16(p-p)}$ | | 3 to 4 V* |

* Permissible range 1 to 7 V.

| | | | |
|---|---|---|---|
| **Noise separator** | | | |
| Input switching voltage | $V_{10\text{-}16}$ | typ. | 1,4 V |
| Input keying current | $I_{10}$ | | 5 to 100 μA |
| Input switching current | $I_{10}$ | > | 100 μA |
| | | typ. | 150 μA |
| Input leakage current at $V_{10\text{-}16} = -5$ V | $I_{10}$ | < | 1 μA |
| Input signal (peak-to-peak value) | $V_{10\text{-}16(p\text{-}p)}$ | | 3 to 4 V * |
| Permissible superimposed noise signal (peak-to-peak value) | $V_{10\text{-}16(p\text{-}p)}$ | < | 7 V |
| **Line flyback pulse** | | | |
| Input current | $I_6$ | typ. | 1 mA |
| | | | 0,02 to 2 mA |
| Input switching voltage | $V_{6\text{-}16}$ | typ. | 1,4 V |
| Input limiting voltage | $V_{6\text{-}16}$ | | −0,7 to + 1,4 V |
| **Switching on VCR** | | | |
| Input voltage | $V_{11\text{-}16}$ | | 0 to 2,5 V |
| | $V_{11\text{-}16}$ | | 9 to $V_{1\text{-}16}$ V |
| Input current | $-I_{11}$ | < | 200 μA |
| | $I_{11}$ | < | 2 mA |
| **Pulse duration switch** | | | |
| For t = 7 μs (thyristor driving) | | | |
| Input voltage | $V_{4\text{-}16}$ | | 9,4 to $V_{1\text{-}16}$ V |
| Input current | $I_4$ | > | 200 μA |
| For t = 14 μs + $t_d$ (transistor driving) | | | |
| Input voltage | $V_{4\text{-}16}$ | | 0 to 3,5 V |
| Input current | $-I_4$ | > | 200 μA |
| For t = 0; $V_{3\text{-}16} = 0$ or input pin 4 open | | | |
| Input voltage | $V_{4\text{-}16}$ | | 5,4 to 6,6 V |
| Input current | $I_4$ | typ. | 0 μA |

* Permissible range 1 to 7 V.

| | | | |
|---|---|---|---|
| **Vertical sync pulse** (positive-going) | | | |
| Output voltage (peak-to-peak value) | $V_{8\text{-}16(p\text{-}p)}$ | > | 10 V |
| | | typ. | 11 V |
| Output resistance | $R_8$ | typ. | 2 kΩ |
| Delay between leading edge of input and output signal | $t_{on}$ | typ. | 15 μs |
| Delay between trailing edge of input and output signal | $t_{off}$ | typ. | $t_{on}$ μs |
| **Burst gating pulse** (positive-going) | | | |
| Output voltage (peak-to-peak value) | $V_{7\text{-}16(p\text{-}p)}$ | > | 10 V |
| | | typ. | 11 V |
| Output resistance | $R_7$ | typ. | 70 Ω |
| Pulse duration; $V_{7\text{-}16}$ = 7 V | $t_p$ | typ. | 4 μs |
| | | | 3,7 to 4,3 μs |
| Phase relation between middle of sync pulse at the input and the leading edge of the burst gating pulse; $V_{7\text{-}16}$ = 7 V | t | typ. | 2,65 μs |
| | | | 2,15 to 3,15 μs |
| Output trailing edge current | $I_7$ | typ. | 2 mA |
| **Line flyback-blanking pulse** (positive-going) | | | |
| Output voltage (peak-to-peak value) | $V_{7\text{-}16(p\text{-}p)}$ | | 4 to 5 V |
| Output resistance | $R_7$ | typ. | 70 Ω |
| Output trailing edge current | $I_7$ | typ. | 2 mA |
| **Line drive pulse** (positive-going) | | | |
| Output voltage (peak-to-peak value) | $V_{3\text{-}16(p\text{-}p)}$ | typ. | 10,5 V |
| Output resistance | | | |
| for leading edge of line pulse | $R_3$ | typ. | 2,5 Ω |
| for trailing edge of line pulse | $R_3$ | typ. | 20 Ω |
| Pulse duration (thyristor driving) | | | |
| $V_{4\text{-}16}$ = 9,4 to $V_{1\text{-}16}$ V | $t_p$ | typ. | 7 μs |
| | | | 5,5 to 8,5 μs |
| Pulse duration (transistor driving) | | | |
| $V_{4\text{-}16}$ = 0 to 4 V; $t_{fp}$ = 12 μs | $t_p$ | | 14 + $t_d$ μs* |
| Supply voltage for switching off the output pulse | $V_{1\text{-}16}$ | typ. | 4 V |
| **Overall phase relation** | | | |
| Phase relation between middle of sync pulse and the middle of the flyback pulse | t | typ. | 2,6 μs** |
| Tolerance of phase relation | $\lvert \Delta t \rvert$ | < | 0,7 μs |

* $t_d$ = switch-off delay of line output stage.
** Line flyback pulse duration $t_{fp}$ = 12 μs.

| | | | | |
|---|---|---|---|---|
| The adjustment of the overall phase relation and consequently the leading edge of the line drive pulse occurs automatically by phase control $\varphi_2$. If additional adjustment is applied it can be arranged by current supply at pin 5 such that | $\Delta I_5/\Delta t$ | typ. | 30 | $\mu A/\mu s$ |
| **Oscillator** | | | | |
| Threshold voltage low level | $V_{14\text{-}16}$ | typ. | 4,4 | V |
| Threshold voltage high level | $V_{14\text{-}16}$ | typ. | 7,6 | V |
| Discharge current | $\pm I_{14}$ | typ. | 0,47 | mA |
| Frequency; free running ($C_{osc}$ = 4,7 nF; $R_{osc}$ = 12 kΩ) | $f_o$ | typ. | 15,625 | kHz |
| Spread of frequency | $\Delta f_o/f_o$ | < | ± 5 | %* |
| Frequency control sensitivity | $\Delta f_o/\Delta I_{15}$ | typ. | 31 | Hz/μA |
| Adjustment range of network in circuit (Fig. 1) | $\Delta f_o/f_o$ | typ. | ± 10 | % |
| Influence of supply voltage on frequency | $\frac{\Delta f_o/f_o}{\Delta V/V_{nom}}$ | < | ± 0,05 | %* |
| Change of frequency when $V_{1\text{-}16}$ drops to 5 V | $\Delta f_o$ | < | ± 10 | %* |
| Temperature coefficient of oscillator frequency | | < | $\pm 10^{-4}$ | Hz/K* |
| **Phase comparison $\varphi_1$** | | | | |
| Control voltage range | $V_{13\text{-}16}$ | | 3,8 to 8,2 | V |
| Control current (peak value) | $\pm I_{13M}$ | | 1,9 to 2,3 | mA |
| Output leakage current at $V_{13\text{-}16}$ = 4 to 8 V | $I_{13}$ | < | 1 | μA |
| Output resistance at $V_{13\text{-}16}$ = 4 to 8 V | $R_{13}$ | high ohmic | | ** |
| at $V_{13\text{-}16}$ < 3,8 V or > 8,2 V | $R_{13}$ | low ohmic | | ▲ |
| Control sensitivity | | typ. | 2 | kHz/μs |
| Catching and holding range (82 kΩ beteeen pins 13 and 15) | $\Delta f$ | typ. | ± 780 | Hz |
| Spread of catching and holding range | $\Delta(\Delta f)$ | typ. | ± 10 | %* |

* Excluding external component tolerances.
** Current source.
▲ Emitter follower.

| | | | |
|---|---|---|---|
| **Phase comparison $\varphi_2$ and phase shifter** | | | |
| Control voltage range | $V_{5\text{-}16}$ | 5,4 to 7,6 | V |
| Control current (peak value) | $\pm I_{5M}$ | typ. 1 | mA |
| Output resistance | | | |
| at $V_{5\text{-}16}$ = 5,4 to 7,6 V | | high ohmic | * |
| at $V_{5\text{-}16} < 5{,}4$ V or $> 7{,}6$ V | $R_5$ | typ. 8 | kΩ |
| Input leakage current | | | |
| $V_{5\text{-}16}$ = 5,4 to 7,6 V | $I_5$ | < 5 | μA |
| Permissible delay between leading edge of output pulse and leading edge of flyback pulse ($t_{fp}$ = 12 μs) | $t_d$ | < 15 | μs |
| Static control error | $\Delta t/\Delta t_d$ | < 0,2 | % |
| **Coincidence detector $\varphi_3$** | | | |
| Output voltage | $V_{11\text{-}16}$ | 0,5 to 6 | V |
| Output current (peak value) | | | |
| without coincidence | $I_{11M}$ | typ. 0,1 | mA |
| with coincidence | $-I_{11M}$ | typ. 0,5 | mA |
| **Time constant switch** | | | |
| Output voltage | $V_{12\text{-}16}$ | typ. 6 | V |
| Output current (limited) | $\pm I_{12}$ | < 1 | mA |
| Output resistance | | | |
| at $V_{11\text{-}16}$ = 2,5 to 7 V | $R_{12}$ | typ. 0,1 | kΩ |
| at $V_{11\text{-}16} < 1{,}5$ V or $> 9$ V | $R_{12}$ | typ. 60 | kΩ |
| **Internal gating pulse** | | | |
| Pulse duration | $t_p$ | typ. 7,5 | μs |

* Current source.

# HORIZONTAL COMBINATION

The TDA2594 is a monolithic integrated circuit intended for use in colour television receivers. The circuit incorporates the following functions:

- Horizontal oscillator based on the threshold switching principle.
- Phase comparison between sync pulse and oscillator voltage ($\varphi_1$).
- Internal key pulse for phase detector ($\varphi_1$) (additional noise limiting).
- Phase comparison between line flyback pulse and oscillator voltage ($\varphi_2$).
- Larger catching range obtained by coincidence detector ($\varphi_3$; between sync and key pulse).
- Switch for changing the filter characteristic and the gate circuit (VCR-operation).
- Sync separator.
- Noise separator.
- Vertical sync separator and output stage.
- Colour burst keying and line flyback blanking pulse generator and clamp circuit for vertical blanking.
- Phase shifter for the output pulse.
- Output pulse duration for transistor deflection systems.
- External switching off of the line trigger pulse.
- Output stage with separate supply voltage.
- Low supply voltage protection.
- Transmitter identification and muting circuit, and vertical sync switch-off.

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_{1\text{-}18} = V_S$ | typ. | 12 V |
| Supply current | $I_1$ | typ. | 30 mA |
| **Input signals** | | | |
| Sync separator input voltage (peak-to-peak value) | $V_{11\text{-}18(p\text{-}p)}$ | typ. | 3 V* |
| Noise separator input voltage (peak-to-peak value) | $V_{12\text{-}18(p\text{-}p)}$ | typ. | 3 V* |
| Pulse duration switch input voltage | | | |
| at t = 14 $\mu$s + $t_d$ (transistor driving) | $V_{4\text{-}18}$ | | 0 to 3,5 V |
| at t = 0 ($V_{3\text{-}18} = 0$); input 4 open ($I_4 = 0$) | $V_{4\text{-}18}$ | | 5,4 to 6,6 V |
| **Output signals** | | | |
| Vertical sync output pulse (peak-to-peak value) | $V_{8\text{-}18(p\text{-}p)}$ | typ. | 11 V |
| Burst key output pulse (peak-to-peak value) | $V_{7\text{-}18(p\text{-}p)}$ | typ. | 11 V |
| Line drive-pulse (peak-to-peak value) | $V_{3\text{-}18(p\text{-}p)}$ | typ. | 10 V |

* Permissible range: 1 to 7 V.

## PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102DS).

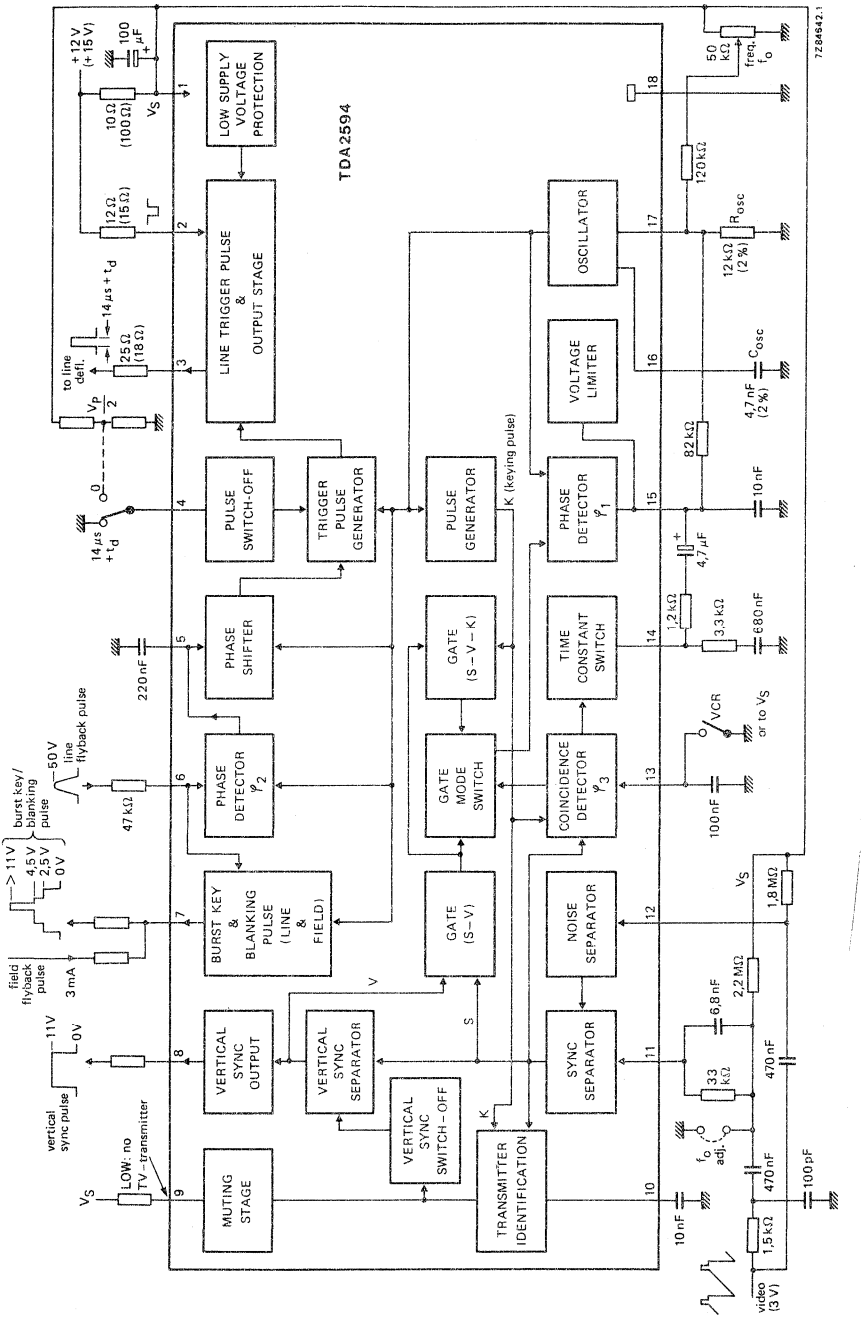

Fig. 1 Block diagram.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | |
|---|---|---|---|
| Supply voltage | | | |

| Phase relation between middle of sync pulse at the input and the leading edge of the burst key pulse; $V_{7-18} = 7$ V | t | typ.<br> | 2,65 μs<br>2,15 to 3,15 μs |
| Output trailing edge current | $I_7$ | typ. | 2 mA |
| Saturation voltage during line scan | $V_{7-18}$ | ⩽ | 1 V |

* Permissible range 1 to 7 V.

**Line flyback-blanking pulse** (positive-going) (pin 7)

| | | | |
|---|---|---|---|
| Output voltage | $V_{7-18}$ | | 4,1 to 4,9 V |
| Output resistance | $R_7$ | typ. | 70 Ω |
| Output trailing edge current | $I_7$ | typ. | 2 mA |

**Field flyback/blanking pulse** (pin 7)

| | | | |
|---|---|---|---|
| Output voltage with externally forced in current $I_7$ = 2,4 to 3,6 mA | $V_{7-18}$ | | 2 to 3 V |
| Output resistance at $I_7$ = 3 mA | $R_7$ | typ. | 70 Ω |

**TV-transmitter identification output** (pin 9; open collector)

| | | | |
|---|---|---|---|
| Output voltage at $I_9$ = 3 mA; no TV-transmitter | $V_{9-18}$ | ⩽ | 0,5 V |
| Output resistance at $I_9$ = 3 mA; no TV-transmitter | $R_9$ | ⩽ | 100 Ω |
| Output current at $V_{10-18} \geqslant 3$ V; TV-transmitter identified | $I_9$ | ⩽ | 5 μA |

**TV-transmitter identification** (pin 10)

When receiving a TV signal the voltage $V_{10-18}$ will change from ⩽ 1 V to ⩾ 7 V.

**Line drive pulse** (positive-going)

| | | | |
|---|---|---|---|
| Output voltage (peak-to-peak value) | $V_{3-18(p-p)}$ | typ. | 10 V |
| Output resistance | | | |
| for leading edge of line pulse | $R_3$ | typ. | 2,5 Ω |
| for trailing edge of line pulse | $R_3$ | typ. | 20 Ω |
| Pulse duration (transistor driving) $V_{4-18}$ = 0 to 3,5 V; $-I_4 \geqslant 200$ μA; $t_{fp}$ = 12 μs | $t_p$ | | $14 + t_d$ μs* |
| Supply voltage for switching off the output pulse | $V_{1-18}$ | typ. | 4 V |

**Overall phase relation**

| | | | |
|---|---|---|---|
| Phase relation between middle of sync pulse and the middle of the flyback pulse | $\Delta t$ | typ. | 2,6 ± 0,7 μs** |

The adjustment of the overall phase relation and consequently the leading edge of the line drive pulse occurs automatically by phase control $\varphi_2$.

If additional adjustment is applied it can be arranged by current supply at pin 5, such that:

| | | | |
|---|---|---|---|
| Supplying current | $\Delta I/\Delta t$ | typ. | 30 μA/μs |

* $t_d$ = switch-off delay of line output stage.

** Line flyback pulse duration $t_{fp}$ = 12 μs.

| | | | | |
|---|---|---|---|---|
| **Oscillator** (pins 16 and 17) | | | | |
| Threshold voltage low level | $V_{16\text{-}18}$ | typ. | 4,4 | V |
| Threshold voltage high level | $V_{16\text{-}18}$ | typ. | 7,6 | V |
| Charging current | $\pm I_{16}$ | typ. | 0,47 | mA |
| Frequency; free running ($C_{osc}$ = 4,7 nF; $R_{osc}$ = 12 kΩ) | $f_o$ | typ. | 15,625 | kHz |

# HORIZONTAL COMBINATION

## GENERAL DESCRIPTION

The TDA2595 is a monolithic integrated circuit intended for use in colour television receivers. The circuit incorporates the following functions:

- Positive video input; capacitively coupled (source impedance $< 200\ \Omega$)
- Adaptive sync separator; slicing level at 50% of sync amplitude
- Internal vertical pulse separator with double slope integrator
- Output stage for vertical sync pulse or composite sync depending on the load; both are switched off at muting
- $\varphi_1$ phase control between horizontal sync and oscillator
- Coincidence detector $\varphi_3$ for automatic time-constant switching; overruled by the VCR switch
- Time-constant switch between two external time-constants or loop-gain; both controlled by the coincidence detector $\varphi_3$
- $\varphi_1$ gating pulse controlled by coincidence detector $\varphi_3$
- Mute circuit depending on TV transmitter identification
- $\varphi_2$ phase control between line flyback and oscillator; the slicing levels for $\varphi_2$ control and horizontal blanking can be set separately
- Burst keying and horizontal blanking pulse generation, in combination with clamping of the vertical blanking pulse (three-level sandcastle)
- Horizontal drive output with constant duty cycle inhibited by the protection circuit or the supply voltage sensor
- Detector for too low supply voltage
- Protection circuit for switching off the horizontal drive output continuously if the input voltage is below 4 V or higher than 8 V
- Line flyback control causing the horizontal blanking level at the sandcastle output continuously in case of a missing flyback pulse
- Spot-suppressor controlled by the line flyback control

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage (pin 15) | $V_{15\text{-}5} = V_P$ | typ. | 12 V |
| Sync pulse amplitude (positive video) | $V_{i(p\text{-}p)}$ | min. | 50 mV |
| Horizontal output current | $I_4$ | max. | 30 mA |

## PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102CS).

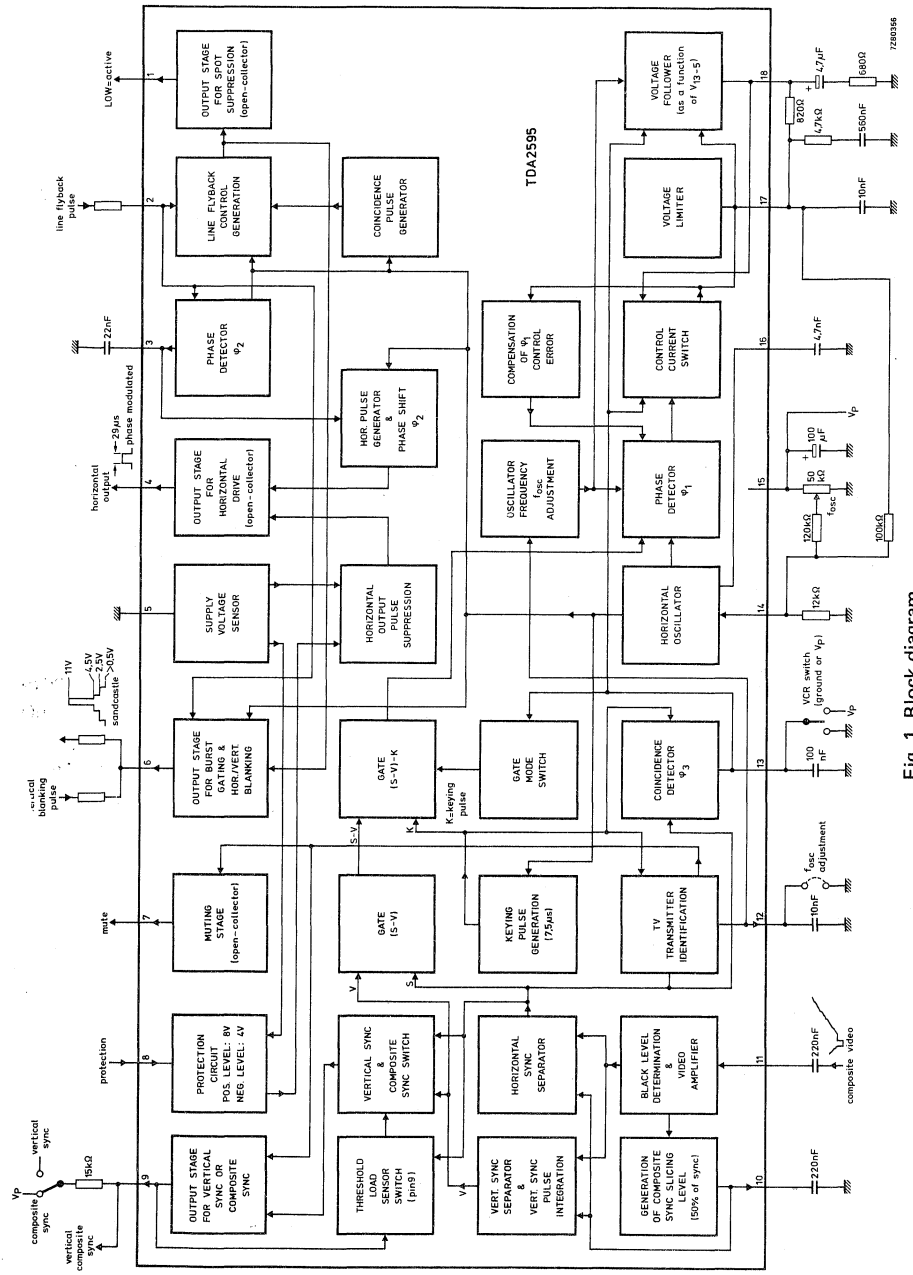

Fig. 1 Block diagram.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | | |
|---|---|---|---|---|
| Supply voltage (pin 15) | $V_{15-5} = V_P$ | max. | 13,2 | V |
| Voltages at: | | | | |
| pins 1, 4 and 7 | $V_{1;4;7-5}$ | max. | 18 | V |
| pins 8, 13 and 18 | $V_{8;13;18-5}$ | max. | $V_P$ | V |
| pin 11 (range) | $V_{11-5}$ | | −0,5 to + 6 | V |
| Currents at: | | | | |
| pin 1 | $I_1$ | max. | 10 | mA |
| pin 2 (peak value) | $\pm I_{2M}$ | max. | 10 | mA |
| pin 4 | $I_4$ | max. | 100 | mA |
| pin 6 (peak value) | $\pm I_{6M}$ | max. | 6 | mA |
| pin 7 | $I_7$ | max. | 10 | mA |
| pin 8 (range) | $I_8$ | | −5 to + 1 | mA |
| pin 9 (range) | $I_9$ | | −10 to + 3 | mA |
| pin 18 | $\pm I_{18}$ | max. | 10 | mA |
| Total power dissipation | $P_{tot}$ | max. | 800 | mW |
| Storage temperature range | $T_{stg}$ | | −25 to + 125 | °C |
| Operating ambient temperature range | $T_{amb}$ | | −20 to + 70 | °C |

DEVELOPMENT SAMPLE DATA

## CHARACTERISTICS

$V_P$ = 12 V; $T_{amb}$ = 25 °C; measured in Fig. 1; unless otherwise specified

| parameter | symbol | min. | typ. | max. | unit |
|---|---|---|---|---|---|
| **Composite video input and sync separator** (pin 11) (internal black level determination) | | | | | |
| Input signal (positive video; standard signal; peak-to-peak value) | $V_{11\text{-}5(p\text{-}p)}$ | 0,2 | 1 | 3 | V |
| Sync pulse amplitude (independent of video content) | $V_{11\text{-}5(p\text{-}p)}$ | 50 | – | – | mV |
| Generator resistance | $R_G$ | – | – | 200 | Ω |
| Input current during: | | | | | |
| video | $I_{11}$ | – | 5 | – | μA |
| sync pulse | $-I_{11}$ | – | 40 | – | μA |
| black level | $-I_{11}$ | – | 30 | – | μA |
| **Composite sync generation** (pin 10) horizontal slicing level at 50% of the sync pulse amplitude | | | | | |
| Capacitor current during: | | | | | |
| video | $I_{10}$ | – | 12 | – | μA |
| sync pulse | $-I_{10}$ | – | 170 | – | μA |
| **Vertical sync pulse generation** slicing level at 25% (50% between black level and horizontal slicing level); pin 9 | | | | | |
| Output voltage | $V_{9\text{-}5}$ | 10 | – | – | V |
| Pulse duration | $t_p$ | – | 190 | – | μs |
| Delay with respect to the vertical sync pulse (leading edge) | $t_d$ | – | 45 | – | μs |
| Pulse-mode control | | | | | |
| output current for vertical sync pulse (dual integrated) | | no current applied at pin 9 | | | |
| output current for horizontal and vertical sync pulse (non-integrated separated signal) | | current applied via a resistor of 15 kΩ from $V_P$ to pin 9 | | | |

| parameter | symbol | min. | typ. | max. | unit |
|---|---|---|---|---|---|
| **Horizontal oscillator** (pins 14 and 16) | | | | | |
| Frequency; free running | $f_{osc}$ | – | 15 625 | – | Hz |
| Reference voltage for $f_{osc}$ | $V_{14-5}$ | – | 6 | – | V |
| Frequency control sensitivity | $\Delta f_{osc}/\Delta I_{14}$ | – | 31 | – | Hz/μA |
| Adjustment range of circuit Fig. 1 | $\Delta f_{osc}$ | – | ± 10 | – | % |
| Spread of frequency | $\Delta f_{osc}$ | – | – | 5 | % |
| Frequency dependency (excluding tolerance of external components) | | | | | |
| with supply voltage ($V_P$ = 12 V) | $\frac{\Delta f_{osc}/f_{osc}}{\Delta V_{15-5}/V_{15-5}}$ | – | ± 0,05 | – | |
| with supply voltage drop of 5 V | $\Delta f_{osc}$ | – | – | 10 | % |
| with temperature | TC | – | – | $\pm 10^{-4}$ | $K^{-1}$ |
| Capacitor current during: | | | | | |
| charging | $-I_{16}$ | – | 1024 | – | μA |
| discharging | $I_{16}$ | – | 313 | – | μA |
| Sawtooth voltage timing (pin 14) | | | | | |
| rise time | $t_r$ | – | 49 | – | μs |
| fall time | $t_f$ | – | 15 | – | μs |
| **Horizontal output pulse** (pin 4) | | | | | |
| Output voltage LOW at $I_4$ = 30 mA | $V_{4-5}$ | – | – | 0,5 | V |
| Pulse duration (HIGH) | $t_p$ | – | 29 ± 1,5 | – | μs |
| Supply voltage for switching off the output pulse (pin 15) | $V_P$ | – | 4 | – | V |

DEVELOPMENT SAMPLE DATA

**CHARACTERISTICS** (continued)

| parameter | symbol | min. | typ. | max. | unit |
|---|---|---|---|---|---|
| **Phase comparison $\varphi_1$** (pin 17) | | | | | |
| Control voltage range | $V_{17\text{-}5}$ | 3,55 | – | 8,3 | V |
| Leakage current at $V_{17\text{-}5}$ = 3,55 to 8,3 V | $I_{17}$ | – | – | 1 | μA |
| Control current for external time-constant switch | $\pm I_{17}$ | 1,8 | 2 | 2,2 | mA |
| Control current at $V_{18\text{-}5} = V_{15\text{-}5}$ and $V_{13\text{-}5} < 2$ V or $V_{13\text{-}5} > 9{,}5$ V | $\pm I_{17}$ | – | 8 | – | mA |
| Control current at $V_{18\text{-}5} = V_{15\text{-}5}$ and $V_{13\text{-}5}$ = 2 to 9,5 V | $\pm I_{17}$ | 1,8 | 2 | 2,2 | mA |
| Horizontal oscillator control | | | | | |
| control sensitivity | $S_\varphi$ | 6 | – | – | kHz/μs |
| catching and holding range | $\Delta f_{osc}$ | – | ± 680 | – | Hz |
| spread of catching and holding range | $\Delta f_{osc}$ | – | ± 10 | – | % |
| Internal keying pulse at $V_{13\text{-}5}$ = 2,9 to 9,5 V | $t_p$ | – | 7,5 | – | μs |
| Time-constant switch | | | | | |
| slow time-constant at | $V_{13\text{-}5}$ | 9,5 | – | 2 | V |
| fast time-constant at | $V_{13\text{-}5}$ | 2 | – | 9,5 | V |
| Impedance converter offset voltage (slow time-constant) | $\pm V_{17\text{-}18}$ | – | – | 3 | mV |
| Output resistance | | | | | |
| slow time-constant | $R_{18\text{-}5}$ | – | – | 10 | Ω |
| fast time-constant | $R_{18\text{-}5}$ | high impedance | | | |

| Leakage current | $I_3$ | – | – | 5 | μA |

DEVELOPMENT SAMPLE DATA

**CHARACTERISTICS** (continued)

| parameter | symbol | min. | typ. | max. | unit |
|---|---|---|---|---|---|
| **Phase comparison $\varphi_2$** (pins 2 and 3) (continued) | | | | | |
| Phase relation between middle of the horizontal sync pulse and the middle of the line flyback pulse at $t_{fp}$ = 12 μs (note 2) | $\Delta t$ | – | 2,6 ± 0,7 | – | μs |
| If additional adjustment is required, it can be arranged by applying a current at pin 3, such that for applied current: | $\Delta I/\Delta t$ | – | 30 | – | μA/μs |
| **Burst gating pulse** (pin 6; note 3) | | | | | |
| Output voltage | $V_{6-5}$ | 10 | 11 | – | V |
| Pulse duration | $t_p$ | 3,7 | 4 | 4,3 | μs |
| Phase relation between middle of sync pulse at the input and the leading edge of the burst gating pulse at $V_{6-5}$ = 7 V | $t_{\varphi 6}$ | 2,15 | 2,65 | 3,15 | μs |
| Output trailing edge current | $I_6$ | – | 2 | – | mA |
| **Horizontal blanking pulse** (pin 6) (note 3) | | | | | |
| Output voltage | $V_{6-5}$ | 4,2 | 4,5 | 4,9 | V |
| Output trailing edge current | $I_6$ | – | 2 | – | mA |
| Saturation voltage at horizontal scan | $V_{6-5sat}$ | – | – | 0,5 | V |
| **Clamping circuit for vertical blanking pulse** (pin 6; note 3) | | | | | |
| Output voltage at $I_6$ = 2,8 mA | $V_{6-5}$ | 2,15 | 2,5 | 3 | V |
| Minimum output current at $V_{6-5} > 2,15$ V | $I_{6min}$ | – | 2,3 | – | mA |
| Maximum output current at $V_{6-5} < 3$ V | $I_{6max}$ | – | 3,3 | – | mA |
| **TV-transmitter identification** (pin 12) | | | | | |
| Output voltage | | | | | |
| no TV transmitter | $V_{12-5}$ | – | – | 1 | V |
| TV transmitter identified | $V_{12-5}$ | 7 | – | – | V |

| parameter | symbol | min. | typ. | max. | unit |
|---|---|---|---|---|---|
| **Mute output** (pin 7) | | | | | |
| Output voltage at $I_7$ = 3 mA no TV transmitter | $V_{7-5}$ | – | – | 0,5 | V |
| Output resistance at $I_7$ = 3 mA no TV transmitter | $R_{7-5}$ | – | – | 100 | Ω |
| Output leakage current at $V_{12-5} > 3$ V TV transmitter identified | $I_7$ | – | – | 5 | μA |
| **Protection circuit (beam-current/ EHT voltage protection)** (pin 8) | | | | | |
| No-load voltage for $I_8 = 0$ (operative condition) | $V_{8-5}$ | – | 6 | – | V |
| Threshold at positive-going voltage | $V_{8-5}$ | – | 8 ± 0,8 | – | V |
| Threshold at negative-going voltage | $V_{8-5}$ | – | 4 ± 0,4 | – | V |
| Current limiting for $V_{8-5}$ = 1 to 8,5 V | $\pm I_8$ | – | 60 | – | μA |
| Input resistance for $V_{8-5} > 8,5$ V | $R_{8-5}$ | – | 3 | – | kΩ |
| Response delay of threshold switch | $t_d$ | – | 10 | – | μs |
| **Control output of line flyback pulse control** (pin 1) | | | | | |
| Saturation voltage at standard operation; $I_1$ = 3 mA | $V_{1\text{-}5sat}$ | – | – | 0,5 | V |
| Output leakage current in case of break in transmission | $I_1$ | – | – | 5 | μA |

**Notes to the characteristics**

1. Phase comparison between horizontal oscillator and the line flyback pulse. Generation of a phase modulated ($\varphi_2$) horizontal output pulse with constant duration.
2. $t_{fp}$ is the line flyback pulse duration.
3. Three-level sandcastle pulse.

# 5 W AUDIO POWER AMPLIFIER

The TDA2611A is a monolithic integrated circuit in a 9-lead single in-line (SIL) plastic package with a high supply voltage audio amplifier. Special features are:

- **possibility for increasing the input impedance**
- single in-line (SIL) construction for easy mounting
- very suitable for application in mains-fed apparatus
- extremely low number of external components
- thermal protection
- well defined open loop gain circuitry with simple quiescent current setting and fixed integrated closed loop gain

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage range | $V_P$ | | 6 to 35 V |
| Repetitive peak output current | $I_{ORM}$ | < | 1,5 A |
| Output power at $d_{tot}$ = 10% | | | |
| $V_P$ = 18 V; $R_L$ = 8 Ω | $P_o$ | typ. | 4,5 W |
| $V_P$ = 25 V; $R_L$ = 15 Ω | $P_o$ | typ. | 5 W |
| Total harmonic distortion at $P_o$ < 2 W; $R_L$ = 8 Ω | $d_{tot}$ | typ. | 0,3 % |
| Input impedance | $\lvert Z_i \rvert$ | typ. | 45 kΩ |
| Total quiescent current at $V_P$ = 18 V | $I_{tot}$ | typ. | 25 mA |
| Sensitivity for $P_o$ = 2,5 W; $R_L$ = 8 Ω | $V_i$ | typ. | 55 mV |
| Operating ambient temperature | $T_{amb}$ | | −25 to + 150 °C |
| Storage temperature | $T_{stg}$ | | −55 to + 150 °C |

## PACKAGE OUTLINE

9-lead SIL; plastic (SOT-110B).

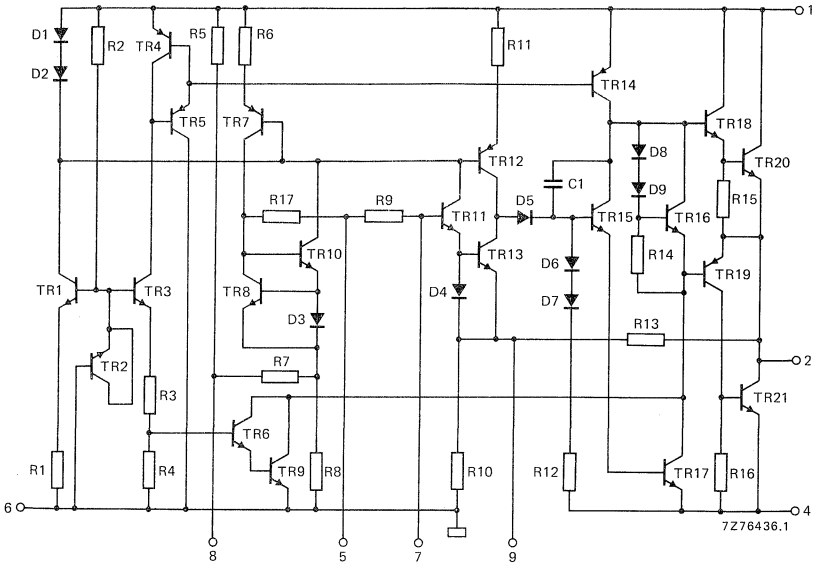

Fig. 1 Circuit diagram; pin 3 not connected.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | |
|---|---|---|---|
| Supply voltage | $V_P$ | max. | 35 V |
| Non-repetitive peak output current | $I_{OSM}$ | max. | 3 A |
| Repetitive peak output current | $I_{ORM}$ | max. | 1,5 A |
| Total power dissipation | see derating curves Fig. 2 | | |
| Storage temperature | $T_{stg}$ | −55 to + 150 | °C |
| Operating ambient temperature | $T_{amb}$ | −25 to + 150 | °C |

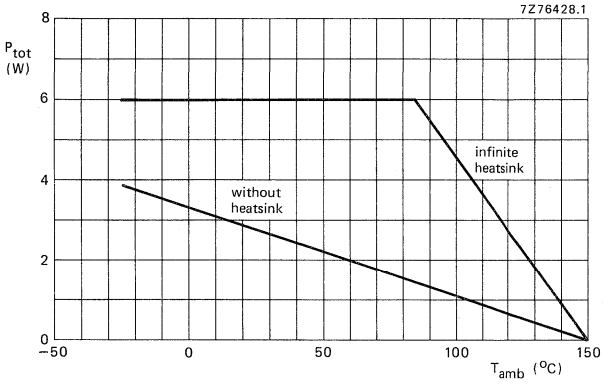

Fig. 2 Power derating curves.

## HEATSINK EXAMPLE

Assume $V_P$ = 18 V; $R_L$ = 8 Ω; $T_{amb}$ = 60 °C maximum; $T_j$ = 150 °C (max. for a 4 W application into an 8 Ω load, the maximum dissipation is about 2,2 W).
The thermal resistance from junction to ambient can be expressed as:

$$R_{th\ j\text{-}a} = R_{th\ j\text{-}tab} + R_{th\ tab\text{-}h} + R_{th\ h\text{-}a} = \frac{150 - 60}{2{,}2} = 41\ K/W.$$

Since $R_{th\ j\text{-}tab}$ = 11 K/W and $R_{th\ tab\text{-}h}$ = 1 K/W, $R_{th\ h\text{-}a}$ = 41 − (11 + 1) = 29 K/W.

## D.C. CHARACTERISTICS

| | | | |
|---|---|---|---|
| Supply voltage range | $V_P$ | | 6 to 35 V |
| Repetitive peak output current | $I_{ORM}$ | < | 1,5 A |
| Total quiescent current at $V_P$ = 18 V | $I_{tot}$ | typ. | 25 mA |

## A.C. CHARACTERISTICS

$T_{amb}$ = 25 °C; $V_P$ = 18 V; $R_L$ = 8 Ω; f = 1 kHz unless otherwise specified; see also Fig. 3

| | | | |

# SWITCHED-MODE POWER SUPPLY DRIVE CIRCUIT

The TDA2640 is a monolithic integrated circuit for driving the switched-mode power supply of a colour or black and white television receiver.
Except for the drive and output voltage stabilizing circuitry the TDA2640 incorporates the following functions:

- fixed frequency determined by external components
- remote switch off and restart
- over-current protection
- over-voltage protection
- slow starting
- low supply voltage protection
- open-circuit feedback protection
- optional synchronization

| QUICK REFERENCE DATA | | | | |
|---|---|---|---|---|
| Supply voltage | $V_{1-16}$ | typ. | 12 | V |
| Supply current | $I_1$ | typ. | 8,1 | mA |

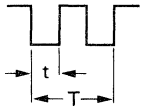
Notes (from page 4)

1. Voltage obtained via an external reference diode (6,2 V).
2. Or pin 14 not connected.
3. The over-voltage protection threshold is equal to the reference voltage $V_{9-16}$ ±50 mV.
4. The temperature coefficient is typ. −1,7 mV/°C (pin 11 or pin 12 can be connected to pin 16).
5. The maximum voltage on pin 6 is limited to approximately the supply voltage (pin 1) by an internal diode.
6. Valid for normal operating conditions. The circuit starts with 0% duty factor, controlled by the switch-on circuit; the duty factor then rises to the normal operating value.

   The duty factor is specified as follows:



$$\delta = \frac{t}{T} \times 100\%.$$

**APPLICATION INFORMATION** (see circuits on pages 3 and 8)

**The function is quoted against the corresponding pin number**

1. 12 V positive supply

The maximum voltage that may be applied is 13, 8 V. Where this is derived from an unstabilized supply rail, a regulator diode (12 V) should be connected between pins 1 and 16 to ensure that the maximum voltage does not exceed 13, 8 V. When the voltage on this pin falls below a minimum of 8 V the protection circuit will switch off the power supply.

2. Sync pulse input

The switching repetition rate may be synchronized to a source of positive-going sync pulses between 1 and 10 V. The free-running frequency of the TDA2640 oscillator must be above the synchronized frequency.
The minimum duration of the sync pulses is the difference between the period of the oscillator pulses and the period of the sync pulses. Synchronization reduces the maximum obtainable duty factor. If synchronization is not required, connect pin 2 to pin 16.

3, 4 and 5. Oscillator timing network

The timing network consists of a capacitor connected between pins 3 and 4, and a resistor connected between pins 4 and 5. The value of these components determines the switching period of the SMPS drive pulses.

6. Output

An external resistor connected between this pin and the supply rail determines the base drive current for the drive transistor. The integrated output circuit consists of an n-p-n transistor with a catching diode connected between its collector and an internal 12 V supply. This provides a low impedance in the "ON" state, that is with the drive transistor turned off.

7. Low feedback protection

An external resistor connected between this pin and pin 13 determines the maximum obtainable duty factor for the output pulses if the feedback voltage (pin 10) remains below the specified limit during starting.

8. Over-voltage protection

A voltage that is proportional to the power supply output voltage can be connected to this pin to operate a protection circuit if a threshold level is exceeded. The threshold level is determined by the external voltage reference diode connected to pin 9 (6, 2 V nominal). If over-voltage protection is not required, pin 8 should be connected to pin 16.

9. Reference input

An external voltage reference diode (6, 2 V nominal) must be connected between this pin and pin 16. The stability of the reference source determines the overall stability of the power supply output voltage. The voltage reference diode current is derived from within the integrated circuit; it has a typical value of 0, 8 mA.

**APPLICATION INFORMATION** (continued)

10. Feedback voltage input

The control loop input is applied to pin 10. This pin is internally connected to one input of a differential error amplifier, functioning as an amplitude comparator, the other input of which is connected to the reference source on pin 9. Under normal operating conditions with the comparator at balance, the voltage on pin 10 will be about equal to the reference voltage on pin 9 (6,2 V), and the d.c. feedback factor of the external network should be designed for this value.

11 and 12. Over-current protection

A voltage proportional to the output current of the SMPS is applied to these pins. Pin 11 is connected to the emitter of an internal n-p-n detection transistor; pin 12 is connected to its base. Either of these pins may be grounded (pin 16) depending on the polarity of the input during increasing current. For example, if pin 11 is grounded the trip level on pin 12 is 660 mV to 760 mV; if pin 12 is grounded, the trip level on pin 11 is −660 mV to −760 mV.

13. Slow start

A resistor and capacitor in parallel must be connected between this pin and pin 16 (1 μF and 390 kΩ). This network controls the rate at which the duty factor of the SMPS drive pulses increases to its normal operating value after switch-on. This minimizes inrush current. The network also influences the repetition period of the slow start during a fault.

14. Inhibitor

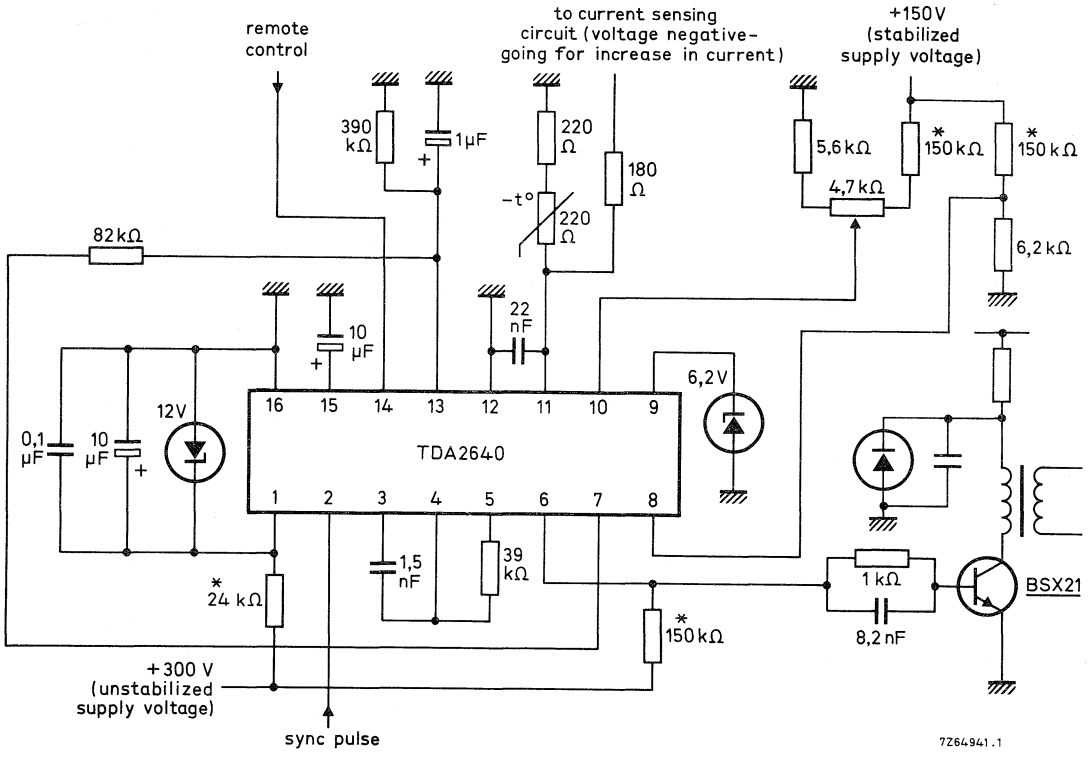
The power supply is switched off if the voltage on this pin is between 0 V and 3 V ($-I_{14} > 0,1$ mA). The power supply is switched on if this pin is not connected, or is connected to a voltage of between 5 V and the 12 V supply. The slow start and protection circuits remain operative under both conditions.

15. Re-start count capacitor

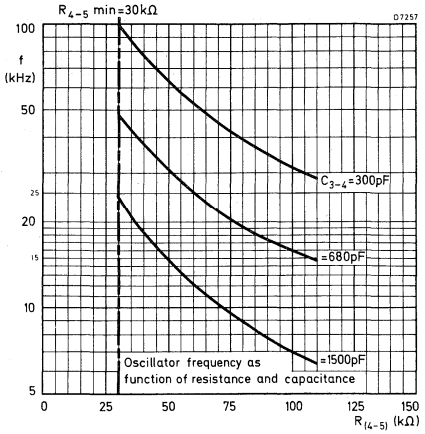
An external capacitor (C15 = 10 μF) should be connected between pins 15 and 16. This capacitor controls the characteristics of the protection circuits as follows. When the protection circuit operates due to a fault, the duty factor of the drive pulses is reduced to zero. After an interval determined by the time-constant of the circuit connected to pin 13, the duty factor of the pulses slowly increases toward its normal operating value. If the fault persists, the duty factor of the pulses is again reduced to zero and the protection cycle is repeated. The number of times that the cycle is repeated before the power supply drive pulses are permanently discontinued is determined by the value of the capacitor connected to pin 15. The number of counts is roughly C15/C13.

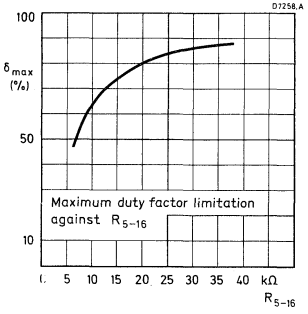
16. Negative supply (ground)

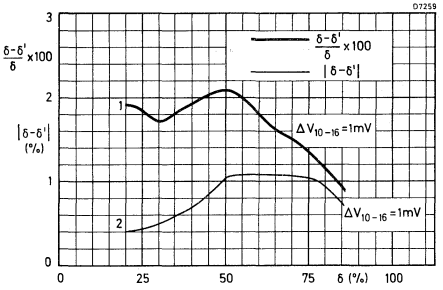
**APPLICATION INFORMATION** (continued)



Note: To operate with other supply and output voltages, alternative values of resistors marked thus * must be chosen.







1. Change of transfer characteristic against duty factor for $\Delta V_{10\text{-}16} = 1\,mV$.
2. Percentage change of transfer characteristics against duty factor for $\Delta V_{10\text{-}16} = 1\,mV$.

# VERTICAL DEFLECTION CIRCUIT

The TDA2652 is a monolithic integrated circuit for colour television receivers with 110° deflection. With an external circuit it can be used in 20AX and 30AX systems. The circuit incorporates the following functions:

- Synchronization circuit
- Vertical oscillator
- Blanking pulse generator
- Sawtooth generator with buffer stage
- Preamplifier
- Driver and output stage
- Short-circuit and thermal protection
- Guard circuit
- Voltage stabilizer

## QUICK REFERENCE DATA

## APPLICATION INFORMATION

**The function is described against the corresponding pin number**

1.2. Oscillator
The frequency of the oscillator is determined by a potentiometer at pin 1 and a capacitor at pin 2.

3.4. Sawtooth generator
The timing of the ramp generator is determined by a potentiometer at pin 3 and a capacitor at pin 4. This capacitor has been split to realize linearity control.

5. Output ramp oscillator
This pin delivers a ramp signal which is used for linearity control, and drive of the preamplifier. The ramp signal is applied via a shaping network to pin 4 (linearity) and via a resistor to pin 12 (preamplifier).

6. Guard circuit input
When a capacitor is connected between this pin and ground a continuous blanking signal is available at pin 14 in case of missing vertical deflection current.
When no continuous blanking is required this capacitor is replaced by a resistor between pin 6 and pin 7.

7. Positive supply
No voltage stabilizer is necessary resulting in optimum tracking with line deflection. The internal stabilizer delivers the voltage for the oscillator, ramp generator and preamplifier.

8. Not connected.

9. Output of class B power stage
The deflection coil is connected to this pin, via a four-pole network, a coupling capacitor and a feedback resistor, to ground.

10. Ground for output stage.

11. Preamplifier
The cut-off frequency of the internal differential amplifier (preamplifier) is adjusted with the capacitor between pin 11 and ground.

12. Preamplifier input
The d.c. voltage is proportional to the output voltage (d.c. feedback). The a.c. voltage is proportional to the sum of the ramp voltage at pin 5 and the voltage, with opposite polarity, at the feedback resistor (a.c. feedback).

13. Reference voltage stage
The bias stage of the preamplifier is decoupled at this pin.

14. Blanking output
The maximum pulse amplitude with no load is $V_P$. When $I_{14}$ is 10 mA the amplitude of the pulse is 1 V.

15. Synchronization input
The oscillator has to be synchronized by a positive-going pulse of between 1 and 12 V.

16. Ground of small signal part.

* For 20AX systems the heatsink has to be constructed for $P_{tot} < 10$ W, $R_{th\ h\text{-}a} = 4$ °C/W at $T_{amb} = 60$ °C.

** For 30AX systems the heatsink has to be constructed for $P_{tot} < 5$ W, $R_{th\ h\text{-}a} = 8{,}5$ °C/W at $T_{amb} = 60$ °C.

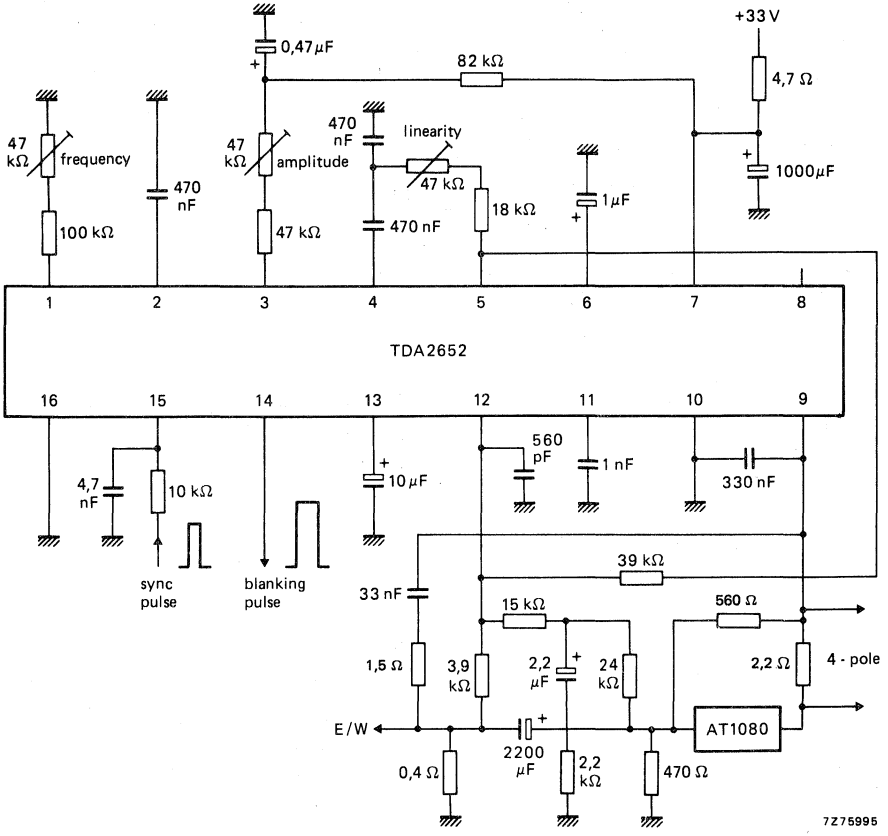

Fig. 3 Complete vertical deflection circuit for 20AX.

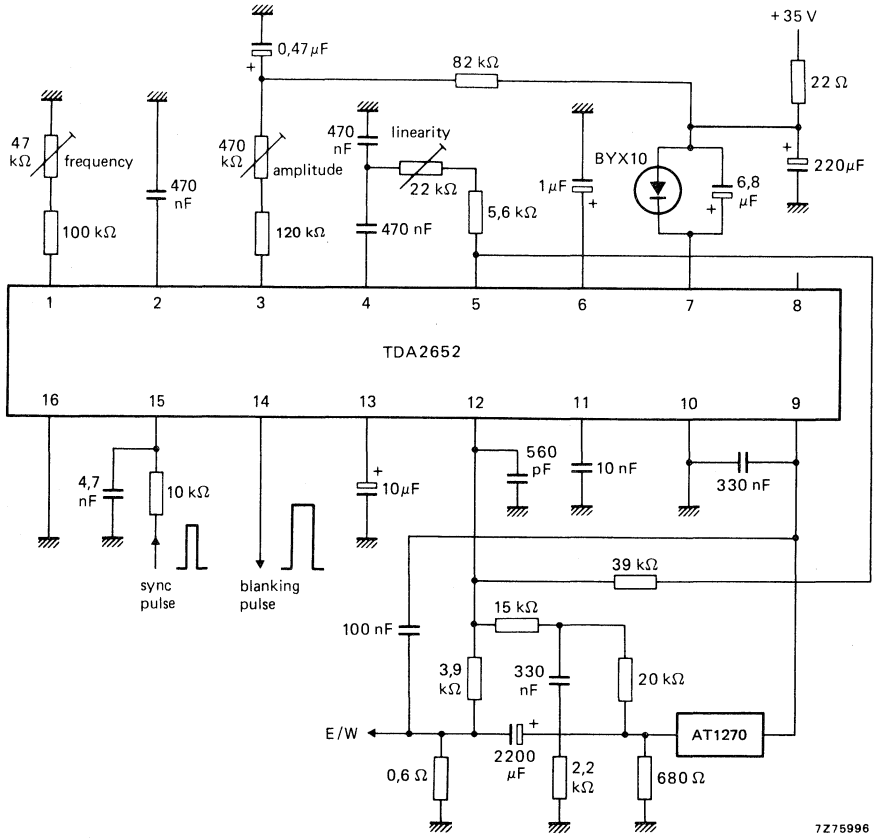

Fig. 4 Complete vertical deflection circuit for 30AX.

# VERTICAL DEFLECTION CIRCUIT

The TDA2653 is a monolithic integrated circuit for vertical deflection in large screen colour television receivers, e.g. 30AX and PIL-S4 systems.

The circuit incorporates the following functions:

- Oscillator.
- Synchronization circuit.
- Blanking pulse generator with guard circuit.
- Frequency detector and storage.
- Sawtooth generator with amplitude switch for 50 Hz/60 Hz.
- Buffer stage.
- Reference voltage unit.
- Preamplifier.
- Output stage with thermal and short-circuit protection.
- Flyback generator.
- Voltage stabilizer.

## APPLICATION INFORMATION

**The function is described against the corresponding pin number**

1. 2. Oscillator

The oscillator frequency is determined by a potentiometer at pin 1 and a capacitor at pin 2.

3. 4. Sawtooth generator

The amplitude of the sawtooth generator is determined by two resistors at pin 3 and a capacitor at pin 4. This capacitor has been split to realize linearity control.

5. Reference voltage decoupling

An electrolytic capacitor connected from this pin to ground, suppresses the ripple voltage on the supply voltage, from which, via an internal resistor divider the reference voltage is derived.

6. Positive supply

The supply voltage at this pin is used to supply the flyback generator, the voltage stabilizer, reference voltage unit, buffer stage and blanking pulse generator.

7. Flyback generator output

An electrolytic capacitor has to be connected between pins 7 and 11 to complete the flyback generator.

8. Negative supply (ground) of output stage

9. Output of class-B power stage

The vertical deflection coil is connected to this pin, via a series connection of a coupling capacitor and a feedback resistor, to ground.

10. Not connected

11. Positive supply of output stage

This supply is obtained from the flyback generator. An electrolytic capacitor between pins 11 and 7, and a diode between pins 6 and 11 have to be connected for proper operation of the flyback generator.

12. Preamplifier input

The d.c. voltage is proportional to the output voltage (d.c. feedback). The a.c. voltage is proportional to the sum of the buffered sawtooth voltage at pin 13 and the voltage, with opposite polarity, at the feedback resistor (a.c. feedback).

13. Output of sawtooth buffer stage

The sawtooth signal is fed via a buffer stage to pin 13. It delivers the signal which is used for linearity control, and drive of the preamplifier. The sawtooth is applied via a shaping network to pin 4 (linearity) and via a resistor to pin 12 (preamplifier).

**APPLICATION INFORMATION** (continued)

14. Blanking output

    The maximum pulse amplitude with no load is $V_S$. When $I_{14}$ is 10 mA the amplitude of the pulse is 6 V.

15. Synchronization input

    The oscillator has to be synchronized by a positive-going pulse between 1 and 12 V. The integrated frequency detector, with storage and amplitude switch, takes care of automatic recognition and processing of 50 Hz or 60 Hz signals.

16. Negative supply (ground) of small signal part.

The following application data are measured in Fig. 3.

| | | | 30AX system | PIL-S4 system | |
|---|---|---|---|---|---|
| System supply voltage | $V_S$ | typ. | 26 | 26 | V |
| Output voltage (d.c. value) | $V_{9\text{-}16}$ | typ. | 14 | 13,5 | V |
| Output voltage (peak value) | $V_{9\text{-}16}$ | typ. | 42 | 49 | V |
| Supply current (pin 6 + pin 11) | $I_6 + I_{11}$ | typ. | 325 | 195 | mA |
| Deflection current (peak-to-peak value) | $I_{9(p\text{-}p)}$ | typ. | 2,2 | 1,32 | A |
| Flyback time | $t_{fl}$ | typ. | 0,85 | 1,1 | ms |
| Blanking time | $t_b$ | typ. | 1,46 | – | ms |
| Total power dissipation per package | $P_{tot}$ | typ. | 4,2 | 3 | W |
| Total power consumption | P | typ. | 8,1 | – | W |
| Thermal resistance of heatsink | $R_{th\ h\text{-}a}$ | typ. | 10 | 10 | K/W |

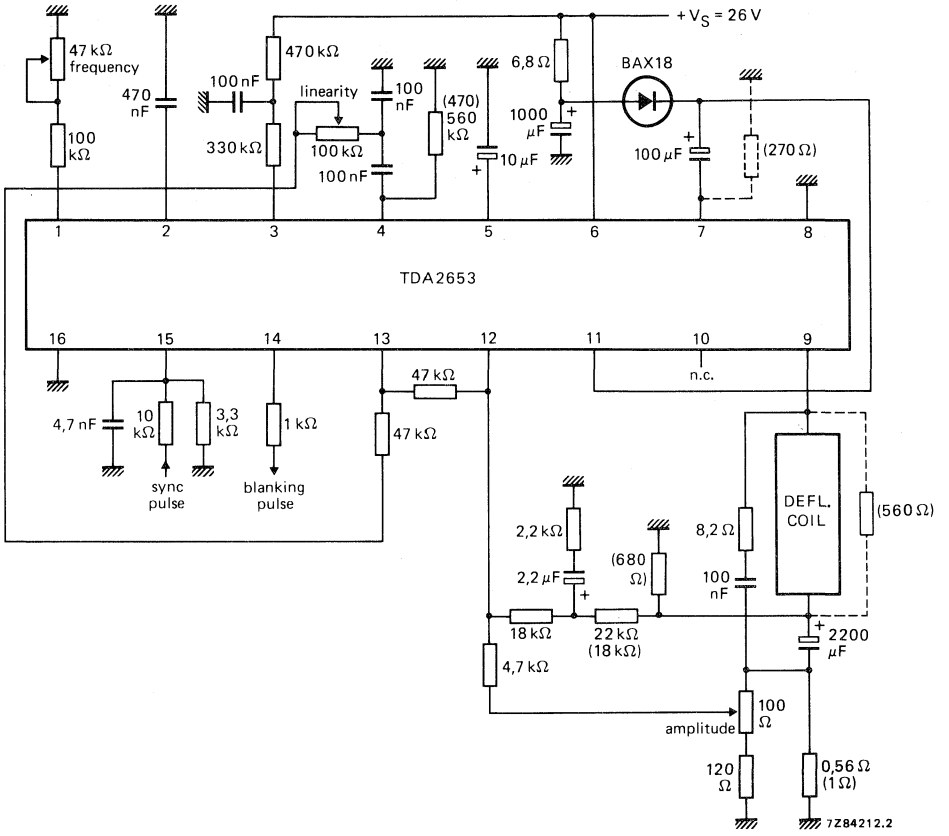

Fig. 3 Typical vertical deflection circuit for 30AX. The values given in parentheses and the dotted components are valid for the PIL-S4 system.

# VERTICAL DEFLECTION CIRCUIT

The TDA2653A is a monolithic integrated circuit for vertical deflection in large screen colour television receivers, e.g. 30AX and PIL-S4 systems.

The circuit incorporates the following functions:

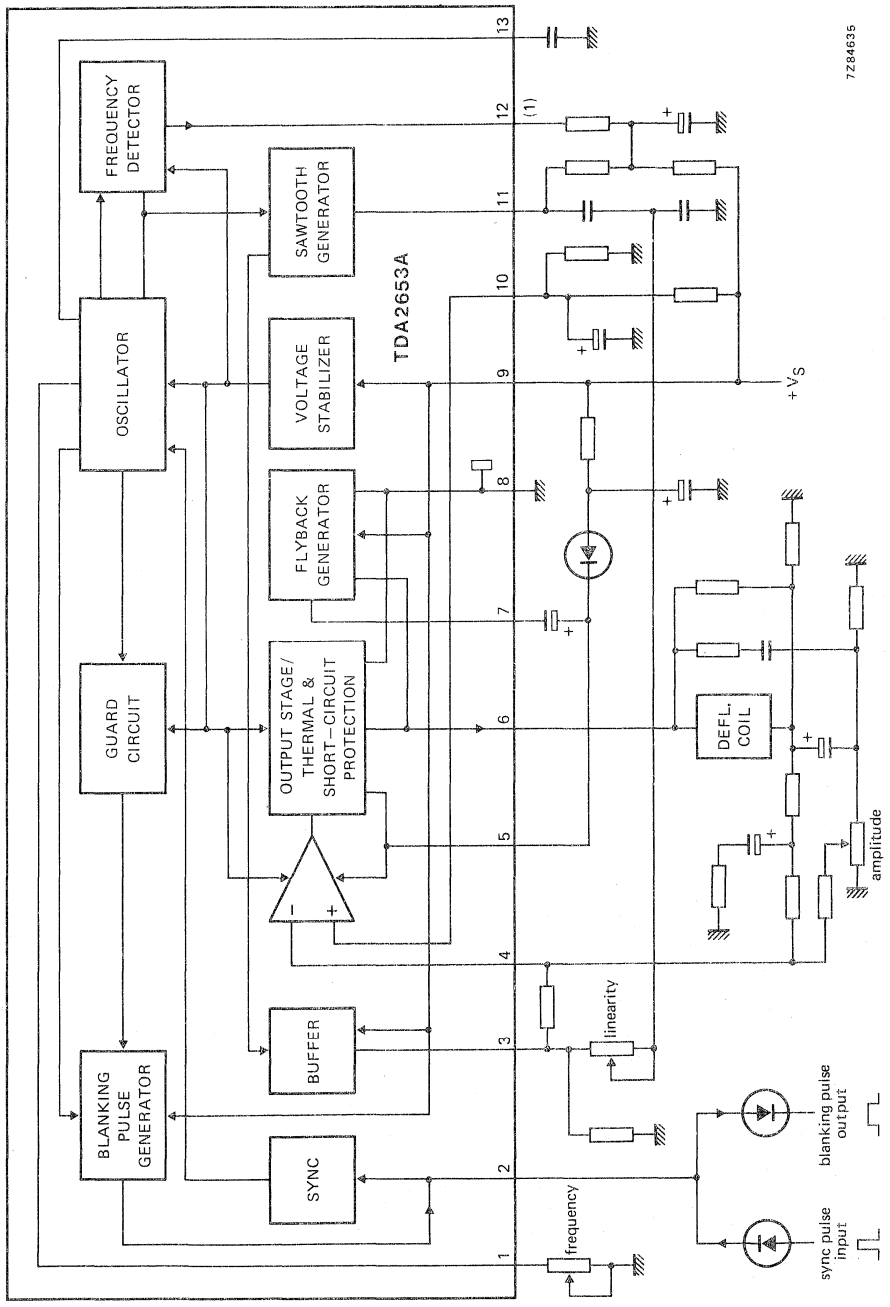
- Oscillator; switch capability for 50 Hz/60 Hz operation.
- Synchronization circuit.
- Blanking pulse generator with guard circuit.
- Sawtooth generator with buffer stage.
- Preamplifier with fed-out inputs.
- Output stage with thermal and short-circuit protection.
- Flyback generator.
- Voltage stabilizer.

## QUICK REFERENCE DATA

| | | | | |
|---|---|---|---|---|
| For 30AX system | | | | |
| Supply voltage (pin 9) | $V_{9\text{-}8} = V_S$ | typ. | 26 | V |
| Supply current (pin 5 + pin 9) | $I_5 + I_9 = I_S$ | typ. | 325 | mA |
| Output current (peak-to-peak value) | $I_{6(p\text{-}p)}$ | typ. | 2,2 | A |
| Picture frequency | f | | 50 Hz/60 | Hz |
| Sync input pulse (peak-to-peak value) | $V_{2\text{-}8(p\text{-}p)}$ | $\geqslant$ | 1 | V |
| Thermal resistance from junction to mounting base | $R_{th\ j\text{-}mb}$ | $\leqslant$ | 5 | K/W |

## PACKAGE OUTLINE

13-lead DIL; plastic power (SOT-141B).



(1) Condition for pin 12: LOW voltage level = 50 Hz; HIGH voltage level = 60 Hz.

Fig. 1 Block diagram.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | |
|---|---|---|---|
| Supply voltage (pin 9) | $V_{9-8} = V_S$ | max. | 40 V |
| Supply voltage output stage (pin 5) | $V_{5-8}$ | max. | 58 V |

## APPLICATION INFORMATION

**The function is described against the corresponding pin number**

1, 13. Oscillator

The oscillator frequency is determined by a potentiometer at pin 1 and a capacitor at pin 13.

2. Sync input/blanking output

Combination of sync input and blanking output. The oscillator has to be synchronized by a positive-going pulse between 1 and 12 V. The integrated frequency detector delivers a switching level at pin 12.
The blanking pulse amplitude is 20 V with a load of 1 mA.

3. Sawtooth generator output

The sawtooth signal is fed via a buffer stage to pin 3. It delivers the signal which is used for linearity control, and drive of the preamplifier. The sawtooth is applied via a shaping network to pin 11 (linearity) and via a resistor to pin 4 (preamplifier).

4. Preamplifier input

The d.c. voltage is proportional to the output voltage (d.c. feedback). The a.c. voltage is proportional to the sum of the buffered sawtooth voltage at pin 3 and the voltage, with opposite polarity, at the feedback resistor (a.c. feedback).

5. Positive supply of output stage

This supply is obtained from the flyback generator. An electrolytic capacitor between pins 7 and 5, and a diode between pins 5 and 9 have to be connected for proper operation of the flyback generator.

6. Output of class-B power stage

The vertical deflection coil is connected to this pin, via a series connection of a coupling capacitor and a feedback resistor, to ground.

7. Flyback generator output

An electrolytic capacitor has to be connected between pins 7 and 5 to complete the flyback generator.

8. Negative supply (ground)

Negative supply of output stage and small signal part.

9. Positive supply

The supply voltage at this pin is used to supply the flyback generator, voltage stabilizer, blanking pulse generator and buffer stage.

## APPLICATION INFORMATION (continued)

10. Reference voltage of preamplifier

    External adjustment and decoupling of reference voltage of the preamplifier.

11. Sawtooth capacitor

    This sawtooth capacitor has been split to realize linearity control.

12. 50 Hz/60 Hz switching level

    This pin delivers a LOW voltage level for 50 Hz and a HIGH voltage level for 60 Hz. The amplitudes of the sawtooth signals can be made equal for 50 Hz and 60 Hz with these levels.

The following application data are measured in Figs 3 and 4.

| | | | 30AX system (26 V) Fig. 3 | 30AX system (26 V/12 V) Fig. 4 | PIL-S4 system Fig. 3 |

## APPLICATION INFORMATION (see also Fig. 1)

**The function is described against the corresponding pin number**

1. Blanking pulse output

When the IC is adjusted on a free running frequency of 46 Hz the internal blanking pulse generator delivers a blanking pulse with a duration between 1,2 ms and 1,5 ms. The circuit is, however, made such that when the flyback time of the deflection current is longer, the blanking pulse corresponds to the flyback time. The output voltage is also high when the voltage at pin 9 is lower than nominal 5 V. An external blanking circuit is recommended when tiny-vision receivers are operated from a car-battery.

2. Synchronization input

The oscillator has to be synchronized by a positive-going pulse. The circuit is made such that synchronization is inhibited during the flyback time.

## APPLICATION INFORMATION (continued)

3. Oscillator

The oscillator frequency is set by the potentiometer P1 and resistor R2 between pins 3 and 7 and capacitor C1 between pin 3 and ground. For 50 Hz systems the free running frequency is preferably adjusted to 46 Hz.

4. Sawtooth generator

This pin supplies the charging and discharging currents of the capacitor between pin 4 and ground (C2).

5. S-correction and linearity control

The amount of S-correction can be set by the value of C3. For 110° deflection coils, e.g. AT1040/15, a capacitor of 15 $\mu$F will give the right value for S-correction. For 90° deflection systems (e.g. AT1235/00) a nearly linear deflection current is required, this can be achieved by increasing C3 to 100 $\mu$F. The linearity can be adjusted by potentiometer P2.

6. Output current feedback

To this pin is applied a part of the output current measured across R6 and superimposed on a d.c. voltage derived from the voltage across the output coupling capacitor. This signal is compared with the internal reference sawtooth. The internal reference sawtooth has an amplitude of about 0,6 V peak to peak and a d.c. level of about 3,4 V, for a supply voltage of 25 V at pin 8.

7. Internal voltage divider decoupling

The voltage on this pin is about half the supply voltage at pin 8 and is applied to the bases of emitter followers supplying the pre-stages of the IC. This voltage controls the amplitude of the internal reference sawtooth. In this way tracking with the line deflection system is achieved when the supply voltage at pin 8 is derived from the line output transformer.

8. Positive supply

The value depends on the deflection coil.

9. Output

The deflection coil is connected to ground via coupling capacitor C9 and current sensing resistor R6. The line frequency superimposed on the output voltage may be too high due to the current feedback system. The line frequency ripple can be decreased by connecting a resistor across the deflection coil. The flyback time can be influenced by the resistor divider (R4, R5) for the d.c. feedback to pin 6. It should be noted that the output voltage shows a negative swing of about 1 V during the first (positive current) part of the flyback.

Tab

The tab is used as negative supply (ground) connection. Therefore, the tab should be well connected to the negative side of the power supply.

Controlled switch-on

This feature is achieved by charging the a.c. coupling capacitor (C4; connected to pin 6) from an internal current source of about 2 mA (voltage limited to maximum 15 V) for a short period after switch-on. The charging time can be influenced by the value of C5 (connected to pin 7). Discharging of C4 results in a slowly increasing deflection current after a delay of about 1 second. The blanking voltage at pin 1 is high during this delay.

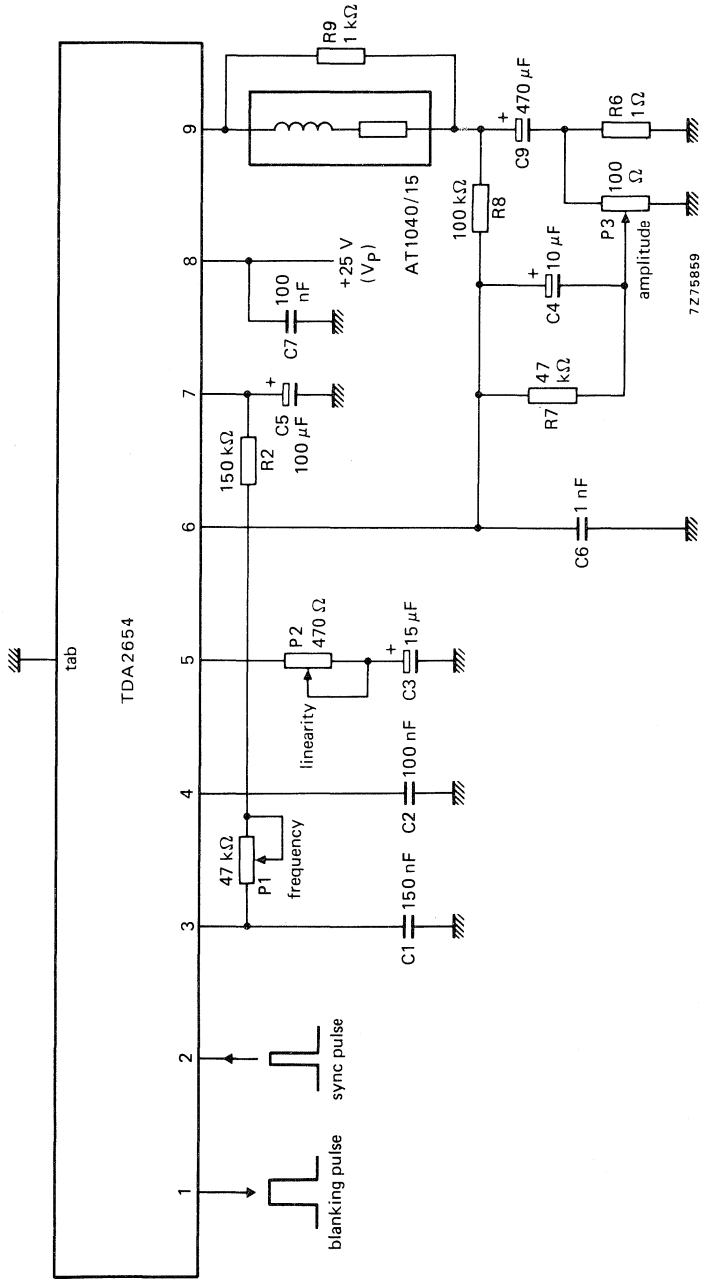

Fig. 3 Monochrome 110° vertical deflection system.

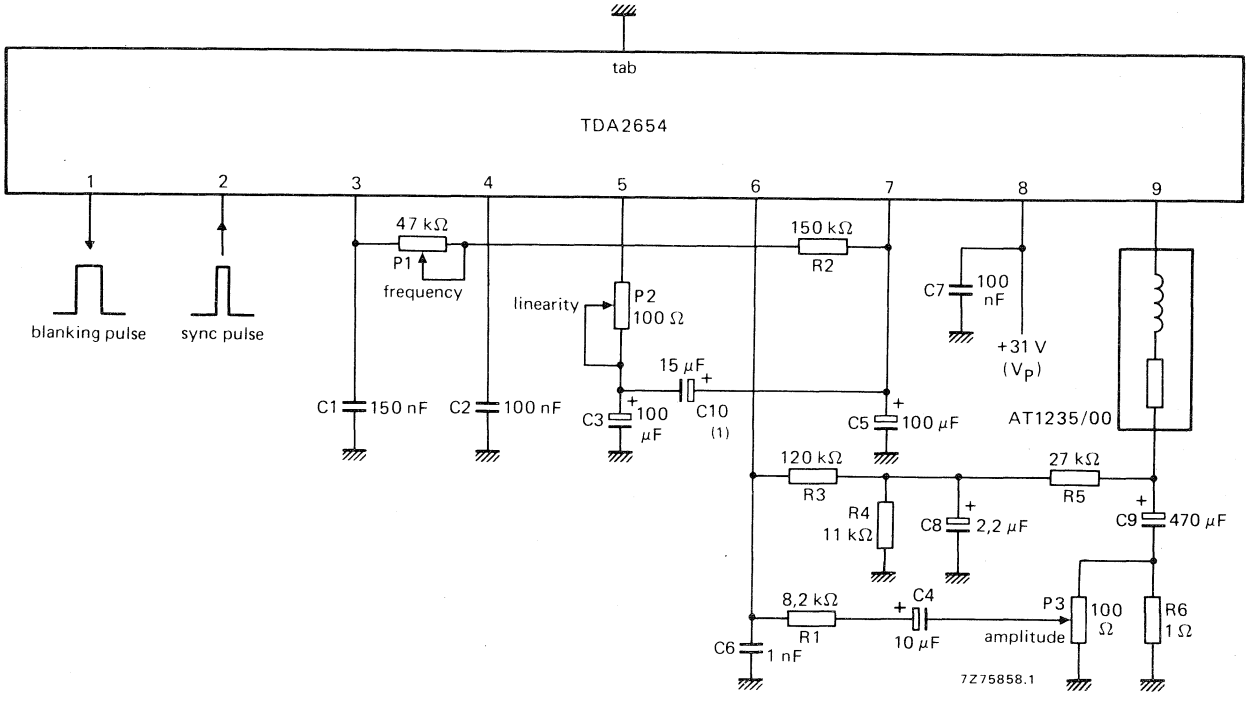
## APPLICATION INFORMATION (continued)



(1) Only required when rapid variations in the supply voltage are expected.

Fig. 4 Colour 90° vertical deflection system.

# VERTICAL DEFLECTION CIRCUIT

The TDA2655A is a monolithic integrated circuit for vertical deflection in colour television receivers with 90° picture tubes.

The circuit incorporates the following functions:

- Synchronization circuit.
- Oscillator.
- Sawtooth generator with buffer stage.
- Preamplifier with fed-out inputs.
- Output stage with thermal and short-circuit protection.
- Flyback generator.
- Blanking pulse generator with guard circuit.
- Voltage stabilizer.

# VERTICAL DEFLECTION CIRCUIT

## GENERAL DESCRIPTION

The TDA2655B is a monolithic integrated circuit for vertical deflection in colour television receivers with 90° picture tubes.

### Features

- Synchronization circuit
- Vertical oscillator; 50/60 Hz switch
- Sawtooth generator with buffer stage
- Preamplifier with fed-out inputs
- Output stage with termal and short-circuit protection
- Flyback generator
- Blanking pulse generator with guard circuit
- Voltage stabilizer
- Frequency detector with memory and storage

## QUICK REFERENCE DATA

# COLOUR SUB-CARRIER OSCILLATOR AND MIXER FOR VIDEO RECORDERS

## GENERAL DESCRIPTION

The TDA2721 is a monolithic integrated circuit for video recorders. The circuit incorporates the following functions:

- 8,8 MHz colour sub-carrier oscillator with 2 : 1 divider stage
- Keyed phase comparison for optimum noise behaviour
- Generation of a reference voltage and two control voltages based upon the synchronous demodulation and envelope demodulation principles respectively.
- Stage for generating the colour killer signal and an identification signal
- A mixer stage for generating the 5,06 MHz sub-carrier frequency

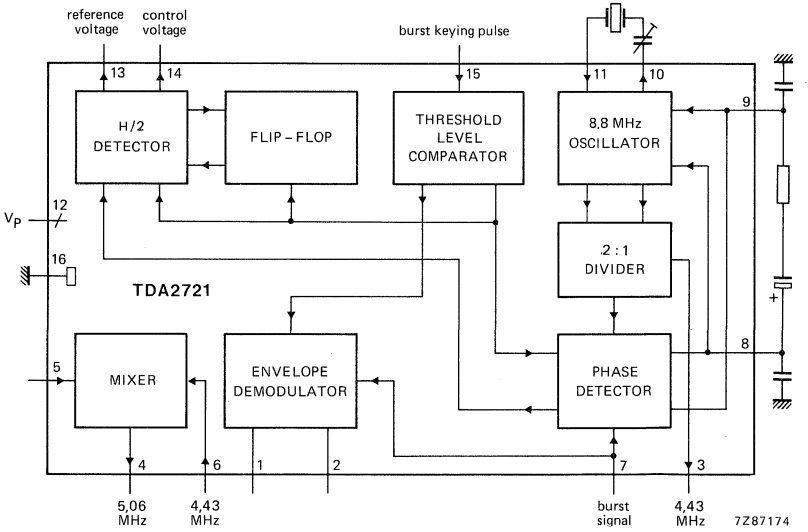

Fig. 1 Block diagram.

## PACKAGE OUTLINE

16-lead DIL; plastic (SOT-38).

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | | |
|---|---|---|---|---|
| Supply voltage (pin 12) | $V_{12-16} = V_P$ | max. | 13,2 | V |

DEVELOPMENT SAMPLE DATA

## CHARACTERISTICS (continued)

| parameter | symbol | min. | typ. | max. | unit |
|---|---|---|---|---|---|
| **Mixer** | | | | | |
| Mixer gain at $V_{5\text{-}16(p\text{-}p)}$ = 250 mV | $G_v$* | – | 16 | – | dB |
| Maximum input voltage (pin 5) | $V_{5\text{-}16}$ | – | 600 | – | mV |
| Carrier suppression at pin 4 at $V_{5\text{-}16(p\text{-}p)}$ = 250 mV | $\alpha$** | 20 | – | – | dB |
| Input resistance | | | | | |
| at pin 5 | $R_{5\text{-}16}$ | – | 1 | – | kΩ |
| at pin 6 | $R_{6\text{-}16}$ | – | 2 | – | kΩ |

* The mixer gain is defined as the ratio: $V_4/V_5$ in which $V_4$ is the total voltage and $V_5$ the voltage at 625 kHz.

** The carrier suppression is defined as the ratio: $V_4/V_6$ in which $V_4$ is the voltage at 5,06 MHz and $V_6$ the voltage at 4,43 MHz.

## APPLICATION INFORMATION

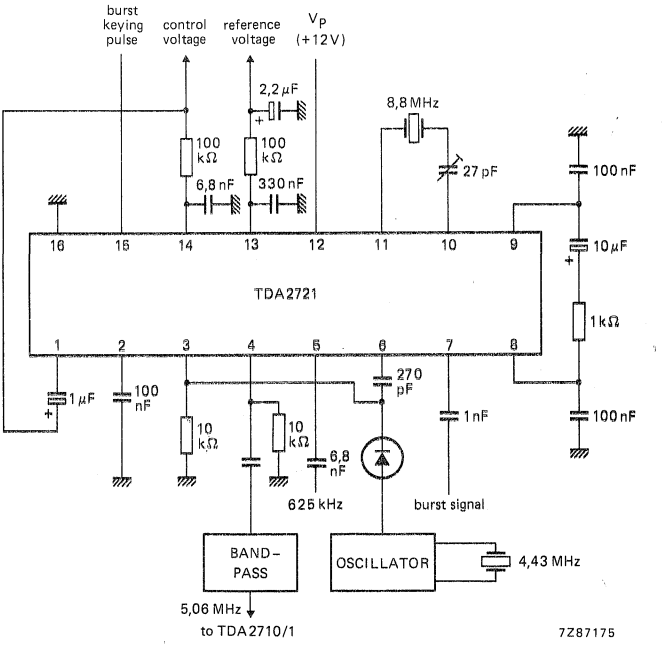

Fig. 2 Application diagram and test circuit.

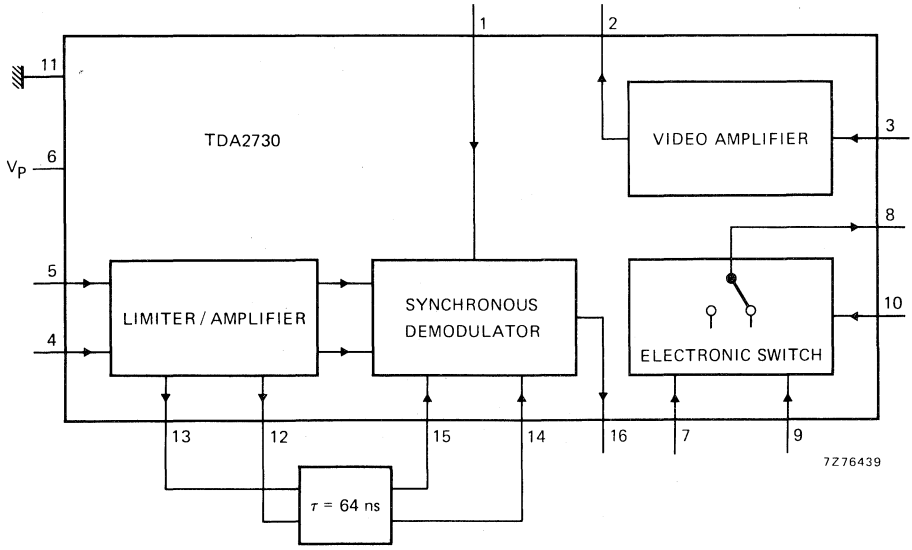
# FM LIMITER/DEMODULATOR

The TDA2730 is a monolithic integrated circuit for use in audio-visual equipment, e.g.; video recorders and video disc players.
The circuit comprises an f.m. limiter/demodulator for the playback signal, a video amplifier and an electronic switch, which can be used for drop-out elimination.

| QUICK REFERENCE DATA | | | | |
|---|---|---|---|---|
| Supply voltage | $V_{6-11}$ | typ. | 12 | V |
| Supply current | $I_6$ | typ. | 42 | mA |
| Input signal range (peak-to-peak value) | $V_{4-5(p-p)}$ | | 30 to 2000 | mV |
| Video output signal (peak-to-peak value) | $V_{2-11(p-p)}$ | typ. | 4 | V |

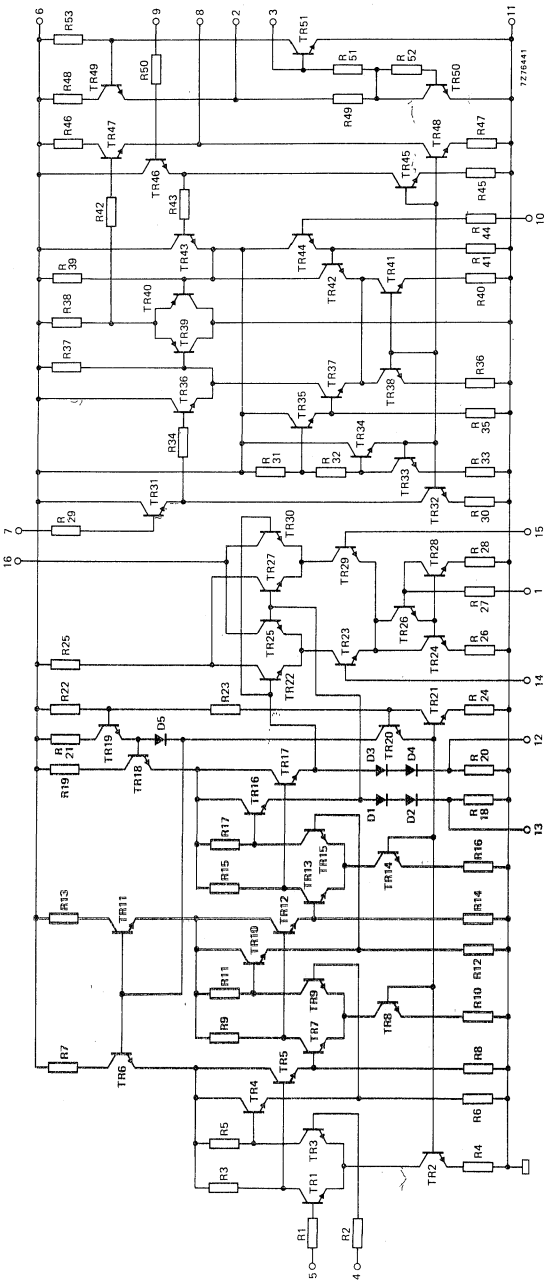
**BLOCK DIAGRAM**



**PACKAGE OUTLINE**

16-lead DIL; plastic (SOT-38).

## CIRCUIT DIAGRAM



**RATINGS** Limiting values in accordance with the Absolute Maximum System (IEC 134)

Voltage

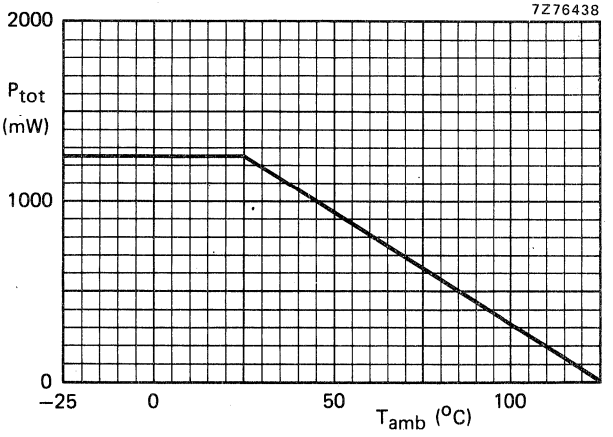
| | | | | |
|---|---|---|---|---|
| Supply voltage | $V_{6-11}$ | max. | 13 | V |

Power dissipation

| | | | | |
|---|---|---|---|---|
| Total power dissipation (see also derating curve below) | $P_{tot}$ | max. | 1,25 | W |

Temperatures

| | | | |
|---|---|---|---|
| Storage temperature | $T_{stg}$ | −65 to +125 | °C |
| Operating ambient temperature | see derating curve below | | |



**CHARACTERISTICS** measured in the circuit on page 7 (Fig. 1)

| | | | | |
|---|---|---|---|---|
| Supply voltage range | $V_{6-11}$ | typ. | 12 | V |
| | | | 11 to 13 | V |

The following characteristics are measured at $V_{6-11}$ = 12 V; $T_{amb}$ = 25 °C

| | | | | |
|---|---|---|---|---|
| Supply current | $I_6$ | typ. | 42 | mA |
| | | | 25 to 54 | mA |

**Limiter**

| | | | | |
|---|---|---|---|---|
| Start of limiting (−3 dB) $f_o$ = 4 MHz; peak-to-peak value | $V_{4-5(p-p)}$ | typ. | 0,8 | V |
| Input signal range for constant luminance output (peak-to-peak value) | $V_{4-5(p-p)}$ | | 30 to 2000 | mV |
| Output voltage (peak-to-peak value) | $V_{12-13(p-p)}$ | typ. | 750 | mV |
| Available output voltage at an external load of 1 kΩ; peak-to-peak value | $V_{12-13(p-p)}$ | > | 5 | V |

**Demodulator**

Measured at $I_1$ = 4 mA; $|Z_{16-11}|$ = 1,5 kΩ; delay time $\tau$ = 64 ns; $\Delta f$ = 1,4 MHz ($f_L$ = 3,0 MHz, $f_H$ = 4,4 MHz)

| | | | | |
|---|---|---|---|---|
| Current ratio | $I_1/I_{16}$ | typ. | 1 | |
| Output voltage (peak-to-peak value) | $V_{16-11}$ | typ. | 540 | mV |

**Drop-out switch**

| | | | | |
|---|---|---|---|---|
| Input drive voltage range | $V_{7;9-11}$ | | 6,5 to 12 | V |
| Voltage drop between input and output | | | | |
| for signal flow from pin 7 to pin 8 | $V_{7-8}$ | typ. | 1,5 | V |
| for signal flow from pin 9 to pin 8 | $V_{9-8}$ | typ. | 1,5 | V |
| Input offset voltage | $\lvert V_{7-8}-V_{9-8}\rvert$ | < | 20 | mV |
| Switch actuating input voltage | | | | |
| for signal flow from pin 7 to pin 8 | $V_{10-11}$ | | 0 to 2,7 | V |
| for signal flow from pin 9 to pin 8 | $V_{10-11}$ | | 3,7 to 6,0 | V |
| Output impedance at 1,5 mA by internal load | $Z_{8-11}$ | | emitter follower | |

**CHARACTERISTICS** (continued)

**Video amplifier**

| | | | | |
|---|---|---|---|---|
| Input voltage level | $V_{3-11}$ | typ. | 730 | mV |
| Output voltage level | $V_{2-11}$ | typ. | 5,5 | V |
| Open loop gain | G | typ. | 43 | dB |
| Bandwidth (3 dB) | B | typ. | 8,8 | MHz |
| Output voltage (peak-to-peak value; see note) | $V_{2-11(p-p)}$ | typ. | 4 | V |

Note

The gain of the amplifier is determined by the feedback network comprising the impedances between pins 2 and 3, and pins 8 and 3. The values quoted apply to the circuit on page 7 (Fig. 1).

**PINNING**

1. Current setting demodulator
2. Video amplifier output
3. Video amplifier input
4. F.M. signal input
5. F.M. signal input
6. Positive supply
7. Switch input
8. Switch output
9. Switch input
10. Switch actuating input
11. Negative supply (ground)
12. Limiter output
13. Limiter output
14. Demodulator input
15. Demodulator input
16. Demodulator output

**APPLICATION INFORMATION**

**The function is quoted against the corresponding pin number**

1. Current setting of demodulator

   The current into this pin directly determines the amplitude and the d.c. level of the demodulator output. At $I_1$ = 4 mA, optimum temperature compensation is obtained.

2. Video amplifier output

   A signal up to 4 V peak-to-peak is available from this output (Fig. 1).
   This can be the video signal (Fig. 1) or the f.m. signal to the delay line (drop-out elimination; Fig. 2).

3. Video amplifier input

   The demodulator output signal is the input signal to this pin (Fig. 1) or the f.m. modulated signal (Fig. 2).

4. F.M. signal input (in conjunction with pin 5)

   A frequency modulated signal of 1 V peak-to-peak is applied between pins 4 and 5. D.C. feedback from the limiter output is applied to stabilize the operation.

5. F.M. signal input

   See pin 4.

**APPLICATION INFORMATION** (continued)

6. Positive supply

   Correct operation can be obtained in the range 11 to 13 V.

7. Switch input

   The signal applied to pin 7 or to pin 9 is transferred to pin 8, depending on the switch position. For an input level between 0 and 2,7 V at pin 10, the signal at pin 7 is transferred to pin 8, and when between 3,7 and 6 V the input signal at pin 9 is transferred to pin 8.
   The signal at pin 7 or pin 9 may vary from 6,5 to 12 V.
   The signal at pin 8 is 1,5 V below the value at pin 7 or 9.
   The difference in input level at pins 7 and 9, to obtain equal output at pin 8, will be less than 20 mV.

8. Switch output

   See pin 7.

9. Switch input

   See pin 7.

10. Switch actuating input

    See pin 7.

11. Negative supply (ground)

12. Limiter output

    A balanced signal is available between pins 12 and 13. The signal amplitude is limited to 750 mV at both outputs.

13. Limiter output

    See pin 12.

14. Demodulator input

    A phase shifted signal (with respect to the internally applied signal) is applied between pins 14 and 15.

15. Demodulator input

    See pin 14.

16. Demodulator output

    The output signal is proportional to :
    - current into pin 1
    - slope of the phase characteristic of the network between pins 12 and 13, and pins 14 and 15
    - impedance level at the output
    - the sweep ($\Delta f$) of the f. m. signal.

    A signal of typically 540 mV is available at this pin when using the component values in Fig. 1 and $\Delta f$ = 1,4 MHz.

# AMPLIFIER AND DROP-OUT IDENTIFICATION CIRCUIT

## GENERAL DESCRIPTION

The TDA2740 is a monolithic integrated circuit intended for use in colour television receivers. It also can be used, in conjunction with the TDA2730, in the reproduction part of video recorder sets. The circuit incorporates the following functions:

- Electronic switch
- A.G.C. FM amplifier with display drive capability
- Drop-out detector
- Schmitt-trigger for generating a drop-out pulse

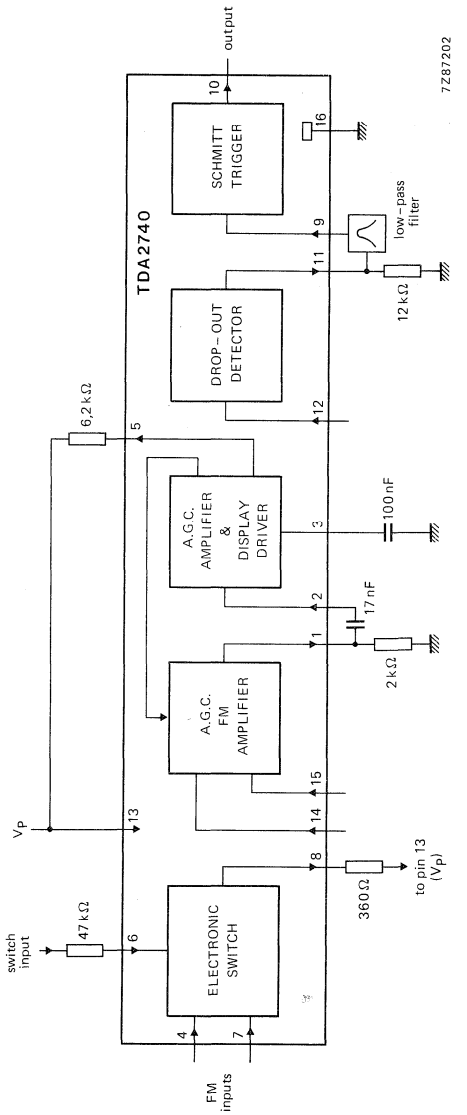

Fig. 2 Test circuit.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | | |
|---|---|---|---|---|
| Supply voltage (pin 13) | $V_{13-16} = V_P$ | max. | 13 | V |
| Total power dissipation | $P_{tot}$ | max. | 780 | mW |
| Storage temperature range | $T_{stg}$ | −25 to | +150 | °C |
| Operating ambient temperature range | $T_{amb}$ | −20 to | +90 | °C |

## CHARACTERISTICS

$V_P$ = 12 V; $T_{amb}$ = 25 °C; measured in Fig. 2; unless otherwise specified

| parameter | symbol | min. | typ. | max. | unit |
|---|---|---|---|---|---|
| **Supply** | | | | | |
| Supply voltage range (pin 13) | $V_P$ | 11,5 | 12 | 13 | V |
| Supply current (pin 13) | $I_P$ | 30 | 40 | 60 | mA |
| **Electronic switch** | | | | | |
| Input voltages (d.c.) | $V_{4;7-16}$ | 6,5 | 7,1 | 7,5 | V |
| Input impedances | $\|Z_{4;7-16}\|$ | – | 1 | – | kΩ |
| Input voltages (pin 6) | | | | | |
| for signal from pin 7 to pin 8 | $V_6$ | 0 | – | 1,7 | V |
| for signal from pin 4 to pin 8 | $V_6$ | 2,7 | – | $V_P$ | V |
| Input current (pin 6) | $I_6$ | – | – | 60 | μA |
| Output pin 8 | | open collector | | | |
| Output current (d.c.) | $I_8$ | 1,3 | 1,8 | 2,5 | mA |
| Output voltage | $V_{8-16}$ | 6,7 | – | $V_P$ | V |
| Forward transfer admittance | $\|Y_f\|$ | 2,45 | 3,3 | 4,45 | mS |
| 2nd harmonic suppression referred to a sinusoidal signal at pin 4 or 7 of $V_{4;7(p-p)}$ = 500 mV; f = 4 MHz | $\alpha$ | – | −43 | – | dB |
| **A.G.C. amplifier and display driver** | | | | | |
| Input voltages (d.c.) | $V_{14;15-16}$ | 2,3 | 2,6 | 2,9 | V |
| Input impedance | $\|Z_{14-15}\|$ | – | 1,2 | – | kΩ |
| Input voltage range (peak-to-peak value) | $V_{14-15(p-p)}$ | 6 | – | 60 | mV |
| Output voltage (peak-to-peak value) | $V_{1(p-p)}$ | 0,7 | 1 | 1,4 | V |
| Open-loop voltage gain at f = 4 MHz | $G_{ov}$ | 43 | 46 | 49 | dB |
| Bandwidth (−3 dB) within control range | B | 7 | – | – | MHz |
| Output voltage (d.c.) | $V_{1-16}$ | 5,0 | 6,7 | 8,5 | V |
| Output impedance | $Z_{1-16}$ | emitter follower | | | |
| Input voltage (d.c.) | $V_{2-16}$ | 2,2 | 2,5 | 2,8 | V |
| Input impedance | $\|Z_{2-16}\|$ | – | 2,3 | – | kΩ |
| Output pin 5 | | open collector | | | |

**CHARACTERISTICS** (continued)

| paramter | symbol | min. | typ. | max. | unit |
|---|---|---|---|---|---|
| **A.G.C. amplifier and display driver** (continued) | | | | | |
| Display current (pin 5) | | | | | |
| without input signal | $I_5$ | – | – | 400 | μA |
| with input signal of 60 mV (peak to peak) | $I_5$ | – | 1,3 | – | mA |
| D.C. voltage at pin 3 | | | | | |
| without input signal | $V_{3-16}$ | 1,1 | 1,5 | 1,9 | V |
| with input signal | $V_{3-16}$ | 2,4 | 2,7 | 3,2 | V |
| **Drop-out detector** | | | | | |
| Input voltage (d.c.) | $V_{12-16}$ | 2,6 | 2,8 | 3,0 | V |
| Input impedance | $\lvert Z_{12-16}\rvert$ | – | 1 | – | kΩ |
| Input voltage (a.c.) (peak-to-peak value) | | | | | |
| for negative-going threshold ($t_{PLH}$) | $V_{12(p-p)}$ | 9 | 18 | 36 | mV |
| for positive-going threshold ($t_{PHL}$) | $V_{12(p-p)}$ | 11 | 26 | 60 | mV |
| Output pin 11 | | | open collector | | |

| Output impedance | $Z_{10-16}$ | | emitter follower | | |

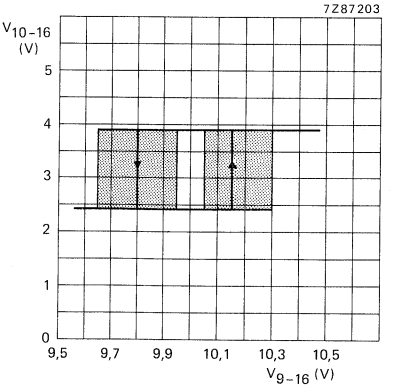

Fig. 3 Schmitt-trigger output voltage as a function of the input voltage.

# TELEVISION SOUND COMBINATION

The TDA2791 contains the following functions:

- Limiter/amplifier
- F.M. detector.
- Physiological d.c. volume control.
- D.C. tone control.

The limiter/amplifier is designed as a four-stage differential amplifier, to obtain good noise and interference suppression. The detector is a balanced quadrature demodulator.

During VTR operation audio signals can be inserted before the tone and volume control circuits. The limiter amplifier and demodulator must be switched off by grounding pin 2. This switching action occurs without a d.c. shift, so that no transients will be noticed in the speaker. The circuit is very flexible in its application because the characteristics of the various controls can be adapted by changing external component values.

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_{13-3}$ | typ. | 12 V |
| Total current drain | $I_{13}$ | typ. | 61 mA |
| Frequency | $f_o$ | | 5,5 MHz |
| Input voltage at start of limiting (r.m.s. value) | $V_{i(rms)}$ | typ. | 100 $\mu$V |
| A.M. rejection at $V_i$ = 5 mV | $\alpha$ | typ. | 60 dB |
| A.F. output voltage at $\Delta f = \pm 27$ kHz (r.m.s. value) (at pin 7 after de-emphasis) | $V_{o(rms)}$ | typ. | 700 mV |
| D.C. bass control range | | < | $^{+16}_{-19}$ dB |
| D.C. treble control range | | < | $^{+12}_{-15}$ dB |
| D.C. volume control range | | > | −75 dB |

## PACKAGE OUTLINE

16-lead DIL; plastic (SOT-38).

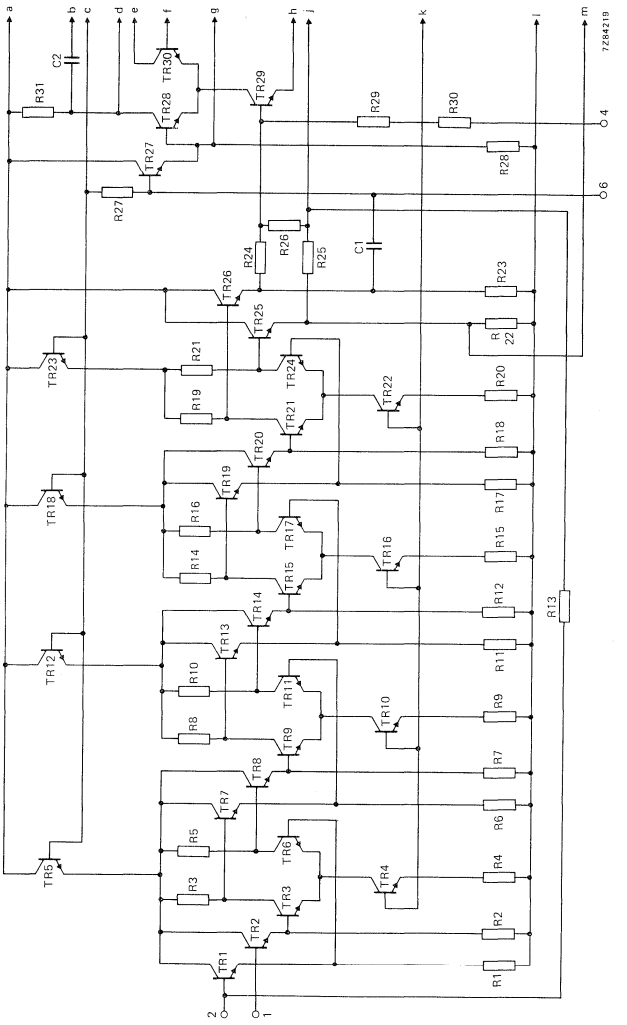

Fig. 1a Circuit diagram; continued in Fig. 1b.

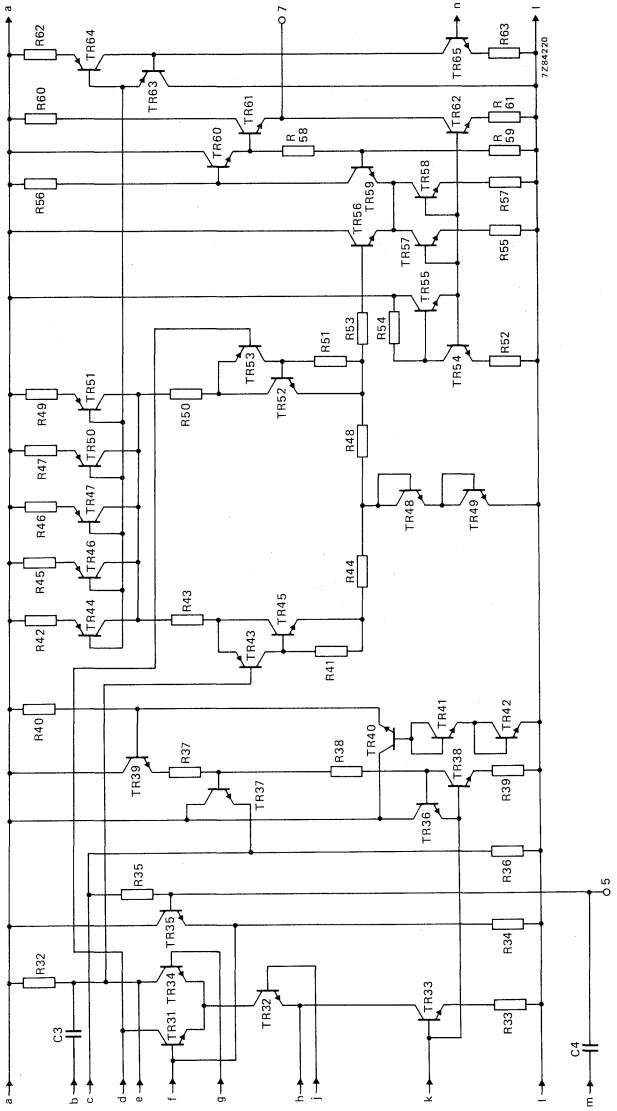

Fig. 1b Circuit diagram; continued from Fig. 1a; continued in Fig. 1c, for line 'n' see Fig. 1d.

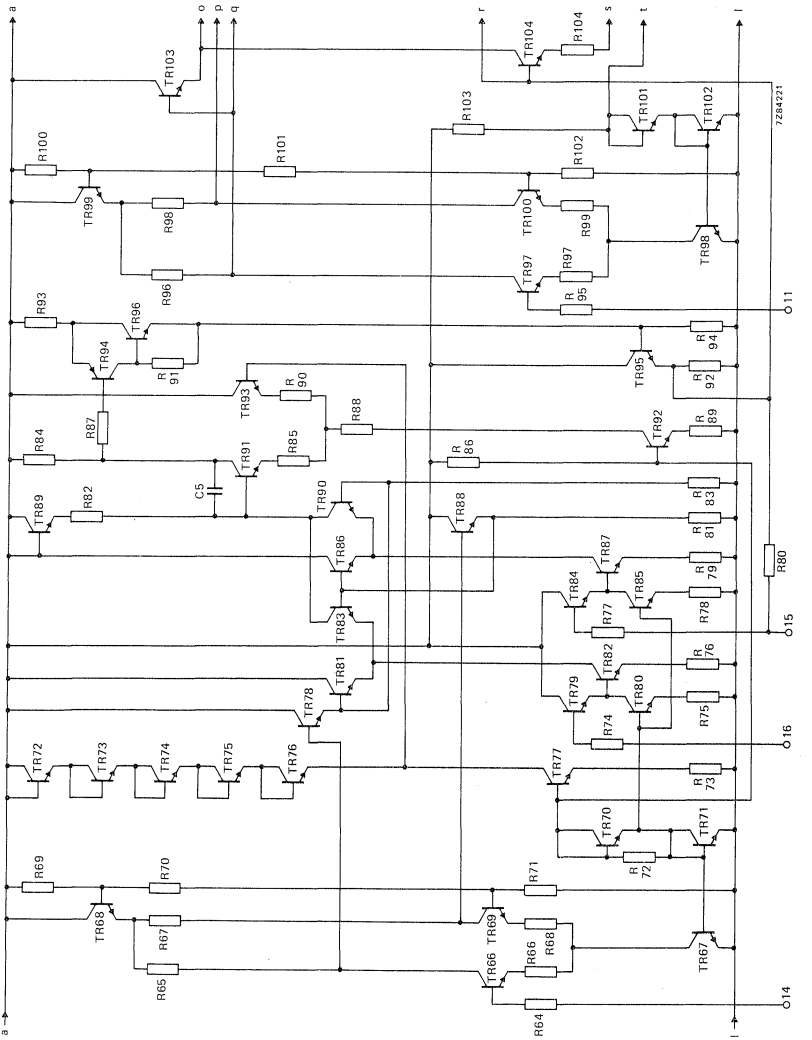

Fig. 1c Circuit diagram; continued from Fig. 1b; continued in Fig. 1d.

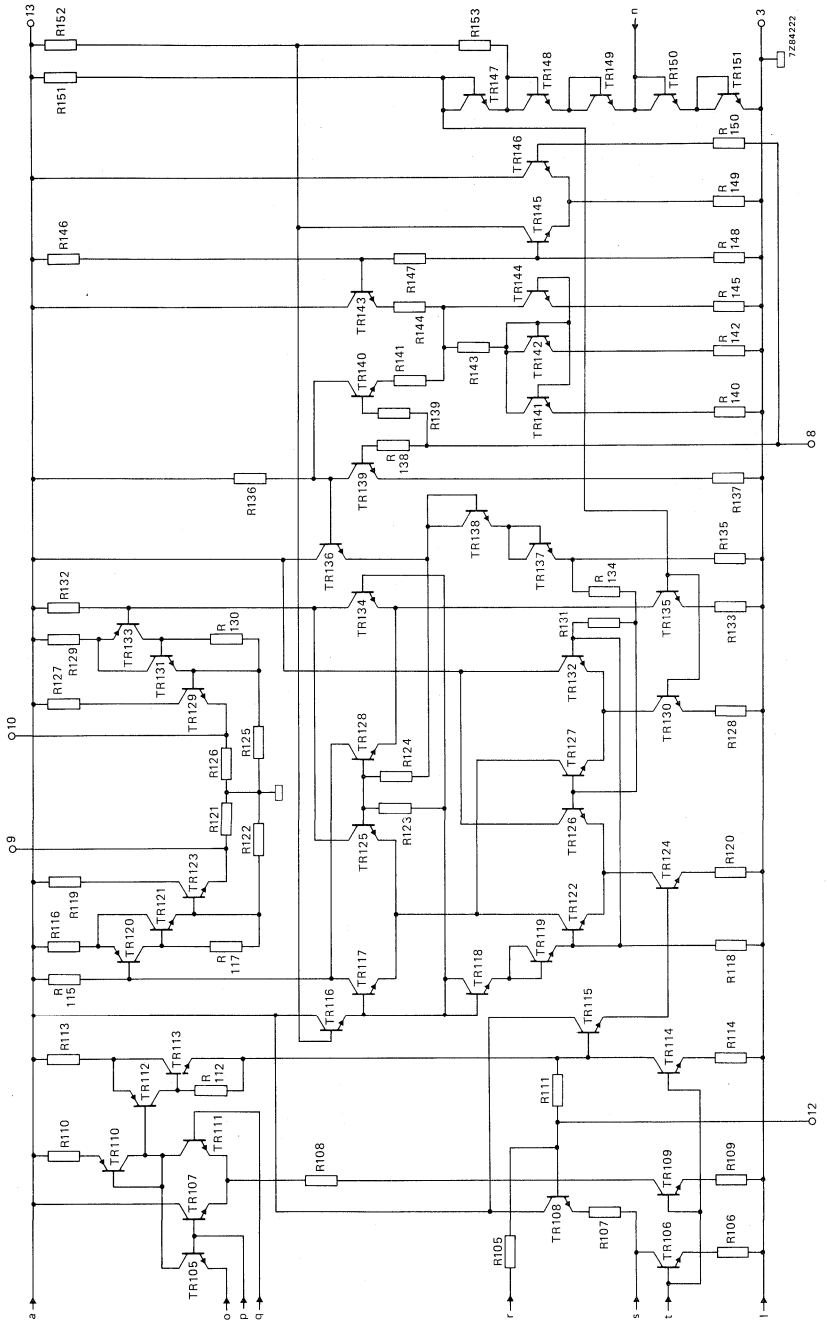

Fig. 1d Circuit diagram; continued from Fig. 1c and Fig. 1b.

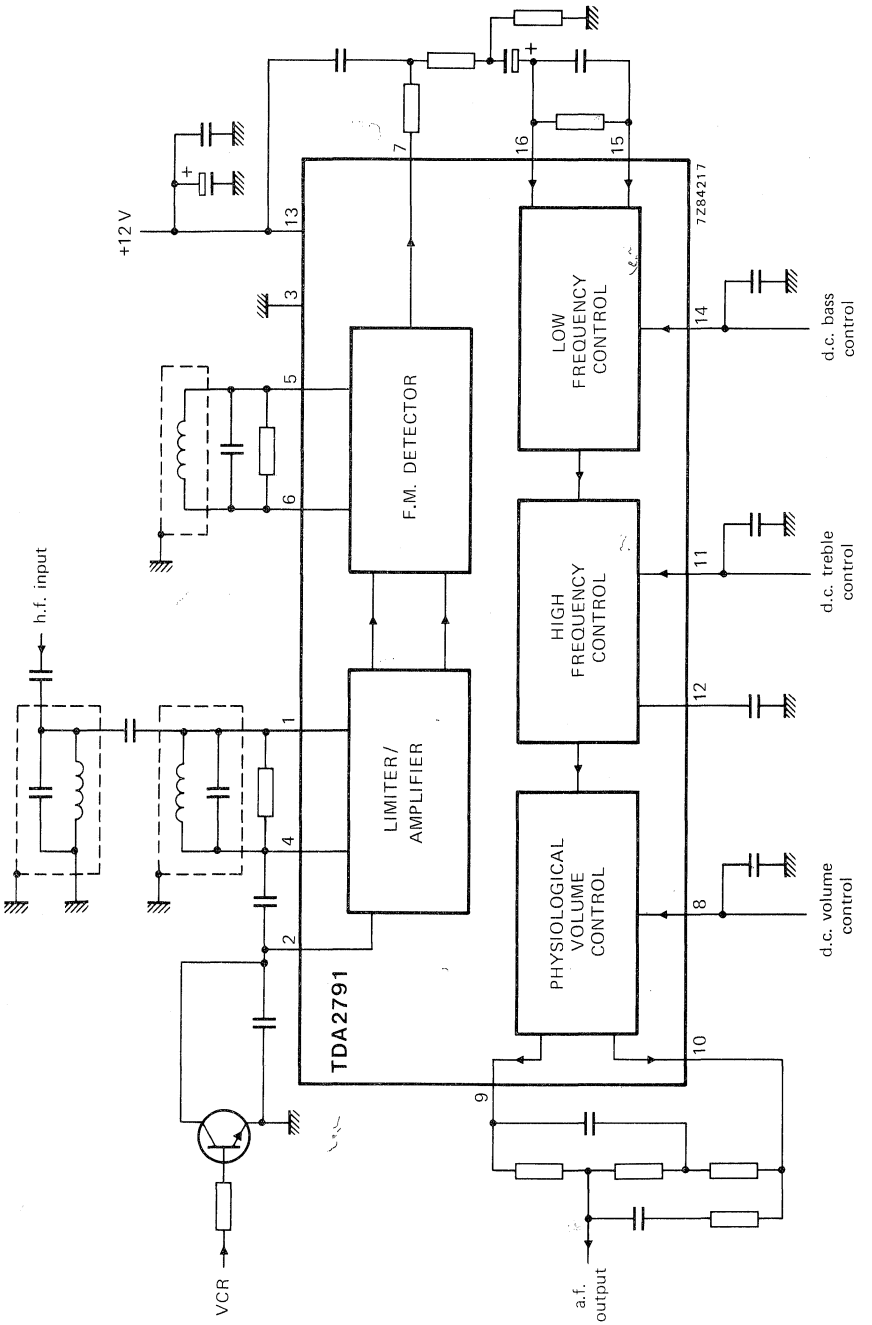

Fig. 2 Block diagram.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | |
|---|---|---|---|
| Supply voltage | $V_{13-3}$ | max. | 13,2 V |

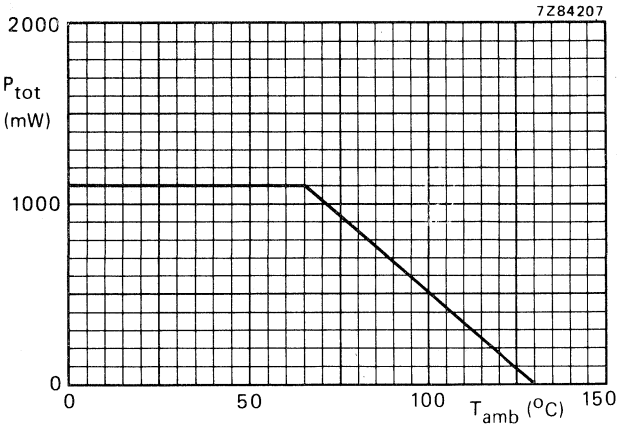

Fig. 3 Power derating curve.

| | | |
|---|---|---|
| Storage temperature | $T_{stg}$ | −25 to + 130 °C |
| Operating ambient temperature | $T_{amb}$ | −25 to + 65 °C |

## CHARACTERISTICS

Measured in Fig. 9 at $T_{amb}$ = 25 °C; $V_{13-3}$ = 12 V; f = 5,5 MHz (unless otherwise specified)

| | | | |
|---|---|---|---|
| Supply voltage range | $V_{13-3}$ | | 10,8 to 13,2 V |
| Total current drain | $I_{13}$ | | 43 to 79 mA |
| **Limiter/amplifier/demodulator** (note 1) | | | |
| Input limiting voltage at $V_{7-3}$ = −3 dB (r.m.s. value) | $V_{i(rms)}$ | typ. | 100 μV |
| Input impedance | $\lvert Z_{1-3} \rvert$ | typ. | 200 kΩ |
| A.M. rejection | | | |
| $V_i$ = 0,5 mV (note 2) | $\alpha$ | typ. | 50 dB |
| $V_i$ = 1 mV (note 2) | $\alpha$ | typ. | 50 dB |
| $V_i$ = 5 mV (note 2) | $\alpha$ | typ. | 60 dB |
| $V_i$ = 50 mV (note 2) | $\alpha$ | typ. | 55 dB |
| A.F. output voltage at pin 7 (r.m.s. value) | | | |
| $f_m$ = 1 kHz; Δf = ± 27 kHz; $V_i$ = 5 mV; $Q_{L3}$ = 12,5 | $V_{o(rms)}$ | typ. | 700 mV |

Notes

1. The quadrature reference circuit must be tuned in such a way that there is no difference in the demodulator d.c. output voltage when the limiter input is switched from signal to no signal.
2. See test set-up Fig. 4.

**CHARACTERISTICS** (continued)

| | | | |
|---|---|---|---|
| Total harmonic distortion at pin 7 | | | |
| $f_m$ = 1 kHz; $\Delta f$ = ± 27 kHz; $V_i$ = 5 mV | $d_{tot}$ | typ. | 0,35 % |
| Zero-point stability at 30 $\mu$V to 10 mV; pin 7 | | typ. | 2 kHz |
| Hum suppression; pin 7 | | typ. | 20 dB |
| Signal-to-noise ratio at pin 7 | | | |
| $f_m$ = 1 kHz; $\Delta f$ = ± 27 kHz; $V_i$ = 5 mV (note 1) | S/N | typ. | 63 dB |
| Demodulator output impedance | $\lvert Z_{7-3} \rvert$ | typ. | 25 Ω |
| **A.F. amplifier** | | | |
| Input voltage bass control circuit at pin 16 (r.m.s. value) | | | |
| at $\Delta f$ = ± 27 kHz | $V_{i(rms)}$ | typ. | 215 mV |

| Control voltages for flat frequency characteristic | $V_{11-3}$ | typ. | 3,2 V |
| | $V_{14-3}$ | typ. | 3,2 V |
| Volume control | see graph, Fig. 7 | | |
| Input current at $V_{8-3}$ = 4 V | $I_8$ | typ. | 40 $\mu$A |
| Physiological volume control (bass and treble compensation) | see graph, Fig. 8 | | |
| Voltage gain of audio part | | | |
| f = 1 kHz; $V_{11-3}$ = 3,2 V; $V_{14-3}$ = 3,2 V; $V_{8-3}$ = 4 V | $G_v$ | typ. | 4 dB |
| D.C. volume control range | | > | −75 dB |
| Weighted signal-to-noise ratio | | | |
| $V_{i(rms)}$ = 215 mV; −24 dB volume control (notes 1 and 2) | | typ. | 56 dB |
| Total harmonic distortion at output | | | |
| f = 1 kHz; $V_{i(rms)}$ = 215 mV | | | |
| (related to max. output; note 2) at: | | | |
| 0 dB | $d_{tot}$ | typ. | 0,2 % |
| −20 dB | $d_{tot}$ | typ. | 0,4 % |

Notes

1. Specified according to DIN 45405; weighted noise (peak value).
2. Measured at flat-tone control characteristics.

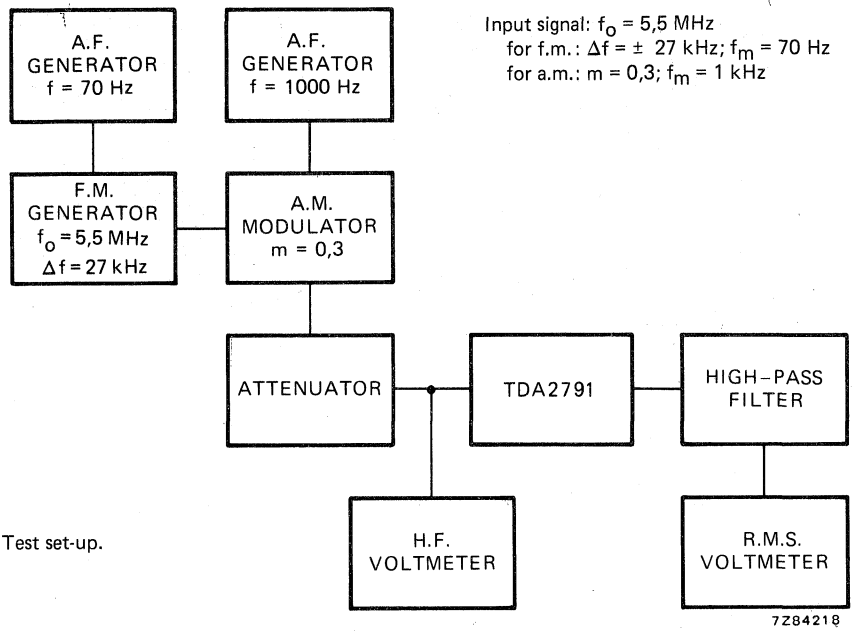

Fig. 4 Test set-up.

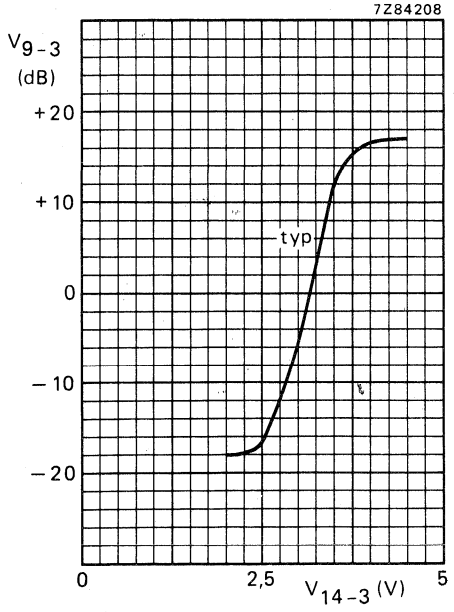

Fig. 5 Bass control curve; f = 40 Hz; $V_{11-3}$ = 3,2 V; $V_{8-3}$ = 4 V.

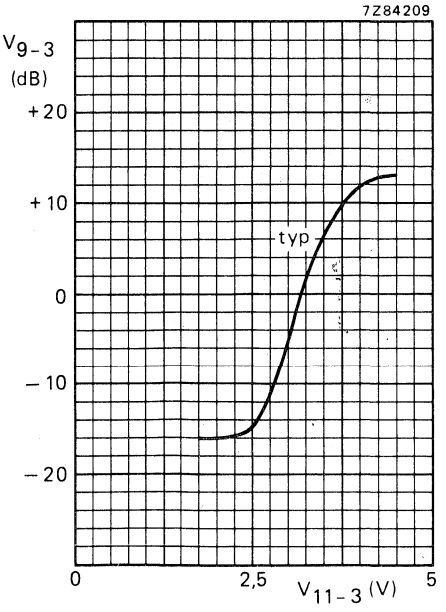

Fig. 6 Treble control curve; f = 15 kHz; $V_{14-3}$ = 3,2 V; $V_{8-3}$ = 4 V.

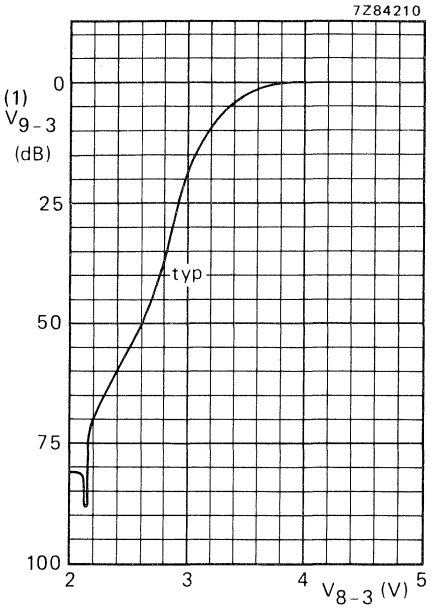

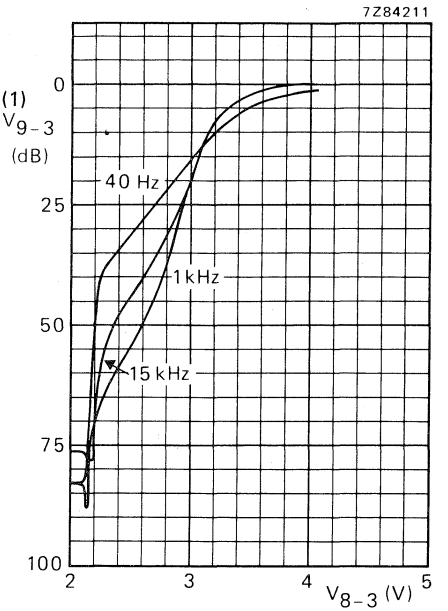

(1) This is actually the a.f. output voltage as shown in Fig. 9.

Fig. 7 Volume control curve; f = 1 kHz. $V_{14-3}$ = 3,2 V; $V_{11-3}$ = 3,2 V.

Fig. 8 Physiological volume control curves (typical values); $V_{14-3}$ = 3,2 V; $V_{11-3}$ = 3,2 V.

## APPLICATION INFORMATION

**The function is quoted against the corresponding pin number**

1. Limiter input.
2. The decoupling capacitor for the internal limiter feedback is connected to this pin.
3. Negative supply (ground).
4. Limiter output for external feedback to pin 1.

5 and 6. External tank circuit (demodulator reference signal).

7. Demodulator output.
8. D.C. volume control.

9 and 10. External circuit for physiological volume control.

11. D.C. treble control.
12. External capacitor for treble control.
13. Positive supply.
14. D.C. bass control.

15 and 16. External circuit for bass control.

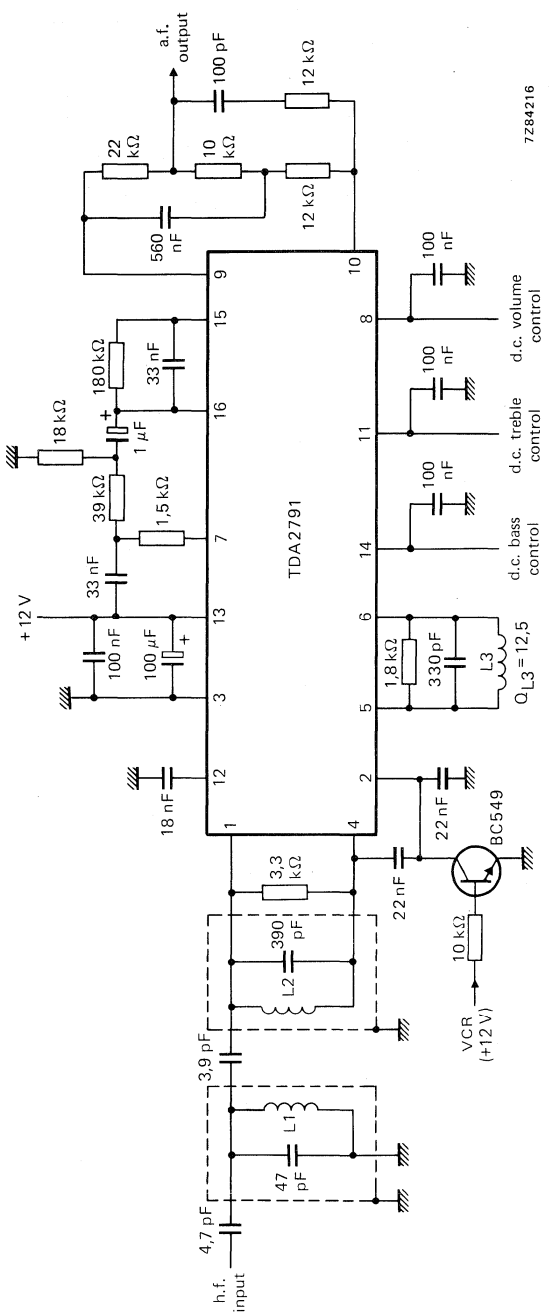

Fig. 9 Application circuit diagram.

# TV STEREO/DUAL SOUND IDENTIFICATION DECODER

The TDA2795 is a monolithic integrated circuit for stereo/dual sound in television receivers.

The circuit incorporates the following functions:

- Controlled pilot signal amplifier.
- Envelope demodulator.
- Two separate signal paths for processing the identification frequencies: operational amplifier for active filter, integral evaluation circuit with TTL compatible 'open collector' outputs.
- Stereo indicator driver.

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_S$ | typ. | 12 V |
| Supply current | $I_S$ | typ. | 8 mA |
| Nominal input voltage at f = 54,6875 kHz | $V_i$ | typ. | 10 mV |
| Input impedance | $\|Z_i\|$ | $\geqslant$ | 500 kΩ |
| Operational amplifier | | | |
| open loop voltage gain at 200 Hz | $G_o$ | $\geqslant$ | 78 dB |
| input resistance | $R_i$ | $\geqslant$ | 1 MΩ |
| output resistance | $R_o$ | $\leqslant$ | 3,5 kΩ |
| Supply voltage range | $V_S$ | | 10,8 to 13,2 V |
| Operating ambient temperature range | $T_{amb}$ | | −20 to +70 °C |

## PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102DS).

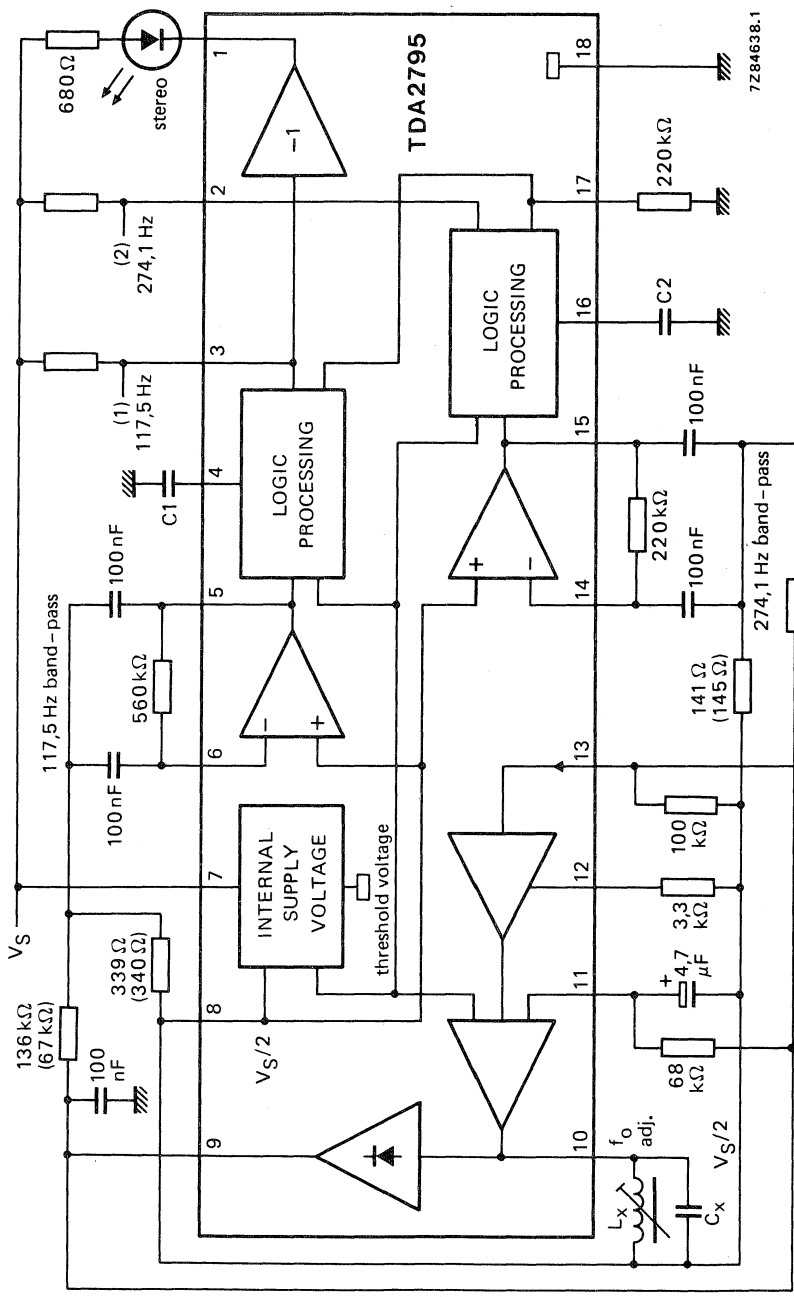

Fig. 1 Block diagram; C1 and C2 values 22 to 150 nF (dependent on switching time); values given in parenthesis are for G = 4 at 117,5/274,1 Hz; $C_x$ = 3,3 nF.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | |
|---|---|---|---|
| Supply voltage (pin 7) | $V_{7-18} = V_S$ | max. | 15 V |
| Signal input (pin 13) | $V_{13-18}$ | max. | $V_S$ V |
| | $-V_{13-18}$ | max. | 0,5 V |
| Switch outputs (pins 1, 2 and 3) | $V_{1-18}$ | max. | 18 V |
| | $I_1$ | max. | 50 mA |
| | $V_{2;3-18}$ | max. | 15 V |
| | $I_{2;3}$ | max. | 5 mA |
| | $-V_{1;2;3-18}$ | max. | 0,5 V |
| Total power dissipation | $P_{tot}$ | max. | 800 mW |
| Storage temperature range | $T_{stg}$ | −25 to | +125 °C |
| Operating ambient temperature range | $T_{amb}$ | −20 to | +70 °C |

## CHARACTERISTICS

$V_S$ = 12 V; $T_{amb}$ = 25 °C, unless otherwise specified; measured in Fig. 1, at $V_i$ = 10 mV; f = 54,6875 kHz amplitude modulated with $f_{m1}$ = 117,5 Hz or $f_{m2}$ = 274,1 Hz; $m_1 = m_2$ = 50%.

| | | | |
|---|---|---|---|
| Supply voltage range | $V_S$ | 10,8 to | 13,2 V |
| Supply current | $I_S$ | typ. | 8 mA |
| | | ⩽ | 12 mA |

**Pilot signal amplifier and envelope demodulator**

| | | | |
|---|---|---|---|
| Maximum input voltage (peak-to-peak value) | $V_{i(p-p)}$ | typ. | 2 V |
| Input impedance | $\|Z_{13-18}\|$ | ⩾ | 500 kΩ |
| Voltage gain ($V_{9-18}/V_{13-18}$) at $V_i$ = 1 mV | $G_{v9-13}$ | typ. | 42 dB |
| Start of control at $V_i$ | see Fig. 3 | | |
| Control range | $\Delta G_v$ | ⩾ | 40 dB |

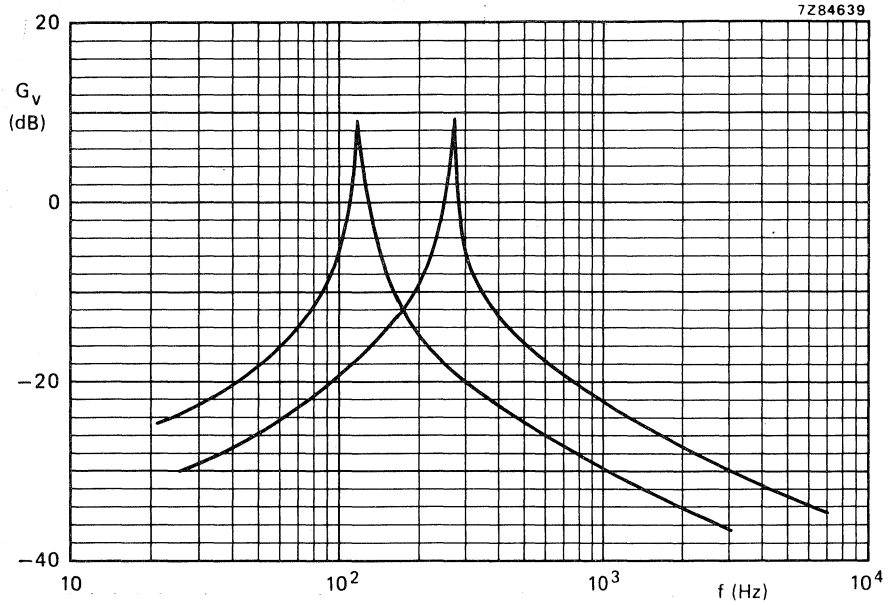

Fig. 2 Band-pass curves for 117,5 Hz and 274,1 Hz.

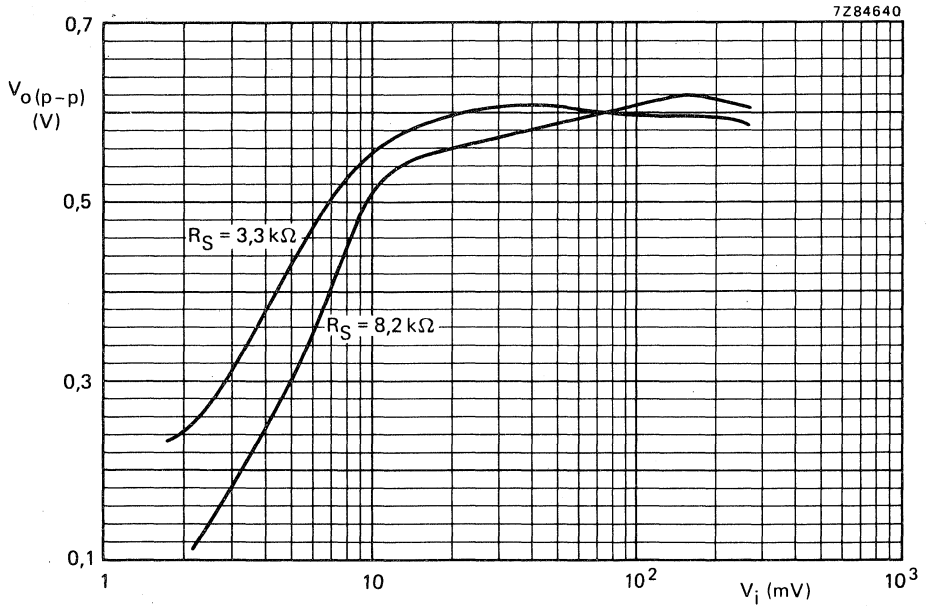

Fig. 3 Controlled output voltage as a function of the input signal ($Q_o$ = 80); pilot frequency $f_o$ = 54,6875 kHz; $R_S$ is source resistance.

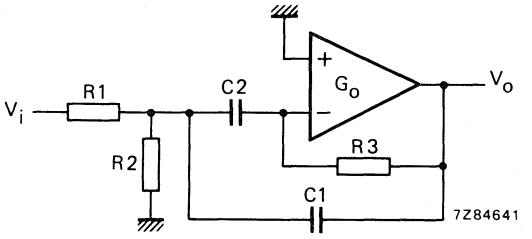
## GENERAL FILTER CALCULATIONS

1. Gain

Amplifier conditions: $G_o >> G_v$ and $G_o >> 2 \cdot Q^2$

$$G_v = - \frac{\frac{p}{R1 \cdot C1}}{p^2 + p\frac{C1 + C2}{R3 \cdot C1 \cdot C2} + \frac{R1 + R2}{R1 \cdot R2 \cdot R3 \cdot C1 \cdot C2}}, \text{ in which: } p = j\omega;\ G_v = \frac{V_o}{V_i}$$



2. Resonance frequency

$$\omega_r = \frac{1}{\sqrt{\frac{R1 \cdot R2}{R1 + R2} \cdot R3 \cdot C1 \cdot C2}}$$

3. Gain at $\omega = \omega_r$

$$-G_{vr} = \frac{C2}{C1 + C2} \cdot \frac{R3}{R1}$$

4. Quality

$$Q = \frac{\sqrt{C1 \cdot C2}}{C1 + C2} \cdot \sqrt{\frac{R3\,(R1 + R2)}{R1 \cdot R2}}$$

5. Recommended components

C1 and C2: 5% MKC (metallized polycarbonate film capacitor)
R1, R2 and R3: 2% MR (metal film resistor)

or:

C1 and C2: 5% MKT (metallized polyester film capacitor)
R1, R2 and R3: 2% CR (carbon film resistor)

# INFRARED RECEIVERS

## GENERAL DESCRIPTION

The TDA3047 and TDA3048 are monolithic integrated circuits for infrared reception with low power consumption. The difference between them is the polarity of the output signal. The ICs combine the following functions:

- Amplifier with a control range of 66 dB
- Synchronous demodulator and reference amplifier
- A.G.C. detector
- Pulse shaper
- Q-factor killing of the input selectivity, which is controlled by the a.g.c. circuit
- Input voltage limiter

## FUNCTIONAL DESCRIPTION

### Amplifier

The input signal is amplified by the gain-controlled amplifier. The output signal of the amplifier is applied to the synchronous demodulator inputs and to the reference amplifier.

### Reference amplifier

The reference amplifier amplifies and limits the input signal. The output signal of this amplifier is applied to the synchronous demodulator.

### Synchronous demodulator

The input signal and reference signal are multiplied in the synchronous demodulator. The output signal of the demodulator is applied to the input of a pulse-shaper circuit and to the input of the a.g.c. circuit.

### A.G.C. circuit

The output signal of the synchronous demodulator is applied to the a.g.c. circuit. The top level of the signal is detected by the a.g.c. detector. Noise pulses are integrated by an internal capacitor. The output signal from the a.g.c. detector is amplified and applied to the first and second stages of the amplifier and to the Q-factor killing circuit.

**A COMPLETE DATA SHEET IS AVAILABLE UPON REQUEST**

## FUNCTIONAL DESCRIPTION (continued)

### Pulse-shaper circuit

The output of the synchronous demodulator is also applied to the pulse-shaper circuit. The slicing level of the pulse shaper is lower than the slicing level of the a.g.c. detector. The output of the pulse shaper is applied to the output buffer.

### Output buffer

The output buffer gives an active high level for the *TDA3047* and, for the *TDA3048,* an active low level on the output pin. To obtain a correct RC-5 code, a hysteresis circuit protects the output against spikes.

### Q-factor killing circuit

In the narrow-band application it is necessary to decrease the Q-factor of the input selectivity particularly when large signals occur at the input. The output of the Q-factor killing circuit can be directly coupled to the input.

### Input voltage limiter

In the narrow-band applications high voltage peaks can occur on the input selectivity circuit. The input limiter limits these voltage peaks to about 0,7 V.

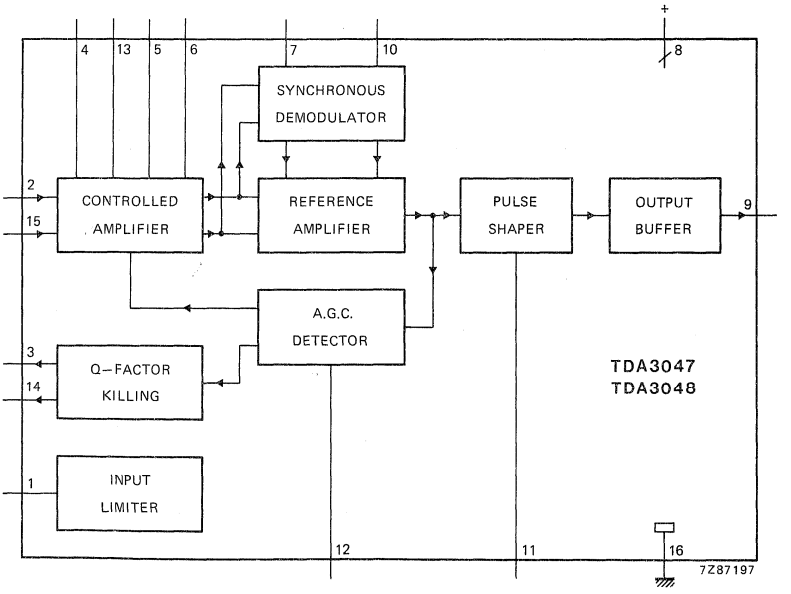


Fig. 1 Block diagram.

# VIDEO CONTROL COMBINATION

The TDA3500 is a monolithic integrated circuit performing the control functions in a PAL/SECAM decoder which additionally comprises the integrated circuits TDA3510 (PAL decoder) and/or TDA3520 (SECAM decoder).
The required input signals are: luminance and colour difference −(R-Y) and −(B-Y), while linear RGB signals can be inserted from an external source.
RGB signals are provided at the output to drive the video output stages.
The TDA3500 has the following features:

- capacitive coupling of the input signals
- linear saturation control
- (G-Y) and RGB matrix
- insertion possibility of linear RGB signals, e.g. video text, video games, picture-in-picture, camera or slide-scanner
- equal black level for inserted and matrixed signals by clamping
- 3 identical channels for the RGB signals
- linear contrast and brightness control, operating on both the inserted and matrixed RGB signals
- horizontal and vertical blanking (black and ultra-black respectively) and black-level clamping obtained via a 3-level sandcastle pulse
- differential amplifiers with feedback-inputs for stabilization of the RGB output stages
- 3 d.c. gain controls for the RGB output signals (white point adjustment)

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_{6-24}$ | typ. | 12 V |
| Supply current | $I_6$ | typ. | 100 mA |

## CHARACTERISTICS

| | | | | |
|---|---|---|---|---|
| Supply voltage range | $V_P$ | | 10,8 to 13,2 | V |

The following characteristics are measured in Fig. 2; $V_P$ = 12 V; $T_{amb}$ = 25 °C; $V_{18-24(p-p)}$ = 1,33 V; $V_{17-24(p-p)}$ = 1,05 V; $V_{15-24(p-p)}$ = 0,45 V; $V_{12,13,14-24(p-p)}$ = 1 V; unless otherwise specified

| | | | | |
|---|---|---|---|---|
| Current consumption | $I_6$ | typ. | 100 | mA |
| **Colour difference inputs** | | | | |
| –(B-Y) input signal (peak-to-peak value)* | $V_{18-24(p-p)}$ | | 1,33 | V |
| –(R-Y) input signal (peak-to-peak value)* | $V_{17-24(p-p)}$ | | 1,05 | V |
| Internal resistance of colour difference sources | | < | 200 | Ω |
| Input resistance | $R_{17,18-24}$ | > | 100 | kΩ |
| Internal d.c. voltage due to clamping | $V_{17,18-24}$ | typ. | 4,2 | V |
| Saturation control | | | | |
| control voltage range for a change of saturation from –20 dB to + 6 dB | $V_{16-24}$ | | 2,1 to 4 | V |
| control voltage for attenuation > 40 dB | $V_{16-24}$ | < | 1,8 | V |
| nominal saturation (6 dB below max.) | $V_{16-24}$ | typ. | 3 | V |
| input current | $I_{16}$ | < | 20 | μA |

* For saturated colour bar with 75% of maximum amplitude.

**CHARACTERISTICS** (continued)

**(G-Y) matrix**

| | | | |
|---|---|---|---|
| Matrixed according the equation | $V_{(G-Y)} = -0{,}51\ V_{(R-Y)} - 0{,}19\ V_{(B-Y)}$ | | |

**Luminance amplifier**

| | | | |
|---|---|---|---|
| Input signal (peak-to-peak) | $V_{15\text{-}24(p\text{-}p)}$ | | 0,45 V |
| Input resistance | $R_{15\text{-}24}$ | typ. | 12 kΩ |
| Internal d.c. voltage | $V_{15\text{-}24}$ | typ. | 2,7 V |

**RGB channels**

| | | | |
|---|---|---|---|
| Signal switching input voltage for insertion | | | |
| on level | $V_{11\text{-}24}$ | | 0,9 to 1,5 V |
| off level | $V_{11\text{-}24}$ | | −0,5 to 0,3 V |
| Input current | $I_{11}$ | | −100 to + 200 μA |
| Signal insertion | | | |
| external RGB input signal (peak-to-peak value)* | $V_{12,13,14\text{-}24(p\text{-}p)}$ | | 1 V |
| internal d.c. voltage due to clamping | $V_{12,13,14\text{-}24}$ | typ. | 3,5 V |
| input current | $I_{12,13,14}$ | < | 5 μA |
| Contrast control | | | |
| control voltage range for a change of contrast from −17 dB to + 3 dB | $V_{19\text{-}24}$ | | 2 to 4 V |
| nominal contrast (3 dB below max.) | $V_{19\text{-}24}$ | typ. | 3,4 V |
| control voltage for −6 dB | $V_{19\text{-}24}$ | typ. | 2,7 V |
| input current | $I_{19}$ | < | 10 μA |
| Brightness control | | | |
| control voltage range | $V_{20\text{-}24}$ | | 1 to 3 V |
| nominal brightness voltage | $V_{20\text{-}24}$ | | 2 V |
| input current | $I_{20}$ | < | 10 μA |
| control voltage for nominal black level which equals the inserted artificial black level | $V_{20\text{-}24}$ | typ. | 2 V |
| change of black level in the control range related to the nominal luminance signal (black-white) | | typ. | ± 50 % |
| Internal signal limiting ** | | | |
| signal limiting for nominal luminance (black to white = 100%) | | | |
| black | | typ. | −25 % |
| white | | typ. | 125 % |

* During the clamping time (see sandcastle detector Fig. 1), the inserted RGB signals are clamped to the same black level as the internal RGB signals. For proper clamping, the internal resistance of the external signal sources should be < 200 Ω.

** Brightness, contrast and saturation control in nominal position.

**White point adjustment**

| | | | | |
|---|---|---|---|---|
| A.C. voltage gain* | | | | |
| at $V_{21, 22, 23\text{-}24}$ = 6 V | | | | 100 % |
| at $V_{21, 22, 23\text{-}24}$ = 0 V | | | < | 60 % |
| at $V_{21, 22, 23\text{-}24}$ = 12 V | | | > | 140 % |
| Input resistance | | $R_{21, 22, 23\text{-}24}$ | typ. | 20 kΩ |

**Differential output amplifier**

| | | | | |
|---|---|---|---|---|
| Feedback inputs (pins 2, 5, 27) | | | | |
| d.c. voltage during clamping | | $V_{2, 5, 27\text{-}24}$ | typ. | 6 V |
| voltage difference between the feedback inputs | | $\Delta V$ | < | 80 mV |
| input resistance | | $R_{2, 5, 27\text{-}24}$ | > | 100 kΩ |
| Output amplifiers (pins 1, 4, 26) transconductance | $\frac{\Delta I_1}{\Delta V_{2\text{-}24}} = \frac{\Delta I_4}{\Delta V_{5\text{-}24}} = \frac{\Delta I_{26}}{\Delta V_{27\text{-}24}}$ | | typ. | 20 mA/V |
| integrated load resistance | | $R_{1, 4, 26\text{-}24}$ | typ. | 610 Ω |
| output current (peak value) at $V_{1, 4, 26\text{-}24}$ = 8,2 V | | $\pm I_{1, 4, 26\ m}$ | typ. | 5 mA |

**Gain data**

| | | | | |
|---|---|---|---|---|
| At nominal contrast, saturation and white point adjustment | | | | |
| Voltage gain between Y-input (pin 15) and feedback inputs (pins 2, 5, 27) | | $G_{2, 5, 27\text{-}15}$ | typ. | 10 dB |
| Frequency response (0 to 5 MHz) | | $d_{2, 5, 27\text{-}15}$ | < | 3 dB |
| Voltage gain between colour difference inputs (pins 17 and 18) and feedback inputs (pins 5 and 27) | | $G_{5\text{-}18} = G_{27\text{-}17}$ | typ. | 0 dB |
| Frequency response (0 to 2 MHz) | | $d_{5\text{-}18} = d_{27\text{-}17}$ | < | 3 dB |
| Voltage gain between signal display inputs (pins 12, 13, 14) and feedback inputs (pins 2, 5, 27) | $G_{2\text{-}13} = G_{5\text{-}12} = G_{27\text{-}14}$ | | < | 0 dB |
| Frequency response (0 to 5 MHz) | $d_{2\text{-}13} = d_{5\text{-}12} = d_{27\text{-}14}$ | | < | 3 dB |

* With input pins 21, 22 and 23 not connected an internal bias voltage of 6 V is supplied.

**CHARACTERISTICS** (continued)

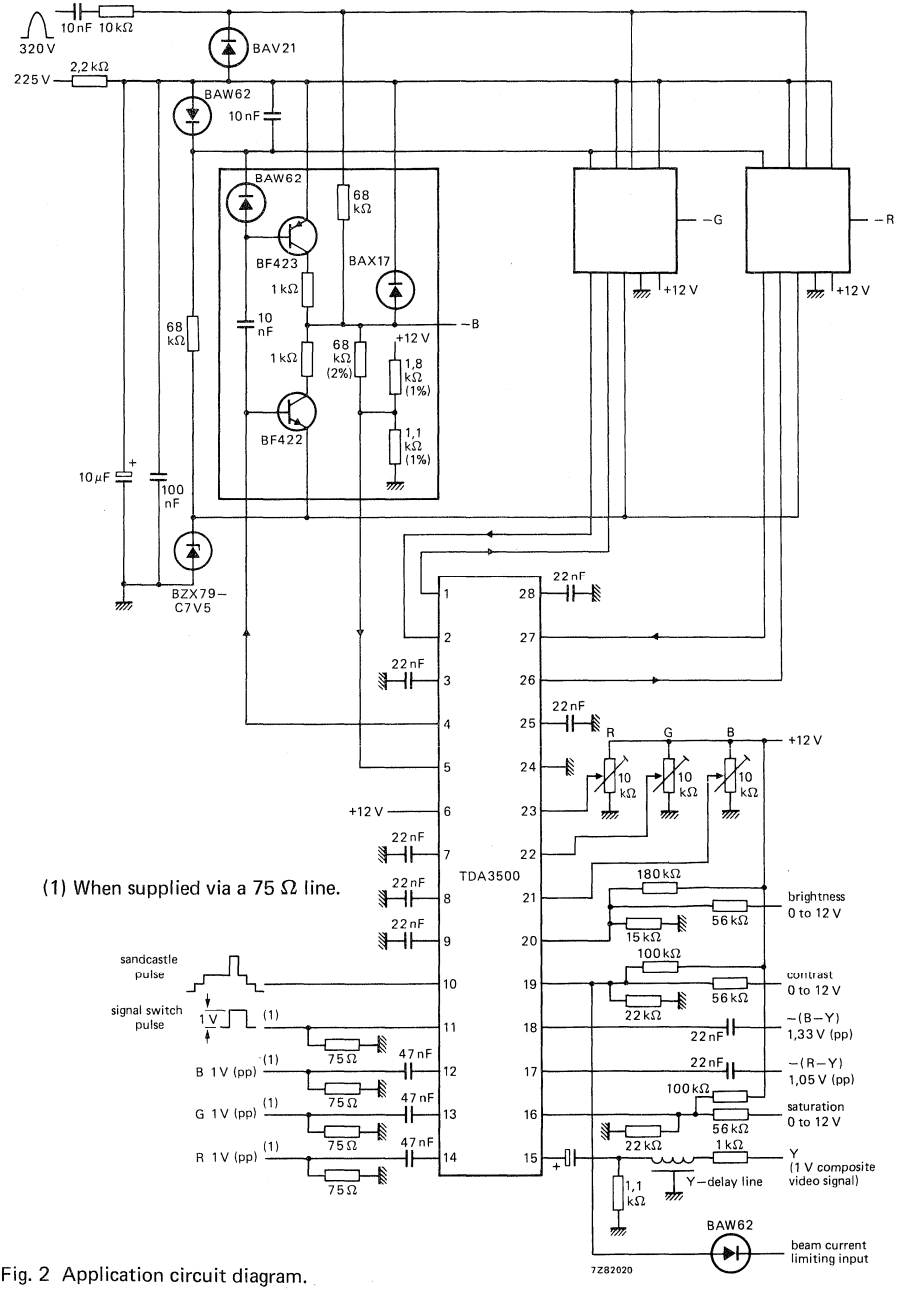
**Sandcastle detector**

There are 3 internal thresholds (proportional to $V_P$) the following amplitudes are required for separating the various pulses:

| | | | |
|---|---|---|---|
| horizontal and vertical blanking pulses (note 1) | $V_{10-24}$ | $>$ | 2 V |
| | | $<$ | 3 V |
| horizontal pulse (note 2) | $V_{10-24}$ | $>$ | 4 V |
| | | $<$ | 5 V |
| clamping pulse (note 3) | $V_{10-24}$ | $>$ | 7,5 V |
| d.c. voltage for artificial black level (note 4) (scan and flyback) | $V_{10-24}$ | $>$ | 7,5 V |
| no keying | $V_{10-24}$ | $<$ | 1 V |

Notes

1. Blanking to ultra-black (−20%).
2. Insertion of artificial black level.
3. Pulse duration $>3{,}5\ \mu s$.
4. This function will also be obtained by leaving pin 10 open.



(1) When supplied via a 75 Ω line.

Fig. 2 Application circuit diagram.

# VIDEO CONTROL COMBINATION

The TDA3501 is a monolithic integrated circuit performing the control functions in a PAL/SECAM decoder which additionally comprises the integrated circuits TDA3510 (PAL decoder) and/or TDA3520 (SECAM decoder).
The required input signals are: luminance and colour difference −(R-Y) and −(B-Y), while linear RGB signals can be inserted from an external source.
RGB signals are provided at the output to drive the video output stages.
The TDA3501 has the following features:

- capacitive coupling of the input signals
- linear saturation control
- (G-Y) and RGB matrix
- insertion possibility of linear RGB signals, e.g. video text, video games, picture-in-picture, camera or slide-scanner
- equal black level for inserted and matrixed signals by clamping
- 3 identical channels for the RGB signals
- linear contrast and brightness control, operating on both the inserted and matrixed RGB signals
- horizontal and vertical blanking (black and ultra-black respectively) and black-level clamping obtained via a 3-level sandcastle pulse
- differential amplifiers with feedback-inputs for stabilization of the RGB output stages
- 2 d.c. gain controls for the green and blue output signals (white point adjustment)
- beam current limiting possibility

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_{6\text{-}24}$ | typ. | 12 V |
| Supply current | $I_6$ | typ. | 100 mA |

# VIDEO CONTROL COMBINATION CIRCUIT

with automatic cut-off control

The TDA3505 performs the control functions in a PAL/SECAM decoder, which also comprises the TDA3510 (PAL decoder) and/or TDA3530 (SECAM decoder).

The required input signals are: luminance and colour difference −(R-Y) and −(B-Y), while linear RGB signals can be inserted from external sources. RGB output signals are delivered for driving the video output stages. This circuit provides automatic cut-off control of the picture tube. The TDA3505 has the following features:

- capacitive coupling of the colour difference and luminance input signals with black level clamping in the input stages
- linear saturation control in the colour difference stages
- (G-Y) and RGB matrix
- linear transmission of inserted signals
- equal black levels for inserted and matrixed signals
- 3 identical channels for the RGB signals
- linear contrast and brightness control, operating on both the inserted and matrixed RGB signals
- peak beam current limiting input
- horizontal and vertical blanking and clamping of the three input signals obtained via a 3-level sandcastle pulse
- d.c. gain controls for each of the RGB output signals (white point adjustment)
- emitter-follower outputs for driving the RGB output stages
- input for automatic cut-off control of the picture tube
- compensation for leakage current of the picture tube

| pin 19 | $I_{19}$ | max. | 10 | mA |
| pin 20 | $I_{20}$ | max. | 5 | mA |
| pin 25 | $-I_{25}$ | max. | 5 | mA |
| Total power dissipation | $P_{tot}$ | max. | 1,7 | W |
| Storage temperature range | $T_{stg}$ | | −25 to +125 | °C |
| Operating ambient temperature range | $T_{amb}$ | | −20 to +70 | °C |

## CHARACTERISTICS

| | | | | |
|---|---|---|---|---|
| Supply voltage range | $V_P = V_{6-24}$ | | 10,8 to 13,2 | V |

The following characteristics are measured in a circuit similar to Fig. 2; $V_P$ = 12 V; $T_{amb}$ = 25 °C; $V_{18-24(p-p)}$ = 1,33 V; $V_{17-24(p-p)}$ = 1,05 V; $V_{15-24(p-p)}$ = 0,45 V; $V_{12,13,14-24(p-p)}$ = 1 V; unless otherwise specified

| | | | | |
|---|---|---|---|---|
| Supply current | $I_6 = I_P$ | typ. | 85 | mA |
| **Colour difference inputs** | | | | |
| −(B-Y) input signal at pin 18 (peak-to-peak value) | * $V_{18-24(p-p)}$ | typ. | 1,33 | V |
| −(R-Y) input signal at pin 17 (peak-to-peak value) | * $V_{17-24(p-p)}$ | typ. | 1,05 | V |
| Input current during scanning | $I_{17, 18}$ | < | 1 | μA |
| Input resistance | $R_{17,18-24}$ | > | 100 | kΩ |
| Internal d.c. voltage due to clamping | $V_{17,18-24}$ | typ. | 4,2 | V |
| Saturation control at pin 16 | | | | |
| control voltage range for a change of saturation from −20 dB to +6 dB | $V_{16-24}$ | | 2,1 to 4,3 | V |
| control voltage for attenuation > 40 dB | $V_{16-24}$ | < | 1,8 | V |
| nominal saturation (6 dB below max.) | $V_{16-24}$ | typ. | 3,1 | V |
| input current | $I_{16}$ | < | 20 | μA |

* For saturated colour bar with 75% of maximum amplitude.

**(G-Y) matrix**

Matrixed according to the equation $V_{(G-Y)} = -0{,}51\ V_{(R-Y)} - 0{,}19\ V_{(B-Y)}$

**Luminance amplifier** (pin 15)

| | | | | |
|---|---|---|---|---|
| Composite video input signal (peak-to-peak value) | $V_{15\text{-}24(p\text{-}p)}$ | typ. | 0,45 | V |
| Input resistance | $R_{15\text{-}24}$ | > | 100 | kΩ |
| Internal d.c. voltage | $V_{15\text{-}24}$ | typ. | 2,7 | V |
| Input current during scanning | $I_{15}$ | < | 1 | μA |

**RGB channels**

| | | | | |
|---|---|---|---|---|
| Signal switching input voltage for insertion (pin 11) | | | | |
| on level | $V_{11\text{-}24}$ | | 0,9 to 3 | V |
| off level | $V_{11\text{-}24}$ | < | 0,4 | V |
| Input current | $I_{11}$ | | −100 to + 200 | μA |
| Signal insertion (pin 12: blue; pin 13: green; pin 14: red) | | | | |
| external RGB input signal (black-to-white values) | $V_{12,13,14\text{-}24(p\text{-}p)}$ | = | 1 | V |
| internal d.c. voltage due to clamping* | $V_{12,13,14\text{-}24}$ | typ. | 4,4 | V |
| input current during scanning | $I_{12,13,14}$ | < | 1 | μA |
| Contrast control (pin 19) | | | | |
| control voltage range for a change of contrast from −18 dB to + 3 dB | $V_{19\text{-}24}$ | | 2 to 4,3 | V |
| nominal contrast (3 dB below max.) | $V_{19\text{-}24}$ | typ. | 3,6 | V |
| control voltage for −6 dB | $V_{19\text{-}24}$ | typ. | 2,8 | V |
| input current at $V_{25\text{-}24} \geqslant 6$ V | $I_{19}$ | < | 2 | μA |
| Peak beam current limiting (pin 25) | | | | |
| internal d.c. bias voltage | $V_{25\text{-}24}$ | typ. | 5,5 | V |
| input resistance | $R_{25\text{-}24}$ | typ. | 10 | kΩ |
| input current at contrast control input at $V_{25\text{-}24} = 5{,}1$ V | $I_{19}$ | typ. | 17 | mA |
| Brightness control (pin 20) | | | | |
| control voltage range | $V_{20\text{-}24}$ | | 1 to 3 | V |
| input current | $-I_{20}$ | ⩽ | 10 | μA |
| control voltage for nominal black level which equals the inserted artificial black level | $V_{20\text{-}24}$ | typ. | 2 | V |
| change of black level in the control range related to the nominal luminance signal (black-white) for $\Delta V_{20\text{-}24} = 1$ V | | typ. | 50 | % |

* $V_{11\text{-}24} < 0{,}4$ V during clamping time: the black levels of the inserted RGB signals are clamped on the black levels of the internal RGB signals.
$V_{11\text{-}24} > 0{,}9$ V during clamping time: the black levels of the inserted signals are clamped on an internal d.c. voltage.
Correct clamping of the external RGB signals is only possible when they are synchronous with the sandcastle pulse.

**CHARACTERISTICS** (continued)

| | | | | |
|---|---|---|---|---|
| Internal signal limiting | | | | |
| signal limiting for nominal luminance (black to white = 100%) | | | | |
| black | | typ. | −25 | % |
| white | | typ. | 120 | % |
| **White point adjustment** (pin 21: blue; pin 22: green; pin 23: red) | | | | |
| A.C. voltage gain (note 1) | | | | |
| at $V_{21,22,23\text{-}24}$ = 5,5 V | | typ. | 100 | % |
| at $V_{21,22,23\text{-}24}$ = 0 V | | = | 60 | % |
| at $V_{21,22,23\text{-}24}$ = 12 V | | = | 140 | % |
| Input resistance | $R_{21,22,23\text{-}24}$ | typ. | 20 | kΩ |
| **Emitter-follower outputs** (pin 1: red; pin 3: green; pin 5: blue) | | | | |
| At nominal contrast, saturation and white point adjustment | | | | |
| Output voltage (black-to-white signal, positive) | $V_{1,3,5\text{-}24(p\text{-}p)}$ | typ. | 2 | V |
| Black level without automatic cut-off control ($V_{28,2,4\text{-}24}$ = 10 V) | $V_{1,3,5\text{-}24}$ | typ. | 6,7 | V |
| Internal current source | $I_{source}$ | typ. | 3 | mA |
| Cut-off current control range | $-\Delta V_{1,3,5\text{-}24}$ | typ. | 4,6 | V |
| **Automatic cut-off control** (pin 26) | | | | |
| The measurement occurs in the following lines after start of the vertical blanking pulse: line 21: measurement of leakage current; line 22: measurement of red cut-off current; line 23: measurement of green cut-off current; line 24: measurement of blue cut-off current | | | | |
| Input voltage range | $V_{26\text{-}24}$ | | 0 to + 6,5 | V |
| Voltage difference between cut-off current measurement (note 2) and leakage current measurement (note 3) | $\Delta V_{26\text{-}24}$ | typ. | 0,7 | V |
| Input 26 switches to ground during horizontal flyback | | | | |

**Notes**

1. With input pins 21, 22 and 23 not connected an internal bias voltage of 5,5 V is supplied.
2. Black level of measured channel is nominal; the other two channels are blanked to ultra-black.
3. All three channels blanked to ultra-black.
   The cut-off control cycle occurs when the vertical blanking part of the sandcastle pulse contains more than 3 line pulses.
   The internal signal blanking continues until the end of the last measurement line.
   The vertical blanking pulse is not allowed to contain more than 34 line pulses otherwise another control cycle begins.

**Gain data**

At nominal contrast, saturation and white point adjustment

| | | | |
|---|---|---|---|
| Voltage gain with respect to Y-input (pin 15) | $G_{1,3,5\text{-}15}$ | typ. | 16 dB |
| Frequency response (0 to 5 MHz) | $d_{1,3,5\text{-}15}$ | $\leqslant$ | 3 dB |
| Voltage gain with respect to colour difference inputs (pins 17 and 18) | $G_{5\text{-}18} = G_{1\text{-}17}$ | typ. | 6 dB |
| Frequency response (0 to 2 MHz) | $d_{5\text{-}18} = d_{1\text{-}17}$ | $\leqslant$ | 3 dB |
| Voltage gain of inserted signals | $G_{1\text{-}14} = G_{3\text{-}13} = G_{5\text{-}12}$ | typ. | 6 dB |
| Frequency response (0 to 6 MHz) | $d_{1\text{-}14} = d_{3\text{-}13} = d_{5\text{-}12}$ | $\leqslant$ | 3 dB |

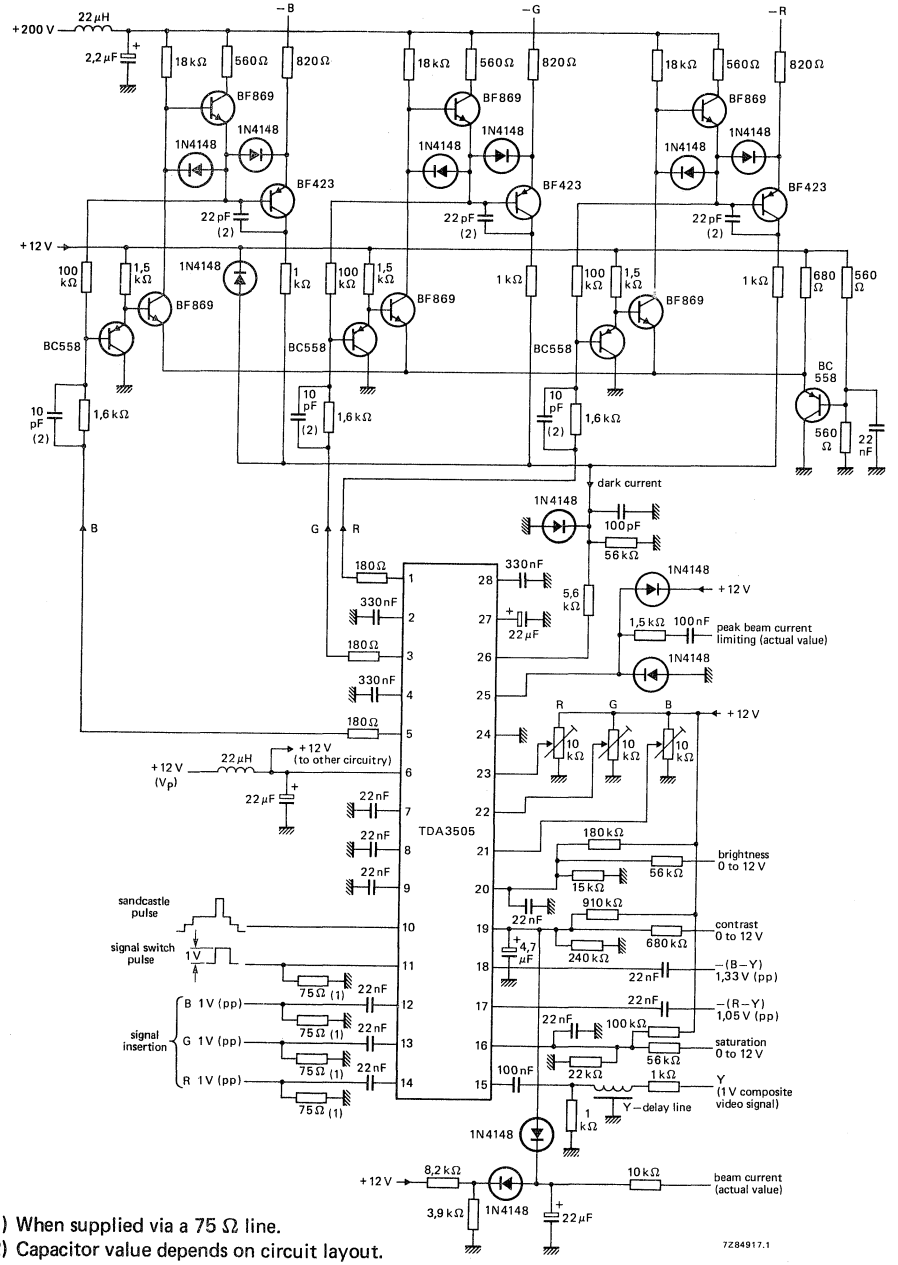
**Sandcastle detector** (pin 10)

There are 3 internal thresholds (proportional to $V_P$); note 1. The following amplitudes are required for separating the various pulses:

| | | | |
|---|---|---|---|
| horizontal and vertical blanking pulses (note 2) | $V_{10\text{-}24}$ | $>$<br>$<$ | 2 V<br>3 V |
| horizontal pulse | $V_{10\text{-}24}$ | $>$<br>$<$ | 4 V<br>5 V |
| clamping pulse (note 3) | $V_{10\text{-}24}$ | $>$ | 7,5 V |
| d.c. voltage for artificial black level (scan and flyback) | $V_{10\text{-}24}$ | $>$ | 7,5 V |
| no keying | $V_{10\text{-}24}$ | $<$ | 1 V |
| input current | $-I_{10}$ | $<$ | 110 $\mu$A |

**Notes**

1. The thresholds are for
   horizontal and vertical blanking: $V_{10\text{-}24} = 1{,}5$ V
   horizontal pulse: $V_{10\text{-}24} = 3{,}5$ V
   clamping pulse: $V_{10\text{-}24} = 7{,}0$ V
2. Blanking to ultra-black (−25%).
3. Pulse duration $\geqslant 3{,}5$ $\mu$s.



(1) When supplied via a 75 Ω line.
(2) Capacitor value depends on circuit layout.

Fig. 2 Typical application circuit diagram using the TDA3505.

# PAL DECODER

The TDA3510 is a monolithic integrated colour decoder for the PAL standard.
The circuit incorporates the following functions:

**Chrominance part**

- Controlled chrominance amplifier
- Chrominance output stage with automatic standard switch for driving the 64 $\mu$s delay line
- Blanking circuit for the colour burst signal

**Reference voltage and control voltage part**

- 8,8 MHz reference oscillator with divider stage to obtain both the 4,4 MHz reference signals
- Gated phase comparison for an optimum noise ratio
- Circuit for obtaining the chrominance control voltage and a reference voltage
- Circuit for generating the colour killer signal and the identification signal

**Demodulator part**

- Two synchronous demodulators for the (B-Y) and (R-Y) signals
- PAL flip-flop and PAL switch
- Flyback blanking incorporated in the synchronous demodulators
- (R-Y) and (B-Y) signal output stages, which are controlled by the colour killer with switchable d.c. voltage levels

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_P = V_{9-24}$ | typ. | 12 V |
| Supply current | $I_9$ | typ. | 58 mA |
| Chrominance input signal (peak-to-peak value) | $V_{1-24(p-p)}$ | | 10 to 200 mV |
| Sandcastle pulse | | | |
| burst gating level | $V_{20-24}$ | > | 7,5 V |
| blanking level | $V_{20-24}$ | > | 1,8 V |
| Colour difference output signals | | | |
| peak-to-peak values | | | |
| —(R-Y) signal | $V_{11-24(p-p)}$ | typ. | 1,05 V ± 3 dB |
| —(B-Y) signal | $V_{10-24(p-p)}$ | typ. | 1,33 V ± 3 dB |

## PACKAGE OUTLINE

24-lead DIL; plastic (SOT-101A).

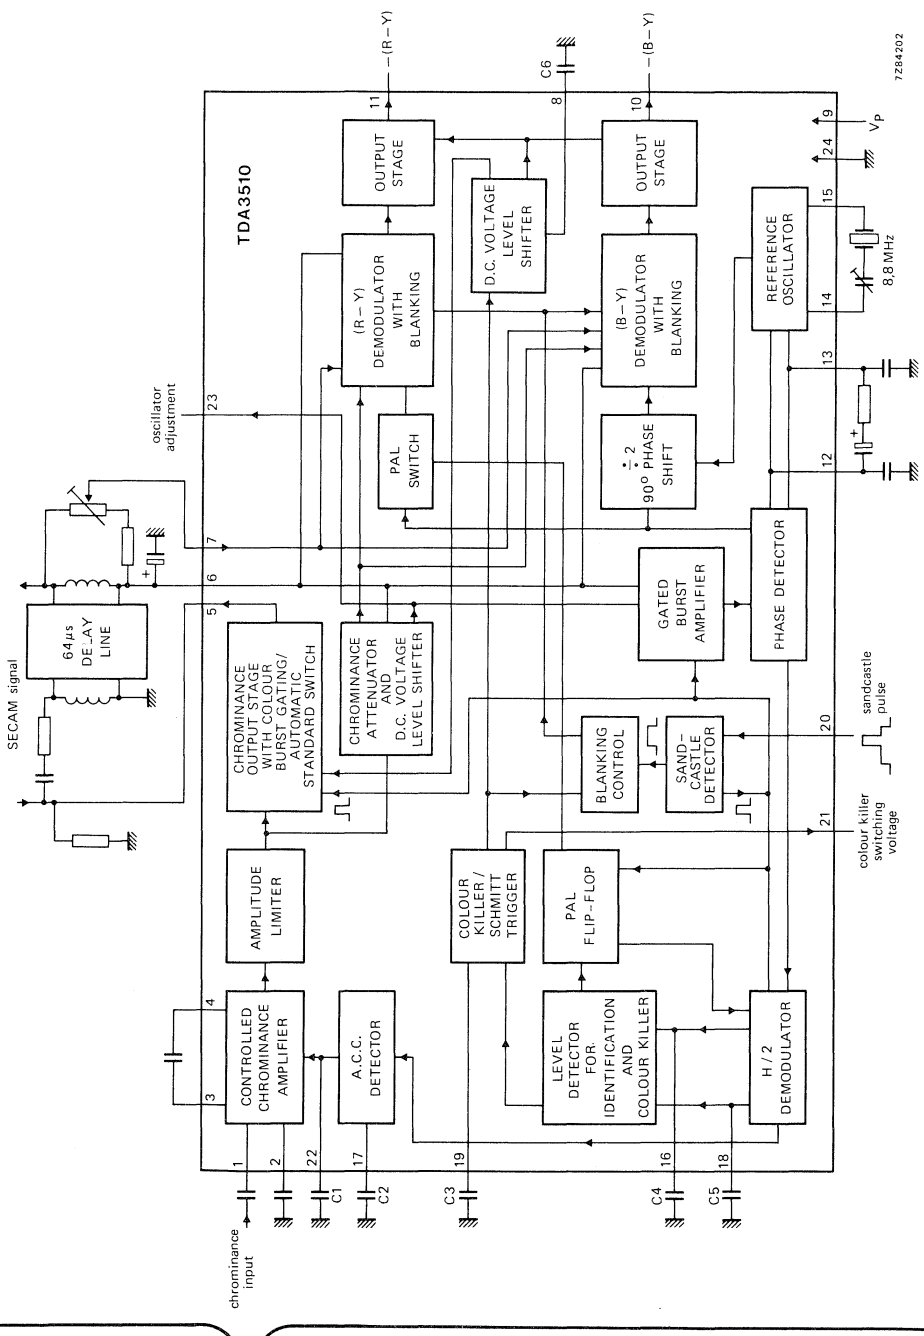


Fig. 1 Block diagram; for external capacitors see next page.

External capacitors in Fig. 1

| capacitor | pins | |
|---|---|---|
| C1 | 22 – 24 | filter capacitor for control voltage |
| C2 | 17 – 24 | time constant for control voltage |
| C3 | 19 – 24 | time constant for colour ON |
| C4 | 16 – 24 | identification signal and colour OFF time constant |
| C5 | 18 – 24 | load capacitor for the reference voltage |
| C6 | 8 – 24 | time constant for the rise or fall time of the d.c. voltage level of the colour difference signal |

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | | |
|---|---|---|---|---|
| Supply voltage range | $V_P = V_{9-24}$ | 10,8 to 13,2 | | V |
| Currents | | | | |
| at pin 5 | $-I_5$ | max. | 10 | mA |
| at pins 10 and 11 | $-I_{10}, -I_{11}$ | max. | 1 | mA |
| at pin 21 | $I_{21}$ | max. | 10 | mA |
| Total power dissipation | $P_{tot}$ | max. | 1,1 | W |
| Storage temperature | $T_{stg}$ | −20 to + 125 | | °C |
| Operating ambient temperature | $T_{amb}$ | −20 to + 65 | | °C |

## CHARACTERISTICS

$V_P$ = 12 V; $T_{amb}$ = 25 °C

| | | | | |
|---|---|---|---|---|
| Supply current | $I_9$ | typ. | 58 | mA |
| **Chrominance part** | | | | |
| Chrominance signal is asymmetric (pins 1, 2) | | | | |
| Input voltage range (peak-to-peak value) | $V_{1-24(p-p)}$ | 10 to 200 | | mV |
| Nominal input voltage (peak-to-peak value) with 75% colour bar signal | $V_{1-24(p-p)}$ | typ. | 100 | mV |
| Input impedance | $\lvert Z_i \rvert$ | typ. | 3,3 | kΩ |
| Colour ON | | | | |
| chrominance output voltage (peak-to-peak value) with 75% colour bar signal | $V_{5-24(p-p)}$ | typ. | 2 | V |
| d.c. voltage at chrominance output | $V_{5-24}$ | typ. | 8 | V |
| Colour OFF | | | | |
| chrominance suppression | | > | 56 | dB |
| d.c. voltage at chrominance output | $V_{5-24}$ | typ. | 4 | V |

**CHARACTERISTICS** (continued)

**Reference voltage and control voltage part**

| | | | |
|---|---|---|---|
| Oscillator (8,8 MHz) | | | |
| Gain | $G_{14\text{-}15}$ | > | 8 dB |
| Input resistance | $R_{15\text{-}24}$ | typ. | 270 Ω |
| Output resistance | $R_{14\text{-}24}$ | < | 200 Ω |
| Catching range | $\Delta f$ | typ. | 500 Hz |
| Sandcastle pulse (pin 20) | | | |
| Burst gating level | $V_{20\text{-}24}$ | > | 7,5 V |
| Blanking level | $V_{20\text{-}24}$ | > | 1,8 V |
| Colour switching voltage (open collector) | | | |
| Maximum output current | $I_{21max}$ | typ. | 10 mA |
| Colour ON | $V_{21\text{-}24}$ | typ. | $V_P$ |
| Colour OFF | $V_{21\text{-}24}$ | < | 0,5 V |
| Reference output voltage | $V_{18\text{-}24}$ | typ. | 5,5 V |
| Colour killer voltages | | | |
| colour OFF at | $V_{18\text{-}16}$ | typ. | 0 V |
| or at | $V_{19\text{-}24}$ | > | 6 V |
| colour ON at | $V_{18\text{-}16}$ | typ. | 1,5 V |
| or at | $V_{19\text{-}24}$ | < | 4 V |
| Colour unkill delay; depends on C3 | $t_d$ | typ. | 20 ms/μF |
| Identification ON | $V_{16\text{-}18}$ | < | 200 mV |

**Demodulator part**

| | | | |
|---|---|---|---|
| Delayed chrominance input signal (peak-to-peak value) with 75% colour bar signal | $V_{7\text{-}24(p\text{-}p)}$ | typ. | 250 mV |
| Colour difference output signals (peak-to-peak values) | | | |
| −(R-Y) signal | $V_{11\text{-}24(p\text{-}p)}$ | typ. | 1,05 V ± 3 dB |
| −(B-Y) signal | $V_{10\text{-}24(p\text{-}p)}$ | typ. | 1,33 V ± 3 dB |
| Ratio of colour difference output signals (R-Y)/(B-Y) | $\frac{V_{11\text{-}24}}{V_{10\text{-}24}}$ | typ. | 0,79 ± 10 % |
| D.C. voltage at colour difference outputs | | | |
| at colour ON | $V_{10;\,11\text{-}24}$ | typ. | 8 V |
| at colour OFF | $V_{10;\,11\text{-}24}$ | typ. | 4 V |
| Signal attenuation at colour OFF | | > | 60 dB |
| Residual 4,4 MHz signal | $V_{10;\,11\text{-}24}$ | < | 20 mV |
| H/2 ripple at (R-Y) output (peak-to-peak value) without input signal | $V_{11\text{-}24(p\text{-}p)}$ | < | 10 mV |

# SECAM DECODER

The TDA3520 is a monolithic integrated circuit which contains all the functions necessary for decoding the SECAM signal from the composite video and which offers the colour difference signals − (R−Y) and − (B−Y) to the video circuits TDA3500 or TDA 3501 in order to complete the SECAM decoding system.

By simply adding the PAL decoder circuit TDA3510, the SECAM system can be extended to receive SECAM/PAL signals as well. The 64 $\mu$s delay line is used in common and all system switching functions are performed automatically.

One of the main features of the TDA3520 is that only the clock filter has to be adjusted; all the other adjustments can be left out due to usage of PLL−type FM demodulators, the system of horizontal identification and the gain controlled chrominance amplifier.

The TDA3520 incorporates the following main functions:

- gain controlled chrominance amplifier
- delay line amplifier (fixed gain of nom. 8), controlled by the colour killer (black−white/colour and SECAM/PAL commutation)
- limiter stages for direct signals and delayed signals
- permutator
- horizontal identification system; in PAL/SECAM receivers automatic standard switching is obtained if only a fixed phase shift circuit is added
- internal clamping generator and identification (1 $\mu$s) triggered either by the sandcastle pulse or by the video signal via the internal sync separator together with the flyback pulse
- (B−Y) and (R−Y) demodulators (without control) with burst level memory by means of an external capacitor
- circuits for horizontal and vertical blanking, during which de-emphasizing and restoring of black levels in the (R−Y) and (B−Y) signals occurs
- low-impedance output stages controlled by the colour killer (black/white/colour and SECAM/PAL switches)
- possibility for vertical identification by adding a simple external circuit
- colour killer output with H/2 information is available to control the luminance suppression filter from line to line.

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage (pins 5, 14, 15) | $V_P$ | typ. | 12 V |
| Supply current ($I_5 + I_{14} + I_{15}$) | $I_P$ | typ. | 90 mA |
| Input voltage range (peak-to-peak value) | $V_{27\text{-}28\ (p\text{-}p)}$ | 10 to | 200 mV |
| A.G.C. control range | | > | 26 dB |
| Colour killer output current (SECAM not identified) | $I_8$ | < | 5 mA |
| PLL demodulator catching range | $\Delta f$ | > | 1 MHz |
| −(R−Y) output voltage (peak-to-peak value) | $V_{16\text{-}24\ (p\text{-}p)}$ | typ. | 1,05 V |
| −(B−Y) output voltage (peak-to-peak value) | $V_{13\text{-}24\ (p\text{-}p)}$ | typ. | 1,33 V |

## PACKAGE OUTLINE

28-lead DIL; plastic (SOT-117).

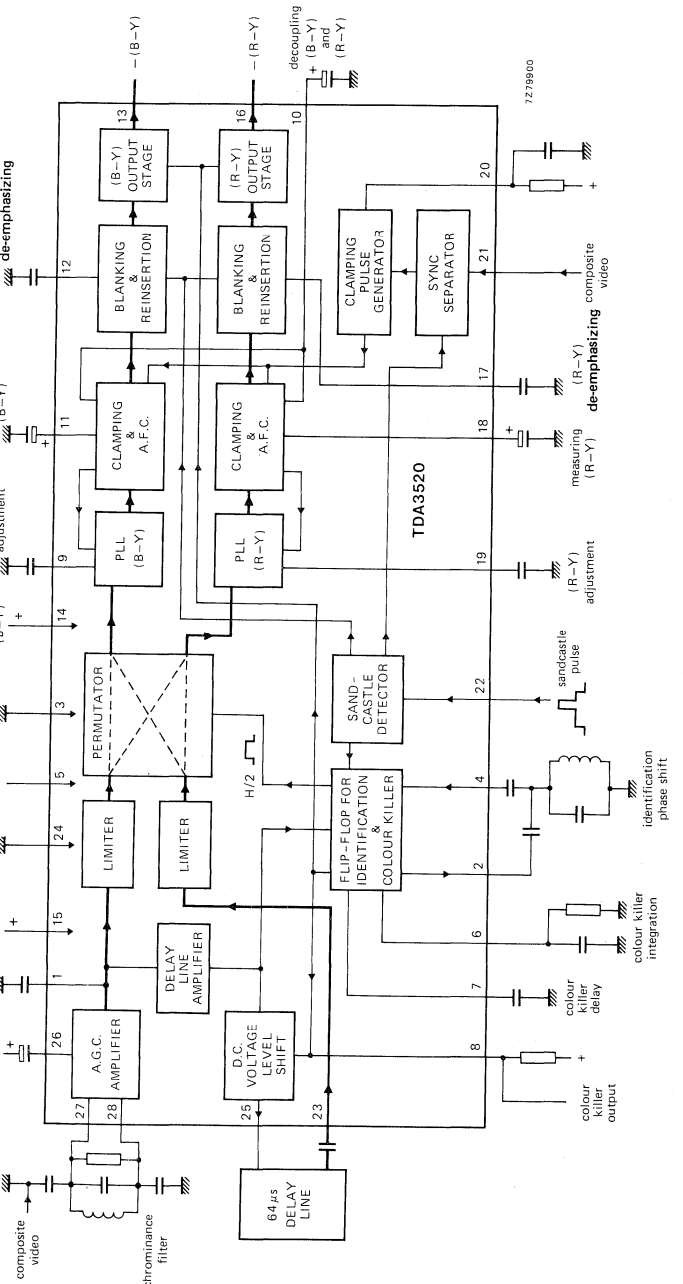

Fig. 1 Block diagram.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | | |
|---|---|---|---|---|
| Supply voltage (pins 5 and 14) | $V_P = V_{5,14,15-3,24}$ | max. | 13,2 | V |
| Total power dissipation | $P_{tot}$ | max. | 1,7 | W |
| Storage temperature | $T_{stg}$ | | −25 to + 125 | °C |
| Operating ambient temperature | $T_{amb}$ | | −20 to + 70 | °C |

## CHARACTERISTICS

| | | | | |
|---|---|---|---|---|
| Supply voltage range (pins 5,14 and 15) | $V_P$ | | 10,8 to 13,2 | V |
| The following characteristics are measured in Fig. 2; $V_P$ = 12 V; $T_{amb}$ = 25 °C | | | | |
| Supply current | $I_P = I_5 + I_{14} + I_{15}$ | typ. | 90 | mA |
| **Chrominance amplifier** (pins 27 and 28) | | | | |
| Input voltage range (peak-to-peak value) | $V_{27-28\ (p-p)}$ | | 10 to 200 | mV |
| Input resistance | $R_{27-28}$ | > | 50 | kΩ |
| A.G.C. control range at 3 dB output signal variation at pin 25 | | > | 26 | dB |
| **Delay line amplifier** (pin 25) | | | | |
| Output voltage (peak-to-peak value) | $V_{25-24\ (p-p)}$ | typ. | 2,6 | V |
| Output impedance | $\lvert Z_{25-24} \rvert$ | < | 100 | Ω |
| D.C. output voltage | | | | |
| SECAM identified | $V_{25-24}$ | typ. | 8 | V |
| SECAM not identified | $V_{25-24}$ | typ. | 4,5 | V |
| Attenuation (SECAM not identified) | | typ. | 60 | dB |
| **Delay line input** (pin 23) | | | | |
| Input voltage (peak-to-peak value) * | $V_{23-24\ (p-p)}$ | typ. | 325 | mV |
| Input resistance | $R_{23-24}$ | > | 3 | kΩ |
| **Identification circuit** (pins 2 and 4) | | | | |
| Output voltage (phase-shift circuit input) (peak-to-peak value) | $V_{2-24\ (p-p)}$ | typ. | 2,8 | V |
| Output resistance | $R_{2-24}$ | < | 200 | Ω |
| Input voltage (phase-shift circuit output) (peak-to-peak value) | $V_{4-24\ (p-p)}$ | typ. | 300 | mV |
| Input resistance | $R_{4-24}$ | > | 1 | kΩ |

* Corresponds with an attenuation of nom. 18 dB at pins 23 and 25 (delay line).

**CHARACTERISTICS** (continued)

| | | | |
|---|---|---|---|
| **Colour killer output** (pin 8; open collector) | | | |
| Saturation voltage (SECAM not identified) | $V_{8\text{-}24}$ | typ. | 300 mV |
| Output current (SECAM not identified) | $-I_8$ | < | 5 mA |
| Output current (SECAM identified; blue line) | $-I_8$ | typ. | 0 mA |
| Output current (SECAM identified; red line) | $-I_8$ | typ. | 0,5 mA |
| **Sync separator** (pin 21) | | | |
| Slicing level * | $V_{21\text{-}24}$ | typ. | 2,5 V |
| Video input voltage (peak-to-peak value) ** | $V_{21\text{-}24\ (p\text{-}p)}$ | typ. | 1 V |
| **Sandcastle input (or flyback pulse)** (pin 22) | | | |
| Blanking level for driving the sync separator | $V_{22\text{-}24}$ | | 1,0 to 2,0 V * |
| Flip-flop slicing level | $V_{22\text{-}24}$ | | 3,0 to 4,0 V * |
| Maximum input current | $I_{22\ max}$ | < | 100 μA |
| **Demodulators** (pins 9 and 19) | | | |
| PLL demodulator catching range | $\Delta f$ | > | 1 MHz |
| Equivalent error at the reinserted reference levels | $\Delta f_o$ | < | 4 kHz |
| **Colour difference output stages** (pins 13 and 16) | | | |
| Output voltages (peak-to-peak values) | | | |
| −(R−Y) signal | $V_{16\text{-}24\ (p\text{-}p)}$ | typ. | 1,05 V |
| −(B−Y) signal | $V_{13\text{-}24\ (p\text{-}p)}$ | typ. | 1,33 V |
| D.C. output voltage | $V_{13,16\text{-}24}$ | typ. | 6 V * |
| Output resistance | $R_{13,16\text{-}24}$ | < | 100 Ω |
| Attenuation (SECAM not identified) | | typ. | 62 dB |
| H/Z ripple at the outputs (peak-to-peak value) | $V_{13,16\text{-}24\ (p\text{-}p)}$ | < | 10 mV |

*Proportional to the supply voltage.

** Capacitive coupling; see Fig. 2.

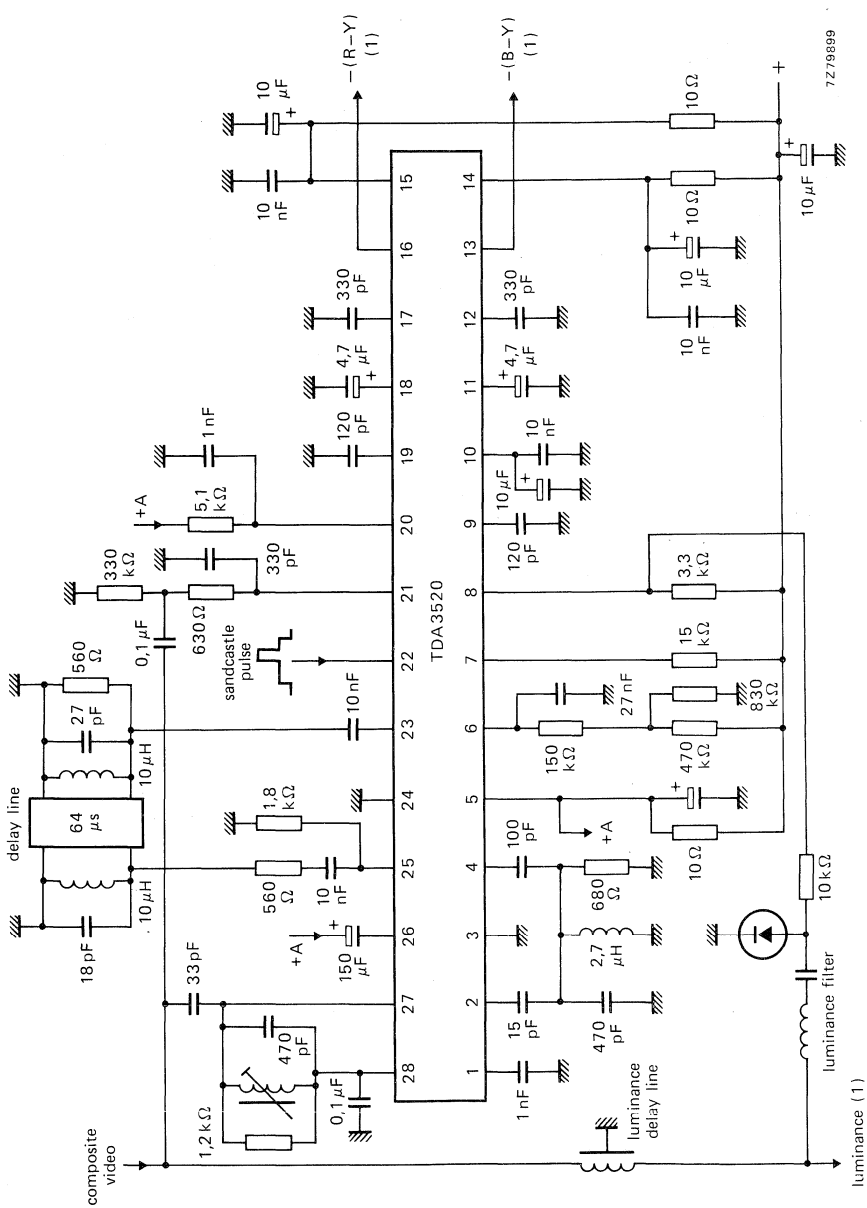

Fig. 2 Application diagram.

(1) To TDA3500 or TDA3501

# TELEVISION I.F. AMPLIFIERS AND DEMODULATORS

The TDA3540 and TDA3541 are i.f. amplifier and demodulator circuits for colour and black and white television receivers, using n-p-n tuners for the TDA3540 and p-n-p tuners for the TDA3541.

They incorporate the following functions:

- gain-controlled wide-band amplifier, providing complete i.f. gain
- synchronous demodulator with excellent intermodulation
- white spot inverter
- video preamplifier with noise protection
- a.f.c. circuit with a.f.c. on/off switch
- a.g.c. circuit with noise gating
- tuner a.g.c. output (n-p-n tuners: **TDA3540**; p-n-p tuners: **TDA3541**)
- external video switch which switches off the video output; e.g. for insertion of a VCR playback signal, by either a high or a low level.

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage | $V_{11-13}$ | typ. | 12 V |
| Supply current | $I_{11}$ | typ. | 50 mA |

b: TDA3541

**CHARACTERISTICS** (continued)

**Notes to characteristics**

1. All input signals are measured r.m.s. at top sync and 38,9 MHz.
2. Measured with 0 dB = 200 $\mu$V.
3. Starting point of the tuner a.g.c. is defined as the input signal level where the tuner a.g.c. current is 9 mA for the **TDA3540** and 1 mA for the **TDA3541**.
4. Measured with pin 3 connected with 39 k$\Omega$ to the supply voltage (pin 11).
5. Measured at 10 mV r.m.s. top sync input signal.
6. So-called 'projected zero point', e.g. with switched demodulator.
7. Measured according to EBU test, line 330.
   The differential gain is expressed as a percentage of the difference in peak amplitudes between the largest and smallest section relative to the sub-carrier amplitude at blanking level.
8. Measured according to EBU test, line 330.
   The differential phase is defined as the difference in degrees between the largest and smallest phase angle of the six sections.
9. $20 \log \frac{V_o \text{ at } 4{,}4 \text{ MHz}}{V_o \text{ at } 1{,}1 \text{ MHz}} + 3{,}6 \text{ dB}$.
10. $20 \log \frac{V_o \text{ at } 4{,}4 \text{ MHz}}{V_o \text{ at } 3{,}3 \text{ MHz}}$.
11. Measured with a 75 $\Omega$ source; $S/N = 20 \log \frac{V_o \text{ black-to-white}}{V_{n(rms)} \text{ at } B = 5 \text{ MHz}}$.
12. Measured with an input signal $V_{1\text{-}16}$ = 10 mV and a.f.c. output pin 5 symmetrically loaded with 100 k$\Omega$ to the supply voltage ($V_{11\text{-}13}$) and 100 k$\Omega$ to ground.

APPLICATION INFORMATION

# PAL DECODER

The TDA3560 is a monolithic integrated colour decoder for the PAL standard. It combines all functions required for the identification and demodulation of PAL signals. Furthermore it contains a luminance amplifier, an RGB-matrix and amplifier. These amplifiers supply output signals up to 5 V peak-to-peak (picture information) enabling direct drive of the output stages. The circuit also contains separate inputs for data insertion, analogue as well as digital, which can be used for Teletext information, channel number display, etc.

## QUICK REFERENCE DATA

## APPLICATION INFORMATION

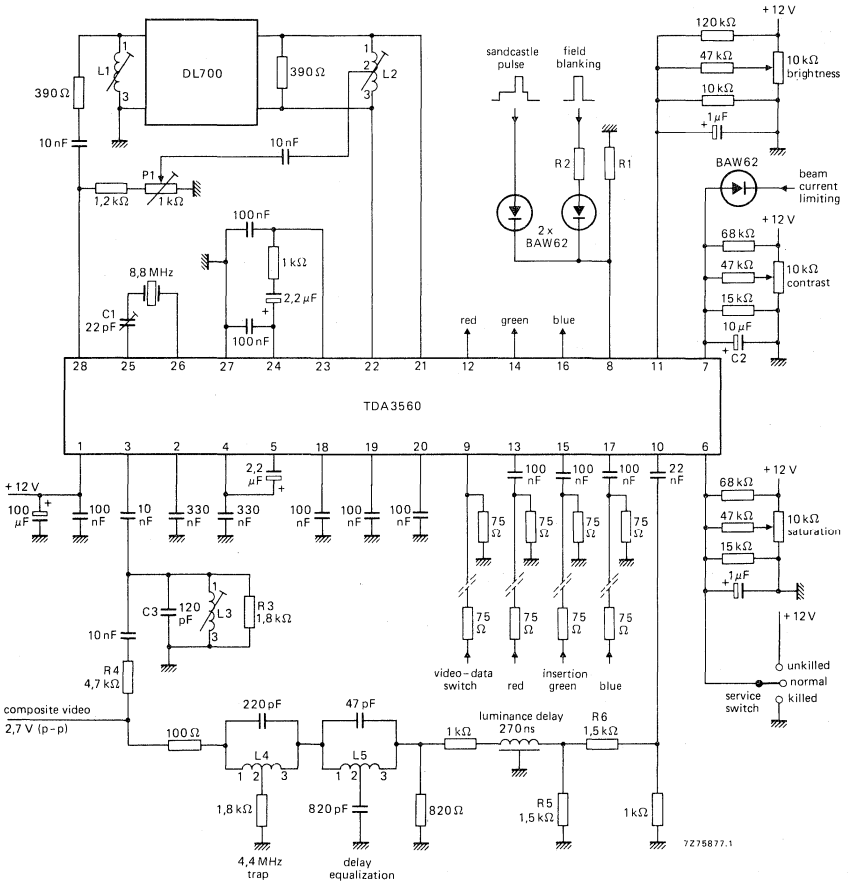

Fig. 6 Application circuit.

For adjustments see page 10.

## APPLICATION INFORMATION

The function is described against the corresponding pin number.

### 1. + 12 V power supply

The circuit gives good operation in a supply voltage range between 8 and 13,2 V provided that the supply voltage for the controls is equal to the supply voltage for the TDA3560. All signal and control levels have a linear dependency on the supply voltage. The current taken by the device at 12 V is typically 85 mA. It is linearly dependent on the supply voltage.

### 2. Control voltage for identification

This pin requires a detection capacitor of about 330 nF for correct operation. The voltages available under various signal conditions are given in the specification.

### 3. Chrominance input

The chroma signal must be a.c.-coupled to the input. Its amplitude must be between 55 mV and 1100 mV peak-to-peak (25 mV to 500 mV peak-to-peak burst signal). All figures for the chroma signals are based on a colour bar signal with 75% saturation, that is the burst-to-chroma ratio of the input signal is 1 : 2,25.

### 4. Reference voltage A.C.C. detector

This pin must be decoupled by a capacitor of about 330 nF. The voltage at this pin is 4,6 V.

### 5. Control voltage A.C.C.

The A.C.C. is obtained by synchronous detection of the burst signal followed by a peak detector. A good noise immunity is obtained in this way and an increase of the colour for weak input signals is prevented. The recommended capacitor value at this pin is 2,2 $\mu$F.

### 6. Saturation control

The saturation control range is in excess of 50 dB. The control voltage range is 2 to 4 V. Saturation control is a linear function of the control voltage.

When the colour killer is active, the saturation control voltage is reduced to a low level if the resistance of the external saturation control network is sufficiently high. Then the chroma amplifier supplies no signal to the demodulator. Colour switch-on can be delayed by proper choice of the time constant for the saturation control setting circuit.

When the saturation control pin is connected to the power supply the colour killer circuit is overruled so that the colour signal is visible on the screen. In this way it is possible to adjust the oscillator frequency without using a frequency counter (see also pins 25 and 26).

### 7. Contrast control

The contrast control range is 20 dB for a control voltage change from + 2 to + 4 V. Contrast control is a linear function of the control voltage. The output signal is suppressed when the control voltage is 1 V or less. If one or more output signals surpasses the level of 9 V the peak white limiter circuit becomes active and reduces the output signals via the contrast control by discharging C2 via an internal current sink.

### 8. Sandcastle and field blanking input

The output signals are blanked if the amplitude of the input pulse is between 2 and 6,5 V. The burst gate and clamping circuits are activated if the input pulse exceeds a level of 7,5 V.
The higher part of the sandcastle pulse should start just after the sync pulse to prevent clamping of video signal on the sync pulse. The width should be about 4 $\mu$s for proper A.C.C. operation.

### 9. Video-data switching

The insertion circuit is activated by means of this input by an input pulse between 1 V and 2 V. In that condition, the internal RGB signals are switched off and the inserted signals are supplied to the output amplifiers. If only normal operation is wanted this pin should be connected to the negative supply. The switching times are very short ($<$ 20 ns) to avoid coloured edges of the inserted signals on the screen.

### 10. Luminance signal input

The input signal should have a peak-to-peak amplitude of 0,45 V (peak white to sync) to obtain a black-white output signal of 5 V at nominal contrast. It must be a.c.-coupled to the input by a capacitor of about 22 nF. The signal is clamped at the input to an internal reference voltage.
A 1 k$\Omega$ luminance delay line can be applied because the luminance input impedance is made very high. Consequently the charging and discharging currents of the coupling capacitor are very small and do not influence the signal level at the input noticeably. Additionally the coupling capacitor value may be small.

### 11. Brightness control

The black level of the RGB outputs can be set by the voltage on this pin (see Fig. 5). The minimum black level is identical to the blanking level. The black level can be set higher than 4 V however the available output signal amplitude is reduced (see pin 7). Brightness control also operates on the black level of the inserted signals.

### 12, 14, 16. RGB outputs

The output circuits for red, green and blue are identical. Output signals are 5 V (black-white) for nominal input signals and control settings. The black levels of the three outputs have the same value. The blanking level at the outputs is 2 V. The peak white level is limited to 9 V. When this level is exceeded the output signal amplitude is reduced via the contrast control (see pin 7).

### 13, 15, 17. Inputs for external RGB signals

The external signals must be a.c.-coupled to the inputs via a coupling capacitor of about 100 nF. Source impedance should not exceed 150 $\Omega$. The input signal required for a 5 V peak-to-peak output signal is 1 V peak -to-peak. At the RGB outputs the black level of the inserted signal is identical to that of normal RGB signals. When these inputs are not used the coupling capacitors have to be connected to the negative supply.

### 18, 19, 20. Black level clamp capacitors

The black level clamp capacitors for the three channels are connected to these pins. The value of each capacitor should be about 100 nF.

### 21, 22. Inputs (B-Y) and (R-Y) demodulators

The input signal is automatically fixed to the required level by means of the burst phase detector and A.C.C. generator which are connected to this pin and pin 22. As the burst (applied differentially to those pins) is kept constant by the A.C.C., the colour difference signals automatically have the correct value.

APPLICATION INFORMATION (continued)

### 23, 24. Burst phase detector outputs

At these pins the output of the burst phase detector is filtered and controls the reference oscillator. An adequate catching range is obtained with the time constants given in the application circuit (see Fig. 6).

### 25, 26. Reference oscillator

The frequency of the oscillator is adjusted by the variable capacitor C1. For frequency adjustment interconnect pin 23 and pin 24. The frequency can be measured by connecting a suitable frequency counter to pin 25.

### 28. Output of the chroma amplifier

Both burst and chroma signals are available at the output. The burst-to-chroma ratio at the output is identical to that at the input for nominal control settings. The burst signal is not affected by the controls. The amplitude of the input signal to the demodulator is kept constant by the A.C.C. Therefore the output signal at pin 28 will depend on the signal loss in the delay line.

Adjustments (see Fig. 6)

| | | |
|---|---|---|
| C1 | 8,8 MHz oscillator | |
| L1 | phase delay line | = 10,7 $\mu$H |
| L2 | nominal value | = 10,7 $\mu$H |
| L3 | 4,4 MHz chrominance input filter | = 10,7 $\mu$H = L1 |
| L4 | 4,4 MHz trap in luminance signal line | = 5,6 $\mu$H |
| L5 | delay equalization | = 66,1 $\mu$H |
| P1 | amplitude of direct chroma signal | |
| R1<br>R2 | field blanking $\frac{R1}{R1 + R2}$ x field blanking amplitude 2,0 V to 6,5 V. | |

For a video input voltage of 1 V peak-to-peak: R4 = 1 k$\Omega$; R3, R5 and R6 can be omitted.

# PAL DECODER

The TDA3561A is a decoder for the PAL colour television standard. It combines all functions required for the identification and demodulation of PAL signals. Furthermore it contains a luminance amplifier, an RGB-matrix and amplifier. These amplifiers supply output signals up to 5 V peak-to-peak (picture information) enabling direct drive of the discrete output stages. The circuit also contains separate inputs for data insertion, analogue as well as digital, which can be used for text display systems (e.g. (Teletext/ broadcast antiope), channel number display, etc. Additional to the TDA3560, the circuit includes the following features:

- The peak white limiter is only active during the time that the 9,3 V level at the output is exceeded. The start of the limiting function is delayed by one line period. This avoids peak white limiting by test patterns which have abrupt transitions from colour to white signals.
- The brightness control is obtained by inserting a variable pulse in the luminance channel. Therefore the ratio of brightness variation and signal amplitude at the three outputs will be identical and independent of the difference in gain of the three channels. Thus discolouring due to adjustment of contrast and brightness is avoided.
- Improved suppression of the internal RGB signals when the device is switched to external signals, and vice versa.
- Non-synchronized external RGB signals do not disturb the black level of the internal signals.
- Improved suppression of the residual 4,4 MHz signal in the RGB output stages.
- Cascoded stages in the demodulators and burst phase detector minimize the radiation of the colour demodulator inputs.
- High current capability of the RGB outputs and the chrominance output.

## QUICK REFERENCE DATA

| $V_{8-27}$ = 1 to 8,5 V | $I_8$ | typ. 20 $\mu$A |
| $V_{8-27}$ = 8,5 to 12 V | $I_8$ | < 2 mA |

**Notes to the characteristics**

1. Signal with the negative-going sync; amplitude includes sync pulse amplitude.
2. Indicated is a signal for a colour bar with 75% saturation, so chrominance to burst ratio is 2,2 : 1.
3. Nominal contrast is specified as the maximum contrast −3 dB and nominal saturation as the maximum saturation −6 dB.
4. All frequency variations are referred to the 4,4 MHz carrier frequency.
5. For ± 400 Hz deviation of the oscillator frequency.
6. These signal amplitudes are determined by the a.c.c. circuit of the reference part.
7. When this level is exceeded, the amplitude of the output signal is reduced via a discharge of the capacitor at pin 7 (contrast control). The start of the peak white limiting action has a delay of one line period.
8. The variation of the black level depends directly on the gain of each channel during brightness control in the three channels. As a consequence, the black levels at the outputs (for output levels above or below 3 V) can have a difference which exceeds 200 mV. Because the amplitude and the black level change with brightness control have a direct relationship, no discolouring can occur, caused by adjustment of contrast and brightness.
9. This difference occurs when the source impedance of the data signal inputs is 150 Ω and the black level clamp pulse duration is 4 $\mu$s (sandcastle pulse). A lower difference is obtained when the impedance is lower.
10. Cross-coupling is measured under the following condition. Input signals nominal, contrast and saturation such that nominal output signals are obtained. The signals at the output at which no signal should be available must be compared with the nominal output signal at that output.
11. The signal-to-noise ratio is specified as peak-to-peak signal with respect to r.m.s. noise.

## APPLICATION INFORMATION

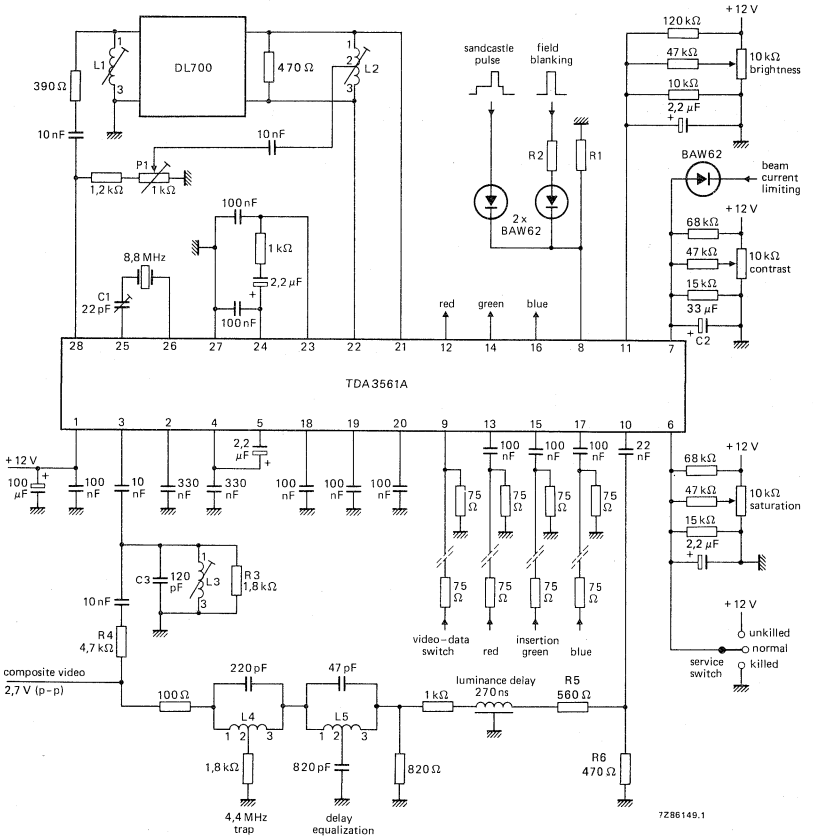

Fig. 6 Application circuit.

Adjustments (see Fig. 6)

| | | |
|---|---|---|
| C1 | 8,8 MHz oscillator | |
| L1 | phase delay line | = 10,7 µH |
| L2 | nominal value | = 10,7 µH |
| L3 | 4,4 MHz chrominance input filter | = 10,7 µH = L1 |
| L4 | 4,4 MHz trap in luminance signal line | = 5,6 µH |
| L5 | delay equalization | = 66,1 µH |
| P1 | amplitude of direct chroma singal | |
| R1<br>R2 | field blanking $\frac{R1}{R1 + R2}$ x field blanking amplitude 2,0 V to 6,5 V. | |

For a video input voltage of 1 V peak-to-peak: R3 can be omitted; R4 = 1 kΩ; R5 must be short-circuited; R6 = 1 kΩ.

DEVELOPMENT SAMPLE DATA

## APPLICATION INFORMATION

The function is described against the corresponding pin number.

### 1. + 12 V power supply

The circuit gives good operation in a supply voltage range between 8 and 13,2 V provided that the supply voltage for the controls is equal to the supply voltage for the TDA3561A. All signal and control levels have a linear dependency on the supply voltage. The current taken by the device at 12 V is typically 85 mA. It is linearly dependent on the supply voltage.

### 2. Control voltage for identification

This pin requires a detection capacitor of about 330 nF for correct operation. The voltages available under various signal conditions are given in the specification.

### 3. Chrominance input

The chroma signal must be a.c.-coupled to the input. Its amplitude must be between 55 mV and 1100 mV peak-to-peak (25 mV to 500 mV peak-to-peak burst signal). All figures for the chroma signals are based on a colour bar signal with 75% saturation, that is the burst-to-chroma ratio of the input signal is 1 : 2,25.

### 4. Reference voltage A.C.C. detector

This pin must be decoupled by a capacitor of about 330 nF. The voltage at this pin is 4,9 V.

### 5. Control voltage A.C.C.

The A.C.C. is obtained by synchronous detection of the burst signal followed by a peak detector. A good noise immunity is obtained in this way and an increase of the colour for weak input signals is prevented. The recommended capacitor value at this pin is 2,2 $\mu$F.

### 6. Saturation control

The saturation control range is in excess of 50 dB. The control voltage range is 2 to 4 V. Saturation control is a linear function of the control voltage.

When the colour killer is active, the saturation control voltage is reduced to a low level if the resistance of the external saturation control network is sufficiently high. Then the chroma amplifier supplies no signal to the demodulator. Colour switch-on can be delayed by proper choice of the time constant for the saturation control setting circuit.

When the saturation control pin is connected to the power supply the colour killer circuit is overruled so that the colour signal is visible on the screen. In this way it is possible to adjust the oscillator frequency without using a frequency counter (see also pins 25 and 26).

### 7. Contrast control

The contrast control range is 20 dB for a control voltage change from + 2 to + 4 V. Contrast control is a linear function of the control voltage. The output signal is suppressed when the control voltage is 1 V or less. If one or more output signals surpasses the level of 9 V the peak white limiter circuit becomes active and reduces the output signals via the contrast control by discharging C2 via an internal current sink.

### 8. Sandcastle and field blanking input

The output signals are blanked if the amplitude of the input pulse is between 2 and 6,5 V. The burst gate and clamping circuits are activated if the input pulse exceeds a level of 7,5 V.
The higher part of the sandcastle pulse should start just after the sync pulse to prevent clamping of video signal on the sync pulse. The width should be about 4 $\mu$s for proper A.C.C. operation.

### 9. Video-data switching

The insertion circuit is activated by means of this input by an input pulse between 1 V and 2 V. In that condition, the internal RGB signals are switched off and the inserted signals are supplied to the output amplifiers. If only normal operation is wanted this pin should be connected to the negative supply. The switching times are very short ($<$ 20 ns) to avoid coloured edges of the inserted signals on the screen.

### 10. Luminance signal input

The input signal should have a peak-to-peak amplitude of 0,45 V (peak white to sync) to obtain a black-white output signal of 5 V at nominal contrast. It must be a.c.-coupled to the input by a capacitor of about 22 nF. The signal is clamped at the input to an internal reference voltage.
A 1 k$\Omega$ luminance delay line can be applied because the luminance input impedance is made very high. Consequently the charging and discharging currents of the coupling capacitor are very small and do not influence the signal level at the input noticeably. Additionally the coupling capacitor value may be small.

### 11. Brightness control

The black level of the RGB outputs can be set by the voltage on this pin (see Fig. 5). The black level can be set higher than 4 V however the available output signal amplitude is reduced (see pin 7). Brightness control also operates on the black level of the inserted signals.

### 12, 14, 16. RGB outputs

The output circuits for red, green and blue are identical. Output signals are 5,25 V (R, G and B) at nominal input signals and control settings. The black levels of the three outputs have the same value. The blanking level at the outputs is 2,1 V. The peak white level is limited to 9,3 V. When this level exceeded the output signal amplitude is reduced via the contrast control (see pin 7).

### 13, 15, 17. Inputs for external RGB signals

The external signals must be a.c.-coupled to the inputs via a coupling capacitor of about 100 nF. Source impedance should not exceed 150 $\Omega$. The input signal required for a 5 V peak-to-peak output signal is 1 V peak -to-peak. At the RGB outputs the black level of the inserted signal is identical to that of normal RGB signals. When these inputs are not used the coupling capacitors have to be connected to the negative supply.

### 18, 19, 20. Black level clamp capacitors

The black level clamp capacitors for the three channels are connected to these pins. The value of each capacitor should be about 100 nF.

### 21, 22. Inputs (B-Y) and (R-Y) demodulators

The input signal is automatically fixed to the required level by means of the burst phase detector and A.C.C. generator which are connected to pin 21 and pin 22. As the burst (applied differentially to those pins) is kept constant by the A.C.C., the colour difference signals automatically have the correct value.

APPLICATION INFORMATION (continued)

### 23, 24. Burst phase detector outputs

At these pins the output of the burst phase detector is filtered and controls the reference oscillator. An adequate catching range is obtained with the time constants given in the application circuit (see Fig. 6).

### 25, 26. Reference oscillator

The frequency of the oscillator is adjusted by the variable capacitor C1. For frequency adjustment interconnect pin 21 and pin 22. The frequency can be measured by connecting a suitable frequency counter to pin 25.

### 28. Output of the chroma amplifier

Both burst and chroma signals are available at the output. The burst-to-chroma ratio at the output is identical to that at the input for nominal control settings. The burst signal is not affected by the controls. The amplitude of the input signal to the demodulator is kept constant by the A.C.C. Therefore the output signal at pin 28 will depend on the signal loss in the delay line.

# PAL/NTSC DECODER

## GENERAL DESCRIPTION

The TDA3562A is a monolithic integrated decoder for the PAL and/or NTSC colour television standards. It combines all functions required for the identification and demodulation of PAL/NTSC signals. Furthermore it contains a luminance amplifier, an RGB-matrix and amplifier. These amplifiers supply output signals up to 4 V peak-to-peak (picture information) enabling direct drive of the discrete output stages. The circuit also contains separate inputs for data insertion, analogue as well as digital, which can be used for text display systems (e.g. Teletext/broadcast Antiope), channel number display, etc.

### Features

- A black-current stabilizer which controls the black-currents of the three electron-guns to a level low enough to omit the black-level adjustment
- Contrast control of inserted RGB signals
- No black-level disturbance when non-synchronized external RGB signals are available on the inputs
- NTSC capability with hue control

## PACKAGE OUTLINE

28-lead DIL; plastic, with internal heat spreader (SOT-117).

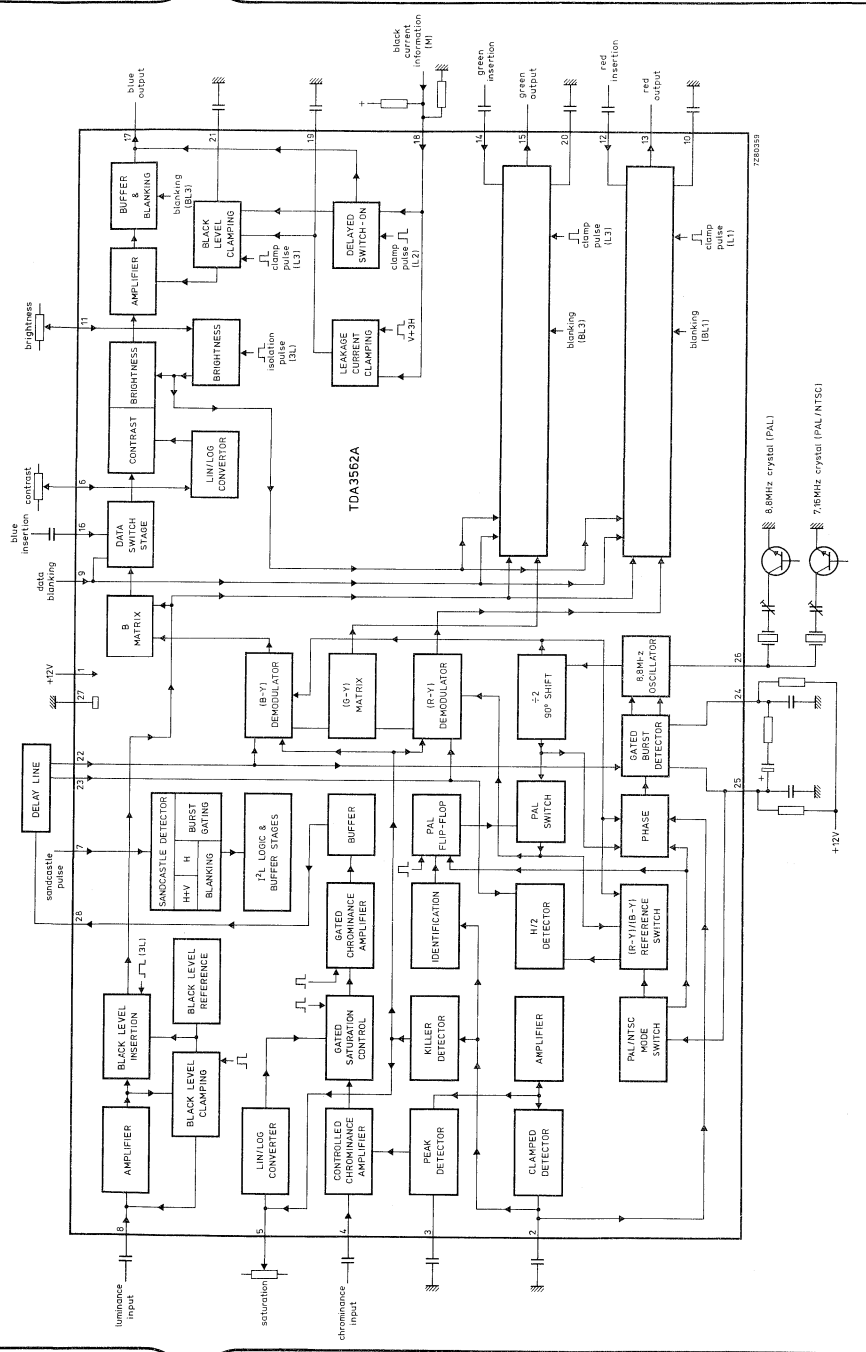

Fig. 1 Block diagram; for explanation of pulse mnemonics see Fig. 6.

## FUNCTIONAL DESCRIPTION

### Luminance amplifier

The luminance amplifier is voltage driven and requires an input signal of 450 mV peak-to-peak (positive video). The luminance delay line must be connected between the i.f. amplifier and the decoder. The input signal is a.c. coupled to the input (pin 8). After amplification, the black level at the output of the preamplifier is clamped to a fixed d.c. level by the black level clamping circuit.

During three line periods after vertical blanking, the luminance signal is blanked out and the black level reference voltage is inserted by a switching circuit. This black level reference voltage is controlled via pin 11 (brightness). At the same time the RGB signals are clamped. Noise and residual signals have no influence during clamping thus simple internal clamping circuitry is used.

### Chrominance amplifiers

The chrominance amplifier has an asymmetrical input. The input signal must be a.c. coupled (pin 4) and have a minimum amplitude of 40 mV peak-to-peak. The gain control stage has a control range in excess of 30 dB, the maximum input signal must not exceed 1,1 V peak-to-peak, otherwise clipping of the input signal will occur. From the gain control stage the chrominance signal is fed to the saturation control stage. Saturation is linear controlled via pin 5. The control voltage range is 2 to 4 V, the input impedance is high and the saturation control range is in excess of 50 dB. The burst signal is not affected by saturation control. The signal is then fed to a gated amplifier which has a 12 dB higher gain during the chrominance signal. As a result the signal at the output (pin 28) has a burst to chrominance ratio which is 6 dB lower than that of the input signal when the saturation control is set at −6 dB. The chrominance output signal is fed to the delay line and, after matrixing, is applied to the demodulator input pins (pins 22 and 23). These signals are fed to the burst phase detector.

### Oscillator and identification circuit

The burst phase detector is gated with the narrow part of the sandcastle pulse (pin 7). In the detector the (R-Y) and (B-Y) signals are added to provide the composite burst signal again. This composite signal is compared with the oscillator signal divided-by-2 (R-Y) reference signal. The control voltage is available at pins 24 and 25, and is also applied to the 8,8 MHz oscillator. The 4,4 MHz signal is obtained via the divide-by-2 circuit, which generates both the (B-Y) and (R-Y) reference signals and provides a 90° phase shift between them.

The flip-flop is driven by pulses obtained from the sandcastle detector. For the identification of the phase at PAL mode, the (R-Y) reference signal coming from the PAL switch, is compared to the vertical signal (R-Y) of the PAL delay line. This is carried out in the H/2 detector, which is gated during burst. When the phase is incorrect, the flip-flop gets a reset from the identification circuit. When the phase is correct, the output voltage of the H/2 detector is directly related to the burst amplitude so that this voltage can be used for the a.c.c. To avoid 'blooming-up' of the picture under weak input signal conditions the a.c.c. voltage is generated by peak detection of the H/2 detector output signal.

The killer and identification circuits get their information from a gated output signal of the H/2 detector. Killing is obtained via the saturation control stage and the demodulators to obtain good suppression. The time constant of the saturation control (pin 5) provides a delayed switch-on after killing.

Adjustment of the oscillator is achieved by variation of the burst phase detector load resistance between pins 24 and 25 (see Fig. 7). With this application the trimmer capacitor in series with the 8,8 MHz crystal (pin 26) can be replaced by a fixed value capacitor to compensate for unbalance of the phase detector.

## FUNCTIONAL DESCRIPTION (continued)

### Demodulator

The (R-Y) and (B-Y) demodulators are driven by the colour difference signals from the delay-line matrix circuit and the reference signals from the 8,8 MHz divider circuit. The (R-Y) reference signal is fed via the PAL-switch. The output signals are fed to the R and B matrix circuits and to the (G-Y) matrix to provide the (G-Y) signal which is applied to the G-matrix. The demodulation circuits are killed and blanked by by-passing the input signals.

### NTSC mode

The NTSC mode is switched on when the voltage at the burst phase detector outputs (pins 24 and 25) is adjusted below 9 V. To ensure reliable application the phase detector load resistors are external. When the TDA3562A is used only for PAL these two 33 kΩ resistors must be connected to + 12 V (see Fig. 7). For PAL/NTSC application the value of each resistor must be reduced to 10 kΩ and connected to the slider of a potentiometer (see Fig. 8). The switching transistor brings the voltage at pins 24 and 25 below 9 V which switches the circuit to the NTSC mode. The position of the PAL flip-flop ensures that the correct phase of the (R-Y) reference signal is supplied to the (R-Y) demodulator. The drive to the H/2 detector is now provided by the (B-Y) reference signal. In the PAL mode it is driven by the (R-Y) reference signal.

Hue control is realized by changing the phase of the reference drive to the burst phase detector. This is achieved by varying the voltage at pins 24 and 25 between 7,5 and 8,5 V, nominal position 8,0 V. The hue control characteristic is shown in Fig. 5.

### RGB matrix and amplifiers

The three matrix and amplifier circuits are identical and only one circuit will be described.

The luminance and the colour difference signals are added in the matrix circuit to obtain the colour signal, which is then fed to the contrast control stage. The contrast control voltage is supplied to pin 6 (high-input impedance). The control range is + 5 dB to −15 dB nominal. The relationship between the control voltage and the gain is linear (see Fig. 2).

During the 3-line period after blanking a pulse is inserted at the output of the contrast control stage. The amplitude of this pulse is varied by a control voltage at pin 11. This applies a variable offset to the normal black level, thus providing brightness control. The brightness control range is 1 V to 3 V.

While this offset level is present, the 'black-current' input impedance (pin 18) is high and the internal clamp circuit is activated. The clamp circuit then compares the reference voltage at pin 19 with the voltage developed across the external resistor network $R_A$ and $R_B$ (pin 18) which is provided by picture tube beam current. The output of the comparator is stored in capacitors connected from pins 10, 20 and 21 to ground which controls the black level at the output. The reference voltage is composed by the resistor divider network and the leakage current of the picture tube into this bleeder. During vertical blanking, this voltage is stored in the capacitor connected to pin 19, which ensures that the leakage current of the CRT does not influence the black current measurement.

The RGB output signals can never exceed a level of 10 V. When the signal tends to exceed this level the output signal is clipped. The black level at the outputs (pins 13, 15 and 17) will be about 3 V. This level depends on the spread of the guns of the picture tube. If a beam current stabilizer is not used it is possible to stabilize the black levels at the outputs, which in this application must be connected to the black current measuring input (pin 18) via a resistor network.

### Data insertion

Each colour amplifier has a separate input for data insertion. A 1 V peak-to-peak input signal provides a 4 V peak-to-peak output signal. To avoid the 'black-level' of the inserted signal differing from the black level of the normal video signal, the data is clamped to the black level of the luminance signal. Therefore a.c. coupling is required for the data inputs. To avoid a disturbance of the blanking level due to the clamping circuit, the source impedance of the driver circuit must not exceed 150 Ω.

The data insertion circuit is activated by the data blanking input (pin 9). When the voltage at this pin exceeds a level of 0,9 V, the RGB matrix circuits are switched off and the data amplifiers are switched on. To avoid coloured edges, the data blanking switching time is short.

The amplitude of the data output signals is controlled by the contrast control at pin 6. The black level is equal to the video black level and can be varied between 2 and 4 V (nominal condition) by the brightness control voltage at pin 11.

Non-synchronized data signals do not disturb the black level of the internal signals.

### Blanking of RGB and data signals

Both the RGB and data signals can be blanked via the sandcastle input (pin 7). A slicing level of 1,5 V is used for this blanking function, so that the wide part of the sandcastle pulse is separated from the remainder of the pulse. During blanking a level of +1 V is available at the output.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | |
|---|---|---|---|
| Supply voltage (pin 1) | $V_P = V_{1-27}$ | max. | 13,2 V |
| Total power dissipation | $P_{tot}$ | max. | 1,7 W |
| Storage temperature range | $T_{stg}$ | −25 to +150 | °C |
| Operating ambient temperature range | $T_{amb}$ | −25 to +70 | °C |

## THERMAL RESISTANCE

| | | | |
|---|---|---|---|
| From junction to ambient (in free air) | $R_{th\ j-a}$ | = | 40 K/W |

## CHARACTERISTICS

$V_P = V_{1-27} = 12$ V; $T_{amb} = 25$ V; unless otherwise specified

Notes to the characteristics

1. Signal with the negative-going sync; amplitude includes sync amplitude.
2. Indicated is a signal for a colour bar with 75% saturation; chrominance to burst ratio is 2,2 : 1.
3. Nominal contrast is specified as the maximum contrast −5 dB and nominal saturation as the maximum saturation −6 dB.
4. Cross coupling is measured under the following condition: input signal nominal, contrast and saturation such that nominal output signals are obtained. The signals at the output at which no signal should be available must be compared with the nominal output signal at that output.
5. The signal-to-noise ratio is defined as peak-to-peak signal with respect to r.m.s. noise.
6. All frequency variations are referred to 4,4 MHz carrier frequency.
7. These signal amplitudes are determined by the a.c.c. circuit of the reference part.
8. The demodulators are driven by a chrominance signal of equal amplitude for the (R-Y) and the (B-Y) components. The phase of the (R-Y) chrominance signal equals the phase of the (R-Y) reference signal. This also applies to the (B-Y) signals.
9. This value depends on the gain setting of the RGB output amplifiers and the drift of the picture tube guns. Higher black level values are possible (up to 5 V) but in that application the amplitude of the output signal is reduced.
10. The variation of the black-level during brightness control in the three different channels is directly dependent on the gain of each channel. Discolouration during adjustments of contrast and brightness does not occur because amplitude and the black-level change with brightness control are directly related.
11. This difference occurs when the source impedance of the data signals is 150 Ω and the black level clamp pulse width is 4 μs (sandcastle pulse). For a lower impedance the difference will be lower.
12. The voltage at pins 24 and 25 can be changed by connecting the load resistors (10 kΩ in this application) to the slider bar of the hue control potentiometer (see Fig. 8). When the transistor is switched on, the voltage at pins 24 and 25 is reduced below 9 V, and the circuit is switched to NTSC mode.

DEVELOPMENT SAMPLE DATA

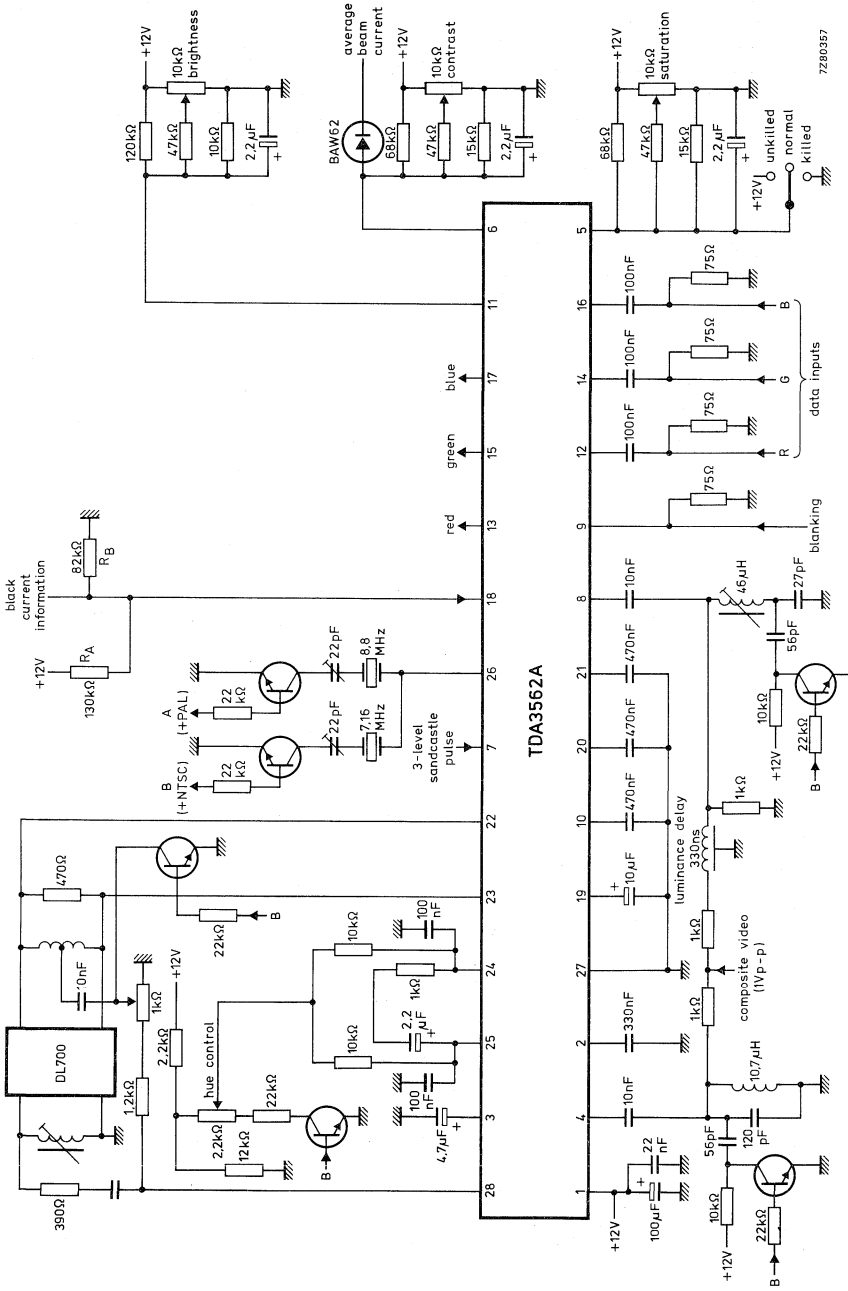

Fig. 8 Application diagram showing the TDA3562A for a PAL/NTSC decoder.

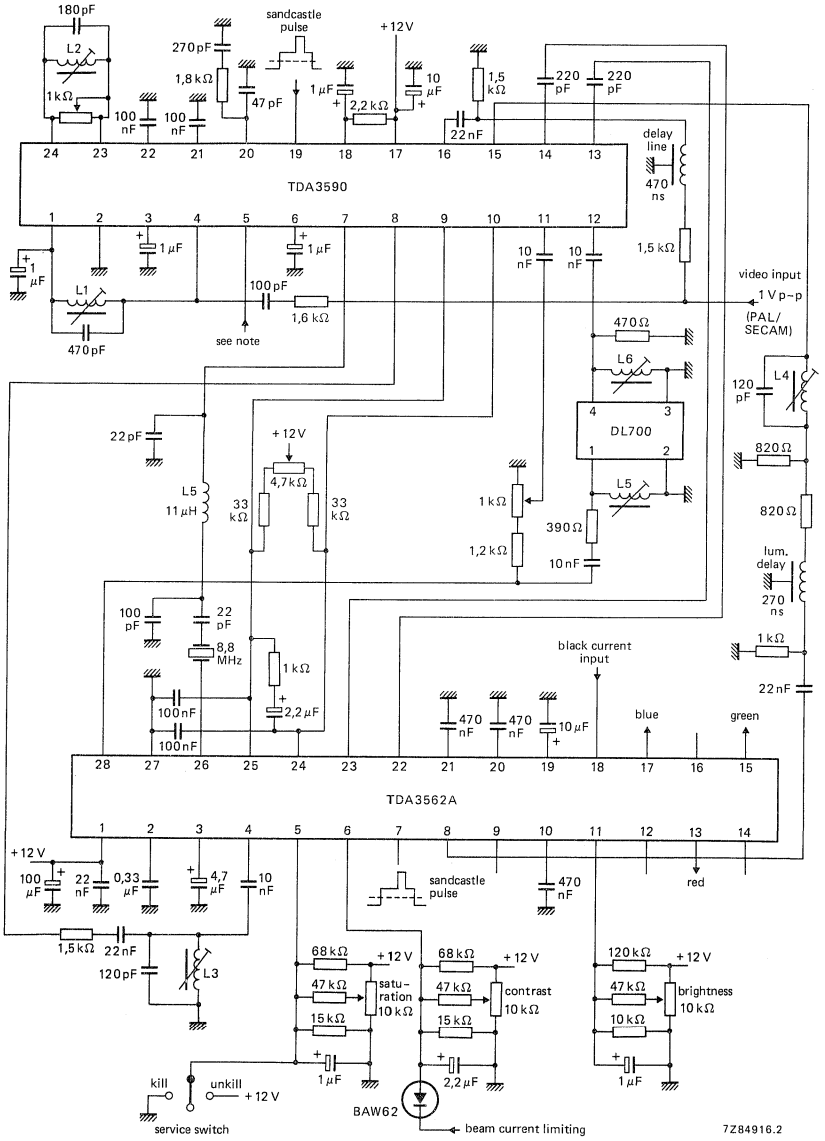

Fig. 9 PAL/SECAM application circuit diagram using the TDA3590 and TDA3562A.

Note to pin 5 TDA3590:

$V_{5\text{-}2} < 1$ V; horizontal identification and black level clamping.
$V_{5\text{-}2} > 11$ V; vertical identification and artificial black level.
$V_{5\text{-}2} =$ 5 to 7 V; horizontal identification and artificial black level.

# NTSC DECODER

## GENERAL DESCRIPTION

The TDA3563 is a monolithic integrated colour decoder for the NTSC standard. It combines all functions required for the identification and demodulation of NTSC signals. Furthermore it contains a luminance amplifier, an RGB-matrix and amplifier. These amplifiers supply signals up to 5,3 V peak-to-peak (picture information) enabling direct drive of the output stages. The circuit also contains inputs for data insertion, analogue as well as digital, which can be used for Teletext information, channel number display, etc.

| at $V_{8-27}$ = 1 to 8,5 V | $I_8$ | – | 20 | – | μA |
| at $V_{8-27}$ = 8,5 to 12 V | $I_8$ | – | – | 2 | mA |

**Notes to the characteristics**

1. Signal with negative-going sync; amplitude includes sync amplitude.
2. Indicated is a signal for a colour bar with 75% saturation; chrominance to burst ratio is 2,2 : 1.
3. At nominal contrast and saturation. Nominal contrast is specified as the maximum contrast –3 dB and nominal saturation as the maximum saturation –6 dB.
4. All frequency variations are referred to 3,58 MHz carrier frequency.
5. For ±400 Hz deviation of the oscillator frequency.
6. If the typical voltage for this white level is exceeded, the output voltage is reduced by discharging the capacitor at pin 7 (contrast control); discharge current is 1,5 mA.

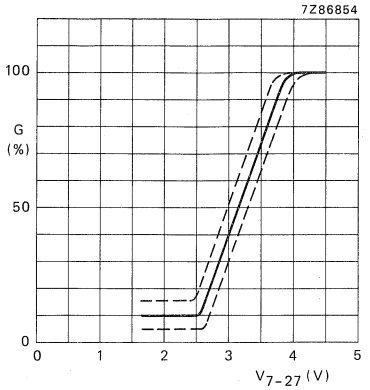

Fig. 2 Contrast control voltage range.

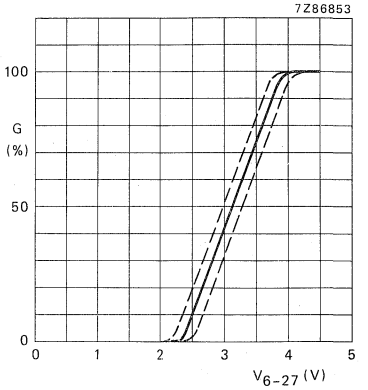

Fig. 3 Saturation control voltage range.

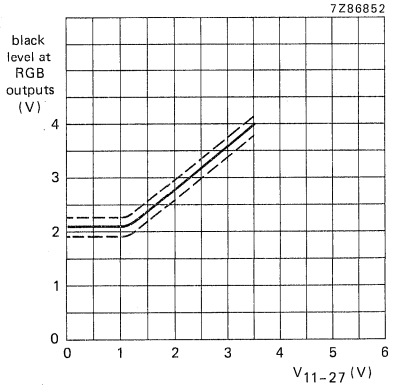

Fig. 4 Brightness control voltage range.

## APPLICATION INFORMATION

The function is described against the corresponding pin number.

### 1. + 12 V power supply

The circuit gives good operation in a supply voltage range between 8 and 13,2 V provided that the supply voltage for the controls is equal to the supply voltage of the TDA3563. All signal and control levels have a linear dependency on the supply voltage. The current consumed by the IC at + 12 V is typically 85 mA. It is linearly dependent on the supply voltage.

### 2. Control voltage for identification

The output pulses of the a.c.c. detector are detected with a sample-and-hold circuit to obtain information for the colour killer. The output is available at pin 2.

### 3. Chrominance input

The chrominance signal must be a.c.-coupled to the input. Its amplitude must be between 55 and 1100 mV peak-to-peak (25 to 500 mV peak-to-peak burst signal). All figures for the chrominance signals are based on a colour bar signal with 75% saturation, that is if the burst-to-chrominance ratio of the input is 1 : 2,2.

### 4. Control voltage a.c.c. detector

The shifted burst signal is synchronously demodulated in a separate a.c.c. detector to generate the a.c.c. voltage. The output pulses of this detector are peak detected to control the gain of the chrominance amplifier, thus preventing blooming-up of the colour during weak signal reception.

### 5. Decoupling of the 90° phase shift circuit

A control circuit is required in the 90° phase shift circuit to make the chrominance voltage independent of the hue setting. The control circuit is decoupled by a capacitor at this pin.

### 6. Saturation control

The saturation control range is in excess of 50 dB. The control voltage range is 2 to 4 V. Saturation control is a linear function of the control voltage.

When the colour killer is active, the saturation control voltage is reduced to a low level if the resistance of the external control network is sufficiently high. Then the chrominance amplifier supplies no signal to the demodulator. Colour switch-on can be delayed by proper choice of the time constant for the saturation control setting circuit.

When the saturation control pin is connected to the power supply the colour killer circuit is overruled so that the colour signal is visible on the screen. In this way it is possible to adjust the oscillator frequency without using a frequency counter (see also pins 24 and 26).

### 7. Contrast control

The contrast control range is 20 dB for a control voltage change from + 2 V to + 4 V. Contrast control is a linear function of the control voltage. The output signal is suppressed when the control voltage is 1 V or less. If one or more output signals surpasses the level of 9 V the peak-white limiter circuit becomes active and reduces the output signals via the contrast control by discharging a 10 $\mu$F capacitor via an internal current sink.

### 8. Sandcastle and vertical blanking input

The output signals are blanked if the amplitude of the pulse is between 2 V and 6,5 V. The burst gate and clamping circuits are activated if the input pulse exceeds a level of 7,5 V. The higher part of the sandcastle pulse should start just after the sync pulse to prevent clamping of the video signal on the sync pulse. The duration should be about 4 $\mu$s for proper a.c.c. operation.

### 9. Video-data switching

The insertion circuit is activated by means of this input by an input pulse between 1 and 2 V. In that condition, the internal RGB signals are switched off and the inserted signals are supplied to the output amplifiers. If only normal operation is wanted this pin should be connected to ground (pin 27).

The switching times are very short ($< 20$ ns) to avoid coloured edges of the inserted signals on the screen.

### 10. Luminance signal input

The input signal should have a peak-to-peak amplitude of 0,45 V (peak-white to sync) to obtain a black-white output signal of 5,3 V at nominal contrast. It must be a.c.-coupled to the input by a capacitor of about 22 nF. The signal is clamped at the input to an internal reference voltage. The 1 kΩ luminance delay line can be applied because the luminance impedance is very high. Consequently the charging and discharging currents of the coupling capacitor are very small and do not influence the signal level at the input noticeably. Additionally the coupling capacitor value may be small.

### 11. Brightness control

The black level of the RGB outputs can be set by the voltage on this pin (see Fig. 4). The minimum black level is identical to the blanking level. The black level can be set higher than 4 V, however, the available output signal amplitude is reduced (see also pin 7). Brightness control also operates on the black level of the inserted signals.

### 12, 14, 16. RGB outputs

The output circuits for red, green and blue are identical. Output signals are 5,3 V (black-white) for nominal input signals and control settings. The black levels of the three outputs have the same value. The blanking level at the outputs is 2,1 V. The peak-white level is limited to 9 V. When this level is exceeded the output signal amplitude is reduced via the contrast control (see also pin 7).

### 13, 15, 17. Inputs for external RGB signals

The external signals must be a.c.-coupled to the inputs via a coupling capacitor of about 100 nF. Source impedance should not exceed 150 Ω. The input signal required for a 5 V peak-to-peak output signal is 1 V peak to peak. At the RGB outputs the black level of the inserted signal is identical to that of normal RGB signals. When these inputs are not used the coupling capacitors have to be connected to ground (pin 27).

### 18, 19, 20. Black level clamp capacitors

The black level clamp capacitors for the three channels are connected to these pins. The value of each capacitor should be about 100 nF.

### 21, 22. Demodulator input and reference signal phase adjustment

The (R-Y) and (B-Y) demodulator inputs are internally connected (pin 21). The phase angle between the two reference carriers is 115°. At the nominal hue adjustment the (B-Y) signal is demodulated with a difference of 0°. The phase shift of 115° can be changing the voltage at pin 22. The gain at the two demodulators is identical. The (G-Y) is composed of $-0{,}27$(R-Y) $-0{,}22$(B-Y).

### 23, 25. Hue control

The hue control is obtained by changing the phase of the input signal of the burst phase detector with respect to the demodulator input signal. This phase shift is obtained by generating a 90° shifted sine-wave via a Miller integrator (biased via pin 23) which is mixed with the original burst signal.

## APPLICATION INFORMATION (continued)

### 24, 26. Reference oscillator

As the burst phase detector has an asymmetrical output the oscillator can be adjusted by changing the voltage of the output (pin 24) via a high-ohmic resistor. The capacitor in series with the oscillator crystal must then have a fixed value. When pin 6 (saturation control) is connected to the positive supply line the burst phase detector is based in its nominal position and the colour killer is overruled. This position can therefore be used for the adjustment of the oscillator.

### 27. Ground

### 28. Output of the chrominance amplifier

The (R-Y) and (B-Y) demodulator input (pin 21) is a.c.-coupled to this output.

# NTSC DECODER

The TDA3570 is a monolithic integrated colour decoder for the NTSC standard. It combines all functions required for the identification and demodulation of NTSC signals. Furthermore it contains a luminance amplifier, an RGB-matrix and amplifier. The amplifier supplies output signals up to 3,5 V peak-to-peak (picture information) enabling direct drive of the output stages. The circuit also contains an automatic picture setting switch to preset positions of both saturation and tint controls.

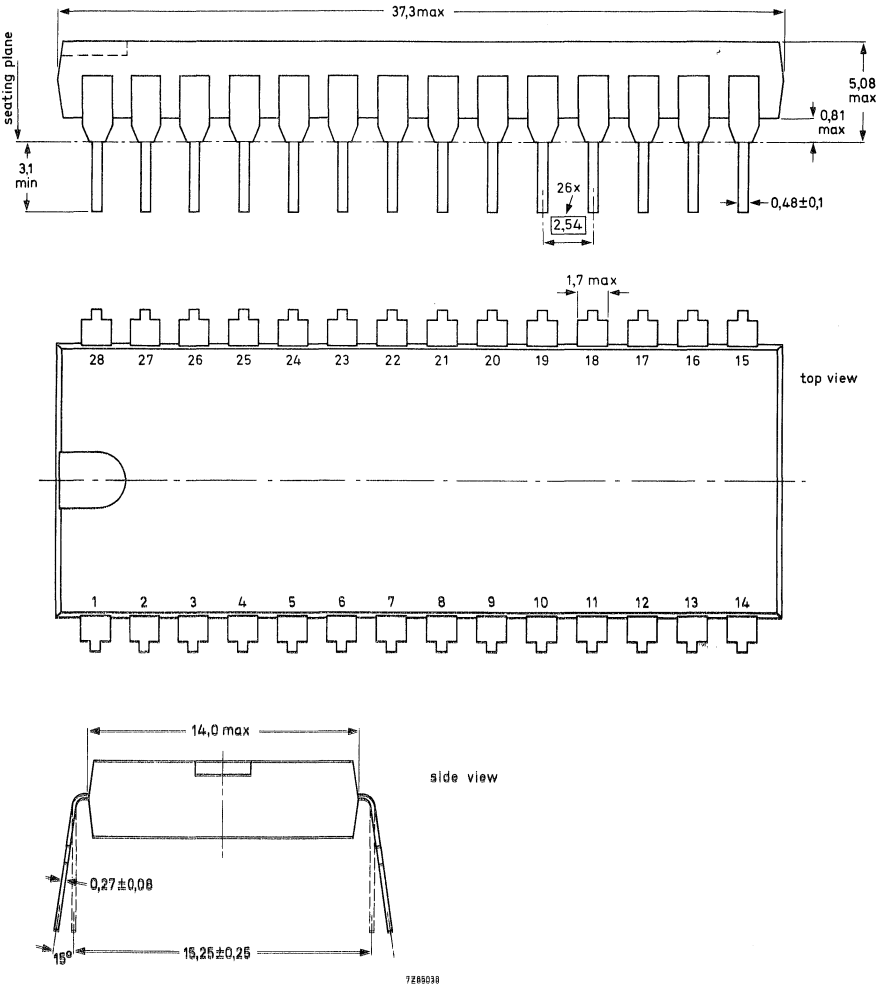
## 28-LEAD DUAL IN-LINE; PLASTIC



# SYNC COMBINATION WITH TRANSMITTER IDENTIFICATION AND VERTICAL 625 DIVIDER SYSTEM

## GENERAL DESCRIPTION

The TDA3571B is a monolithic integrated circuit for use in colour television receivers with switched-mode driven or self-regulating horizontal time-base circuits. It is designed in combination with the TDA2581 to operate as a matched pair. When supplied with a composite video signal the TDA3571B delivers drive pulses for the TDA2581 and sync pulses for the vertical deflection. The circuit is optimized for a horizontal and vertical frequency ratio of 625. It incorporates the following features:

### Features

- Horizontal sync separator (including noise inverter)
- Horizontal phase detector
- Horizontal oscillator (31,25 kHz)
- Sandcastle pulse generator
- Vertical sync pulse separator
- Very stable automatic vertical synchronization due to the 625 divider system, without delay after channel change
- Three voltage level sensor on coincidence detector circuit output
- Video transmitter identification circuit for sound muting and search tuning systems
- Inhibit of vertical sync pulse when no video transmitter is detected

## QUICK REFERENCE DATA

| catching range | $\Delta f$ | typ. | ± 900 Hz |
| Operating ambient temperature range | $T_{amb}$ | −25 to + 65 | °C |

## PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102A).

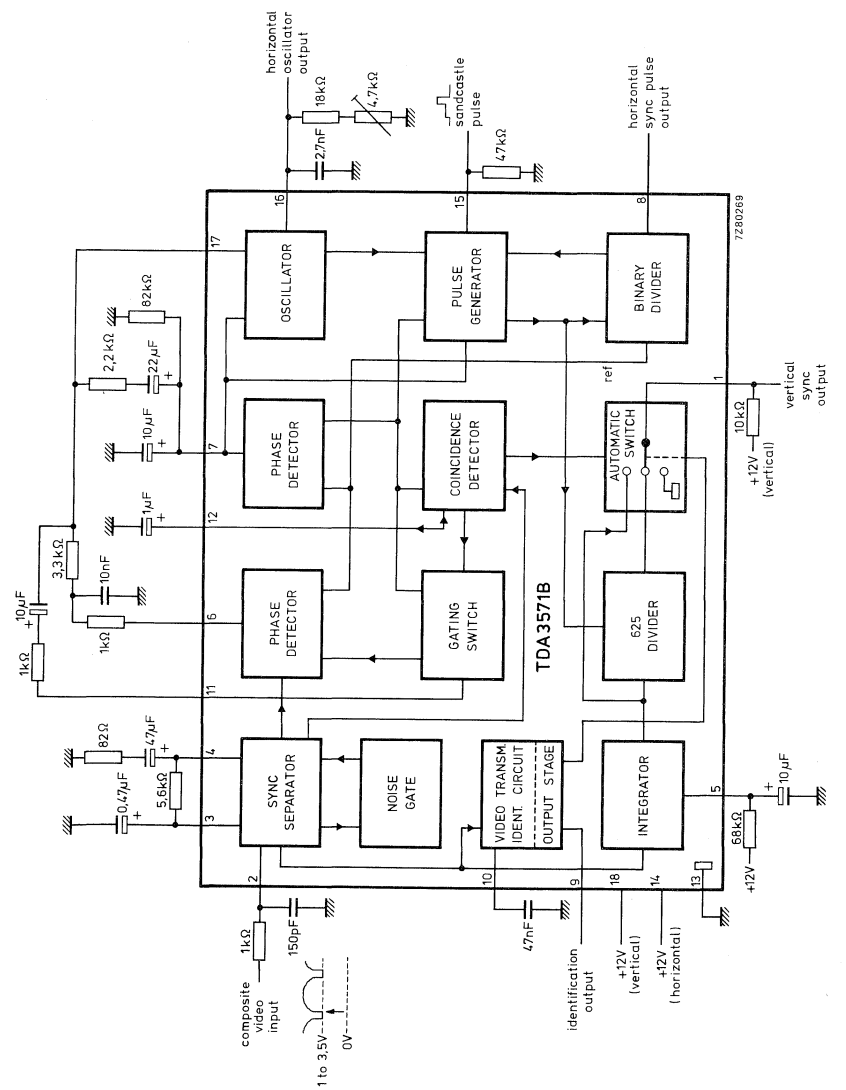

Fig. 1 Block diagram.

## FUNCTIONAL DESCRIPTION

The video input voltage to drive the sync separator must have negative-going sync, which can be obtained from synchronous demodulators such as TDA2540, TDA2541 and TDA2670.

The slicing level of the sync separator is determined by the value of the resistor between pins 3 and 4. A 5,6 kΩ resistor provides a slicing level midway between the top sync level and the blanking level. Thus the slicing level is independent of the amplitude of the sync pulse input at pin 2.

The nominal top sync level at pin 2 is 1,5 V, and the amplitude selective noise inverter is activated at 0,7 V. The horizontal phase detector has a steepness of 1,2 V/μs and together with the 1800 Hz/V of the horizontal oscillator provides a total control steepness of 2000 Hz/μs.

A second horizontal phase detector provides a 5,5 μs pulse which ensures symmetrical gating of the horizontal synchronization. During catching the gating is automatically switched off. At the same time the flywheel filter is switched to a short time constant. The value of this time constant can be determined externally via pin 11.

When the indirect vertical sync output is generated by the 625 divider system an anti-top flutter pulse switches off the equalizing and vertical sync pulse operation of the phase detector. Thus top flutter distortion of the control voltage due to vertical pulses can be anticipated. When the 625 divider system is in the direct mode the anti-top flutter pulse is inhibited.

The free running output frequency of the horizontal oscillator is 31,25 kHz. The vertical frequency output is obtained by dividing this double horizontal frequency by 625. The double horizontal frequency is fed via a binary divider to provide the normal 15,625 kHz horizontal output at pin 8. The trailing edge of this pulse is positioned 0,9 μs after the end of the video sync pulse input at pin 2 (see Fig. 2).

The automatic vertical sync block contains the following:

- 625 divider
- In/out-sync detector
- Direct/indirect sync switch
- Identification circuit

It is fed by a signal obtained by integration of the composite sync signal and an internally generated, clipped video signal. The vertical sync pulse is sliced out of this integrated signal by an automatically biased clipper. The videopart of the signal helps to build up a vertical sync pulse when heavy negative-going reflections (mountains) distort the video signal. The in/out sync-detector considers a signal out-of-sync when fifteen or more successive incoming vertical sync pulses are not in phase with a reference signal from the 625 divider. Therefore a distorted vertical sync signal needs only one out-of-fifteen pulses to be in phase to keep the system in sync. When the sixteenth successive out-of-sync pulse is detected, the direct/indirect sync switch is activated to feed the vertical sync signal directly out of the block at pin 2 (direct sync vertical output).
At the same time the 625 divider is reset by one of the sync pulses. After the reset pulse, if the 7th sliced vertical sync pulse coincides with a 625 divider window, the sync output pulse is presented again by the divider system and switch-over to indirect mode occurs.
In the direct mode, every 7th non-coinciding sliced vertical sync pulse will reset the counter. Thus a non-standard video signal will result in continuous reset pulses and the direct/indirect switch will remain in the direct position.

To avoid delay in vertical synchronization, caused by waiting time of the divider circuit after channel change or an unsynchronized camera change in the studio, information is fed from the horizontal coincidence detector to the automatic switch for the vertical sync pulse. The loss of horizontal synchronization sets the automatic switch to direct vertical sync. When horizontal coincidence is detected again the setting of the automatic switch depends on whether a standard video signal is received or not. When an external voltage between 2,5 V and 7,25 V is applied via pin 12 to the coincidence detector, the horizontal phase detector is switched to a short time constant and the automatic switch to direct vertical

## FUNCTIONAL DESCRIPTION (continued)

sync. A voltage level on pin 12 > 8,25 V switches the horizontal phase detector to a short time constant, without affecting the indirect/direct vertical sync system which remains operational.

The video transmitter identification circuit detects when a sync pulse occurs during the internal gating pulse. This indicates the presence of a video transmitter and results in the capacitor connected to pin 10 being charged to 8 V. When no sync pulse is present the capacitor discharges to < 1 V. The voltage at pin 10 is compared with an internal d.c. voltage. The identification output at pin 9 is active when pin 10 is < 1,6 V (no video transmitter) and inactive (high impedance) when pin 10 is > 3,5 V. The vertical sync output pulse at pin 1 is inhibited when no video transmitter is identified, which prevents interference or noise affecting the frequency of the vertical output stage. This results in a vertical stable picture, plus vertical stable position information of tuning systems.

**Notes to characteristics**

1. The video signal at pin 2 must have negative-going sync.
2. Up to 1 V peak-to-peak the slicing level is constant; at amplitudes exceeding 1 V peak-to-peak the slicing level will increase.
3. The slicing level is determined by the value of the resistor between pin 3 and pin 4. The 50% figure is obtained with a 5,6 kΩ resistor.
4. Values of external circuitry as shown in Fig. 1.
5. The voltage is a peak-to-peak value; the figure can be reduced to 0,6 μs/V (p-p) by connecting a 330 nF capacitor between pins 7 and 14.
6. The video transmitter identification output stage at pin 9 consists of a p-n-p current source with an n-p-n emitter-follower.
7. A voltage level between 2,5 V and 7,25 V switches the horizontal phase detector to a short time constant and the automatic switch to direct vertical sync.
8. A voltage level > 8,25 V switches the horizontal phase detector to a short time constant without affecting the operation of the automatic switch.

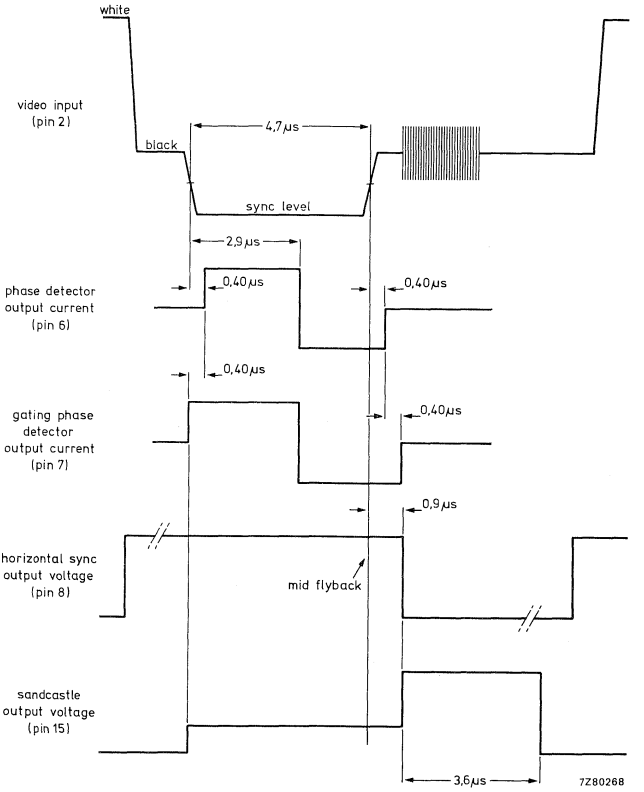

Fig. 2 Phase relationship between the input and output signals of the TDA3571B.

## APPLICATION INFORMATION (see also Fig. 3)

The function is described against the corresponding pin number.

### 1. Vertical output pulse

A 10 kΩ resistor must be connected between pin 1 and the positive vertical supply line at pin 18. The pulse is obtained from the 625 divider circuit when standard input signals are received or from the sync separator when the signals are non-standard. The pulse is inhibited when no video transmitter is detected.

### 2. Video input

The video input signal must have negative-going sync pulses. The top-sync level can vary between 1 V and 3,5 V without affecting the sync separator operation. The slicing level is fixed at 50% for the sync pulse amplitude range 0,07 to 1 V which provides good sync separation down to pulses with an amplitude of 70 mV peak-to-peak. The slicing level is increased for sync pulses in excess of 1 V peak-to-peak. The noise gate is activated at an input level $< 1$ V, thus when noise gating is required the top sync level should be close to the minimum level of 1 V. When i.f. circuits with a noise gate are used (TDA2540; TDA2541) the noise gate of the TDA3571B is not required.

### 3. Sync separator slicing level output

The sync separator slicing level is determined on this pin. A slicing level of 50% is obtained by comparing this level with the black level of the video signal, which is detected at pin 4. The slicing level P is determined by the following formula:

$$P = \frac{R_S}{R_S + T_{hor}/T_{sync} \times 0{,}35\ k\Omega} \times 100\% = \frac{R_S}{R_S + 5{,}6\ k\Omega} \times 100\%$$

where $R_S$ is the resistor (in kΩ) between pins 3 and 4. The capacitor that is connected to pin 3 must be between 0,47 μF and 4,7 μF.

### 4. Black level detector output

The black level of the input signal is detected on this pin. This is required to obtain good sync separator operation. A 47 μF capacitor in series with a resistor of 82 Ω must be connected to this pin. A 5,6 kΩ resistor connected between pin 3 and pin 4 results in a slicing level of 50%.

### 5. Vertical sync pulse integrator biasing network

The vertical sync pulse is obtained by integrating the composite sync signal in an internal RC-network. An external RC-network is required for the correct biasing of this circuit for various input conditions. Typical values are: R = 68 kΩ; C = 10 μF. The resistor influences the delay of the **direct** vertical sync pulse.

### 6. Horizontal phase detector output

The control voltage for the horizontal oscillator is obtained on this pin. The output current is about 2 mA.

### 7. Reference voltage horizontal frequency control stage

This pin has two functions. It is used to decouple the reference voltage for the frequency control of the horizontal (so a good suppression of interference is obtained which may be present on the supply line). It also controls the reference waveform for symmetrical gating of the horizontal synchronization, thus providing good noise immunity.

DEVELOPMENT SAMPLE DATA

APPLICATION INFORMATION (continued)

**8. Horizontal sync pulse output**

This pulse is obtained from the horizontal oscillator via a divider circuit. The duty factor is 54%. The trailing edge of this pulse occurs 0,9 $\mu$s after the end of the video sync pulse input at pin 2. Because of this phase relationship the horizontal sync pulse can drive directly the TDA2581.

**9. Video transmitter identification output**

This is an emitter-follower output which will be inactive (high-impedance) when the level at pin 10 is $>$3,5 V (video transmitter detected). The output will be active high when the level at pin 10 is $<$ 1,6 V (no video transmitter detected). This feature can be used for search-tuning and sound-muting.

**10. Video transmitter identification**

A 47 nF capacitor must be connected to this pin. It charges to a level of 8 V when a sync pulse is detected, and discharges to a level of $<$ 1 V when no sync pulse is detected.

**11. Gating switch**

This pin is used to switch the time constant of the flywheel filter. The pin condition is determined by the coincidence detector (pin 12). During in-sync or when only noise is being received pin 11 assumes ground level, which results in a long time constant and good noise immunity.

**12. Coincidence detector output**

A 1 $\mu$F capacitor must be connected to this pin. The output voltage depends on the oscillator condition (synchronized or not) and on the video input signal. There are two switching levels at pin 12. At the first switching level when the output voltage is $<$ 1,85 V, the flywheel filter is switched to a long time constant and the gating of the phase detector is switched on. When the output voltage is $>$ 1,85 V, the flywheel filter has a short time constant, and the gating of the phase detector is switched off. The result is that during noise the flywheel filter time constant remains long thus preventing large shifts in the frequency of the horizontal oscillator (and screening of the horizontal output transformer). At the second switching level when the output voltage is $>$ 8,25 V the sync system is switched to a short time constant while the indirect/direct vertical sync system remains fully operational. This condition is suitable for VCR application.

**13. Negative supply (ground)**

**14. Positive supply horizontal oscillator**

Interference and hum on this supply line can affect the oscillator frequency. It is therefore necessary to have separate decoupling of this pin with respect to pin 18.

**15. Sandcastle pulse output**

This pulse is composed of two parts. The lower part has an amplitude of typ. 4,5 V peak-to-peak and a width of max. 9,2 $\mu$s (for phase relationship see Fig. 2). The upper part has a total amplitude in excess of 9 V peak-to-peak and a width of max. 4,4 $\mu$s. The leading edge of this pulse has a delay of 0,9 $\mu$s with respect to the trailing edge of the sync pulse at the input (pin 2). This pulse can directly drive the burst gate/black level clamp input of the TDA2560.

**16. RC-network horizontal oscillator**

Stable components should be chosen for good frequency stability. For adjusting the frequency a part of the total resistance must be variable. This part must be as small as possible, because of poor stability of variable carbon resistors.
The oscillator can be adjusted when pins 7 and 17 are short circuited (see Fig. 3).

### 17. Horizontal oscillator control pin

### 18. Positive supply sync separator and divider circuit (vertical)

This supply requires only simple decoupling. The typical combined current draw of pins 14 and 18 is 52 mA.

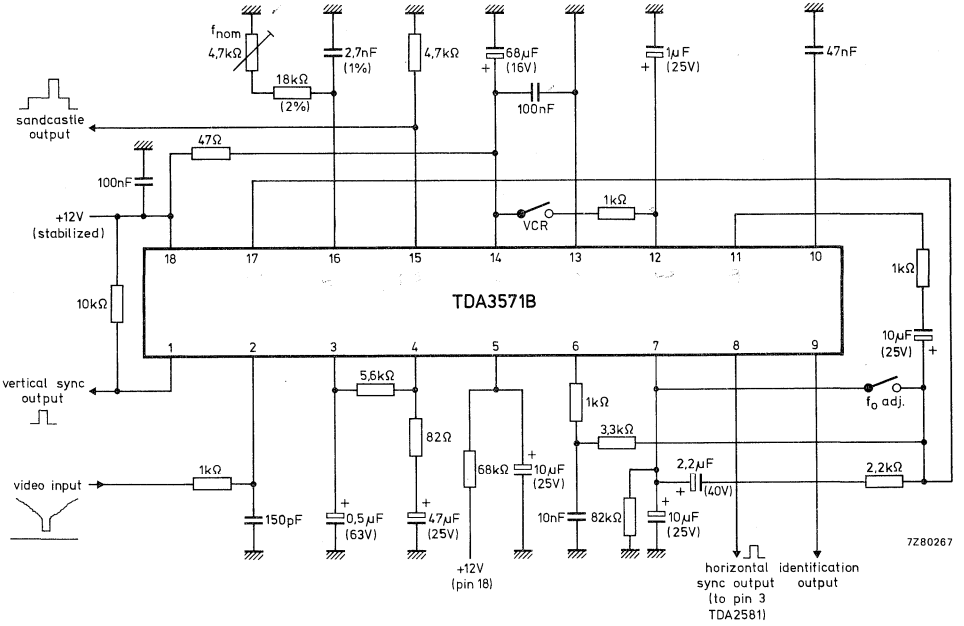

Fig. 3 Typical application circuit diagram; for combination of the TDA3571B with the TDA2581.

DEVELOPMENT SAMPLE DATA

# SYNC COMBINATION WITH TRANSMITTER IDENTIFICATION AND VERTICAL 625 DIVIDER SYSTEM

## GENERAL DESCRIPTION

The TDA3576B is a monolithic integrated circuit for use in colour television receivers. The circuit is optimized for a horizontal and vertical frequency ratio of 625.

### Features

- Horizontal sync separator (including noise inverter) with sliding bias such that the sync pulse is always sliced between top sync level and blanking level
- Phase detector which compares the horizontal sync pulse with the oscillator voltage; this phase detector is gated
- Phase detector which compares the horizontal flyback pulse with the oscillator voltage
- Horizontal oscillator (31,25 kHz)
- Time constant switching of the first control loop (short time constant during catching and reception of VCR signals)
- Burst key pulse generator (sandcastle pulse with three levels)
- Very stable automatic vertical synchronization due to the 625 divider system, without delay after channel change
- Vertical sync pulse separator
- Three voltage level sensor on coincidence detector circuit output
- Video transmitter identification circuit for sound muting and search tuning systems
- Inhibit of vertical sync pulse when no video transmitter is detected

## PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102HE4).

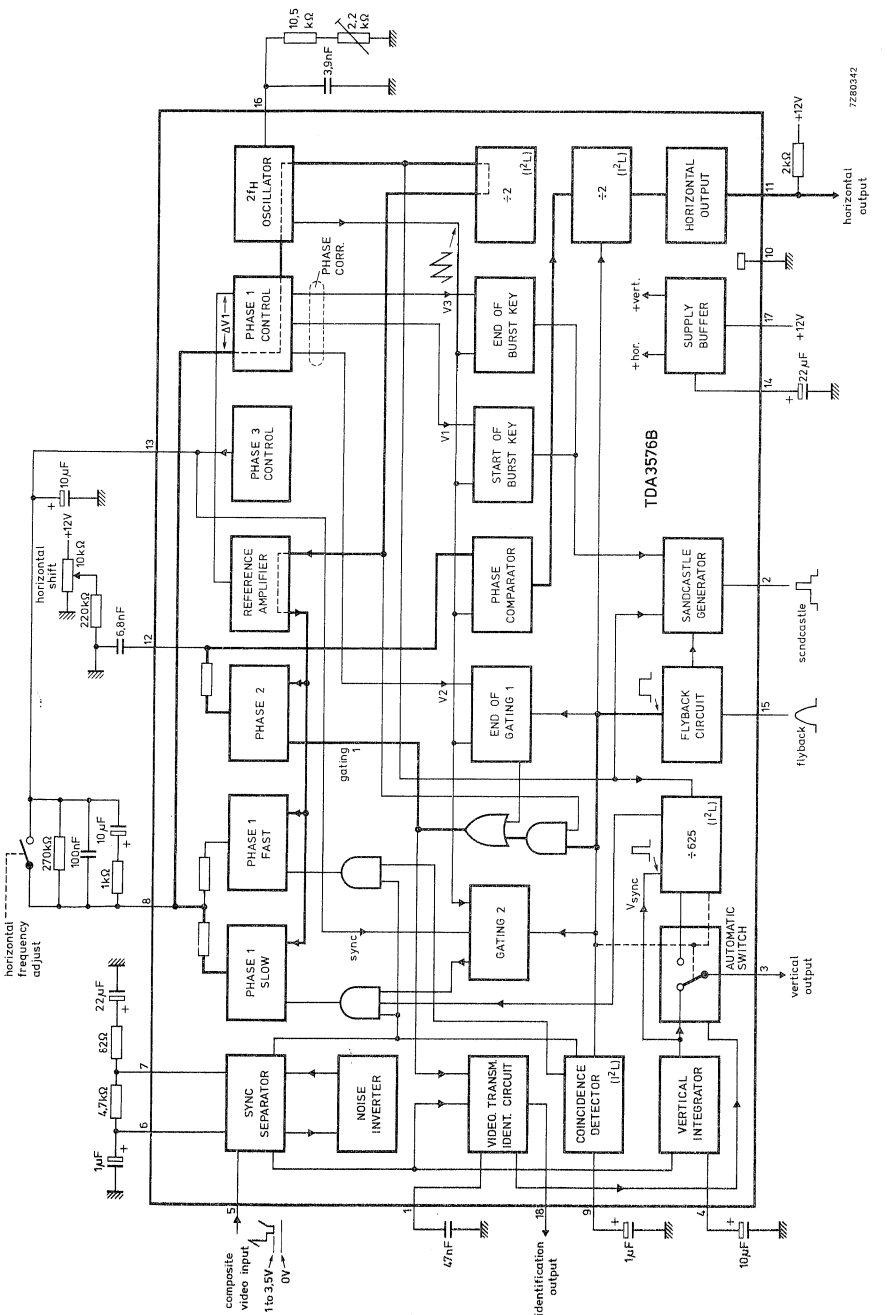

Fig. 1 Block diagram.

## FUNCTIONAL DESCRIPTION

The video input voltage to drive the sync separator must have negative-going sync, which can be obtained from synchronous demodulators such as TDA2540 and TDA2541.

The slicing level of the sync separator is determined by the value of the resistor between pins 6 and 7. A 4,7 kΩ resistor provides a slicing level midway between the top sync level and the blanking level. Thus the slicing level is independent of the amplitude of the sync pulse input at pin 5.

The nominal top sync level at pin 5 is 3 V, and the amplitude selective noise inverter is activated at 0,7 V.

To obtain good stability the circuit contains three control loops. In the first loop the phase of the horizontal sync pulse is compared with a reference output pulse from the horizontal oscillator. In the second loop the phase of the flyback pulse is compared with the same reference output pulse. The first loop is designed for good noise immunity and the second loop has a fast time constant to compensate quickly for storage variations of the output stage. The second loop also generates a gating signal of about 5,5 μs for use in the transmitter identification circuit. The third control loop generates a second gating signal which is used in the first phase detector. The pulse width is typically 14 μs.

For a short catching time the output current of the first phase detector is not gated but is increased by 5 times during catching. This is caused by the voltage of the coincidence detector at pin 9. For VCR playback conditions the first control loop must be forced to a fast time constant, this is achieved by applying an external voltage of $\geqslant$ 2,7 V to pin 9.

The free running output frequency of the horizontal oscillator is 31,25 kHz. The vertical frequency output is obtained by dividing this double horizontal frequency by 625. The double horizontal frequency is fed via a binary divider to provide the normal 15,625 kHz horizontal output to pin 11.

The sandcastle pulse is generated at pin 2 and has three levels. The burst key pulse is of short duration, typically 4 μs, with an amplitude of 10 V and is the highest level. The second level has a pulse duration equal to the horizontal flyback pulse with an amplitude of 4,5 V and is used for horizontal blanking. The third level, amplitude 2,5 V, is used for vertical blanking and has a pulse duration of 1,34 ms. The last pulse is internally generated by the divider circuit and is only available when a standard video input signal is received. An external vertical blanking pulse can be added to this pin via a suitable series resistor. This pulse will be automatically clamped to 2,5 V.

The automatic vertical sync block contains the following:

- 625 divider
- In/out-sync detector
- Direct/indirect sync switch
- Identification circuit

It is fed by a signal obtained by integration of the composite video signal and an internally generated, clipped video signal. The vertical sync pulse is sliced out of this integrated signal by an automatically biased clipper. The video part of the signal helps to build up a vertical sync when heavy negative-going reflections (mountains) distort the video signal. The in/out sync-detector considers a signal out-of-sync when fourteen or more successive incoming vertical sync pulses are not in phase with a reference signal from the 625 divider. Therefore a distorted vertical sync signal needs only one out-of-fourteen pulses to be in phase to keep the system in sync. When the fifteenth successive out-of-sync pulse is detected, the direct/indirect sync switch is activated to feed the vertical sync signal directly out of the block at pin 3 (direct sync vertical output).

At the same time the 625 divider is reset by one of the sync pulses. After the reset pulse, if the 7th sliced vertical sync pulse coincides with a 625 divider window, the sync output pulse is presented again by the divider system and switch-over to indirect mode occurs.

In the direct mode, every 7th non-coinciding sliced vertical sync pulse will reset the counter. A non-standard video signal will result in continuous reset pulses and the direct/indirect switch will remain in the direct position.

## FUNCTIONAL DESCRIPTION (continued)

To avoid delay in vertical synchronization, caused by waiting time of the divider circuit after channel change or an unsynchronized camera change in the studio, information is fed from the horizontal coincidence detector to the automatic switch for the vertical sync pulse. The loss of horizontal synchronization sets the automatic switch to direct vertical sync.

When an external voltage between 2,7 V and 8,2 V is applied via pin 9 to the coincidence detector, the horizontal phase detector is switched to a short time constant and the automatic switch to direct vertical sync. A voltage level on pin 9 between 9,2 V and 12 V switches the horizontal phase detector to a short time constant, without affecting the indirect/direct vertical sync system which remains operational. Thus when standard signals are received vertical sync pulses are generated by the divider system.

To avoid disturbance of the horizontal phase detector by the vertical sync pulse the 625 divider system generates an anti-top-flutter pulse. This pulse is applied to the phase 1 detector when a standard video signal is received. The anti-top-flutter pulse is also active for standard VCR signal conditions, voltage at pin $9 \geqslant 9{,}2$ V.

The video transmitter identification circuit detects when a sync pulse occurs during the internal 5,5 $\mu$s gating pulse. This indicates the presence of a video transmitter and results in the capacitor connected to pin 1 being charged to 8,4 V. When no sync pulse is present the capacitor discharges to $< 1$ V. The voltage at pin 1 is compared with an internal d.c. voltage. The identification output at pin 18 is active when pin 1 is $\leqslant 1{,}5$ V (no video transmitter) and inactive (high impedance) when pin 1 is $> 3{,}5$ V, this information can be used for search tuning.

The vertical sync output pulse at pin 3 is inhibited when no video transmitter is identified, which prevents interference or noise affecting the frequency of the vertical output stage. This results in a vertical stable picture, plus vertical stable position information for tuning systems.

* The maximum allowed voltage at pin 9 is $V_P$ (pin 17).

**Notes to characteristics**

1. The video signal at pin 5 must have negative-going sync.
2. Up to 1 V peak-to-peak the slicing level is constant; at amplitudes exceeding 1 V peak-to-peak the slicing level will increase.
3. The slicing level is determined by the value of the resistor between pin 6 and pin 7. The 50% figure is obtained with a 4,7 kΩ resistor. The slicing level P is determined by the formula:

   $P = \frac{R_S}{4880 + R_S} \times 100\%$; where $R_S$ is the resistor between pins 6 and 7.
4. Values of external circuitry as shown in Fig. 1; the voltage in this ratio has a peak-to-peak value.
5. The horizontal output configuration is an open collector with internal high voltage protection during the off-state of the output transistor.
6. The horizontal output pulse width is determined by the horizontal flyback pulse. The circuit is designed such that the horizontal output transistor cannot be switched on during flyback, but is switched on directly after flyback. Thus $t_p$ = switch-off delay of horizontal output stage plus flyback time.
7. When the voltage level at pin 9 is $< 2{,}1$ V, phase detector 1 (pin 8) is gated. When the level is $> 2{,}7$ V, the dynamical control sensitivity of the phase detector is raised such that the output current is increased by five times the original amount and the phase detector is not gated.
8. An external vertical blanking pulse can be applied to pin 2 via a series resistor. The required input current is 2 mA. This external pulse is clamped to 2,5 V by internal circuitry.
9. The video transmitter identification output stage at pin 18 consists of a p-n-p current source with an n-p-n emitter-follower.

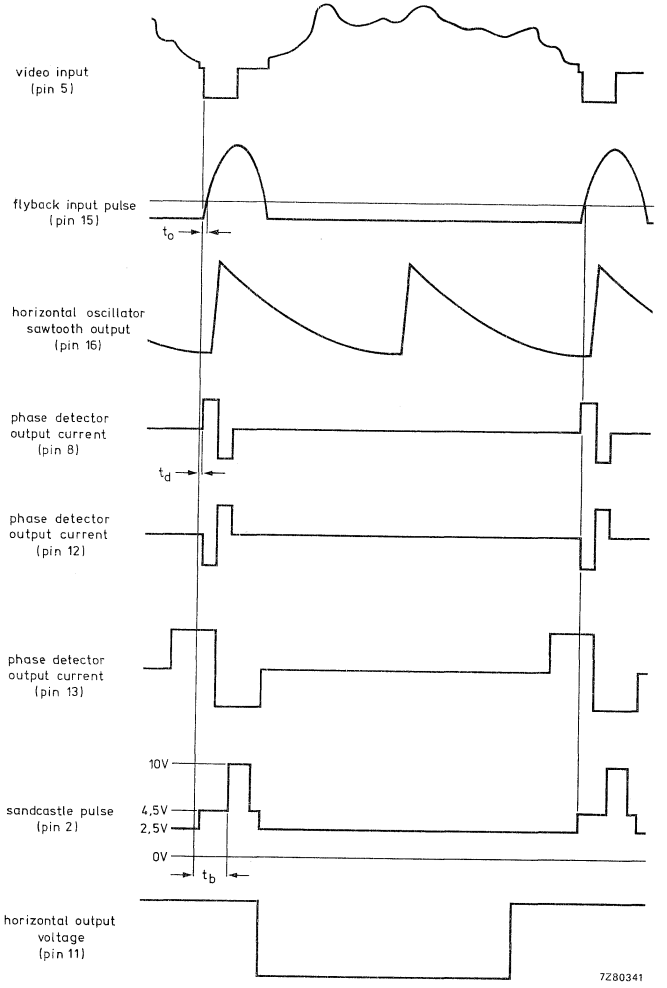

Fig. 2 Phase relationship between the input and output signals of the TDA3576B.

## APPLICATION INFORMATION (see also Fig. 3)

The function is described against the corresponding pin number.

### 1. Video transmitter identification

A 47 nF capacitor must be connected to this pin. It charges to a level of 8 V when a sync pulse is detected, and discharges to a level of $< 1$ V when no sync pulse is detected.

### 2. Sandcastle output pulse

This output has three levels. The first and highest level (10 V) is the burst key pulse with a typical duration of 4,0 $\mu$s. The second level, for the horizontal blanking, is typically 4,5 V with a pulse duration equal to the horizontal flyback pulse. For the third level an external vertical flyback pulse must be applied to this pin. This pulse will be clamped to 2,5 V by an internal clamping circuit. The input current is typically 2 mA.

### 3. Vertical output pulse

This pulse is obtained from the 625 divider circuit when standard input signals are received or from the sync separator when the signals are non-standard. The pulse is inhibited when no video transmitter is detected. Both pulses have good stability and accuracy and are used to trigger the vertical oscillator.

### 4. Vertical sync pulse integrator biasing network

The vertical sync pulse is obtained by integrating the composite sync signal in an internal RC-network. An external capacitor of 10 $\mu$F is required for biasing the vertical sync separator, this provides the vertical sync output pulse with a delay of 37 $\mu$s. This value can be changed by an external resistor. A resistor of 470 k$\Omega$ between pin 3 and +12 V gives a delay of 45 $\mu$s.

### 5. Video input

The video input signal must have negative-going sync pulses. The top-sync level can vary between 1 V and 3,5 V without affecting the sync separator operation. The slicing level is fixed at 50% for the sync pulse amplitude range 0,1 to 1 V which provides good sync separation down to pulses with an amplitude of 100 mV peak-to-peak. The slicing level is increased for sync pulses in excess of 1 V peak-to-peak. The noise gate is activated at an input level $< 1$ V, thus when noise gating is required the top sync level should be close to the minimum level of 1 V.

### 6. Sync separator slicing level output

The sync separator slicing level is determined on this pin. A slicing level of 50% is obtained by comparing this level with the black level of the video signal, which is detected at pin 7.

### 7. Black level detector output

The black level of the input signal is detected on this pin. This is required to obtain good sync separator operation. A 22 $\mu$F capacitor in series with a resistor of 82 $\Omega$ must be connected to this pin. A 4,7 k$\Omega$ resistor connected between pins 6 and 7 results in a slicing level of 50%.

### 8. Horizontal phase detector output and control oscillator input

The flywheel filter must be connected to this pin. Typical values for the components are a capacitor of 100 nF in parallel with an RC-network of 1 k$\Omega$ and 10 $\mu$F. Furthermore, a resistor of 270 k$\Omega$ should be connected between pins 8 and 13 to limit the free running frequency drift.

The output current of the phase detector depends on the condition of the coincidence detector. The output current is high when the oscillator is out-of-sync. The result is a large catching range, and the phase detector not gated. The output current is low when the oscillator is synchronized and the phase detector is gated; this provides good noise immunity.

APPLICATION INFORMATION (continued)

**9. Coincidence detector output**

A 1 $\mu$F capacitor must be connected to this pin. The output voltage depends on the oscillator condition (synchronized or not) and on the video input signal. The following output voltages can occur:

- when in-sync 1,3 V
- when out-of-sync 2,7 V
- during noise at the input 2,1 V

There are two switching levels at pin 9. At the first switching level when the output voltage is $< 2{,}1$ V, the phase detector output is low and the gating of the phase detector is switched on. When the output voltage is $> 2{,}7$ V, the output current of the phase detector is high and the gating of the phase detector is switched off. The result is a large catching range and a high dynamic steepness of the PLL. At the second switching level when the output voltage is $> 9{,}2$ V the sync system is switched to a short time constant while the indirect/direct vertical sync system remains fully operational. This condition is suitable for VCR application.

**10. Negative supply (ground)**

**11. Horizontal sync pulse output**

This is an open collector output. The collector resistor mus be chosen such that sufficient current is supplied to the driver stage. The maximum current is 60 mA. The circuit is designed such that the horizontal output transistor cannot be switched on during flyback, but is switched on directly after flyback.

**12. Control voltage second loop**

This voltage controls the output pulse at pin 11 (positive-going edge). The capacitor connected to this pin must have a minimum value of 6,8 nF. A higher value decreases the dynamic-loop gain in the second control loop. When a high dynamic-loop gain is not required a capacitor value of 100 nF is recommended. Horizontal shift is possible by applying an external current to pin 12.

**13. Reference voltage control loops**

The reference voltage must be decoupled by a capacitor of 10 $\mu$F.

**14. Decoupling internal power supply**

The IC has two power terminals. The main terminal (pin 17) supplies the output stages, the sync separator and the divider circuit. The specially decoupled terminal (pin 14) supplies the horizontal oscillator. The decoupling capacitor should be 22 $\mu$F.

**15. Flyback input pulse**

This pulse is required for the second phase control loop and for generating the horizontal blanking pulse in the sandcastle output. The input current must be at least 0,2 mA and not exceed 3 mA.

**16. RC-network horizontal oscillator**

Stable components should be chosen for good frequency stability. For adjusting the frequency a part of the total resistance must be variable. This part must be as small as possible, because of poor stability of variable carbon resistors. The oscillator can be adjusted when pins 8 and 13 are short circuited (see Fig. 3).

**17. Positive supply**

The supply voltage may vary between 10,5 and 13,2 V. The current-draw is typ. 70 mA and the range is 50 to 85 mA.

**18. Video transmitter identification output**

This is an emitter-follower output which will be inactive (high-impedance) when the level at pin 1 is $> 4$ V (video transmitter detected). The output will be active high when the level at pin 1 is $< 1{,}7$ V (no video transmitter detected). This feature can be used for search-tuning and sound-muting.

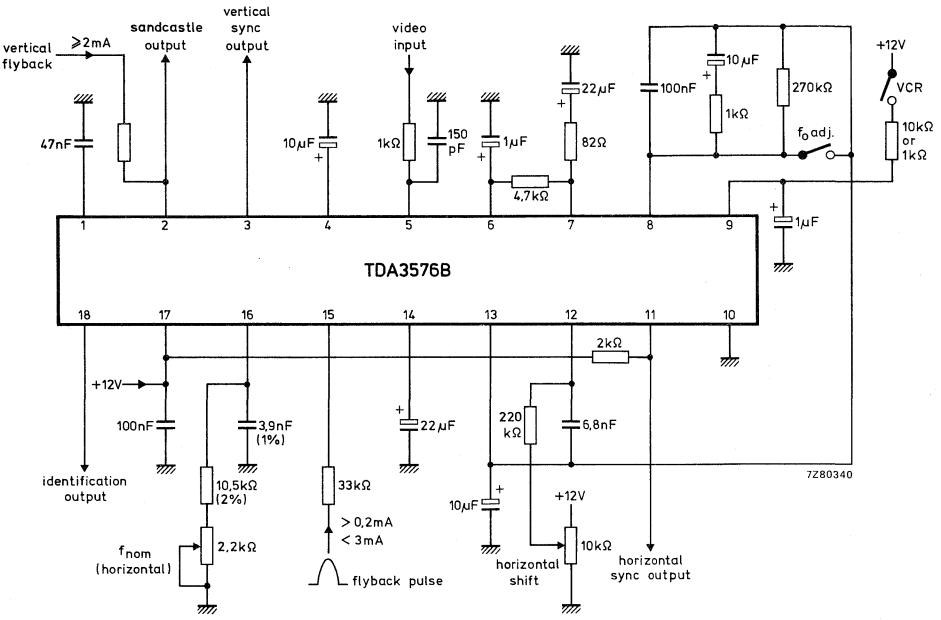

Fig. 3 Application circuit diagram.

DEVELOPMENT SAMPLE DATA

# SECAM PROCESSOR CIRCUIT

The TDA3590 is a processor circuit that converts SECAM signals into sequential phase modulated signals. This circuit is intended to be used in combination with the TDA3560, TDA3561 or TDA3562 of which the 8,8 MHz oscillator signal is used as the carrier for the modulator. The TDA3590 incorporates the following functions:

- Limiter/amplifier for the chrominance signal
- SECAM demodulator
- Clamp circuit and de-emphasis for the colour difference signals
- Modulator to convert the colour difference signals in sequential phase modulated signals
- Identification circuit which can be used as:
  - horizontal identification
  - vertical identification
  - combination of hor./vert. identification
- Divider circuit which generates the 4,4 MHz carrier signal from the 8,8 MHz signal of the PAL-modulator oscillator
- Sandcastle pulse detector
- SECAM switch and PAL matrix
- Video amplifier

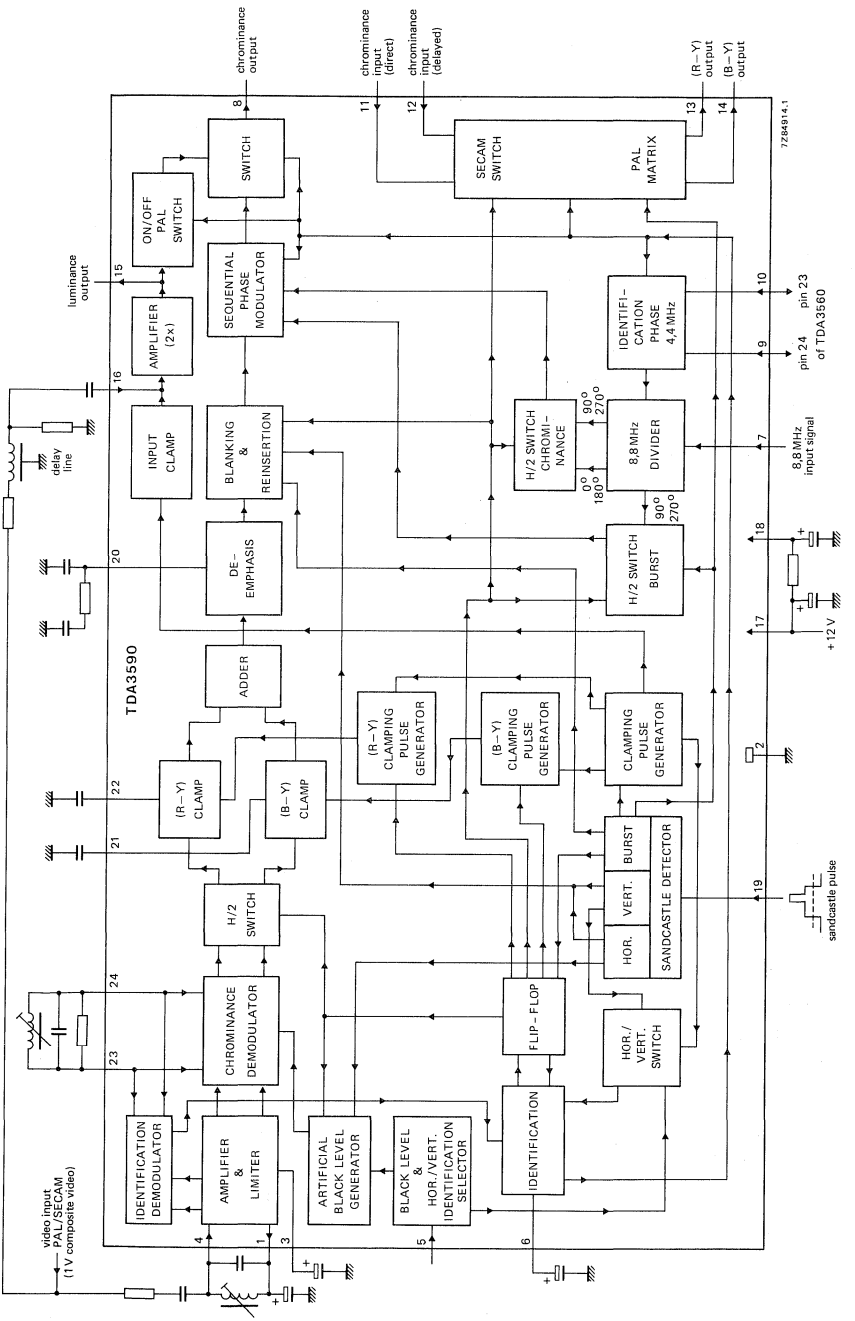

Fig. 1 Block diagram.

## GENERAL DESCRIPTION

### Demodulation

The TDA3590 comprises a chrominance and an identification demodulator, both using the same reference tuned circuit. The identification circuit automatically detects whether the incoming signal at pin 4 is SECAM or not (NTSC, PAL or black-and-white). When PAL signals are received, they are diverted via pin 16 to the chrominance output (pin 8).

The delay line connected to pin 16 delays the PAL luminance signal. The SECAM signal has the same delay in the processor circuitry. When SECAM signals are received, the PAL signal path is switched off. Then, the SECAM signal is applied to a limiter/amplifier (via a bandpass filter with a bell-shaped response, after which it is demodulated). The (R−Y) and (B−Y) signals are available sequentially, so only one demodulator is necessary. After demodulation the signals are applied to an H/2 switch, which separates the two colour difference signals. Now the signals are applied to the (R−Y) and (B−Y) clamp circuits, where the black levels are clamped to the same d.c. level. The optimum black level can be obtained at the end of the horizontal burst, so the timing of the (R−Y) and (B−Y) clamp is determined by an internally generated pulse of 800 ns, which starts just after the sandcastle burst gate pulse. The two signals are added again after clamping. The signal is applied to the modulator via a de-emphasis, blanking and reinsertion circuit.

If $V_{5\text{-}2} > 2$ V, artificial black levels are inserted during the horizontal blanking period. The clamp circuits then react upon these levels instead of the demodulated burst signals (necessary in case there are no horizontal burst signals available). The inserted signals may not be identical to the detected signals, because of circuitry spread. This can be corrected by detuning the demodulator tuned circuit.

### Modulation

The (R−Y)/(B−Y) ratio is 1,78 at the de-emphasis output (pin 20). The demodulated (R−Y) and (B−Y) signals have a positive phase position for a magenta colour.

A burst signal is added to the demodulated SECAM signal at the input of the modulator. A sequential modulated chrominance signal is present at the modulator output. The modulation carriers of the (R−Y) and (B−Y) signals are 90° out of phase. The burst is modulated in the + (R−Y) direction and is only present during an (R−Y) line. The modulated (R−Y) component has the same phase position as the (R−Y) burst for a magenta colour.

### Identification

The identification circuit compares the voltage difference, which is obtained after demodulation, with the phase of the flip-flop. For horizontal identification this comparison occurs during the internally generated 800 ns pulse. Only SECAM signals have a voltage difference from line to line during comparison. If the phase relationship between both the signals is wrong, the flip-flop will get a reset with an extra input pulse.

The identification detector information is also used for colour killing and for switching to PAL, if required.

The identification (as above) occurs when the horizontal identification system is active. When the vertical identification system is switched on (pin 5), the system only compares the demodulator output voltage during line scanning of the vertical blanking. The further operation is identical to the horizontal identification.

### Sandcastle pulse detector

The sandcastle pulse detector is able to handle a 3-level sandcastle pulse. It detects the various blanking and gating pulses and it generates the correct drive pulses for the clamping circuits.

## GENERAL DESCRIPTION (continued)

### Carrier generation

The carrier signal for the PAL modulator is obtained from the 8,8 MHz oscillator signal of the TDA3560. The frequency of this signal is divided-by-two to obtain 90° shift. These two signals are applied to the modulator. There is a possibility that the two dividers in the TDA3560 (pins 23 and 24) and the TDA3590 are out-of-phase. This can be corrected by connecting pins 9 and 10 of the TDA3590 to pins 24 and 23 of the TDA3560 respectively. At incorrect phase, the TDA3590 divider is reset and correct phase is obtained.

### PAL-matrix and SECAM-switch

The colour difference signals are transmitted sequentially in the SECAM-system, so the modulated PAL-signal from the TDA3590 is also sequential. The consequences are:

- The two colour difference signals are mixed again in the delay line matrix circuit, so that both demodulators get a combination of an (R–Y) and (B–Y) signal. The phase position of the reference carrier must be very accurate for obtaining a proper demodulated signal, otherwise colour errors will occur (e.g. in the NTSC-system).
- Two different signals are added or subtracted in the matrix circuit, which results in an amplitude that has half the amplitude when compared with a normal PAL signal.

  Increase of the chrominance signal in the TDA3590 results in an overdrive of the chrominance amplifier of the TDA3560.

These effects can be avoided by the matrix and switching circuit which is included in the TDA3590. The direct and delayed (from the PAL delay line) signals are applied to the processor where they are matrixed (for PAL) or switched (for SECAM). In the latter condition, the gain of the circuit is twice as high as for the normal PAL reception. The phase accuracy is not critical in this situation, because the two colour difference signals are not mixed.

For SECAM, the (B–Y) output of the SECAM-switch will be a signal without burst. The (R–Y) output of the SECAM-switch only has a burst during the +(R–Y) line. This burst is modulated in the +(R–Y) direction.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | |
|---|---|---|---|
| Supply voltage | $V_P = V_{17-2}$ | max. | 13,2 V |

**Notes to the characteristics**

1. When an artificial black level is inserted after demodulation, the resulting black level deviation depends on the adjustment of the demodulator tuned circuit. It is therefore possible to obtain a value of zero per cent.
2. This pulse starts directly after the burst clamping pulse.
3. The phase delay between the oscillator output of the TDA3560 and the input of the TDA3590 (pin 7) must be adjusted such, that the burst amplitude at pin 28 of the TDA3560 is minimum.

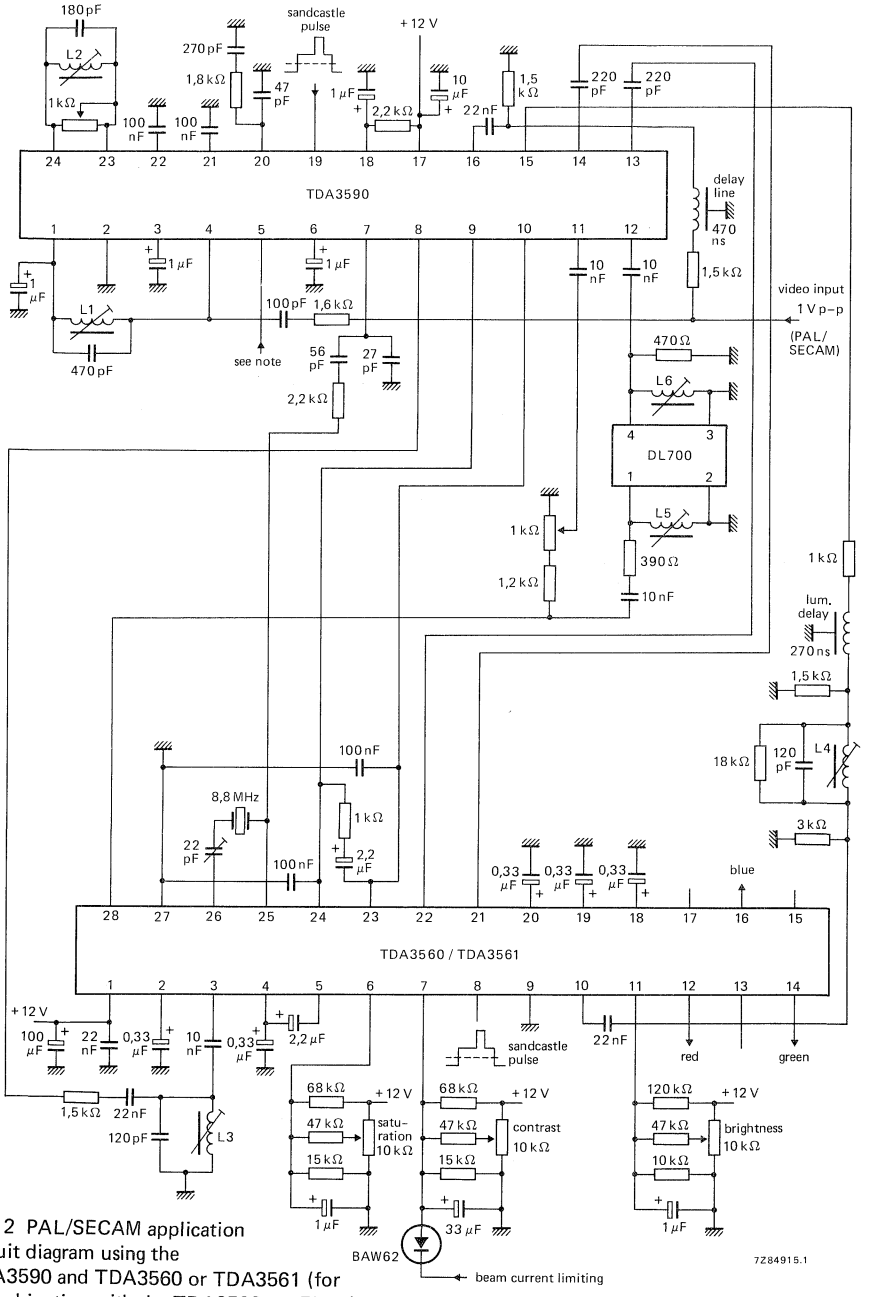

Fig. 2 PAL/SECAM application circuit diagram using the TDA3590 and TDA3560 or TDA3561 (for a combination with the TDA3562 see Fig. 3). For note to pin 5 of the TDA3590 see next page.

**Note to Fig. 2**

$V_{5\text{-}2} < 0{,}5$ V : horizontal identification and black level clamping.
$V_{5\text{-}2} > 10{,}5$ V : vertical identification and artificial black level.
$V_{5\text{-}2} = 5$ to 7 V: horizontal identification and artificial black level.

## PINNING

1. Limiter feedback to pin 4.
2. Ground.
3. Limiter feedback.
4. Input limiter; PAL identification input; SECAM chrominance/identification input.
5. Via a d.c. voltage to this pin, the SECAM identification system can be chosen.
   At $V_{5\text{-}2} < 8$ V the processor is preset for horizontal identification.
   At $V_{5\text{-}2} > 10{,}5$ V the processor is preset for vertical identification.
   At $V_{5\text{-}2} < 0{,}5$ V the demodulated black level of the SECAM horizontal burst will be used as black level reference.
   At $V_{5\text{-}2} > 2$ V the demodulated chroma signal will have an artificial black level during the SECAM horizontal burst.
6. Store capacitor of PAL/SECAM identification circuit;
   horizontal identification: 100 nF
   vertical identification: 1 $\mu$F
7. Input of 8,8 MHz oscillator signal.
8. PAL/processed SECAM signal output (chrominance output).
9. Identification input of 8,8 MHz divider (to pin 24 of TDA3560).
10. Identification input of 8,8 MHz divider (to pin 23 of TDA3560).
11. Direct chrominance input of PAL matrix/processed SECAM switch.
12. Delayed chrominance input of PAL matrix/processed SECAM switch.
13. PAL/processed SECAM (R–Y) h.f. output.
14. PAL/processed SECAM (B–Y) h.f. output.
15. Luminance output.
16. Luminance/PAL input.
17. Positive supply voltage (+ 12 V).
18. Decoupled positive supply voltage.
19. Three-level sandcastle pulse input. It detects the various blanking and gating pulses and it generates the correct drive pulses for the clamping circuits.
20. De-emphasis is performed at this pin with a 1,8 k$\Omega$ resistor and a 270 pF capacitor. To avoid moiré patterns on the screen, additional filtering of the demodulator double-frequency products is obtained by a 47 pF decoupling capacitor.
21. Store capacitor (B–Y) clamp.
22. Store capacitor (R–Y) clamp.
23. Demodulator reference tuned circuit.
24. Demodulator reference tuned circuit. The demodulator reference circuit has to be tuned to a nominal frequency of about 4,33 MHz. The quality factor of the tuned circuit must be nominal 2,45.

## APPLICATION INFORMATION (see Fig. 2)

**The function is described against the corresponding pin number**

### Pin 4. Chrominance input

The SECAM input signal is typically 100 mV peak to peak, while the PAL input signal is about 550 mV peak to peak. This corresponds to a PAL/SECAM ratio of 5,5 (based on 75% saturated colour bar signals). The input signal, which should be free from any sound modulation, is applied single-ended to pin 4 via a filter which provides the required bell-shaped bandpass for SECAM signals. D.C. biasing takes place via coil L1, which has an unloaded quality factor between 80 and 100.

### Pin 8. Chrominance output

During PAL reception, this output is internally connected to the luminance stage, therefore a composite video signal of 0,9 V peak to peak (typical) is present at the output. During SECAM reception, the chrominance output stage is connected to the modulator. The sequentially modulated (R−Y) and (B−Y) signals are then available at the output (amplitudes of typically 1100 mV peak to peak). These signals are applied via a chrominance bandpass filter to the chrominance a.c.c. amplifier in the TDA3560.

### Pin 6. System identification

A 1 $\mu$F capacitor is connected to this pin. During PAL reception, the typical voltage at pin 6 is 10,3 V. The chrominance output stage is then internally connected to the luminance stage and the PAL matrix circuit is activated for normal matrixing of the PAL signals. During SECAM reception, the voltage at pin 6 is about 7 V (typical). The chrominance output stage is connected to the modulator and the SECAM switch is enabled. During noisy SECAM signals, the voltage at pin 6 increases and colour killing/unkilling occurs around 9,20 V and 9,05 V respectively.

### Pin 5. Horizontal/vertical identification

Horizontal or vertical identification can be selected depending on the externally applied voltage at pin 5. When the d.c. level on pin 5 changes with time (pulse information), a combination of horizontal and vertical identification is possible.

*Horizontal identification*

If the voltage at pin 5 is $< 2$ V, horizontal identification occurs with black level clamping. This clamping occurs on the back-porch of the demodulated colour difference signals. If artificial black level insertion is required, the voltage at pin 5 should be $< 8$ V.

*Vertical identification*

If the voltage at pin 5 is $> 10,5$ V, vertical identification occurs, i.e. identification on 9 lines in the vertical blanking period. In this mode, the black level is artificially inserted after demodulation.

### Pin 19. Sandcastle pulse

A 3-level sandcastle pulse is required and this can be directly coupled to the sandcastle pulse detector. Horizontal blanking, vertical blanking and burst clamping pulses are separated by the IC. A clamping pulse of 800 ns is generated internally just after the burst gating pulse. The input current is typically 10 $\mu$A at an input signal of 7 V.

**Pins 16 and 15. Luminance input/output**

The input signal at pin 16 should be typically 0,5 V peak to peak. The input impedance is relatively high, so a 22 nF coupling capacitor can be applied. This luminance signal is internally clamped and after a 2 times amplification available at pin 15.

During SECAM reception, the luminance signal is delayed by about 470 ns in a luminance delay line. The chrominance and luminance signals are then correctly timed at the output of the TDA3590.

During PAL reception, the composite video signal passes through this delay line and, after amplification, is available at pins 8 and 15. The nominal amplitude of the signals is 900 mV peak to peak in both cases.

**Pins 11, 12, 13 and 14. SECAM switch and PAL matrix**

During PAL reception, the system identification 'enables' the PAL matrix circuitry. An a.c.c. composite chroma signal (from pin 28 TDA3560) is coupled via the glass delay line to pin 12 of the TDA3590. A direct signal is applied to pin 11 of the TDA3590 via a resistor network. Active matrixing takes place in the IC and consequently (R−Y) and (B−Y) signals are available at pins 13 and 14 respectively. These signals are applied to the TDA3560 demodulators (pins 22 and 21 respectively).

During SECAM reception, the PAL matrix circuitry is 'disabled' and the SECAM switch is 'enabled'. A sequentially modulated (R−Y) and (B−Y) signal is available at pin 28 of the TDA3560. Direct and delayed signals are applied to pins 11 and 12 of the TDA3590, and via the SECAM switch the (R−Y) and (B−Y) signals are applied to their respective demodulator in the TDA3560.

**Pins 17 and 18. Supply voltage (+ 12 V)**

Correct operation is ensured within the supply range of 10,8 V to 13,2 V, and the typical power dissipation of the IC is 1,1 W at 12 V.

Pins 17 and 18 are separated by an external RC filter. Pin 18 is the supply for biasing several current-sinks in the IC and for all the output stages.

This supply voltage separation minimizes crosstalk via the supply lines between various parts of the circuitry. The capacitor at pin 18 must be small ($\approx 1\ \mu F$) so that, if pin 17 is short-circuited to ground, the collector-base junction of a transistor in the IC, through which the discharge current flows, is not damaged.

**Pin 20. De-emphasis**

De-emphasis is performed at this pin with a 1,8 kΩ and a 270 pF capacitor. To avoid moiré patterns on the screen, additional filtering of the 8,8 MHz signal is obtained by a 47 pF decoupling capacitor.

**Pins 21 and 22. Clamping of (R−Y) and (B−Y) signals**

After demodulation, the sequential (R−Y) and (B−Y) signals are separated by means of an H/2 switch and passed-on to their respective clamping circuits, where they are clamped to the same d.c. level. The value of each clamping capacitor should be 100 nF and they may, if desired, be increased to 470 nF.

**Pins 23 and 24. Demodulator reference tuned circuit**

The SECAM signal is applied to the demodulator via the 'bell-filter' and limiter/amplifier. Only one demodulator is used because of the sequential nature of the signal. The reference signal, obtained from the tank circuit, is applied to pins 23 and 24. At $V_{5\text{-}2} > 2$ V, the tuning and damping of the tank circuit should be done in such a way that a minimum modulator output voltage at pin 8 of the TDA3590 is obtained (the (R−Y) and (B−Y) information in the SECAM video signal is switched off). Therefore, any deviations between the black levels (when clamping on the back-porch and when an artificial black level is filled in) can be made minimum.

## APPLICATION INFORMATION (continued)

### Pin 7. Carrier generation

An 8,8 MHz signal from pin 25 of the TDA3560 is applied via pin 7 to the divider circuit in the TDA3590. Two 4,4 MHz signals are obtained with a phase shift of 90° with respect to each other. These signals are applied to the modulator via an H/2 switch. The phase delay of the 8,8 MHz input signal must be adjusted such that the burst amplitude of the chrominance signal at pin 28 (TDA3560) has its minimum amplitude. Under this condition, the burst generated by the TDA3590 is in phase with the (R−Y) reference signal for the demodulator in the TDA3560. Since the a.c.c. of the TDA3560 operates in the + (R−Y) direction, the burst signal at pin 28 of the TDA3560 will have its minimum amplitude.

### Pins 9 and 10. Divider resetting

The output of the burst phase detector of the TDA3560 is connected to pins 9 and 10. At SECAM reception, the differential a.c. current information, obtained from the burst detector (TDA3560), is applied to pins 9 and 10 (TDA3590). This gives information about the phase relationship between the two 4,4 MHz dividers in both ICs. The TDA3590 now generates a minimum relative voltage between pins 9 and 10 at an absolute voltage level of 10,6 V. The result is that the oscillator control function of the TDA3560 is overruled, and the oscillator is set to 2 x 4,43 MHz.

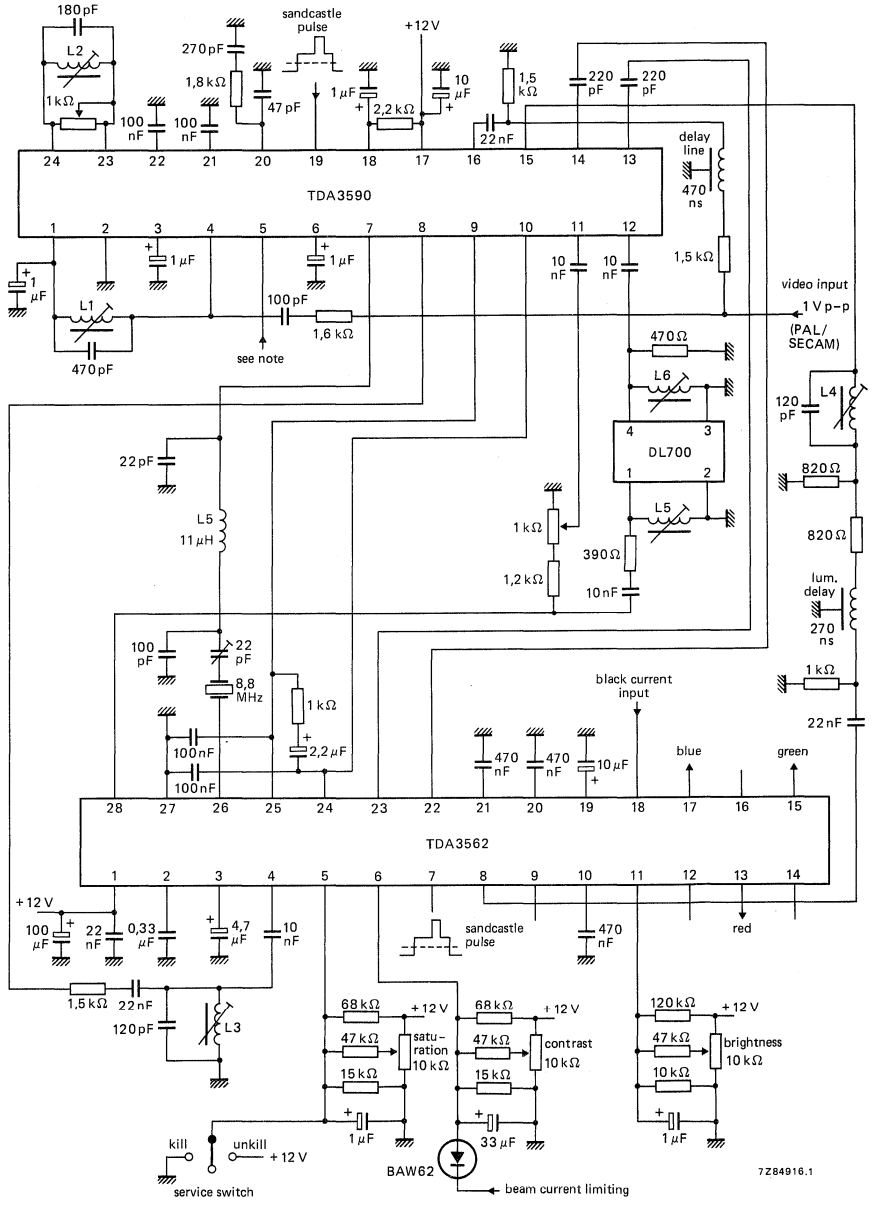

Fig. 3 PAL/SECAM application circuit diagram using the TDA3590 and TDA3562.
Note to pin 5 TDA3590: $V_{5\text{-}2} < 2$ V; horizontal identification and black level clamping.
$V_{5\text{-}2} > 10{,}5$ V; vertical identification and artificial black level.
$V_{5\text{-}2} = 5$ to 7 V; horizontal identification and artificial black level.

# SECAM PROCESSOR CIRCUIT

## GENERAL DESCRIPTION

The TDA3590A is pin compatible with the TDA3590. Additional improvements have been made and are described below.

### Luminance amplifier

The luminance amplifier is modified (between pins 16 and 15). The amplifier can now handle input signal levels at pin 16 of up to 1,2 V peak to peak (2,7 V peak to peak −7 dB). The gain of the amplifier is typical 7 dB.

### Horizontal identification with black level re-insertion

The TDA3590A is automatically set to internal horizontal identification with black level re-insertion by means of a voltage divider which presets pin 5 to 6 V.

### Internal current sources at pins 9 and 10

Pins 9 and 10 of the TDA3590A are provided with internal current sources, thus, the two 150 kΩ (1%) resistors currently used in the TDA3590 can be deleted.

### Coupling of system identification between the TDA3590A and TDA3560;61;62

If desired, the identification systems of the TDA3590A and TDA3560;61;62 can be coupled. Under this condition the system choice (PAL, NTSC or SECAM) will take place correctly.

### Spread of internal de-emphasis network

The external de-emphasis component values are changed to R = 1 kΩ and C = 470 pF. The spread of the internal de-emphasis network is now $< 15\%$.

### Suppression of higher harmonics

In addition to the quasi-PAL chrominance signal, odd and even harmonics of the 4,4 MHz signal are also generated at the modulator, which appear at pin 8 of the TDA3590A. These harmonics are suppressed by internal on-chip filters.

### Black level clamping

If artificial black level re-insertion is desired, the burst gating pulse (duration is about 4 μs) is used for black level clamping.

### Burst chrominance ratio for a SECAM signal

For equal saturation of PAL and SECAM signals, a correction in the burst-chrominance ratio of the quasi-PAL signals is made.

### Cross-talk in the SECAM switch

The cross-talk between the (R-Y) and (B-Y) sequential signals in the SECAM switch is improved.

**A COMPLETE DATA SHEET IS AVAILABLE UPON REQUEST**

GENERAL DESCRIPTION (continued)

**SECAM hysteresis**

This hysteresis is improved and will be ± 2 dB when measured at the aerial input. The corresponding d.c. levels for switching the colour ON or OFF at pin 6 of the TDA3590A are:

colour ON: 9,1 V
colour OFF: 9,9 V

**L.F. PAL/SECAM interference**

The internal circuit layout of the limiter and SECAM demodulator is improved which will give a better l.f. interference.

**Linearity of the (B-Y) signal**

The linearity of the (B-Y) signal is improved and is as follows:

for (R-Y) at $\Delta f = \pm 280$ kHz: 95%
for (B-Y) at $\Delta f = \pm 230$ kHz: 92%

**Zero-point stability of demodulator**

The zero-point stability of the demodulator for an input signal change between 10 and 300 mV peak to peak is typically 6 kHz.

**Re-inserted burst**

The nominal duration of the re-inserted burst is 2,8 $\mu$s (4 $\mu$s for the TDA3590). On the one hand this is approximately the duration of the PAL burst and, on the other hand, in combination with the horizontal blanking pulse which is used as a keying pulse in the SECAM switch, it results in a minimum interference of the a.c.c. loop of the TDA3560/61/62 due to spikes etc.

**Phase shift in the PAL matrix**

The phase shift between pins 11 and 12 with respect to pin 13 (for $0^o$ phase shift between pins 11 and 12 with respect to pin 14) is reduced from $2{,}5^o$ (nominal) to $1^o$ (nominal).

**Identification**

The burst gate pulse is internally divided into two parts. The first part of 2,8 $\mu$s is used for burst timing. The second part of 1,2 $\mu$s is used for SECAM signal identification timing.

**Luminance clamping**

The luminance clamping circuit is activated during the SECAM signal identification timing.

# SECAM PROCESSOR CIRCUIT

## GENERAL DESCRIPTION

The TDA3591 is a processor circuit that converts SECAM signals into sequential phase-modulated signals. This circuit is intended to be used in combination with the TDA3560, TDA3561A or TDA3562A of which the 8,8 MHz oscillator signal is used as the carrier for the modulator.

### Features

- Limiter/amplifier for the chrominance signal
- SECAM demodulator
- Clamp circuit and de-emphasis for the colour difference signals
- Modulator to convert the colour difference signals in sequential phase-modulated signals
- Identification circuit which can be used as:
  – horizontal identification – vertical identification – combination of hor./vert. identification
- Divider circuit which generates the 4,4 MHz carrier signal from the 8,8 MHz signal of the PAL-modulator oscillator
- Sandcastle pulse detector
- SECAM switch and PAL matrix
- Video amplifier

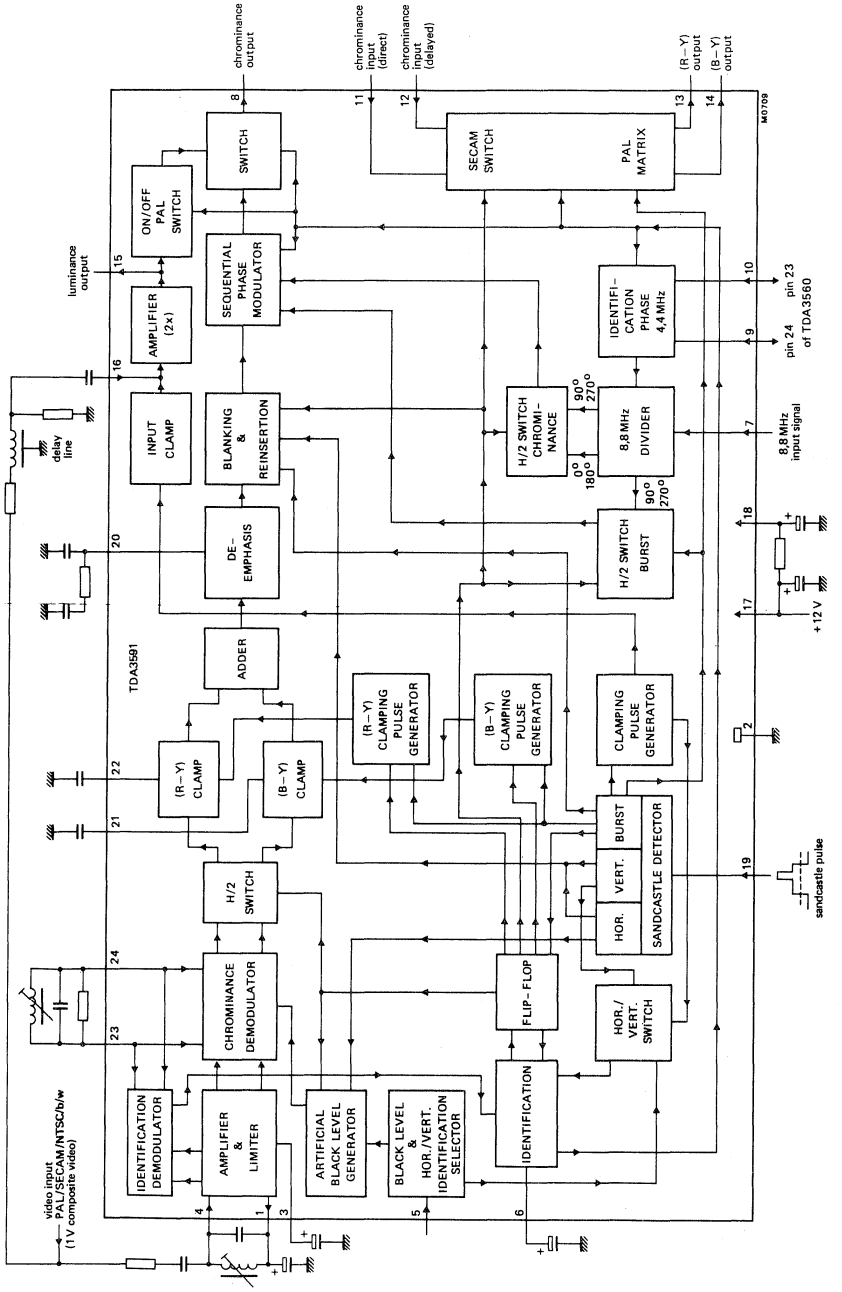

Fig.1 Block diagram

## FUNCTIONAL DESCRIPTION

### Demodulation

The TDA3591 comprises a chrominance and an identification demodulator, both using the same reference tuned circuit. The identification circuit automatically detects whether the incoming signal at pin 4 is SECAM or not (NTSC, PAL or black-and-white). When PAL signals are received, they are diverted via pin 16 to the chrominance output (pin 8).

The delay line connected to pin 16 delays the PAL luminance signal by 450 ns. The SECAM signal has the same delay in the processor circuitry. When the SECAM signals are received, the PAL signal path is switched off. Then, the SECAM signal is applied to a limiter/amplifier (via a bandpass filter with a bell-shaped response) after which it is demodulated. The (R−Y) and (B−Y) signals are applied sequentially, so only one demodulator is necessary. After demodulation the signals are applied to an H/2 switch, which separates the two colour difference signals. Now the signals are applied to the (R−Y) and (B−Y) clamp circuits, where the black levels are clamped to the same d.c. level. The (R−Y) and (B−Y) clamps are only active during the burst gate period.

If $V_{5\text{-}2} > 2$ V, artificial black levels are inserted during the horizontal blanking period. The clamp circuits then react upon these levels instead of the demodulated burst signals (necessary in case there are no horizontal burst signals available). The inserted signals may not be identical to the detected signals, because of circuitry spread. This can be corrected by detuning the demodulator tuned circuit.

### Modulation

The (R−Y)/(B−Y) ratio is nominally 1,78 at the de-emphasis output (pin 20). The demodulated (R−Y) and (B−Y) signals have a positive phase position for a magenta colour.

A burst signal is added to the demodulated SECAM signal at the input of the modulator. A sequential modulated chrominance signal is present at the modulator output. The modulation carriers of the (R−Y) and (B−Y) signals are 90° out of phase. The burst is modulated in the + (R−Y) direction and is only present during an (R−Y) line. The modulated (R−Y) component for a magenta colour has the same phase position as the (R−Y) burst.

### Identification

The identification circuit compares the voltage difference, which is obtained after demodulation, with the state of the flip-flop. For horizontal identification this comparison occurs during the internally generated 800 ns pulse. Only SECAM signals have a voltage difference from line to line during comparison. If the phase relationship between both the signals is wrong, the flip-flop will be reset by an extra input pulse.

The identification detector information is also used for colour killing and for switching to PAL, if required.

The identification (as above) occurs when the horizontal identification system is active. When the vertical identification system is switched on (pin 5), the system only compares the demodulator output voltage during line scanning of the vertical blanking. The further operation is identical to the horizontal identification.

### Sandcastle pulse detector

The sandcastle pulse detector is able to handle a 3-level sandcastle pulse. It detects the various blanking and gating pulses and it generates the correct drive pulses for the clamping circuits.

## FUNCTIONAL DESCRIPTION (continued)

### Carrier generation

The carrier signal for the PAL modulator is obtained from the 8,8 MHz oscillator signal of the TDA3560. The frequency of this signal is divided-by-two to obtain 90° shift. These two signals are applied to the modulator. There is a possibility that the two dividers in the TDA3560 (pins 23 and 24) and the TDA3591 are out-of-phase. This can be corrected by connecting pins 9 and 10 of the TDA3591 to pins 24 and 23 of the TDA3560 respectively. At incorrect phase, the TDA3591 divider is reset and correct phase is obtained.

### PAL-matrix and SECAM-switch

The colour difference signals are transmitted sequentially in the SECAM-system, so the modulated PAL-signal from the TDA3591 is also sequential. The consequences are:

- The two colour difference signals are mixed again in the delay line matrix circuit, so that both demodulators get a combination of an (R–Y) and (B–Y) signal. The phase position of the reference carrier must be very accurate for obtaining a proper demodulated signal, otherwise colour errors will occur (e.g. in the NTSC-system).
- Two different signals are added or subtracted in the matrix circuit, which results in an amplitude that has half the amplitude when compared with a normal PAL signal.

  Increase of the chrominance signal in the TDA3591 results in an overdrive of the chrominance amplifier of the TDA3560.

These effects are avoided by the matrix and switching circuit which is included in the TDA3591. The direct and delayed signals (from the PAL delay line) are applied to the processor where they are matrixed (for PAL) or switched (for SECAM). In the latter condition, the gain of the circuit is twice as high as for the normal PAL reception. The phase accuracy is not critical in this situation, because the two colour difference signals are not mixed.

For SECAM, the (B–Y) output of the SECAM-switch will be a signal without burst. The (R–Y) output of the SECAM-switch only has a burst during the +(R–Y) line. This burst is modulated in the +(R–Y) direction.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

DEVELOPMENT SAMPLE DATA

**Notes to characteristics**

1. A nominal value of 5% is obtained for clamping on the back porch of the colour difference signals. This value is related to the demodulated (B−Y) signal at $\Delta f$ = 230 kHz. When an artificial black level is inserted after demodulation, the resulting black level deviation depends on the adjustment of the demodulator tuned circuit. It is therefore possible to obtain a value of zero percent.
2. This value is related to the demodulated (B−Y) signal at $\Delta f$ = 230 kHz.
3. The luminance amplifier input voltage (peak-to-peak value) must be typically 0,45 V based on 75% saturated colour bar signals.
4. This pulse starts directly after the burst clamping pulse.
5. The phase delay between the oscillator output of the TDA3560 and the 8,8 MHz input of the TDA3591 (pin 7) must be adjusted so as to minimize the burst amplitude at pin 28 of the TDA3560.
6. $\Delta G = G_{11\text{-}13}/G_{12\text{-}13}$ and/or $G_{11\text{-}14}/G_{12\text{-}14}$.

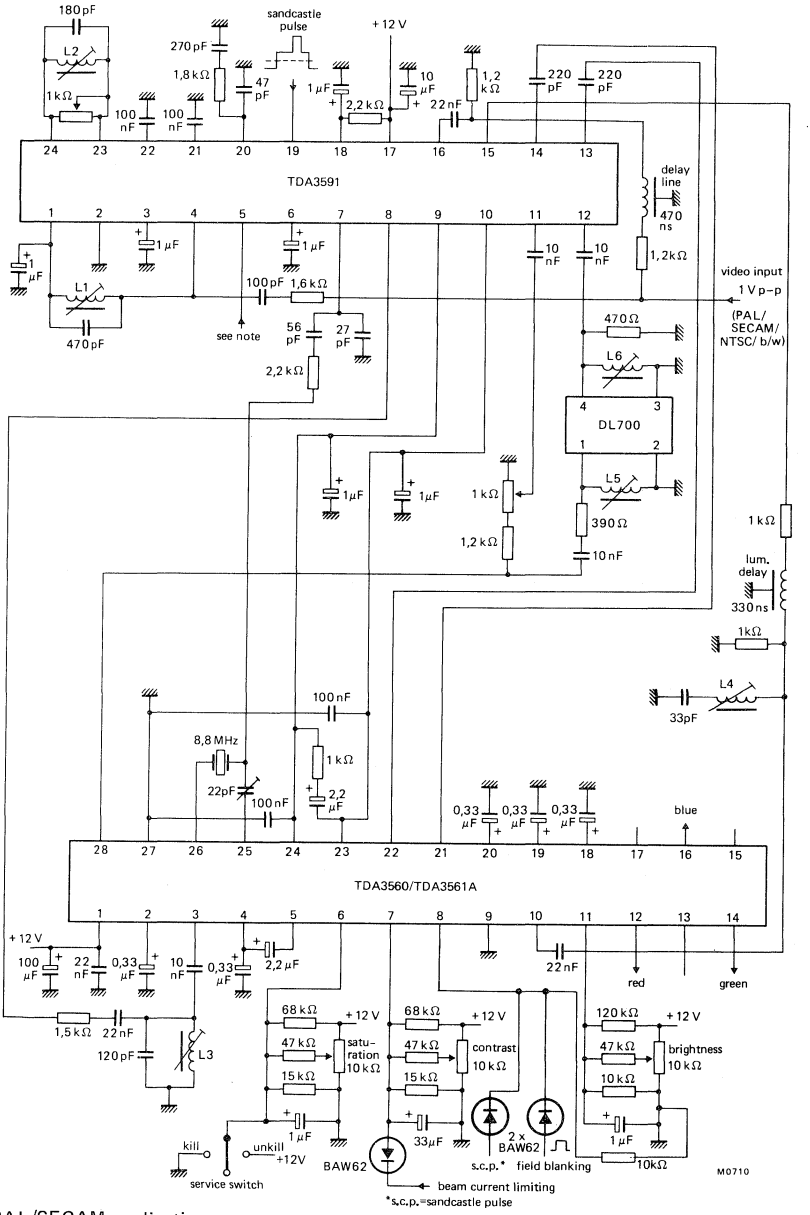

Fig.2 PAL/SECAM application circuit diagram using the TDA3591 and TDA3560; (for a combination with the TDA3562A see Fig.3). For note to pin 5 of the TDA3591 see next page.

**Note to Fig. 2**

$V_{5\text{-}2} < 0{,}5$ V : horizontal identification and black level clamping.
$V_{5\text{-}2} > 10{,}5$ V : vertical identification and artificial black level.
$V_{5\text{-}2} = 5$ to 7 V: horizontal identification and artificial black level.

## PINNING

1. Limiter feedback to pin 4.
2. Ground.
3. Limiter feedback.
4. Input limiter; PAL identification input; SECAM chrominance/identification input.
5. Via a d.c. voltage to this pin, the SECAM identification system can be chosen.
   At $V_{5\text{-}2} < 8$ V the processor is preset for horizontal identification.
   At $V_{5\text{-}2} > 10{,}5$ V the processor is preset for vertical identification.
   At $V_{5\text{-}2} < 0{,}5$ V the demodulated black level of the SECAM horizontal burst will be used as black level reference.
   At $V_{5\text{-}2} > 2$ V the demodulated chroma signal will have an artificial black level during the SECAM horizontal burst.
6. Store capacitor of PAL/SECAM identification circuit;
   horizontal identification: 100 nF
   vertical identification: 1 $\mu$F
7. Input of 8,8 MHz oscillator signal.
8. PAL/processed SECAM signal output (chrominance output).
9. Identification input of 8,8 MHz divider (to pin 24 of TDA3560).
10. Identification input of 8,8 MHz divider (to pin 23 of TDA3560).
11. Direct chrominance input of PAL matrix/processed SECAM switch.
12. Delayed chrominance input of PAL matrix/processed SECAM switch.
13. PAL/processed SECAM (R–Y) h.f. output.
14. PAL/processed SECAM (B–Y) h.f. output.
15. Luminance output.
16. Luminance/PAL input.
17. Positive supply voltage (+ 12 V).
18. Decoupled positive supply voltage.
19. Three-level sandcastle pulse input. It detects the various blanking and gating pulses and it generates the correct drive pulses for the clamping circuits.
20. De-emphasis is performed at this pin with a 1,8 k$\Omega$ resistor and a 270 pF capacitor. To avoid moiré patterns on the screen, additional filtering of the demodulator double-frequency products is obtained by a 47 pF decoupling capacitor.
21. Store capacitor (B–Y) clamp.
22. Store capacitor (R–Y) clamp.
23. Demodulator reference tuned circuit.
24. Demodulator reference tuned circuit. The demodulator reference circuit has to be tuned to a nominal frequency of about 4,33 MHz. The quality factor of the tuned circuit must be nominal 2,45.

## APPLICATION INFORMATION (see Fig. 2)

**The function is described against the corresponding pin number**

### Pin 4. Chrominance input

The SECAM input signal is typically 100 mV peak to peak, while the PAL input signal is about 550 mV peak to peak. This corresponds to a PAL/SECAM ratio of 5,5 (based on 75% saturated colour bar signals). The input signal, which should be free from any sound modulation, is applied single-ended to pin 4 via a filter which provides the required bell-shaped bandpass for SECAM signals. D.C. biasing takes place via coil L1, which has an unloaded quality factor between 80 and 100.

### Pin 8. Chrominance output

During PAL reception, this output is internally connected to the luminance stage, therefore a composite video signal of 0,9 V peak to peak (typical) is present at the output. During SECAM reception, the chrominance output stage is connected to the modulator. The sequentially modulated (R−Y) and (B−Y) signals are then available at the output (amplitudes of typically 1300 mV peak to peak). These signals are applied via a chrominance bandpass filter to the chrominance a.c.c. amplifier in the TDA3560.

### Pin 6. System identification

A 1 $\mu$F capacitor is connected to this pin. During PAL reception, the typical voltage at pin 6 is 10,1 V. The chrominance output stage is then internally connected to the luminance stage and the PAL matrix circuit is activated for normal matrixing of the PAL signals. During SECAM reception, the voltage at pin 6 is about 7 V (typical). The chrominance output stage is connected to the modulator and the SECAM switch is enabled. During noisy SECAM signals, the voltage at pin 6 increases and colour killing/unkilling occurs around 9,25 V and 9,1 V respectively.

### Pin 5. Horizontal/vertical identification

Horizontal or vertical identification can be selected depending on the externally applied voltage at pin 5. When the d.c. level on pin 5 changes with time (pulse information), a combination of horizontal and vertical identification is possible.

*Horizontal identification*

If the voltage at pin 5 is $< 2$ V, horizontal identification occurs with black level clamping. This clamping occurs on the back-porch of the demodulated colour difference signals. If artificial black level insertion is required, the voltage at pin 5 should be $< 8$ V.

*Vertical identification*

If the voltage at pin 5 is $> 10{,}5$ V, vertical identification occurs, i.e. identification on 9 lines in the vertical blanking period. In this mode, the black level is artificially inserted after demodulation.

### Pin 19. Sandcastle pulse

A 3-level sandcastle pulse is required and this can be directly coupled to the sandcastle pulse detector. Horizontal blanking, vertical blanking and burst clamping pulses are separated by the IC. A clamping pulse of 800 ns is generated internally just after the burst gating pulse. The input current is typically 10 $\mu$A at an input signal of 7,2 V.

**Pins 16 and 15. Luminance input/output**

The input signal at pin 16 should be typically 0,5 V peak to peak. The input impedance is relatively high, so a 22 nF coupling capacitor can be applied. This luminance signal is internally clamped and after a 2 times amplification available at pin 15.

During SECAM reception, the luminance signal is delayed by about 470 ns in a luminance delay line. The chrominance and luminance signals are then correctly timed at the output of the TDA3591.

During PAL reception, the composite video signal passes through this delay line and, after amplification, is available at pins 8 and 15. The nominal amplitude of the signals is 900 mV peak to peak in both cases.

**Pins 11, 12, 13 and 14. SECAM switch and PAL matrix**

During PAL reception, the system identification 'enables' the PAL matrix circuitry. An a.c.c. composite chroma signal (from pin 28 TDA3560) is coupled via the glass delay line to pin 12 of the TDA3591. A direct signal is applied to pin 11 of the TDA3591 via a resistor network. Active matrixing takes place in the IC and consequently (R−Y) and (B−Y) signals are available at pins 13 and 14 respectively. These signals are applied to the TDA3560 demodulators (pins 22 and 21 respectively).

During SECAM reception, the PAL matrix circuitry is 'disabled' and the SECAM switch is 'enabled'. A sequentially modulated (R−Y) and (B−Y) signal is available at pin 28 of the TDA3560. Direct and delayed signals are applied to pins 11 and 12 of the TDA3591, and via the SECAM switch the (R−Y) and (B−Y) signals are applied to their respective demodulator in the TDA3560.

**Pins 17 and 18. Supply voltage (+ 12 V)**

Correct operation is ensured within the supply range of 10,8 V to 13,2 V, and the typical power dissipation of the IC is 1,1 W at 12 V.

Pins 17 and 18 are separated by an external RC filter. Pin 18 is the supply for biasing several current-sinks in the IC and for all the output stages.

This supply voltage separation minimizes crosstalk via the supply lines between various parts of the circuitry. The capacitor at pin 18 must be small ($\approx 1\ \mu F$) so that, if pin 17 is short-circuited to ground, the collector-base junction of a transistor in the IC, through which the discharge current flows, is not damaged.

**Pin 20. De-emphasis**

De-emphasis is performed at this pin with a 1,8 kΩ and a 270 pF capacitor. To avoid moiré patterns on the screen, additional filtering of the 8,8 MHz signal is obtained by a 47 pF decoupling capacitor.

**Pins 21 and 22. Clamping of (R−Y) and (B−Y) signals**

After demodulation, the sequential (R−Y) and (B−Y) signals are separated by means of an H/2 switch and passed-on to their respective clamping circuits, where they are clamped to the same d.c. level. The value of each clamping capacitor should be 100 nF and they may, if desired, be increased to 470 nF.

**Pins 23 and 24. Demodulator reference tuned circuit**

The SECAM signal is applied to the demodulator via the 'bell-filter' and limiter/amplifier. Only one demodulator is used because of the sequential nature of the signal. The reference signal, obtained from the tank circuit, is applied to pins 23 and 24. At $V_{5\text{-}2} > 2$ V, the tuning and damping of the tank circuit should be done in such a way that a minimum modulator output voltage at pin 8 of the TDA3591 is obtained (the (R−Y) and (B−Y) information in the SECAM video signal is switched off). Therefore, any deviations between the black levels (when clamping on the back-porch and when an artificial black level is filled in) can be made minimum.

## APPLICATION INFORMATION (continued)

### Pin 7. Carrier generation

An 8,8 MHz signal from pin 25 of the TDA3560 is applied via pin 7 to the divider circuit in the TDA3591. Two 4,4 MHz signals are obtained with a phase shift of $90^{o}$ with respect to each other. These signals are applied to the modulator via an H/2 switch. The phase delay of the 8,8 MHz input signal must be adjusted such that the burst amplitude of the chrominance signal at pin 28 (TDA3560) has its minimum amplitude. Under this condition, the burst generated by the TDA3591 is in phase with the (R–Y) reference signal for the demodulator in the TDA3560. Since the a.c.c. of the TDA3560 operates in the + (R–Y) direction, the burst signal at pin 28 of the TDA3560 will have its minimum amplitude.

### Pins 9 and 10. Divider resetting

The output of the burst phase detector of the TDA3560 is connected to pins 9 and 10. At SECAM reception, the differential a.c. current information, obtained from the burst detector (TDA3560), is applied to pins 9 and 10 (TDA3591). This gives information about the phase relationship between the two 4,4 MHz dividers in both ICs. The TDA3591 now generates a minimum relative voltage between pins 9 and 10 at an absolute voltage level of 10,6 V. The result is that the oscillator control function of the TDA3560 is overruled, and the oscillator is set to 2 x 4,43 MHz.

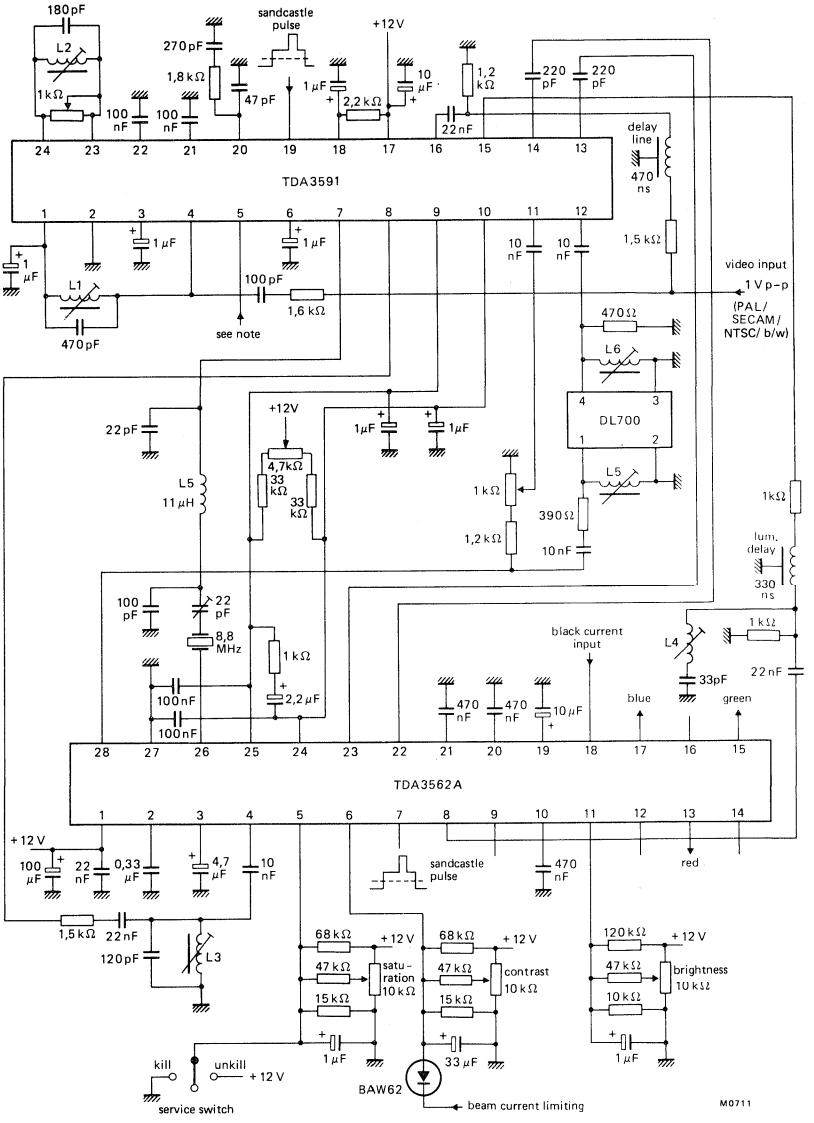

Fig.4 PAL/SECAM application circuit diagram using the TDA3591 and the TDA3562A.
Note to pin 5 TDA3591: $V_{5\text{-}2} < 2$ V; horizontal identification and black level clamping.
$V_{5\text{-}2} > 10{,}5$ V; vertical identification and artificial black level.
$2\text{ V} < V_{5\text{-}2} < 10{,}5$ horizontal identification and artificial black level.

# VERTICAL DEFLECTION CIRCUIT

## GENERAL DESCRIPTION

TDA3650 is a monolithic integrated circuit for vertical deflection in large screen colour television receivers.

The circuit incorporates the following functions:

- Oscillator
- Synchronization circuit
- Blanking pulse generator
- Sawtooth generator
- S-correction and linearity control
- Comparator and drive circuit
- Output stage
- Flyback generator
- Voltage stabilizer
- Thermal protection circuit
- Guard circuit
- Output stage protection

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage range (pin 13) | $V_{P1} = V_{13-12}$ | 0 to 30 | V |
| Output current (peak-to-peak value) | $I_{3(p-p)}$ | typ. 2,2 | A |
| Operating junction temperature | $T_j$ | max. 150 | °C |
| Thermal resistance from junction to copper heat spreader (mounting base) | $R_{th\ j-mb}$ | max. 4 | K/W |

## PACKAGE OUTLINE

TDA3650: 13-lead SIL bent to DIL; plastic power (SOT-141B).

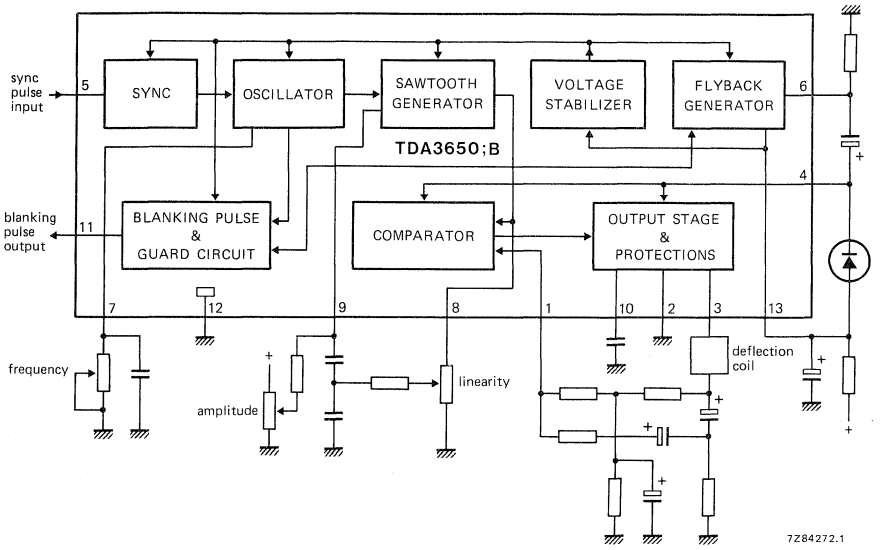

Fig. 1 Block diagram.

DEVELOPMENT SAMPLE DATA

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

### Voltages

| | | | |
|---|---|---|---|
| Pin 1; feedback voltage | $V_{1-12}$ | max. | 6 V |
| Pin 3; output voltage | $V_{3-12}$ | max. | 50 V |
| Pin 4; supply voltage output stage | $V_{4-12}$ ($V_{P2}$) | max. | 47 V |
| Pin 5; sync voltage | $V_{5-12}$ | max. | 6 V |
| Pin 11; blanking pulse | $V_{11-12}$ | max. | 6 V |
| Pin 13; supply voltage | $V_{13-12}$ ($V_{P1}$) | max. | 30 V |

### Currents

| | | | |
|---|---|---|---|
| Pin 3; repetitive peak output current | $\pm I_{3RM}$ | max. | 2,8 A |
| Pin 3; non-repetitive peak output current | $\pm I_{3SM}$ | max. | 6 A |
| Pin 6; flyback generator | $I_6$ | max. | 2,8 A |
| Pin 11; blanking pulse | $I_{11}$ | max. | 10 mA |

Total power dissipation internally limited by the thermal protection circuit (see also Fig. 2)

| | | | |
|---|---|---|---|
| Storage temperature range | $T_{stg}$ | −65 to +150 | °C |
| Operating junction temperature | $T_j$ | max. 150 | °C |

DEVELOPMENT SAMPLE DATA

**Notes to characteristics**

1. When the flyback generator is used, the maximum supply voltage must be chosen such that during flyback the voltage at pin 3 and pin 4 (supply voltage output stage) does not exceed 50 V.
2. These values (pin 3) are obtained at an output current of 2,8 A peak-to-peak (knee voltages of the output transistors). For an output current of 1 A peak-to-peak the maximum knee voltage is 2,5 V.

   The output voltage of the flyback generator is given at an output current of 2,8 A peak-to-peak ($I_6$). For an output current of 1 A peak-to-peak the output voltage at pin 3 will be $V_{P1}$ − 2,5 V.
3. These values are obtained with the free running oscillator frequency adjusted to 45,5 kHz (22 ms) and an external 150 Ω resistor connected to pin 7 in series with the 150 nF capacitor. Without the 150 Ω resistor the width of the blanking pulse is 1,6 ± 0,1 ms.
4. The width of the synchronization pulse must be smaller than the oscillator flyback.
5. These values are obtained with the free running oscillator frequency adjusted to 45,5 kHz (22 ms).
6. These values are obtained with a load resistance of 1 kΩ between pin 3 and ground, and a 4,7 nF decoupling capacitor connected between pin 10 and ground.

## APPLICATION INFORMATION

The function is described against the corresponding pin number.

### 1. Comparator and drive circuit

The current flowing through the deflection coils is measured across an external series resistor. The signal across this resistor is fed to the comparator via pin 1, where it is compared with the internally generated sawtooth signal. The output of the comparator drives the output stage. Pin 1 is also used for d.c. feedback of the output stage (mid-point setting).

### 2. Negative supply (ground) for the output stage

### 3. Output stage

The output stage provides the current to the deflection coils. The vertical deflection coil is connected to this pin, via a series connection of a coupling capacitor and a feedback resistor to ground. The output stage is protected against over-voltages and over-currents by a SOAR-protection circuit. When one of the transistors exceeds its operational threshold the drive current is reduced to a safe level. Temperature protection reduces the drive of the output stage when the junction temperature exceeds 170 °C.

### 4. Positive supply of output stage

This supply is obtained from the flyback generator. An electrolytic capacitor between pins 4 and 6, a diode between pins 4 and 13, and a resistor between pins 6 and ground must be connected for correct operation of the flyback generator.

### 5. Synchronization input

When the voltage applied to pin 5 reaches a level of 0,7 V the lower switching level is increased thus initiating the charge cycle of the oscillator capacitor. The synchronization circuit is inhibited during oscillator flyback time.

### 6. Flyback generator

The flyback generator reduces power dissipation in the vertical stage. As a result a lower power supply can be chosen (26 V for 30AX application). Whereas the voltage during flyback is increased to 45 V (depending on the design of external components), the maximum increase of the voltage during flyback is nearly factor 2.

The capacitor between pins 6 and 4 is charged via the external diode during the scan period. Then, when the flyback generator is activated by the oscillator flyback pulse, the voltage across the capacitor is connected in series with the supply voltage to provide the required flyback voltage. At the end of the oscillator pulse the drive of the flyback generator is maintained by the flyback voltage of the deflection circuit.

### 7. Oscillator

The oscillator frequency is determined by the values of the external resistor and capacitor connected in parallel to pin 7. The capacitor is discharged via the resistor which is connected to ground. The voltage on the capacitor is compared with an internal voltage from the voltage stabilizer (lower switching level). When this lower switching level is reached the capacitor is charged via an internal 500 Ω resistor. At the same time the comparator voltage is increased (higher switching level). When the voltage on the capacitor reaches the higher switching level the charge current is switched off and the capacitor is discharged again.

### 8. S-correction and linearity circuit

From pin 8 an adjustable parabolic current is fed back to the mid-point of the sawtooth generator capacitors at pin 9 to provide linearity control. The external components connected between pins 8 and 9 together with the d.c. feedback circuitry at pin 1 define the S-shape of the deflection current.

### 9. Sawtooth generator

The sawtooth signal is obtained by charging the capacitors connected to pin 9 via an external resistor. Variation of the charge current will vary the amplitude of the signal. During oscillator flyback time the capacitors are discharged to an internally fixed voltage level.

### 10. Output stage decoupling

A low value capacitor must be connected to pin 10 for decoupling of the output driver stage.

### 11. Blanking pulse generator

The blanking pulse duration is determined by the oscillator sawtooth signal. The guard circuit provides continuous blanking when the vertical deflection current is absent.

### 12. Negative supply (ground) of small-signal part

### 13. Positive supply

The supply voltage at this pin is used to supply the flyback generator, the voltage stabilizer and the protection circuits.

The following application data are measured in a typical 30AX system (Fig. 3).

DEVELOPMENT SAMPLE DATA

| parameter | symbol | min. | typ. | max. | unit |
|---|---|---|---|---|---|
| **Supply** (pin 13) | | | | | |
| Supply voltage* | $V_{13-12}$ | 22 | 26 | 30 | V |
| Supply current* | $I_{13}$ | 260 | 320 | 380 | mA |
| **Output** (pin 3) | | | | | |
| Output voltage (peak value) | $V_{3-2}$ | – | – | 50 | V |
| Output voltage (mid-point) | $V_{3-2}$ | – | 13 | – | V |
| Output current (peak-to-peak value)** | $I_{3(p-p)}$ | 1,6 | 2,1 | 2,4 | A |
| Flyback time▲ | $t_{f1}$ | – | 0,7 | 0,9 | ms |
| Total power dissipation in IC▲ | $P_{tot}$ | – | 4,6 | 5,0 | W |
| Total power consumption | P | 5,2 | 8,5 | 11,5 | W |
| Blanking time | $t_p$ | – | 1,45 | – | ms |
| Non-linearity | | – | – | 3 | % |
| Thermal resistance of heatsink | $R_{th\ h-a}$ | – | 8 | – | K/W |
| Ambient temperature | $T_{amb}$ | – | – | 65 | °C |

* These values are obtained with a supply voltage ($V_S$) of 26 V and an output current of 2,1 A peak-to-peak. When the supply voltage is decreased to 22 V the output current changes to 1,6 A peak-to-peak and the supply current to 260 mA. When the supply voltage is increased to 30 V the output current increases to 2,4 A peak-to-peak and the supply current to 380 mA. But when the circuit is adjusted for an output current of 2,1 A peak-to-peak at a supply voltage of 30 V, the supply current remains at 320 mA (see note 1 to characteristics).

** Including 6% overscan.

▲ With the supply voltage $V_S$ = 26 V.

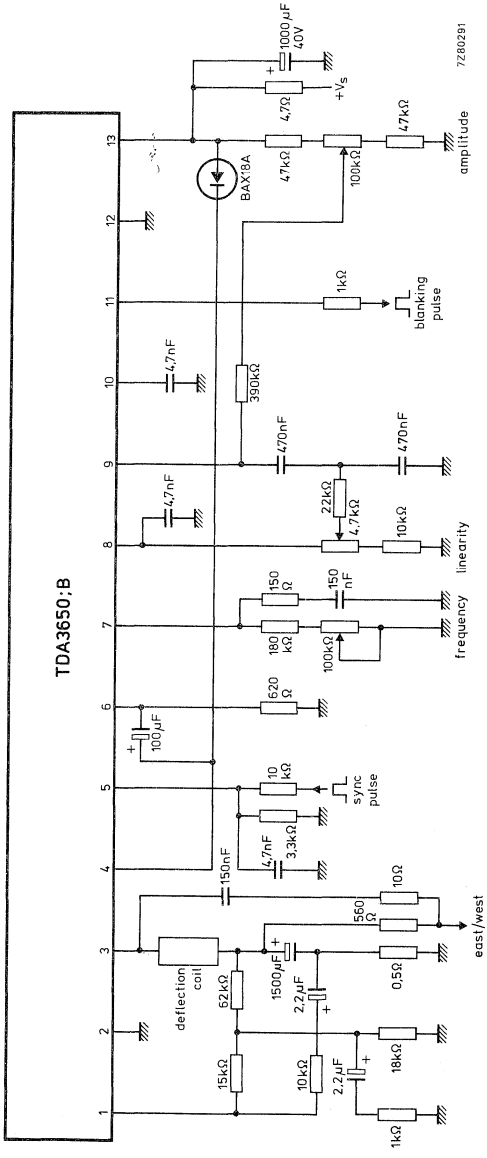

Fig. 3 Complete vertical deflection circuit for 30AX.

# VERTICAL DEFLECTION CIRCUIT

The TDA3651 is a vertical deflection output circuit for drive of various deflection systems with deflection currents up to 2 A peak-to-peak.

The circuit incorporates the following functions:

- Driver
- Output stage
- Thermal protection and output stage protection
- Flyback generator
- Voltage stabilizer

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage (pin 9) | $V_P$ | typ. | 26 V |
| Output current (peak-to-peak value) | $I_{5(p-p)}$ | $<$ | 2 A |
| Operating junction temperature | $T_j$ | max. | 150 °C |
| Thermal resistance from junction to tab | $R_{th\,j\text{-}tab}$ | typ. | 10 K/W |

## PACKAGE OUTLINE

9-lead SIL; plastic (SOT-110B).

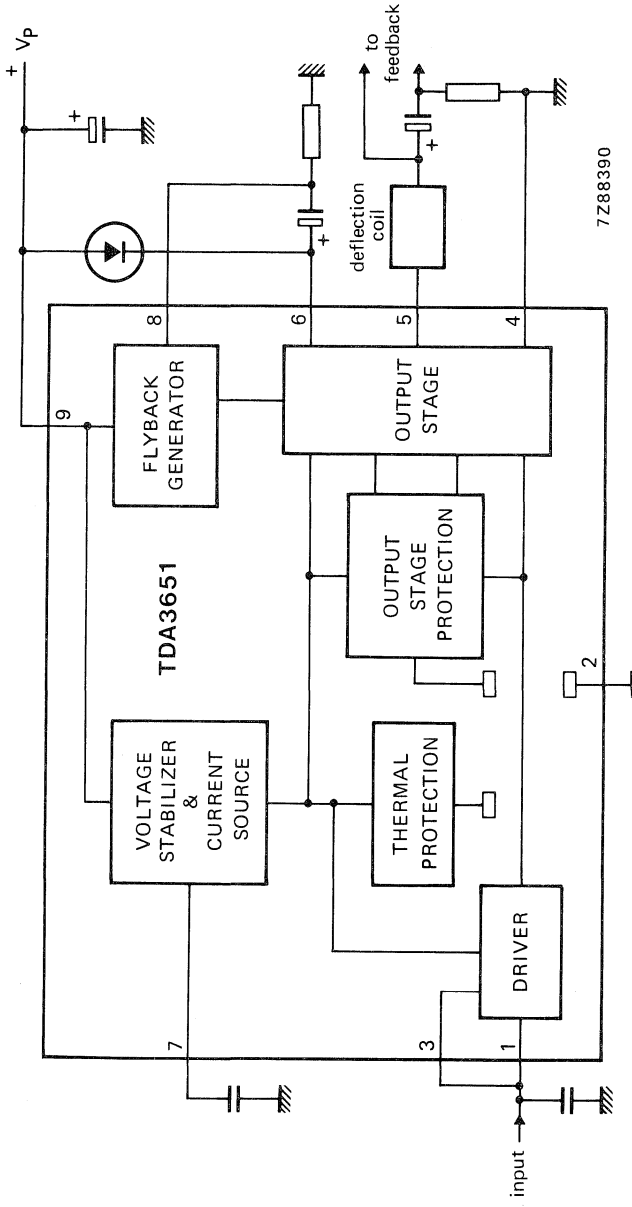

Fig. 1 Block diagram.

## GENERAL DESCRIPTION

### Output stage and protection circuit

Pin 5 is the output pin. The supply for the output stage is fed to pin 6 and the output stage ground is connected to pin 4. The output transistors of the class-B output stage can each deliver 1 A maximum. The 'upper' power transistor is protected against short-circuit currents to ground, whereas, during flyback, the 'lower' power transistor is protected against too high voltages which may occur during adjustments.
Moreover, the output transistors have been given extra solidity by means of special measures in the internal circuit layout.
A thermal protection circuit is incorporated to protect the IC against too high dissipation. This circuit is 'active' at 175 °C and then reduces the deflection current to such a value that the dissipation cannot increase.

### Driver and switching circuit

Pin 1 is the input for the driver of the output stage. The signal at pin 1 is also applied to pin 3 which is the input of a switching circuit. When the flyback starts, this switching circuit rapidly turns off the lower output stage and so limits the turn-off dissipation. It also allows a quick start of the flyback generator.
Pin 3 is connected externally to pin 1, in order to allow for different applications in which pin 3 is driven separately from pin 1.

### Flyback generator

The capacitor at pin 6 is charged to a maximum voltage, which is equal to the supply voltage $V_P$ (pin 9), during scan.
When the flyback starts and the voltage at the output pin (pin 5) exceeds the supply voltage (pin 9), the flyback generator is activated. Then $V_P$ is connected in series (via pin 8) with the voltage across the capacitor.
The voltage at the supply pin (pin 6) of the output stage will then be maximum twice $V_P$. Lower voltages can be chosen by changing the value of the external resistor at pin 8.

### Voltage stabilizer

The internal voltage stabilizer provides a stabilized supply of 6 V for drive of the output stage, so the drive current of the output stage is not affected by supply voltage variations. The stabilized voltage is available at pin 7.
A decoupling capacitor of 2,2 $\mu$F can be connected to this pin.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

**Voltages** (pins 4 and 2 externally connected to ground)

| | | | |
|---|---|---|---|
| Output voltage (pin 5) | $V_{5-4}$ | max. | 50 V |
| Supply voltage (pin 9) | $V_{9-4} = V_P$ | max. | 50 V |
| Supply voltage output stage (pin 6) | $V_{6-4}$ | max. | 50 V |
| Input voltage (pins 1 and 3) | $V_{1-2}$; $V_{3-2}$ | max. | $V_P$ |

**Currents**

| | | | |
|---|---|---|---|
| Repetitive peak output current (pin 5) | $\pm I_{5RM}$ | max. | 1 A |
| Non-repetitive peak output current (pin 5) | $\pm I_{5SM}$ | max. | 1,5 A* |
| Repetitive peak flyback generator output current (pin 8) | $I_{8RM}$ | max. | −1,0 A<br>+1,1 A |
| Non-repetitive peak flyback generator output current (pin 8) | $I_{8SM}$ | max. | −1,5 A<br>+1,6 A* |

**Temperatures**

| | | |
|---|---|---|
| Storage temperature range | $T_{stg}$ | −65 to + 150 °C |
| Operating ambient temperature range | $T_{amb}$ | −25 to + 65 °C |
| Operating junction temperature range | $T_j$ | −25 to + 150 °C |

## CHARACTERISTICS

$T_{amb}$ = 25 °C; $V_P$ = 26 V; pins 4 and 2 externally connected to ground; unless otherwise specified.

| | | | |

## GENERAL DESCRIPTION

### Output stage and protection circuit

Pin 5 is the output pin. The supply for the output stage is fed to pin 6 and the output stage ground is connected to pin 4. The output transistors of the class-B output stage can each deliver 1 A maximum. The 'upper' power transistor is protected against short-circuit currents to ground, whereas, during flyback, the 'lower' power transistor is protected against too high voltages which may occur during adjustments.
Moreover, the output transistors have been given extra solidity by means of special measures in the internal circuit layout.
A thermal protection circuit is incorporated to protect the IC against too high dissipation. This circuit is 'active' at 175 °C and then reduces the deflection current to such a value that the dissipation cannot increase.

### Driver and switching circuit

Pin 1 is the input for the driver of the output stage. The signal at pin 1 is also applied to pin 3 which is the input of a switching circuit. When the flyback starts, this switching circuit rapidly turns off the lower output stage and so limits the turn-off dissipation. It also allows a quick start of the flyback generator. Pin 3 is connected externally to pin 1, in order to allow for different applications in which pin 3 is driven separate from pin 1.

### Flyback generator

The capacitor at pin 6 is charged to a maximum voltage, which is equal to the supply voltage $V_P$ (pin 9), during scan.
When the flyback starts and the voltage at the output pin (pin 5) exceeds the supply voltage (pin 9), the flyback generator is activated. The $V_P$ is connected in series (via pin 8) with the voltage across the capacitor.
The voltage at the supply pin (pin 6) of the output stage will then be maximum twice $V_P$. Lower voltages can be chosen by changing the value of the external resistor at pin 8.

### Voltage stabilizer

The internal voltage stabilizer provides a stabilized supply of 6 V for drive of the output stage, so the drive current of the output stage is not affected by supply voltage variations. The stabilized voltage is available at pin 7.
A decoupling capacitor of 2,2 $\mu$F can be connected to this pin.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

**Voltages** (pins 4 and 2 externally connected to ground)

| | | | |
|---|---|---|---|
| Output voltage (pin 5) | $V_{5-4}$ | max. | 50 V |

| Driver input voltage (pin 1) | $V_{1-2}$ | 0 to $V_P$ | V* |
| Switching circuit input voltage (pin 3) | $V_{3-2}$ | 0 to 5,6 | V |
| **Currents** | | | |
| Repetitive peak output current (pin 5) | $\pm I_{5RM}$ | max. 1,5 | A |
| Non-repetitive peak output current (pin 5) | $\pm I_{5SM}$ | max. 3 | A** |
| Repetitive peak flyback generator output current (pin 8) | $I_{8RM}$ | max. −1,5<br>+1,6 | A<br>A |
| Non-repetitive peak flyback generator output current (pin 8) | $\pm I_{8SM}$ | max. 3 | A** |
| **Temperatures** | | | |
| Storage temperature range | $T_{stg}$ | −65 to +150 | °C |
| Operating ambient temperature range | $T_{amb}$ | −25 to +65 | °C |
| Operating junction temperature range | $T_j$ | −25 to +150 | °C |

* The maximum input voltage should not exceed the supply voltage ($V_P$ at pin 9). In most applications pin 1 is connected to pin 3; the maximum input voltage should then not exceed 5,6 V.

** Non-repetitive duty factor maximum 3,3%.

## CHARACTERISTICS

$V_P$ = 26 V; $T_{amb}$ = 25 °C; pins 4 and 2 externally connected to ground; unless otherwise specified

| parameter | symbol | min. | typ. | max. | unit |

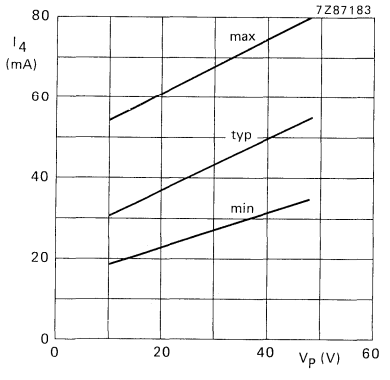

Fig. 2 Quiescent current ($I_4$) as a function of supply voltage ($V_P$).

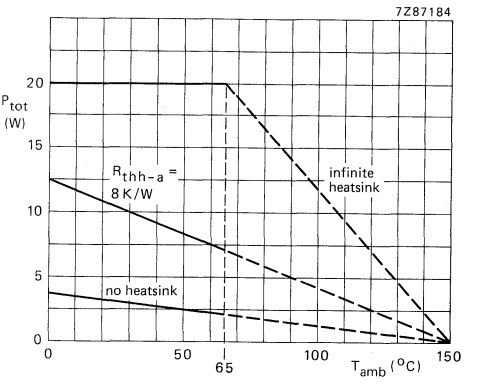

Fig. 3 Power derating curve.

## APPLICATION INFORMATION

The function is described against the corresponding pin number.

### 1. Driver

This is the input for the driver of the output stage.

### 2. Negative supply (ground)

### 3. Switching circuit

This pin is normally connected externally to pin 1. It is also possible to use this pin to drive the switching circuit for different applications. This switching circuit rapidly turns off the lower output stage at the end of scan and also allows for a quick start of the flyback generator.

### 4. Output stage ground

### 5 and 6. Output stage and protection circuits

Pin 5 is the output pin and pin 6 is the output stage supply pin. The output stage is a class-B type with each transistor capable of delivering 1,5 A maximum. The "upper" output transistor is protected against short-circuit currents to ground. The base of the "lower" power transistor is connected to ground during flyback and so it is protected against too high flyback pulses which may occur during adjustments. In addition the output transistors are protected by a special layout of the internal circuit. The circuit is protected thermally against excessive dissipation by a circuit which operates at temperatures of 175 $^{o}$C upwards causing the output current to drop to a value such that the dissipation cannot increase.

### 7. Voltage stabilizer

The internal voltage stabilizer provides a stabilized supply voltage of 6 V for drive of the output stage, so the drive current is not influenced by the various voltages of different applications.

### 8 and 9. Flyback generator

Pin 8 is the output pin of the flyback generator. Depending on the value of the external resistor at pin 8, the capacitor at pin 6 will be charged to a fixed level during the scan period. The maximum height of this level is equal to the supply voltage at pin 9 ($V_P$). When the flyback starts and the flyback pulse at pin 5 exceeds the supply voltage, the flyback generator is activated and then the supply voltage is connected in series (via pin 8) with the voltage across the capacitor. The voltage at the supply pin (pin 6) of the output stage will then be not more than twice the supply voltage.

# PAL SYNCHRONIZATION PROCESSOR FOR VIDEO RECORDERS

## GENERAL DESCRIPTION

The TDA3700A is a monolithic integrated circuit for PAL synchronization processing in video recorders.

### Features

- Sync separator with noise inverter
- Phase detector with 2 time constants for oscillator synchronization
- Automatic identification of normal synchronization signals (625 lines referred to CCIR)
- Colour subcarrier oscillator with separate output (625 kHz sinewave) and 1:40 divider
- Separate horizontal and vertical coincidence detectors
- Internal production of a complete standard synchronization pulse
- Vertical synchronization pulse output
- Output for indicating detection of first or second half-picture lines
- Burst gate pulse output (externally adjustable phase relationship)
- H/8 signal output and H/8 signal correction/inversion inputs
- Record (REC/TV; REC/VCR)/playback (PB) selector

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage (pin 22) | $V_P = V_{22-23}$ | typ. | 12 V |
| Supply current (pin 22) | $I_P = I_{22}$ | typ. | 85 mA |
| **Sync separator** | | | |
| Sync pulse amplitude (peak-to-peak value) | $V_{4-23(p-p)}$ | typ. | 0,3 V |
| **Phase detector** | | | |
| Catching range | $\Delta f$ | typ. | ±5 % |
| **Vertical sync pulse** | | | |
| Output voltage (peak-to-peak value) | $V_{27-23}$ | min. | 10 V |
| **Half-picture line identification pulse** (pin 26) | | | |
| Output voltage | | | |
| 1st half picture | $V_{26-23}$ | min. | 10 V |
| 2nd half picture | $V_{26-23}$ | max. | 1 V |
| **H/8 signal output** (pin 20) | | | |
| Amplitude of output pulse (peak-to-peak value) | $V_{20-23(p-p)}$ | min. | 10 V |

## PACKAGE OUTLINE

28-lead DIL; plastic (SOT-117).

| input voltage | $V_{18-23}$ | 10 | – | – | V |
| input current ($V_{18-23}$ = 12 V) | $I_{18}$ | – | – | 2 | mA |

**Notes to characteristics**

1. The sync separator input signal is shown in Fig. 2.

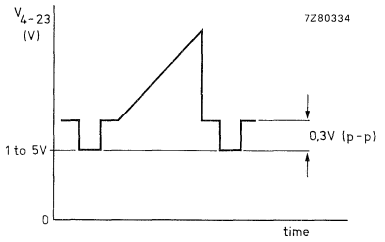

Fig. 2 Colour composite video input signal at pin 4.

2. The internally produced standard sync pulse is available at pin 21 when: horizontal and vertical coincidence is detected, that is, a standard input signal is applied to pin 4 and the record/playback selector is in the record mode.
3. The control sensitivity of the phase detector depends on the horizontal frequency.
4. Balance of the oscillator output frequency is achieved when pins 10 and 11 are short-circuited.
5. The vertical sync pulse is also available without application of the colour composite video signal provided the record/playback selector is in the record mode.
6. During active correction of the H/8 signal one of 8 input pulses of the 1:8 divider circuit will be rejected in a time interval of 4 half-picture lines.

DEVELOPMENT SAMPLE DATA

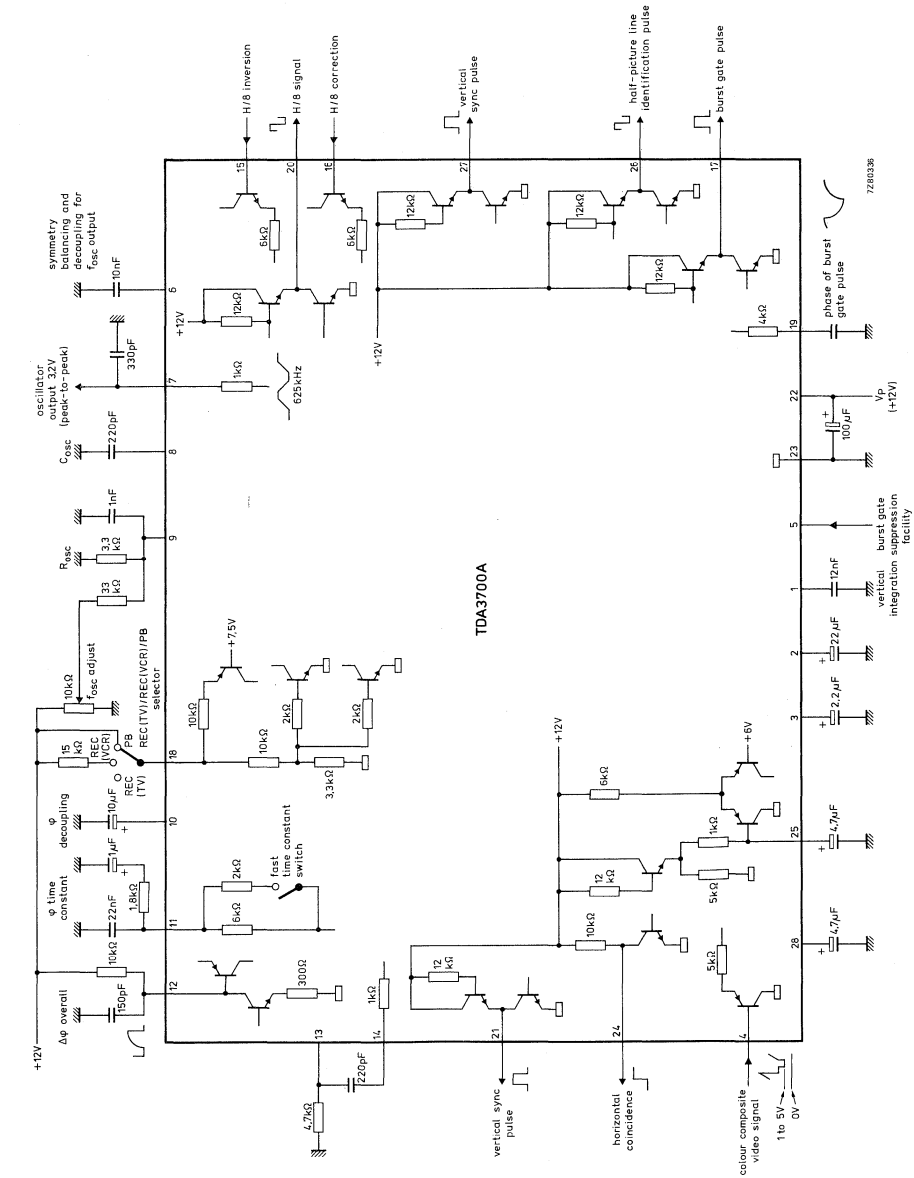

Fig. 3 Application circuit diagram.

# CHROMINANCE SIGNAL/MIXER FOR VIDEO RECORDERS

## GENERAL DESCRIPTION

The TDA3710 is a monolithic integrated circuit for chrominance signal processing in video recorders.

### Features

- Automatic gain controlled preamplifier with record/playback selection
- Signal mixer with balancing stage for phase inversion of chrominance signal
- H/8-control for subcarrier phase inversion
- Amplifier with record/playback selected burst pre- and de-emphasis
- Output stage for the 625 kHz chrominance signal, with facility for being disabled by colour killer, record/playback mode switch and external track sensing circuit
- Amplitude detector with automatic gain control for the preamplifier
- 4,43 MHz voltage controlled oscillator (VCO) for recording and 4,43 MHz local oscillator for playback
- Phase discriminator controlled synchronization of the voltage controlled oscillator
- Subcarrier mixer, disabled for SECAM operation
- H/2 demodulator for the production of PAL identification and colour killing signals
- Flip-flop for PAL identification
- Burst pulse stage for the production of non-delayed (BK1) and delayed (BK2) keying pulses
- Colour killing stage with hysteresis and heterodyned H/2 signal
- Threshold voltage detector for SECAM operation or forced colour on/off
- Voltage stabilization with external reference voltage (5,6 V)
- Internal record/playback and PAL/SECAM selection.

## QUICK REFERENCE DATA

# VIDEO PROCESSOR FOR VIDEO RECORDERS

## GENERAL DESCRIPTION

The TDA3771 is a monolithic integrated circuit for video signal processing in video recorders. It incorporates the following features:

### Features

- 3 channel input selector
- 4 dB preamplifier
- A.G.C. amplifier:
  during record: controlled to sync pulse level and peak white level
  during playback: controlled to sync pulse level
- Pulse triggered clamping control stage
- Regeneration of the sync pulse
- Adder stage for the luminance signal (with keyed-in burst pulse) and chrominance signal
- Emitter follower output stage for the luminance signal (composite video)
- Two emitter follower output stages for the composite colour video signal.

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage (pin 14) | $V_P = V_{14-11}$ | typ. | 12 V |
| Supply current (pin 14) | $I_P = I_{14}$ | typ. | 60 mA |
| **Preamplifier** | | | |
| Composite colour video input signals (peak-to-peak value) | $V_{2,3,4-11(p-p)}$ | typ. | 2 V |
| Gain | $G_{18-2,3,4}$ | typ. | 4 dB |
| **A.G.C. amplifier** | | | |
| Composite video signal (peak-to-peak value) | $V_{12-11(p-p)}$ | typ. | 0,4 ± 6 dB |
| **Sync level detector** | | | |
| Threshold voltage for active sync | $V_{9-11}$ | min. | 6 V |
| **Sync pulse regenerator** | | | |
| Composite video output signal (controlled) (peak-to-peak value) | $V_{6-11(p-p)}$ | typ. | 4 V |
| **Adder stage** | | | |
| Input voltage (peak-to-peak value) | $V_{16-11(p-p)}$ | typ. | 0,3 V |

## PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102CS).

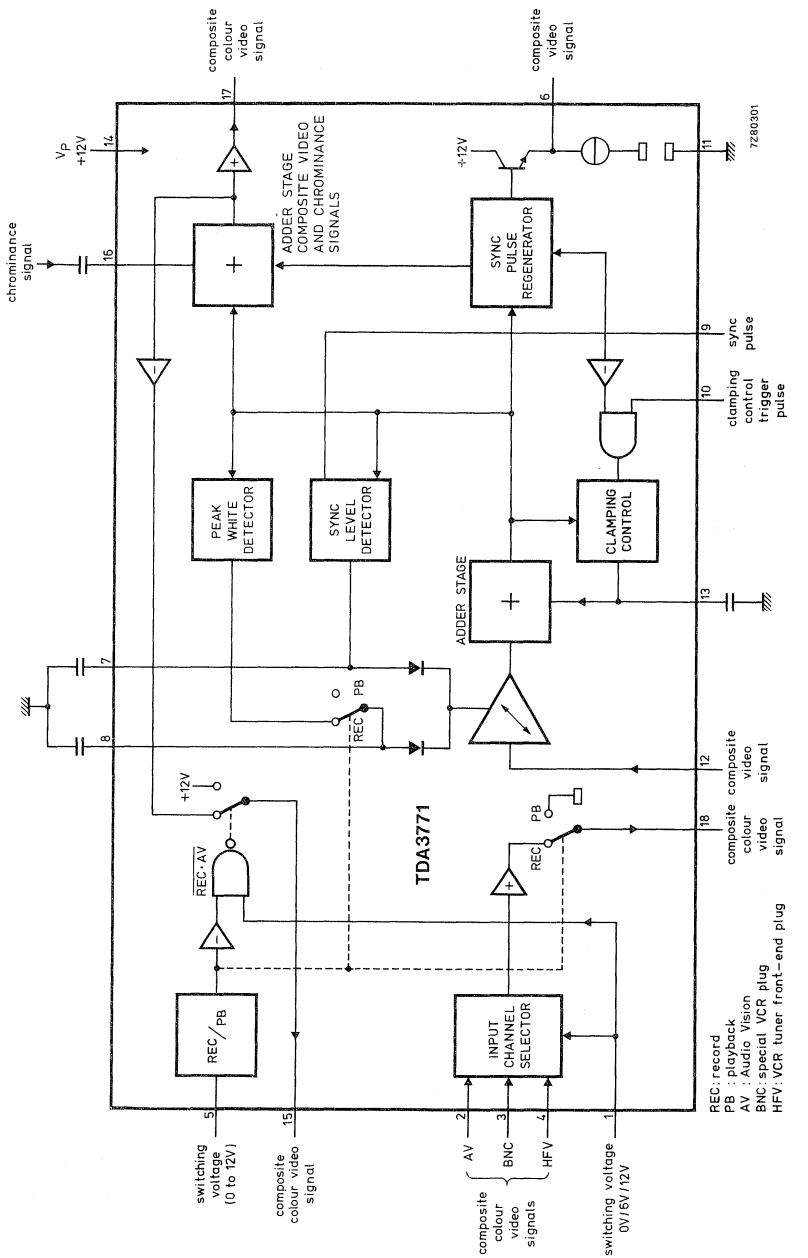

Fig. 1 Block diagram.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | |
|---|---|---|---|
| Supply voltage range (pin 14) | $V_P = V_{14-11}$ | 0 to 13,2 | V |
| Voltage range at pins 1, 5, 9, 10, 12, 16 to pin 11 (ground) | $V_{n-11}$ | 0 to $V_P$ | V |
| Voltage ranges | | | |
| at pins 2, 3, 4 | $V_{2,3,4-11}$ | 0 to 0,8$V_P$ | V |
| at pins 7, 8 | $V_{7,8-11}$ | 0,7$V_P$ to $V_P$ | V |
| at pin 13 | $V_{13-11}$ | 0,25$V_P$ to $V_P$ | V |
| Currents | | | |
| at pins 6, 15, 17 | $I_{6,15,17}$ | max. 10 | mA |
| at pin 18 | $I_{18}$ | max. 20 | mA |
| Total power dissipation | $P_{tot}$ | max. 1 | W |
| Storage temperature range | $T_{stg}$ | −25 to +150 | °C |
| Operating ambient temperature range | $T_{amb}$ | −20 to +70 | °C |

DEVELOPMENT SAMPLE DATA

## CHARACTERISTICS

$V_P = V_{14-11} = 12$ V; trigger pulse on pin 10 with a width of 4 $\mu$s; $T_{amb} = 25\ ^oC$; measured in test circuit Fig. 2; unless otherwise specified

## APPLICATION INFORMATION

# FREQUENCY MODULATOR FOR VIDEO RECORDERS

## GENERAL DESCRIPTION

The TDA3780 is a monolithic integrated circuit for frequency modulation in video recorders.

### Features

- Voltage clamping control stage
- Two-stage amplification for the luminance signal with linear and dynamic pre-emphasis (adjustable)
- Adjustable white limiter
- 3 MHz voltage controlled oscillator (VCO), with facility for switch-off
- Limiting stage with facility to disconnect from output stage
- Switch-off pulse for VCO and output stage

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage (pin 1) | $V_P = V_{1\text{-}18}$ | typ. | 12 V |
| Supply current (pin 1) | $I_P = I_1$ | typ. | 52 mA |
| **Pre-emphasis amplifier and clamping stage** (dynamic) | | | |
| Luminance input signal (pin 2) (peak-to-peak value) | $V_{2\text{-}18(p\text{-}p)}$ | typ. | 2,0 V |
| Output voltage (pin 4) | $V_{4\text{-}18}$ | | 2,5 to 8,0 V |
| **Pre-emphasis amplifier stage** (linear) | | | |
| Output voltage (pin 7) | $V_{7\text{-}18}$ | | 2,5 to 8,0 V |
| **Output stage** | | | |
| D.C. output voltage | $V_{17\text{-}18}$ | typ. | 6,0 V |
| FM signal output voltage (peak-to-peak value) | $V_{17\text{-}18(p\text{-}p)}$ | typ. | 4,2 V |

## PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102CS).

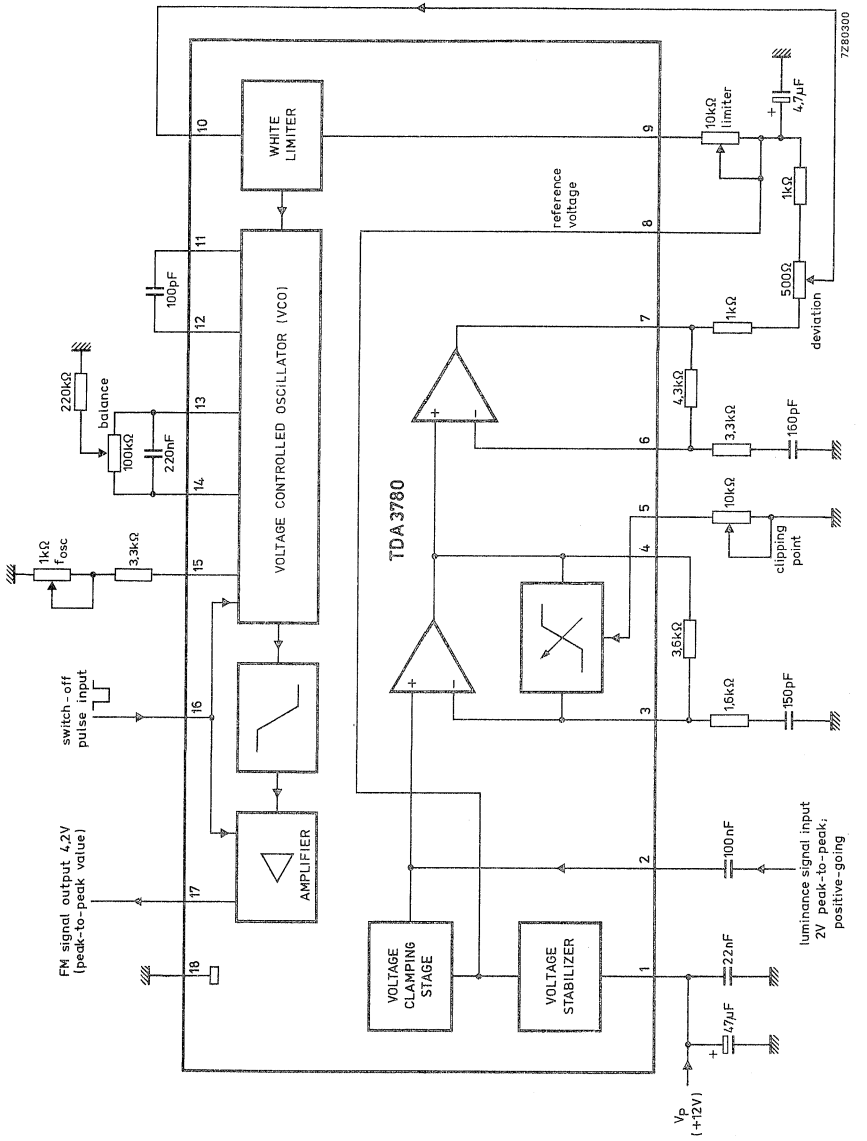

Fig. 1 Block diagram.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | | |

# STEREO/DUAL TV SOUND PROCESSING CIRCUIT

The TDA3800 is a stereo/dual TV sound decoder circuit, including the second i.f. amplifier and f.m. demodulator.

The circuit includes the following functions:

- 2nd i.f. limiter/amplifier and demodulator (5,742 MHz) for second sound channel
- Level adjustment for the demodulated a.f. signal for channel matching
- Pilot carrier processing with digital identification, hysteresis and short switching times
- De-matrixing of the signals for the two audio channels
- De-emphasis
- Mode selection of stereo/mono or sound 1/sound 2 with storage of selected mode
- Two dual channel, independently controllable a.f. outputs
- Low-resistance a.f. outputs (short-circuit protected); can be used for headphone
- Switched output for controlling external audio/video equipment
- Signal path control by an identification bit (also in audio/video mode)
- LED indication of selected mode (also in audio/video mode)
- Possibility to apply a.f. signals from external equipment via the de-emphasis inputs (audio/video mode)

## QUICK REFERENCE DATA

| | | | |
|---|---|---|---|
| Supply voltage (pin 20) | $V_P$ | typ. | 12 V |
| 2nd sound i.f. input voltage for start of limiting (r.m.s. value) | $V_{i(rms)}$ | typ. | 50 μV |
| Pilot carrier amplifier control range | $\Delta G_v$ | > | 20 dB |
| A.F. input voltage (r.m.s. value) | $V_{i(rms)}$ | typ. | 1 V |
| A.F. demodulator output voltage (r.m.s. value) | $V_{o(rms)}$ | typ. | 0,6 V |
| LED output current | $I_{LED}$ | typ. | 15 mA |
| Signal-to-noise ratio of the a.f. signal switches | S/N | typ. | 80 dB |
| Crosstalk in stereo mode | $\alpha_S$ | > | 40 dB |
| Crosstalk in dual sound mode | $\alpha_{DS}$ | > | 60 dB |

## PACKAGE OUTLINES

28-lead DIL; plastic (SOT-117).

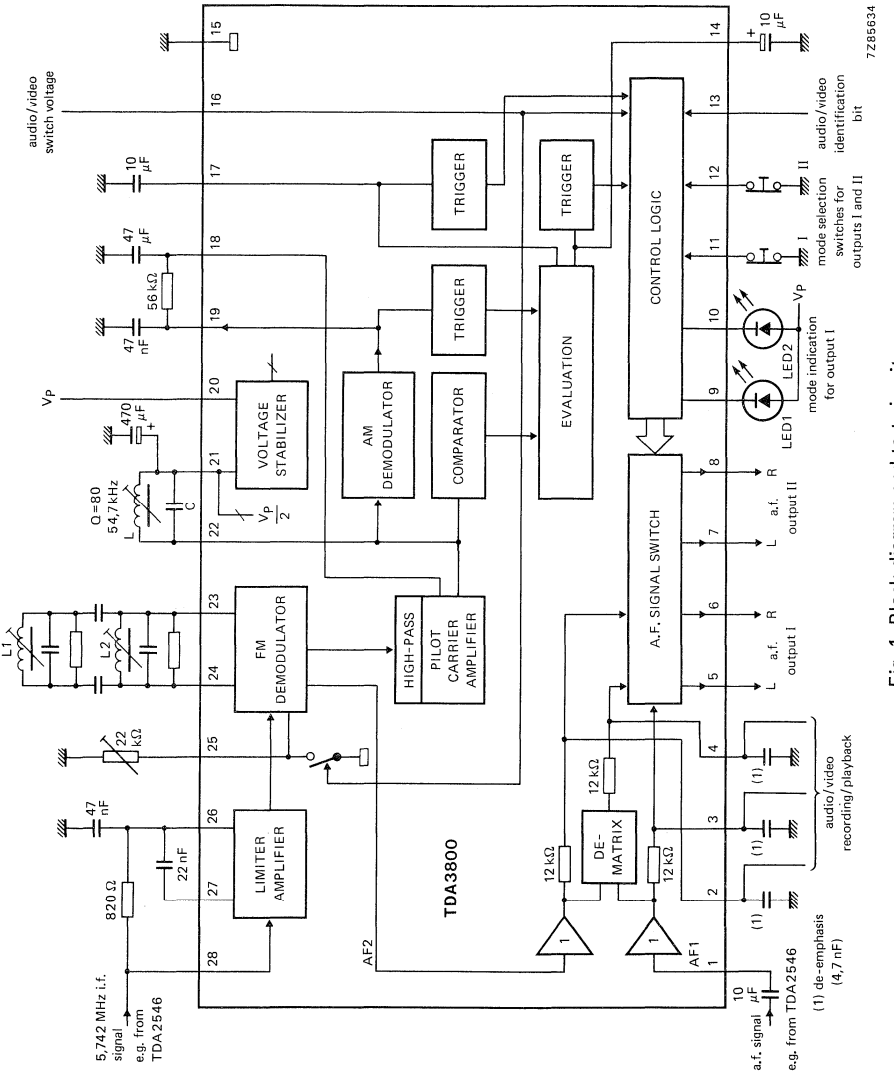

Fig. 1 Block diagram and test circuit.

DEVELOPMENT SAMPLE DATA

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

| | | | |
|---|---|---|---|
| Supply voltage (pin 20) | $V_P = V_{20-15}$ | max. | 14 V |
| Voltage | | | |
| at pin 1 | $V_{1-15}$ | max. | $V_P$ |
| at pins 9 and 10 | $V_{9;\,10-15}$ | max. | $V_P$ |
| at pin 16 | $V_{16-15}$ | max. | $V_P$ |
| Current | | | |
| at pins 11 and 12 | $I_{11;\,12}$ | max. | 1 mA |
| at pin 13 | $I_{13}$ | max. | 1 mA |
| at pin 21 | short-circuit protected | | |
| Total power dissipation | $P_{tot}$ | max. | 1,5 W |
| Storage temperature range | $T_{stg}$ | | −25 to + 125 °C |
| Operating ambient temperature range | $T_{amb}$ | | −20 to + 70 °C |

## CHARACTERISTICS

$V_P$ = 12 V; $T_{amb}$ = 25 °C; measured in Fig. 1 with a 1 kHz signal. $V_{1-15(rms)}$ = 0,5 V, an i.f. signal $V_{28-15(rms)}$ = 5 mV (VC/2SC = 20 dB, Δf = ± 50 kHz, $f_m$ = 400 Hz) and with adjusted de-matrix circuit; i.f. filter selection at input pin 28 as in Fig. 2.

| | | | |
|---|---|---|---|
| Supply voltage range | $V_P = V_{20-15}$ | | 10,8 to 13,2 V |
| Supply current | $I_P = I_{20}$ | typ. | 53 mA |
| **FM limiter/amplifier and demodulator** | | | |
| Start of limiting at: | $V_{28-15(rms)}$ | typ. | 50 μV |
| Input resistance | $R_{28-15}$ | typ. | 40 kΩ |
| Input capacitance | $C_{28-15}$ | typ. | 4,5 pF |
| AM suppression | $\alpha_{AM}$ | typ. | 60 dB |
| **Pilot carrier processing** | | | |
| Input voltage | $V_{18-15}$ | typ. | 6,9 V |
| AM demodulator output voltage | $V_{19-15}$ | typ. | 7,0 V |
| AM demodulator output voltage for m = 50% (peak-to-peak value) | $V_{19-15(p-p)}$ | typ. | 2,0 V |
| Controlled pilot carrier output voltage (peak-to-peak value) | $V_{22-21(p-p)}$ | typ. | 200 mV |
| Output resistance | $R_{22-15}$ | > | 50 kΩ |
| **Identification frequency evaluation** | | | |
| No identification signal (mono) | $V_{14-15}$ | < | 2 V |
| Identification signal available (dual sound/stereo) | $V_{14-15}$ | typ. | 6 V |
| Stereo transmission | $V_{17-15}$ | < | 2 V |
| Dual sound transmission | $V_{17-15}$ | > | 7 V |

CHARACTERISTICS (continued)

| for recording (LOW) | $V_{16\text{-}15}$ | | 0 to 2,5 V |
| Audio/video identification bit | | | |
| for stereo mode (LOW) | $V_{13\text{-}15}$ | | 0 to 0,2 V |
| for dual sound mode (HIGH $V_{13\text{-}15} = 0{,}7$ V | $I_{13}$ | typ. | 0 mA |

* Connection of high-impedance headphones is possible.

**Mode selection switches for output I and II** (see Fig. 1)

The pushbuttons at pins 11 and 12 are assigned to the a.f. outputs I and II respectively.

Serial commands can be applied to the mode selection switch inputs (pins 11 and 12) for choice of stereo/mono or AF1/AF2. The choice for stereo and dual sound transmission is stored internally.

When a television transmitter changes its identification from dual sound to stereo and then back to dual sound again, the last selected dual sound signal is available automatically because of the internal storage of the choice. This holds for mono/stereo selection too.

Power-on reset: when applying the supply voltage, the stereo or the AF1 signal appears at both the outputs I and II or depending on the type of transmission.

| | | | |
|---|---|---|---|

# SMALL SIGNAL COMBINATION IC FOR MONOCHROME TV

## GENERAL DESCRIPTION

The TDA4500 combines all small signal functions (except the tuner) which are required for a monochrome television receiver.

For a complete monochrome television receiver only output stages are required to be added for horizontal and vertical deflection, video and sound. The TDA4500 can also be used in simple colour television receivers. In this application an external sandcastle pulse generator is required.

It incorporates the following functions:

- vertical sync separator/oscillator
- vertical output
- coincidence detector (sound mute)
- phase detector/frequency control
- a.g.c. detector
- sync separator
- horizontal oscillator
- synchronous demodulator
- vision i.f. amplifier
- tuner a.g.c.
- d.c. volume control
- a.f.c. detector
- video output
- sound demodulator
- audio output
- gate pulse generator
- sound limiter/feedback
- 90° phase shift
- overload detector
- horizontal output

DEVELOPMENT SAMPLE DATA

## FUNCTIONAL DESCRIPTION (Fig. 1)

A complete black-and-white receiver can be built around this circuit by adding only the output stages for horizontal and vertical deflection with the video and sound output stages. The TDA4500 can also be used in simple colour television receivers using an external circuit to generate the sandcastle.

The block diagram (Fig. 1) depicts the various functions which are described briefly below.

The sensitivity of the i.f. amplifier is 70 $\mu$V for a peak-to-peak output voltage of 3 V (compare the TDA3541). This amplifier has a symmetrical input (pins 8 and 9) and is followed by a synchronous demodulator. The external tuned circuit is connected to pins 20 and 21. This circuit provides the information for the a.f.c. circuit, the 90° phase shift being supplied by internal RC-networks. An a.f.c. output with a voltage swing of about 9 V is obtained from pin 17 ($V_{7-10}$ = 10,5 V).

The a.g.c. detector is gated to reduce sensitivity to external electrical noise and the a.g.c. time constant network is connected to pin 24. Gain control range of the i.f. amplifier is greater than 60 dB. Adjustments of the tuner take-over point is made at pin 4. When the voltage at pin 4 is approximately 3,5 V the direction of the tuner control voltage is positive-going. When the voltage at pin 4 is approximately 8 V the direction of the tuner control voltage is negative-going.

An output signal of 3 V (p-p) is obtained from the video amplifier (top sync level 1,5 V) with negative-going sync. Since the sound signal is derived from pin 16 (see Fig. 4) the video output is not blanked during the flyback period. As shown in the application circuit (Fig. 4) the band-pass filter for the sound must be connected between video output (pin 16) and sound i.f. input (pin 15). Sound information passes through a sound limiter network and a sound demodulator circuit with an external tuned circuit for this stage connected to pin 13. The demodulator is followed by a volume control stage with a control range of 80 dB and an output amplifier with an audio output signal of 170 mV (r.m.s.) for a $\Delta$f of 7,5 kHz and at maximum volume setting.

The slicing level of the sync separator is referred to the top sync and is determined by the values of external resistors, the recommended slicing level being 30%. Noise protection is provided for the sync separator stage. Separated sync pulses are supplied to the gated phase detector which compare the sync pulses with the sawtooth voltage obtained from the horizontal flyback pulse (pin 5). During catching the gating of the phase detector is switched off and the phase detector output current is increased.

The in-sync or out-of-sync condition is detected with the coincidence detector which is also used for transmitter identification. Sound output is suppressed when no input signal is available. Clamping the voltage on pin 28 to a level of 3,5 V sets the phase detector to a high output current, short time constant mode. This is appropriate for the reception of VCR signals.

Phase detector output voltage levels maintain the horizontal oscillator at its correct operating frequency. The push-pull output (pin 27) has a typical duty cycle of 40%.

Vertical sync pulses are obtained from an internal integrating network with the vertical sawtooth being generated in the vertical oscillator. This sawtooth voltage is compared with the feedback voltage from the deflection coil via pin 3. The comparator generates the drive voltage for the vertical deflection output stage.

The TDA4500 has four supply pins. Pin 7 and pin 10 are for the main positive supply and circuit ground respectively.

Critical circuits are grounded by pin 19. Pin 22 is the supply for the horizontal oscillator. A low current supply (5 mA minimum) can be used to start the oscillator from an external high voltage supply rail.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC134)

| | | | | |
|---|---|---|---|---|
| Supply voltage | $V_{7-10}$, $V_{22-10}$ | max. | 13,2 | V |

| A.C. input voltage (peak-to-peak value) | $V_{3-10(p-p)}$ | – | 1,2 | – | V |
| Input current | $I_3$ | – | – | 10 | μA |
| Non-linearity of deflection current at $V_P$ = 10,5 V | | – | – | 2,5 | % |

**Notes to characteristics**

1. It is possible to start the horizontal oscillator by supplying a current of 5 mA which can be taken from the mains rectifier, to pin 22. The main supply (pin 7) can then be derived from the horizontal output stage.
2. I.F. input voltage (r.m.s.) — value at top sync level at which the video amplitude has dropped 0,5 dB compared with the amplitude at an input signal of 10 mV.
3. The input impedance has been chosen such that a SAW-filter can be applied. 800 Ω is an acceptable compromise between the requirements for triple transient suppression and power loss.
4. Measured with 0 dB = 150 μV.
5. Measured at 10 mV(r.m.s.) top sync input signal.
6. With switched demodulator.
7. Signal with negative-going sync with top white being 10% of the top sync amplitude (Fig. 2).
8. This figure is valid for the complete video signal amplitude (peak-white to top sync).
9. Measured with an input signal ($V_{8-9}$) of 10 mV(r.m.s.); the a.f.c. output (pin 7) loaded with 2 x 100 kΩ between the supply and ground. The Q factor of the reference tuned circuit is 50.
10. Voltage at pin 15 is the r.m.s. value. $Q_L$ of the demodulator tuned circuit is 20. Audio frequency is 1 kHz and the carrier frequency is 5,5 MHz.
11. Measured with an input signal of 1 mV(r.m.s.)
12. The tuned demodulator circuit must give an output level equal to that given in the "mute" condition.
13. Volume can be controlled using a variable resistor connected to ground (nominal 5 kΩ) or by means of a variable d.c. voltage. In this latter case the rather low impedance at pin 11 must be taken into account.

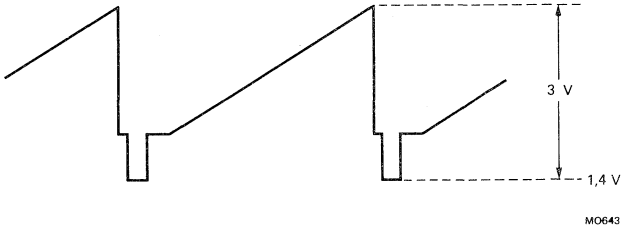

Fig. 2 Video output signal.

Notes to characteristics (continued)

14. The sync separator is noise gated. The slicing level is referred to top sync level and is independent of the video information. The value given is a percentage of the sync pulse amplitude. The slicing depends on the values of external resistors connected to pin 26.
15. Phase detector current increases by a factor of 7 during "catching" and when phase detector operates in the 'FAST' mode (pin 28). This ensures a high catching range and a higher dynamic loop gain.
16. Supply voltage variation in the range 8 to 12 V.
17. The negative-going edge of this pulse initiates the switch-off of the horizontal output transistor (simultaneous driver).
18. The circuit requires an integrated flyback pulse. The gate pulses for a.g.c. and the coincidence detector are obtained from the sawtooth.
19. The functions of in-sync/out-of-sync and transmitter identification have been combined on pin 28. For reception of VCR-signals the voltage on this pin must be fixed between 3 V and 4,5 V so that the time constant is fast and the sound is still available.

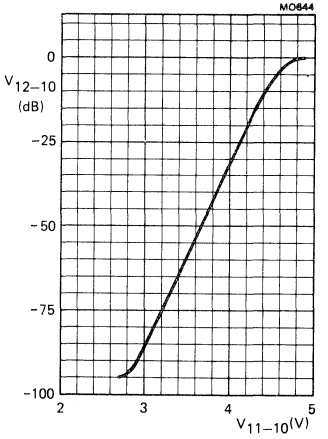

Fig. 3 Volume control characteristic at f = 1 kHz.

## GENERAL DESCRIPTION

The TEA1002 PAL colour encoder and video summer IC has an internal 8,86 MHz oscillator from which the 4,43 MHz (R-Y) and B-Y) waveforms are generated. For use in TV games systems, a 3,54 MHz clock output is provided which is buffered via the 2621 sync generator IC. The TEA1002 accepts timing signals (composite sync burst gate, PAL switch and composite blanking) from the 2621 and 4-bit binary coded logic inputs giving colour information from the 2636 programmable video interface IC. The resulting output, which has an adjustable d.c. level, is a 16 colour (including black and white) composite video signal, based on 75% colour bars. Alternatively, with one of the colour inputs connected to ground and the d.c. adjustment disabled, the TEA1002 can be used as a general purpose video encoder providing standard 95% colour bars from RGB logic inputs, suitable for applications such as add-on teletext.

| Internal impedance at pin 11 | $\lvert Z_i \rvert$ | – | 1,5 | – | kΩ |

### Notes

1. This circuit assumes capacitive coupling to the N-MOS games IC (see Fig. 5).
2. The integrated circuit gates the CBF and CSYNC signals to provide a 'frame offset' which lengthens two clock periods by 56 ns every field. This provides a subcarrier/line frequency relationship of $f_{sc} = 283¾\ f_l + 25$ Hz which gives an optimum picture response.
3. These figures hold for a typical quartz crystal as specified below:
   Crystal catalogue no. 4322 143 04051, used in series with 20 pF trimmer capacitance ($C_L$).
   motional resistance (R1): typ. 15 Ω; max. 60 Ω
   static capacitance (C0): typ. 5 pF; max. 6 pF.
4. These figures exclude the temperature dependence of the crystal and load capacitance ($C_L$).
5. The chroma/luminance phase inequality can be compensated by an external delay line connected between pins 6 and 7 (see Fig. 8).
   For measurements on the composite video output use the circuit as shown in Fig. 7.
6. To generate standard colour bar signals, pin 1 must be grounded externally.

## APPLICATION INFORMATION

**The function is described against the corresponding pin number**

1. **Inverting logic input**

   When this pin is connected to ground, the logic inputs on pins 2, 3 and 4 are decoded as R, G and B respectively and the chrominance signal at the output is at its full amplitude. If this pin is taken HIGH (> 2 V) the logic inputs are decoded as $\overline{R}$, $\overline{G}$ and $\overline{B}$ and the chrominance signal is reduced to half its full amplitude (see Table 1).

2, 3, 4. **Red, green and blue logic inputs**

5. **Composite sync input**

   This pin requires a negative logic composite sync signal ($\overline{CSYNC}$). The signal is also gated with CBF to control a frame offset phase adjustment for the 3,54 MHz clock (see pins 13 and 14).

6, 7. **Luminance delay line**

The combined luminance and sync signal appearing at pin 6 must be d.c. coupled to pin 7 via an appropriate luminance delay line or resistor network. The resistors must have a tolerance of ± 5% (see Fig. 7).

8. **Composite video output**

The output is internally buffered by an emitter follower stage giving a nominal output voltage of 3 V sync-white. The d.c. level is temperature compensated and can be continuously adjusted over a nominally 2,5 V range via an input on pin 9.

9. **D.C. adjustment and colour bar switch**

This pin provides the dual function of d.c. level adjustment for the composite video output stage and colour bar standard selection. An adjustment of $V_{9\text{-}16}$ from 9,5 V to 12 V will cause a corresponding change of output sync tip level from 3 V to 5,5 V (nominal values).

With $V_{9\text{-}16} \geqslant 4$ V the luminance levels are set to give 75% (E.B.U.) colour signals when using the RGB inputs with pin 1 grounded. With $V_{9\text{-}16} \leqslant 3$ V the output levels will be changed to give 95% (B.B.C.) colour signals (see Table 1). Thus d.c. adjustment can only be obtained with 75% colours.

10. **Supply voltage** (+ 12 V)

11. **Chroma band limiting**

This pin is connected internally to the chrominance summing junction and may be used to limit the bandwidth of the chroma signal by connecting it to a 4,43 MHz tuned filter via a blocking capacitor. The internal impedance is nominally 1,5 kΩ. If a filter is used at this point, then the delay of the chroma signals must be compensated by an appropriate luminance delay line between pins 6 and 7.

12. **PAL switch**

This pin requires a logic signal at half line frequency to control the phase of the (R-Y) modulator and the burst signal.

13, 14. **8,86 MHz crystal**

An 8,867238 MHz crystal in series with a trimmer capacitor is connected between these pins to form part of an oscillator. The output of the oscillator is divided to provide the four subcarrier phases required in the encoder.

The 8,86 MHz signal is also divided by 2½ to give a 3,54 MHz clock input to the 2621 sync generator IC. A phase correction is made after every field to ensure the correct subcarrier to line frequency relationship.

15. **Colour burst flag**

This pin requires a positive logic signal to enable the colour burst encoder.

16. **Ground** (0 V)

17. **Clock output**

The 3,54 MHz clock signal from this pin must be a.c. coupled to the 2621 sync generator IC.

18. **Composite blanking**

This pin requires a positive logic composite blanking signal. The colour logic inputs at pins 1 to 4 are gated to logic '0' when this input is HIGH.

APPLICATION INFORMATION (continued)

Table 1. Logic inputs and composite video output

| | inputs | | | | colour | nominal outputs | | | |
|---|---|---|---|---|---|---|---|---|---|
| | pin 2 R | pin 3 G | pin 4 B | pin 1 INV | | luminance $V_{9\text{-}16} \geqslant 4$ V (%) | luminance $V_{9\text{-}16} \leqslant 3$ V (%) | chroma phase (degrees) | chroma amplitude (% black-white) |
