DATA HANDBOOK SYSTEM

Our Data Handbook System is a comprehensive source of information on electronic components, sub-assemblies and materials; it is made up of three series of handbooks each comprising several parts.

ELECTRON TUBES

BLUE

SEMICONDUCTORS AND INTEGRATED CIRCUITS

RED

COMPONENTS AND MATERIALS

GREEN

The several parts contain all pertinent data available at the time of publication, and each is revised and reissued periodically.

Where ratings or specifications differ from those published in the preceding edition they are pointed out by arrows. Where application information is given it is advisory and does not form part of the product specification.

If you need confirmation that the published data about any of our products are the latest available, please contact our representative. He is at your service and will be glad to answer your inquiries.

This information is furnished for guidance, and with no guarantee as to its accuracy or completeness; its publication conveys no licence under any patent or other right, nor does the publisher assume liability for any consequence of its use; specifications and availability of goods mentioned in it are subject to change without notice; it is not to be reproduced in any way, in whole or in part without the written consent of the publisher.

October 1977

ELECTRON TUBES (BLUE SERIES)

Part 1a	December 1975	ET1a 12-75	Transmitting tubes for communication, tubes for r.f. heating Types PE05/25 to TBW15/25
Part 1b	August 1977	ET1b 08-77	Transmitting tubes for communication, tubes for r.f. heating, amplifier circuit assemblies
Part 2a	November 1977	ET2a 11-77	Microwave tubes Communication magnetrons, magnetrons for microwave heating, klystrons, travelling-wave tubes, diodes, triodes T-R switches
Part 2b	May 1978	ET2b 05-78	Microwave semiconductors and components Gunn, Impatt and noise diodes, mixer and detector diodes, backward diodes, varactor diodes, Gunn oscillators, sub- assemblies, circulators and isolators
Part 3	January 1975	ET3 01-75	Special Quality tubes, miscellaneous devices
Part 4	March 1975	ET4 03-75	Receiving tubes
Part 5a	March 1978	ET5a 03-78	Cathode-ray tubes Instrument tubes, monitor and display tubes, C.R. tubes for special applications
Part 5b	May 1975	ET5b 05-75	Camera tubes, image intensifier tubes
Part 6	January 1977	ET6 01-77	Products for nuclear technology Channel electron multipliers, neutron tubes, Geiger-Müller tubes
Part 7a	March 1977	ET7a 03-77	Gas-filled tubes Thyratrons, industrial rectifying tubes, ignitrons, high-voltage rectifying tubes
Part 7b	March 1977	ET7b 03-77	Gas-filled tubes Segment indicator tubes, indicator tubes, switching diodes, dry reed contact units
Part 8	May 1977	ET8 05-77	TV picture tubes
Part 9	March 1978	ET9 03-78	Photomultiplier tubes; phototubes

SEMICONDUCTORS AND INTEGRATED CIRCUITS (RED SERIES)

Part 1a August 1978	SC1a 08-78	Rectifier diodes, thyristors, triacs Rectifier diodes, voltage regulator diodes (> 1,5 W), transient suppressor diodes, rectifier stacks, thyristors, triacs
Part 1b May 1977	SC1b 05-77	Diodes Small signal germanium diodes, small signal silicon diodes, special diodes, voltage regulator diodes (< 1,5 W), voltage reference diodes, tuner diodes
Part 2 November 1977	SC2 11-77	Low-frequency and dual transistors
Part 3 January 1978	SC3 01-78	High-frequency, switching and field-effect transistors
Part 4a June 1976	SC4a 06-76	Special semiconductors* Transmitting transistors, field-effect transistors, dual transistors, microminiature devices for thick and thin-film circuits
Part 4b September 1978	SC4b 09-78	Devices for optoelectronics Photosensitive diodes and transistors, light emitting diodes, photocouplers, infrared sensitive devices, photoconductive devices
Part 4c July 1978	SC4c 07-78	Discrete semiconductors for hybrid thick and thin-film circuits
Part 5a November 1976	SC5a 11-76	Professional analogue integrated circuits
Part 5b March 1977	SC5b 03-77	Consumer integrated circuits Radio-audio, television
Part 6 October 1977	SC6 10-77	Digital integrated circuits LOCMOS HE4000B family
Signetics integrated circuits 1978		Bipolar and MOS memories Bipolar and MOS microprocessors Analogue circuits

* The most recent information on field-effect transistors can be found in SC3 01-78, on dual transistors in SC2 11-77, and on microminiature devices in SC4c 07-78.

COMPONENTS AND MATERIALS (GREEN SERIES)

Part 1	June 1977	CM1 06-77	Assemblies for industrial use High noise immunity logic FZ/30-series, counter modules 50-series, NORbits 60-series, 61-series, circuit blocks 90-series, circuit block CSA70(L), PLC modules, input/output devices, hybrid circuits, peripheral devices, ferrite core memory products
Part 2a	October 1977	CM2a 10-77	Resistors Fixed resistors, variable resistors, voltage dependent resistors (VDR), light dependent resistors (LDR), negative temperature coefficient thermistors (NTC), positive temperature coefficient thermistors (PTC), test switches
Part 2b	February 1978	CM2b 02-78	Capacitors Electrolytic and solid capacitors, film capacitors, ceramic capacitors, variable capacitors
Part 3	January 1977	CM3 01-77	Radio, audio, television Loudspeakers, components for black and white television, components for colour television
Part 3a	September 1978	CM3a 09-78	FM tuners, television tuners, surface acoustic wave filters
Part 4a	September 1978	CM4a 09-78	Soft ferrites Ferrites for radio, audio and television, beads and chokes, Ferroxcube potcores and square cores, Ferroxcube transformer cores
Part 4b	December 1976	CM4b 12-76	Piezoelectric ceramics, permanent magnet materials
Part 6	April 1977	CM6 04-77	Electric motors and accessories Small synchronous motors, stepper motors, miniature direct current motors
Part 7	September 1971	CM7 09-71	Circuit blocks Circuit blocks 100 kHz-series, circuit blocks 1-series, circuit blocks 10-series, circuit blocks for ferrite core memory drive
Part 8	February 1977	CM8 02-77	Variable mains transformers
Part 9	March 1976	CM9 03-76	Piezoelectric quartz devices
Part 10	April 1978	CM10 04-78	Connectors

F.M. tuners

F.M. TUNER with diode tuning

QUICK REFERENCE DATA

Supply voltage (d. c.)	15 V
Frequency range	87,5 - 108 MHz
Intermediate frequency	10,7 MHz

APPLICATION

This tuner is intended for use in hi-fi radio sets.
The required range can be obtained by limiting the tuning voltage.
The tuners are provided with a four-fold i. f. circuit.

MECHANICAL DATA

Dimensions in mm

Note : The left and right sides are identical.

Mounting

The tuner can be mounted in any position.

Marking

The tuner is marked with the 12-digit catalogue number and the production code.

ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of $60 \pm 15\%$ and a supply voltage of 15 ± 1 V.

Shift of oscillator frequency	
at a change of the supply voltage from 15 to 12 V	≤ 100 kHz
at a change of the ambient temperature from 0 to +55 °C	≤ 5 kHz/°C; typ. 2,5 kHz/°C
after resistance to moisture test (IEC 68-2-30, test Db, 21 days, 40 °C; recovery time 1 h)	≤ 1250 kHz; typ. 600 kHz
Reduction of power gain at a change of the supply voltage from 15 to 12 V	≤ 3,5 dB
Oscillator radiation and oscillator terminal voltage	according to C. I. S. P. R. recommen- dation no. 24/3; measured according to I. E. C. 106.

¹⁾ Suppression of a signal arising by conversion of harmonics of the oscillator signal and those of a strong aerial signal. Reference voltage: 10 μV (aerial e. m. f.); aerial impedance: 75 Ω.

²⁾ Suppression of a signal arising from two strong aerial signals. Reference voltage: 10 μV (aerial e. m. f.); aerial impedance: 75 Ω.

³⁾ Suppression of a signal arising from the harmonic of two strong aerial signals with a frequency difference equal to the intermediate frequency.

ADDITIONAL INFORMATION

Aligning of the i. f. circuit

The tuner is fully h.f. and i.f. aligned in the factory.

However, if an adaptation to the receiver is necessary, aligning should be done in the following way.

1. Adjust the tuning voltage to +8,35 V.
2. Apply a generator signal (≤ 100 mV, $10,7$ MHz ± 2 kHz) to the i. f. injection point (Fig. 1) via the circuit shown in Fig. 3.

Fig. 3

3. Adjust the i. f. coils in sequence 1 to 4 (Fig. 4) to maximum output.

rear view

Fig. 4

4. Apply a generator signal (100 mV, $10,7$ MHz ± 500 kHz) to the i. f. injection point for checking the i. f. bandwidth; top of the curve at $10,7$ MHz ± 5 kHz. Check the i. f. bandwidth (3 dB) and S 300: their values must be as specified in "Electrical Data".

Measurement of power gain

Fig. 5

The r. f. input signal: ≤ 1 mV (r. m. s.)

The gain = $20 \log \frac{\text{i. f. voltage across } R (= 390 \Omega)}{\text{aerial e. m. f.}}$

F.M. TUNER

- With diode tuning
- For European and American band
- With automatic frequency control
- Suited for digital tuning systems

QUICK REFERENCE DATA

Supply voltage (d.c.)	12 V
Frequency range	87,5 to 108 MHz
Intermediate frequency	10,7 MHz

APPLICATION

This f.m. tuner is designed for use in hi-fi radio receivers. An output voltage from the local oscillator is made available for driving digital frequency displays and tuning systems. Apart from this the tuner is compatible with tuner FD1A.

DESCRIPTION

The FD1B is an f.m. tuner with electronic tuning, covering the v.h.f. band II (frequency range 87,5 to 108 MHz).

Mechanically the tuner is built on a low-loss printed board, carrying all components, in a metal housing of a rectangular frame, and front and rear cover (Fig. 2). All contacts are on a board edge at the underside, which can be inserted into a mounting socket, facilitating set repair. Connections to the tuner can also be directly soldered to the contacts.

The tuner has a coaxial socket at the side of the frame for coupling out the oscillator sample.

The tuner is equipped with silicon transistors and silicon variable capacitance diodes.

The aerial signal is fed via an input filter to the r.f. amplifier stage, which is equipped with a high-current transistor BF324 operating in common base mode. Due to the high operating current of this transistor its gain is so high that the coupling to the tuned input circuit can be loose, resulting in good signal handling capability, low noise and good repeat-spot suppression. At the output the r.f. amplifier is provided with a tunable band-pass filter, whose secondary circuit is loosely coupled via capacitors to the base of mixer transistor BF324, operating in common emitter mode, contributing to good signal handling capability of the mixer stage. The oscillator is equipped with a transistor BF451 in common base mode and coupled to the mixer via a low-pass filter, which effectively suppresses harmonics of the oscillator frequency.

The a.f.c. circuit is provided with variable capacitance diode BB106, which controls the oscillator frequency directly.

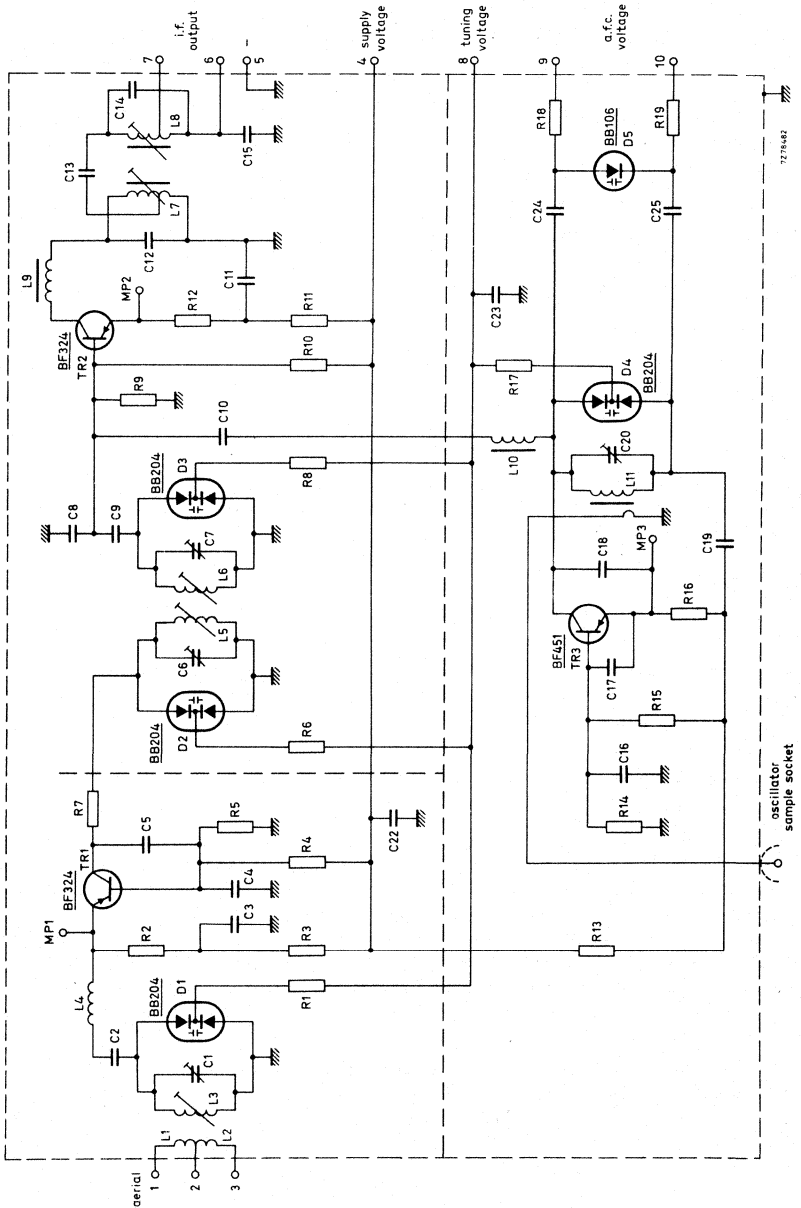

Fig. 1.

 8 = tuning voltage, +3,8 to +28 V
 9 and 10 = a.f.c. voltage

Mounting

The tuner can be inserted into a mounting socket* or soldered directly to a printed board. The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

For connection to the oscillator sample socket a coaxial plug has to be used; type 3/2-50 (manufacturer: Daut und Rietz) is recommended.

Marking

The f.m. tuners are marked with the type number, the 12-digit catalogue number, and the production code.

* Type 3/6 – 178.01 or type 3/6 – 178.02 (manufacturer: Daut und Rietz) is recommended.

F.M. TUNER

- With diode tuning
- For European and American band
- With automatic frequency control

QUICK REFERENCE DATA

Supply voltage (d.c.)	12 V
Frequency range	87,5 to 108 MHz
Intermediate frequency	10,7 MHz

APPLICATION

This f.m. tuner is designed for use in hi-fi radio receivers. The tuner is compatible with tuner FD1A.

DESCRIPTION

The FD1F is an f.m. tuner with electronic tuning, covering the v.h.f. band II (frequency range 87,5 to 108 MHz).

Mechanically the tuner is built on a low-loss printed board, carrying all components, in a metal housing of a rectangular frame, and front and rear cover (Fig. 2). All contacts are on a board edge at the underside, which can be inserted into a mounting socket, facilitating set repair. Connections to the tuner can also be directly soldered to the contacts.

The tuner is equipped with silicon transistors and silicon variable capacitance diodes.

The aerial signal is fed via a tuned input filter to the r.f. amplifier stage, which is equipped with a dual-gate MOS field-effect transistor BF900. Due to the properties of this transistor its gain is so high that the coupling to the tuned input circuit can be loose, resulting in good signal handling capability, low noise and good repeat-spot suppression. At the output the r.f. amplifier is provided with a tunable band-pass filter, whose secondary circuit is loosely coupled via capacitors to the base of mixer transistor BF324, operating in common emitter mode, contributing to good signal handling capability of the mixer stage. The oscillator is equipped with a transistor BF936 in common base mode and coupled to the mixer via a low-pass filter, which effectively suppresses harmonics of the oscillator frequency.

The a.f.c. circuit is provided with variable capacitance diode BB106, which controls the oscillator frequency directly.

F.M. TUNERS

- With diode tuning
- For European and American band
- Suited for digital tuning systems

QUICK REFERENCE DATA

Supply voltages (d.c.)	5 V, 20 V and 30 V
Frequency range	87,5 to 108 MHz
Intermediate frequency	10,7 MHz

APPLICATION

The f.m. tuners FD11 and FD11K are designed for use in high-quality, hi-fi radio receivers.

In the FD11 an output voltage from the local oscillator is made available for driving digital frequency displays and tuning systems. Apart from this both tuners are identical.

DESCRIPTION

The FD11 and FD11K are f.m. tuners with electronic tuning, covering the v.h.f. band II (frequency range 87,5 to 108 MHz).

Mechanically the tuners are built on a low-loss printed board, carrying all components, in a metal housing of a rectangular frame, and front and rear cover. (Fig. 2). All contacts are on a board edge at the bottom, which can be inserted into a mounting socket, facilitating set repair. Connections to the tuner can also be directly soldered to the contacts.

The tuners are equipped with silicon semiconductors. The aerial signal is fed via a double-tuned input filter to the r.f. amplifier stage. This stage is equipped with a dual-gate MOS field-effect transistor BF900, the gain of which can be controlled by an a.g.c. voltage. At the output the r.f. amplifier is provided with a double-tuned band filter, transferring the signal to the mixer stage, which is built-up with the integrated circuit TCA240. At the output the mixer has a 10,7 MHz band filter (L8, K1), which can be aligned if adaptation to the receiver is necessary.

The oscillator is equipped with a transistor BF451. The stability of the oscillator frequency has been increased to a high degree by special means. The influence of supply voltage variations has been reduced by a separate stabilizing of the oscillator supply, while temperature influences on coils, transistors, board material and trimmers are compensated by the careful choice of the temperature coefficients of the capacitors of the tuned circuit and of the feedback capacitors. Moreover the influence of drift of the capacitance diodes is compensated by travelling the tuning-voltage signal via an emitter follower. By loosely coupling the oscillator to the mixer, the pulling is very small.

A rectifier circuit, which is connected to the secondary of the i.f. output filter, provides an internal a.g.c. (terminals 1 and 7 interconnected). If in the case of weak signal reception, the controlling is disturbed by neighbouring carriers, the a.g.c. can be switched off, or be provided by an external a.g.c. voltage, generated in the receiver. Without a.g.c. the power gain is maximum.

The oscillator signal is brought to ECL level via a transistor BF199. The frequency (f_0) is changed to $f_0/4$ by a 4 : 1 divider (GXB10131). The sample signal, which is coupled out symmetrically, can be applied to standard circuits for digital frequency display without any difficulty. By means of a signal to the reset input the divider can be stopped (terminals 17 and 18 on the same potential).

APPLICATION INFORMATION

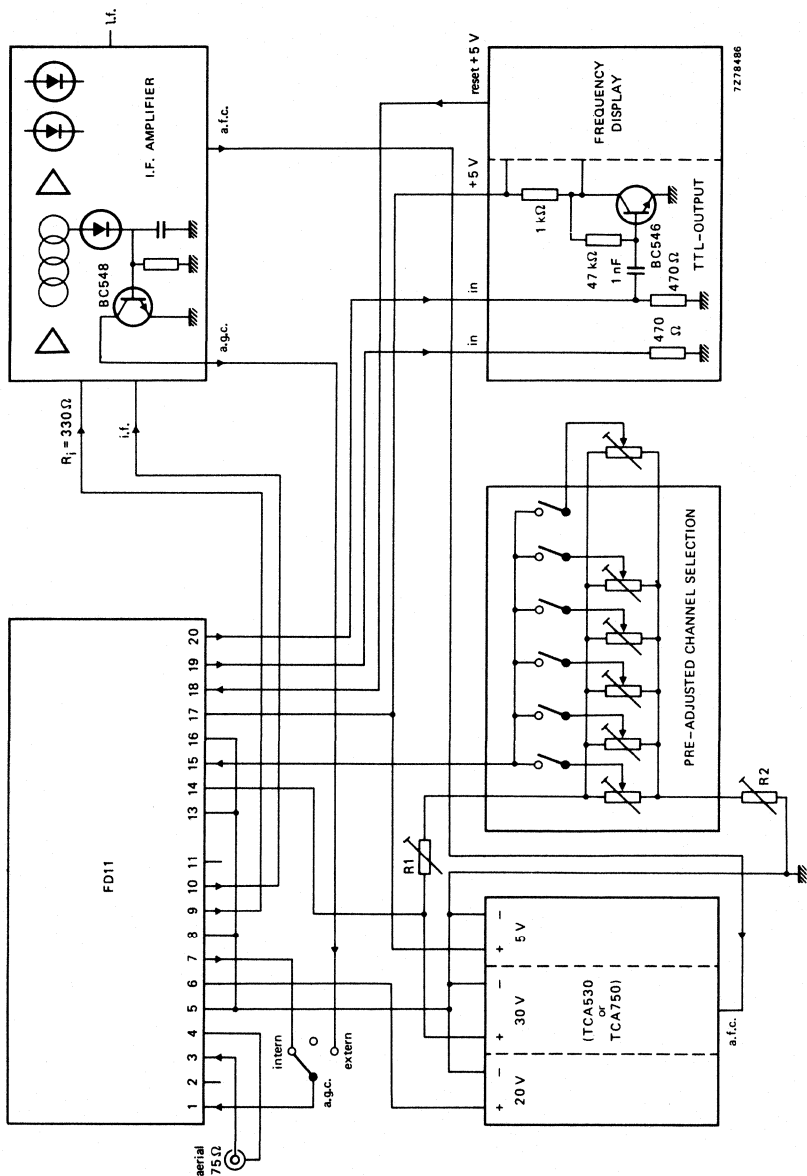

Fig. 6 Application example for FD11 with digital frequency display. The built-in 4 : 1 divider applies the oscillator sample signal on ECL level; a simple circuit with a transistor BC546 converts it to TTL level. Connections should be symmetrically to avoid radiation. The limits of the frequency range are adjusted with resistors R1 and R2.

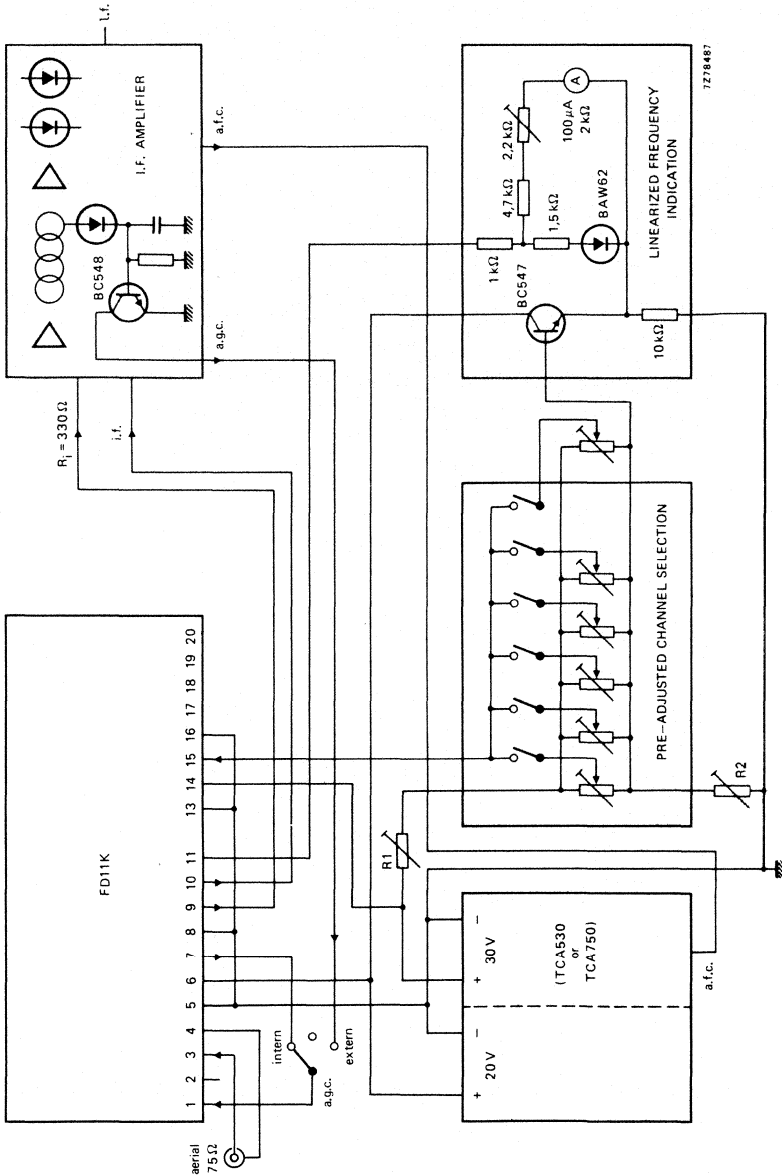

Fig. 7 Application example for FD11K with analogue frequency indication. The linearizing circuit with transistor BC547 and diode BAW62 adapts the oscillator signal to the indicating instrument. With this circuit the specified values for the drift of the oscillator frequency could be exceeded.

APPLICATION

Designed to cover 405 line v.h.f. and 625 line (wired distribution) channels, and the v.h.f. channels of C. C. I. R. system B.

DESCRIPTION

The ELC1042/05 is a v.h.f. tuner with electronic tuning and band switching, covering the v.h.f. band I (frequency range 41,5 to 68 MHz), and the v.h.f. band III (frequency range 174 to 230 MHz).

Mechanically the tuner is built on a low-loss printed-wiring board, carrying all components in a metal housing made of a rectangular frame and front and rear cover (see Fig.2). The aerial connection is on the frame side, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages) are made via feedthrough capacitors in the underside. The mounting method is shown in Figs.3 and 4.

The v.h.f. aerial signal is fed via an i.f. trap to a tuned input circuit, which is connected to the emitter of the input transistor BF264. The collector load of this transistor is formed by a double tuned circuit, transferring the signal to the base of the mixer transistor BF195. The oscillator is equipped with a BF194 transistor. The three r.f. circuits are tuned by three capacitance diodes BB105G. Switching between v.h.f. I and III is achieved by five switching diodes BA182.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is capacitively coupled out of the tuner.

The tuner requires transistor supply voltages of +12 V, a switching voltage of +12 V, a.g.c. voltages, variable from +2,5 V (normal operating point) to about +6 V (maximum a.g.c.) and a tuning voltage, variable from +0,3 V to +25 V.

The aerial input of the tuner is asymmetrical. For use in symmetrical aerial systems, aerial transformers (baluns) are available (see ACCESSORIES).

**Oscillator radiation (oscillator voltages at
the aerial terminal)**

The oscillator radiation will be within the limits of BS905: 1969 provided no connection has been made to the test point and the circuit connected to the i. f. output is carefully shielded.

For the oscillator fundamentals use is made of the relaxed limits, assuming that the design of the i. f. amplifier of the receiver is such that a detuning of the oscillator of -2, 0 MHz or +0, 6 MHz from the nominal frequency will result in unacceptable picture and/or sound degradation.

Immunity from radiated interference

If the tuner, including the aerial connection (see Fig. 4) is installed in a professional manner, the immunity from radiated interference will be within the limits specified in BS905: 1969.

If a higher safety margin, or another cable connection is required, use can be made of an immunity shield (see ACCESSORIES).

Microphonics

If the tuner is installed in a professional manner, there will be no noticeable microphonics.

Fig. 9. Cross modulation, in channel.

Fig. 10. Cross modulation, in band; the interfering channels are given between brackets.

ADDITIONAL INFORMATION

Measuring method of power gain

The i.f. output of the tuner should be terminated with the circuit given below, the test-point (terminal 9) not being connected.

Fig. 11.

Feed an i.f. sweep signal to the v.h.f. I-mixer coupling coil.

Fig. 12.

Adjust the trimmer (Fig. 11), tunable coil La/Lb, i.f. output coil of the tuner L18 (Fig. 1), and the coupling between La and Lb to get the resonant curve as given below.

Fig. 13

Display the r. f. + i. f. curve of the tuner at 190 MHz (picture carrier frequency) and make, if necessary, small corrections in the alignment of the i. f. coils (L_a/L_b and L18) to get the markers 39,5 MHz and 33,5 MHz symmetrically on the slopes of the curve, and the peaks at equal amplitude.

Because the output impedance of the dummy circuit is 50 to 75 Ω , the power gain can be measured in the conventional manner by inserting tuner and dummy circuit between a 75 Ω source and a 75 Ω detector (or between a 50 Ω source and matching pad 50/75 Ω and a 50 Ω detector).

ACCESSORIES

Aerial input transformer ELC 1094, catalogue number 3122 107 10121, for converting the aerial input from 75 Ω asymmetric to 300 Ω symmetric.

Immunity shield for screening the aerial connection, consisting of:
shield, catalogue number 4313 132 01910
clamp, catalogue number 4313 132 01890

OTHER AVAILABLE VERSION

ELC1042 - catalogue number 2422 542 10421.

This tuner is identical with the ELC1042/05 except that the i. f. coil L18 of the ELC1042 has four additional turns.

Channels	21 to 69	
Intermediate frequencies	<u>system G</u>	<u>system I</u>
picture	38,9 MHz	39,5 MHz
sound	33,4 MHz	33,5 MHz

APPLICATION

Designed to cover the u. h. f. channels 21 to 69 of C. C. I. R. systems G and I.

DESCRIPTION

The ELC1043/05 is an u.h.f. tuner with electronic tuning covering the u.h.f. bands IV and V (frequency range 470 to 860 MHz).

Mechanically the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2). The aerial connection is on the frame side, all other connections (supply voltages, a.g.c. voltage and tuning voltage) are made via feedthrough capacitors in the under side. The mounting method is shown in Figs. 3 and 4.

The tuner is of the three transistor type, comprising two r.f. stages and an oscillator/mixer. The input circuit is untuned, so that optimum noise figures may be realised, whilst the additional r.f. stage compensates for the increased insertion loss associated with diode tuned circuits.

Coupling between the first and second r.f. stages is by a half-wave tuned line, between the second r.f. stage and the mixer is by bandpass half-wave tuned lines. The secondary of the bandpass is coupled to the emitter of the oscillator/mixer stage via a coupling loop, which also provides the inductive feedback of the oscillator.

Half-wave lines, terminated at one end by a fixed capacitor and tuned at the other end by a variable capacitance diode, are used throughout.

The tuner requires transistor supply voltages of +12 V, a.g.c. voltages, variable from +2,5 V (normal operating point) to about +7,5 V (maximum a.g.c.) and a tuning voltage, variable from +0,3 V to +25 V.

The aerial input of the tuner is asymmetrical. For use in symmetrical aerial systems, aerial transformers (baluns) are available (see ACCESSORIES).

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a snap-in mount or a bracket. Information will be supplied upon request).

The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

Signal handling

Minimum input signal (e. m. f.) producing cross modulation (1%) at nominal gain, in channel
(wanted signal: picture carrier frequency, interfering signal: sound carrier frequency).

typ. 8 mV (Note 1)

in band
(wanted signal: picture carrier frequency of channel X, interfering signal: picture carrier of channel X-5)

typ. 25 mV (Note 1)

Minimum input signal (e. m. f.) producing overloading, at nominal gain at maximum a. g. c.

typ. 15 to 20 mV (Note 2)
min. 250 mV (Note 2)

Minimum input signal (e. m. f.) at nominal gain producing a shift of the oscillator frequency of 20 kHz

typ. 5 to 15 mV (Note 3)

Detuning of the i. f. output circuit as a result of tuning

max. 150 kHz

Shift of oscillator frequency at a change of the supply voltage of 10%

max. 500 kHz

during warm-up time (measured between 3 s and 60 s after switching on)

max. 200 kHz

at a gain reduction of 30 dB

max. 100 kHz

Drift of oscillator frequency

at a change of the ambient temperature from 25 to 50 °C

max. 1000 kHz

Note 1- This e. m. f. is referred to an impedance of 75 Ω.

1% cross modulation means that 1% of the modulation depth of the interfering signal is transferred to the wanted signal.

Note 2- This e. m. f. is referred to an impedance of 75 Ω.

Criterion of overloading: 30% compression of the synchronization pulses of a standard television signal or a noticeable deterioration of the picture quality.

Note 3- This e. m. f. is referred to an impedance of 75 Ω.

Oscillator radiation (oscillator voltages at the aerial terminal)

The oscillator radiation will be within the limits of BS905:1969 provided the circuit connected to the i. f. output is carefully shielded.

For the oscillator fundamentals use is made of the relaxed limits, assuming that the design of the i. f. amplifier of the receiver is such that a detuning of the oscillator of - 2,0 MHz or +0,6 MHz from the nominal frequency will result in unacceptable picture and/or sound degradation.

Immunity from radiated interference

If the tuner, including the aerial connection (see Fig. 4) is installed in a professional manner, the immunity from radiated interference will be within the limits specified in BS905:1969.

If a higher safety margin, or another cable connection is required, use can be made of an immunity shield (see ACCESSORIES).

Microphonics

If the tuner is installed in a professional manner, there will be no noticeable microphonics.

ADDITIONAL INFORMATION

Measuring method of power gain

The i. f. output of the tuner should be terminated with the circuit given below.

Fig. 7.

Feed an i. f. sweep signal to the emitter of the BF363 (mixer/oscillator) and make the oscillator inoperative (e.g. ferrite core in resonant chamber).

Fig. 8.

Adjust the trimmers C1 and C2, coil L (Fig. 7) and the i. f. output coil of the tuner (L21) to get the resonant curve with maximum gain as shown below.

Fig. 9

7264948

Display the r.f. + i.f. curve of the tuner at 470 MHz and make, if necessary, small corrections in the alignment of C1, C2, L and L21 to get the markers 33,5 MHz and 39,5 MHz symmetrically on the slopes of the curve, and the peaks at equal amplitude.

Because the output impedance of the dummy circuit is 50 to 75 Ω , the power gain can be measured in the conventional manner by inserting tuner and dummy circuit between a 75 Ω source and a 75 Ω detector (or between a 50 Ω source and matching pad 50/75 Ω and a 50 Ω detector).

ACCESSORIES

Aerial input transformer ELC 1095, catalogue number 2422 542 10951, for converting the aerial input from 75 Ω asymmetric to 300 Ω symmetric.

Immunity shield for screening the aerial connection, consisting of:
shield, catalogue number 4313 132 01910
clamp, catalogue number 4313 132 01890

OTHER AVAILABLE VERSION

ELC1043/06 - See the relevant data sheet.

U.H.F. TELEVISION TUNER with diode tuning

These data should be read in conjunction with data on ELC 1043/05.

This type is identical to ELC 1043/05 except for the following:

- The i.f. output circuit consists of an i.f. coil with increased turns damped by a 680Ω resistor. This changes the tuning range and Q of the i.f. output coil, making it suitable for coupling to a block filter input i.f. amplifier.
- The power gain is reduced to a nominal of 12 dB and a minimum of 9 dB by the damping resistor mentioned above.
- The same dummy circuit is used for measuring power gain but, as a result of damping the i.f. coil, a single tuned response will appear at the output, instead of the double tuned response, as in the case of ELC 1043/05 (see below).

APPLICATION

Designed to cover the v. h. f. and u. h. f. channels of C. C. I. R. systems B and G, including the italian channels.

DESCRIPTION

The ELC 2000 is a combined v.h.f. /u.h.f. tuner with electronic tuning and band switching, covering the v.h.f. band I including the Italian channel C (frequency range 47 to 88 MHz), the v.h.f. band III (frequency range 174 to 230 MHz), and the u.h.f. band (frequency range 470 to 860 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2). The two aerial connections (v.h.f. and u.h.f.) are on the two frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages) are made via feedthrough capacitors in the under side. The mounting method is shown in Figs. 3 and 4.

Electrically, the tuner consists of a v.h.f. and u.h.f. part. The v.h.f. aerial signal is fed via an i.f. trap, combined with a high pass filter, to a tuned input circuit, which is connected to the emitter of the input transistor BF 200. The collector load of this transistor is formed by a double tuned circuit, transferring the signal to the base of the mixer transistor BF 182. The oscillator is equipped with a transistor BF 194. The four r.f. circuits are tuned by four capacitance diodes BB 106. Switching between v.h.f. I and III is achieved by four switching diodes BA 243/244.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is capacitively coupled out of the tuner.

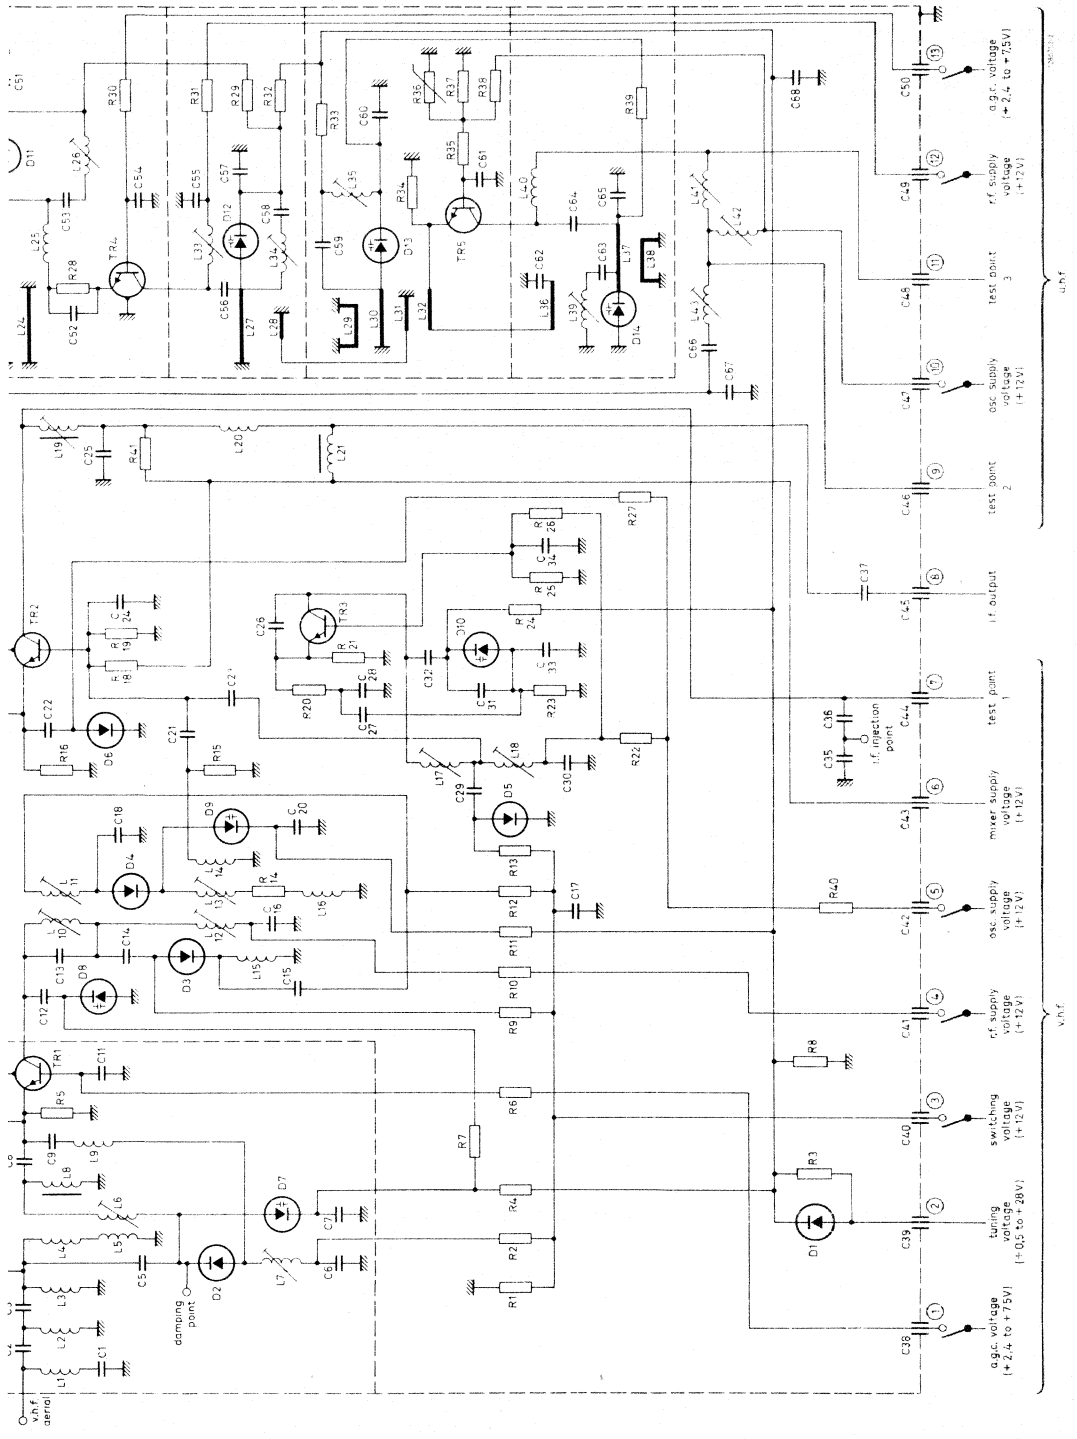

An i.f. injection point is provided at the collector of the mixer, for aligning this circuit together with the i.f. amplifier of the television receiver.

The u.h.f. part of the tuner consists of a tuned input circuit, connected to the emitter of the amplifier transistor BF 180. The interstage network between this transistor and the self-oscillating mixer stage is formed by a double tuned circuit. A transistor BF 181 acts as a self-oscillating mixer. The four tuned u.h.f. circuits are tuned by four capacitance diodes BB 105B.

The output of the self-oscillating mixer is fed to a double tuned i.f. circuit which is connected to the emitter of the v.h.f. mixer transistor BF 182, now operating as an i.f. amplifier in grounded base configuration. Band switching between v.h.f. and u.h.f. is achieved by another diode BA 243.

The tuner requires transistor supply voltages of +12 V, a switching voltage of +12 V, a.g.c. voltages, variable from +2,4 V (normal operating point) to about +7,5 V (maximum a.g.c.) and a tuning voltage, variable from +0,5 V to +28 V.

The aerial inputs of the tuner are asymmetrical. For use in symmetrical aerial systems, aerial transformers (baluns) are available (see ACCESSORIES).

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a snap-in mount or a bracket. Information will be supplied upon request).

The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

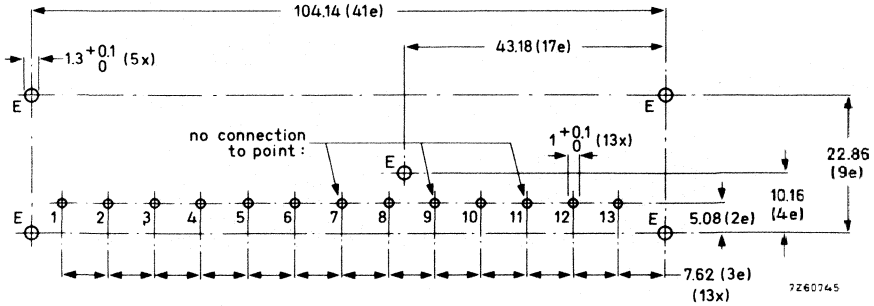

Fig. 3. Piercing diagram viewed from solder side of board; e = 2,54 mm (0,1 in).
No connection must be made to the points 7, 9 and 11, as otherwise the oscillator radiation would increase.

Fig. 4 Recommended fixing method of the aerial cables. Use a self-tapping screw.

ELECTRICAL DATA

Oscillator radiation

The tuner is in conformity with the radiation requirements of C. I. S. P. R. Recommendation No. 24/3, provided the following conditions are fulfilled:

- A low-pass filter (Fig. 11) with a cut-off frequency of about 300 MHz has to be inserted between the v. h. f. aerial terminal of the tuner and the aerial terminal of the receiver. Television receivers with a common v. h. f. /u. h. f. connector in combination with a low-pass/high-pass splitter do not need this additional filter.

Fig. 11.

- No connections must be made to the terminals 7, 9, and 11.
- Earthing of the tuner and connections to the i. f. amplifier have to be made in such a way, that additional radiation is prevented.

Microphonics

If the tuner is installed in a professional manner, there will be no microphonics.

Fig. 12. Cross modulation, in channel.

Fig. 13. Cross modulation, in band; the interfering channels are given between brackets.

APPLICATION INFORMATION

Connection of the tuner

For connection of the tuner the terminal location, Fig. 2, should be consulted. If the tuner is used in receivers the chassis of which is connected to the mains, isolating capacitors according to the safety rules have to be inserted in the aerial leads. Five ways of connecting, depending on the number of switches available, are given below.

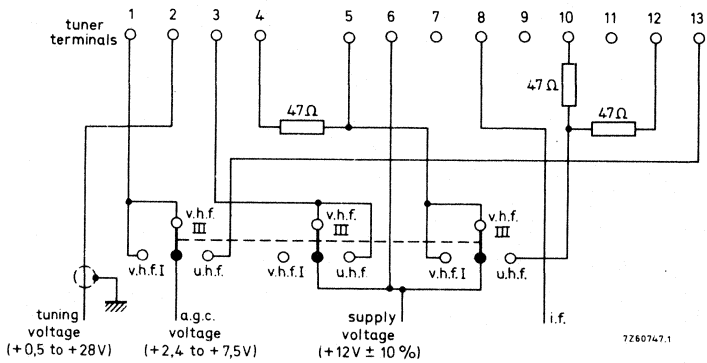

Fig. 14. Connection diagram with three switches.

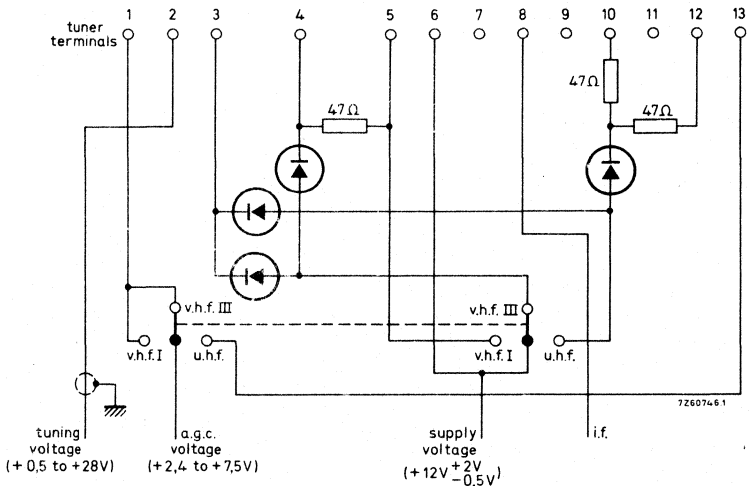

Fig. 15. Connection diagram with two switches.
All diodes: BAX13, BA217 or comparable silicon diodes.

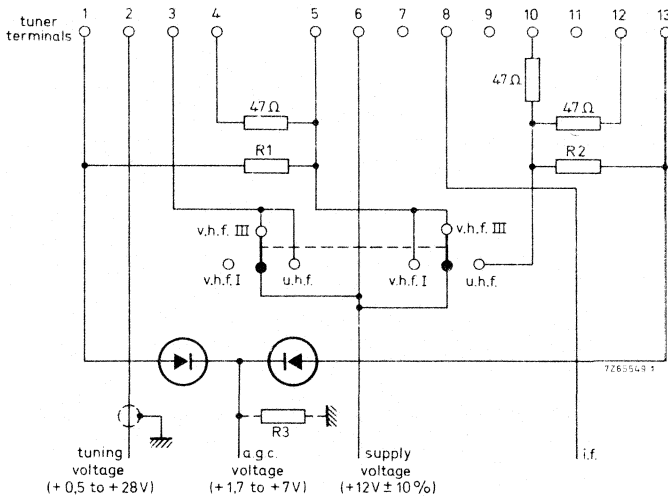

Fig. 16. Connection diagram with two switches.

All diodes: BAX13, BA217 or comparable silicon diodes.

The values of R₁, R₂ and R₃ are depending on a. g. c. circuit.

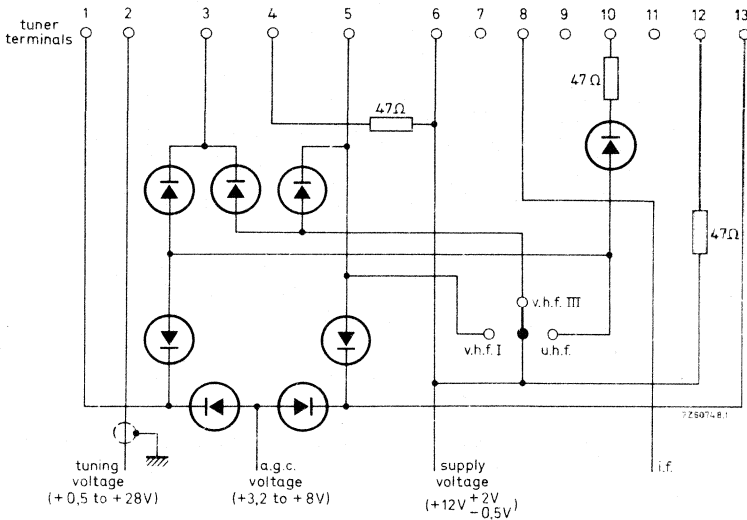

Fig. 17. Connection diagram with one switch.

All diodes: BAX13, BA217 or comparable silicon diodes.

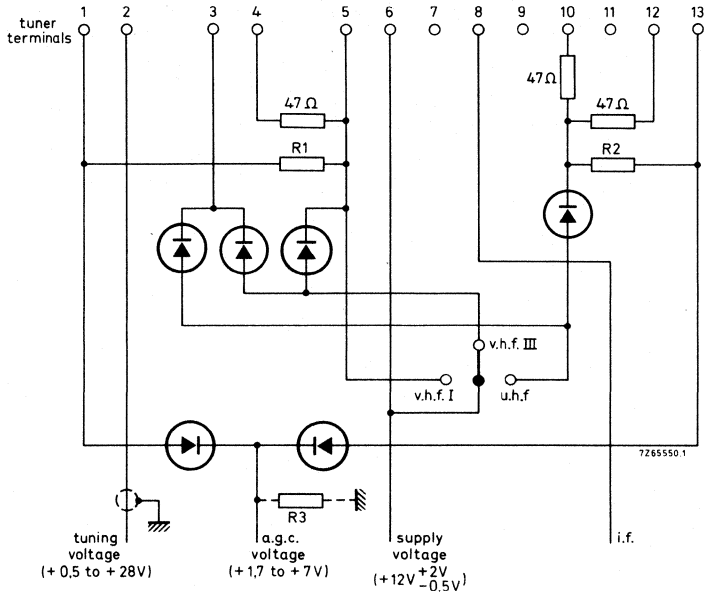

Fig. 18. Connection diagram with one switch.
All diodes: BAX13, BA217 or comparable silicon diodes. The values of R₁, R₂ and R₃ are depending on a.g.c. circuit.

Alignment of the i. f. circuit

The tuner is provided with an i. f. injection point at the collector of the mixer for aligning the i. f. circuit together with the i. f. amplifier of the television receiver (for the position of the i. f. injection point see Fig. 2).

The aligning should be done with the v. h. f. III band tuned. The tuning voltage should be 15 to 20 V.

If this injection method cannot be employed in the television receiver (e. g. because the injection point is not accessible or there is not enough i. f. signal available) use can be made of feeding the i. f. signal to test point 3 (terminal 11) via a capacitor of 0, 82 to 1pF. The tuner must be switched to the u. h. f. position; the tuning voltage should be approx. 10 V. This injection method requires approx. 14 dB less signal than the first method. No permanent connection must be made to test point 3, otherwise the tuner may exceed the oscillator radiation limits.

MEASURING METHOD OF POWER GAIN

The i. f. output of the tuner should be terminated with the circuit given below.
The terminals 7, 9 and 11 should be not connected.

Fig. 19

Switch the tuner to the v. h. f. III band; the tuning voltage should be 15 to 20 V.
Feed an i. f. sweep signal (e. m. f. 500 to 1000 mV) to the i. f. injection point.
Adjust the trimmer (Fig. 19), tunable coil (L_a/L_b), i. f. output coil of the tuner L19
(Fig. 1) and the coupling between L_a and L_b to get the resonant curve as given below.

Fig. 20

Then display the r. f. + i. f. curve of the tuner at 190 MHz (picture carrier frequency) and make small corrections in the alignment of the i. f. coils (L_a/L_b and L19, if necessary, to get the markers 38,9 MHz and 33,4 MHz symmetrically on the slopes of the curve, and the peaks at equal amplitude.

Because the output impedance of the dummy circuit is 50 to 75 Ω , the power gain can be measured in the conventional manner by inserting tuner and dummy circuit between a 75 Ω source and a 75 Ω detector (or between a 50 Ω source and matching pad 50/75 Ω and a 50 Ω detector).

V.H.F./U.H.F. TELEVISION TUNER**QUICK REFERENCE DATA**

Systems	C.C.I.R. systems B and G
Channels	New Zealand 1 to R4 (band I) M4 to E12 (band III) E21 to E69 (bands IV and V)
Intermediate frequencies	
picture	38,9 MHz
sound	33,4 MHz

APPLICATION

Designed to cover the v.h.f. and u.h.f. channels of C.C.I.R. systems B and G, with extended v.h.f. frequency ranges. This tuner is basically interchangeable with the ELC2000.

DESCRIPTION

The ELC2004 is a combined v.h.f./u.h.f. tuner with electronic tuning and band switching, covering the v.h.f. band I including the New Zealand channel 1, the Italian channel C and the OIRT channel R4 (frequency range 44 to 92 MHz), the v.h.f. band III including the Morocco channel M4 (frequency range 162 to 230 MHz), and the u.h.f. band (frequency range 470 to 861 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2). The two aerial connections (v.h.f. and u.h.f.) are on the two frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages) are made via feed-through capacitors in the underside. The mounting method is shown in Figs 3 and 4.

Electrically, the tuner consists of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via an i.f. trap, combined with a high-pass filter and switchable bandpass filters, to the emitter of the input transistor BF200. The collector load of this transistor is formed by a double tuned circuit, transferring the signal to the base of the mixer transistor BF199. The oscillator is equipped with a transistor BF494. The three r.f. circuits are tuned by three capacitance diodes BB109G. Switching between v.h.f. I and III is achieved by five switching diodes BA243/244/182.

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is capacitively coupled out of the tuner. A test point at the collector of the mixer can be used for i.f. injection to align the i.f. output circuit of the tuner together with the i.f. amplifier of the television receiver.

The u.h.f. part of the tuner consists of a high-pass input circuit, connected to the emitter of the amplifier transistor BF180. The interstage network between this transistor and the self-oscillating mixer stage is formed by a double tuned circuit. A transistor BF181 acts as a self-oscillating mixer. The three tuned u.h.f. circuits are tuned by three capacitance diodes BB105B. The output of the self-oscillating mixer is fed to a double tuned i.f. circuit which is connected to the base of the v.h.f. mixer transistor BF199, now operating as an i.f. amplifier.

The tuner requires transistor supply voltages of + 11 V, a switching voltage of + 11 V, a.g.c. voltages, variable from + 2,4 V (normal operating point) to about + 9 V (maximum a.g.c.) and a tuning voltage, variable from + 0,5 V to + 28 V.

The aerial inputs of the tuner are asymmetrical. For use in symmetrical aerial systems, aerial transformers (baluns) are available (see Accessories).

The ELC2004 tuner is basically interchangeable with the ELC2000. Small modifications in the receiver with respect to a.g.c. and supply voltages may be necessary.

- 9 = test point 2 (alignment short)
- 11 = test point 3, u.h.f.
- 12 = r.f./oscillator supply voltage, u.h.f., + 11 V (approx. 6 to 13 mA)
- 13 = a.g.c. voltage, + 2,4 to + 9 V (3,5 mA)
- E = earth

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a bracket. Information will be supplied upon request.) The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10 \text{ }^\circ\text{C}$, $2 \pm 0,5 \text{ s}$). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5 \text{ }^\circ\text{C}$, $10 \pm 1 \text{ s}$).

Fig. 3 Piercing diagram viewed from solder side of board; $e = 2,54 \text{ mm}$ ($0,1 \text{ in}$). No connection must be made to the points 7, 9 and 11, as otherwise the oscillator radiation would increase.

Fig. 4 Recommended fixing method of the aerial cables. Use a self-tapping screw.

ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of $60 \pm 15\%$, a supply voltage of $11 \pm 0,3$ V and an a.g.c. voltage of $2,4 \pm 0,2$ V.

band III	max. 300 kHz
bands IV and V	max. 500 kHz

Oscillator radiation

The tuner is in conformity with the radiation requirements of C.I.S.P.R. publication No. 13, provided the following conditions are fulfilled.

- A low-pass filter (Fig. 11) with a cut-off frequency of about 300 MHz has to be inserted between the v.h.f. aerial terminal of the tuner and the aerial terminal of the receiver.
Television receivers with a common v.h.f./u.h.f. connector in combination with a low-pass/high-pass splitter do not need this additional filter.

Fig. 11.

- No connections must be made to terminals 7, 9 and 11.
- Earthing of the tuner and connections to the i.f. amplifier has to be done in such a way, that additional radiation is prevented.

Microphonics

If the tuner is installed in a professional manner, there will be no microphonics.

Surge protection

Protection against voltages max. 8 kV

Note: Three discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes max. 30 kV, 400 mWs

Note: A flash-over circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

Notes

1. Referred to an impedance of 75 Ω.
2. 1% cross-modulation means that 1% of the modulation depth of the interfering signal is transferred to the wanted signal.
3. Criterion of overloading: 30% compression of the synchronization pulses of a standard television signal or a noticeable deterioration of the picture quality.

Fig. 12 Cross-modulation, in channel.

Fig. 13 Cross-modulation, in band; the interfering channels are given between brackets.

APPLICATION INFORMATION

Connection of the tuner

For connection of the tuner the terminal location, Fig. 2, should be consulted. If the tuner is used in receivers the chassis of which is connected to the mains, isolating capacitors according to the safety rules have to be inserted in the aerial leads. A convenient way of connecting is given below.

Fig. 14 Connection diagram; diode: BAX13, BA217 or comparable silicon diode.

Alignment of the i.f. circuit

The tuner is provided with a test point at the collector of the v.h.f. mixer, which can be used for i.f. injection to align the i.f. output circuit. The i.f. signal should be fed to test point 1 (terminal 7) via a capacitor of 0,5 to 1 pF (Fig. 15). This capacitor should have short leads to avoid oscillator radiation. After alignment it should be soldered to earth, to avoid detuning of the i.f. circuit (Fig. 16).

Fig. 15.

Fig. 16.

In receivers where the tuner is soldered into a printed-wiring board, the capacitor can be printed as shown in Figs 17 and 18.

Fig. 17.

Fig. 18.

The aligning should be done with the v.h.f. III band tuned. The tuning voltage should be 15 to 20 V. If this injection method cannot be employed in the television receiver (e.g. there is not enough i.f. signal available) the i.f. signal can be fed to test point 3 (terminal 11) via a capacitor of 0,82 to 1 pF. The tuner must be switched to the u.h.f. position; the tuning voltage should be approx. 10 V. This injection method requires approx. 14 dB less signal than the first method. The capacitor has to be removed after alignment. No permanent connection must be made to test point 3, otherwise the tuner may exceed the oscillator radiation limits.

MEASURING METHOD OF POWER GAIN

The i.f. output of the tuner should be measured with the circuit given in Fig. 19. The terminals 7, 9 and 11 should be not connected.

Fig. 19.

Switch the tuner to the v.h.f. III band; the tuning voltage should be 15 to 20 V. Feed an i.f. sweep signal (e.m.f. 500 to 1000 mV) to test point 1 as given in Alignment of the i.f. circuit. Adjust the trimmer (Fig. 19), tunable coil (L_a/L_b), i.f. output coil of the tuner L519 (Fig. 1) and the coupling between L_a and L_b to get the resonant curve as given in Fig. 20.

Fig. 20.

Then display the r.f. + i.f. curve of the tuner at 190 MHz (picture carrier frequency) and make small corrections in the alignment of the i.f. coils (L_a/L_b and L519), if necessary, to get the 38,9 MHz and 33,4 MHz markers symmetrically on the slopes of the curve and the peaks at equal amplitude.

Because the output impedance of the dummy circuit is 50 to 75 Ω , the power gain can be measured in the conventional manner by inserting tuner and dummy circuit between a 75 Ω source and a 75 Ω detector (or between a 50 Ω source and matching pad 50/75 Ω and a 50 Ω detector).

APPLICATION

Designed to cover the Australian v. h. f. and u. h. f. channels of C. C. I. R. systems B and G.

¹⁾ In accordance with the publications of the Australian Broadcasting Control Board (ABCB).

DESCRIPTION

The ELC2060 is a combined v.h.f./u.h.f. tuner with electronic tuning and band switching, covering the low v.h.f. band with the channels 0 to 4 (frequency range 45 to 101 MHz), the high v.h.f. band with the channels 5 to 11 (frequency range 101 to 222 MHz), and the u.h.f. band with the channels 28 to 63 (frequency range 526 to 814 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2). The two aerial connections (v.h.f. and u.h.f.) are on the two frame sides, all other connections (supply voltages, a.g.c. voltage, tuning and switching voltages) are made via feed-through capacitors in the under side. The mounting method is shown in Figs. 3 and 4.

Electrically, the tuner consists of v.h.f. and u.h.f. parts. The v.h.f. aerial signal is fed via an i.f. trap, combined with a high-pass filter, to a tuned input circuit, which is connected to the emitter of the input transistor BF200. The collector load of this transistor is formed by a double tuned circuit, transferring the signal to the base of the mixer transistor BF183. The oscillator is equipped with a transistor BF494. The four r.f. circuits are tuned by four capacitance diodes BB109G. A capacitance diode BB106 provides a frequency-dependent coupling of the r.f. input signal to the tuned input circuit. Switching between the low and high v.h.f. bands is done by four switching diodes (BA182, BA243, and BA244).

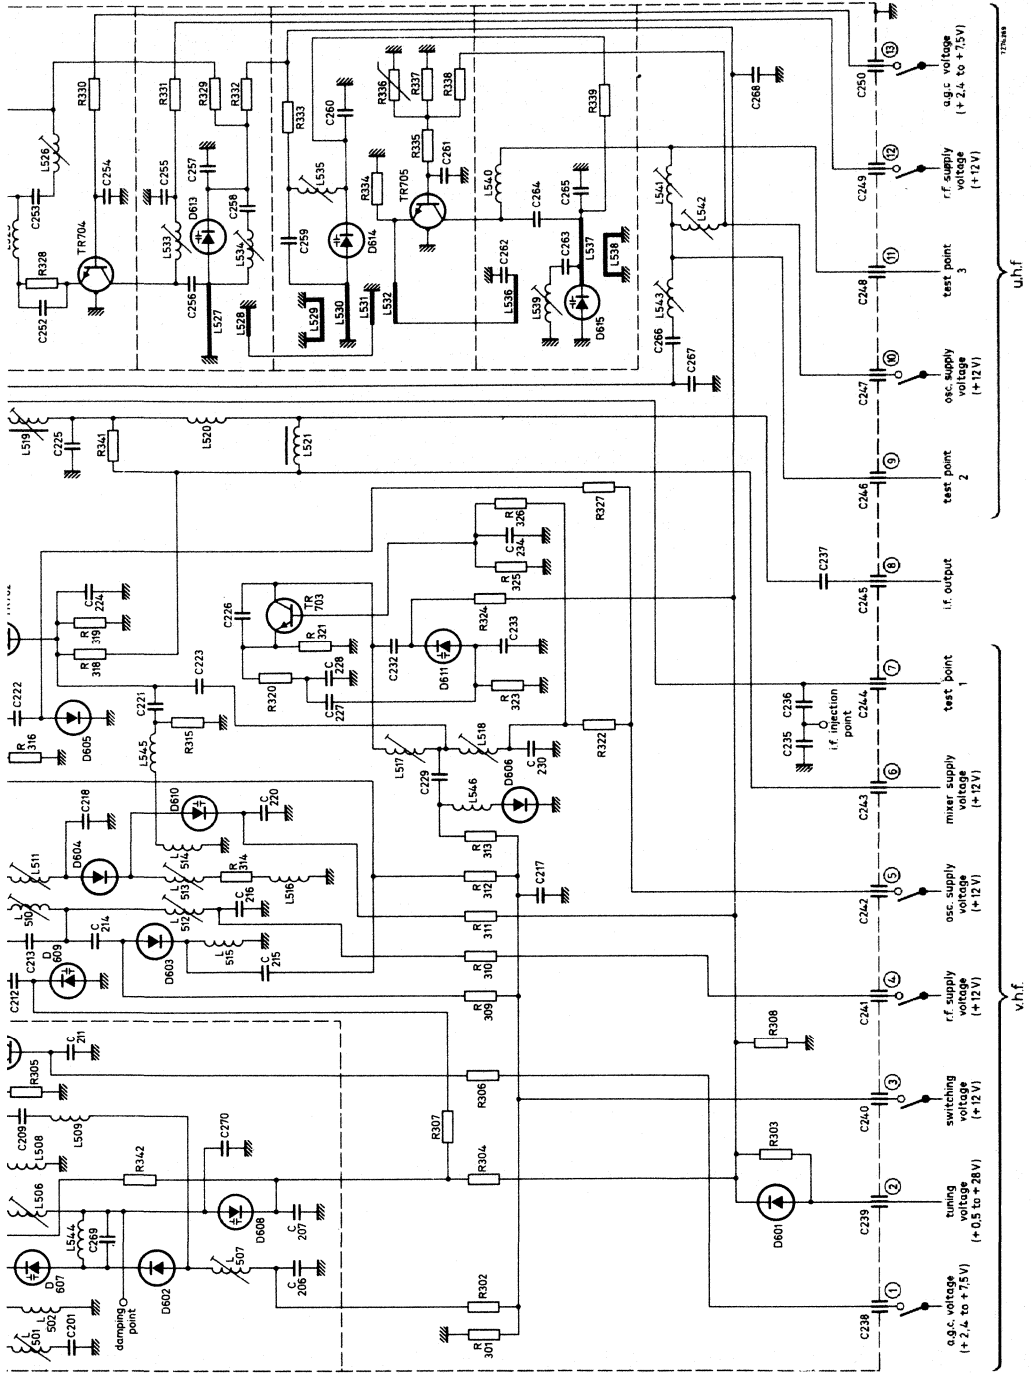

The collector circuit of the mixer transistor is a single tuned i.f. resonant circuit, at the low end of which the i.f. signal is capacitively coupled out of the tuner (low capacitance coupling). An i.f. injection point is provided at the collector of the mixer, for aligning this circuit together with the i.f. amplifier of the television receiver.

The u.h.f. part of the tuner consists of a tuned input circuit, connected to the emitter of the amplifier transistor BF183. The inter-stage network between this transistor and the self-oscillating mixer stage is formed by a double tuned circuit. A transistor BF181 acts as a self-oscillating mixer. The four tuned u.h.f. circuits are tuned by four capacitance diodes BB105B.

The output of the self-oscillating mixer is fed to a double tuned i.f. circuit which is connected to the emitter of the v.h.f. mixer transistor BF183, now operating as an i.f. amplifier in grounded-base configuration. Band switching between v.h.f. and u.h.f. is achieved by a diode BA243.

The tuner requires transistor supply voltages of +12 V, a switching voltage of +12 V, a.g.c. voltages, variable from +2,4 V (normal operating point) to about +7,5 V (maximum a.g.c.) and a tuning voltage, variable from +0,5 V to +28 V.

The aerial inputs of the tuner are asymmetrical. For use in symmetrical aerial systems, aerial transformers (baluns) are available (see ACCESSORIES).

MECHANICAL DATA

Dimensions in mm

- 12 = r. f. supply voltage, u. h. f. , +12 V (approx. 2,5 to 9,5 mA)
- 13 = a. g. c. voltage, u. h. f. , +2,4 to +7,5 V
- E = earth

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a snap-in mount or a bracket. Information will be supplied upon request.)
The tuner may be mounted anywhere in the receiver and there are no restrictions on orientation.

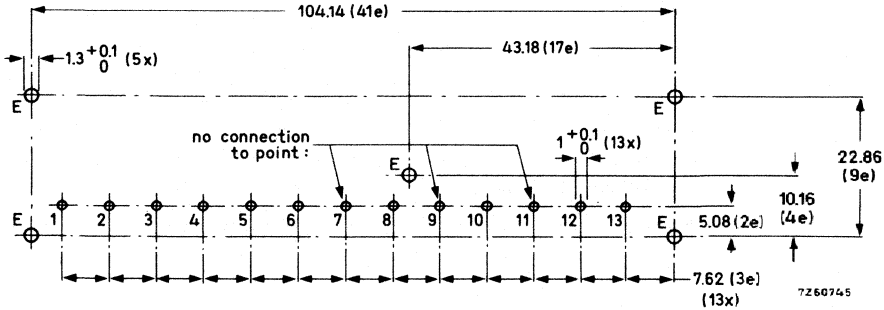

Fig. 3. Piercing diagram viewed from solder side of board; e = 2,54 mm (0,1 in).
No connection must be made to the points 7, 9 and 11, otherwise the oscillator radiation may increase.

Fig. 4. Recommended fixing method of the aerial cables. Use a self-tapping screw.

ELECTRICAL DATA

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C and a supply voltage of $12 \pm 0,3$ V.

Oscillator radiation

The tuner is in conformity with the radiation requirements of the Australian Standard AS 1053-1973 and of C.I.S.P.R. Recommendation No. 24/3, provided the following conditions are fulfilled:

- A low-pass filter (Fig. 11) with a cut-off frequency of about 300 MHz has to be inserted between the v. h. f. aerial terminal of the tuner and the aerial terminal of the receiver. Television receivers with a common v. h. f. /u. h. f. connector in combination with a low-pass/high-pass splitter ¹⁾ may not need this additional filter.

Fig. 11.

- No connections must be made to the terminals 7, 9 and 11.
- Earthing of the tuner and connections to the i. f. amplifier have to be made in such a way, that additional radiation is prevented.

Microphonics

If the tuner is installed in a professional manner, there will be no microphonics.

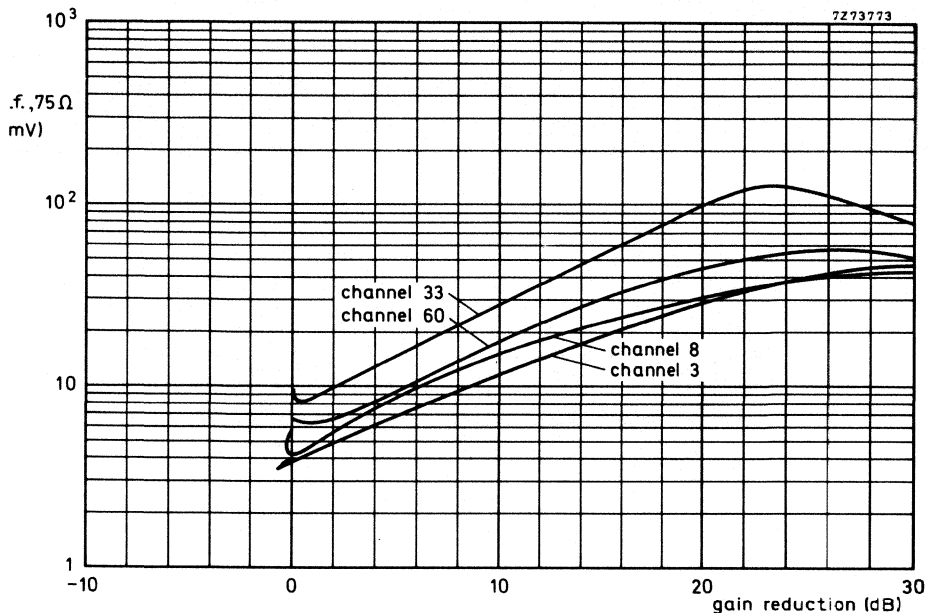

Fig. 12. Cross-modulation, in channel.

Fig. 13. Cross-modulation, in band; the interfering channels are given between brackets.

APPLICATION INFORMATION

Connection of the tuner

For connection of the tuner the terminal location, Fig. 2, should be consulted. If the tuner is used in receivers the chassis of which is connected to the mains, isolating capacitors according to the safety rules have to be inserted in the aerial leads. Five ways of connecting, depending on the number of switches available, are given below.

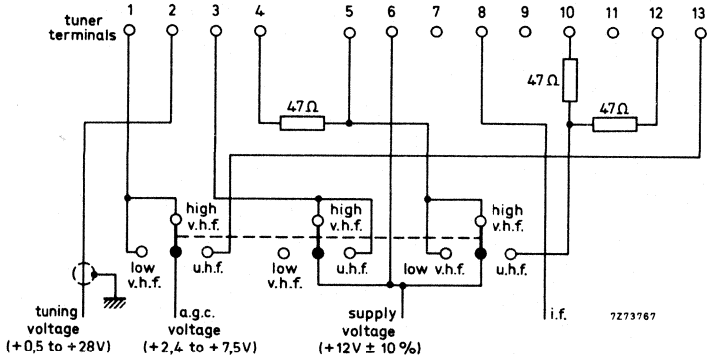

Fig. 14. Connection diagram with three switches.

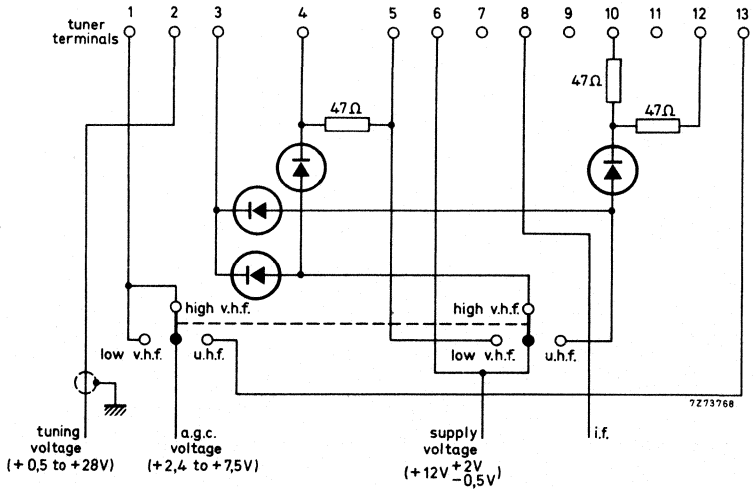

Fig. 15. Connection diagram with two switches.

All diodes : BAX13, BA217 or comparable silicon diodes.

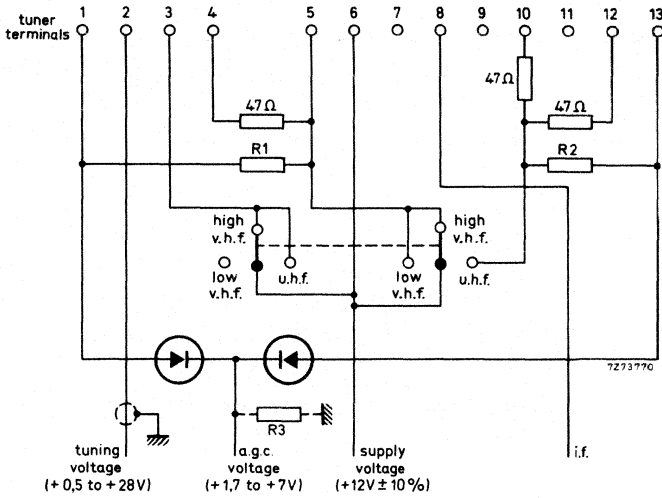

Fig. 16. Connection diagram with two switches.

The values of R_1 , R_2 and R_3 depend on a.g.c. circuit.

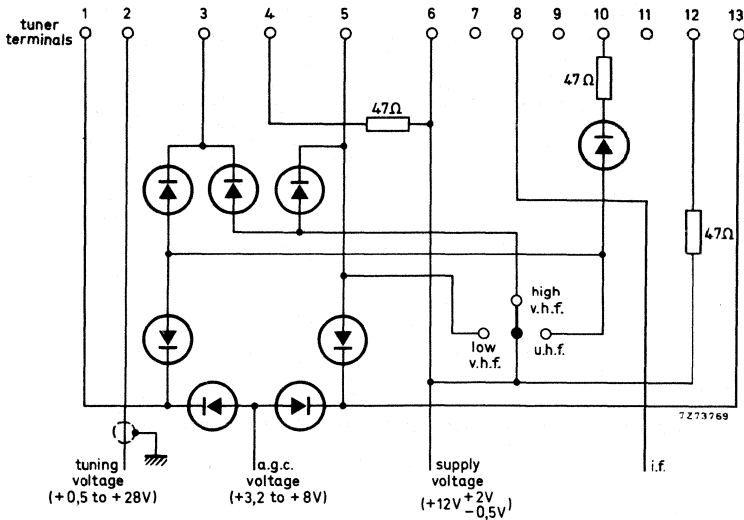

Fig. 17. Connection diagram with one switch.
All diodes: BAX13, BA217 or comparable silicon diodes.

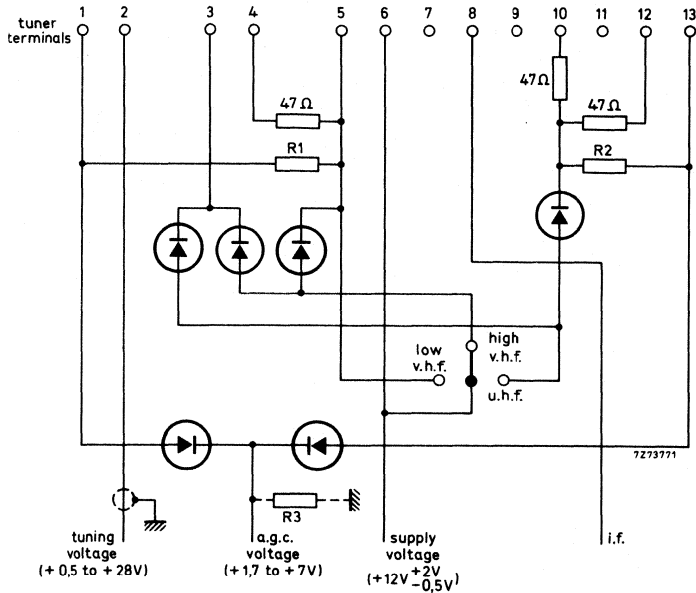

Fig. 18. Connection diagram with one switch.

All diodes: BAX13, BA217 or comparable silicon diodes.
The values of R_1 , R_2 and R_3 depend on a.g.c. circuit.

Alignment of the i. f. circuit

The tuner is provided with an i. f. injection point at the collector of the mixer for aligning the i. f. circuit together with the i. f. amplifier of the television receiver (for the position of the i. f. injection point see Fig. 2).

The alignment should be done with the high v. h. f. band tuned. The tuning voltage should be 15 to 20 V.

If this injection method cannot be employed in the television receiver (e. g. because the injection point is not accessible or there is not enough i. f. signal available), the i. f. signal can be fed to test point 3 (terminal 11) via a capacitor of 0,82 to 1 pF. The tuner must be switched to the u. h. f. position; the tuning voltage should be approx. 10 V. This injection method requires approx. 14 dB less signal than the first method. No permanent connection must be made to test point 3, otherwise the tuner may exceed the oscillator radiation limits.

MEASURING METHODSPower gain

The i. f. output of the tuner should be terminated with the dummy circuit given below. The terminals 7, 9 and 11 should be not connected.

Fig. 19.

The dummy circuit should be aligned as follows.

Switch the tuner to the high v. h. f. band; the tuning voltage should be 15 to 20 V.

Feed an i. f. sweep signal (500 to 1000 mV) to the i. f. injection point.

Adjust the trimmer (Fig. 19), tunable coil (L_a/L_b), i. f. output coil of the tuner L519 (Fig. 1) and the coupling between L_a and L_b to get the resonant curve as given below.

Fig. 20.

Then display the r. f. + i. f. curve of the tuner at 190 MHz (picture carrier frequency) and make small corrections in the alignment of the i. f. coils (L_a/L_b and L519), if necessary, to get the markers 36, 875 MHz and 31, 375 MHz symmetrically on the slopes of the curve, and the peaks at equal amplitude.

Because the output impedance of the dummy circuit is 50 to 75 Ω , the power gain can be measured in the conventional manner by inserting tuner and dummy circuit between a 75 Ω source and a 75 Ω detector (or between a 50 Ω source and matching pad 50/75 Ω and a 50 Ω detector).

Tuning range of i. f. output circuit

The i. f. output of the tuner should be terminated with the circuit given in Fig. 21. The terminals 7, 9 and 11 should not be connected.

Fig. 21.

QUICK REFERENCE DATA

System	C.C.I.R. system I
Channels (South African channel distribution)	4 to 13 (v.h.f. band) 21 to 69 (u.h.f. band)
Intermediate frequencies	
picture	38,9 MHz
sound	32,9 MHz

APPLICATION

Designed to cover the South African v.h.f. and u.h.f. channels of C.C.I.R. system I.

DESCRIPTION

The ELC2070 is a combined v. h. f. /u. h. f. tuner with electronic tuning and band switching, covering the South African v. h. f. band (frequency range 174 to 254 MHz) and the u. h. f. band (frequency range 470 to 860 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2). The two aerial connections (v. h. f. and u. h. f.) are on the two frame sides, all other connections (supply voltages, a. g. c. voltage and tuning voltage) are made via feed-through capacitors in the under side. The mounting method is shown in Figs. 3 and 4.

Electrically, the tuner consists of v. h. f. and u. h. f. parts. The v. h. f. aerial signal is fed via an i. f. trap, combined with a high-pass filter, to a tuned input circuit, which is connected to the emitter of the input transistor BF200. The collector load of this transistor is formed by a double tuned circuit, transferring the signal to the base of the mixer transistor BF182. The oscillator is equipped with a transistor BF494. The four r. f. circuits are tuned by four capacitance diodes BB106.

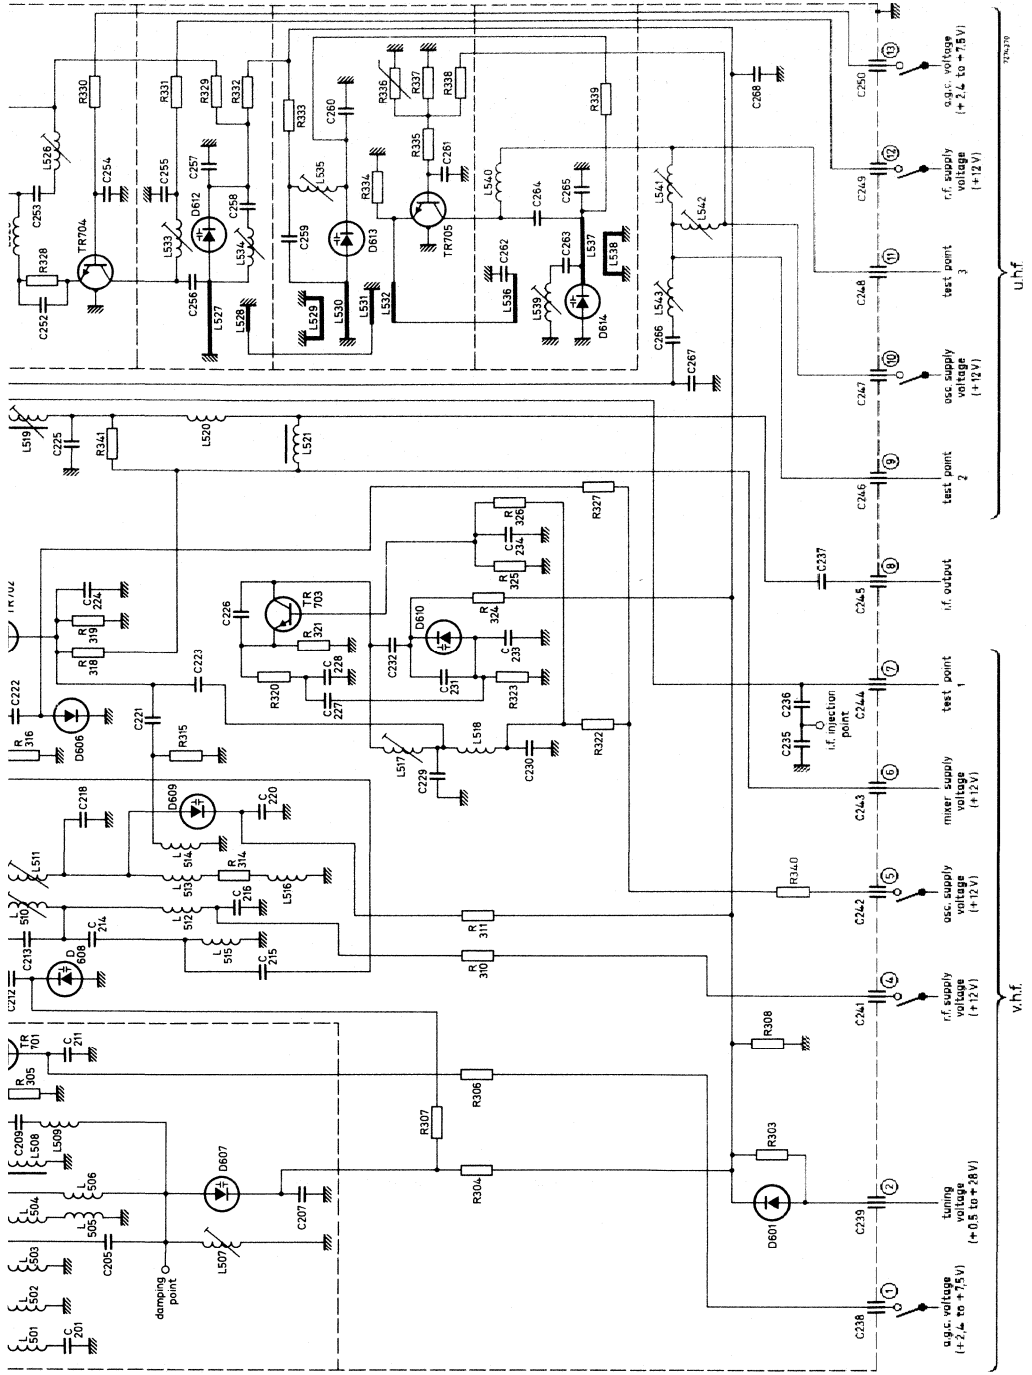

The collector circuit of the mixer transistor is a single tuned i. f. resonant circuit, at the low end of which the i. f. signal is capacitively coupled out of the tuner. An i. f. injection point is provided at the collector of the mixer, for aligning this circuit together with the i. f. amplifier of the television receiver.

The u. h. f. part of the tuner consists of a tuned input circuit, connected to the emitter of the amplifier transistor BF180. The inter-stage network between this transistor and the self-oscillating mixer stage is formed by a double tuned circuit. A transistor BF181 acts as a self-oscillating mixer. The four tuned u. h. f. circuits are tuned by four capacitance diodes BB105B.

The output of the self-oscillating mixer is fed to a double tuned i. f. circuit which is connected to the emitter of the v. h. f. mixer transistor BF182, now operating as an i. f. amplifier in grounded-base configuration. Band switching between v. h. f. and u. h. f. is achieved by a diode BA243.

The tuner requires transistor supply voltages of +12 V, a. g. c. voltages, variable from +2,4 V (normal operating point) to about +7,5 V (maximum a. g. c.), and a tuning voltage, variable from +0,5 V to +28 V.

The aerial inputs of the tuner are asymmetrical. For use in symmetrical aerial systems, aerial transformers (baluns) are available (see ACCESSORIES).

Oscillator radiation

The tuner is in conformity with the radiation requirements of C. I. S. P. R. Recommendation No. 24/3, provided the following conditions are fulfilled:

- A low-pass filter (Fig. 9) with a cut-off frequency of about 300 MHz has to be inserted between the v. h. f. aerial terminal of the tuner and the aerial terminal of the receiver. Television receivers with a common v. h. f. /u. h. f. connector in combination with a low-pass/high-pass splitter ¹⁾ may not need this additional filter.

Fig. 9

- No connections must be made to the terminals 7, 9 and 11.
- Earthing of the tuner and connections to the i. f. amplifier have to be made in such a way, that additional radiation is prevented.

Microphonics

If the tuner is installed in a professional manner, there will be no microphonics.

Fig. 10. Cross-modulation, in channel.

Fig. 11. Cross-modulation, in band; the interfering channels are given between brackets.

APPLICATION INFORMATION

Connection of the tuner

For connection of the tuner the terminal location, Fig. 2, should be consulted. If the tuner is used in receivers the chassis of which is connected to the mains, isolating capacitors according to the safety rules have to be inserted in the aerial leads. Three ways of connecting, depending on the number of switches available, are given below.

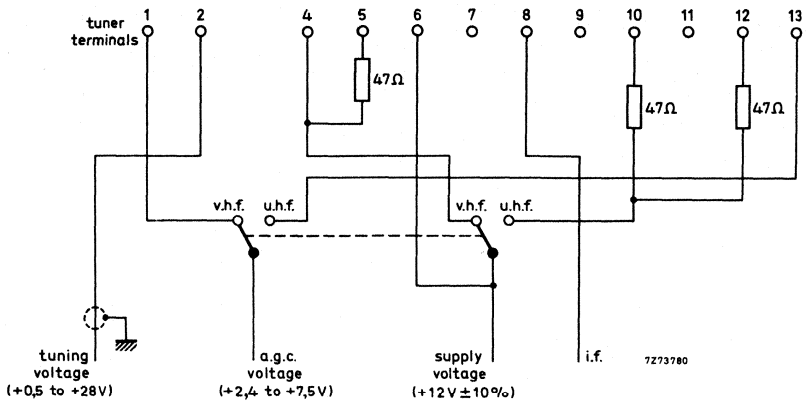

Fig. 12. Connection diagram with two switches.

Fig. 13. Connection diagram with one switch.

All diodes: BAX13, BA217 or comparable silicon diodes.

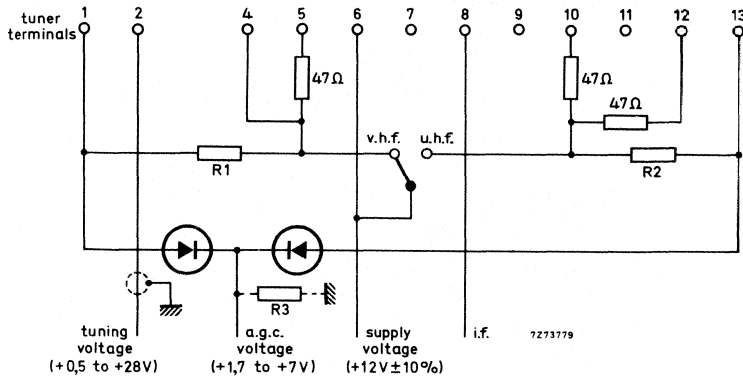

Fig. 14. Connection diagram with one switch.

All diodes : BAX13, BA217 or comparable silicon diodes.

The values of R_1 , R_2 and R_3 depend on a.g.c. circuit.

Alignment of the i. f. circuit

The tuner is provided with an i. f. injection point at the collector of the mixer for aligning the i. f. circuit together with the i. f. amplifier of the television receiver (for the position of the i. f. injection point see Fig. 2).

The aligning should be done with the v. h. f. band tuned. The tuning voltage should be 15 to 20 V.

If this injection method cannot be employed in the television receiver (e. g. because the injection point is not accessible or there is not enough i. f. signal available), the i. f. signal can be fed to test point 3 (terminal 11) via a capacitor of 0, 82 to 1 pF. The tuner must be switched to the u. h. f. position; the tuning voltage should be approx. 10 V.

This injection method requires approx. 14 dB less signal than the first method.

No permanent connection must be made to test point 3, otherwise the tuner may exceed the oscillator radiation limits.

MEASURING METHOD OF POWER GAIN

The i. f. output of the tuner should be terminated with the circuit given below.
The terminals 7, 9 and 11 should be not connected.

Fig. 15

Switch the tuner to the v. h. f. band; the tuning voltage should be 15 to 20 V.
Feed an i. f. sweep signal (500 to 1000 mV) to the i. f. injection point.
Adjust the trimmer (Fig. 15), tunable coil (L_a/L_b), i. f. output coil of the tuner L519 (Fig. 1) and the coupling between L_a and L_b to get the resonant curve as given below.

Fig. 16

Then display the r. f. + i. f. curve of the tuner at 190 MHz (picture carrier frequency) and make small corrections in the alignment of the i. f. coils (L_a/L_b and L519), if necessary, to get the markers 38,9 MHz and 32,9 MHz symmetrically on the slopes of the curve, and the peaks at equal amplitude.

Because the output impedance of the dummy circuit is 50 to 75 Ω , the power gain can be measured in the conventional manner by inserting tuner and dummy circuit between a 75 Ω source and a 75 Ω detector (or between a 50 Ω source and matching pad 50/75 Ω and a 50 Ω detector).

Channels	A2 to A6 (low v. h. f. band) A7 to A13 (high v. h. f. band)
Intermediate frequencies	
picture	45, 75 MHz
sound	41, 25 MHz

APPLICATION

Designed to cover the v. h. f. channels of C. C. I. R. systems M and N (R. T. M. A.). Thanks to its good signal-handling properties, the tuner is especially suited for strong signal areas.

DESCRIPTION

The ELC3082 is a v. h. f. tuner with electronic tuning and band switching, covering the low v. h. f. band (frequency range 54 to 88 MHz) and the high v. h. f. band (frequency range 174 to 216 MHz).

Mechanically, the tuner is built on a low-loss printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2). The aerial connection is on one of the frame sides, all other connections (supply voltages, a. g. c. voltage, tuning and switching voltages) are made via feed-through capacitors in the under side. The mounting method is shown in Figs. 3 and 4.

Electrically, the tuner consists of v. h. f. and i. f. parts. The aerial signal is fed to the input filters, providing i. f. rejection and band selection. The filters are followed by a P-I-N diode attenuator, equipped with two diodes BA379. The output of the attenuator is connected to the emitter of the input transistor BF480, operating as r. f. amplifier in grounded base configuration. The same transistor also delivers the current drive for the P-I-N diode attenuator, controlled by an a. g. c. voltage fed to the transistor base. The combination of the diode attenuator with this high current transistor (I_E at normal gain about 10 mA) has excellent signal-handling properties within the whole a. g. c. range.

The collector load of the input transistor is formed by a double tuned circuit, transferring the signal to the emitter of the mixer transistor BF324.

Good signal-handling properties of this stage are achieved by high oscillator injection. The oscillator is equipped with a transistor BF324. In the low v. h. f. position, self-detection of the oscillator signal is used to back-bias the five switching diodes BA243/244 (or BA182), required for band switching between low and high v. h. f. channels.

Three capacitance diodes BB106 provide tuning of the r. f. circuits.

The collector of the mixer transistor is connected to a single tuned i. f. resonant circuit (about 20 MHz bandwidth), the output of which is fed to the i. f. output stage, equipped with another transistor BF324 in grounded base configuration.

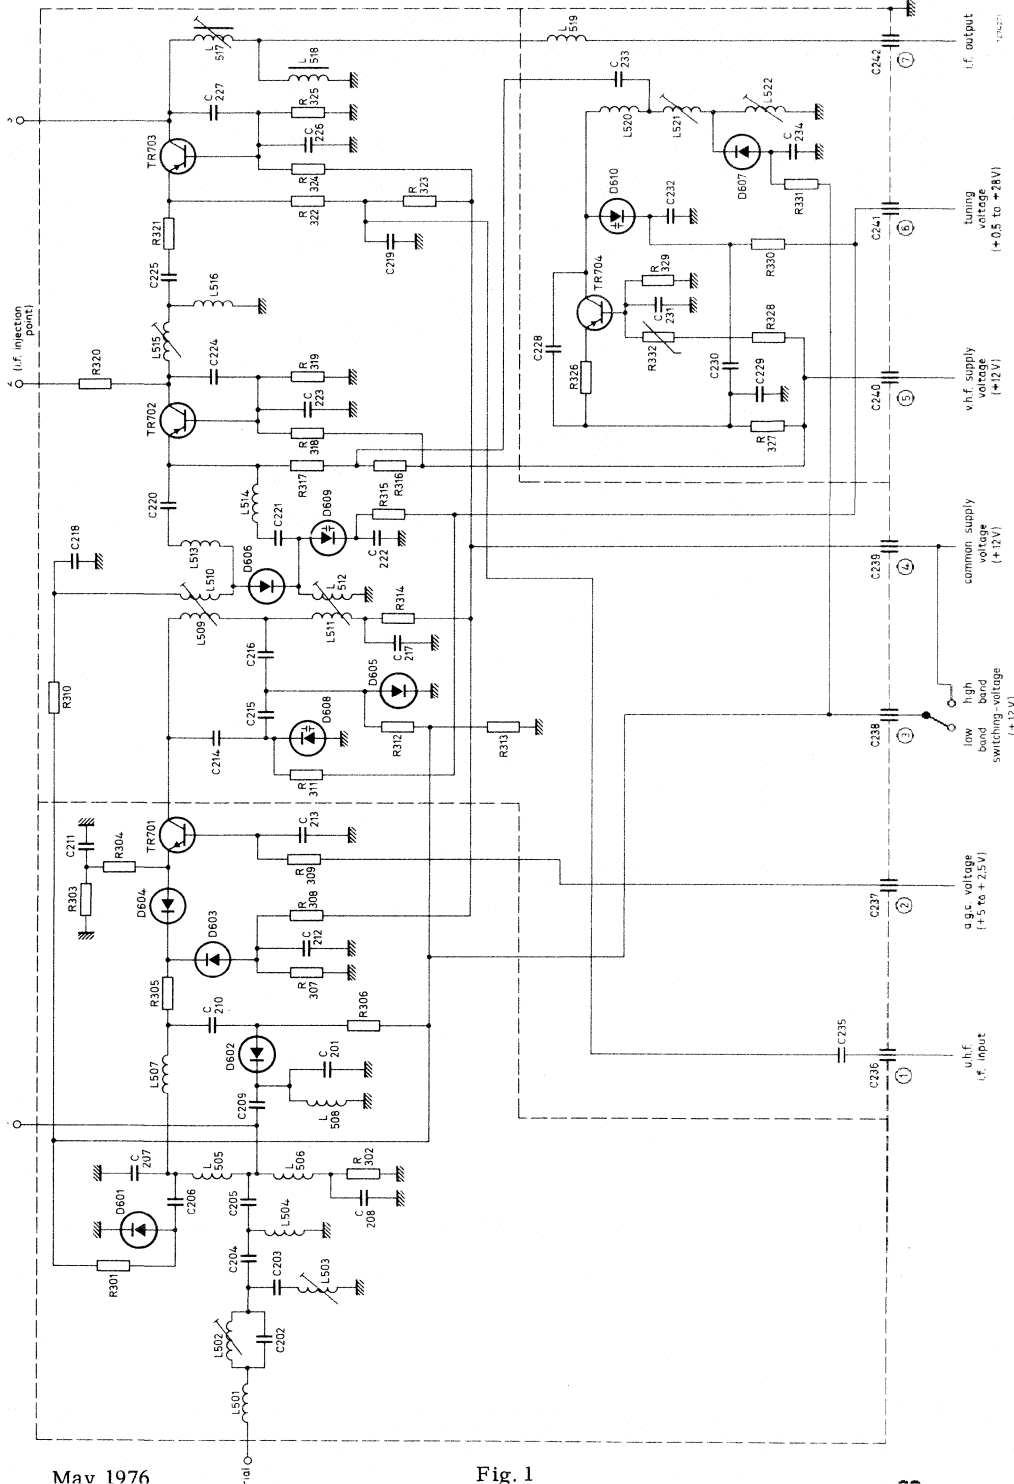

This stage has also been designed especially for good signal-handling properties. The collector load of the i. f. output transistor is formed by a single tuned i. f. circuit, at the low end of which the i. f. signal is capacitively coupled out of the tuner.

The tuner can be used in combination with a u. h. f. tuner. In this case the u. h. f. i. f. signal is fed to the emitter of the i. f. output transistor, which acts as i. f. amplifier for u. h. f. as well as for v. h. f.

The u. h. f. i. f. input terminal can be used as an i. f. injection point for aligning the i. f. output circuit together with the i. f. amplifier of the television receiver. For the same purpose a separate i. f. injection point has been provided at the collector of the mixer.

The tuner requires transistor supply voltages of +12 V, a switching voltage of +12 V, a. g. c. voltages, variable from +5 V (normal operating point) to about +2,5 V (maximum a. g. c.) and a tuning voltage, variable from +0,5 V to +28 V.

The aerial input of the tuner is asymmetrical. For use in symmetrical aerial systems, aerial transformers (baluns) are available (see ACCESSORY).

mixer	BF324
oscillator	BF324
tuning diodes	3 x BB106
switching diodes	5 x BA243/244 (or BA182)
i.f. amplifier	BF324

Ambient temperature range

operating	+5 to +55 °C
storage	-25 to +85 °C

Supply voltage

Current drawn from +12 V supply at nominal gain	+12 V \pm 10%
low band	46,5 mA \pm 10%
high band	63,5 mA \pm 10%

Notes - At 40 dB gain reduction the currents decrease about 5 mA.

- The supply voltage at terminal 4 should be carefully filtered to avoid hum modulation in one of the P-I-N diodes when the attenuator is biased to higher attenuation ratios. Under most unfavourable conditions a ripple voltage of 3 mV (p-p) may produce a disturbance which is just visible.

A.G.C. voltage (Figs. 5 and 6)

low band, at nominal gain	+5 \pm 0,2 V ¹⁾
at 40 dB gain reduction	+3,3 V (typical)
high band, at nominal gain	+5 \pm 0,2 V ¹⁾
at 40 dB gain reduction	+3,3 V (typical)

A.G.C. current

at nominal gain	max. 1 mA
with a.g.c.	max. 1 mA

Tuning voltage range (Figs. 7 and 8)

Current drawn from 28 V tuning voltage supply	max. 0,5 mA
---	-------------

Note - The source impedance of the tuning voltage, offered to terminal 6, must be max. 100 k Ω at tuning voltages below 5 V.

Switching voltage

low band	open circuit
high band	+12 V \pm 10%

Note - In the low band position the tuner produces a negative voltage (3 to 8 V) at terminal 3; this terminal must not be loaded with an external resistance below 50 M Ω .

¹⁾ This value may be increased to 5,5 V if a certain deterioration of signal handling is accepted. At voltages above 5,5 V the cross-modulation in band may deteriorate rapidly.

Oscillator radiation

The tuner is in conformity with the radiation requirements of C.I.S.P.R. Recommendation No. 24/2 and the corresponding F.C.C. rules, provided the tuner is installed in a professional manner.

Microphonics

If the tuner is installed in a professional manner, there will be no microphonics.

ALIGNMENT OF THE I.F. CIRCUIT

For i.f. injection the u.h.f. i.f. input (terminal 1) or the i.f. injection point at the collector of the mixer transistor (at the top of the tuner, Fig. 2) can be used. The aligning can be done with any channel tuned. A probe as shown in Fig. 9 should be used.

Fig. 9

The signal attenuation between the i.f. generator and the i.f. output of the tuner is about 4 dB when injection is done via the injection point, and about 8,5 dB in the case of injection via the u.h.f. i.f. input.

The i.f. output circuit is detuned about +300 kHz¹⁾ or -150 kHz¹⁾ when injection is done via the injection point or via the u.h.f. i.f. input respectively.

MEASURING METHOD OF POWER GAIN

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

Fig. 10

Fig. 11

The RC-circuit roughly matches the i.f. output impedance to 75 Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 43,5 MHz. The bandwidth should be approx. 4,5 MHz.

Because the input and output impedances of the tuner are now 75 Ω, the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75 Ω source and a 75 Ω detector (or between a 50 Ω source and matching pad 50/75 Ω and a 50 Ω detector).

U.H.F. TELEVISION TUNERS

QUICK REFERENCE DATA

Systems	C.C.I.R. systems I (United Kingdom), G, H and K	
Channels	E21 to E69	
Intermediate frequencies	<u>systems I and K</u>	<u>systems G and H</u>
	picture	38,9 MHz
	sound	33,4 MHz

APPLICATION

These tuners are designed to be used in u.h.f. single standard receivers. In combination with v.h.f. tuner V311, V314 or V315 they can also be used in v.h.f./u.h.f. receivers.

The tuners meet the special requirements of the United Kingdom.

The U321LO is a special version of the U321: an output voltage from the local oscillator is made available for driving digital tuning systems. Apart from this the tuners are identical.

DESCRIPTION

The tuners are u.h.f. tuners with electronic tuning, covering the u.h.f. band from 470 to 860 MHz.

Mechanically, the tuner is built on a printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2). The shielded aerial connection is on one of the frame sides, all other connections (supply voltages, a.g.c., tuning voltage, i.f. injection, i.f. output) are made via terminals on the bottom. The mounting method is shown in Figs 3 and 4.

Tuner U321LO has a coaxial socket on the top of the frame for coupling out the oscillator sample.

Electrically, the tuner consists of an input circuit with a high-pass characteristic, followed by a p-i-n diode attenuator (2 diodes BA379) and the input transistor BF480 in grounded-base configuration. This transistor operates at an emitter current of about 5 to 8 mA, featuring good noise figures and good signal handling properties. The a.g.c. current for driving the p-i-n diode attenuator is directly controlled by the a.g.c. system of the receiver.

The collector load of the input transistor is formed by a double tuned circuit, transferring the signal to the mixer diode BA280. The selectivity of this circuit at the image frequency has been improved. The mixer diode BA280 is driven by an oscillator, equipped with a transistor BF480. At the U321LO the oscillator sample is coupled out of the mixer via a small capacitor in series with a resistor.

The i.f. signal, originated in the mixer, is amplified by a transistor BF324 in grounded-base configuration. The combination of the Schottky-barrier diode BA280 and the i.f. transistor BF324 also features good noise figures and good signal handling properties. Three capacitance diodes BB205B tune the double tuned circuit and the oscillator.

The i.f. output circuit of the tuner is a single tuned one, at the low end of which the i.f. signal is coupled out of the tuner. A d.c. path to earth for the collector current of the i.f. transistor BF324 has to be provided outside the tuner, preferably by a choke of about $5 \mu\text{H}$. Damping of the i.f. output circuit and matching of the i.f. output to the i.f. circuit of the receiver can be achieved by connecting a series resistor and a parallel capacitor outside the tuner.

An i.f. injection point has been provided at the collector of the i.f. transistor, connected to terminal 7.

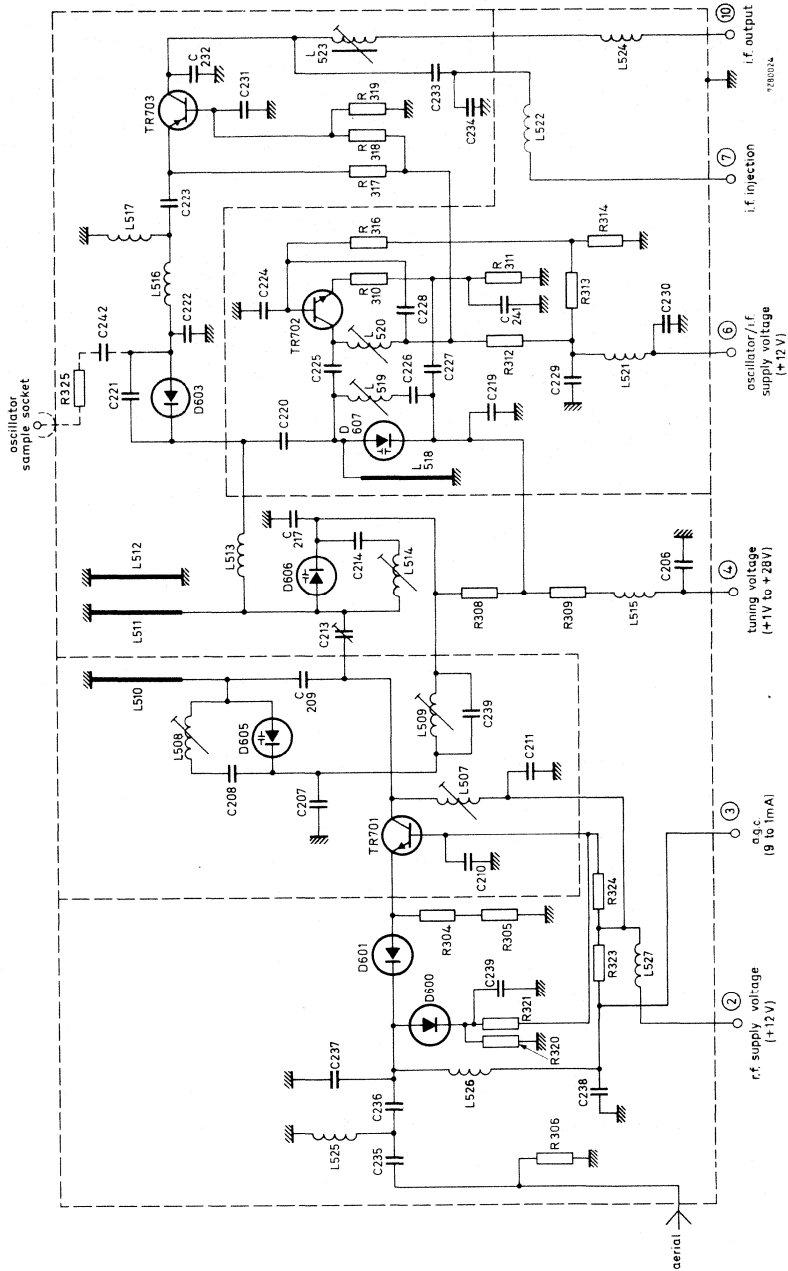

Fig. 1.

- 7 = i.f. injection point
- 10 = i.f. output

Note: When the tuner is operated together with a v.h.f. tuner, only the supply voltage at terminal 6 should be switched off during v.h.f. operation.

Fig. 2b I.F. output coil.
Torque for alignment: 2 to 15 mNm
Press-through force: ≥ 10 N

Mass approx. 75 g

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a socket. Information will be supplied upon request.)

It is recommended that the tuner be installed in the cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10 \text{ }^\circ\text{C}$, $2 \pm 0,5 \text{ s}$). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5 \text{ }^\circ\text{C}$, $10 \pm 1 \text{ s}$).

Fig. 3 Piercing diagram viewed from solder side of board.

For connection to the socket on the top of tuner U322LO a coaxial plug has to be used; type 3/2-50 (manufacturer: Daut und Rietz) is recommended.

The aerial cable should be connected as follows:

- strip the cable according to Fig. 4B;
- fix the cable as indicated in Fig. 4C and solder the inner conductor on the aerial tag;
- insert lugs on immunity shield under the tabs on tuner body, push the shield into position so that the locating tags snap into place in the tuner body.

Fig. 4 Fixing of the aerial cable.

Recommended cable: DAVU wire CX4004 (outer sheath diameter 5,32 mm).

ELECTRICAL DATA

The electrical values are measured on the u.h.f. tuner alone, but they are also valid for the u.h.f. tuner in combination with a v.h.f. tuner V311, V314 or V315. Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0,3$ V and an a.g.c. current of $-9 \pm 0,2$ mA.

Within the given tolerance range of supply voltage and a.g.c. current only insignificant deviations from the specified values can be expected. Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

General

Semiconductors

p-i-n diode	2 x BA379
r.f. amplifier	BF480
mixer	BA280
oscillator	BF480
tuning diodes	3 x BB205B
i.f. amplifier	BF324

Ambient temperature range

operating	+5 to +55 °C
storage	-25 to +85 °C

Relative humidity

max. 90%

Voltages and currents

Supply voltage	+12 V \pm 10%
----------------	-----------------

Note: The supply voltage at terminal 2 (input stage) should be filtered to avoid hum modulation in one of the p-i-n diodes when the attenuator is biased to higher attenuation ratios.

Current drawn from +12 V supply

r.f. amplifier, at nominal gain	typ. 16 mA
r.f. amplifier, at 26 dB gain reduction	typ. 13 mA
oscillator/i.f. amplifier	max. 16 mA

and i.f. output of the tuner typ. 23 dB

Miscellaneous

Radio interference

Oscillator radiation and oscillator
voltage at the aerial terminal

Within the limits of C.I.S.P.R. 13 (1975)
and VDE 0872/7.72.*
For the oscillator radiation use is made
of the relaxed limit of 3 mV/m
(70 dB μ V/m).

Microphonics

There will be no microphonics, provided
the tuner is installed in a professional
manner.

Surge protection

Protection against voltages max. 8 kV

Note: Three discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

* For U321LO: when the oscillator sample socket is either open or terminated with a shielded resistor of 75 Ω .

ADDITIONAL INFORMATION

I.F. injection

The tuner is provided with an i.f. injection point at the collector of the i.f. transistor (coupled via a capacitor to terminal 7). The i.f. generator can be connected directly to this point (Fig. 8). The tuner needs normal supply voltages and a tuning voltage of 15 V; the i.f. output should be loaded with the circuit shown in Fig. 7.

Fig. 8.

Connection of the i.f. amplifier

The tuner needs a d.c. path from the i.f. output terminal (10) to earth, preferably via a choke of approx. $5 \mu\text{H}$ outside the tuner (Fig. 9). Where the tuner is used in combination with a v.h.f. tuner, this choke can be common for both tuners; a resistor in series with the choke can make ineffective the i.f. output circuit of the switched-off tuner. For damping the i.f. output circuit and matching the i.f. output impedance of the tuner to the i.f. amplifier, a series resistor and a parallel capacitor as shown in Fig. 9 should be used.

Fig. 9.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 7.

Fig. 10.

The RC-circuit roughly matches the i.f. output impedance to 75Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36,15 MHz; the bandwidth should be approx. 5 MHz (Fig. 10).

Because the input and output impedances of the tuner are now 75Ω , the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75Ω source and a 75Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 11. A suitable tool is available under catalogue number 7122 005 47680.

Fig. 11.

U.H.F. TELEVISION TUNERS

QUICK REFERENCE DATA

Systems	C.C.I.R. systems G, H, I and K	
Channels	E21 to E69	
Intermediate frequencies	<u>systems G and H</u>	<u>systems I and K</u>
picture	38,9 MHz	39,5 MHz
sound	33,4 MHz	33,5 MHz

APPLICATION

These tuners are designed to cover the u.h.f. channels E21 to E69 of C.C.I.R. systems G, H, I and K.

In combination with a suitable v.h.f. tuner, e.g. V311, V314 or V315 they can be used in v.h.f./u.h.f. receivers. The aerial inputs and i.f. outputs of both tuners can then be connected in parallel **without** additional circuitry.

The U322LO is a special version of the U322: an output voltage from the local oscillator is made available for driving digital tuning systems. Apart from this the tuners are identical.

DESCRIPTION

The tuners are u.h.f. tuners with electronic tuning, covering the u.h.f. band from 470 to 860 MHz.

Mechanically, the tuners are built on a printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2a). All connections (aerial, supply voltages, a.g.c. voltage, tuning voltage, i.f. injection, i.f. output) are made via terminals on the underside. The mounting method is shown in Fig. 3. Tuner U322LO has a coaxial socket on the top of the frame for coupling out the oscillator sample.

Electrically, the tuner consists of an input circuit with a high-pass characteristic, followed by a P-I-N diode attenuator (1 diode BA379) and the input transistor BF480 in grounded-base configuration. This transistor operates at an emitter current of about 8 to 10 mA, featuring good noise figures and good signal handling properties. It also supplies the current drive for the P-I-N diode attenuator, controlled by an a.g.c. voltage fed to the transistor's base. This combination has good signal handling properties throughout the a.g.c. range. The collector load of the input transistor is formed by a double tuned circuit, transferring the signal to the mixer diode BA280 (or MBD102). The selectivity of this circuit at the image frequency has been improved by special means. The mixer diode BA280 (or MBD102) is driven by an oscillator, equipped with a transistor BF480. At the U322LO the oscillator sample is coupled out of the mixer via a small capacitor in series with a resistor.

The i.f. signal, originated in the mixer, is amplified by a transistor BF324 in grounded-base configuration. The combination of the Schottky-barrier diode BA280 (or MBD102) and the i.f. transistor BF324 also features good noise figures and good signal handling properties. Three capacitance diodes BB105B tune the double tuned circuit and the oscillator.

The i.f. output circuit of the tuner is a single tuned one, at the low end of which the i.f. signal is coupled out of the tuner. A d.c. path to earth for the collector current of the i.f. transistor BF324 has to be provided outside the tuner, preferably by a choke of about 5 μ H. Damping of the i.f. output circuit and matching of the i.f. output to the i.f. circuit of the receiver can be achieved by connecting a series resistance and a parallel capacitance outside the tuner.

An i.f. injection point has been provided at the collector of the i.f. transistor, connected to terminal 7.

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a socket. Information will be supplied upon request.)

It is recommended that the tuner be installed in the cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta (230 ± 10 °C, $2 \pm 0,5$ s). The resistance to soldering heat is according to IEC 68-2, test Tb (260 ± 5 °C, 10 ± 1 s).

Fig. 3 Piercing diagram viewed from solder side of board.

For connection to the socket on the top of tuner U322LO a coaxial plug has to be used; type 3/2-50 (manufacturer: Daut und Rietz) is recommended.

ELECTRICAL DATA

The electrical values are measured on the u.h.f. tuner alone, but they are also valid for the u.h.f. tuner in combination with a v.h.f. tuner V311, V314 or V315. Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0,3$ V and an a.g.c. voltage of $9,2 \pm 0,2$ V.

Within the given tolerance range of supply voltage and a.g.c. voltage only insignificant deviations from the specified values can be expected. Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

ADDITIONAL INFORMATION

I.F. injection

The tuner is provided with an i.f. injection point at the collector of the i.f. transistor (coupled via a capacitor to terminal 7). The i.f. generator can be connected directly to this point (Fig. 7).

The tuner needs normal supply voltages and a tuning voltage of 15 V; the i.f. output should be loaded with the circuit shown in Fig. 6.

Fig. 7.

Connection of the i.f. amplifier

The tuner needs a d.c. path from the i.f. output terminal (10) to earth, preferably via a choke of approx. $5 \mu\text{H}$ outside the tuner (Fig. 8). Where the tuner is used in combination with a v.h.f. tuner, this choke can be common for both tuners; a resistor in series with the choke can make ineffective the i.f. output circuit of the switched-off tuner. For damping the i.f. output circuit and matching the i.f. output impedance of the tuner to the i.f. amplifier, a series resistor and a parallel capacitor as shown in Fig. 8 should be used.

Fig. 8.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 6.

Fig. 9.

The RC-circuit roughly matches the i.f. output impedance to 75Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36,15 MHz; the bandwidth should be approx. 5 MHz (Fig. 9).

Because the input and output impedances of the tuner are now 75Ω , the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75Ω source and a 75Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 10. A suitable tool is available under catalogue number 7122 005 47680.

Fig. 10.

APPLICATION

This tuner is designed to cover the v.h.f. channels of C.C.I.R. systems B and I. In combination with the u.h.f. tuner U322 it can be used in v.h.f./u.h.f. receivers. The aerial inputs and i.f. outputs of both tuners can then be connected in parallel without additional circuitry.

DESCRIPTION

The V311 is a v.h.f. tuner with electronic tuning, covering the v.h.f. band I (44 to 68 MHz) and the v.h.f. band III (174 to 230 MHz). Switching between the bands is done automatically by a built-in comparator circuit.

Mechanically, the tuner is built on a printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2). All connections (aerial, supply voltage, a.g.c. voltage, tuning voltage, i.f. injection, i.f. output) are made via terminals on the under side. The mounting method is shown in Fig. 3.

Electrically the tuner consists of two input circuits in parallel (bands I and III) with band-pass characteristics, followed by a p-i-n diode attenuator (2 diodes BA379) and the input transistor AF379 in grounded-base configuration. This transistor operates at an emitter current of about 4 to 12 mA, featuring good noise figures and good signal handling properties. It also supplies the current drive for the p-i-n diode attenuator, controlled by an a.g.c. voltage fed to the transistor's base. This combination has good signal handling properties throughout the a.g.c. range.

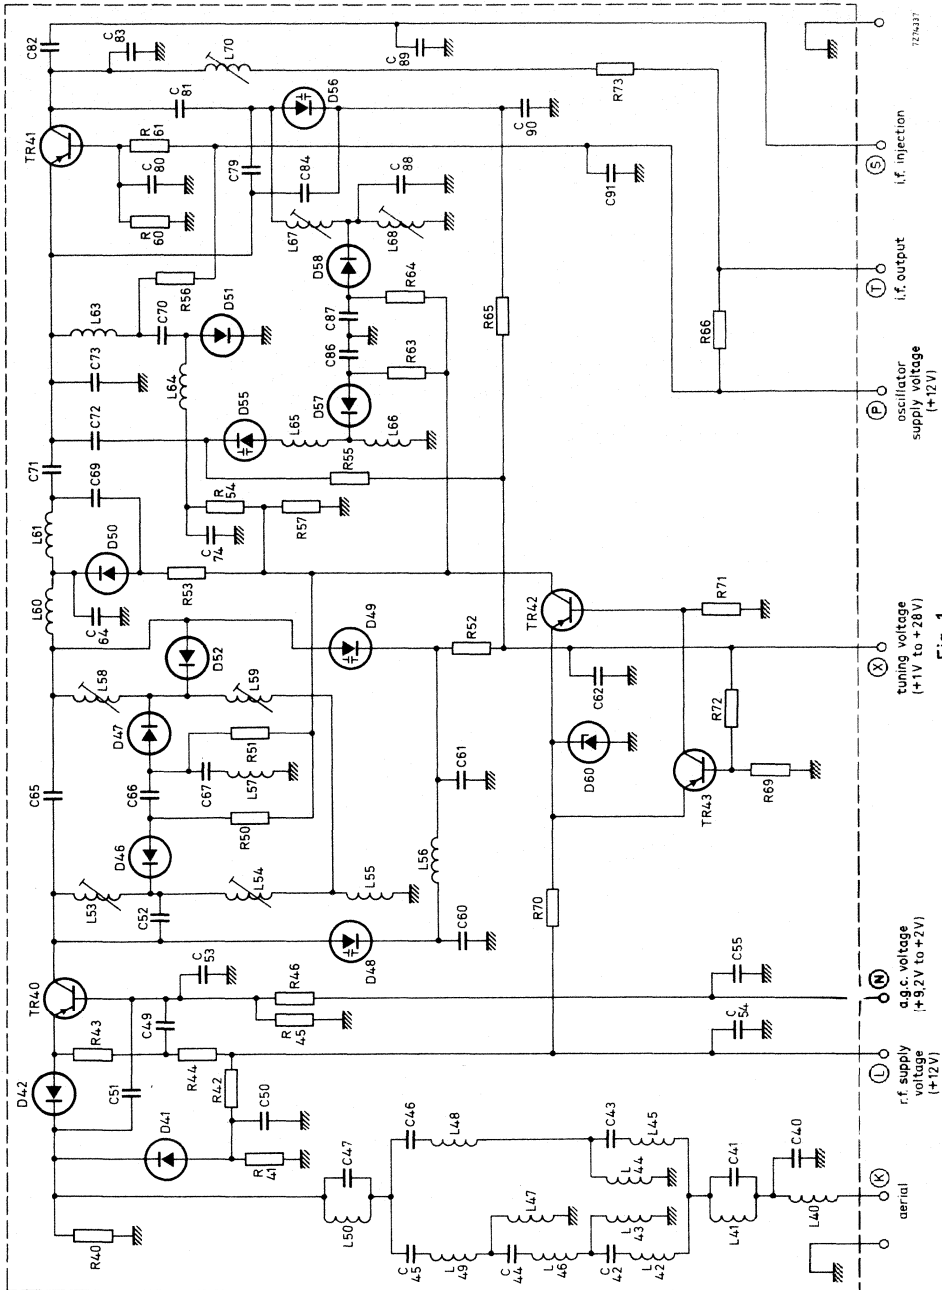

The collector load of the input transistor is formed by a double tuned circuit, transferring the signal to the self-oscillating mixer AF367. The selectivity of this circuit at the intermediate frequency has been improved.

Four capacitance diodes BB106 tune the double-tuned circuit and the oscillator.

The i.f. output circuit of the tuner is a single tuned one, at the low end of which the i.f. signal is coupled out of the tuner. A d.c. path to earth for the collector current of the mixer has to be provided outside the tuner, preferably by a choke of about 5 μ H. Damping of the i.f. output circuit and matching of the i.f. output to the i.f. circuit of the receiver can be achieved by connecting a series resistance and a parallel capacitance outside the tuner.

An i.f. injection point has been provided at the collector of the mixer transistor, connected to terminal S.

A comparator circuit supplying the automatic switching-over between bands I and III consists of two p-n-p transistors, the emitters of which have the same stabilized 5,6 V reference voltage, thereby supplying a very good temperature and supply voltage dependence. The voltage divider at the input of the circuit consists of two high-ohmic resistors to prevent unacceptable loading of the tuning voltage.

MECHANICAL DATA

Dimensions in mm

Fig. 2a.

Terminal T = i.f. output

X = tuning voltage, + 1 to + 28 V

P = self-oscillating mixer supply voltage, + 12 V

Press-through force: ≥ 10 N

Mass

approx. 80 g

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a socket. Information will be supplied upon request).

It is recommended that the tuner be installed in the cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10 \text{ }^\circ\text{C}$, $2 \pm 0,5 \text{ s}$). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5 \text{ }^\circ\text{C}$, $10 \pm 1 \text{ s}$).

Fig. 3 Piercing diagram viewed from solder side of board.

ELECTRICAL DATA

The electrical values are measured on the v.h.f. tuner alone, but they are also valid for the v.h.f. tuner in combination with a u.h.f. tuner U322.

Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0,3$ V and an a.g.c. voltage of $9,2 \pm 0,2$ V.

Within the given tolerance range of supply voltage and a.g.c. voltage only insignificant deviations from the specified values can be expected.

Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

max. 30 kV, 400 mWs

Note

A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

* I.F. output of the tuner terminated with the circuit shown in Fig. 10; tuning voltage is 15 V.

ADDITIONAL INFORMATION

If the tuner is used in receivers designed for v.h.f. only, a capacitor of 5,6 pF should be applied between the aerial input and earth.

I.F. injection

The tuner is provided with an i.f. injection point at the collector of the mixer transistor (coupled via a capacitor to terminal S). The i.f. generator can be connected directly to this point (Fig. 11).

The tuner needs normal supply voltages and a tuning voltage of 15 V; the i.f. output should be loaded with the circuit shown in Fig. 10.

Fig. 11.

Connection of the i.f. amplifier

The tuner needs a d.c. path from the i.f. output terminal (T) to earth, preferably via a choke of approx. 5 μ H outside the tuner (Fig. 12).

In the case where the tuner is used in combination with a u.h.f. tuner, this choke can be common for both tuners; a resistor in series with the choke can make ineffective the i.f. output circuit of the switched off tuner. For damping the i.f. output circuit and matching the i.f. output impedance of the tuner to the i.f. amplifier, a series resistor and a parallel capacitor as shown in Fig. 12 should be used.

Fig. 12.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

Fig. 13.

The RC-circuit roughly matches the i.f. output impedance to 75Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36,15 MHz; the bandwidth should be approx. 5 MHz (Fig. 13).

Because the input and output impedances of the tuner are now 75Ω , the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75Ω source and a 75Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 14. A suitable tool is available under catalogue number 7122 009 47680.

Fig. 14.

V.H.F TELEVISION TUNER

QUICK REFERENCE DATA

Systems	C.C.I.R. systems B and G
Channels	
v.h.f. I	E2 to C
v.h.f. III	Morocco 4 to E12
Intermediate frequencies	
picture	38,9 MHz
sound	33,4 MHz

APPLICATION

This tuner is designed to cover the v.h.f. channels of C.C.I.R. systems B and G, including the Italian and Moroccan channels.

In combination with the u.h.f. tuner U322 it can be used in v.h.f./u.h.f. receivers. The aerial inputs and i.f. outputs of both tuners can then be connected in parallel without additional circuitry.

The tuner is compatible with tuner V315. It is also compatible with tuner V311 except for the band switching.

DESCRIPTION

The V314 is a v.h.f. tuner with electronic tuning, covering the v.h.f. band I (47 to 88 MHz) and the v.h.f. band III (162 to 230 MHz). Switching between the bands is done by connecting the supply voltage to terminal V for band I and to terminal P for band III.

Mechanically, the tuner is built on a printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2a). All connections (aerial, supply voltage, a.g.c. voltage, tuning voltage, i.f. injection, i.f. output) are made via terminals on the underside. The mounting method is shown in Fig. 3.

Electrically the tuner consists of two input circuits in parallel (bands I and III) with band-pass characteristics, followed by a P-I-N diode attenuator (2 diodes BA379) and the input transistor AF379 in grounded-base configuration. This transistor operates at an emitter current of about 4 to 12 mA, featuring good noise figures and good signal handling properties. It also supplies the current drive for the P-I-N diode attenuator, controlled by an a.g.c. voltage fed to the transistor's base. This combination has good signal handling properties throughout the a.g.c. range. The collector load of the input transistor is formed by a double tuned circuit, transferring the signal to the self-oscillating mixer AF367. The selectivity of this circuit at the intermediate frequency has been improved. Three capacitance diodes BB106 tune the double tuned circuit and the oscillator.

The i.f. output circuit of the tuner is a single tuned one, at the low end of which the i.f. signal is coupled out of the tuner. A d.c. path to earth for the collector current of the mixer has to be provided outside the tuner, preferably by a choke of about 5 μ H. Damping of the i.f. output circuit and matching of the i.f. output to the i.f. circuit of the receiver can be achieved by connecting a series resistance and a parallel capacitance outside the tuner.

An i.f. injection point has been provided at the collector of the mixer transistor, connected to terminal S.

Mass approx. 80 g

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a socket. Information will be supplied upon request.)

It is recommended that the tuner be installed in the cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10 \text{ }^\circ\text{C}$, $2 \pm 0,5 \text{ s}$). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5 \text{ }^\circ\text{C}$, $10 \pm 1 \text{ s}$).

Fig. 3 Piercing diagram viewed from solder side of board.

ELECTRICAL DATA

The electrical values are measured on the v.h.f. tuner alone, but they are also valid for the v.h.f. tuner in combination with a u.h.f. tuner U322. Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0,3$ V and an a.g.c. voltage of $9,2 \pm 0,2$ V.

Within the given tolerance range of supply voltage and a.g.c. voltage only insignificant deviations from the specified values can be expected. Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

Miscellaneous

Radio interference

Oscillator radiation and oscillator voltage at the aerial terminal

Within the limits of C.I.S.P.R. 13 (1975) and VDE 0872/7.72.

For the oscillator radiation above 200 MHz use is made of the relaxed limit of 2 mV/m (66 dB μ V/m).

Microphonics

There will be no microphonics, provided the tuner is installed in a professional manner.

Surge protection

Protection against voltages

max. 8 kV

Note: Three discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes

max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

ADDITIONAL INFORMATION

If the tuner is used in receivers designed for v.h.f. only, a capacitor of 8,2 pF should be applied between the aerial input and earth.

I.F. injection

The tuner is provided with an i.f. injection point at the collector of the mixer transistor (coupled via a capacitor and a resistor to terminal S). The i.f. generator can be connected directly to this point (Fig. 11).

The tuner needs normal supply voltages and a tuning voltage of 15 V; the i.f. output should be loaded with the circuit shown in Fig. 10.

Fig. 11.

Connection of the i.f. amplifier

The tuner needs a d.c. path from the i.f. output terminal (T) to earth, preferably via a choke of approx. 5 μH outside the tuner (Fig. 12). Where the tuner is used in combination with a u.h.f. tuner, this choke can be common for both tuners; a resistor in series with the choke can make ineffective the i.f. output circuit of the switched off tuner. For damping the i.f. output circuit and matching the i.f. output impedance of the tuner to the i.f. amplifier, a series resistor and a parallel capacitor as shown in Fig. 12 should be used. (During v.h.f. operation the voltage across the 470 Ω resistor is 1 to 1,2 V.)

Fig. 12.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

Fig. 13.

The RC-circuit roughly matches the i.f. output impedance to 75Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36,15 MHz; the bandwidth should be approx. 6 MHz (Fig. 13).

Because the input and output impedances of the tuner are now 75Ω , the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75Ω source and a 75Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 14. A suitable tool is available under catalogue number 7122 005 47680.

Fig. 14.

V.H.F. TELEVISION TUNERS

QUICK REFERENCE DATA

Systems	C.C.I.R. systems B and G
Channels	
v.h.f. I	E2 to S1
v.h.f. III	S2 to min. S17 (typ. S19)
Intermediate frequencies	
picture	38,9 MHz
sound	33,4 MHz

APPLICATION

These tuners are designed to cover the v.h.f. channels of C.C.I.R. systems B and G, including the S channels for cable television.

In combination with the u.h.f. tuner U322 they can be used in v.h.f./u.h.f. receivers. The aerial inputs and i.f. outputs of both tuners can then be connected in parallel without additional circuitry.

The tuners are compatible with tuner V314. They are also compatible with tuner V311, except for the band switching.

The V315LO is a special version of the V315: an output voltage from the local oscillator is made available for driving digital tuning systems. Apart from this the tuners are identical.

DESCRIPTION

The tuners are v.h.f. tuners with electronic tuning, covering the v.h.f. band I (47 to 111 MHz) and the v.h.f. band III (111 to 279 MHz). Switching between the bands is done by external band switching.

Mechanically, the tuners are built on a printed-wiring board, carrying all components, in a metal housing made of a rectangular frame and front and rear cover (see Fig. 2a). All connections (aerial, supply voltage, a.g.c. voltage, tuning voltage, i.f. injection, i.f. output) are made via terminals on the underside. The mounting method is shown in Fig. 3. Tuner V315LO has a coaxial socket on the top of the frame, for coupling out the oscillator sample.

Electrically the tuner consists of two tunable input circuits in parallel (bands I and III), each followed by an r.f. transistor in grounded-base configuration (BF939 for band I, BF967 for band III). The collector load of each input transistor is formed by a double tuned circuit, transferring the signal to the mixer BF324 fed by the oscillator BF198. Eight capacitance diodes BB209 tune the double-tuned circuit and the oscillator.

The i.f. output circuit of the tuner is a single tuned one, at the low end of which the i.f. signal is coupled out of the tuner. A d.c. path to earth for the collector current of the mixer has to be provided outside the tuner, preferably by a choke of about $5 \mu\text{H}$. Damping of the i.f. output circuit and matching of the i.f. output to the i.f. circuit of the receiver can be achieved by connecting a series resistance and a parallel capacitance outside the tuner.

An i.f. injection point has been provided at the collector of the mixer transistor, connected to terminal S.

Mass

approx. 80 g

Mounting

The tuner may be mounted by soldering it on to a printed-wiring board, using the piercing diagram shown in Fig. 3. (The tuner may also be mounted by means of a socket. Information will be supplied upon request.)

It is recommended that the tuner be installed in the cool part of the receiver cabinet and not exposed to the vibrations of the loudspeaker. There are no restrictions on orientation.

The solderability of the terminals and mounting tabs is according to IEC 68-2, test Ta ($230 \pm 10^\circ\text{C}$, $2 \pm 0,5$ s). The resistance to soldering heat is according to IEC 68-2, test Tb ($260 \pm 5^\circ\text{C}$, 10 ± 1 s).

Fig. 3 Piercing diagram viewed from solder side of board.

For connection to the socket on the top of tuner V315LO a coaxial plug has to be used; type 3/2-50 (manufacturer: Daut und Rietz) is recommended.

ELECTRICAL DATA

The electrical values are measured on the v.h.f. tuner alone, but they are also valid for the v.h.f. tuner in combination with a u.h.f. tuner U322. Unless otherwise specified all electrical values apply at an ambient temperature of 25 ± 5 °C, a relative humidity of $60 \pm 15\%$, a supply voltage of $12 \pm 0,3$ V and an a.g.c. voltage of $9,2 \pm 0,2$ V.

Within the given tolerance range of supply voltage and a.g.c. voltage only insignificant deviations from the specified values can be expected. Under the extreme conditions of temperature and humidity as given below, the tuner will function normally, but some specified limits may be exceeded.

Input signal of tuned frequency producing
a shift of the oscillator frequency of
10 kHz, at nominal gain

v.h.f. I

typ. 75 dB (μ V) into 75 Ω

v.h.f. III

typ. 75 dB (μ V) into 75 Ω

Shift of oscillator frequency

at a change of the supply voltage of 5%

max. 400 kHz

Drift of oscillator frequency

during warm-up time (after the tuner
has been completely out of operation
for 15 min, measured between 5 s
and 15 min after switching on)

max. 250 kHz

during warm-up time (after the input
stage is in operation for 15 min,
measured between 2 s and 15 min
after switching on the self-oscillating
mixer stage)

max. 250 kHz

at a change of the ambient temperature
from + 25 to + 40 °C (measured after
3 cycles from + 25 to + 60 °C)

max. 650 kHz

I.F. circuit characteristics

Bandwidth of i.f. output circuit

6 MHz

Note: I.F. output of the tuner terminated with the circuit shown in Fig. 10; tuning voltage is 15 V;
band III at minimum gain.

Bandwidth variation of i.f. output circuit
as a result of r.f. tuning and
band switching (reference: v.h.f. III)

max. 350 kHz

Note: I.F. output of the tuner terminated with a modified circuit of Fig. 10, i.e. a 100 pF capacitor of
connected in parallel with C1 and R1 is short-circuited; tuning voltage is 15 V.

Fig. 10.

7276933

Detuning of the i.f. output circuit as a result of r.f. tuning in band III

max. 350 kHz

Note: I.F. output of the tuner terminated with a modified of Fig. 10, i.e. a 100 pF capacitor is connected in parallel with C1 and R1 is short-circuited; tuning voltage is 15 V.

Tuning range of i.f. output coil

max. 34 to min. 41 MHz

Note: I.F. output of the tuner terminated with the circuit shown in Fig. 10; tuning voltage is 15 V.

Attenuation between i.f. injection point and i.f. output of the tuner

typ. 23 dB

Miscellaneous

Radio interference
Oscillator radiation and oscillator voltage at the aerial terminal

Within the limits of C.I.S.P.R. 13 (1975) and VDE 0872/7.72.*

For the oscillator radiation above 200 MHz use is made of the relaxed limit of 2 mV/m (66 dBμV/m).

Microphonics

There will be no microphonics, provided the tuner is installed in a professional manner.

Surge protection

Protection against voltages

max. 8 kV

Note: Three discharges of a 470 pF capacitor into the aerial terminal.

Protection against flashes

max. 30 kV, 400 mWs

Note: A flashover circuit producing flashes with frequencies of 1 to 20 Hz for 30 s is connected to the aerial terminal.

* For V315LO: when the oscillator sample socket is either open or terminated with a shielded resistor of 75 Ω.

ADDITIONAL INFORMATION

I.F. injection

The tuner is provided with an i.f. injection point at the collector of the mixer transistor (coupled via a capacitor and a resistor to terminal S). The i.f. generator can be connected directly to this point (Fig. 11).

The tuner needs normal supply voltages and a tuning voltage of 15 V; the i.f. output should be loaded with the circuit shown in Fig. 10.

Fig. 11.

Connection of the i.f. amplifier

The tuner needs a d.c. path from the i.f. output terminal (T) to earth, preferably via a choke of approx. $5 \mu\text{H}$ outside the tuner (Fig. 12). Where the tuner is used in combination with a u.h.f. tuner, this choke can be common for both tuners; a resistor in series with the choke can make ineffective the i.f. output circuit of the switched-off tuner. For damping the i.f. output circuit and matching the i.f. output impedance of the tuner to the i.f. amplifier, a series resistor and a parallel capacitor as shown in Fig. 12 should be used (During v.h.f. operation the voltage across the 470Ω resistor is 1 to 1,2 V.)

Fig. 12.

Measuring method of power gain

The i.f. output of the tuner should be terminated with the RC-circuit given in Fig. 10.

Fig. 13.

The RC-circuit roughly matches the i.f. output impedance to 75Ω at the resonant frequency of the i.f. output circuit, which should be tuned to 36,15 MHz; the bandwidth should be approx. 6 MHz (Fig. 13). Because the input and output impedances of the tuner are now 75Ω , the power gain can be measured in the conventional manner by inserting tuner and RC-circuit between a 75Ω source and a 75Ω detector.

Alignment of the i.f. output coil

The i.f. output coil should be adjusted with a brass tool with a blade as shown in Fig. 14. A suitable tool is available under catalogue number 7122 005 47680.

Fig. 14.

ACCESSORIES

- Connector assembly for use of tuner V315 or V315LO in combination with u.h.f. tuner U322 (or UDI):
- connector, catalogue number 3112 200 20720;
- washer, catalogue number 3112 221 01220;
- clamp, catalogue number 3112 274 13220.

COAXIAL AERIAL INPUT ASSEMBLIES

APPLICATION

These coaxial aerial input assemblies have been developed for application in television sets with 75 ohm input impedance, for use in v.h.f. as well as in u.h.f. (40-890 MHz). The connectors meet the demands of both the IEC standards (diameter 9,5 mm) and the French standards (diameter 9,0 mm). They have to be used with plugs complying with the properties mentioned in DIN 45325, IEC 169-2 (diameter 9,5 mm) and SNIR (diameter 9,0 mm). The units meet the safety requirements of IEC 65.

AVAILABLE TYPES

Coaxial aerial input assembly 75 Ω

- Attenuation : ≤ 1 dB
 Reflection, v.h.f. : $\leq 15\%$
 u.h.f. : $\leq 25\%$
 Catalogue number : 3122 127 10260

Dimensions in mm

3122 127 10260
 3122 127 10450
 3122 127 14730

COAXIAL AERIAL INPUT ASSEMBLIES

Recommended fixing of the aerial cable
 Soldering conditions : $370 \pm 5 \text{ }^\circ\text{C}$; $3,5 \pm 0,5 \text{ s}$

Cable diameter $\geq 5 \text{ mm}$

Cable diameter $< 5 \text{ mm}$

Coaxial aerial input assembly 75 Ω, with filter

Reflection, v. h. f.	≤ 25%
u. h. f.	≤ 30%
Frequency characteristic	
v. h. f. , 50 to 230 MHz	≤ 1 dB
470 MHz	≥ 13 dB
700 MHz	23 dB (typical value)
u. h. f. , 470 to 850 MHz	≤ 1 dB
230 MHz	≥ 15 dB
100 MHz	40 dB (typical value)
Catalogue number	3122 127 10450

Cable diameter < 5 mm

Surface acoustic wave filters

SURFACE ACOUSTIC WAVE FILTER

The SW102/M is a lithium niobate surface wave device for use as an i.f. bandpass filter in colour and monochrome TV receivers. It is specifically designed for CCIR system I as used in the United Kingdom. Its use in place of conventional LC circuitry improves the amplitude and group delay characteristics as well as avoiding the need for critical adjustments in receiver production. The response characteristics are stable with life.
