## DATA HANDBOOK SYSTEM

Our Data Handbook System is a comprehensive source of information on electronic components, sub-assemblies and materials; it is made up of four series of handbooks each comprising several parts.

ELECTRON TUBES	BLUE
SEMICONDUCTORS	RED
INTEGRATED CIRCUITS	PURPLE
COMPONENTS AND MATERIALS	GREEN

The several parts contain all pertinent data available at the time of publication, and each is revised and reissued periodically.

Where ratings or specifications differ from those published in the preceding edition they are pointed out by arrows. Where application information is given it is advisory and does not form part of the product specification.

If you need confirmation that the published data about any of our products are the latest available, please contact our representative. He is at your service and will be glad to answer your inquiries.

---

This information is furnished for guidance, and with no guarantee as to its accuracy or completeness; its publication conveys no licence under any patent or other right, nor does the publisher assume liability for any consequence of its use; specifications and availability of goods mentioned in it are subject to change without notice; it is not to be reproduced in any way, in whole or in part without the written consent of the publisher.

---

## ELECTRON TUBES (BLUE SERIES)

The blue series of data handbooks is comprised of the following parts:

- T1 Tubes for r.f. heating**
- T2a Transmitting tubes for communications, glass types**
- T2b Transmitting tubes for communications, ceramic types**
- T3 Klystrons, travelling-wave tubes, microwave diodes**
- ET3 Special Quality tubes, miscellaneous devices (will not be reprinted)**
- T4 Magnetrons**
- T5 Cathode-ray tubes**  
Instrument tubes, monitor and display tubes, C.R. tubes for special applications
- T6 Geiger-Müller tubes**
- T7 Gas-filled tubes**  
Segment indicator tubes, indicator tubes, dry reed contact units, thyratrons, industrial rectifying tubes, ignitrons, high-voltage rectifying tubes, associated accessories
- T8 Picture tubes and components**  
Colour TV picture tubes, black and white TV picture tubes, colour monitor tubes for data graphic display, monochrome monitor tubes for data graphic display, components for colour television, components for black and white television and monochrome data graphic display
- T9 Photo and electron multipliers**  
Photomultiplier tubes, phototubes, single channel electron multipliers, channel electron multiplier plates
- T10 Camera tubes and accessories, image intensifiers**
- T11 Microwave semiconductors and components**

## SEMICONDUCTORS (RED SERIES)

The red series of data handbooks is comprised of the following parts:

- S1 Diodes**  
Small-signal germanium diodes, small-signal silicon diodes, voltage regulator diodes (< 1,5 W), voltage reference diodes, tuner diodes, rectifier diodes
- S2 Power diodes, thyristors, triacs**  
Rectifier diodes, voltage regulator diodes (> 1,5 W), rectifier stacks, thyristors, triacs
- S3 Small-signal transistors**
- S4a Low-frequency power transistors and hybrid modules**
- S4b High-voltage and switching power transistors**
- S5 Field-effect transistors**
- S6 R.F. power transistors and modules**
- S7 Microminiature semiconductors for hybrid circuits**
- S8 Devices for optoelectronics**  
Photosensitive diodes and transistors, light-emitting diodes, displays, photocouplers, infrared sensitive devices, photoconductive devices.
- S9 Power MOS transistors**
- S10 Wideband transistors and wideband hybrid IC modules**

## INTEGRATED CIRCUITS (PURPLE SERIES)

The purple series of data handbooks is comprised of the following parts:

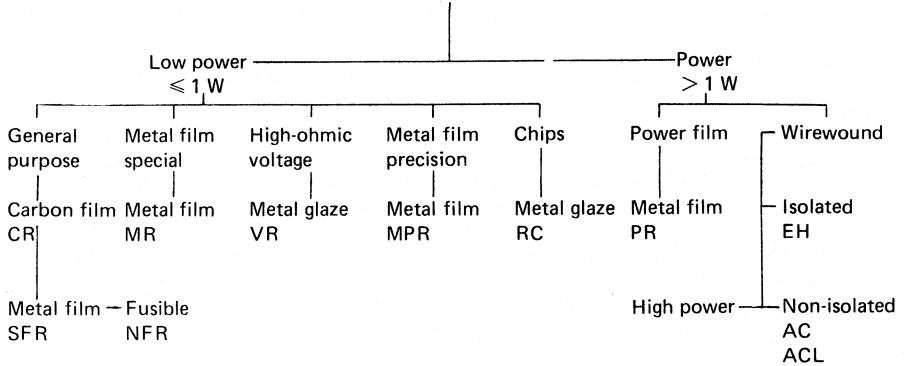

- IC1** Bipolar ICs for radio and audio equipment
- IC2** Bipolar ICs for video equipment
- IC3** ICs for digital systems in radio, audio and video equipment
- IC4** Digital integrated circuits  
CMOS HE4000B family
- IC5** Digital integrated circuits – ECL  
ECL10 000 (GX family), ECL100 000 (HX family), dedicated designs
- IC6** Professional analogue ICs
- IC7** Signetics bipolar memories
- IC8** Signetics analogue ICs
- IC9** Signetics TTL logic
- IC10** Signetics Integrated Fuse Logic (IFL)
- IC11** Microprocessors, microcomputers and peripheral circuitry

## COMPONENTS AND MATERIALS (GREEN SERIES)

The green series of data handbooks is comprised of the following parts:

- C1 Assemblies for industrial use**  
PLC modules, PC20 modules, HN1L FZ/30 series, NORbits 60-, 61-, 90-series, input devices, hybrid ICs
- C2 Television tuners, video modulators, surface acoustic wave filters**
- C3 Loudspeakers**
- C4 Ferroxcube potcores, square cores and cross cores**
- C5 Ferroxcube for power, audio/video and accelerators**
- C6 Synchronous motors and gearboxes**
- C7 Variable capacitors**
- C8 Variable mains transformers**
- C9 Piezoelectric quartz devices**  
Quartz crystal units, temperature compensated crystal oscillators, compact integrated oscillators, quartz crystal cuts for temperature measurements
- C10 Connectors**
- C11 Non-linear resistors**  
Voltage dependent resistors (VDR), light dependent resistors (LDR), negative temperature coefficient thermistors (NTC), positive temperature coefficient thermistors (PTC)
- C12 Variable resistors and test switches**
- C13 Fixed resistors**
- C14 Electrolytic and solid capacitors**
- C15 Film capacitors, ceramic capacitors**
- C16 Permanent magnet materials**
- C17 Stepping motors and electronics**
- C18 D.C. motors**
- C19 Piezoelectric ceramics**

## RESISTOR PROGRAMME

For easy reference, type numbers (such as MR16) are at the top of each page. Orders should, however, always state the 12-figure catalogue number.

The resistor programme is divided into two parts: low power resistors ( $\leq 1$  W) and power resistors ( $> 1$  W). The index of catalogue numbers is at the back of this book and lists the relevant page numbers.

All dimensions on drawings are in mm unless otherwise indicated. According to the S.I. units the symbol K (Kelvin) is used instead of  $^{\circ}\text{C}$  in combinations such as K/W. Also  $\Delta T$  is in K. Atmospheric pressure is given in kPa instead of millibars, mm Hg, etc.  $1000 \text{ mbar} = 100 \text{ kPa}$ .

Some devices are labelled "**Maintenance Type**". The relevant resistors are available for equipment maintenance only and are no longer recommended for equipment production.

GENERAL

## INTRODUCTION

The data are presented - whenever possible - according to a "format", in which the following items are stated:

Title

**QUICK REFERENCE DATA**

**APPLICATION**

**DESCRIPTION**

**MECHANICAL DATA**

Mass

Mounting

Marking

**ELECTRICAL DATA**

**PULSE LOAD BEHAVIOUR**

**COMPOSITION OF THE TYPE NUMBER**

**TESTS AND REQUIREMENTS**

**STANDARD PACKAGING**

### DESCRIPTION

Almost all types have a cylindrical ceramic body, either rod or tube. The resistive element is either a carbon film, a metal film or a wound wire element. The film types have been trimmed to the required ohmic resistance by cutting a helical groove in the resistive layer. This process is completely computer controlled and yields a high reliability. The terminations are usually iron end caps to which tinned connecting wires of electrolytic copper are welded. Some of the high power wirewound resistors are provided with solder tags or bolts.

All resistor bodies are coated with a coloured lacquer or enamel for protection. Dependent on the types this lacquer provides electrical, mechanical and/or climatic protection — also against soldering flux and cleaning solvents, according to MIL-STD-202E, method 215 and IEC 68-2-45.

### MECHANICAL DATA

A dimensional sketch and, if applicable, a table of dimensions are given. The lead length of axial types is usually not stated if the resistors are only available on tape.

Fig. 1.

The sketch does include, however, length (L), and diameter of the body (D) and the lead diameter (d). For certain types, the length is stated as L1 and L2; L1 is the body length, L2 is the body length plus lacquer on the leads. In other cases the maximum area on the leads which may be covered by lacquer is stated (a1 and a2; usually  $a1 + a2 \leq 1$  mm). By specifying L1/L2 or L and a1/a2 the dimensional "clean lead to clean lead" properties can be determined.

Fig. 2.

For so called "bare bottom" types no lacquer is allowed on the leads at all. The length of the cylindrical body (L or L1) is measured by inserting the leads into the holes of two identical gauge plates and moving these plates parallel to each other until the resistor body is clamped without deformation (IEC publication 294).

Fig. 3.

The relationship between the diameter of the leads and the diameter of the holes in gauge plate is as follows:

d	hole diameter
0,5	0,8
0,6	1,0
0,7	1,0
0,8	1,2

This method, of course, does not apply to rectangular resistors, "stand-up" types and wirewound resistors with side terminations.

Some resistors (CR25A, SFR25A, VR25A) are available as "stand-up" types. The bent lead is partially covered with insulating lacquer with a breakdown voltage of at least 50 V (d.c.)

Fig. 4.

**Mass**

The mass (weight) is given per 100 resistors.

**Mounting**

Most types with straight axial leads, as well as most resistors in the "stand-up" version (radial leads), are suitable for processing on automatic insertion equipment and cutting and bending machines. Chip resistors are suitable for handling by automatic chip placement systems.

**Marking**

The resistors are either colour coded or provided with an identification stamp. The colour code consists of a number of coloured bands according to IEC publication 62: "Colour code for fixed resistors". See also IEC 115-1 clause 4.5. The coloured bands indicate the *nominal resistance*, the *tolerance* on the resistance and, if applicable, the *temperature coefficient*. A maximum of bands may be used, but in some instances there are fewer, e.g. if the products are too small. The *resistance code* consists of either 3 or 4 bands and is followed by a distinctly wider band representing the *tolerance*. The temperature coefficient is to the right of the tolerance band and usually positioned on the cap (MR types), as a wide band.

The *resistance code* includes the first two or three *significant figures* of the resistance value (in ohms), followed by a *multiplier*. This is a factor by which the significant-figure value must be multiplied to find the relevant resistance value. Whether two or three significant figures are represented depends on the tolerance:  $\pm 2\%$  and higher requires two bands;  $\pm 1\%$  and lower requires three bands.

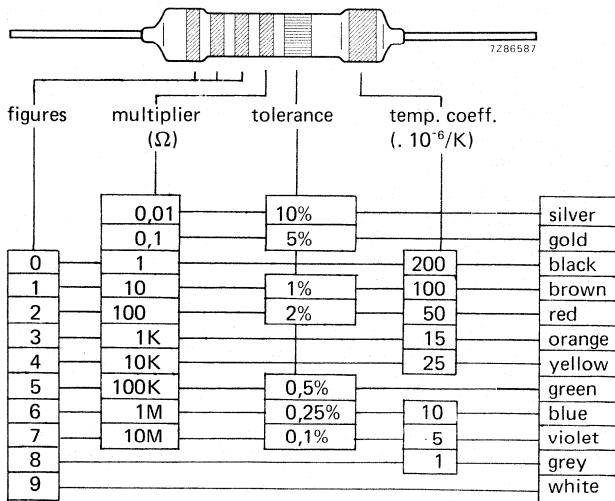

Fig. 5.

The "figures" refer to the first two or three digits of the resistance value of the standard series of values in a decade, according to IEC publication 63 and as indicated in the relevant data sheet and printed at the back of this book.

**Body colours** The resistor bodies are lacquered in different colours to simplify identification:

tan	CR16, CR25, CR37, CR52, CR68
light green	SFR16, SFR25, SFR30
grey	NFR25, NFR30
green	MR16, MR25, MR30, MR52
	MR24E/C/D, MR34E/C/D, MR54E/C/D, MR74E/C/D
	MPR24, MPR34
	AC04, AC05, AC07, AC10, AC15, AC20
	ACL01, ACL02, ACL03
light blue	VR25, VR37, VR68
red	PR37, PR52
brown	WR0167E, WR0842E, WR0825E, WR0865E

Certain resistors are not coded by colour bands but by a stamp giving pertinent data (alphanumeric marking). This is adopted with MIL types MR24E/C/D, MR34E/C/D, MR54E/C/D, MR74E/C/D as well as PR37 and PR52. Resistors outside the standard IEC 63 series of types MPR24 and MPR34 are stamped. All wirewound resistors are likewise stamped. Chip resistors are unmarked but the relevant marking is given on the package.

## ELECTRICAL DATA

The electrical data include: nominal resistance range and tolerance, limiting voltage, temperature coefficient, absolute maximum dissipation, climatic category and stability.

The *limiting voltage* (r.m.s.) for resistor element and insulation is the maximum voltage that may be applied continuously to the resistor element or the insulation, see IEC publications 115-1 and 115-2. Where applicable, *derating details* and performance *nomograms* are given, showing the relationship between power dissipation, ambient temperature, hot-spot temperature and maximum resistance drift after prolonged operation. For power resistors graphs indicate the relationship between temperature rise and dissipation with lead-length or heatsinks as parameters.

The temperature rise in a resistor due to power dissipation is determined by laws of heat conduction, convection and radiation. The maximum body temperature usually occurs in the middle of the resistor and is called the *hot-spot* temperature.

Heat conducted by the leads — which can be considerable in power types — must not reach the melting point of the solder at the joints. This may call for the use of heatsinks and/or longer leads.

In the normal operating temperature range of film resistors the temperature rise at the hot-spot,  $\Delta T$ , is proportional to the power dissipated:  $\Delta T = A \times P$ . The proportionally constant A gives the temperature rise per watt of dissipated power and can be interpreted as a thermal resistance in K/W. This thermal resistance is a function of the dimensions of the resistor, the heat conductivity of the materials used and, to a lesser degree, of the way of mounting. The sum of the temperature rise and the ambient temperature is:

$$T_m = T_{amb} + \Delta T.$$

The stability of a film resistor during endurance tests is mainly determined by the hot-spot temperature and the resistance. The lower the resistance — other conditions kept constant — the higher the stability due to the greater film thickness.

Summarizing:

dimensions determine	=	heat resistance
heat resistance x dissipation	=	temperature rise
temperature rise + ambient temperature	=	hot-spot temperature
hot-spot temperature and resistance value determine	=	stability

**Performance**

When specifying the performance of a resistor, the dissipation is given as a function of the hot-spot temperature, with the ambient temperature as a parameter.

From  $\Delta T = A \times P$  and  $T_m = T_{amb} + \Delta T$  it follows that:

$$P = \frac{T_m - T_{amb}}{A}$$

If P is plotted against  $T_m$  for a constant value of A, parallel straight lines are obtained for different values of the ambient temperature. The slope of these lines,

$\frac{dP}{dT_m} = \frac{1}{A}$ , is the reciprocal of the heat resistance and is characteristic for the resistor.

The stability  $\frac{\Delta R}{R}$  can be determined experimentally, for instance after 1000 h, as a function of the hot-spot temperature with the resistance value as a parameter. It has been found that the resistance changes exponentially with temperature, giving a straight line when  $\log \frac{\Delta R}{R}$  is plotted against  $T_m$ .

A combination of the graphs of P and  $\frac{\Delta R}{R}$  against  $T_m$  gives a nomogram from which the values of several variables can be determined for a resistor of a given size under different working conditions. An example of such a nomogram with fictitious values is given in Fig. 6. The intersection of the broken line with the horizontal axis gives the hot-spot temperature under chosen conditions.

Fig. 6 Performance nomogram (for a fictitious resistor) illustrating the way of specifying the performance of film resistors.

**Example 1**

Assume that a 10 kΩ resistor whose characteristics are described by the nomogram is to be operated at a power dissipation of 0,4 W and an ambient temperature of 60 °C. To find out whether this dissipation is allowable at this ambient temperature and, if so, what the expected stability of the resistor will be, draw in the upper half of the nomogram a horizontal line through A (power dissipation of 0,4 W). This line intersects the 60 °C ambient temperature line at point B, corresponding to a hot-spot temperature of 128 °C (point C). This is safely below the maximum indicated by the broken line at 155 °C; therefore a dissipation of 0,4 W at an ambient temperature of 60 °C is well within the allowable limit.

Extend line BC into the lower half of the nomogram until it intersects the 10 kΩ line at point D. This means that at a hot-spot temperature of 128 °C a resistance change of about 2,5% (point E) can be expected after 1000 hours of operation.

**Example 2**

Assume that a 100 Ω resistor, whose characteristics are described by the nomogram, is to be operated at an ambient temperature of 70 °C with a required stability after 1000 h of 0,5%. It is desired to find the maximum permissible power dissipation. In the lower half of the nomogram, a line that corresponds to a stability of 0,5% intersects the 100 Ω resistance line at point b, corresponding to a hot-spot temperature of 112 °C (point c).

Extending the line b-c into the upper half of the nomogram, it intersects the line indicating an ambient temperature of 70 °C at point d, corresponding to a maximum permissible power dissipation of 0,25 W (point e).

If the power to be dissipated exceeds the value found, a bigger type of resistor should be used.

**The temperature coefficient**

The temperature coefficient of resistance is a ratio which indicates the rate of increase (decrease) of resistance per °C increase (decrease) of temperature within a specified range, and is expressed in parts per million per °C ( $\cdot 10^{-6}/K$ ).

Example: If the temperature coefficient of a resistor of  $R_{nom} = 1 M\Omega$  between  $-55\text{ }^{\circ}C$  and  $+155\text{ }^{\circ}C$  is  $\pm 100 \cdot 10^{-6}/K$  its resistance will be:

- at 25 °C: 1 000 000 Ω (nominal = rated value)
- at +155 °C:  $1\ 000\ 000\ \Omega + (130 \cdot 100 \cdot 10^{-6}) \times 1\ 000\ 000\ \Omega = 1\ 013\ 000\ \Omega$
- at -55 °C:  $1\ 000\ 000\ \Omega - (80 \cdot 100 \cdot 10^{-6}) \times 1\ 000\ 000\ \Omega = 992\ 000\ \Omega$

If the temperature coefficient is specified as  $\leq 100 \cdot 10^{-6}/K$  the resistance will be within the shaded area.

Fig. 7.

## PULSE-LOAD BEHAVIOUR

In future, information on pulse-load behaviour is to be included in all new or revised data; pending revision, same data will continue to be published without such information.

Knowing the thermal characteristics of a resistor, it is possible to calculate the load due to a single pulse which will cause a resistor to fail by going open circuit. This theoretical maximum can be expressed in terms of peak pulse power,  $\hat{P}$ , and pulse duration,  $t_i$ , the straight line in Fig. 1 is a typical example for a film resistor. In practice, however, owing to variations in the resistance film, substrate, or spiralling, resistors fail at loads less than this theoretical maximum; the dashed line in Fig. 1 shows the observed maximum for a resistor under single-pulse loading.

The magnitude of a single pulse at which failure occurs is of little practical value. More usually, the resistor must withstand a continuous train of pulses of repetition time  $t_p$  during which only a small resistance change is acceptable. This resistance change  $\Delta R/R$  is equal to the change permissible under continuous load conditions. The continuous pulse train and small permissible resistance change both reduce the maximum pulse handling capability.

Using a computer program which takes account of all factors affecting resistor behaviour under pulse loads, curves similar to those of Fig. 1 are being produced for all our resistor ranges.

Measurements have shown that the calculated value is accurate to within 10% of the true value.

Fig. 1 Max. permissible peak pulse power ( $\hat{P}_{max}$ ) versus pulse duration ( $t_i$ ) for a typical resistor.

Fig. 2 Max. permissible peak pulse voltage ( $\hat{V}_{max}$ ) versus pulse duration ( $t_i$ ) for a typical resistor.

Fig. 3 Rectangular pulses.

Fig. 4 Exponential pulses.

- $\hat{P}$  = applied peak pulse power
- $\hat{P}_{max}$  = max. permissible peak pulse power (see Fig. 1)
- $\hat{V}_i$  = applied peak pulse voltage (Figs 3 and 4)
- $\hat{V}_{max}$  = max. permissible peak pulse voltage (Fig. 2)
- R = nominal resistance value
- $t_i$  = pulse duration (rectangular pulses)
- $t_p$  = pulse repetition time
- $\tau$  = time constant (exponential pulses)
- $T_{amb}$  = ambient temperature
- $T_{hsp}$  = max. hot spot temperature of the resistor

**Pulse-load behaviour of metal film resistors ( $R > 10 \Omega$ )***Definitions*

**Single Pulse.** The resistor is considered to be operating under single pulse conditions if, during its life, it is loaded with a limited number (approx. 1500) of pulses at long time intervals (greater than one hour).

**Repetitive Pulse.** The resistor is operating under repetitive pulse conditions when it is loaded by a continuous train of pulses of similar power.

**Determination of pulse loading**

The graphs of Figs 1 and 2 may be used to determine the maximum pulse loading for a resistor. The calculations assume:

- $T_{amb} = 70 \text{ }^\circ\text{C}$
- $T_{hsp}$  is the maximum permissible hot spot temperature for the relevant resistor family;
- $\Delta R/R$  equal to the permitted value for 1000 hours at continuous level.

- *For repetitive rectangular pulses:*

- $\frac{\hat{V}_i^2}{R}$  must be lower than the value of  $\hat{P}_{max}$  given by the solid lines of Fig. 1 for the applicable value of  $t_i$  and duty cycle  $t_p/t_i$ .
- $\hat{V}_i$  must be lower than the value of  $\hat{V}_{max}$  given in Fig. 2 for the applicable value of  $t_i$ .

- *For repetitive exponential pulses:*

- As for rectangular pulses, except that  $t_i = 0,5 \tau$ .

- *For single rectangular pulses:*

- $\frac{\hat{V}_i^2}{R}$  must be lower than the value of  $\hat{P}_{max}$  given by the dashed line of Fig. 1 for the applicable of  $t_i$ .
- $\hat{V}_i$  must be lower than the value of  $\hat{V}_{max}$  given in Fig. 2 for the applicable value of  $t_i$ .

**Examples**

Determine the stability of a typical resistor for operation under the following pulse-load conditions.

*1. Continuous pulse train*

A 100 Ω resistor is required to operate under the following conditions:

$$\hat{V}_i = 40 \text{ V}; t_i = 10^{-5} \text{ s}; t_p = 10^{-3} \text{ s}.$$

Therefore:

$$P = \frac{40^2}{100} = 16 \text{ W} \quad \text{and} \quad \frac{t_p}{t_i} = \frac{10^{-3}}{10^{-5}} = 100.$$

For

$$t_i = 10^{-5} \text{ s} \quad \text{and} \quad \frac{t_p}{t_i} = 100,$$

Fig. 1 gives  $\hat{P}_{\max} = 19 \text{ W}$  and Fig. 2 gives  $\hat{V}_{\max} = 500 \text{ V}$ . As the operating conditions  $\hat{P} = 16 \text{ W}$  and  $\hat{V}_i = 40 \text{ V}$  are lower than these limiting values, this resistor can safely be used.

*2. Single pulse*

A 1000 Ω resistor is required to operate under the following conditions:

$$\hat{V}_i = 200 \text{ V}; t_i = 10^{-4} \text{ s}.$$

Therefore:

$$\hat{P}_{\max} = \frac{200^2}{1000} = 40 \text{ W}.$$

The dashed curve of Fig. 1 shows that at  $t_i = 10^{-4} \text{ s}$ , the permissible  $\hat{P}_{\max} = 70 \text{ W}$  and Fig. 2 shows a permissible  $\hat{V}_{\max}$  of 480 V, so again this resistor may be used.

## COMPOSITION OF THE CATALOGUE NUMBER

Resistors are ordered by their *catalogue number*, a 12-digit number. The packaging method is an integral part of this number, and so is the resistance code.

## TESTS AND REQUIREMENTS

Essentially all tests on resistors are carried out according to the schedule of IEC publication 115-1 in the specified climatic category and along the lines of IEC publication 68, "Recommended basic climatic and mechanical robustness testing procedure for electronic components". In some instances deviations from the IEC recommendation are made.

## STANDARD PACKAGING

Most types can be processed automatically. They are supplied on tape for this purpose, i.e. a bandolier which fits most commonly used automatic mounting machine. Not all bandolier configurations are identical, the deviating parameters are given in Figs 8 and 9.

### Axial leads

Fig. 8.

S = spacing

T = maximum deviation of spacing: 1 mm per 10 spacings or  
0,5 mm per 5 spacings

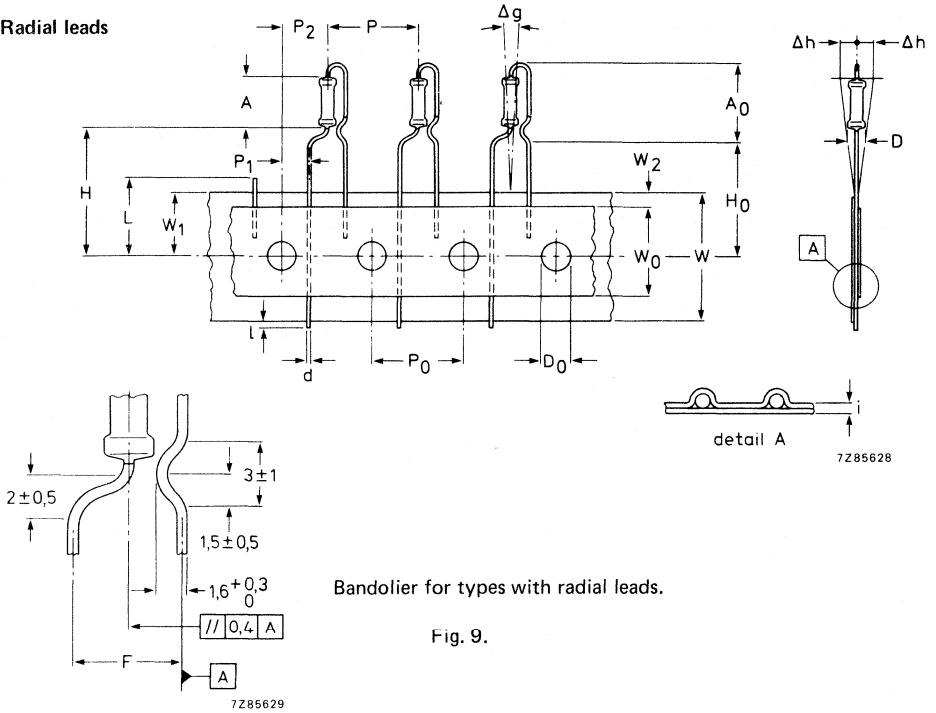

a = tape width

A = tape distance

B1 – B2 = centricity

\* 0,5 max. for type SFR16T.

Radial leads

Bandolier for types with radial leads.

Fig. 9.

- |                                   |                |

| Lead wire clinch height           | H <sub>0</sub> |
| Lead wire protrusion              | l              |
| Feed hole diameter                | D <sub>0</sub> |
| Total tape thickness              | i              |
| Length of snipped lead            | L              |

Extraction force for components in the tape plane, vertically to the direction of unreeling:  $\geq 5N$ .

Bandoliers can be reeled; dimensions A and B differ per type.

Fig. 10.

Bandoliers may also be supplied concertinaed in a cardboard box ("ammopack").

Fig. 11.

"Ammopack" is an abbreviation of "ammunition packing". The dimensions A-B-C vary per type and quantity.

CARBON FILM - CR

## CARBON FILM RESISTORS

### QUICK REFERENCE DATA

Resistance ranges	1 $\Omega$ to 1 M $\Omega$ ; E12 or E24 series		
Resistance tolerance	$\pm 5$ and $\pm 10\%$		
Absolute maximum dissipation at $T_{amb} = 70\text{ }^{\circ}\text{C}^*$	CR16 = 0,2 W; CR25 = 0,33 W; CR37 = 0,5 W; CR52 = 0,67 W; CR68 = 1,15 W		
Basic specification	IEC 115-1 and 115-2		
Climatic category	55/155/56		
Stability after load climatic tests	$R \leq 220\text{ k}\Omega$	$\Delta R/R$	see nomogram (Fig. 3) max. 1,5%
	$R > 220\text{ k}\Omega$	$\Delta R/R$	max. 3%
soldering short time overload		$\Delta R/R$	max. 0,5% or 0,5 $\Omega$ max. 1%

### DESCRIPTION

Resistors of 10  $\Omega$  to 1 M $\Omega$  have a homogeneous film of pure carbon deposited on a high grade ceramic body. Resistors  $R < 10\text{ }\Omega$  have an electroless-deposited nickel film, and resistors  $R > 1\text{ M}\Omega$  have a homogeneous film of metal alloy. After a helical groove has been cut in the resistive layer, tinned connecting wires of electrolytic copper are welded to the end-caps. The resistors are coated with a tan lacquer which provides electrical, mechanical and climatological protection. The encapsulation is resistant to all cleaning solvents commonly used for printed-wiring boards.

### MECHANICAL DATA

Fig. 1.

type	$D_{max}$	$L_{max}$	d	$a_1 + a_2$
CR16	1,6	4,0	0,5	$\leq 1$
CR25	2,5	6,5	0,6	$\leq 1$
CR37	3,7	10	0,7	$\leq 1$
CR52	5,2	16,5	0,8	$\leq 2$
CR68	6,8	18	0,8	$\leq 2$

\* Dissipation at  $T_{amb} = 70\text{ }^{\circ}\text{C}$  which causes the maximum permissible hot-spot temperature of 155  $^{\circ}\text{C}$  to occur, irrespective of the resistance drift provoked by this condition.

Fig. 2 "Stand-up" type, CR25A,  
for vertical mounting.

The bent lead is partially covered with an insulating lacquer with a break-down voltage of at least 50 V (d.c.)

The length of the body is measured by inserting the leads into holes of two identical gauge plates and moving these plates parallel to each other until the resistor body is clamped without deformation (see IEC publication 294).

nominal lead diameter (mm)	dia. of hole in gauge plate (mm)
0,5	0,8
0,6/0,7	1,0
0,8	1,2

Mass (per 100 resistors)

CR16	8 g	CR52	96 g
CR25	23 g	CR68	148 g
CR37	42 g		

### Mounting

The resistors are suitable for processing on automatic insertion equipment and cutting and bending machines. Type CR25A can be inserted at a pitch of 1 e.

### Marking

The nominal resistance and the tolerance are marked on the resistors by means of four coloured bands according to IEC publication 62: "Colour code for fixed resistors". See General Section. The code on type CR25A should be read downwards from the bent lead.

## ELECTRICAL DATA

## Standard values of rated resistance and tolerance

Standard values of rated resistance (nominal resistance) are taken from the E12 - E24 series within the range 1  $\Omega$  to 1 M $\Omega$ . These values are given in the table "Standard series of values in a decade" at the back of the handbook.

The tolerance on the rated voltage is either  $\pm 10$  or  $\pm 5\%$ .

The limiting voltage (r.m.s.) for resistor element and insulation is the maximum voltage that may be applied continuously to the resistor element or the insulation, see IEC publication 115-1 and 115-2.

## Composition of the catalogue number

In the above-mentioned catalogue number, replace the first two dots by the first two digits of the resistance value. Replace the third dot by a figure according to the following table:

1 - 9,1 $\Omega$	8	10 - 91 k $\Omega$	3
10 - 91 $\Omega$	9	100 - 910 k $\Omega$	4
100 - 910 $\Omega$	1	1 M $\Omega$	5
1 - 9,1 k $\Omega$	2		

\* For resistance values higher than 1 M $\Omega$ , those from the VR37/VR68 series are recommended, see Fig. 4 of the relevant specification.

Fig. 3.

Performance nomogram for different styles of resistor showing the relationship between power dissipation  $P$ , ambient temperature  $T_{amb}$ , hot-spot temperature  $T_m$ , resistance value  $R$ , and maximum resistance drift  $\Delta R/R$  after 1000 h of operation.

For continuous operation longer or shorter than 1000 h,  $t_x$ , the stability can be approximated by multiplying the drift  $\Delta R/R$  after 1000 h with the square root of the time ratio, so:

$$(\Delta R/R \text{ after } x \text{ h}) = (\Delta R/R \text{ after } 1000 \text{ h}) \cdot (t_x/1000)^{1/2}$$

See also following notes.

## Notes on nomogram

1. The nomogram should not be extended beyond the maximum permissible hot-spot temperature of 155 °C.
2. The resistance change given by the nomogram for  $P = 0$  at a particular ambient temperature is indicative of the shelf life stability of a resistor at that temperature.
3. The stability lines do not give exact values for  $\Delta R/R$ , but represent a probability of 95% that the real values will be smaller than those obtained from the nomogram.
4. In the nomogram the limiting voltage of the resistors has not been taken into consideration.
5. IEC publication 115-1 is still based on the conventional method of rating resistors by a fixed "rated dissipation" at 70 °C requiring at that dissipation a fixed maximum permissible drift. In our specification, however, the rated dissipation is no longer specified and also the guaranteed resistance drift is made dependent on the working conditions. To bridge the gap between the system of IEC 115-1 and our system, Fig. 4 is added. In this figure the permissible dissipation at 70 °C for a resistance drift of max. 1,5% after 1000 hours is given, taking into consideration that the hot-spot temperature should not rise above 155 °C (horizontal part of the curves). In our specification the curves of Fig. 4 replace the rated dissipation.

Fig. 4 Maximum permissible dissipation at  $T_{amb} = 70$  °C as a function of the resistance value for a resistance drift of 1,5% after 1000 hours or for a maximum temperature of 155 °C without reaching the resistance drift of 1,5%, limiting voltage being taken into account.

Fig. 5 Temperature coefficient as a function of the resistance value, applicable to all CR types. For values  $< 10 \Omega$  the temperature coefficient is  $\leq + 200 \cdot 10^{-6}/K$ .

Fig. 6 Noise as a function of the resistance value.  $0 \text{ dB} = 1 \mu V/V$ .

**High-frequency behaviour**

The behaviour of a resistor at high frequencies is influenced not only by its construction but also by external factors such as length of leads, environmental stray capacitances and the measuring apparatus. Thus these factors have to be considered when measuring. The following table gives typical values under test conditions at 250 MHz using the measuring arrangement shown below. An RX-meter type 250 A of Boonton Radio Corporation is used.

Frequency: 250 MHz

TESTS AND REQUIREMENTS

Essentially all tests are carried out according to the schedule of IEC publication 115-1, category 55/155/56 (rated temperature range -55 to + 155 °C; damp heat, long term, 56 days) are carried and along the lines of IEC publication 68, "Recommended basic climatic and mechanical robustness testing procedure for electronic components". In the following table the tests are listed with reference to the relevant clauses of IEC publications 115-1 and 68; a short description is also given of the test procedure and requirements. In some instances deviations from the IEC specification were necessary for our method of specifying.

Table

IEC 115-1 clause	IEC 68 test method	test	procedure	requirements

## DESCRIPTION

A homogeneous film of metal alloy is deposited on a high grade ceramic body. After a helical groove has been cut in the resistive layer, tinned connecting wires of electrolytic copper are welded to the end-caps. The resistors are coated with a light-green lacquer which provides electrical, mechanical and climatic protection. The encapsulation is resistant to all cleaning solvents commonly used for printed wiring boards.

## MECHANICAL DATA

Fig. 1 This standard version is specially made to obtain a minimum "clean lead to clean lead" dimension L2.

$D_{\text{max}} = 1,6 \text{ mm}$ ;  $L1 \text{ max} = 3,7 \text{ mm}$ ;  $L2 \text{ max} = 4,0 \text{ mm}$ ;  $d = 0,5 \text{ mm}$ .

The length of the body is measured by inserting the leads into holes of two identical gauge plates and moving these plates parallel to each other until the resistor body is clamped without deformation (IEC publication 294). For leads of 0,5 mm diameter, the diameter of the holes in the gauge plates is 0,8 mm.

\* Dissipation at  $T_{\text{amb}} = 70 \text{ }^\circ\text{C}$  which causes the maximum permissible hot-spot temperature of 155  $^\circ\text{C}$  to occur, irrespective of the resistance drift provoked by this condition.

**Mass** 8 g per 100 resistors

## Mounting

The resistors are suitable for processing on automatic insertion equipment and cutting and bending machines. The minimum pitch for this type is  $3e$  (7,6 mm).

## Marking

The nominal resistance and the tolerance are marked on the resistors by four coloured bands according to IEC publication 62 "Colour code for fixed resistors". See also General Section.

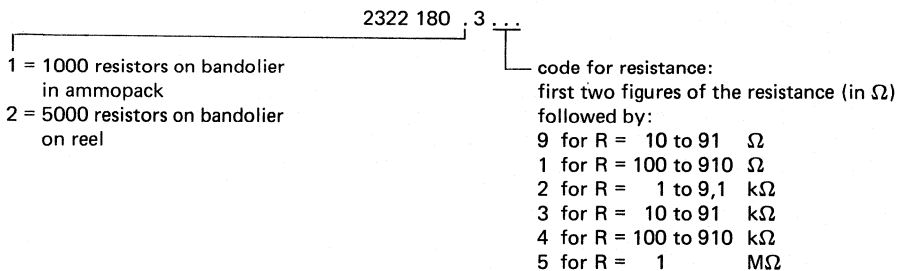

## ELECTRICAL DATA

### Standard values of rated resistance and tolerance

Standard values of rated resistance (nominal resistance) are taken from the E24 series within the range  $10 \Omega$  to  $1 \text{ M}\Omega$ . E24 series of values is given in the table "Standard series of values in a decade" at the back of the handbook. The tolerance on the rated resistance is  $\pm 5\%$ .

The limiting voltage (*r.m.s.*) for resistor element and insulation is the maximum voltage that may be applied continuously to the resistor element or the insulation. See IEC publications 115-1 and 115-2. This voltage is 150 V.

### COMPOSITION OF THE CATALOGUE NUMBER

### Example

The catalogue number of a resistor SFR16 of  $5600 \Omega$ , taped on a bandolier of 1000 items, supplied in ammpack, is 2322 180 13562.

## TESTS AND REQUIREMENTS

Essentially all tests are carried out according to the schedule of IEC publication 115-1, category 55/155/56 (rated temperature range  $-55$  to  $+155$  °C; damp heat, long term, 56 days) and along the lines of IEC publication 68, "Recommended basic climatic and mechanical robustness testing procedure for electronic components". In the following table the tests are listed with reference to the relevant clauses of IEC publications 115-1 and 68; a short description is also given of the test procedure and requirements. In some instances deviations from the IEC recommendation were necessary for our method of specifying.

short time overload	$\Delta R/R$	max. 0,25% + 0,05 $\Omega$	0,5 % + 0,05 $\Omega$

## DESCRIPTION

A homogeneous film of metal alloy is deposited on a high grade ceramic body. After a helical groove has been cut in the resistive layer, tinned connecting wires of electrolytic copper are welded to the end-caps. The resistors are coated with a light-green lacquer which provides electrical, mechanical and climatic protection. The encapsulation is resistant to all cleaning solvents commonly used for printed wiring boards.

## MECHANICAL DATA

Fig. 1 Standard version, specially made to obtain a minimum "clean lead to clean lead" dimension L2 (bare bottom). For lead length see Fig. 5.

type and style	D	L1	L2 max	d
SFR16T	1,7 $\begin{smallmatrix} +0,2 \\ -0,1 \end{smallmatrix}$	3,5 $\begin{smallmatrix} +0,2 \\ -0,1 \end{smallmatrix}$	3,7	0,5 $\begin{smallmatrix} +0,01 \\ -0,03 \end{smallmatrix}$

\* The maximum permissible hot-spot temperature is 155 °C.

The length of the body is measured by inserting the leads into holes of two identical gauge plates and moving these plates parallel to each other until the resistor body is clamped without deformation (IEC publication 294). For leads of 0,5 mm diameter, the diameter of the holes in the gauge plates is 0,8 mm.

Mass 12,5 g per 100 resistors.

#### Mounting

The resistors are suitable for processing on automatic insertion equipment and cutting and bending machines. The minimum pitch is 2e (5 mm).

#### Marking

The nominal resistance and the tolerance are marked on the resistors by four coloured bands according to IEC publication 62 "Colour code for fixed resistors".

### ELECTRICAL DATA

#### Standard values of rated resistance and tolerance

Standard values of rated resistance (nominal resistance) are taken from the E24 series within the range 10  $\Omega$  to 1 M $\Omega$ . E24 series of values is given in the table "Standard series of values in a decade" at the back of the handbook. The tolerance on the rated resistance is  $\pm 5\%$ .

The limiting voltage (r.m.s.) for resistor element and insulation is the maximum voltage that may be applied continuously to the resistor element or the insulation. See IEC publications 115-1 and 115-2. This voltage is 200 V.

type	bandolier width	packing	quantity	resistance range	tolerance $\pm \%$	catalogue number
SFR16T	26 mm	ammopack	2000	10 $\Omega$ to 1 M $\Omega$	5	2322 180 63 ...
	52 mm	ammopack	1000	10 $\Omega$ to 1 M $\Omega$	5	2322 180 73 ...
	52 mm	on reel	5000	10 $\Omega$ to 1 M $\Omega$	5	2322 180 83 ...

#### COMPOSITION OF THE CATALOGUE NUMBER

The catalogue number in the above table is completed by inserting the resistance code: the first two figures of the resistance (in  $\Omega$ ) followed by:

- 9 for R = 10 to 91  $\Omega$
- 1 for R = 100 to 910  $\Omega$
- 2 for R = 1 to 9,1 k $\Omega$
- 3 for R = 10 to 91 k $\Omega$
- 4 for R = 100 to 910 k $\Omega$
- 5 for R = 1 M $\Omega$

#### Example

The catalogue number of a resistor SFR16T of 5600  $\Omega \pm 5\%$ , on a 52 mm bandolier of 1000 items, supplied in ammopack, is 2322 180 73562.

Fig. 2 Hot-spot temperature rise ( $\Delta T$ ) versus dissipated power.

Fig. 3 Temperature rise ( $\Delta T$ ) at the end of lead (soldering point) versus dissipated power, at various lead lengths after mounting.

Fig. 4 Max. permissible peak pulse power ( $\hat{P}_{max}$ ) versus pulse duration ( $t_i$ ).

## TESTS AND REQUIREMENTS

Essentially all tests are carried out according to the schedule of IEC publication 115-1, category 55/155/56 (rated temperature range  $-55$  to  $+155$  °C; damp heat, long term, 56 days) and along the lines of IEC publication 68, "Recommended basic climatic and mechanical robustness testing procedure for electronic components". In the following table the tests are listed with reference to the relevant clauses of IEC publications 115-1 and 68; a short description is also given of the test procedure and requirements. In some instances deviations from the IEC recommendation were necessary for our method of specifying.

Table 4

IEC 115-1 clause	IEC 68 test method	test	procedure	requirements

short time overload	$\Delta R/R$	max.	0,25% + 0,05 $\Omega$

## DESCRIPTION

A homogeneous film of metal alloy is deposited on a high grade ceramic body. After a helical groove has been cut in the resistive layer, tinned connecting wires of electrolytic copper are welded to the end-caps. The resistors are coated with a light-green lacquer which provides electrical, mechanical and climatic protection. The encapsulation is resistant to all cleaning solvents commonly used for printed wiring boards.

## MECHANICAL DATA

Fig. 1 Standard version, style 1 and 2. Style 2 is specially made to obtain a minimum "clean lead to clean lead" dimension L2 (bare bottom).

type and style	D <sub>max</sub>	L1 max	L2 max	d
SFR25, style 1	2,5	6,5	7,5	0,6
SFR25, style 2	2,5	6,5	7,0	0,6

\* This is the dissipation at T<sub>amb</sub> = 70 °C which causes the maximum permissible hot-spot temperature of 155 °C to occur, irrespective of the resistance drift provoked by this condition.

The length of the body is measured by inserting the leads into holes of two identical gauge plates and moving these plates parallel to each other until the resistor body is clamped without deformation (IEC publication 294). For leads of 0,6 mm diameter, the diameter of the holes in the gauge plates is 1,0 mm.

Fig. 2 "Stand-up" type SFR25A, for vertical mounting. The bent lead is partially covered with an insulating lacquer with a breakdown voltage of at least 50 V (d.c.).

**Mass** 25 g per 100 resistors.

#### Mounting

Styles 1 and 2 are suitable for processing on automatic insertion equipment and cutting and bending machines. The minimum pitch for style 1 is 5e (12,7 mm) and for style 2, 4e (10,2 mm). The "stand-up" type, SFR25A, can be inserted into holes with a pitch of 1e.

#### Marking

The nominal resistance and the tolerance are marked on the resistors by four coloured bands according to IEC publication 62 "Colour code for fixed resistors". See also General Section.

### ELECTRICAL DATA

#### Standard values of rated resistance and tolerance

Standard values of rated resistance (nominal resistance) are taken from the E24 series within the range  $1\ \Omega$  to  $10\ M\Omega$ . E24 series of values is given in the table "Standard series of values in a decade" at the back of the handbook. The tolerance on the rated resistance is either  $\pm 5\%$  or  $\pm 2\%$ .

The limiting voltage (r.m.s.) for resistor element and insulation is the maximum voltage that may be applied continuously to the resistor element or the insulation. See IEC publications 115-1 and 115-2. This voltage is 250 V.

### DESCRIPTION

A homogeneous film of metal alloy is deposited on a high grade ceramic body. After a helical groove has been cut in the resistive layer, tinned connecting wires of electrolytic copper are welded to the end-caps. The resistors are coated with a red-brown lacquer which provides electrical, mechanical and climatic protection. The encapsulation is resistant to all cleaning solvents according to MIL-STD-202E, method 215 and IEC 68-2-45.

### MECHANICAL DATA

Fig. 1.

type	D <sub>max</sub>	L1 max.	L2 max.	d
SFR25H	2,5	6,5	7,5	0,6

The length of the body is measured by inserting the leads into holes of two identical gauge plates and moving these plates parallel to each other until the resistor body is clamped without deformation (IEC publication 294). For leads of 0,6 mm diameter, the diameter of the holes in the gauge plates is 1,0 mm.

**Mass** 25 g per 100 resistors.

#### Mounting

The resistors are suitable for processing on automatic insertion equipment and cutting and bending machines. The minimum pitch for this type is 5e (12,7 mm).

#### Marking

The nominal resistance and the tolerance are marked on the resistors by four coloured bands according to IEC publication 62 "Colour code for fixed resistors". See also General Section.

### ELECTRICAL DATA

#### Standard values of rated resistance and tolerance

Standard values of rated resistance (nominal resistance) are taken from the E24 series within the range 1  $\Omega$  to 10 M $\Omega$ . E24 series of values is given in the table "Standard series of values in a decade" according to IEC publication 63. The tolerance on the rated resistance is either  $\pm 5\%$  or  $\pm 2\%$ .

The limiting voltage (r.m.s.) for resistor element and insulation is the maximum voltage that may be applied continuously to the resistor element or the insulation. See IEC publications 115-1 and 115-2. This voltage is 350 V.

Table 1

type	packing	quantity	resistance range	tolerance $\pm \%$	catalogue number
SFR25H	ammopack	1000	1 $\Omega$ to 10 M $\Omega$	5	2322 186 13 ...
		1000	1 $\Omega$ to 1 M $\Omega$	2	2322 186 14 ...
		5000	1 $\Omega$ to 10 M $\Omega$	5	2322 186 73 ...
		5000	1 $\Omega$ to 1 M $\Omega$	2	2322 186 74 ...

#### COMPOSITION OF THE CATALOGUE NUMBER

The catalogue number in the above table is completed by inserting the resistance code: the first two figures of the resistance (in  $\Omega$ ) followed by:

- 8 for R = 1 to 9,1  $\Omega$
- 9 for R = 10 to 91  $\Omega$
- 1 for R = 100 to 910  $\Omega$
- 2 for R = 1 to 9,1 k $\Omega$
- 3 for R = 10 to 91 k $\Omega$
- 4 for R = 100 to 910 k $\Omega$
- 5 for R = 1 to 9,1 M $\Omega$
- 6 for R = 10 M $\Omega$

#### Example

The catalogue number of a resistor SFR25H of 5600  $\Omega \pm 5\%$  on a bandolier of 1000 items, supplied in ammopack, is 2322 186 13562.

Fig. 5 Max. permissible peak pulse voltage ( $\hat{V}_{max}$ ) versus pulse duration ( $t_i$ ).

## TESTS AND REQUIREMENTS

Essentially all tests are carried out according to the schedule of IEC publication 115-1, category 55/155/56 (rated temperature range  $-55$  to  $+155$  °C; damp heat, long term, 56 days) and along the lines of IEC publication 68, "Recommended basic climatic and mechanical robustness testing procedure for electronic components". In the following table the tests are listed with reference to the relevant clauses of IEC publications 115-1 and 68; a short description is also given of the test procedure and requirements. In some instances deviations from the IEC recommendation were necessary for our method of specifying.

Table 2

IEC 115-1 clause	IEC 68 test method	test	procedure	requirements

### DESCRIPTION

A homogeneous film of metal alloy is deposited on a high grade ceramic body. After a helical groove has been cut in the resistive layer tinned connecting wires of electrolytic copper are welded to the end-caps. The resistors are coated with a light-green lacquer which provides electrical, mechanical and climatic protection. The encapsulation is resistant to all cleaning solvents commonly used for printed wiring boards.

### MECHANICAL DATA

Fig. 1 D<sub>max</sub> = 3,0 mm; L<sub>1</sub> max = 8,5 mm; L<sub>2</sub> max = 9,5 mm; d = 0,7 mm.

The length of the body is measured by inserting the leads into holes of two identical gauge plates and moving these plates parallel to each other until the resistor is clamped without deformation (IEC publication 294). For leads of 0,7 mm diameter, the diameter of the holes in the gauge plates is 1,0 mm

\* This is the dissipation at T<sub>amb</sub> = 70 °C which causes the maximum permissible hot-spot temperature of 155 °C to occur, irrespective of the resistance drift provoked by this condition.

**Mass** 33 g per 100 resistors

## Mounting

The resistors are suitable for processing on automatic insertion equipment and cutting and bending machines. The minimum pitch for this type is 5e (12,7 mm).

## Marking

The nominal resistance and the tolerance are marked on the resistors by four coloured bands according to IEC publication 62 "Colour code for fixed resistors". See also General Section.

## ELECTRICAL DATA

### Standard values of rated resistance and tolerance

Standard values of rated resistance (nominal resistance) are taken from the E24 series within the range 1  $\Omega$  to 10 M $\Omega$ . E24 series of values is given in the table "Standard series of values in a decade" at the back of the handbook. The tolerance on the rated resistance is either  $\pm 5\%$  or  $\pm 2\%$ .

The limiting voltage (r.m.s.) for resistor element and insulation is the maximum voltage that may be applied continuously to the resistor element or the insulation, see IEC publication 115-1 and 115-2. This voltage is 350 V.

Absolute maximum dissipation at $T_{amb} = 70 \text{ }^\circ\text{C}^*$	NFR25	0,33 W	
	NFR30	0,50 W	
Basic specifications		IEC 115-1 and 115-2	
Climatic category (IEC 68)		55/155/56	
Stability after endurance test		NFR25	NFR30
climatic tests	$\Delta R/R$ max.	1% + 0,05 $\Omega$	1% + 0,05 $\Omega$
soldering	$\Delta R/R$ max.	0,25% + 0,05 $\Omega$	0,25% + 0,05 $\Omega$

### APPLICATION

These resistors have been designed to meet the safety requirements in audio and video applications, in circuits where protection against overloads is needed, e.g. in power supply circuits. The resistors will become open circuited within a certain range of overload, without the risk of fire (see Figs 2 and 5).

### DESCRIPTION

A homogenous film of metal alloy is deposited on a high grade ceramic body. After a helical groove has been cut in the resistive layer, tinned connecting wires of electrolytic copper are welded to the end-caps. The resistors are coated with a grey flame retardant lacquer which provides electrical, mechanical and climatic protection. The encapsulation is resistant to all cleaning solvents commonly used for printed-wiring boards.

### MECHANICAL DATA

Fig. 1.

type	$D_{max}$	$L_{max}$	d	$a_1 + a_2$
NFR25	2,5	6,5	0,6	$\leq 1$
NFR30	3,0	8,5	0,7	$\leq 1$

\* This is the dissipation at  $T_{amb} = 70 \text{ }^\circ\text{C}$  which causes the maximum permissible hot-spot temperature of 155  $^\circ\text{C}$  to occur, irrespective of the resistance drift provoked by this condition.

The length of the body is measured by inserting the leads into holes of two identical gauge plates and moving these plates parallel to each other until the resistor body is clamped without deformation (IEC publication 294). For leads of 0,6 and 0,7 mm diameter of the holes in the gauge plate is 1,0 mm.

**Mass**

NFR25            25 g per 100  
NFR30            33 g per 100

**Mounting**

The resistors are suitable for processing on automatic insertion equipment and cutting and bending machines.

Since these resistors are used in applications where overloads can occur, it is not advisable to mount the resistors against other components or against printed circuit boards.

**Marking**

The nominal resistance and the tolerance are marked on these resistors by means of four coloured bands according to IEC publication 62 "Colour code for fixed resistors". See also General Section.

**ELECTRICAL DATA**

**Standard values of rated resistance and tolerance**

Standard values of rated resistance (nominal resistance) are taken from the E24 series within the range 1 Ω to 15 kΩ. E24 series of values is given in the table "Standard series of values in a decade" at the back of this book. The tolerance on the rated resistance is ± 5%.

The limiting voltage (r.m.s.) for element and insulation is the maximum voltage that may be applied continuously to the resistor element or the insulation. See IEC publications 115-1 and 115-2. This voltage is 250 V for NFR25 and 350 V for NFR30.

**Composition of the catalogue number**

**Example**

The catalogue number of a resistor NFR25 of 5600 Ω, taped on a bandolier of 1000 items, supplied in ammopack, is 2322 205 13562.

Time to interruption as a function of overload

“Interruption” means that the nominal resistance has increased at least 10 times.

Fig. 2 NFR25;  $R \leq 15 \Omega$ .

METAL FILM — MR, MPR

## METAL FILM RESISTORS

## QUICK REFERENCE DATA

Type	MR16	MR25	MR30	MR52
Resistance range	10 $\Omega$ to 100 k $\Omega$	1 $\Omega$ to 1 M $\Omega$	1 $\Omega$ to 1 M $\Omega$	4,99 $\Omega$ to 1 M $\Omega$
Series	E24; E96	E192; E24; E96	E24; E96	E96
Resistance tolerance	$\pm 1\%$ ; $\pm 2\%$	$\pm 0,5\%$ ; $\pm 1\%$ ; $\pm 2\%$	$\pm 0,5\%$ ; $\pm 1\%$ ; $\pm 2\%$	$\pm 1\%$
Temperature coefficient	$\pm 50 \cdot 10^{-6}/K$	$\pm 50 \cdot 10^{-6}/K$	$\pm 50 \cdot 10^{-6}/K$	$\pm 100 \cdot 10^{-6}/K$
Absolute max. dissipation at $T_{amb} = 70 \text{ }^\circ\text{C}$	0,25 W	0,4 W	0,5 W	1 W
Basic specification	IEC 115-1			
Climatic category (IEC 68)	55/155/56			
Approval	 CECC 40101			
Stability after load	$\Delta R/R$ see nomogram			
climatic tests	$\Delta R/R$ max. 0,5% + 0,05 $\Omega$			
soldering	$\Delta R/R$ max. 0,1% + 0,01 $\Omega$			
short time overload	$\Delta R/R$ max. 0,25% + 0,05 $\Omega$			

## APPLICATION

For use in professional equipment: computers, telecom, measuring, etc.

## DESCRIPTION

A homogeneous film of metal alloy is deposited on a high grade ceramic body. After a helical groove has been cut in the resistive layer, tinned connecting wires of electrolytic copper are welded to the end-caps. The resistors are coated with layers of green lacquer which provides electrical, mechanical and climatic protection. The encapsulation is resistant to all cleaning solvents commonly used for printed-wiring boards.

## MECHANICAL DATA

Fig. 1 This standard version is specially made to obtain a minimum "clean lead to clean lead" dimension L2.

Table 1

type	$D_{max}$	$L1_{max}$	$L2_{max}$	d
MR16	1,6	4,0	5,0	0,5
MR25	2,5	6,5	7,5	0,6
MR30	3,0	10,0	11,0	0,6
MR52	5,2	16,5	17,5	0,6

\* Dissipation at  $T_{mab} = 70 \text{ }^\circ\text{C}$  which causes the maximum permissible hot-spot temperature of 175  $^\circ\text{C}$  to occur, irrespective of the resistance drift provoked by this condition.

The length of the body is measured by inserting the leads into the holes of two identical gauge plates and moving these plates parallel to each other until the resistor body is clamped without deformation (IEC publication 294). For leads of 0,5 mm dia the diameter of the holes in the gauge plate is 0,8 mm and for leads of 0,6 mm dia these holes are 1,0 mm dia.

#### Mass

type MR16 : 8 g per 100  
MR25 : 25 g per 100  
MR30 : 32 g per 100  
MR52 : 92 g per 100

#### Mounting

The resistors are suitable for processing an automatic insertion equipment and cutting and bending machines.

#### → Marking

The nominal resistance and tolerance are marked on the resistors by four or six coloured bands according to IEC publication 62 "Colour code for fixed resistors". Four bands are used for resistors with a 2% tolerance: 2 for the resistance value, 1 for multiplier and 1 red for tolerance.

Six bands are used for resistors with either 1% or 0,5% tolerance: 3 for resistance value, 1 for multiplier, 1 for tolerance and 1 for the temperature coefficient.

See General Section.

#### ELECTRICAL DATA

##### Standard values of rated resistance and tolerance

Standard values of rated resistance (nominal resistance) are taken from the E24 series for resistors with a tolerance of  $\pm 2\%$ , from E24/E96 series for  $\pm 1\%$  and from the E192 series for  $\pm 0,5\%$ . The values of these series are given in the table "Standard series of values in a decade" at the back of the handbook. The limiting voltage (r.m.s.) for resistor element and insulation is the maximum voltage that may be applied continuously to the resistor element or the insulation. See IEC publication 115-1 and 115-2.

Table 2

type	packing	quantity	resistance range	tol. %	series	temp. coefficient $\cdot 10^{-6}/K$	limiting voltage V	catalogue number 2322 followed by:

## COMPOSITION OF THE CATALOGUE NUMBER

The catalogue number in the above table is completed by inserting the resistance code: the first three figures of the resistance in  $\Omega$  followed by

8 for R = 1 to 9,76  $\Omega$

9 for R = 10 to 97,6  $\Omega$  (see note)

1 for R = 100 to 976  $\Omega$

2 for R = 1 to 9,76 k $\Omega$

3 for R = 10 to 97,6 k $\Omega$

4 for R = 100 to 976 k $\Omega$

5 for R = 1 M $\Omega$

Example: the catalogue number of a resistor  
MR25 of 3650  $\Omega \pm 1\%$  in ammpack of 1000 is  
2322 151 53652

## Note

The composition of catalogue number is not applicable for R = 49,9  $\Omega$  the relevant catalogue numbers will be indicated on request.

\* For R < 4,99  $\Omega$  : 100.10<sup>-6</sup>/K.

**DISSIPATION AND STABILITY**

The stability as a function of dissipation and ambient temperature is indicated in the performance nomogram of Fig. 2.

**Notes on nomogram**

1. It cannot be used for MR16.
2. It should not be extended beyond the maximum permissible hot-spot temperature of 175 °C.
3. The change in resistance for P = 0 at a particular ambient temperature is indicative for the shelf-life stability of a resistor at that temperature.
4. The stability lines do not give exact values of  $\Delta R/R$  but represent a probability of 95% that the actual values will be smaller than those obtained from the nomogram.
5. The limiting voltage has not been taken into consideration.

Fig. 2 Performance nomogram for different styles of resistor, showing the relationship between power dissipation P, ambient temperature  $T_{amb}$ , hot-spot temperature ( $T_m$ ) and max. resistance drift  $\Delta R/R$  after 1000 to 10000 hours of operation.

## TESTS AND REQUIREMENTS

Essentially all tests are carried out according to the schedule of IEC publication 115-1, category 55/155/56 (rated temperature range  $-55$  to  $+155$  °C, damp heat, long term, 56 days) are carried out along the lines of IEC publication 68, "Recommended basic climatic and mechanical robustness testing procedure for electronic components". In the following table the tests are listed with reference to the relevant clauses of IEC publications 115-1 and 68; a short description is also given of the test procedure and requirements. In some instances deviations from the IEC specification were necessary for our method of specifying.

Table 3

IEC 115-1 clause	IEC 68 test method	test	procedure	requirements
18	Ua Ub Uc	Robustness of terminations Tensile all samples Bending half number of samples Torsion other half number of samples	load 10 N, 10 s load 5 N, 4 x 90° (MR16: load 2,5 N, 4 x 90°) 3 x 360° in opposite directions	no damage $\Delta R$ max. 0,1% + 0,01 $\Omega$
19	T	Soldering	solderability: 2 s 230 °C, flux 600 thermal shock: 3 s. 350 °C, 6 mm from body	good tinning no damage $\Delta R$ max. 0,1%
20	Na	Rapid change of temperature	$\frac{1}{2}$ h $-55$ °C/ $\frac{1}{2}$ h $+155$ °C, 5 cycles	$\Delta R$ max. 0,1% + 0,01 $\Omega$
22	Fc	Vibration	frequency 10-500 Hz, displacement 1,5 mm or acceleration 10g, three directions; total 6 h	no damage $\Delta R$ max. 0,1% + 0,01 $\Omega$
21	Eb	Bump	3 x 1500 bumps in three directions, 40g	no damage $\Delta R$ max. 0,1% + 0,01 $\Omega$ MR16, for $R \leq 100 \Omega$ : $\Delta R$ max. 0,5% + 0,05 $\Omega$

Table 3 (continued)

## LACQUERED METAL FILM RESISTORS

according to MIL-R-10509F

### QUICK REFERENCE DATA

Resistance range	10 $\Omega$ to 1 M $\Omega$ , E96 and E192 series		
Resistance tolerance	$\pm$ 0,1; 0,25; 0,5; 1%		
Rated dissipation at $T_{amb} = 70\text{ }^{\circ}\text{C}$	MR24D	0,125 W	
	MR34D	0,25 W	
	MR54D	0,5 W	
	MR74D	0,75 W	
$T_{amb} = 125\text{ }^{\circ}\text{C}$	MR24E/C	0,1 W	
	MR34E/C	0,125 W	
	MR54E/C	0,25 W	
	MR74E/C	0,5 W	
Basic specification	MIL-R-10509F		
Stability after load	$\Delta R/R$	max. 0,5%	+0,05 $\Omega$
climatic tests	$\Delta R/R$	max. 0,5%	+0,05 $\Omega$
soldering	$\Delta R/R$	max. 0,1%	+0,05 $\Omega$
short-time overload	$\Delta R/R$	max. 0,25%	+0,05 $\Omega$

### APPLICATION

For use in professional equipment: computers, telecom, measuring, etc.

### DESCRIPTION

A homogeneous film of metal alloy is deposited on a high grade ceramic body. After a helical groove has been cut in the resistive layer, tinned connecting wires of electrolytic copper are welded to the end-caps. The resistors are coated with layers of green lacquer which provide electrical, mechanical and climatic protection. The encapsulation is resistant to all cleaning solvents commonly used for printed wiring boards.

### MECHANICAL DATA

Table 1

type	$D_{max}$	$L_{max}$	$a_1, a_2$ $a_1 + a_2$	d
MR24E/C/D	2,4	6,5	$\leq 1$	0,6
MR34E/C/D	3,1	10,5	$\leq 1$	0,6
MR54E/C/D	5,2	16,5	$\leq 1$	0,6
MR74E/C/D	6,8	20,5	$\leq 1$	0,8

Fig. 1.

The length of the body is measured by inserting the leads into the holes of two identical gauge plates and by moving these plates parallel to each other until the resistor body is clamped without deformation (see IEC publication 294). For leads of 0,6 mm diameter the diameter of the holes in the gauge plate is 1,0 mm and for leads of 0,8 mm these holes are 1,2 mm diameter.

#### Mass

MR24E/C/D	25 g per 100
MR34E/C/D	32 g per 100
MR54E/C/D	92 g per 100
MR74E/C/D	200 g per 100

#### Mounting

The resistors must be mounted stress free so as to allow thermal expansion over the wide permissible temperature range.

#### Marking

The resistors are marked according to the MIL specification MIL-R-10509F. This means that the following information is printed on the resistor:

MIL style

Value and tolerance in MIL code

Manufacturers' identification symbol.

In the MIL code for value and tolerance the value is indicated by four figures and a letter: first the three significant figures according to the E192 or E96 series, a fourth figure indicating the number of zeros to follow and then a letter indicating the tolerance as follows:

$$B = \pm 0,1\%; C = \pm 0,25\%; D = \pm 0,5\% \text{ and } F = \pm 1\%.$$

Example: 22,1 k $\Omega$   $\pm$  1% is written as 2212 F.

This code should not be used for ordering. Please use the catalogue number (see next page) for this purpose.

## ELECTRICAL DATA

### Standard values of rated resistance and tolerance

Standard values of rated resistance (nominal resistance) are taken from the E96 series for resistors with a tolerance of  $\pm$  1%, from the E192 series for resistors with a tolerance of  $\pm$  0,5%,  $\pm$  0,25% or  $\pm$  0,1% (MIL-R-10509F para 1.2.1.3). Resistors with a tolerance of  $\pm$  0,1% and  $\pm$  0,25% may also be requested with resistance values deviating from the E192 series, provided the value can be indicated with no more than three significant figures. The values of the E96 and E192 series are given at the back of this book.

Table 2

style	rated dissipation W	maximum temperature coefficient $\cdot 10^{-6}/K$	resistance range and tolerance	max. voltage V rms	MIL style	catalogue number 2322 followed by
	at 125 °C	±	0,1/0,25/0,5% E 192 series 1% E96 series

MR74D	0,75	100	10 Ω to 1 MΩ	500	RN70D	171.....

COMPOSITION OF THE CATALOGUE NUMBER

The catalogue number in the above table is completed by inserting the tolerance and resistance code:

For the resistance values mentioned in Table 3 the "Composition of the catalogue number" is not applicable. In this table the last 5 digits of the catalogue number are stated in full.

Table 3

resistance value $\Omega$	last 5 digits of the catalogue number			
	0,1%	0,25%	0,5%	1%
29,9	92102	92122		
39,9	92103	92123		
49,9	92104	92124	92134	92144
59,9	92105	92125		
69,9	92106	92126		
79,9	92107	92127		
89,9	92108	92128		
99,9	92109	92129		

### TESTS AND REQUIREMENTS

All tests are carried out according to the schedule of MIL-R-10509F para 4.4.2. In the table below the tests and requirements are listed with reference to the relevant paragraphs of this specification.

Table 4

MIL method			requirement	
R 10509F paragraph	STD 202 method	procedure	MIL-R-10509F paragraph	requirement*
4.6.4	102	Temperature cycling	3.9	$\Delta R \leq 0,25\% + 0,05 \Omega$
4.6.5	—	Low-temperature operation	3.10	$\Delta R \leq 0,25\% + 0,05 \Omega$
4.6.6	—	Short-time overload	3.11	$\Delta R \leq 0,25\% + 0,05 \Omega$
4.6.7	211	Terminal strength	3.12	$\Delta R \leq 0,2\% + 0,05 \Omega$
4.6.8	301/105	Dielectric withstanding voltage	3.13	$\Delta R \leq 0,25\% + 0,05 \Omega$
4.6.9	302	Insulation resistance	3.14	$R_{ins} \geq 10\ 000\ M\Omega$
4.6.10	210	Resistance to soldering heat	3.15	$\Delta R \leq 0,1\% + 0,05 \Omega$
4.6.11	106	Moisture resistance	3.16	$\Delta R \leq 0,5\% + 0,05 \Omega$
4.6.13	108	Life	3.18	$R_{ins} \geq 100\ M\Omega$ $\Delta R \leq 0,5\% + 0,05 \Omega$
4.6.15	205	Shock, medium impact	3.20	$\Delta R \leq 0,25\% + 0,05 \Omega$
4.6.16	204	Vibration	3.21	$\Delta R \leq 0,25\% + 0,05 \Omega$

### PACKAGING

Bulk packing, 100 per box.

\* Although resistors with a temperature coefficient of  $100 \cdot 10^{-6}/K$  correspond with characteristic D resistors of MIL-R-10509F, they meet the more severe test requirements of characteristic C and E resistors.

## METAL FILM PRECISION RESISTORS

### APPLICATION

These resistors have been developed for highly professional applications such as computers, test and telecommunication equipment, where high stability and low temperature coefficient are essential.

### DESCRIPTION

A homogeneous film of metal alloy is deposited on a high grade ceramic body. After a helical groove has been cut in the resistive layer, tinned connecting wires of electrolytic copper are welded to the end-caps. The resistors are coated with layers of green lacquer which provides electrical, mechanical and climatic protection. The encapsulation is resistant to all cleaning solvents commonly used for printed-wiring boards.

Resistors  $\leq 200\text{ }\Omega$  with tolerances of 0,05, 0,02 and 0,01% have a low inductance.

MECHANICAL DATA

Fig. 1.

Table 1

type	D <sub>max</sub>	L <sub>max</sub>	a <sub>1</sub> + a <sub>2</sub>	d
MPR24	2,5	6,5	≤ 1	0,6
MPR34	3,0	10,0	≤ 1	0,6

The lead length (38 ± 3 mm) only applies to untaped resistors, i.e. those packed in a cassette. See Standard Packaging.

The length of the body is measured by inserting the leads into the 1 mm diameter holes of two identical gauge plates and by moving these plates parallel to each other until the resistor body is clamped without deformation (see IEC publication 294).

Mass (per 100 items): MPR24 – 25g  
MPR34 – 30g

Coding

The resistors are either colour-coded or marked. Any value within the range can be supplied colour-coded, provided the resistance can be expressed in 3 coloured bands according to IEC publication 62 "Colour code for fixed resistors". See also General Section. All other resistors, including those in cassette packing, are marked.

Colour coding

colour	significant figures	multiplier	tol. %	TC . 10 <sup>-6</sup> /K
black	0	1 x		
brown	1	10 x		
red	2	100 x		50
orange	3	1 000 x		15
yellow	4	10 000 x		25
green	5	100 000 x	± 0,5	
blue	6	1 000 000 x	± 0,25	10
violet	7		± 0,1	5
grey	8			
white	9			
silver	—	0,01 x		
gold	—	0,1 x		

**Marking**

When marked, the following details are printed on the resistors:

Tolerance: (acc IEC 62).

- ± 0,5 % = D
- ± 0,25% = C
- ± 0,1 % = B
- ± 0,05% = W
- ± 0,02% = P
- ± 0,01% = L

Temperature coefficient:

- TC 25 = 1
- TC 15 = 2
- TC 10 = 3
- TC 5 = 4

Resistors with other temperature coefficients are available on request.

Resistance value:

Nine positions are available for the resistance value according to IEC 62.

- Example: 4R99 = 4,99 Ω
- K2751 = 275,1 Ω
- 27R83 = 27,83 Ω

**ELECTRICAL DATA**

Maximum permissible voltage: 250 V (d.c.). Insulation voltage: 500 V (d.c.)

Resistance range	24 $\Omega$ to 100 k $\Omega$	4,99 $\Omega$ to 1 M $\Omega$
Resistance tolerance	$\pm 0,05; 0,02; 0,01\%$	$\pm 0,5; 0,25; 0,1\%$
Climatic category (IEC68)	25/125/56	55/155/56
Failure level	S	R
Absolute maximum dissipation at $T_{amb} = 70^\circ\text{C}$	MPR24 0,125 W MPR34 0,25 W	0,250 W 0,40 W
Temperature coefficient	5,10,15,25 $\cdot 10^{-6}/\text{K}$	5,10,15,25 $\cdot 10^{-6}/\text{K}$

Resistors in the range 24  $\Omega$  to 200  $\Omega$ , tolerance  $< 0,1\%$ , are of low inductance.

**Derating at temperatures above 70  $^\circ\text{C}$**

Fig. 2a Maximum dissipation ( $P_{max}$ ) as a function of  $T_{amb}$  for R tolerances of 0,05, 0,02 and 0,01%.

Fig. 2b Maximum dissipation ( $P_{max}$ ) as a function of  $T_{amb}$  for R tolerances of 0,5, 0,25 and 0,1%.

**Dissipation and stability**

The stability as a function of dissipation and ambient temperature is indicated in the performance nomogram of Fig. 3 for resistors with R tolerance  $\geq 0,1\%$ .

**Notes on nomogram**

1. The nomogram should not be extended beyond the maximum permissible hot-spot temperature of 175  $^\circ\text{C}$ .
2. The resistance change given by the nomogram for  $P = 0$  at a particular ambient temperature is indicative of the shelf-life stability of a resistor at that temperature.
3. The stability lines do not give exact values  $\Delta R/R$ , but represent a probability of 95% that the real values will be smaller than those obtained from the nomogram.
4. In the nomogram the limiting voltage of the resistors has not been taken into consideration.

Fig. 3 Performance nomogram for different styles of resistor, showing the relationship between power dissipation  $P$ , ambient temperature  $T_{amb}$ , hot-spot temperature ( $T_m$ ) and max. resistance drift  $\Delta R/R$  after 1000 to 10 000 hours of operation.

## TESTS AND REQUIREMENTS

Essentially all tests are carried out according to the schedule of the CECC publication 40.300-category 55/155/56 (for the 0,5%, 0,25% and 0,1% tolerance classes) and category 25/125/56 (for the 0,05%, 0,02% and 0,01% tolerance classes) along the lines of CECC 40.000, "Recommended basic climatic and mechanical robustness testing procedure for electronic components".

In the following table the tests are listed with reference to the relevant clauses of CECC publication 40.000 and IEC publication 68; a short description is also given on the test procedure and requirements. In some instances deviations from the CECC were necessary for our method of specifying.

Table 2

CECC 40.000 test method	IEC 68 test method	test	procedure	requirements
4.5		Insulation resistance	after 1 min with 500 V d.c.	min. $10^4 \text{ M}\Omega$

Noise	max. 5 $\mu\text{V}/\text{V}$

## APPLICATION

These resistors are for applications in which high resistance, high stability and reliability are required at high voltages. The resistors meet the safety requirements of IEC 65.

## DESCRIPTION

A metal-glazed film is deposited on a high grade ceramic body; tinned electrolytic copper connecting wires are welded to the end caps. The resistors are coated with a light-blue insulating lacquer which also provides protection against environmental effects.

## MECHANICAL DATA

Fig. 1 Axial leads.

Table 1

type	$D_{\text{max}}$	$L1_{\text{max}}$	$L2_{\text{max}}$	d
VR25	2,5	6,5	7,5	0,6

The length of the body is measured by inserting the leads into holes of two identical gauge plates and moving these plates parallel to each other until the resistor body is clamped without deformation (IEC publication 294). For leads of 0,6 mm diameter, the diameter of the holes in the gauge plates is 1,0 mm.

Fig. 2 "Stand-up" type VR25A, for vertical mounting. The bent lead is partially covered with an insulating lacquer with a breakdown voltage of at least 50 V (d.c.).

Mass 23 g per 100 resistors

**Mounting**

The resistors are suitable for processing on automatic insertion equipment and cutting and bending machines. The minimum pitch for the type with axial leads is 5 e (12,7 mm). The "stand-up" type, VR25A, can be inserted into holes with a pitch of 1 e.

**Marking**

The nominal resistance and the tolerance are marked on these resistors by four or five coloured bands according to IEC publication 62 "Colour code for fixed resistors". See General Section.

Yellow and grey are used instead of gold and silver because metal particles in the lacquer could affect high-voltage properties.

**ELECTRICAL DATA****Standard values of rated resistance and tolerance**

Standard values of rated resistance (nominal resistance) are taken from the

E12 series within the range 12 M $\Omega$  to 22 M $\Omega$  for R  $\pm$  10%,

E24 series within the range 220 k $\Omega$  to 10 M $\Omega$  for R  $\pm$  5% and

E24/E96 series within the range 220 k $\Omega$  to 15 M $\Omega$  for R  $\pm$  1%

See the table "Standard series of values in a decade" at the back of the book.

The limiting voltage for resistor element and insulation is the maximum voltage that may be applied continuously to the resistor element or the insulation, see IEC publications 115-1 and 115-2. This voltage is 1600 V (d.c.) or 1150 V (r.m.s.).

Table 2

**COMPOSITION OF THE CATALOGUE NUMBER**

The catalogue number in the above table is completed by inserting the resistance code: the first two figures (for 1% tolerance first three figures) of the resistance, followed by:

4 for R = 280 to 910 k $\Omega$

5 for R = 1 to 9,1 M $\Omega$

6 for R > 10 M $\Omega$

Fig. 3 Maximum dissipation ( $P_{max}$ ) as a function of the ambient temperature ( $T_{amb}$ ).

Fig. 4 Maximum permissible dissipation at  $T_{amb} = 70\text{ }^{\circ}\text{C}$  as a function of the resistance.

## TESTS AND REQUIREMENTS

Essentially all tests are carried out according to the schedule of IEC publication 115-1, category 55/155/56 (rated temperature range  $-55$  to  $+155$  °C; damp heat, long term, 56 days) and along the lines of IEC publication 68, "Recommended basic climatic and mechanical robustness testing procedure for electronic components". In the following table the tests are listed with reference to the relevant clauses of IEC publications 115-1 and 68; a short description is also given of the test procedure and requirements. In some instances deviations from the IEC recommendation were necessary for our method of specifying.

Table 4

IEC 115-1 clause	IEC 68 test method	test	procedure	requirements

### APPLICATION

Where high resistance, high stability and high reliability at high voltage are required. The resistors meet the safety requirements of IEC 65, 4th edition; NFC 92.130; BS415; VDE 0860.

### DESCRIPTION

A metal-glazed film is deposited on a high grade ceramic body; tinned electrolytic copper wires are welded to the end caps. The resistors are coated with a light blue insulating lacquer which also provides protection against environmental effects.

### MECHANICAL DATA

Fig. 1 Axial leads.

Table 1

type	$D_{\text{max}}$	$L1_{\text{max}}$	$L2_{\text{max}}$	d
VR37	3,7	9,0	10,0	0,7
VR68	6,8	16,5	19,0	0,8

The length of the body is measured by inserting the leads into holes of two identical gauge plates and moving those plates parallel to each other until the resistor body is clamped without deformation (IEC publication 294). For leads of 0,7 mm diameter, the diameter of the holes in the gauge plates is 1,0 mm; for leads of 0,8 mm diameter, the holes are 1,2 mm.

Mass (per 100) VR37: 42g; VR68: 148g

#### Mounting

The resistors are suitable for processing on automatic insertion equipment and cutting and bending machines.

#### Marking

The nominal resistance and the tolerance are marked on these resistors by four (E24 series) or five (E96 + E24) coloured bands according to IEC publication 62 "Colour code for fixed resistors". See General Section.

Yellow and grey are used instead of gold and silver, because metal particles in the lacquer could affect high-voltage properties.

### ELECTRICAL DATA

#### Standard values of rated resistance and tolerance

→ Standard values of rated resistance (nominal resistance) are taken from the E24/E96 series (tolerance  $\pm 1\%$ ) and E24 series (tolerance  $\pm 5\%$ ) within the range 220 k $\Omega$  to 33 M $\Omega$  for type VR37 and 100 k $\Omega$  to 68 M $\Omega$  for type VR68. Values up to 220 M $\Omega$  are available on request. See the table "Standard series of values in a decade" at the back of the book.

The limiting voltage for resistor element and insulation is the maximum voltage that may be supplied continuously to the resistor element or the insulation, see IEC publications 115-1 and 115-2. This voltage is 3500 V (d.c.) or 2500 V (r.m.s.) for type VR37 and 10 kV (d.c.) or 7 kV (r.m.s.) for type VR68.

→ Table 2

type	packing	quantity	resistance range	tolerance $\pm \%$	series	catalogue number 2322 followed by:

### COMPOSITION OF THE CATALOGUE NUMBER

The catalogue number in the above table is completed by inserting the resistance code: the first two figures (E24 series) resp. first three figures (E24/E96) of the resistance (in  $\Omega$ ) followed by:

4 for R = 100 k $\Omega$  to 976 k $\Omega$

5 for R = 1 M $\Omega$  to 9,76 M $\Omega$

6 for R = 10 M $\Omega$  to 68 M $\Omega$

Fig. 2 Maximum dissipation ( $P_{max}$ ) as a function of the ambient temperature ( $T_{amb}$ ).

Fig. 3 Power versus resistance value of high-voltage resistors at  $T_{amb} = 70^\circ\text{C}$ .

TESTS AND REQUIREMENTS

Essentially all tests are carried out according to the schedule of IEC publication 115-1, category 55/155/56 (rated temperature range  $-55$  to  $+155$  °C; damp heat, long term, 56 days) and along the lines of IEC publication 68, "Recommended basic climatic and mechanical robustness testing procedure for electronic components". In the following table the tests are listed with reference to the relevant clauses of IEC publications 115-1 and 68; a short description is also given of the test procedure and requirements. In some instances deviations from the IEC recommendation were necessary for our method of specifying.

Table 4

### DESCRIPTION

A homogeneous film of metal alloy is deposited on a high grade ceramic body. After a helical groove has been cut in the resistive layer, tinned connecting wires of electrolytic copper are welded to the end-caps.

The resistor has a red non-inflammable coating of a protective silicon lacquer which can withstand 500 V (r.m.s.) and is resistant against most of the commonly used cleaning solvents according to MIL-STD-202E, method 215 and IEC 68-2-45.

### COMPOSITION OF THE CATALOGUE NUMBER

\* Values 1 to 2  $\Omega$  can be delivered on request.

MECHANICAL DATA

Fig. 1 Version with straight leads, see Table 1.

Fig. 2 Version with cropped and formed leads.

Table 1

type	leads	$D_{max}$	$L1_{max}$	$L2_{max}$	d	b +0,1	h +2	$S_{max}$	P ± 3	B $\phi_{max}$

		5,2	16,7	17,9	0,8	1,3	15	3	25,4	1,2

Mass (per 100) PR37: 40 g; PR52: 92 g.

Mounting

The resistors must be mounted stress free so as to allow thermal expansion over the wide permissible temperature range. The mounting pitch of version with cropped and formed leads is 7 e for PR37 and 10 e for PR52.

Marking

Each resistor is marked with:  
 — resistance value (R for  $\Omega$ , K for k $\Omega$ )  
 — tolerance on resistance in %.

Example: 27 R ± 5%

**ELECTRICAL DATA**

**Standard values of rated resistance and tolerance**

Standard values of rated resistance (nominal resistance) are taken from the E24 series within the range 2,2 Ω to 27 kΩ (type PR37) and 2,2 Ω to 51 kΩ (type PR52). \* E24 series of values is given in the table "Standard series of values in a decade" at the back of the handbook. The tolerance on the rated resistance is ± 5%.

Climatic category (IEC 68)	40/200/56
Stability after	
load	$\Delta R/R$ max. 5%
climatic tests	$\Delta R/R$ max. 5%
short time overload	$\Delta R/R$ max. 2%

### APPLICATION

These resistors have been designed to dissipate high powers in a small volume.

### DESCRIPTION

The resistor element is wound in a single layer on a ceramic rod. Metal caps are pressed over the ends of the rod. The ends of the resistance wire and the leads are connected to the caps by welding. Tinned copper-clad iron leads with poor heat conductivity are employed permitting the use of relatively short leads to obtain stable mounting. The resistor is coated with a green silicon cement which is non-inflammable and cannot drip even at high overloads, and is resistant to most commonly used cleaning solvents, according to MIL-STD-202E, method 215 and IEC 68-2-45.

### MECHANICAL DATA

Fig. 1.

Table 1

type	$D_{\text{max}}$	$L_{\text{max}}$	d
AC03	5,5	13	0,8
AC04	5,5	17	0,6
AC05	7,5	17	0,8
AC07	7,5	25	0,8
AC10	8	44	0,8
AC15	10	51	0,8
AC20	10	67	0,8

Note: The lead length ( $28 \pm 2$  mm) only applies to untaped resistors, i.e. types AC10, AC15 and AC20.

The length of the body is measured by inserting the leads into the holes of two identical gauge plates and moving these plates parallel to each other until the resistor body is clamped without deformation (IEC publication 294). For leads of 0,6 mm diameter, the diameter of the holes is 1,0 mm; for leads of 0,8 mm diameter the holes are 1,2 mm.

**Mass (per 100)**

AC03	80 g
AC04	100 g
AC05	175 g
AC07	225 g
AC10	530 g
AC15	840 g
AC20	1090 g

**Mounting**

The resistors AC03, AC04, AC05 and AC07 are suitable for processing on cutting and bending machines. Care should be taken that the temperature rise of the resistor body does not affect nearby components or materials by conducted or convected heat. The temperature rise of the resistor body and of leads of different lengths is given as a function of the dissipation in Figs 2 and 3.

Fig. 2 Temperature rise of the resistor body as a function of the dissipation.  
— for lead length of 25 mm  
- - - for lead length of 10 mm

Fig. 9 Lead length as a function of the dissipation with the temperature rise at the end of the lead (soldering spot) as parameter, for style AC20.

### Marking

The nominal resistance (R for  $\Omega$ , K for  $k\Omega$ ), the tolerance on the resistance and the rated dissipation at  $T_{amb} = 40^\circ\text{C}$  are printed on the resistor body, e.g. 27 R 5% 4 W.

### ELECTRICAL DATA

#### Standard values of rated resistance and tolerance

Standard values of rated resistance (nominal resistance) are taken from the E24 series, tolerance  $\pm 5\%$  or  $\pm 10\%$  within the range  $0,1 \Omega$  to  $33 k\Omega$  as per Table 2. See the table "Standard series of values in a decade" at the back of the Handbook.

### COMPOSITION OF THE CATALOGUE NUMBER

The catalogue number in the above table is completed by inserting the resistance code: the first two figures of the resistance followed by:

7 for R = 0,1 to 0,82  $\Omega$

8 for R = 1 to 8,2  $\Omega$

9 for R = 10 to 91  $\Omega$

1 for R = 100 to 910  $\Omega$

2 for R = 1 to 9,1  $k\Omega$

3 for R = 10 to 33  $k\Omega$

## TESTS AND REQUIREMENTS

Essentially all tests are carried out according to the schedule of IEC publications 266 and 266A category 40/200/56 (rated temperature range  $-40$  to  $+200$  °C; damp heat, long term, 56 days) and along the lines of IEC publication 68. "Recommended basic climatic and mechanical robustness testing procedure for electronic components". In the following table the tests are listed with reference to the relevant clauses of IEC publications 266, 266A and 68; a short description is also given of the test procedure and requirements. In some instances deviations from the IEC recommendation were necessary for our method of specifying.

Table 4

IEC 266 clause	IEC 68 test method	test	procedure	requirements

## CEMENTED WIREWOUND RESISTORS

These wirewound resistors are specially designed to dissipate high powers in a small volume.

## QUICK REFERENCE DATA

Resistance range		from 0,1 $\Omega$ to 12 k $\Omega$ , E24 or E12 series
Resistance tolerance		$\pm 5\%$ or $\pm 10\%$
Maximum body temperature		350 $^{\circ}\text{C}$
Rated dissipation at $T_{\text{amb}} = 70\text{ }^{\circ}\text{C}$	ACL01	1 W
	ACL02	2 W
	ACL03	3 W
Basic specification		IEC publication 266
Climatic category (IEC 68, DIN 40 045)		40/200/56
Stability after:		
load, 1000 h		$\Delta R/R$ max. 3%
climatic tests		$\Delta R/R$ max. 5%
short time overload		$\Delta R/R$ max. 2%

## DESCRIPTION

The resistor element is wound in a single layer on a glass-fibre rod. Metal caps are pressed over the ends of the rod. The ends of the resistance wire and the leads are connected to the caps by welding. Tinned copper-clad iron leads with poor heat conductivity are employed permitting the use of relatively short leads to obtain stable mounting. The resistor is coated with a green silicon cement which is non-flammable and cannot drip even at high overloads.

(1) If taped: 35 mm.

Fig. 1 Standard version with straight leads.

Fig. 2 Special version with cropped and formed leads, available on special request.

Table 1

type	$L_{max}$	G	h
ACL01	16	20	8 or 15
ACL02	24	27,5	8 or 15
ACL03	34	—	8 or 15

Mass (per 100 pieces)

ACL01	66 g
ACL02	79 g
ACL03	96 g

**Mounting**

The resistors must be mounted in such a way that:

- no stress is exerted on the leads so as to allow thermal expansion over the wide permissible temperature range.
- nearby components and materials are not affected by the dissipated heat.
- the temperature at the soldering spots of the leads does not reach the melting point of the solder.

The temperature rise of the resistor body and of the leads at various distances from the body is given as a function of the dissipation for the different resistor styles in Figs 3 to 5.

**Marking**

Each resistor is marked with:

- resistance value (R for  $\Omega$ , K for  $k\Omega$ )  
e.g. 27  $\Omega$  = 27R  
15  $k\Omega$  = 15K
- tolerance on resistance in %
- rated dissipation at  $T_{amb} = 70\text{ }^{\circ}\text{C}$

Example: 10R 5%  
1W

**ELECTRICAL DATA**

WIREWOUND - WW

## ENAMELLED WIREWOUND RESISTORS

### QUICK REFERENCE DATA

Resistance ranges		4,7 $\Omega$ to 100 k $\Omega$ , E24 or E12 series
Resistance tolerance		$\pm 5\%$ or $\pm 10\%$
Max. body temperature (hot spot)		400 $^{\circ}\text{C}$
Rated dissipation at $T_{\text{amb}} = 70\text{ }^{\circ}\text{C}$	WR0617E	4 W
	WR0825E	7 W
	WR0842E	11 W
	WR0865E	17 W
Basic specification		IEC publication 266, type 2
Climatic category (IEC 68)		55/200/56
Stability after:		
1000 h max. load		$\Delta R/R$ max. 5%
climatic tests		$\Delta R/R$ max. 1%
dip-soldering test		$\Delta R/R$ max. 0,5%
short time overload		$\Delta R/R$ max. 2%

### APPLICATION

As power resistors in electrical and electronic circuitry.

### DESCRIPTION

These resistors have a single layer of resistance wire wound on a ceramic body. Leads of solder-coated copper-clad wire are secured to caps which are force-fitted on to the ends of the ceramic body. The resistor is coated with brown enamel.

### MECHANICAL DATA

Fig. 1.

Table 1

type	$D_{\text{max}}$	$L1_{\text{max}}$	$L2_{\text{max}}$	$a_{\text{max}}$
WR0617E	6	19	25	3
WR0825E	8	27	33	3
WR0842E	8	44	50	3
WR0865E	8	67	73	3

#### Note

The lead length ( $28 \pm 2$  mm)  
only applies to untaped resistors,  
i.e. types WR0842E and WR0865E.

The length of the resistor body is measured by inserting the leads into the holes of two identical gauge plates and by moving these plates parallel to each other until the resistor body is clamped without deformation (see IEC publication 294). The diameter of the holes in the gauge plate is 1,0 mm.

#### Mass

WR0617E  
WR0825E  
WR0842E  
WR0865E

#### Mounting

The resistors must be mounted in such a way that:

- no stress is exerted on the leads so as to allow thermal expansion over the wide temperature range.
- nearby components and materials are not affected by the dissipated heat.

#### Marking

Each resistor is marked with:

- resistance value (R for  $\Omega$ , K for  $k\Omega$ )  
e.g. 27  $\Omega$  = 27R  
27  $k\Omega$  = 27K
- tolerance on resistance in %
- rated dissipation at  $T_{amb} = 70\text{ }^{\circ}\text{C}$

Example: 27R 10%  
4W

Climatic category (IEC 68)

55/200/56

\* See the table "Standard series of values in a decade" at the back of this book.

**COMPOSITION OF THE CATALOGUE NUMBER**

The catalogue number in Table 2 is completed by inserting the resistance code: the first two significant figures of the resistance value (in  $\Omega$ ) followed by:

- 8 for R of 4,7 to 9,1  $\Omega$
- 9 for R of 10 to 91  $\Omega$
- 1 for R of 100 to 910  $\Omega$
- 2 for R of 1 to 9,1 k $\Omega$
- 3 for R of 10 to 91 k $\Omega$
- 4 for R of 100 k $\Omega$

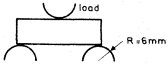

Fig. 2 Temperature rise ( $\Delta T$ ) of the resistor body as a function of the dissipation. Distance between cap and solder joint is 10 mm.

### TESTS AND REQUIREMENTS

Essentially all tests are carried out according to the schedule of IEC publications 266 and 266A, category 55/200/56 (rated temperature range  $-55\text{ }^{\circ}\text{C}$  to  $+200\text{ }^{\circ}\text{C}$ ; damp heat, long term, 56 days) and along the lines of IEC publication 68, "Recommended basic climatic and mechanical robustness testing procedure for electronic components". In the following table the tests are listed with reference to the relevant clauses of IEC publications 266, 266A and 68; a short description is also given of the test procedure and requirements. In some instances deviations from the IEC recommendation were necessary for our method of specifying.

Table 3

IEC 266 clause	IEC 68 test method	test	procedure	requirements
14		Robustness of resistor body	 load 200 $\pm$ 10N	no visible damage $\Delta R \leq 0,5\%$ or $0,05\ \Omega$

## RECTANGULAR WIREWOUND RESISTORS

### QUICK REFERENCE DATA

Resistance range	0,15 to 22 kΩ, E24/E12 series	
Resistance tolerance	± 5% or ± 10%	
Max. permissible body temperature (hot spot)	350 °C	
Rated dissipation of T <sub>amb</sub> = 70 °C	EH04: 4 W; EH05: 5 W; EH07: 7 W; EH09: 9 W; EH17: 17 W	
Basic specification	IEC 266	
Climatic category (IEC 68)	40/200/56	
Stability after		
load	ΔR/R max.	5%
climatic tests	ΔR/R max.	3%
short time overload	ΔR/R max.	2%

### APPLICATION

The resistors are for high dissipation in a small volume. The rectangular shape facilitates mounting against a flat surface.

### DESCRIPTION

The resistor element is wound in a single layer on a glass fibre rod. Metal caps are pressed over the ends of rod and wire. Tinned copper leads are welded to the caps. The resistor is mounted in a rectangular, sandfilled ceramic case. The ends of the body are impregnated with a protective silicon resin. The resistors are resistant against aggressive solvents.

### MECHANICAL DATA

Fig. 1.

Table 1

type	D <sub>max</sub>	L <sub>max</sub>
EH04	7,2	20
EH05	7,2	26
EH07	7,2	36
EH09	7,2	46
EH17	10,7	62

**Mass (per 100)**

EH04: 295 g; EH05: 319 g; EH07: 400 g

EH09: 510 g; EH17: 1400 g

**Mounting**

The resistors must be mounted in such a way that:

- no stress is exerted on the leads so as to allow thermal expansion over the wide permissible temperature range.
- nearby components and materials are not affected by the dissipated heat.
- the temperature at the soldering spots of the leads does not reach the melting point of the solder.

The temperature rise of the resistor body and of leads of different lengths is given as a function of the dissipation in Fig. 2.

Fig. 2 Hot spot temperature rise ( $\Delta T$ ) as a function of the dissipation ( $P$ ) at two lead lengths.

————— for lead length of 22 mm

- - - - - for lead length of 28 mm

**Marking**

The nominal resistance (R for  $\Omega$ , k for k $\Omega$ ), the tolerance on the resistance and the rated dissipation at  $T_{amb} = 70^\circ\text{C}$  are printed on the resistor body, e.g. 27R 5% 9 W.

**ELECTRICAL DATA**

**Standard values of rated resistance**

Standard values of rated resistance (nominal resistance) are taken from the E24 series, tolerance  $\pm 5\%$  and E12 series, tolerance  $\pm 10\%$ , within the range of 0,1  $\Omega$  to 22 k $\Omega$  as per Table 2. See the table "Standard series of values in a decade" at the back of the Handbook.

**Table 2**

CHIP - RC

## RESISTOR CHIP

## QUICK REFERENCE DATA

Resistance range	1 $\Omega$ to 10 M $\Omega$ and jumper (0 $\Omega$ ) E24, E12 and E6 series
Resistance tolerance	$\pm 5, \pm 10, \pm 20\%$
Temperature coefficient	$< \pm 200 \cdot 10^{-6}/K$
Abs. max. dissipation at $T_{amb} = 70\text{ }^{\circ}C$	0,125 W
Maximum permissible voltage	200 V (r.m.s.)
Climatic category (IEC 68)	55/155/56
Basic specification	IEC 115-1
Stability after:	
load, 1000 h at $T_{amb} = 70\text{ }^{\circ}C$	$\Delta R/R$ max. 1,5% + 0,2 $\Omega$
climatic tests	$\Delta R/R$ max. 1,5% + 0,2 $\Omega$
soldering	$\Delta R/R$ max. 1% + 0,05 $\Omega$
short time overload, max. 400 V	$\Delta R/R$ max. 2% + 0,2 $\Omega$

## APPLICATION

Resistor chips are used in a wide scale of equipment. Important considerations for using chip resistors are:

- decrease of size and mass of equipment
- reduction of assembly costs of equipment
- specific electrical requirements (such as h.f. characteristics).

The main application areas for resistor chips are:

TV (tuner), radio (hi-fi slim-line and portable), radio recorders, watches, video cameras, shavers, pocket calculators, instruments, telecommunication, medical equipment, military equipment and automotive industry.

## DESCRIPTION

On a high grade ceramic body (aluminium oxide) a metal glaze layer is screened. Depending on the composition of the metal glaze different resistance values can be obtained. On both ends a contact is made in such a way that optimum solderability is guaranteed. This is achieved by applying three layers. The resistive layer is covered with a protective coat.

## MECHANICAL DATA

## Outlines

Fig. 1.

→ Mass (per 100): 1,0 g

**Mounting**

This resistor chip is most suitable to be handled by automatic chip placement systems, due to its rectangular shape and the small tolerances on the dimensions. Chip placement can be done on ceramic substrates and printed circuit boards. The electrical connection to the circuit can be made by wave-soldering or reflow soldering. The electrodes guarantee a reliable contact. The protective coatings enable "face-down" mounting. Thanks to its robust construction the resistor chip can be immersed completely in a solder bath of 255 °C for one minute. By doing so it is possible to mount chip resistors on one side of a printed circuit board and other discrete components the other side.

**Marking**

The chips will not be marked. The marking is done on the packing. The marking includes resistance value, tolerance, code number, style, quantity, production period and an origin source code.

**Soldering**

Limiting conditions min. 230 °C, 2 s  
max. 250 °C, 60 s

Maximum permitted solder conditions:

Fig. 2 Reflow soldering.

Fig. 3 Wave soldering. The resistors may be soldered twice according to this method if necessary.

7289653

**ELECTRICAL DATA**

Standard values of resistance and tolerance

Standard values of nominal resistance are taken from the E6 series for resistors with a tolerance of  $\pm 20\%$ ; from the E12 series for resistors with a tolerance of  $\pm 10\%$  and from the E24 series for resistors with a tolerance of  $\pm 5\%$  and  $\pm 10\%$ . The values of these series are given at the back of the Data Handbook and are according to IEC publication 63.

The limiting voltage (r.m.s.) for element and insulation is the maximum voltage that may be applied continuously to the resistor element or the insulation. See IEC publications 115-1 and 115-2. This voltage is 200 V.

The temperature coefficient is  $< \pm 200 \cdot 10^{-6} / K$ .

Table 1

resistance range	tol. $\pm \%$	series	catalogue number 2322 followed by				
			cardboard tape		blister tape		bulk
			4000	10 000	4000	10 000	1000
10 $\Omega$ to 1 M $\Omega$	5	E24	711 20 ...	711 50 ...	712 30 ...	712 70 ...	715 50 ...
1 $\Omega$ to 10 $\Omega$	10	E24	711 10 ...	—	712 40 ...	712 80 ...	715 40 ...
10 $\Omega$ to 1 M $\Omega$	10	E12					
1 M $\Omega$ to 10 M $\Omega$	10	E24					
1 $\Omega$ to 10 M $\Omega$	20	E6	711 00 ...	—	—	—	715 30 ...

The jumper has a maximum resistance  $R_{max} = 50 \text{ m}\Omega$  at a rated current  $I_r = 2 \text{ A}$ . They are supplied 4000 on reel, catalogue number 2322 711 90001 or 1000 per bag, catalogue number 2322 715 90004.

**COMPOSITION OF THE CATALOGUE NUMBER**

In the above-mentioned catalogue number, replace the first two dots by the first two digits of the resistance value. Replace the third dot by a figure according to the following table:

1 to 9,1 $\Omega$ : 8	10 to 91 k $\Omega$ : 3
10 to 91 $\Omega$ : 9	100 to 910 k $\Omega$ : 4
100 to 910 $\Omega$ : 1	1 to 9,1 M $\Omega$ : 5
1 to 9,1 k $\Omega$ : 2	10 M $\Omega$ : 6

## TESTS AND REQUIREMENTS

Essentially all tests are carried out according to the schedule of IEC publication 115-1. This means: rated temperature range  $-55$  to  $+155$  °C; damp heat (long term) 56 days (see IEC publication 115-2 clause 4.1). The tests are carried out along the lines of IEC publication 68, "Recommended basic climatic and mechanical robustness testing procedure for electronic components".

In Table 2 the tests and requirements are listed with reference to the relevant clauses of IEC publications 115-1 and 68; a short description of the test procedure is also given. In some instances deviations from the IEC recommendations were necessary for our method of specifying.

Table 2

IEC 115-1 clause	IEC 68 test method	test	procedure	requirements
19	T	soldering	unmounted chips completely immersed for $4 \pm 1$ s in a solder bath of $230 \pm 10$ °C	good tinning no damage $\Delta R$ max. $1\% + 0,05 \Omega$
20	Na	Rapid change of temp.	$\frac{1}{2}$ h $-55$ °C/ $\frac{1}{2}$ h $+155$ °C 5 cycles	$\Delta R$ max. 1,5% $+ 0,2 \Omega$
22	Fc	Vibration	frequency: 10-500 Hz; displacement 1,5 mm or acceleration 10g, three directions; total 6 h	no damage $\Delta R$ max. 0,5% $+ 0,05 \Omega$
21	Eb	Bump	3 x 1500 bumps in three directions; 40g	no damage, $\Delta R$ max. 0,5% $+ 0,05 \Omega$
23 23.2 23.3	Ba D	Climatic sequence Dry heat Damp heat (accel.) 1st cycle	16 h; 155 °C  24 h; 55 °C; 95-100% R.H.	
23.4 23.5	Aa M	Cold Low air pressure	2 h; $-55$ °C 1 h; 8,5 kPa; 15-35 °C
