Vidicon and Newvicon camera tubes
and Deflection units

Elcoma – Philips Electronic Components and Materials Division – embraces a world-wide group of companies operating under the following names:

IBRAPE

PHILIPS

MBLE

Miniwatt

signetics

Mullard

VALVO

Elcoma offers you a technological partnership in developing your systems to the full. A partnership to which we can bring

- world-wide production and marketing
- know-how
- systems approach
- continuity
- broad product line
- fundamental research
- leading technologies
- applications support
- quality

DATA HANDBOOK SYSTEM

Our Data Handbook System comprises more than 60 books with specifications on electronic components, subassemblies and materials. It is made up of four series of handbooks:

ELECTRON TUBES	BLUE
SEMICONDUCTORS	RED
INTEGRATED CIRCUITS	PURPLE
COMPONENTS AND MATERIALS	GREEN

The contents of each series are listed on pages iv to viii.

The data handbooks contain all pertinent data available at the time of publication, and each is revised and reissued periodically.

When ratings or specifications differ from those published in the preceding edition they are indicated with arrows in the page margin. Where application information is given it is advisory and does not form part of the product specification.

Condensed data on the preferred products of Philips Electronic Components and Materials Division is given in our Preferred Type Range catalogue (issued annually).

Information on current Data Handbooks and on how to obtain a subscription for future issues is available from any of the Organizations listed on the back cover.

Product specialists are at your service and enquiries will be answered promptly.

ELECTRON TUBES (BLUE SERIES)

The blue series of data handbooks comprises:

- T1** Tubes for r.f. heating
- T2a** Transmitting tubes for communications, glass types
- T2b** Transmitting tubes for communications, ceramic types
- T3** Klystrons
- T4** Magnetrons for microwave heating
- T5** Cathode-ray tubes
Instrument tubes, monitor and display tubes, C.R. tubes for special applications
- T6** Geiger-Müller tubes
- T7** Gas-filled tubes (will not be reprinted)
- T8** Picture tubes and components
Colour TV picture tubes, black and white TV picture tubes, colour monitor tubes for data graphic display, monochrome monitor tubes for data graphic display, components for colour television, components for black and white television and monochrome data graphic display
- T9** Photo and electron multipliers
- T10** Plumbicon camera tubes and accessories
- T11** Microwave semiconductors and components
- T12** Vidicon and Newvicon camera tubes
- T13** Image intensifiers
- T14** Infrared detectors
- T15** Dry reed switches
- T16** Monochrome tubes and deflection units
Black and white TV picture tubes, monochrome data graphic display tubes, deflection units

} Data collations on these subjects are available now.
Data Handbooks will be published in 1985.

SEMICONDUCTORS (RED SERIES)

The red series of data handbooks comprises:

- S1 Diodes**
Small-signal germanium diodes, small-signal silicon diodes, voltage regulator diodes (< 1,5 W), voltage reference diodes, tuner diodes, rectifier diodes
- S2a Power diodes**
- S2b Thyristors and triacs**
- S3 Small-signal transistors**
- S4a Low-frequency power transistors and hybrid modules**
- S4b High-voltage and switching power transistors**
- S5 Field-effect transistors**
- S6 R.F. power transistors and modules**
- S7 Surface mounted semiconductors**
- S8 Devices for optoelectronics**
Photosensitive diodes and transistors, light-emitting diodes, displays, photocouplers, infrared sensitive devices, photoconductive devices.
- S9 Power MOS transistors**
- S10 Wideband transistors and wideband hybrid IC modules**
- S11 Microwave semiconductors** (to be published in this series in 1985)
At present available in Handbook T11
- S12 Surface acoustic wave devices**

INTEGRATED CIRCUITS (PURPLE SERIES)

The purple series of data handbooks comprises:

Superseded by:

EXISTING SERIES

IC1	Bipolar ICs for radio and audio equipment	
IC2	Bipolar ICs for video equipment	IC02N
IC3	ICs for digital systems in radio, audio and video equipment	
IC4	Digital integrated circuits CMOS HE4000B family	
IC5	Digital integrated circuits – ECL ECL10 000 (GX family), ECL100 000 (HX family), dedicated designs	IC08N
IC6	Professional analogue integrated circuits	
IC7	Signetics bipolar memories	
IC8	Signetics analogue circuits	IC11N
IC9	Signetics TTL logic	IC09N and IC15N
IC10	Signetics Integrated Fuse Logic (IFL)	IC13N
IC11	Microprocessors, microcomputers and peripheral circuitry	

NEW SERIES

IC01N	Radio, audio and associated systems Bipolar, MOS	
IC02N	Video and associated systems Bipolar, MOS	(published 1985)
IC03N	Telephony equipment Bipolar, MOS	
IC04N	HE4000B logic family CMOS	
IC05N	HE4000B logic family uncased integrated circuits CMOS	(published 1984)
IC06N	High-speed CMOS; PC54/74HC/HCT/HCU Logic family	(published 1985)
IC07N	PC54/74HC/HCU/HCT uncased integrated circuits HCMOS	
IC08N	10K and 100K logic family ECL	(published 1984)
IC09N	Logic series TTL	(published 1984)
IC10N	Memories MOS, TTL, ECL	
IC11N	Linear LSI	(published 1985)
IC12N	Semi-custom gate arrays & cell libraries ISL, ECL, CMOS	
IC13N	Semi-custom Integrated Fuse Logic	(published 1985)
IC14N	Microprocessors, microcontrollers & peripherals Bipolar, MOS	
IC15N	Logic series FAST TTL	(published 1984)

Note

Books available in the new series are shown with their date of publication.

COMPONENTS AND MATERIALS (GREEN SERIES)

The green series of data handbooks comprises:

- C1 Programmable controller modules**
PLC modules, PC20 modules
- C2 Television tuners, coaxial aerial input assemblies, surface acoustic wave filters**
- C3 Loudspeakers**
- C4 Ferroxcube potcores, square cores and cross cores**
- C5 Ferroxcube for power, audio/video and accelerators**
- C6 Synchronous motors and gearboxes**
- C7 Variable capacitors**
- C8 Variable mains transformers**
- C9 Piezoelectric quartz devices**
- C10 Connectors**
- C11 Non-linear resistors**
Voltage dependent resistors (VDR), light dependent resistors (LDR), negative temperature coefficient thermistors (NTC), positive temperature coefficient thermistors (PTC)
- C12 Potentiometers, encoders and switches**
- C13 Fixed resistors**
- C14 Electrolytic and solid capacitors**
- C15 Ceramic capacitors**
- C16 Permanent magnet materials**
- C17 Stepping motors and associated electronics**
- C18 Direct current motors**
- C19 Piezoelectric ceramics**
- C20 Wire-wound components for TVs and monitors**
- C21 Assemblies for industrial use**
HNIL FZ/30 series, NORbits 60-, 61-, 90-series, input devices
- C22 Film capacitors**

Abbreviations used in the tables

I = integral mesh	HI = for high-quality black and white and colour cameras in sub-broadcast, medical, educational and industrial applications	MS = in cameras for military, surveillance, and scientific applications
S = separate mesh	Ind = for black and white and colour cameras in non-critical industrial applications	GP = general purpose tube for low-cost cameras
A = standard layer	Med = in medical or industrial X-ray equipment, coupled with an image intensifier	
B = layer with peak response at approx. 475 nm		
Br = for black and white and colour broadcast cameras, telecine		

GENERAL OPERATIONAL NOTES

1 PROPERTIES OF THE VIDICON PHOTOCONDUCTIVE LAYER

The vidicon photoconductive layer consists mainly of antimony trisulphide (Sb_2S_3). It is built up of a number (2 to 4) of sublayers. Its properties are dependent on the antimony-sulphur ratios and the porosities of the sublayers.

In the vidicons, described in this Data Handbook, two layer variants are found, denominated layer A and layer B. The standard vidicons intended e.g. for industrial and educational applications contain layer A., the vidicons for medical applications in conjunction with X-ray image intensifiers contain layer B.

1.1 Sensitivity

The light transfer characteristic of a vidicon is not linear and depends strongly on the target voltage. A single value for the sensitivity can therefore not be given, but a series of transfer curves is required with e.g. the dark current as a parameter.

For a 1-inch size vidicon with layer A typical light transfer characteristics for three dark current settings are given in Fig. 1.

Fig. 1 Typical light transfer characteristics for 1-inch size vidicons with layer A.

(Note: A comparison can be made with Plumbicon tubes: at an input light level on the layer of approx. 8 lx the signal current in nA is equal to the sensitivity in $\mu A/lumen$.)

Vidicons with type B layer are intended mainly for use in X-ray equipment, coupled to an X-ray image intensifier equipped with a P11 or P20 output phosphor. Detailed information on the light transfer characteristics in such situations is found in the data sheets for these tubes: the XQ1280 with plain glass faceplate and the XQ1285 with fibre-optic faceplate.

1.2 Spectral response

Typical relative spectral responses of the layers type A and type B are found in Fig. 2.

Fig. 2 Typical spectral response curves.

The response has been measured at constant signal output current.

1.3 Dark current

The influence of temperature on dark current for layer type A is shown in Fig. 3. Roughly, the dark current doubles with every 7 to 8 °C temperature increase (this applies also to layer type B).

1.4 Resolution

The photoconductive layer in a vidicon being very thin (2 to 3 μm), gun construction and operating conditions are the determining factors for resolution. As an example, Fig. shows typical modulation transfer characteristics for the 1-inch tube XQ1280 in the low voltage mode and in the high voltage mode (scanning are 9,6 mm x 12,8 mm).

1.5 Lag

Lag is dependent on signal current, dark current and temperature. At low signal currents discharge lag dominates whereas at high signal currents photoconductive lag is preponderant. A typical residual signal level, 200 ms after cessation of an illumination giving a signal current of 200 nA, for the 1-inch vidicon type XQ1240 with layer type A, at a dark current of 20 nA is 8% (16 nA).

2 EQUIPMENT DESIGN AND OPERATING CONDITIONS

(See also General Operational Notes Plumbicon Camera tubes.)

The signal electrode voltage should be limited to such a value that the peak dark current does not exceed 250 nA for tubes with layer A and 100 nA for tubes with layer B.

This is of particular importance for the design and adjustment of vidicon cameras with automatically controlled sensitivity (automatic control of the signal-electrode voltage).

Operation of vidicons at excess dark current may result in damage to the photoconductive target and hence shorten the tube life.

The temperature of the faceplate should never exceed 80 °C, neither during operation nor storage.

Operation at a faceplate temperature of 25 to 30 °C is recommended.

The temperature of the faceplate is determined by the heating effects of the environment, the associated components, the incident illumination and, to a minor extent, by the tube itself.

Under difficult environmental conditions a flow of cooling air directed at the faceplate is recommended. Under conditions of high heat irradiation, an infrared filter between object and camera lens should be used.

A cathode heating time of at least a minute is advised before drawing cathode current. During prolonged idle periods, (days or weeks) gas pressure may very slowly build up in the tube due to residual gas molecules emerging from the electrodes and the glass wall. There is then a slight risk that the pressure is sufficiently high to cause cathode damage by ion bombardment if cathode current is drawn immediately after switching on the camera.

7275747

Fig. 3 Temperature dependency of dark current.

7275746

Fig. 4 Typical modulation transfer characteristics for XQ1280.
 Curve 1: $V_{g3} = 375 \text{ V}$, $V_{g4} = 600 \text{ V}$; curve 2: $V_{g3} = 600 \text{ V}$, $V_{g4} = 960 \text{ V}$.

CAMERA TUBES

Vidicon television camera tubes with low heater consumption, integral mesh construction, magnetic focusing, magnetic deflection, short length (130 mm, 5 in), and 25,9 mm (1 in) diameter.

QUICK REFERENCE DATA

Integral mesh	
Focusing	magnetic
Deflection	magnetic
Diameter	25,9 mm (1 in)
Length	130 mm (5 in)
Heater	6,3 V, 95 mA
Limiting resolution	600 TV lines

The electrical and mechanical properties of the two types are essentially identical, the main difference being found in the degree of freedom from blemishes of the photoconductive layers.

XQ1031 — intended for use in industrial and broadcast applications in which a high standard of performance is required.

XQ1032 — general purpose tube for less critical industrial applications, experiments, amateur use etc.

OPTICAL

Diagonal of quality rectangle on photoconductive layer (aspect ratio 3 : 4) 16 mm

Orientation of image on photoconductive layer:

The direction of the horizontal scan should be essentially parallel to the plane passing through the longitudinal tube axis and the short index pin.

Photoconductive layer	type A
Spectral response, max. response at	approx. 550 nm
Faceplate thickness	2,5 mm
refractive index	1,487

HEATING

Indirect by a.c. or d.c.; parallel or series supply

Heater voltage V_f 6,3 V \pm 10%

Heater current at $V_f = 6,3$ V I_f 95 mA

When the tube is used in a series heater chain, the heater voltage must not exceed 9,5 V r.m.s. when the supply is switched on.

CAPACITANCES

Signal electrode to all

$$C_{as} \approx 4,6 \text{ pF}$$

This capacitance, which effectively is the output impedance of the tube, increases when the tube is inserted into the deflection and focusing coil unit.

MECHANICAL DATA

Dimensions in mm

Base: JEDEC no. E8-11

Mounting position: any

Net mass: $\approx 57 \text{ g}$

ACCESSORIES

Socket	type 56098 or equivalent
Deflection and focusing coil unit	AT1102/01, KV9G or equivalent

DEFLECTION magnetic**FOCUSING** magnetic**LIMITING VALUES**

(Absolute maximum rating system) for scanned area of 9,6 mm x 12,8 mm (3/8 in x 1/2 in)

"Full-size scanning", i.e. scanning of a 9,6 mm x 12,8 mm area of the photoconductive layer should always be applied. Underscanning, i.e. scanning of an area less than 9,6 mm x 12,8 mm, may cause permanent damage to the specified full-size area.

Signal-electrode voltage	V_{as}	max.	100 V
Grid 4 voltage and grid 3 voltage	$V_{g4, g3}$	max.	750 V
Grid 2 voltage	V_{g2}	max.	750 V
Grid 1 voltage, negative	$-V_{g1}$	max.	300 V
positive	V_{g1}	max.	0 V
Cathode-to-heater voltage, peak positive	V_{kfp}	max.	125 V
peak negative	$-V_{kfp}$	max.	10 V
Dark current, peak	I_{darkp}	max.	250 nA
Output current, peak	I_{asp}	max.	550 nA *
Faceplate illumination	E	max.	10 000 lx
Faceplate temperature, storage and operation	T	max.	70 °C **
Cathode heating time before drawing cathode current	t_h	min.	1 min

* Video amplifiers should be capable of handling signal-electrode currents of this magnitude without overloading the amplifier or distorting the picture.

** Under difficult environmental conditions a flow of cooling air directed at the faceplate is recommended. When televising flames and furnaces appropriate infrared absorbing filters should be used.

OPERATING CONDITIONS AND PERFORMANCE

notes

For a scanned area of 9,6 mm x 12,8 mm and a faceplate temperature of 25 to 35 °C.

CONDITIONS

Grid 4 and grid 3 (beam focus electrode) voltage	$V_{g4,g3}$	250 to 300 V	1
Grid 2 (accelerator) voltage	V_{g2}	300 V	
Grid 1 voltage for picture cut-off (no blanking applied)	V_{g1}	-100 to -45 V	
Blanking voltage, peak-to-peak			
when applied to grid 1		75 V	
when applied to the cathode		20 V	
Flux density at centre of focusing coil		4,0 mT	
Flux density of adjustable alignment coils		0 to 0,4 mT	

PERFORMANCE

	min.	typ.	max.	
Signal electrode voltage for dark current of 20 nA	V_{as} 10	30	V	
Signal current faceplate illumination 10 lx c.t. 2856 K, dark current 20 nA	I_s 150	240	nA	
Decay: residual signal current 60 ms after cessation of the illumination (c.t. 2856 K, initial signal current 200 nA, dark current 20 nA)		21	%	
Limiting resolution, at picture centre	500	600	TV lines	2
at picture corners	350	450	TV lines	2
Average γ of transfer characteristic for signal currents between 20 and 200 nA	0,55	0,74	0,85	
Spurious signals (spot and blemishes)				3

Notes see next page.

NOTES

- Resolution decreases with decreasing grid 3 and 4 voltages. In general grids 3 and 4 should be operated above 250 V.
- On EIA resolution test chart, faceplate illumination adjusted for peak signal current of 200 nA and dark current of 20 nA.

3. Conditions:

The camera focused on a uniformly illuminated two-zone test pattern, the diameter of the centre zone (1) being equal to the raster height. Zone (2) being defined as the remainder of the scanned area. Signal electrode voltage adjusted for a dark current of 20 nA, illumination on target (c.t. = 2856 K) adjusted to provide a signal current of 200 nA. Beam current adjusted for correct stabilization.

Scanning amplitudes of the monitor adjusted to obtain a raster with an aspect ratio of 3 : 4.

Monitor set-up and contrast control adjusted for faint raster when lens of camera is capped, and for non-blooming bright raster when lens of camera is uncapped.

Under the above conditions the number and size of the spots visible in the monitor picture will not exceed the limits stated below. Both black and white spots must be counted. Only white and black spots with contrasts $\geq 50\%$ and $\geq 100\%$ respectively (of peak white signal) are taken into account.

XQ1031

Spot size in % of raster height	Maximum number of spots	
	zone 1	zone 2
> 0,8	none	none
$\leq 0,8$ to 0,6	none	none
$\leq 0,6$ to 0,2	1	2
$\leq 0,2$	*	*
total (max.)	2	

XQ1032

Spot size in % of raster height	Maximum number of spots	
	zone 1	zone 2
> 0,8	none	none
$\leq 0,8$ to 0,6	none	1
$\leq 0,6$ to 0,2	2	3
$\leq 0,2$	*	*
total (max.)	4	

* Do not count spots of this size unless concentration causes a smudgy appearance.

- Minimum separation between any 2 spots greater than 0,4% of raster height is limited to a distance equivalent to 3% of raster height.
- Tubes are rejected for smudge, lines, streaks, mottled, grainy, or uneven background having contrasts $> 50\%$.

CAMERA TUBES

Vidicon television camera tubes with low heater consumption, separate mesh construction, magnetic focusing, magnetic deflection and 25,9 mm (1 in) diameter intended for use in black-and-white and colour television cameras in industrial, medical and broadcast applications.

QUICK REFERENCE DATA

Separate mesh	
Focusing	magnetic
Deflection	magnetic
Diameter	25,9 mm (1 in)
Length	159 mm (6¼ in)
Heater	6,3 V, 95 mA
Limiting resolution	800 TV lines

The electrical and mechanical properties of the two types are essentially identical, the differences being found in the degree of freedom from blemishes of the photoconductive layers, in the sensitivity and the signal electrode voltage range.

XQ1240 — intended for use in industrial, medical and broadcast applications in which a high standard of performance is required.

XQ1241 — general purpose tube for less critical industrial applications, experiments, amateur use etc.

OPTICAL

Diagonal of quality rectangle on photoconductive layer
(aspect ratio 3 : 4) 16 mm

Orientation of image on photoconductive layer:

The direction of the horizontal scan should be essentially parallel to the plane passing through the short index pin and the longitudinal axis of the tube.

Photoconductive layer	type A
Spectral response, max. response at	approx. 550 nm
Faceplate thickness	2,5 mm
refractive index	1,487

HEATING

Indirect by a.c. or d.c.; parallel or series supply

Heater voltage	V_f	6,3 V \pm 10%
Heater current at $V_f = 6,3$ V	I_f	95 mA

When the tube is used in a series heater chain, the heater voltage must not exceed 9,5 V r.m.s. when the supply is switched on.

XQ1240
XQ1241

CAPACITANCES

Spurious signals (spots and blemishes)					4

Notes see next page.

NOTES

1. Grid 4 voltage must always be higher than grid 3 voltage. The recommended ratio of grid 4 to grid 3 voltage, for best geometry and most uniform signal output depends upon the type of coil used and will be 5 : 3 for the recommended types (see "Accessories").
2. Resolution decreases with decreasing grid 3 voltage. In general grid 3 should be operated above 250 V.
3. On EIA resolution test chart, faceplate illumination adjusted for peak signal current of 200 nA and dark current of 20 nA.
4. Conditions:

The camera focused on a uniformly illuminated two-zone test pattern, the diameter of the centre zone (1) being equal to the raster height. Zone (2) being defined as the remainder of the scanned area. Signal electrode voltage adjusted for a dark current of 20 nA, illumination on the target (c.t. = 2856 K) adjusted to provide a signal current of 200 nA. Beam current adjusted for correct stabilization.

Scanning amplitudes of the monitor adjusted to obtain a raster with an aspect ratio of 3 : 4.

Monitor set-up and contrast control adjusted for faint raster when lens of camera is capped, and for non-blooming bright raster when lens of camera is uncapped.

Black spots having a contrast $\geq 100\%$ ($\geq 10\%$ for XQ1240) and white spots having a contrast $\geq 50\%$ of peak white signal ($\geq 10\%$ for XQ1240) are fully counted.

Under the above conditions the number and size of the spots visible in the monitor picture will not exceed the limits stated below.

XQ1240

Spot size in % of raster height	Maximum number of spots	
	zone 1	zone 2
> 0,8	none	none
$\leq 0,8$ to 0,6	none	none
$\leq 0,6$ to 0,2	1	2
$\leq 0,2$	*	*
total (max.)	2	

XQ1241

Spot size in % of raster height	Maximum number of spots	
	zone 1	zone 2
> 0,8	none	none
$\leq 0,8$ to 0,6	none	1
$\leq 0,6$ to 0,2	2	3
$\leq 0,2$	*	*
total (max.)	4	

- * Do not count spots of this size unless concentration causes a smudgy appearance.
- a) Minimum separation between any two spots greater than 0,4% of raster height is limited to a distance equivalent to 3% of raster height.
 - b) Tubes are rejected for smudge, lines, streaks, mottled, grainy or uneven background having contrast ratios in excess of 10% (XQ1240) and 50% (XQ1241).

CAMERA TUBE

Small size vidicon television camera tube with low heater consumption, integral mesh construction, magnetic focusing and magnetic deflection. Overall length 108 mm (4 1/4 in) and diameter 17,7 mm (2/3 in).

The XQ1270 is intended for use in ultra compact TV cameras for industrial and consumer applications.

QUICK REFERENCE DATA

Integral mesh	
Focusing	magnetic
Deflection	magnetic
Diameter	17,7 mm
Length	max. 108 mm
Heater	6,3 V; 110 mA
Limiting resolution	500 TV lines

OPTICAL

Diagonal of quality rectangle on photoconductive layer (aspect ratio 3 : 4)	max. 11 mm
--------------------------------------------------------------------------------	------------

Orientation of image on photoconductive layer:

The direction of the horizontal scan should be essentially parallel to the plane passing through pin 4 and the longitudinal axis of the tube.

Photoconductive layer	type A
Spectral response, max. response at	approx. 550 nm
Faceplate	
thickness	1,5 mm
refractive index	1,487

HEATING

Indirect by a.c. or d.c.; parallel or series supply

Heater voltage	V_f	6,3 V \pm 10%
Heater current at $V_f = 6,3$ V	I_f	110 mA

When the tube is used in a series heater chain, the heater voltage must not exceed an r.m.s. value of 9,5 V when the supply is switched on.

CAPACITANCES

Signal electrode to all

$$C_{as} \approx 2 \text{ pF}$$

This capacitance, which is effectively the output impedance of the tube, increases when the tube is inserted into the deflection and focusing coil unit.

MECHANICAL DATA

Dimensions in mm

Base: JEDEC no. E7-91.

Mounting position: any

Net mass: ≈ 22 g

ACCESSORIES

Socket	special miniature 7-pin, type 56049 or equivalent
Deflection and focusing coil unit	KV12S or equivalent

DEFLECTION magnetic**FOCUSING** magnetic**LIMITING VALUES**

(Absolute maximum rating system) for scanned area of 6,6 mm x 8,8 mm.

“Full-size scanning” i.e. scanning of a 6,6 mm x 8,8 mm area of the photoconductive layer should always be applied. Underscanning, i.e. scanning of an area smaller than 6,6 mm x 8,8 mm, may cause permanent damage to the specified full-size area.

Signal electrode voltage	V_{as}	max.	80 V
Grid 4 and grid 3 voltage	$V_{g4,g3}$	max.	750 V
Grid 2 voltage	V_{g2}	max.	350 V
Grid 1 voltage, negative	$-V_{g1}$	max.	300 V
positive	V_{g1}	max.	0 V
Cathode-to-heater voltage, peak positive	V_{kfp}	max.	125 V
peak negative	$-V_{kfp}$	max.	10 V
Dark current, peak	I_{dp}	max.	150 nA
Output current, peak	I_{asp}	max.	500 nA*
Faceplate illumination	E	max.	10 000 lx
Faceplate temperature, storage and operation	T	max.	70 °C**
Cathode heating time before drawing cathode current	t_h	min.	1 min

* Video amplifiers should be capable of handling signal-electrode currents of this magnitude without overloading the amplifier or distorting the picture.

** Under difficult environmental conditions a flow of cooling air directed at the faceplate is recommended. When televising flames and furnaces, appropriate infra-red absorbing filters should be used.

OPERATING CONDITIONS AND PERFORMANCE

For a scanned area of 6,6 mm x 8,8 mm and a faceplate temperature of 25 to 35 °C.

CONDITIONS

notes

Grid 4 and grid 3 (beam focus electrode) voltage	$V_{g4,g3}$	250 to 300 V	1
Grid 2 (accelerator) voltage	V_{g2}	300 V	
Grid 1 voltage for picture cut-off (no blanking applied)	V_{g1}	-80 to -20 V	
Blanking voltage, peak-to-peak			
when applied to grid 1		75 V	
when applied to the cathode		20 V	
Flux density at centre of focusing coil		5 mT	
Flux density of adjustable alignment magnets		0 to 0,4 mT	

PERFORMANCE

	min.	typ.	max.	
Signal electrode voltage for dark current of 20 nA	V_{as} 10	30	V	
Signal current faceplate illumination 10 lx c.t. 2856 K, dark current 20 nA	I_s 100	200	nA	
Decay: residual signal current 60 ms after cessation of the illumination (c.t. 2856 K, initial signal current 200 nA, dark current 20 nA		17	%	
Limiting resolution, at picture centre	400	500	TV lines	2
at picture corners	300	400	TV lines

Spurious signals (spots and blemishes)				3

Notes see next page.

NOTES

1. Resolution decreases with decreasing grid 3 and 4 voltages. In general grids 3 and 4 should be operated above 250 V.
2. On EIA resolution test chart, faceplate illumination adjusted for peak signal current of 200 nA and dark current of 20 nA.
3. Conditions:

The camera focused on a uniformly illuminated two-zone test pattern, the diameter of the centre zone (1) being equal to the raster height. Zone (2) being defined as the remainder of the scanned area. Signal electrode voltage adjusted for a dark current of 20 nA, illumination (c.t. 2856 K) adjusted to provide a signal current of 200 nA. Beam current adjusted for correct stabilization.

Scanning amplitudes of the monitor adjusted to obtain a raster aspect ratio of 3 : 4.

Monitor set-up and contrast control adjusted for faint raster when lens of camera is capped, and for non-blooming bright raster when lens of camera is uncapped.

Under the above conditions the number and size of the spots visible in the monitor picture will not exceed the limits stated below. Both black and white spots must be counted. Only white and black spots with contrasts $\geq 50\%$ and $\geq 100\%$ respectively (of peak white signal) are taken into account.

Spot size in % of raster height	Maximum number of spots	
	zone 1	zone 2
> 0,8	none	none
$\leq 0,8$ to 0,6	none	1
$\leq 0,6$ to 0,2	2	3
$\leq 0,2$	*	*
total (max.)	4	

- * Do not count spots of this size unless concentration causes a smudgy appearance.
- a) Minimum separation between any 2 spots greater than 0,4% of raster height is limited to a distance equivalent to 3% of raster height.
 - b) Tubes are rejected for smudge, lines, streaks, mottled, grainy or uneven background having contrasts $> 50\%$.

Fig. 1 Typical light transfer characteristic. Scanned area 6,6 mm x 8,8 mm. Faceplate temperature ≈ 30 °C.

CAMERA TUBE

Small size vidicon television camera tube with low heater consumption, separate mesh construction for improved resolution, magnetic focusing and magnetic deflection.

Overall length 108 mm (4¼ in) and diameter 17,7 mm (2/3 in).

The XQ1271 is intended for use in ultra compact TV cameras for industrial and consumer applications.

CAMERA TUBE

Vidicon TV camera tube with 25,4 mm (1 in) diameter, low heater power consumption, magnetic focusing and deflection, provided with a precision electron gun as in the 1 in diameter Plumbicon® tubes of the XQ1070 series.

The XQ1280 is intended mainly for use in medical or industrial X-ray equipment in which it is lens coupled to an X-ray image intensifier with a P11 or P20 output phosphor.

The tube is provided with a special photoconductive layer of high sensitivity in the 450 to 500 nm spectral region, and medium lag for proper X-ray noise integration.

QUICK REFERENCE DATA

Separate mesh	
Focusing	magnetic
Deflection	magnetic
Diameter	25,4 mm (1 in)

notes

NOTES

1. a. The circular quality area of 16,2 mm diameter is concentric with the faceplate.
b. The scanning amplitudes must be so adjusted that a target area of about 15 mm diameter is displayed on a standard monitor as a circular area with a diameter equal to the raster height. (15 mm x 20 mm scan).
c. The displayed circular area of approximately 15 mm diameter should fall within the quality area of 16,2 mm diameter but is generally not concentric with the latter due to excentricities of the output window of the image intensifier and the optical system.
d. Underscanning of the chosen area, or failure of scanning, should be avoided, since this may cause damage to the photoconductive layer.
2. The optimal grid 4 voltage for best uniformity of black and white level depends on the type of coil unit used and will be 1,5 to 1,6 times V_{g3} for the coil units mentioned under "Accessories". Under no circumstances should grid 4 (mesh) be allowed to operate at a voltage level below that of grid 3, as this may damage the target.
3. Focus current adjusted for optimal electrical focus.
4. The polarity of the focusing coil should be such that its image end attracts an external north-seeking pole.
5. The alignment coil unit should be so positioned that its centre is at a distance of approx. 94 mm (3 11/16 in) from the face of the tube and that its axis coincides with the axis of the tube, the deflecting yoke and the focusing coil.
6. See chapter "Deflection units".
7. The dark current is dependent on the signal electrode voltage and the temperature. This is shown in Figs 2 and 3.
8. Signal current is output current minus dark current.
9. As measured on a waveform oscilloscope.
10. Measured with a 100% peak signal current of 150 nA.
11. Measured with a video amplifier system with suitable bandwidth and a high-quality lens adjusted to f: 5,6.
12. For typical transfer characteristics with P20 and P11 light input see Fig. 5 and 6.

Fig. 1 Typical spectral response curve measured at constant output current $I_{as} = 50 \text{ nA}$, with $I_{dark} = 20 \text{ nA}$

Spurious signal specification

TEST CONDITIONS

- The tube shall be operated in a test chain under the voltage conditions as shown in the data sheet.
- The scanning amplitudes shall be adjusted to correspond to a scanned area of 16,2 mm x 21,6 mm.
- The tube shall be aligned and focused in accordance with the "Instructions for use".
- A back illuminated test transparency with three quality zones (see Fig. below) is projected onto the specified target area (16,2 mm diameter circular) producing an even illumination.

- The light level shall be adjusted to produce a peak signal current of 150 nA, the beam current shall be adjusted to just stabilize a peak signal current of 600 nA, the signal electrode voltage shall be adjusted for a peak dark current of 20 nA, the temperature of the faceplate shall be 30 ± 2 °C.
- The video amplifier system shall have a bandwidth (-3 dB) of at least 7 MHz.
- The monitor shall be adjusted for a non-blooming white.

Permitted number, size and location of blemishes

Dimensions of blemishes in % of picture height (16,2 mm)	Zone I	Zone II	Zone III
$> 0,7$	0	0	0
$\leq 0,7$ but $> 0,45$	0	1	3
$\leq 0,45$ but $> 0,2$	2	3	6
total	2	6	

Both black and white blemishes as observed on the monitor shall be counted. Blemishes $\leq 0,2\%$ of picture height* and blemishes with a contrast $\leq 6\%$ (of 150 nA peak signal current, as measured on a waveform oscilloscope), however, shall be neglected.

* Spots of this size are allowed unless concentration causes a smudgy appearance. The average contrast of the concentration is taken as the smudge contrast.

CAMERA TUBE

Vidicon TV camera tube with 25,4 mm (1 in) diameter, low heater power consumption, magnetic focusing and deflection, provided with a precision electron gun as in the 1 in diameter Plumbicon® tubes of the XQ1070 series.

The XQ1285 has a fibre optic faceplate and is mainly intended for use in medical or industrial X-ray equipment in which it is directly coupled to an X-ray image intensifier with a P11 or P20 phosphor on a fibre optic output window. For this purpose it is provided with a special photoconductive layer with a high sensitivity in the 450 to 500 nm spectral region and medium lag for proper X-ray noise integration.

QUICK REFERENCE DATA

Faceplate	fibre optic
Separate mesh	
Focusing	magnetic
Deflection	magnetic
Diameter	25,4 mm (1 in)
Length	159 mm (6¼ in)
Heater	6,3 V, 95 mA
Spectral response, max. at cut-off at approx.	450 to 500 nm 800 nm
Resolution	≥ 50 lp/mm

OPTICAL DATA

Dimensions of quality area on photoconductive target	circle of 15,8 mm dia (note 1)
Orientation of image on target	
The direction of the horizontal scan should be essentially parallel to the plane defined by pin 1 and the longitudinal axis of the tube.	
Photoconductive layer	type B
Spectral response, max. at cut-off	approx. 475 nm approx. 800 nm
Spectral response curve	see Fig. 1
Faceplate	
Centre to centre spacing of fibres	7,5 µm
Flat within	1,5 µm
Numerical aperture	1,0

® Registered trade mark for television camera tubes.

MECHANICAL DATA

Dimensions in mm

Base: JEDEC E8-11; IEC 67-1-33a

Mounting position: any

Weight: ≈ 55 g

ACCESSORIES

Socket

56098 or equivalent

Deflection and focusing coil unit

AT1102/01, AT1116S or equivalent

(1) Epoxy resin. Proper coupling of the XQ1285 to the fibre optic output window of an image intensifier may be obtained by mechanical arrangements which either exert an evenly distributed axial forward pulling force on the signal-electrode ring or an axial forward pushing force on the base end or socket of the tube.

In either case the recommended force is in the order of 100 to 120 N.

ELECTRICAL DATA**Heating:** Indirect by a.c. or d.c.; parallel or series supply

Heater voltage	V_f	6,3 V \pm 10%
Heater current, at $V_f = 6,3$ V	I_f	95 mA

When the tube is used in a series heater chain, the heater voltage must never exceed an r.m.s. value of 9,5 V when the supply is switched on.

Electron gun characteristics

Cut-off		
grid 1 voltage for cut-off at $V_{g2} = 300$ V	V_{g1}	-30 to -100 V
Blanking voltage, peak-to-peak		
on grid 1	V_{g1pp}	50 \pm 10 V
on cathode	V_{kpp}	20 V

Notes see next page.

NOTES

1. a. The circular quality area of 15,8 mm diameter is concentric with the faceplate.
b. The scanning amplitudes are so adjusted that a target area of about 15 mm diameter is displayed on a standard monitor as a circular area with a diameter equal to the raster height. (15 mm x 20 mm scan).
c. The displayed circular area of approximately 15 mm diameter should fall within the quality area of 15,8 mm diameter but is generally not concentric with the latter due to eccentricities of the output window of the image intensifier and of the optical system.
d. Underscanning of the chosen target area, or failure of scanning, should be avoided, so as not to cause damage to the photoconductive layer.
2. The optimal grid 4 voltage for best uniformity of black and white level depends on the type of coil unit used and will be 1,5 to 1,6 times V_{g3} for the coil units mentioned under "Accessories". Under no circumstances should grid 4 (mesh) be allowed to operate at a voltage level below that of grid 3, as this may damage the target.
3. Focus current adjusted for optimal electrical focus.
4. The polarity of the focusing coil should be such that its image end attracts an external north-seeking pole.
5. The alignment coil unit should be so positioned that its centre is at a distance of approx. 94 mm (3 11/16 in) from the face of the tube and that its axis coincides with the axis of the tube, the deflecting yoke and the focusing coil.
6. See chapter "Deflection units".
7. The dark current is dependent on the signal electrode voltage and the temperature. This is shown in Figs 2 and 3.
8. Signal current is output current minus dark current.
9. As measured on a waveform oscilloscope.
10. Measured with a 100% peak signal current of 150 nA.
11. Obtained with a video amplifier system with adequate bandwidth.
Measured with a transparent square-wave test pattern applied directly to the faceplate and which is illuminated with P20 light of a lambertian distribution. The average transmission of the test transparency is about 50% of the transmission of the transparency's whites.
No aperture correction or gamma correction is applied.
12. For typical transfer characteristics with P20 and P11 light input see Figs 5 and 6.

Fig. 1 Spectral response curve.

Fig. 2. Dark current range versus signal electrode voltage.

Fig. 3. Temperature dependence of dark current.

Fig. 4 Square wave modulation transfer characteristic.

Fig. 6 Typical light transfer characteristics.

Fig. 5 Typical light transfer characteristics.

Spurious signal specification

TEST CONDITIONS

- The tube shall be operated in a test chain under the voltage conditions as shown in the data sheet.
- The scanning amplitudes shall be adjusted to overscan the target such that it is displayed as a circle on the monitor.
- A test transparency, back illuminated with lambertian light of c.t. = 2856 K, with two quality zones (see Fig. below) is applied directly to the faceplate and positioned such that it is concentric with the target as observed on the monitor.
- The tube shall be aligned and focused.
- The scanning amplitudes shall be slightly reduced, horizontal and vertical centring controls be adjusted such that the circular area of 15,8 mm dia just fits in the picture height of the monitor and is displayed as a circle.
- The temperature of the faceplate shall be 30 ± 2 °C.
The signal electrode voltage shall be adjusted for a peak dark current of 20 nA.
The light level shall be adjusted to produce a peak signal current of 150 nA, the beam current shall be adjusted to just stabilize a peak signal current of 600 nA.
- The video amplifier shall have a bandwidth (-3 dB) of at least 7 MHz.
- The monitor shall be adjusted for a non-blooming white.

$h = 15,8$ mm on target
 $\frac{1}{2}h = 7,9$ mm on target

7264.959

Permitted number, size and location of blemishes

The table below shows what number of blemishes, black or white, are permitted per size, per zone and total (notes 1 and 2).

Dimensions of blemishes in % of picture height	Zone I		Zone II		Total I + II
	white	black	white	black	
> 0,8	0	0	0	0	0
≤ 0,8 but > 0,5	0	1	0	2	2
≤ 0,5 but > 0,4	1	2	2	3	4
≤ 0,4 but > 0,2	2	3	4	5	6
≤ 0,2 (note 3)					
total	3		6		8

Background structure (e.g. chicken wire pattern) originating from the fibre-optic faceplate shall not have a contrast exceeding 2%. (note 2)

NOTES

- Both black and white blemishes as observed on the monitor shall be counted, however, blemishes ≤ 0,2% of picture height and black blemishes with a contrast ≤ 6%, and white blemishes with a contrast ≤ 3% shall be ignored.
- The contrast is measured as a percentage of 150 nA peak signal current on a waveform oscilloscope. The dimensions of blemishes are determined on the monitor with a transparent blemish gauge, calibrated in percent of picture height.
- If such blemishes form a concentration this will be evaluated as a blemish with as contrast the average contrast of the concentration.

CAMERA TUBE

Small size vidicon television camera tube with low heater consumption, separate mesh construction, electrostatic focusing and magnetic deflection and mechanically interchangeable with vidicons such as XQ1272. Overall length 108 mm (4¼ in) and diameter 17,7 mm (2/3 in). The XQ1590 is intended for use in ultra compact TV cameras for industrial and consumer applications in which a minimum of size, weight and power consumption is essential.

QUICK REFERENCE DATA

Separate mesh	
Focusing (bipotential focusing lens)	electrostatic
Deflection	magnetic
Diameter	17,7 mm
Length	max. 108 mm
Heater	6,3 V, 95 mA
Limiting resolution	550 TV lines

OPTICAL

Diagonal of quality rectangle on photoconductive layer
(aspect ratio 3 : 4) 11 mm

Orientation of image on photoconductive layer:

The direction of the horizontal scan should be essentially parallel to the plane passing through pin 4 and the longitudinal axis of the tube.

Photoconductive layer		type A
Special response, max. response at	approx.	550 nm
Faceplate thickness		1,5 mm
refractive index		1,487

HEATING

Indirect by a.c. or d.c. parallel or series supply

Heater voltage	V_f	6,3 V \pm 10%
Heater current, at $V_f = 6,3$ V	I_f	95 mA

When the tube is used in a series heater chain, the heater voltage must not exceed an r.m.s. value of 9,5 V when the supply is switched on.

CAPACITANCES

Signal electrode to all

$$C_{as} \approx 2 \text{ pF}$$

This capacitance, which is effectively the output impedance of the tube, increases when the tube is inserted into the deflection coil unit.

MECHANICAL DATA

Dimensions in mm

Base: JEDEC no. E7-91

Mounting position: any

Net mass: $\approx 25 \text{ g}$

FOCUSING

electrostatic

LIMITING VALUES

(Absolute maximum rating system) for scanned area of 6,6 mm x 8,8 mm.

"Full-size scanning" i.e. scanning of a 6,6 mm x 8,8 mm area of the photoconductive layer should always be applied. Underscanning, i.e. scanning of an area smaller than 6,6 mm x 8,8 mm, may cause permanent damage to the specified full-size area.

Signal electrode voltage	V_{as}	max.	80 V
Grid 3 and 6 voltage	$V_{g3,g6}$	max.	750 V
Grid 4 (beam focus electrode) voltage	V_{g4}	max.	350 V
Grid 2 and 5 voltage	$V_{g2,g5}$	max.	350 V
Grid 1 voltage, negative	$-V_{g1}$	max.	300 V
positive	V_{g1}	max.	0 V
Cathode-to-heater voltage peak positive	V_{kfp}	max.	125 V
peak negative	$-V_{kfp}$	max.	10 V
Dark current, peak	I_{dp}	max.	150 nA
Output current, peak	I_{asp}	max.	500 nA*
Faceplate illumination	E	max.	10 000 lx
Faceplate temperature, storage and operation	T	max.	70 °C**
Cathode heating time before drawing cathode current	t_h	min.	1 min

* Video amplifiers should be capable of handling signal-electrode currents of this magnitude without overloading the amplifier or distorting the picture.

** Under difficult environmental conditions a flow of cooling air directed at the faceplate is recommended. When televising flames and furnaces, appropriate infrared absorbing filters should be used.

OPERATING CONDITIONS AND PERFORMANCE

For a scanned area of 6,6 mm x 8,8 mm and a faceplate temperature of 25 to 35 °C.

CONDITIONS

			notes
Grid 3 and 6 (decelerator) voltage	$V_{g3,g6}$	500 V	1
Grid 4 (beam focus electrode) voltage	V_{g4}	60 to 85 V	2
Grid 2 and 5 voltage	$V_{g2,g5}$	300 V	3
Grid 1 voltage for picture cut-off (no blanking applied)	V_{g1}	-80 to -30 V	
Blanking voltage, peak-to-peak			
when applied to grid 1		75 V	
when applied to the cathode		20 V	
Flux density of adjustable alignment magnets		0 to 0,4 mT	

PERFORMANCE

		min.	typ.	max.	
Signal electrode voltage for dark current of 20 nA	V_{as}	15	30	V	
Signal current					
faceplate illumination 10 lx					
c.t. 2856 K, dark current 20 nA	I_s	130	200	nA	
Decay: residual signal current 60 ms after cessation of the illumination (c.t. 2858 K, initial signal current 200 nA, dark current 20 nA)			17	%	
Limiting resolution at picture centre			550	TV lines 4	
at picture corners			475	TV lines 4	
Average γ of transfer characteristic for signal currents between 20 and 200 nA (see Fig. 1)		0,55	0,74	0,85	
Spurious signals (spots and blemishes)					5

Notes see next page.

Notes

- Grids 3 and 6 voltage must always be higher than grids 2 and 5 voltage. The recommended voltage ratio of grids 3 and 6 to grids 2 and 5 both for best geometry and most uniform signal output current depends upon the type of coil used and will be 5 : 3 for the recommended type (see "Accessories").
- Adjusted for correct electrical focus. This voltage range is higher than that of unipotential electrostatic focus types, such as XQ1272.
- Grids 2 and 5 voltage must be > 250 V to provide sufficient beam current.
- On EIA resolution test chart, faceplate illumination adjusted for peak signal current of 200 nA and dark current of 20 nA.

5. Conditions:

The camera focused on a uniformly illuminated two-zone test pattern, the diameter of the centre zone (1) being equal to the raster height. Zone (2) being defined as the remained of the scanned area. Signal electrode voltage adjusted for a dark current of 20 nA, illumination (c.t. 2856K) adjusted to provide a signal current of 200 nA. Beam current adjusted for correct stabilization.

Scanning amplitudes of the monitor adjusted to obtain a raster aspect ratio of 3 : 4.

Monitor set-up and contrast control adjusted for faint raster when lens of camera is capped, and for non-blooming bright raster when lens of camera is uncapped.

Under the above conditions the number and size of the spots visible in the monitor picture will not exceed the limits stated below. Both black and white spots must be counted. Only white and black spots with contrasts $\geq 50\%$ and $\geq 100\%$ respectively (of peak white signal) are taken into account.

Spot size in % of raster height	Maximum number of spots	
	zone 1	zone 2
$> 0,8$	none	none
$\leq 0,8$ to 0,6	none	1
$\leq 0,6$ to 0,2	2	3
$\leq 0,2$	*	*
total (max.)	4	

* Do not count spots of this size unless concentration causes a smudgy appearance.

- Minimum separation between any 2 spots greater than 0,4% of raster height a limited to a distance equivalent to 3% of raster height.
- Tubes are rejected for smudge, lines, streaks, mottled, grainy or uneven background having contrasts $> 50\%$.

Fig. 1 Typical light transfer characteristic. Scanned area 6,6 mm x 8,8 mm. Faceplate temperature ≈ 30 °C.

CAMERA TUBE

Extremely small size vidicon television camera tube with very low heater consumption, separate mesh construction, electrostatic focusing and magnetic deflection. Overall length 85 mm (3½ in) and diameter 13,5 mm (½ in).

The XQ1600 is intended for use in ultra-compact TV cameras for industrial and consumer applications in which a minimum of size, weight and power consumption is essential.

QUICK REFERENCE DATA

Separate mesh	
Focusing	electrostatic
Deflection	magnetic
Diameter	13,5 mm
Length	max. 85 mm
Heater	2,8 V, 107 mA
Limiting resolution	450 TV lines

OPTICAL

Diagonal of quality rectangle on photoconductive layer
(aspect ratio 3 : 4) 7,75 mm

Orientation of image on photoconductive layer:

The direction of the horizontal scan should be essentially parallel to the plane passing through the short index pin and the longitudinal axis of the tube.

Photoconductive layer		type A
Spectral response, max. response at	approx.	550 nm
Faceplate		
thickness		1,6 mm
refractive index		1,474

HEATING

Indirect by a.c. or d.c. parallel or series supply

Heater voltage	V_f	2,8 V \pm 5%
Heater current, at $V_f = 2,8$ V	I_f	107 mA \pm 10%

When the tube is used in a series heater chain, the heater voltage must not exceed an r.m.s. value of 3,5 V when the supply is switched on.

CAPACITANCES

Signal electrode to all

$C_{as} \approx 1,5 \text{ pF}$

This capacitance, which is effectively the output impedance of the tube, increases when the tube is inserted into the deflection coil unit.

Abbreviations used in the tables

S = separate mesh

Nw = cadmium and zinc telluride layer (Newvicon tubes)

HI = for high-quality black and white and colour cameras in sub-broadcast, medical, educational and industrial applications

Ind = for black and white and colour cameras in non-critical industrial applications

MS = in cameras for military, surveillance, and scientific applications

© Newvicon is a registered trade mark for television camera tubes.

GENERAL OPERATIONAL NOTES

1 PROPERTIES OF THE NEWVICON PHOTOCONDUCTIVE LAYER

The Newvicon photoconductive layer is a heterojunction layer, consisting of a sublayer of zinc selenide (ZnSe) and a sublayer formed by a mixture of zinc telluride (ZnTe) and cadmium telluride (CdTe). In the Newvicon tubes described in this Data Handbook two layer variants are found, differing mainly in spectral response and sensitivity in the infrared region.

1.1 Sensitivity

The Newvicon tube has a high sensitivity in the entire visible spectral region. The sensitivity for white light (colour temperature 2856 K) filtered by an infrared eliminating filter, type B1/K1, is 3 to 4 times as high as that of a Plumbicon® tube.

The light transfer characteristic of the Newvicon tube is linear, except for a slight saturation in the high signal current region.

1.2 Spectral response

Typical spectral responses of the two Newvicon layers are found in Fig. 1.

Fig. 1 Typical Newvicon spectral response curves. Curve 1: XQ1274, XQ1275, XQ1278, XQ1380, XQ1381, XQ1440, XQ1442, XQ1444. Curve 2: XQ1276, XQ1277, XQ1443.

® Registered trade mark for television camera tubes.

1.3 Dark current

The dark current in a Newvicon tube is lower than in a vidicon, but it is not negligible. A typical value at 30 °C for a 2/3-inch tube is 5 nA; for a 1-inch tube: 10 nA.

Roughly, the dark current doubles with every 7 to 8 °C temperature increase.

1.4 Resolution

The resolution of a Newvicon tube is determined mainly by the construction of the electron gun and by the operating conditions. Typical modulation transfer characteristics are given in the data sheets.

1.5 Lag

Because of its much larger target capacitance, the lag of a Newvicon tube is significantly higher than that of a Plumbicon tube. As it does not show photoconductive lag like vidicons, however, a Newvicon tube is faster than a vidicon.

Typical values of decay at 200 nA signal current can be found in the data sheets.

1.6 Stray light

The reflectance of the photoconductive layer in a Newvicon tube being low, halation effects in the faceplate of the tube are practically negligible.

1.7 Burn-in

In normal operating conditions, Newvicon tubes show negligible burn-in.

2 EQUIPMENT DESIGN AND OPERATING CONDITIONS

The signal electrode voltage should be adjusted to the value indicated by the tube manufacturer as printed on the envelope ($E_{sj} = \dots V$).

The signal electrode voltage should be adjusted within an accuracy of $\pm 2 V$; the voltage drop across R_i should be kept small. In the case of cathode blanking, the voltage drop across the cathode resistor during read-out should be taken into account. Too low a signal electrode voltage will cause picture sticking effects, whereas too high a voltage may result in picture defects (spots).

A ready way of adjusting the signal electrode voltage, which usually gives satisfactory results, is as follows:

- apply an even illumination to the target, resulting in a signal current of about 150 nA;
- increase the signal electrode voltage until a grainy structure just becomes visible;
- reduce the signal electrode voltage by 5 V, or, alternatively, reduce the signal electrode voltage until slightly above the point where, as observed on an oscilloscope, the signal amplitude commences to decrease.

As Newvicon tubes do not permit sensitivity control by means of regulation of the signal electrode voltage, adequate control is to be achieved by other means (iris control and neutral density filters). If the tube is applied in cameras originally designed for vidicon tubes, the automatic sensitivity control circuitry should be made inoperative and the signal electrode voltage set to the value indicated by the tube manufacturer.

The input light level on the target of a 2/3-inch Newvicon tube should be adjusted at approximately 0,8 lx at the highlight level of the scene. This means that a signal current of 200 nA at highlight level is preferred for optimum operation. For a 1-inch tube the input light level should be set at approximately 0,5 lx.

If the solar image, or a spot image of similar intensity, is focused on the target through a lens opening wider than $f : 11$, instantaneous breakdown of the target will occur. If it is possible that such a situation may arise, protection measures are necessary, e.g. a lens cap, a neutral density filter or a shutter.

The temperature of the faceplate should not exceed 70 °C, neither during operation nor storage. Whilst dark current doubles at every 7 to 8 °C temperature increase, lag decreases and resolution remains practically constant.

CAMERA TUBE

NEVVICON® television camera tube with a photoconductive target composed of cadmium and zinc tellurides featuring high resolution and an extremely high sensitivity.

The XQ1274 is a 2/3 in diameter camera tube with low heater power, separate mesh, magnetic focusing and deflection, and is mechanically interchangeable with vidicons like the XQ1271 and has the same pin connections.

The XQ1274 is intended for use in ultra-compact cameras for security and surveillance applications, for example, where its high sensitivity and resolution, small size and low power consumption are essential.

QUICK REFERENCE DATA

Separate mesh	
Focusing	magnetic
Deflection	magnetic
Diameter	17,7 mm
Length	max. 108 mm
Special response, max. at	approx. 750 nm
cut-off at	approx. 900 nm
Heater	6,3 V, 95 mA
Limiting resolution	650 TV lines

OPTICAL

Diagonal of quality rectangle on photoconductive layer (aspect ratio 3 : 4) 11 mm

Orientation of image on photoconductive layer:

The direction of the horizontal scan should be essentially parallel to the plane passing through the longitudinal tube axis and pin 4.

Spectral response, curve see Fig. 1

Faceplate thickness	1,5 mm
refractive index	1,61

HEATING Indirect by a.c. or d.c.; parallel or series supply

Heater voltage	V_f	6,3 V \pm 10%
Heater current, at $V_f = 6,3$ V	I_f	95 mA

When the tube is used in a series heater chain, the heater voltage must not exceed an r.m.s. value of 9,5 V when the supply is switched on.

Average γ of transfer characteristic, see Fig. 2			≈ 1		
Spurious signals (spots and blemishes)					5

Notes

1. The signal electrode voltage should be adjusted to the value indicated by the tube manufacturer as printed on the envelope ($E_{sj} = . . . V$). To minimize picture sticking effects the signal electrode should be adjusted with an inaccuracy of $\pm 2 V$; the voltage drop across R_1 should be kept small. In case of cathode blanking the voltage drop across the cathode resistor during read-out should be taken into account.
2. Grid 4 voltage must always be higher than grid 3 voltage. The recommended ratio of grid 4 voltage to grid 3 voltage both for best geometry and most uniform signal output depends upon the type of coil unit used and will be 4 : 3 for the recommended type (see 'Accessories').
3. Resolution decreases with decreasing grid 3 voltage. In general grid 3 should be operated above 250 V.
4. On EIA resolution test chart; faceplate illumination adjusted for a peak output current of 200 nA.

5. Conditions

The camera focused on a uniformly illuminated two-zone test pattern, the diameter of the centre zone (1) being equal to the raster height. Zone (2) being defined as the remainder of the scanned area.

Faceplate illumination adjusted to produce 200 nA signal current, beam current adjusted for correct stabilization.

Monitor set-up and contrast control adjusted for faint raster when lens of camera is capped and for non-blooming bright raster when lens of camera is uncapped.

Under above conditions the number and size of spots per zone visible in the monitor picture will not exceed the limits stated below. Both black and white spots must be counted, unless their contrast is less than 50% of peak white signal as observed on a waveform oscilloscope. Spots having a contrast $\geq 100\%$ are fully counted, spots having a contrast $> 50\%$ but $< 100\%$ will be considered as having half their actual size.

Spot size in % of raster height	Maximum number of spots	
	zone 1	zone 2
$> 1,2$	none	none
$\leq 1,0$ to 0,8	none	1
$\leq 0,8$ to 0,4	4	4
$\leq 0,4$ to 0,2	4	4
$\leq 0,2$	*	*
total (max.)	8	

* Do not count spots of this size unless concentration causes a smudgy appearance.

Tubes are rejected for: smudges, lines, streaks, mottled, grainy or uneven background having contrast $> 50\%$.

2. Grid 4 voltage must always be higher than grid 3 voltage. The recommended ratio of grid 4 voltage to grid 3 voltage both for best geometry and most uniform signal output depends upon the type of coil unit used and will be 4: 3 for the recommended type (see 'Accessories').
3. Resolution decreases with decreasing grid 3 voltage. In general grid 3 should be operated above 250 V.
4. On EIA resolution test chart; faceplate illumination adjusted for a peak output current of 200 nA.

5. Conditions

The camera focused on a uniformly illuminated two-zone test pattern, the diameter of the centre zone (1) being equal to the raster height. Zone (2) being defined as the remainder of the scanned area.

Faceplate illumination adjusted to produce 200 nA signal current, beam current adjusted for correct stabilization.

Monitor set-up and contrast control adjusted for faint raster when lens of camera is capped and for non-blooming bright raster when lens of camera is uncapped.

Under above conditions the number and size of spots per zone visible in the monitor picture will not exceed the limits stated below. Both black and white spots must be counted, unless their contrast is less than 50% of peak white signal as observed on a waveform oscilloscope. Spots having a contrast $\geq 100\%$ are fully counted, spots having a contrast $> 50\%$ but $< 100\%$ will be considered as having half their actual size.

spot size in % of raster height	maximum number of spots	
	zone 1	zone 2
$> 1,2$	none	none
$\leq 1,2$ to 0,8	none	1
$\leq 0,8$ to 0,4	4	5
$\leq 0,4$ to 0,2	5	5
$\leq 0,2$	*	*
total (max.)	5	7

* Do not count spots of this size unless concentration causes a smudgy appearance. Tubes are rejected for: smudges, lines, streaks, mottled, grainy or uneven background having contrast $> 50\%$.

CAMERA TUBE

NEWVICON® television camera tube with a photoconductive target composed of cadmium and zinc tellurides featuring high resolution and an extremely high sensitivity extending into the near infrared region.

The XQ1277 is a 2/3 in diameter camera tube with low heater power, separate mesh, electrostatic focusing and magnetic deflection and is mechanically interchangeable with vidicons such as XQ1272, XQ1590 and newvicons XQ1275. Pin configuration is similar.

The XQ1277 is intended for use in ultra-compact cameras for security and surveillance applications, for example, where its high sensitivity extending into the near infrared, small size and low power consumption are essential.

QUICK REFERENCE DATA

Average γ of transfer characteristic, see Fig. 3			≈ 1		
Spurious signals (spots and blemishes)					

Notes

1. The signal electrode voltage should be adjusted to the value indicated by the tube manufacturer as printed on the envelope ($E_{sj} = \dots V$). To minimize picture sticking effects the signal electrode should be adjusted with an inaccuracy of $\pm 2 V$; the voltage drop across R_1 should be kept small. In the case of cathode blanking the voltage drop across the cathode resistor during read-out should be taken into account.
2. Grids 3 + 6 voltage must always be higher than grids 2 + 5 voltage.
The recommended ratio of grids 3 + 6 voltage to grids 2 + 5 voltage for best geometry and most uniform signal output depends upon the type of coil used and will be 5 : 3 for the recommended types (see "Accessories").
3. Adjusted for correct electrical focus. This voltage range is higher than that of unipotential electrostatic focus, such as XQ1275.
4. Grids 2 + 5 voltage should be $> 250 V$ to provide sufficient beam current.
5. On EIA resolution test chart: faceplate illumination adjusted for a peak output current of 200 nA. The resolution is highly dependent on the coil used; the indicated figures are only valid for the recommended coil.
6. **Conditions**

The camera focused on a uniformly illuminated two-zone test pattern, the diameter of the centre zone (1) being equal to the raster height. Zone (2) being defined as the remainder of the scanned area.

Faceplate illumination adjusted to produce 200 nA signal current, beam current adjusted for correct stabilization.

Monitor set-up and contrast control adjusted for faint raster when lens of camera is capped and for non-blooming bright raster when lens of camera is uncapped.

Under above conditions the number and size of spots per zone visible in the monitor picture will not exceed the limits stated below. CAMERA TUBE

Newvicon® camera tube, mechanically and electron-optically identical to the XQ1274, the major difference being the radiation resistant (anti-browning) faceplate.

The XQ1380 is intended for use in compact cameras which are subjected to high doses of ionizing radiation.

RADIATION RESISTANT FACEPLATE

The faceplate of the XQ1380 is made of a special type of glass and does not turn brown under the influence of high doses of gamma radiation.

- Maximum dose rate per hour: 5×10^5 Röntgen/hour
- Maximum cumulative dose: 5×10^7 Röntgen
- Maximum decrease of transmission of faceplate:

Maximum decrease	After a cumulative dose of
3%	10^5 Röntgen
10%	10^6 Röntgen
15%	5×10^7 Röntgen

- Maximum increase of dark current at 25 °C after a cumulative dose of 5×10^7 Röntgen: 75%

SENSITIVITY

The typical sensitivity of the XQ1380 is approximately 10% less than for the XQ1274.

For all other information see data of XQ1274.

CAMERA TUBE

Newvicon® camera tube, mechanically and electron-optically identical to the XQ1275, the major difference being the radiation resistant (anti-browning) faceplate.

The XQ1381 is intended for use in compact cameras which are subjected to high doses of ionizing radiation.

RADIATION RESISTANT FACEPLATE

The faceplate of the XQ1381 is made of a special type of glass and does not turn brown under the influence of high doses of gamma radiation.

- Maximum dose rate per hour: 5×10^5 Röntgen/hour
- Maximum cumulative dose: 5×10^7 Röntgen
- Maximum decrease of transmission of faceplate:

Maximum decrease	After a cumulative dose of
3%	10^5 Röntgen
10%	10^6 Röntgen
15%	5×10^7 Röntgen

- Maximum increase of dark current at 25 °C after a cumulative dose of 5×10^7 Röntgen: 75%

SENSITIVITY

The typical sensitivity of the XQ1381 is approximately 10% less than for the XQ1275.

For all other information see data of XQ1275.

CAMERA TUBE

NEWVICON® television camera tube with a photoconductive target composed of cadmium and zinc tellurides featuring high resolution and an extremely high sensitivity.

The XQ1440 is a 1 in diameter camera tube with low heater power, separate mesh, magnetic focusing and deflection, and is mechanically interchangeable with vidicons like the XQ1240 and has the same pin connections.

The XQ1440 is intended for use in cameras for security and surveillance applications, for example, where its high sensitivity and resolution are essential.

LIMITING VALUES (Absolute maximum rating system)
for a scanned area of 9,6 mm x 12,8 mm.

'Full-size scanning' i.e. scanning of a 9,6 mm x 12,8 mm area of the photoconductive layer should always be applied. Underscanning i.e. scanning of an area smaller than 9,6 mm x 12,8 mm, may cause permanent damage to the specified full-size area.

Signal electrode voltage	V_{as}	max	50 V*
Grid 4 voltage	V_{g4}	max	1000 V
Grid 3 voltage	V_{g3}	max	1000 V
Grid 2 voltage	V_{g2}	max	750 V
Grid 1 voltage, negative	$-V_{g1}$	max	300 V
positive	V_{g1}	max	0 V
Cathode-to-heater voltage, peak positive	$V_{kf p}$	max	125 V
peak negative	$-V_{kf p}$	max	10 V
Output current, peak	I_{asp}	max	800 nA**
Faceplate illumination	E	max	10 000 lx [▲]
Faceplate temperature, storage and operation	T	max	70 °C
Cathode heating time before drawing cathode current	t_h	min	1 min

* Newvicon tubes do not permit automatic sensitivity control by means of regulation of the signal electrode voltage. Adequate control is therefore to be achieved by other means (iris control and neutral density filters). If the tube is applied in cameras originally designed for vidicon tubes, the automatic sensitivity control circuitry should be made inoperative and the signal electrode voltage set to the value indicated by the tube manufacturer. See General Operational Notes.

** Video amplifiers should be capable of handling signal electrode currents of this magnitude without overloading the amplifier or distorting the picture.

▲ White light, uniformly diffused over entire tube face. Care must be taken not to focus the solar image on the target through a lens opening wider than $f:11$ to avoid instantaneous breakdown.

OPERATING CONDITIONS AND PERFORMANCE

for a scanned area of 9,6 mm x 12,8 mm, a faceplate temperature of 25 to 35 °C and standard TV scanning rate.

Conditions

notes

Signal electrode voltage	V_{as}	10 to 25 V	1
Grid 4 (decelerator) voltage	V_{g4}	500 V	2
Grid 3 (beam focus electrode) voltage	V_{g3}	300 V	3
Grid 2 (accelerator) voltage	V_{g2}	300 V	
Grid 1 voltage picture cut-off (no blanking applied)	V_{g1}	-100 to -45 V	
Blanking voltage, peak to peak			
when applied to grid 1		75 V	
when applied to cathode		20 V	
Flux density at centre of focusing coil		3,8 to 4,4 mT	
Flux density of adjustable alignment coil or magnet		0 to 0,4 mT	

Performance

	min.	typ.	max.

Signal current, white light faceplate illuminance 0,5 lx, c.t. 2856 K	I_s 140	180	nA	
Decay: residual signal current 60 ms after cessation of the illumination (c.t. 2856 K), initial signal current 200 nA		17	22 %	
Limiting resolution, at picture centre	550	650	TV lines 4	
at picture corners		450	TV lines 4	
Average γ of transfer characteristic		≈ 1		
Spurious signals (spots and blemishes)				5

Notes

- The signal electrode voltage should be adjusted to the value indicated by the tube manufacturer as printed on the envelope ($E_{sj} = \dots V$).
To minimize picture sticking effects the signal electrode voltage should be adjusted with an inaccuracy of $\pm 2 V$, the voltage drop across R_1 should be kept small. In the case of cathode blanking, the voltage drop across the cathode resistor during read-out should be taken into account.
- Grid 4 voltage must always be higher than grid 3 voltage. The recommended ratio of grid 4 voltage to grid 3 voltage both for best geometry and most uniform signal output depends upon the type of coil unit used and will be 5 : 3 for the recommended types (see "Accessories").
- Resolution decreases with decreasing grid 3 voltage. In general grid 3 should be operated above 250 V.
- On EIA resolution test chart; faceplate illumination adjusted for a peak output current of 200 nA.

5. Conditions

The camera focused on a uniformly illuminated two-zone test pattern, the diameter of the centre zone (1) being equal to the raster height. Zone (2) being defined as the remainder of the scanned area.

Faceplate illumination adjusted to produce 200 nA signal current, beam current adjusted for correct stabilization.

Monitor set-up and contrast control adjusted for faint raster when lens of camera is capped and for non-blooming bright raster when lens of camera is uncapped.

Under the above conditions the number and size of spots per zone visible in the monitor picture, under both capped and uncapped conditions will not exceed the limits stated below. Both black and white spots must be counted unless their contrast is less than 10% of peak white signal as observed on a waveform oscilloscope.

Background lines, originating from the structure of the fibre optic faceplate will have a contrast of $\leq 25\%$ of peak white signal and will not exceed a width of 0,4%, or a length of 6% of picture height.

	spot size in % of raster height	maximum number of spots	
		zone 1	zone 2
white and black spots	$> 1,4$	none	none
	$\leq 1,4$ to 0,8	none	1
	$\leq 0,8$ to 0,6	2	3
white spots	$\leq 0,6$ to 0,2	4	6
	$\leq 0,2$	*	*
black spots	$\leq 0,6$ to 0,4	8	10
	$\leq 0,4$	*	*

* Do not count spots of this size unless concentration causes a smudgy appearance.

CAMERA TUBE

NEWVICON® television camera tube with a photoconductive target composed of cadmium and zinc tellurides featuring high resolution and an extremely high sensitivity extending into the near infrared region.

The XQ1443 is a 1 in diameter camera tube with low heater power, separate mesh, magnetic focusing and deflection, and is mechanically interchangeable with vidicons like the XQ1240/XQ1241 and Newvicon tube XQ1440 and has the same pin connections.

The XQ1443 is intended for use in ultra-sensitive cameras for security and surveillance applications, for example, where its high sensitivity extending into the near infrared, and its high resolution, small size and low power consumption are essential.

CAMERA TUBE

Newwicon® camera tube, mechanically and electron-optically identical to the XQ1440, the major difference being the radiation resistant (anti-browning) faceplate.

The XQ1444 is intended for use in cameras which are subjected to high doses of ionizing radiation.

RADIATION RESISTANT FACEPLATE

The faceplate of the XQ1444 is made of a special type of glass and does not turn brown under the influence of high doses of gamma radiation.

- Maximum dose rate per hour: 5×10^5 Röntgen/hour
- Maximum cumulative dose: 5×10^7 Röntgen
- Maximum decrease of transmission of faceplate:

Maximum decrease	After a cumulative dose of
3%	10^5 Röntgen
10%	10^6 Röntgen
15%	5×10^7 Röntgen

- Maximum increase of dark current at 25 °C after a cumulative dose of 5×10^7 Röntgen: 75%

SENSITIVITY

The typical sensitivity of the XQ1444 is approximately 10% less than for the XQ1440.

For all other information see data of XQ1440.

® Registered trade mark for television camera tubes.

CAMERA TUBE

NEWVICON® television camera tube with a photoconductive target composed of cadmium and zinc tellurides featuring high resolution and an extremely high sensitivity.

The XQ1601 is a ½ in diameter camera tube with very low heater power, separate mesh, electrostatic focusing and magnetic deflection. It is mechanically interchangeable with vidicons like XQ1600 and has the same pin connections.

The XQ1601 is intended for use in ultra-compact cameras for security and surveillance applications, for example, where its high sensitivity and resolution, small size and low power consumption are essential.

focusing coil*		$55 \pm 10\%$

Required currents for normal operation

Line deflection, peak-peak	$150 \text{ mA} \pm 5\%$
Frame deflection, peak-peak	$20 \text{ mA} \pm 5\%$
Focusing, at 5 mT	$120 \text{ mA} \pm 10\%$

Insulation resistance

Between coils, and between coils and earth shield, at 100 V d.c. $>50 \text{ M}\Omega$

Geometric distortion

Barrel, keystone and pin cushion distortion are within 2% at picture height.

Skew: $90^\circ \pm 2^\circ$ (4% of picture height).

* If a positive voltage is applied to the brown lead, the north-seeking pole of a compass should be attracted to the image end of the unit.

DEFLECTION UNIT FOR $\frac{2}{3}$ -inch CAMERA TUBES

with electrostatic focusing

QUICK REFERENCE DATA

	inductance	resistance
Line deflection coils	0,9 mH	4,4 Ω
Frame deflection coils	26 mH	145 Ω

APPLICATION

The KV19G is for use in black and white cameras using front loading $\frac{2}{3}$ -inch camera tubes.

DESCRIPTION

The deflection unit consists of deflection coils and alignment ring magnets for 17,7 mm ($\frac{2}{3}$ -inch) vidicon, Newwicon[®] and similar camera tubes (e.g. XQ1272, XQ1275).

CATALOGUE NUMBER

The catalogue number is 9390 271 20000.

[®] Registered trade mark for television camera tubes.

MECHANICAL DATA

Dimensions in mm

Leads		approx. 50 g
Line deflection coil	red-blue	Alignment ring magnets
Frame deflection coil	green-yellow	Magnet rotation torque (with one ring fixed) 0,01 to 0,1 Nm
Shield	black	Flux density
Length from rear of unit	190 ± 10 mm	max. 0,4 mT
The ends of the leads are stripped for 5 mm		min. 0,03 mT
		Operating temperature
		-10 to +60 °C

ELECTRICAL DATA

7Z86071.1B

coils	inductance mH	resistance Ω
line deflection coils	$0,9 \pm 10\%$	$4,4 \pm 10\%$
frame deflection coils	$26 \pm 10\%$	$145 \pm 10\%$

Required currents for normal operation

Line deflection, peak-peak $100 \text{ mA} \pm 5\%$
 Frame deflection, peak-peak $16 \text{ mA} \pm 5\%$

Insulation resistance

Between coils, and between coils and earth shield $>50 \text{ M}\Omega$

Geometric distortion

Barrel, keystone and pin cushion distortion within 2% of picture height.
 Skew: $90^\circ \pm 2^\circ$ (4% of picture height).

DEFLECTION UNIT FOR $\frac{2}{3}$ -inch CAMERA TUBES
with electrostatic focusing

QUICK REFERENCE DATA

	inductance	resistance
Line deflection coils	0,9 mH	4,4 Ω
Frame deflection coils	26 mH	145 Ω

APPLICATION

The KV19L is for use in black and white cameras using front-loading $\frac{2}{3}$ -inch camera tubes.

DESCRIPTION

The deflection unit consists of deflection coils and alignment ring magnets for 17,7 mm ($\frac{2}{3}$ -inch) diameter Vidicon, Newwicon[®] and similar television camera tubes (e.g. XQ1272, XQ1275).

CATALOGUE NUMBER

The catalogue number is 9390 299 00000.

MECHANICAL DATA

Dimensions in mm

Leads

- Line deflection coil red-blue
- Frame deflection coil green-yellow
- Length from rear of unit 190 ± 10 mm
- The ends of the leads are stripped for 5 mm

Mass 50 g approx.

Alignment ring magnets

Magnet rotation torque (with one ring fixed) 0,01 to 0,1 Nm

Flux density
 max. 0,4 mT
 min. 0,03 mT

Operating temperature -10 to $+60$ °C

ELECTRICAL DATA

coils	inductance mH	resistance Ω
line deflection	$0,9 \pm 10\%$	$4,4 \pm 10\%$
frame deflection	$26 \pm 10\%$	$145 \pm 10\%$

Required currents for normal operation

Line deflection, peak-peak	$100 \text{ mA} \pm 5\%$
Frame deflection, peak-peak	$16 \text{ mA} \pm 5\%$

Insulation resistance

Between coils, and between coils and earth shield, at 100 V d.c. $> 50 \text{ M}\Omega$

Geometric distortion

Barrel, keystone and pin cushion distortion are within 2% of picture height.

Skew: $90^\circ \pm 2^\circ$ (4% of picture height).

DEFLECTION UNIT FOR $\frac{2}{3}$ -inch CAMERA TUBES**QUICK REFERENCE DATA**

	inductance	resistance
Line deflection coils	0,86 mH	3,2 Ω
Frame deflection coils	28 mH	146 Ω
Focus coil	—	55 Ω

APPLICATION

The KV22B is for use in black and white cameras using front-loading $\frac{2}{3}$ -inch camera tubes.

DESCRIPTION

The deflection unit consists of deflection, focus coils and alignment ring magnets for 17,7 mm ($\frac{2}{3}$ -inch) diameter vidicon, Newwicon[®] and similar television camera tubes (e.g. XQ1270, XQ1271 and XQ1274).

CATALOGUE NUMBER

The catalogue number is 9390 299 10000.

MECHANICAL DATA

Dimensions in mm

Mass 280 g approx.

Alignment ring magnets

Magnet rotation torque (with one ring fixed) 0,005 to 0,15 Nm

Flux density

max. 0,5 mT

min. 0,1 mT

Operating temperature -10 to +60 °C

Leads

Line deflection coil red-blue

Frame deflection coil green-yellow

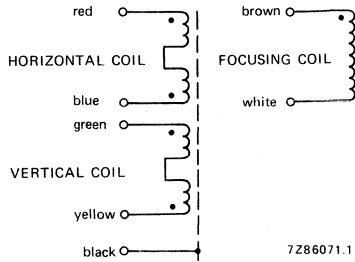

Focus coil brown-white

Shield black

Length from rear of unit 190 ± 10 mm

The ends of the leads are stripped for 5 mm

ELECTRICAL DATA

coils	inductance mH	resistance Ω
line deflection	0,86 ± 7%	3,2 ± 10%
frame deflection	28 ± 10%	146 ± 10%
focus*		55 ± 10%

Required currents for normal operation

Line deflection, peak-peak	150 mA ± 5%
Frame deflection, peak-peak	20 mA ± 5%
Focus, at 5 mT	120 mA ± 10%

Insulation resistance

Between coils, and between coils and shield, at 100 V d.c. > 50 MΩ

Geometric distortion

Barrel, keystone and pin cushion distortion are within 2% of picture height.

Skew: 90 degrees ± 2 degrees (4% of picture height).

* If a positive voltage is applied to the brown lead, the north-seeking pole of a compass should be attracted to the image end of the unit.

DEFLECTION UNIT FOR ½-inch CAMERA TUBES

with electrostatic focusing

QUICK REFERENCE DATA

	inductance	resistance
Line deflection coils	1,4 mH	11,3 Ω
Frame deflection coils	5,7 mH	60,7 Ω

APPLICATION

The KV29E is for use in black and white cameras using front-loading ½-inch camera tubes.

DESCRIPTION

The deflection unit consists of deflection coils and alignment ring magnets for 13,5 mm (½-inch) diameter Vidicon, Newvicon® and similar television camera tubes (e.g. XQ1600, XQ1601).

CATALOGUE NUMBER

The catalogue number is 9390 300 90000.

MECHANICAL DATA

Dimensions in mm

Leads

- Line deflection coil red-blue
- Frame deflection coil orange-yellow
- Shield green

Length from rear of unit 200 ± 10 mm

The ends of the leads are stripped for 5 mm

Mass 22 g approx.

Alignment ring magnets

Magnet rotation torque (with one ring fixed) 0,01 to 0,1 Nm

Flux density

max. 0,5 mT

min. 0,04 mT

Operating temperature -10 to +60 °C

ELECTRICAL DATA

coils	inductance mH	resistance Ω
line deflection	$1,4 \pm 10\%$	$11,3 \pm 10\%$
frame deflection	$5,7 \pm 10\%$	$60,7 \pm 10\%$

Required currents for normal operation

Line deflection, peak-peak $70 \text{ mA} \pm 5\%$
 Frame deflection, peak-peak $26 \text{ mA} \pm 5\%$

Insulation resistance

Between coils, and between coils and earth shield, at 100 V d.c. $> 50 \text{ M}\Omega$

Geometric distortion

Barrel, keystone and pin cushion distortion are within 1,5% of picture height.
 Skew: $90^\circ \pm 1^\circ$ (2% of picture height).

- * V = vidicon tube
 N = Newvicon tube
 D = deflection unit.

For Plumbicon television camera tubes see relevant Data Handbook.

RATING SYSTEM

(in accordance with IEC Publication 134)

ABSOLUTE MAXIMUM RATING SYSTEM

Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, which should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.

The equipment manufacturer should design so that, initially and throughout life, no absolute maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply variation, equipment component variation, equipment control adjustment, load variations, signal variation, environmental conditions, and variations in characteristics of the device under consideration and of all other electronic devices in the equipment.
