**Bipolar, MOS**

**Elcoma** – Philips Electronic Components and Materials Division – embraces a world-wide group of companies operating under the following names:

**IBRAPE**

Miniwatt

Signetics

**Mullard**

**VALVO**

**PHILIPS**

Elcoma offers you a technological partnership in developing your systems to the full. A partnership to which we can bring

- world-wide production and marketing
- know-how
- systems approach
- continuity
- broad product line
- fundamental research
- leading technologies
- applications support
- quality

## DATA HANDBOOK SYSTEM

Our Data Handbook System comprises more than 60 books with specifications on electronic components, subassemblies and materials. It is made up of four series of handbooks:

ELECTRON TUBES	BLUE
SEMICONDUCTORS	RED
INTEGRATED CIRCUITS	PURPLE
COMPONENTS AND MATERIALS	GREEN

The contents of each series are listed on pages iv to viii.

The data handbooks contain all pertinent data available at the time of publication, and each is revised and reissued periodically.

When ratings or specifications differ from those published in the preceding edition they are indicated with arrows in the page margin. Where application information is given it is advisory and does not form part of the product specification.

Condensed data on the preferred products of Philips Electronic Components and Materials Division is given in our Preferred Type Range catalogue (issued annually).

Information on current Data Handbooks and on how to obtain a subscription for future issues is available from any of the Organizations listed on the back cover.

Product specialists are at your service and enquiries will be answered promptly.

## ELECTRON TUBES (BLUE SERIES)

The blue series of data handbooks comprises:

- T1 Tubes for r.f. heating**
- T2a Transmitting tubes for communications, glass types**
- T2b Transmitting tubes for communications, ceramic types**
- T3 Klystrons**
- T4 Magnetrons for microwave heating**
- T5 Cathode-ray tubes**  
Instrument tubes, monitor and display tubes, C.R. tubes for special applications
- T6 Geiger-Müller tubes**
- T8 Colour display systems**  
Colour TV picture tubes, colour data graphic display tube assemblies, deflection units
- T9 Photo and electron multipliers**
- T10 Plumbicon camera tubes and accessories**
- T11 Microwave semiconductors and components**
- T12 Vidicon and Newvicon camera tubes**
- T13 Image intensifiers and infrared detectors**
- T15 Dry reed switches**
- T16 Monochrome tubes and deflection units**  
Black and white TV picture tubes, monochrome data graphic display tubes, deflection units

## SEMICONDUCTORS (RED SERIES)

The red series of data handbooks comprises:

- S1 Diodes**  
Small-signal silicon diodes, voltage regulator diodes (< 1,5 W), voltage reference diodes, tuner diodes, rectifier diodes
- S2a Power diodes**
- S2b Thyristors and triacs**
- S3 Small-signal transistors**
- S4a Low-frequency power transistors and hybrid modules**
- S4b High-voltage and switching power transistors**
- S5 Field-effect transistors**
- S6 R.F. power transistors and modules**
- S7 Surface mounted semiconductors**
- S8a Light-emitting diodes**
- S8b Devices for optoelectronics**  
Optocouplers, photosensitive diodes and transistors, infrared light-emitting diodes and infrared sensitive devices, laser and fibre-optic components
- S9 Power MOS transistors**
- S10 Wideband transistors and wideband hybrid IC modules**
- S11 Microwave transistors**
- S12 Surface acoustic wave devices**
- S13 Semiconductor sensors**

## INTEGRATED CIRCUITS (PURPLE SERIES)

The NEW SERIES of handbooks is now completed. With effect from the publication date of this handbook the "N" in the handbook code number will be deleted. Handbooks to be replaced during 1986 are shown below.

The purple series of handbooks comprises:

IC01	<b>Radio, audio and associated systems</b> Bipolar, MOS	new issue 1986 IC01N 1985
IC02a/b	<b>Video and associated systems</b> Bipolar, MOS	new issue 1986 IC02Na/b 1985
IC03	<b>Integrated circuits for telephony</b> Bipolar, MOS	new issue 1986 IC03N 1985
IC04	<b>HE4000B logic family</b> CMOS	new issue 1986 IC4 1983
IC05N	<b>HE4000B logic family – uncased ICs</b> CMOS	published 1984
IC06N	<b>High-speed CMOS; PC74HC/HCT/HCU</b> Logic family	published 1986
IC08	<b>ECL 10K and 100K logic families</b>	New issue 1986 IC08N 1984
IC09N	<b>TTL logic series</b>	published 1986
IC10	<b>Memories</b> MOS, TTL, ECL	new issue 1986 IC7 1982
IC11N	<b>Linear LSI</b>	published 1985
Supplement to IC11N	<b>Linear LSI</b>	published 1986
IC12	<b>I<sup>2</sup>C-bus compatible ICs</b>	not yet issued
IC13	<b>Semi-custom</b> Programmable Logic Devices (PLD)	new issue 1986 IC13N 1985
IC14N	<b>Microprocessors, microcontrollers and peripherals</b> Bipolar, MOS	published 1985
IC15	<b>FAST TTL logic series</b>	new issue 1986 IC15N 1985
IC16	<b>CMOS integrated circuits for clocks and watches</b>	first issue 1986
IC17	<b>Integrated Services Digital Networks (ISDN)</b>	not yet issued
IC18	<b>Microprocessors and peripherals</b>	new issue 1986*

\* The Microprocessors were included in handbook IC14N 1985, so IC18 will replace that part of IC14N.

## COMPONENTS AND MATERIALS (GREEN SERIES)

The green series of data handbooks comprises:

- C2** Television tuners, coaxial aerial input assemblies, surface acoustic wave filters
- C3** Loudspeakers
- C4** Ferroxcube potcores, square cores and cross cores
- C5** Ferroxcube for power, audio/video and accelerators
- C6** Synchronous motors and gearboxes
- C7** Variable capacitors
- C8** Variable mains transformers
- C9** Piezoelectric quartz devices
- C11** Varistors, thermistors and sensors
- C12** Potentiometers, encoders and switches
- C13** Fixed resistors
- C14** Electrolytic and solid capacitors
- C15** Ceramic capacitors
- C16** Permanent magnet materials
- C17** Stepping motors and associated electronics
- C18** Direct current motors
- C19** Piezoelectric ceramics
- C20** Wire-wound components for TVs and monitors
- C22** Film capacitors

## SELECTION GUIDE

**Functional index**

**Numerical index**

**Maintenance type list**

FUNCTIONAL INDEX

type number	description	page
<b>AM CHANNELS</b>		
TDA1072A	AM receiver circuit for hi-fi and car radios	465
TEA5550	AM car radio receiver circuit	803
TEA5570	RF/IF circuit for AM/FM radio	827
<b>FM CHANNELS</b>		
TCA420A	FM/IF combination	315
TDA1574	integrated FM tuner for radio receivers	589
TDA1576	FM/IF amplifier and detector	597
TDA7000	FM radio circuit; $f_i = 70$ kHz; $V_o = 75$ mW; DIL-18	701
TDA7010T	FM radio circuit; $f_i = 70$ kHz; $V_o = 75$ mW; SO-16	709
TDA7020T	FM stereo/mono radio circuit; $f_i = 76$ kHz; $V_o = 90$ mV	717
TDA7021T	FM stereo/mono radio circuit; low-voltage Micro Tuning System (MTS)	725
TEA5560	FM/IF system	815
TEA5570	RF/IF circuit for AM/FM radio	827
TEA6000	FM/IF system and microcomputer-based tuning interface; I <sup>2</sup> C bus	851
<b>AM/FM COMBINED CHANNELS</b>		
TEA5570	RF/IF circuit for AM/FM radio	827
<b>STEREO DECODERS</b>		
TDA1005A; AT	frequency multiplex PLL stereo decoder	353
TDA1578A	time multiplex PLL stereo decoder with muting system for hi-fi and car radios	609
TDA1598	time multiplex PLL stereo decoder for hi-fi and car radios	641
TEA5580	PLL stereo decoder	841
<b>INTERFERENCE SUPPRESSORS</b>		
TDA1001B; BT	interference and noise suppression circuit for FM receivers	333
<b>TUNING CIRCUITS</b>		
HEF4750V	frequency synthesizer	27
HEF4751V	universal divider	29
SAA1057	radio tuning PLL frequency synthesizer (SYMO II)	121
SAA1300	tuner switching circuit	157
SAB1164	sensitive 1 GHz divider-by-64 ( $R_o = 1$ k $\Omega$ )	279
SAB1165	sensitive 1 GHz divider-by-64 ( $R_o = 0,5$ k $\Omega$ )	279
SAB1256	sensitive 1 GHz divider-by-256	281
SAB6456; T	sensitive 1 GHz divide-by-64/divide-by-256 switchable prescaler	283
TDA1574	integrated FM tuner for radio receivers	589

# FUNCTIONAL INDEX

type number	description	page
<b>ARI SYSTEM</b>		
TDA1579	traffic warning decoder circuit	623
TDA1589	traffic control messages and warning tone circuit	633
<b>BUS-CONTROLLED AUDIO CIRCUITS</b>		
SAA7250A	audio signal processor; I <sup>2</sup> C bus; I <sup>2</sup> S bus; up/down sampling filters	255
SAA7250B	audio signal processor; I <sup>2</sup> C bus; I <sup>2</sup> S bus; reverberation	255
SAA7250C	audio signal processor; I <sup>2</sup> C bus; I <sup>2</sup> S bus; dynamic range controller or 10-band equalizer	255
TDA8420	hi-fi audio processor; I <sup>2</sup> C bus	737
TEA6300	car radio preamplifier and source selector with sound and fader controls; I <sup>2</sup> C bus	863
<b>D.C. CONTROLLED AUDIO CIRCUITS</b>		
TDA1029	signal-sources switch (4 x two channels)	439
TDA1074A	dual tandem electronic potentiometer circuit	481
TDA1524A	stereo-tone/volume control circuit	545
TDA3810	spatial, stereo and pseudo-stereo sound circuit	663
<b>AUDIO POWER AMPLIFIERS</b>		
TDA1010A	6 W audio power amplifier for in-car applications/ 10 W audio power amplifier for mains-fed applications	373
TDA1011	2 to 6 W audio power amplifier; V <sub>O</sub> = 0,7 V (preamplifier)	391
TDA1013A	4 W audio power amplifier with d.c. volume control	407
TDA1015	1 to 4 W audio power amplifier	411
TDA1015T	0,5 W audio power amplifier	421
TDA1020	12 W audio power amplifier for car radios	433
TDA1510	24 W BTL or 2 x 12 W stereo car-radio power amplifier	491
TDA1512; Q	12 to 20 W hi-fi audio power amplifier	497
TDA1514	40 W hi-fi audio power amplifier (e.g. Compact Disc)	503
TDA1515A	24 W BTL or 2 x 12 W stereo car-radio power amplifier	509
TDA1520; Q	20 W hi-fi audio power amplifier; I <sub>tot</sub> = 54 mA	515
TDA1520A; AQ	20 W hi-fi audio power amplifier; I <sub>tot</sub> = 70 mA	521
TDA1521	2 x 12 W hi-fi audio power amplifier	527
TDA2611A	5 W audio power amplifier	649
TDA7050T	low voltage mono/stereo audio power amplifier: stereo 75 mW; BTL 140 mW	733
<b>RECORDER (CASSETTE) AMPLIFIERS/CONTROL CIRCUITS</b>		
TDA1002A	recording and playback amplifier	343
TDA1012	recording/playback and 2 W audio power amplifier	403
TDA1016	recording/playback and 2 W audio power amplifier with thermal protection	427
TDA1522	stereo cassette head preamplifier and equalizer	535
<b>MOTOR SPEED CONTROL CIRCUITS</b>		
SAK150BT	servo-motor control circuit	287
TDA1059B	motor speed regulator with thermal shut-down (V <sub>ref</sub> = 1,3 V)	453
TDA1059C	motor speed regulator (V <sub>ref</sub> = 1,1 V)	453
TDA1559A	motor speed regulator (V <sub>ref</sub> = 1,26 V)	581

type number	description	page
<b>DISPLAY DRIVERS</b>		
PCF2100	LCD duplex driver; 40 segments	71
PCF2110	LCD duplex driver; 60 segments and 2 LEDs	73
PCF2111	LCD duplex driver; 64 segments	75
PCF2112	LCD driver; 32 segments	77
PCF8576	universal LCD driver for low multiplex rates (1:1 to 1:4); max. 160 segments; I <sup>2</sup> C bus	103
PCF8577	LCD direct driver (32 segments) or duplex driver (64 segments); I <sup>2</sup> C bus	105
PCF8577A	LCD direct driver (32 segments) or duplex driver (64 segments); I <sup>2</sup> C bus; different slave address	105
SAA1060	LED display/interface circuit	131
SAA1062A; AT	LCD display/interface circuit	133
SAA1063	fluorescent display/interface circuit	135
<b>PERSONAL RADIO/AUDIO</b>		
TDA7000	FM radio circuit; f <sub>i</sub> = 70 kHz; V <sub>O</sub> = 75 mV; DIL-18	701
TDA7010T	FM radio circuit; f <sub>i</sub> = 70 kHz; V <sub>O</sub> = 75 mV; SO-16	709
TDA7020T	FM stereo/mono radio circuit; f <sub>i</sub> = 76 kHz; V <sub>O</sub> = 90 mV	717
TDA7021T	FM stereo/mono radio circuit; low-voltage Micro Tuning System (MTS)	725
TDA7050T	low voltage mono/stereo audio power amplifier: stereo 75 mW; BTL 140 mW	733
TEA0670T	low voltage Dolby* B & C processor with preamplifier and electronic switch	799
<b>DIGITAL AUDIO CIRCUITS</b>		
SAA7000	interpolation and muting circuit for Compact Disc	169
SAA7010	demodulator for Compact Disc	179
SAA7020	error corrector for Compact Disc	191
SAA7030	digital filter for Compact Disc	205
SAA7210	second generation decoder for Compact Disc	213
SAA7220	second generation digital filter and interpolator for Compact Disc	235
SAA7250A	audio signal processor; I <sup>2</sup> C bus; I <sup>2</sup> S bus; up/down sampling filters	255
SAA7250B	audio signal processor; I <sup>2</sup> C bus; I <sup>2</sup> S bus; reverberation	255
SAA7250C	audio signal processor; I <sup>2</sup> C bus; I <sup>2</sup> S bus; dynamic range controller or 10-band equalizer	255
TDA1534	14-bit ADC	557
TDA1540P	14-bit DAC	565
TDA1541	dual 16-bit DAC	571
TDA5708	photo diode signal processor for Compact Disc players with single spot read-out system	667
TDA5709	radial error signal processor for Compact Disc players	687
<b>DOLBY* CIRCUITS</b>		
TEA0651	Dolby* B & C type noise reduction circuit; THD < 0,1%	755
TEA0652	Dolby* B & C type noise reduction circuit; THD < 0,2%	755
TEA0653T	stereo or 2-channel Dolby* B type noise reduction circuit	773
TEA0654	preamplifier and electronic switch for Dolby* B & C type noise reduction circuits	755
TEA0665; T	Dolby* B & C processor with preamplifier and electronic switch	779
TEA0666; T	Dolby* D & C processor with preamplifier and electronic switch; changed frequency response in relation to TEA0665	789
TEA0670T	low voltage Dolby* B & C processor with preamplifier and electronic switch	799

\* Dolby is a registered trademark of Dolby Laboratories Licensing Corporation, San Francisco, California (U.S.A.).

<b>SINGLE-CHIP 8-BIT MICROCONTROLLERS (continued)</b>				
	<u>RAM</u>	<u>ROM</u>		
MAF8442P	128	4K	plus 8-bit LED driver; extended temperature	DIL-20; SOT-146 33
MAF84A42P	128	4K	plus 8-bit LED driver; automotive temperature; reduced frequency	DIL-20; SOT-146 33
MAF8461P	128	6K	plus 8-bit LED driver; extended temperature	DIL-28; SOT-117D 31
MAF84A61P	128	6K	plus 8-bit LED driver; automotive temperature; reduced frequency	DIL-28; SOT-117D 31
MEA8000	voice synthesizer		DIL-24; SOT-101A	35
OM200/S2	integrated amplifier for hearing aids		SIL-4; SOT-20*	49
OM8200	speech demonstration board (for PCF8200)		standard Eurocard	55
OM8201	speech demonstration box (for OM8200)		special pack	59
OM8210	speech analysis/editing system (for PCF8200)		special pack	61

## SINGLE-CHIP 8-BIT MICROCONTROLLERS (continued)

	<u>RAM</u>	<u>ROM</u>		
PCB80C31P	128	—	ROM-less version of PCB80C51	DIL-40; SOT-129 65
PCB80C31WP	128	—	ROM-less version of PCB80C51	44-PLCC; SOT-187A 65
PCB80C39P	128	—	ROM-less version of PCB80C49	DIL-40; SOT-129 67
PCB80C39WP	128	—	ROM-less version of PCB80C49	44-PLCC; SOT-187A 67
PCB80C49P	128	2K		DIL-40; SOT-129 67
PCB80C49WP	128	2K		44-PLCC; SOT-187A 67
PCB80C51P	128	4K	mask-programmable ROM	DIL-40; SOT-129 65
PCB80C51WP	128	4K	mask-programmable ROM	44-PLCC; SOT-187A 65
PCB8582	256 x 8-bit EEPROM with I <sup>2</sup> C bus interface		DIL-8; SOT-97A	69
PCF2100P	LCD duplex driver; 40 segments		DIL-28; SOT-117D	71
PCF2100T	LCD duplex driver; 40 segments		SO-28; SOT-136A	71
PCF2110P	LCD duplex driver; 60 segments and 2 LEDs		DIL-40; SOT-129	73
PCF2110T	LCD duplex driver; 60 segments and 2 LEDs		VSO-40; SOT-158A	73
PCF2111P	LCD duplex driver; 64 segments		DIL-40; SOT-129	75
PCF2111T	LCD duplex driver; 64 segments		VSO-40; SOT-158A	75
PCF2112P	LCD driver; 32 segments		DIL-40; SOT-129	77
PCF2112T	LCD driver; 32 segments		VSO-40; SOT-158A	77

## SINGLE-CHIP 8-BIT MICROCONTROLLERS (continued)

	<u>RAM</u>	<u>ROM</u>		
PCF80C39P	128	—	ROM-less version of PCF80C49	DIL-40; SOT-129 67
PCF80C49P	128	2K	extended temperature	DIL-40; SOT-129 67
PCF8200	voice synthesizer (CMOS)		DIL-24; SOT-101A	79

Operating temperature range: 0 to 70 °C.

Extended temperature range: -40 to + 85 °C.

Automotive temperature range: -40 to + 110 °C.

\* The package outline is included in the device data sheet.

PCF84C00B	256	—	bond-out version PCF84CXX family 28/28 Piggy-back	93
PCF84C00T	256	—	bond-out version PCF84CXX family VSO-56; SOT-190	93
PCF84C00WP	256	—	bond-out version PCF84CXX family 68-PLCC; SOT-188A	93
PCF84C20D	64	2K	extended temperature DIL-28; SOT-135A	93
PCF84C20P	64	2K	extended temperature DIL-28; SOT-117D	93
PCF84C20T	64	2K	extended temperature SO-28; SOT-136A	93
PCF84C40D	128	4K	extended temperature DIL-28; SOT-135A	93
PCF84C40P	128	4K	extended temperature DIL-28; SOT-117D	93
PCF84C40T	128	4K	extended temperature SO-28; SOT-136A	93
PCF8570P	256 x 8-bit static RAM; I <sup>2</sup> C bus		DIL-8; SOT-97A	95
PCF8570T	256 x 8-bit static RAM; I <sup>2</sup> C bus		SO-8L; SOT-176	95
PCF8571P	128 x 8-bit static RAM; I <sup>2</sup> C bus		DIL-8; SOT-97A	97
PCF8571T	128 x 8-bit static RAM; I <sup>2</sup> C bus		SO-8L; SOT-176	97
PCF8573P	clock/calendar; I <sup>2</sup> C bus		DIL-16; SOT-38	99
PCF8573T	clock/calendar; I <sup>2</sup> C bus		SO-16L; SOT-162A	99
PCF8574P	remote 8-bit I/O expander; I <sup>2</sup> C bus		DIL-16; SOT-38	101
PCF8574T	remote 8-bit I/O expander; I <sup>2</sup> C bus		SO-16L; SOT-162A	101
PCF8576T	universal LCD driver for low multiplex rates (1:1 to 1:4); max. 160 segments; I <sup>2</sup> C bus		VSO-56; SOT-190	103
PCF8576U	universal LCD driver for low multiplex rates (1:1 to 1:4); max. 160 segments; I <sup>2</sup> C bus		uncased in tray	103
PCF8577P	LCD direct driver (32 segments) or duplex driver (64 segments); I <sup>2</sup> C bus		DIL-40; SOT-129	105
PCF8577AP	LCD direct driver (32 segments) or duplex driver (64 segments); I <sup>2</sup> C bus; different slave address		DIL-40; SOT-129	105
PCF8577T	LCD direct driver (32 segments) or duplex driver (64 segments) I <sup>2</sup> C bus		VSO-40; SOT-158A	105
PCF8577AT	LCD direct driver (32 segments) or duplex driver (64 segments); I <sup>2</sup> C bus; different slave address		VSO-40; SOT-158A	105
PNA7509	7-bit, 22 MHz, 3-state output, ADC		DIL-24; SOT-101	107
PNA7518	8-bit, 30 MHz, multiplying DAC		DIL-16; SOT-38WE-1	115
SAA1057	radio tuning PLL frequency synthesizer (SYMO II)		DIL-18; SOT-102HE	121
SAA1060	LED display/interface circuit		DIL-24; SOT-101A	131
SAA1062A	LCD display/interface circuit		DIL-28; SOT-117	133
SAA1062AT	LCD display/interface circuit		SO-28; SOT-136A	133
SAA1063	fluorescent display/interface circuit		DIL-24; SOT-101A	135
SAA1099	stereo sound generator for sound effects and music synthesis ( $\mu$ C controlled)		DIL-18; SOT-102CS	141
SAA1300	tuner switching circuit		SIL-9; SOT-142B	157
SAA3004P	infrared remote control transmitter; $f_{osc} = 455$ kHz; up to 448 commands		DIL-20; SOT-146C1	161

type number	description	package	page
SAA3004T	infrared remote control transmitter; $f_{osc} = 455$ kHz; up to 448 commands	SO-20; SOT-163A	161
SAA3006	low voltage infrared remote control transmitter (RC-5); up to 2048 commands	DIL-28; SOT-117	163
SAA3007P	low voltage infrared remote control transmitter; $f_{osc} = 455$ kHz; up to 1280 commands	DIL-20; SOT-146C1	165
SAA3007T	low voltage infrared remote control transmitter; $f_{osc} = 455$ kHz; up to 1280 commands	SO-20; SOT-163A	165
SAA3028	infrared remote control transcoder (RC-5); I <sup>2</sup> C bus	DIL-16; SOT-38Z	167
SAA7000	interpolation and muting circuit for Compact Disc	DIL-18; SOT-102CS	169
SAA7010	demodulator for Compact Disc	DIL-28; SOT-117	179
SAA7020	error corrector for Compact Disc	DIL-40; SOT-129	191
SAA7030	digital filter for Compact Disc	DIL-24; SOT-101A	205
SAA7210	second generation decoder for Compact Disc	DIL-40; SOT-129	213
SAA7220	second generation digital filter and interpolator for Compact Disc	DIL-24; SOT-101A	235
SAA7250AP	audio signal processor; I <sup>2</sup> C bus; I <sup>2</sup> S bus; up/down sampling filters	DIL-40; SOT-129	255
SAA7250BP	audio signal processor; I <sup>2</sup> C bus; I <sup>2</sup> S bus; reverberation	DIL-40; SOT-129	255
SAA7250CP	audio signal processor; I <sup>2</sup> C bus; I <sup>2</sup> S bus; dynamic range controller or 10-band equalizer	DIL-40; SOT-129	255
SAB1164P	sensitive 1 GHz divider-by-64 ( $R_O = 1$ k $\Omega$ )	DIL-8; SOT-97A	279
SAB1165P	sensitive 1 GHz divider-by-64 ( $R_O = 0,5$ k $\Omega$ )	DIL-8; SOT-97A	279
SAB1256P	sensitive 1 GHz divider-by-256	DIL-8; SOT-97A	281
SAB6456	sensitive 1 GHz divide-by-64/divide-by-256 switchable prescaler	DIL-8; SOT-97A	283
SAB6456T	sensitive 1 GHz divide-by-64/divide-by-256 switchable prescaler	SO-8; SOT-96A	283
SAF1032P	receiver/decoder for infrared operation	DIL-18; SOT-102	285
SAF1039P	remote control transmitter for infrared operation	DIL-16; SOT-38Z	285
SAK150BT	servo-motor control circuit	SO-14; SOT-108A	287
TAA263	low-level amplifier	TO-72; SOT-18/17*	295
TAA320	integrated MOST amplifier	TO-18; SOT-18/13*	299
TAA320A	integrated MOST level sensor	TO-18; SOT-18/13*	309
TCA420A	FM/IF combination	DIL-16; SOT-38	315
TDA1001B	interference and noise suppression circuit for FM receivers	DIL-16; SOT-38	333
TDA1001BT	interference and noise suppression circuit for FM receivers	SO-16; SOT-109A	333
TDA1002A	recording and playback amplifier	DIL-16; SOT-38	343
TDA1005A	frequency multiplex PLL stereo decoder	DIL-16; SOT-38	353
TDA1005AT	frequency multiplex PLL stereo decoder	SO-16; SOT-109A	353
TDA1010A	6 W audio power amplifier for in-car applications/ 10 W audio power amplifier for mains-fed applications	SIL-9; SOT-110B	373
TDA1011	2 to 6 W audio power amplifier; $V_O = 0,7$ V (preamplifier)	SIL-9; SOT-110B	391

\* The package outline is included in the device data sheet.

# NUMERICAL INDEX

type number	description	package	page
TDA1012	recording/playback and 2 W audio power amplifier	DIL-16; SOT-38WE-2	403
TDA1013A	4 W audio power amplifier with d.c. volume control	SIL-9; SOT-110B	407
TDA1015	1 to 4 W audio power amplifier	SIL-9; SOT-110B	411
TDA1015T	0,5 W audio power amplifier	SO-8; SOT-96A	421
TDA1016	recording/playback and 2 W audio power amplifier with thermal protection	DIL-16; SOT-38WE-2	427
TDA1020	12 W audio power amplifier for car radios	SIL-9; SOT-110B	433
TDA1029	signal-sources switch (4 x two channels)	DIL-16; SOT-38	439
TDA1059B	motor speed regulator with thermal shut-down ( $V_{ref} = 1,3 V$ )	TO-126; SOT-32*	453
TDA1059C	motor speed regulator ( $V_{ref} = 1,1 V$ )	TO-126; SOT-32*	459
TDA1072A	AM receiver circuit for hi-fi and car radios	DIL-16; SOT-38	465
TDA1074A	dual tandem electronic potentiometer circuit	DIL-18; SOT-102HE	481
TDA1510	24 W BTL or 2 x 12 W stereo car-radio power amplifier	SBD-13; SOT-141B	491
TDA1512	12 to 20 W hi-fi audio power amplifier	SIL-9; SOT-131B	497
TDA1512Q	12 to 20 W hi-fi audio power amplifier	SBD-9; SOT-157B	497
TDA1514	40 W hi-fi audio power amplifier (e.g. Compact Disc)	SIL-9; SOT-131A	503
TDA1515A	24 W BTL or 2 x 12 W stereo car-radio power amplifier	SBD-13; SOT-141B	509
TDA1520	20 W hi-fi audio power amplifier; $I_{tot} = 54 mA$	SIL-9; SOT-131A	515
TDA1520Q	20 W hi-fi audio power amplifier; $I_{tot} = 54 mA$	SBD-9; SOT-157A	515
TDA1520A	20 W hi-fi audio power amplifier; $I_{tot} = 70 mA$	SIL-9; SOT-131A	521
TDA1520AQ	20 W hi-fi audio power amplifier; $I_{tot} = 70 mA$	SBD-9; SOT-157A	521
TDA1521	2 x 12 W hi-fi audio power amplifier	SIL-9; SOT-131B	527
TDA1522	stereo cassette head preamplifier and equalizer	SIL-9; SOT-142	535
TDA1524A	stereo-tone/volume control circuit	DIL-18; SOT-102HE	545
TDA1534	14-bit ADC	DIL-28; SOT-117BE	557
TDA1540P	14-bit DAC	DIL-28; SOT-117BE	565
TDA1541	dual 16-bit DAC	DIL-28; SOT-117BE-13	571
TDA1559A	motor speed regulator ( $V_{ref} = 1,26 V$ )	TO-126; SOT-32*	581
TDA1574	integrated FM tuner for radio receivers	DIL-18; SOT-102HE	589
TDA1576	FM/IF amplifier and detector	DIL-18; SOT-102HE	597
TDA1578A	time multiplex PLL stereo decoder with muting system for hi-fi and car radios	DIL-18; SOT-102HE	609
TDA1579	traffic warning decoder circuit (ARI system)	DIL-18; SOT-102HE	623
TDA1589	traffic control messages and warning tone circuit	DIL-18; SOT-102HE	633
TDA1598	time multiplex PLL stereo decoder for hi-fi and car radios	DIL-18; SOT-102HE	641
TDA2611A	5 W audio power amplifier	SIL-9; SOT-110B	649
TDA3047P	infrared receiver (positive output voltage)	DIL-16; SOT-38	659
TDA3047T	infrared receiver (positive output voltage)	SO-16L; SOT-162A	659
TDA3048P	infrared receiver (negative output voltage)	DIL-16; SOT-38	661
TDA3048T	infrared receiver (negative output voltage)	SO-16L; SOT-162A	661

\* The package outline is included in the device data sheet.

# NUMERICAL INDEX

type number	description	package	page
TDA3810	spatial, stereo and pseudo-stereo sound circuit	DIL-18; SOT-102HE	663
TDA5708	photo diode signal processor for Compact Disc players with single spot read-out system	DIL-28; SOT-117	667
TDA5709	radial error signal processor for Compact Disc players	DIL-20; SOT-146	687
TDA7000	FM radio circuit; $f_i = 70$ kHz; $V_o = 75$ mW	DIL-18; SOT-102HE	701
TDA7010T	FM radio circuit; $f_i = 70$ kHz; $V_o = 75$ mW	SO-16; SOT-109A	709
TDA7020T	FM stereo/mono radio circuit; $f_i = 76$ kHz; $V_o = 90$ mV	SO-16; SOT-109A	717
TDA7021T	FM stereo/mono radio circuit; low-voltage Micro Tuning System (MTS)	SO-16; SOT-109A	725
TDA7050T	low voltage mono/stereo audio power amplifier: stereo 75 mW; BTL 140 mW	SO-8; SOT-96A	733
TDA8420	hi-fi audio processor; I <sup>2</sup> C bus	DIL-28; SOT-117	737
TEA0651	Dolby* B & C type noise reduction circuit; THD < 0,1%	DIL-18; SOT-102HE	755
TEA0652	Dolby* B & C type noise reduction circuit; THD < 0,2%	DIL-18; SOT-102HE	755
TEA0653T	stereo or 2-channel Dolby* B type noise reduction circuit	SO-20; SOT-163A	773
TEA0654	preamplifier and electronic switch for Dolby* B & C type noise reduction circuits	DIL-24; SOT-101A	755
TEA0665	Dolby* B & C processor with preamplifier and electronic switch	DIL-28; SOT-117	779
TEA0665T	Dolby* B & C processor with preamplifier and electronic switch	SO-28; SOT-136A	779
TEA0666	Dolby* B & C processor with preamplifier and electronic switch; changed frequency response in relation to TEA0665	DIL-28; SOT-117	789
TEA0666T	Dolby* B & C processor with preamplifier and electronic switch; changed frequency response in relation to TEA0665	SO-28; SOT-136A	789
TEA0670T	low voltage Dolby* B & C processor with preamplifier and electronic switch	SO-28; SOT-136A	799
TEA5550	AM car radio receiver circuit	DIL-16; SOT-38	803
TEA5560	FM/IF system	SIL-9; SOT-142	815
TEA5570	RF/IF circuit for AM/FM radio	DIL-16; SOT-38	827
TEA5580	PLL stereo decoder	DIL-16; SOT-38	841
TEA6000	FM/IF system and microcomputer-based tuning interface; I <sup>2</sup> C bus	DIL-18; SOT-102HE	851
TEA6300	car radio preamplifier and source selector with sound and fader controls; I <sup>2</sup> C bus	DIL-28; SOT-117BE	863

## MAINTENANCE TYPE LIST

The types listed below are not included in this handbook. Detailed information will be supplied on request.

SAA1056P	PLL frequency synthesizer	successor type: SAA1057
SAA3027	infrared remote control transmitter (RC-5)	successor type: SAA3006
TCA730A	d.c. volume and balance stereo control circuit	
TCA740A	d.c. treble and bass stereo control circuit	
TDA1011A	2 to 6 W audio power amplifier	successor type: TDA1011
TDA1506	motor regulator and function controller for car cassette systems	
TDA1508	auto-reverse car radio cassette deck steering circuit	
TDA1533	PLL motor speed control circuit for hi-fi applications	

## GENERAL

**Type designation**  
**Rating systems**  
**Handling MOS devices**

PRO ELECTRON TYPE DESIGNATION CODE  
FOR INTEGRATED CIRCUITS

This type nomenclature applies to semiconductor monolithic, semiconductor multi-chip, thin-film, thick-film and hybrid integrated circuits.

A basic number consists of:

*THREE LETTERS FOLLOWED BY A SERIAL NUMBER*

**FIRST AND SECOND LETTER****1. DIGITAL FAMILY CIRCUITS**

The **FIRST TWO LETTERS** identify the **FAMILY** (see note 1).

**2. SOLITARY CIRCUITS**

The **FIRST LETTER** divides the solitary circuits into:

- S : Solitary digital circuits
- T : Analogue circuits
- U : Mixed analogue/digital circuits

The **SECOND LETTER** is a serial letter without any further significance except 'H' which stands for hybrid circuits.

**3. MICROPROCESSORS**

The **FIRST TWO LETTERS** identify microprocessors and correlated circuits as follows:

- MA : { Microcomputer  
Central processing unit
- MB : Slice processor (see note 2)
- MD : Correlated memories
- ME : Other correlated circuits (interface, clock, peripheral controller, etc.)

**4. CHARGE-TRANSFER DEVICES AND SWITCHED CAPACITORS**

The **FIRST TWO LETTERS** identify the following:

- NH : Hybrid circuits
- NL : Logic circuits
- NM : Memories
- NS : Analogue signal processing, using switched capacitors
- NT : Analogue signal processing, using CTDs
- NX : Imaging devices
- NY : Other correlated circuits

**Notes**

1. A logic family is an assembly of digital circuits designed to be interconnected and defined by its basic electrical characteristics (such as: supply voltage, power consumption, propagation delay, noise immunity).
2. By 'slice processor' is meant: a functional slice of microprocessor.

### THIRD LETTER

It indicates the operating ambient temperature range.

The letters A to G give information about the temperature:

- A : temperature range not specified
- B : 0 to + 70 °C
- C : -55 to + 125 °C
- D : -25 to + 70 °C
- E : -25 to + 85 °C
- F : -40 to + 85 °C
- G : -55 to + 85 °C

If a circuit is published for another temperature range, the letter indicating a narrower temperature range may be used or the letter 'A'.

Example: the range 0 to + 75 °C can be indicated by 'B' or 'A'.

### SERIAL NUMBER

This may be either a 4-digit number assigned by Pro Electron, or the serial number (which may be a combination of figures and letters) of an existing company type designation of the manufacturer.

To the basic type number may be added:

#### *A VERSION LETTER*

Indicates a minor variant of the basic type or the package. Except for 'Z', which means customized wiring, the letter has no fixed meaning. The following letters are recommended for package variants:

- C : for cylindrical
- D : for ceramic DIL
- F : for flat pack
- L : for chip on tape
- P : for plastic DIL
- Q : for QIL
- T : for miniature plastic (mini-pack)
- U : for uncased chip

Alternatively a TWO LETTER SUFFIX may be used instead of a single package version letter, if the manufacturer (sponsor) wishes to give more information.

*FIRST LETTER:* General shape

*SECOND LETTER:* Material

- C : Cylindrical
- D : Dual-in-line (DIL)
- E : Power DIL (with external heatsink)
- F : Flat (leads on 2 sides)
- G : Flat (leads on 4 sides)
- K : Diamond (TO-3 family)
- M : Multiple-in-line (except Dual-, Triple-, Quadruple-in-line)
- Q : Quadruple-in-line (QIL)
- R : Power QIL (with external heatsink)
- S : Single-in-line
- T : Triple-in-line

- C : Metal-ceramic
- G : Glass-ceramic (cerdip)
- M : Metal
- P : Plastic

A hyphen precedes the suffix to avoid confusion with a version letter.

## RATING SYSTEMS

The rating systems described are those recommended by the International Electrotechnical Commission (IEC) in its Publication 134.

### DEFINITIONS OF TERMS USED

*Electronic device.* An electronic tube or valve, transistor or other semiconductor device.

Note

This definition excludes inductors, capacitors, resistors and similar components.

*Characteristic.* A characteristic is an inherent and measurable property of a device. Such a property may be electrical, mechanical, thermal, hydraulic, electro-magnetic, or nuclear, and can be expressed as a value for stated or recognized conditions. A characteristic may also be a set of related values, usually shown in graphical form.

*Bogey electronic device.* An electronic device whose characteristics have the published nominal values for the type. A bogey electronic device for any particular application can be obtained by considering only those characteristics which are directly related to the application.

*Rating.* A value which establishes either a limiting capability or a limiting condition for an electronic device. It is determined for specified values of environment and operation, and may be stated in any suitable terms.

Note

Limiting conditions may be either maxima or minima.

*Rating system.* The set of principles upon which ratings are established and which determine their interpretation.

Note

The rating system indicates the division of responsibility between the device manufacturer and the circuit designer, with the object of ensuring that the working conditions do not exceed the ratings.

### ABSOLUTE MAXIMUM RATING SYSTEM

Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, which should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.

The equipment manufacturer should design so that, initially and throughout life, no absolute maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply voltage variation, equipment component variation, equipment control adjustment, load variations, signal variation, environmental conditions, and variations in characteristics of the device under consideration and of all other electronic devices in the equipment.

## DESIGN MAXIMUM RATING SYSTEM

Design maximum ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking responsibility for the effects of changes in operating conditions due to variations in the characteristics of the electronic device under consideration.

The equipment manufacturer should design so that, initially and throughout life, no design maximum value for the intended service is exceeded with a bogey device under the worst probable operating conditions with respect to supply voltage variation, equipment component variation, variation in characteristics of all other devices in the equipment, equipment control adjustment, load variation, signal variation and environmental conditions.

## DESIGN CENTRE RATING SYSTEM

Design centre ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device of a specified type as defined by its published data, and should not be exceeded under normal conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device in average applications, taking responsibility for normal changes in operating conditions due to rated supply voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations in the characteristics of all electronic devices.

The equipment manufacturer should design so that, initially, no design centre value for the intended service is exceeded with a bogey electronic device in equipment operating at the stated normal supply voltage.

## HANDLING MOS DEVICES

Though all our MOS integrated circuits incorporate protection against electrostatic discharges, they can nevertheless be damaged by accidental over-voltages. In storing and handling them, the following precautions are recommended.

### *Caution*

Testing or handling and mounting call for special attention to personal safety. Personnel handling MOS devices should normally be connected to ground via a resistor.

### **Storage and transport**

Store and transport the circuits in their original packing. Alternatively, use may be made of a conductive material or special IC carrier that either short-circuits all leads or insulates them from external contact.

### **Testing or handling**

Work on a conductive surface (e.g. metal table top) when testing the circuits or transferring them from one carrier to another. Electrically connect the person doing the testing or handling to the conductive surface, for example by a metal bracelet and a conductive cord or chain. Connect all testing and handling equipment to the same surface.

Signals should not be applied to the inputs while the device power supply is off. All unused input leads should be connected to either the supply voltage or ground.

### **Mounting**

Mount MOS integrated circuits on printed circuit boards *after* all other components have been mounted. Take care that the circuits themselves, metal parts of the board, mounting tools, and the person doing the mounting are kept at the same electric (ground) potential. If it is impossible to ground the printed-circuit board the person mounting the circuits should touch the board before bringing MOS circuits into contact with it.

### **Soldering**

Soldering iron tips, including those of low-voltage irons, or soldering baths should also be kept at the same potential as the MOS circuits and the board.

### **Static charges**

Dress personnel in clothing of non-electrostatic material (no wool, silk or synthetic fibres). After the MOS circuits have been mounted on the board proper handling precautions should still be observed. Until the sub-assemblies are inserted into a complete system in which the proper voltages are supplied, the board is no more than an extension of the leads of the devices mounted on the board. To prevent static charges from being transmitted through the board wiring to the device it is recommended that conductive clips or conductive tape be put on the circuit board terminals.

### **Transient voltages**

To prevent permanent damage due to transient voltages, do not insert or remove MOS devices, or printed-circuit boards with MOS devices, from test sockets or systems with power on.

### **Voltage surges**

Beware of voltage surges due to switching electrical equipment on or off, relays and d.c. lines.

## FREQUENCY SYNTHESIZER

The HEF4750V frequency synthesizer is one of a pair of LOCMOS devices, primarily intended for use in high-performance frequency synthesizers, e.g. in all communication, instrumentation, television and broadcast applications. A combination of analogue and digital techniques results in an integrated circuit that enables high performance. The complementary device is the universal divider type HEF4751V.

Together with a standard prescaler, the two LOCMOS integrated circuits offer low-cost single loop synthesizers with full professional performance. Salient features offered (in combination with HEF4751V) are:

- Wide choice of reference frequency using a single crystal.
- High-performance phase comparator — low phase noise — low spurious.
- System operation to  $> 1$  GHz.
- Typical 15 MHz input at 10 V.
- Flexible programming:
  - frequency offsets
  - ROM compatible
  - fractional channel capability.
- Programme range  $6\frac{1}{2}$  decades, including up to 3 decades of prescaler control.
- Division range extension by cascading.
- Built-in phase modulator.
- Fast lock feature.
- Out-of-lock indication.
- Low power dissipation and high noise immunity.

### APPLICATION INFORMATION

Some examples of applications for the HEF4750V in combination with the HEF4751V are:

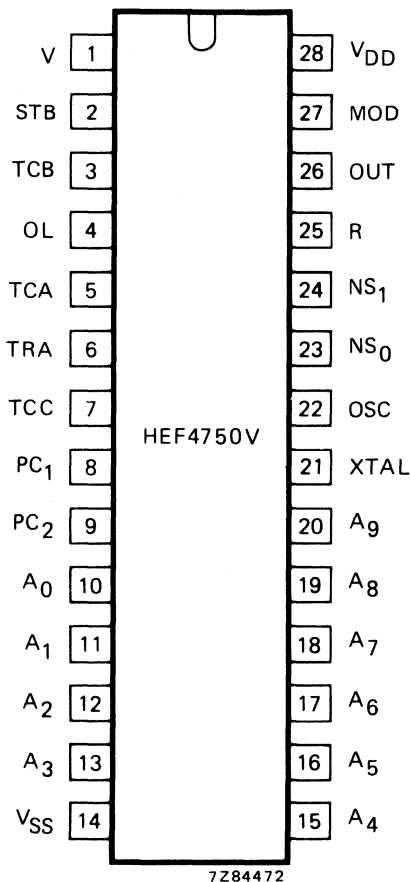

- VHF/UHF mobile radios.
- HF s.s.b. transceivers.
- Airborne and marine communications and nav aids.
- Broadcast transmitters.
- High quality radio and television receivers.
- High performance citizens band equipment.
- Signal generators.

## UNIVERSAL DIVIDER

The HEF4751V is a universal divider (U.D.) intended for use in high performance phase lock loop frequency synthesizer systems. It consists of a chain of counters operating in a programmable feedback mode. Programmable feedback signals are generated for up to three external (fast)  $\div 10/11$  prescaler.

The system comprising one HEF4751V U.D. together with prescalers is a fully programmable divider with a maximum configuration of: 5 decimal stages, a programmable mode M stage ( $1 \leq M \leq 16$ , non-decimal fraction channel selection), and a mode H stage ( $H = 1$  or  $2$ , stage for half channel offset). Programming is performed in BCD code in a bit-parallel, digit-serial format.

To accommodate fixed or variable frequency offset, two numbers are applied in parallel, one being subtracted from the other to produce the internal programme.

The decade selection address is generated by an internal programme counter which may run continuously or on demand. Two or more universal dividers can be cascaded, each extra U.D. (in slave mode) adds two decades to the system. The combination retains the full programmability and features of a single U.D. The U.D. provides a fast output signal FF at output OFF, which can have a phase jitter of  $\pm 1$  system input period, to allow fast frequency locking. The slow output signal FS at output OFS, which is jitter-free, is used for fine phase control at a lower speed.

## SINGLE-CHIP 8-BIT MICROCONTROLLER

### DESCRIPTION

The MAB84XX family of microcontrollers is fabricated in NMOS. The family consists of the following devices:

- MAB8401 – 128 RAM bytes, external program memory plus 8-bit LED-driver (10 mA), emulation of MAB/F8422/42\* possible
- MAB/F8411 – 1K ROM/ 64 RAM bytes plus 8-bit LED-driver
- MAB/F8421 – 2K ROM/ 64 RAM bytes plus 8-bit LED-driver
- MAB/F8441 – 4K ROM/128 RAM bytes plus 8-bit LED-driver
- MAB/F8461 – 6K ROM/128 RAM bytes plus 8-bit LED-driver

Each version has 20 quasi-bidirectional I/O port lines, one serial I/O line, one single-level vectored interrupt, an 8-bit timer event counter and on-board clock oscillator and clock circuits. Two 20-pin versions, MAB/F8422 and MAB/F8442\* are also available.

This microcontroller family is designed to be an efficient controller as well as an arithmetic processor. The instruction set is based on that of the MAB8048. The microcontrollers have extensive bit handling abilities and facilities for both binary and BCD arithmetic.

For detailed information see the "Users manual Single-chip microcomputers" (supplied upon request).

\* See data sheet on MAB/F8422/42.

### Features

- 8-bit: CPU, ROM, RAM and I/O in a single 28-lead DIL package
- 1K, 2K, 4K or 6K ROM bytes plus a ROM-less version
- 64 or 128 RAM bytes
- 20 quasi-bidirectional I/O port lines
- Two testable inputs: one of which can be used to detect zero cross-over, the other is also the external interrupt input
- Single level vectored interrupts: external, timer/event counter, serial I/O
- Serial I/O that can be used in single or multi-master systems (serial I/O data via an existing port line and clock via a dedicated line)
- 8-bit programmable timer/event counter
- Internal oscillator, generated with inductor, crystal, ceramic resonator or external source
- Over 80 instructions (based on MAB8048) all of 1 or 2 cycles
- Single 5 V power supply ( $\pm 10\%$ )
- Operating temperature ranges: 

0 to + 70 °C	MAB84XX family
-40 to + 85 °C	MAF84XX family (extended temperature)
-40 to + 110 °C	MAF84AXX family (automotive temperature)

### PACKAGE OUTLINES

MAB8401B: 28-lead 'Piggy-back' package (with up to 28-pin EPROM on top).

MAB8401WP: 68-lead plastic leaded chip-carrier (PLCC) (SOT-188A).

MAB/F8411/21/41/61P: 28-lead DIL; plastic (SOT-117D).

MAF84A11/A21/A41/A61P: 28-lead DIL; plastic (SOT-117D).

## SINGLE-CHIP 8-BIT MICROCONTROLLER

The MAB8422/8442 is a high-performance microcontroller incorporating dedicated hardware, memory capacity and I/O lines. This dedication means a microcontroller can be economically installed in high-volume products where its main function is control.

The MAB8422/8442 is a 20 pin, single-chip 8-bit microcontroller that has been developed from the 28 pin MAB8421/8441 microcontrollers. The versions are:

- MAB8422 - 2K ROM/64 RAM bytes plus 8-bit LED-driver
- MAB8442 - 4K ROM/128 RAM bytes plus 8-bit LED-driver

Each version has 15 I/O port lines comprising one 8-bit parallel port (P0), one 2-bit parallel port (P10 and P11 that are shared with the serial I/O lines SDA and SCL), one 3-bit parallel port (P20-P22) and two input lines ( $\overline{\text{INT}}/\text{T0}$  and T1).

The serial I/O interface is I<sup>2</sup>C compatible and therefore the MAB8422/8442 can operate as a slave or a master in single and multi-master systems. Conversion from parallel to serial data when transmitting, and vice versa when receiving, is done mainly in software. There is a minimum of hardware for the serial I/O implemented. This hardware is controlled by the status of the SDA and SCL lines and can be read or written under software control. Standard software for I<sup>2</sup>C-bus control is available on request.

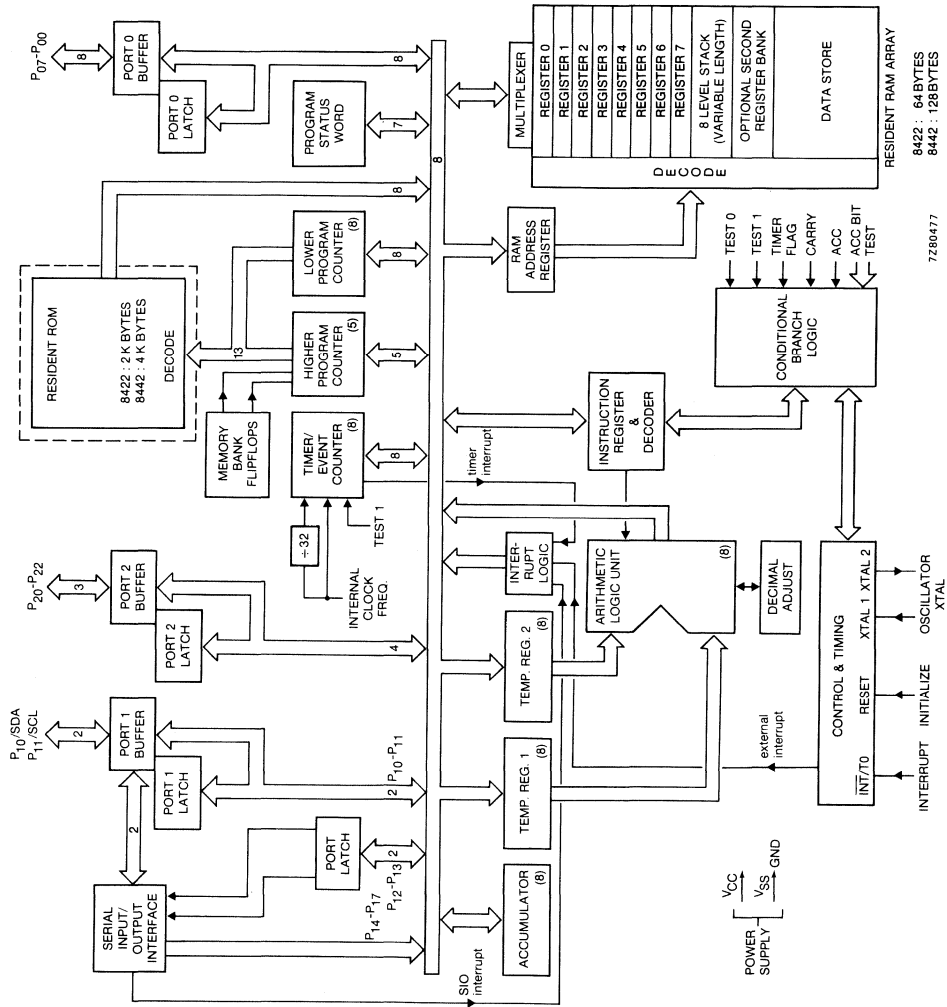

### Features

- 8-bit: CPU, ROM, RAM and I/O
- 20 pin package
- MAB8422: 2K ROM/64 RAM bytes
- MAB8442: 4K ROM/128 RAM bytes
- 13 quasi-bidirectional I/O port lines
- Two testable inputs  $\overline{\text{INT}}/\text{T0}$  and T1
- High current output on P0 ( $I_{OL} = 10 \text{ mA}$  at  $V_{OL} = 1 \text{ V}$ )
- One interrupt line combined with the testable input line  $\overline{\text{INT}}/\text{T0}$
- Single-level interrupts: external, timer/event counter, serial I/O
- I<sup>2</sup>C-compatible serial I/O that can be used in single or multi-master systems (serial I/O data and clock via P10 and P11 port lines, respectively)
- 8-bit programmable timer/event counter
- Internal oscillator, generated with inductor, crystal, ceramic resonator or external source
- Over 80 instructions (based on MAB8048)
- All instructions 1 or 2 cycles, cycle time dependent on oscillator frequency
- Single 5 V power supply
- 0 to 70 °C operating temperature range, also versions for -40 to 85 °C (extended temperature range) and -40 to 110 °C (automotive temperature range)

## VOICE SYNTHESIZER

### GENERAL DESCRIPTION

The MEA8000 is a 24-pin N-MOS integrated circuit for generating good quality speech from digital code with a programmable bit rate. The circuit is primarily intended for applications in microprocessor controlled systems, where the speech code is stored separately.

### Features

- Interfaces easily with most popular microprocessors and microcomputer
- 8-bit wide data bus
- 32-bit wide data buffer holding speech frame codes
- Digital filter of 8th order with 3 programmable formant frequencies, one fixed formant frequency, and 4 programmable formant bandwidths
- Programmable amplitudes
- Programmable duration of each frame; 8, 16, 32 or 64 ms
- Synthesis occupies less than 1% of control processor time
- Capable of sophisticated unvoiced sound generation
- Crystal controlled oscillator or external (TTL) clock
- Minimal external audio filter requirement
- Single + 5 V power supply

### QUICK REFERENCE DATA

Fig. 2 Pinning diagram.

**FUNCTIONAL DESCRIPTION (pin number)****Control**

D0 to D7	(10 to 3)	Data bus to which command or speech can be written.
D7	(3)	Data port via which the status can be read.
$\overline{CE}$	(12)	Chip enable (chip select).
$\overline{W}$	(23)	Write.
$\overline{R/W}$	(22)	Read/Write The control signals $\overline{W}$ and $\overline{R/W}$ allow connections to most microcomputers or microprocessors (see timing diagrams).
A0	(11)	Data/control input: discriminates between speech code input buffer (A0 = '0') and command register (A0 = '1') during a 'write' operation.
$\overline{REQ}$	(2)	Data request (open drain output); output signal which follows inverse of the status REQ bit, but only if enabled by either the ROE bit in the command register or the external REQEN pin.
$\overline{REQEN}$	(14)	Request enable input; $\overline{REQEN}$ = '0' enables the status REQ output, independent of the status of the command register.

**Timing**

OSC IN	(16)	Connections for internal clock oscillator; nominal crystal frequency 4 MHz.
OSC OUT	(17)	
CLK IN	(18)	Clock input for external clock, TTL compatible, 4 MHz.
CLK OUT	(21)	A buffered output for the internal clock cycle (which is equal to CLK divided by 3). May be used as a clock, for a microprocessor, for example.

**Output**

REF	(19)	Input pin for biasing the audio output level. This reference current can be derived from a resistor to the positive supply.
OUT	(20)	Speech output; this output is a 64 kHz pulse, modulated in both width and amplitude. It is configured as a current sink with a saturating voltage of about 3 V.

**Supply**

V <sub>DD</sub>	(13)	Single supply voltage, nominally 5 V, but battery operation is possible.
V <sub>SS</sub>	(1)	Ground.
TEST	(24)	Used for testing purposes. Changes other pin functions. Must be tied to ground for user operation.
NC	(15)	It is recommended to ground this pin.

**HANDLING**

Inputs and outputs are protected against electrostatic charge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices (see 'Handling MOS Devices').

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	conditions	symbol	min.	max.	unit

Control hold		t <sub>CH</sub>	20	—	—	ns

**Notes**

1. The circuit will continue to operate from a supply of up to 6,5 V, but without necessarily meeting the specification.
2. This is also valid for V<sub>DD</sub> = 0 V.
3. This permits the connection of the output load to a supply higher than that supplying the synthesizer.
4. Timing reference level is 1,5 V.
5. An external pull-up resistor is required, as this is an open drain output.  
The time (t<sub>RH</sub>) to reach 2,0 V is specified at a load to 5 V of 3,3 kΩ and 50 pF.
6. Between two data write operations of one speech frame.
7. Levels greater than 2,0 V for a '1' or less than 0,8 V for a '0' are reached with a load of one TTL input and 50 pF.
8. Typical voltage level at the REF pin is 2,5 V.

## OPERATION PRINCIPLE

The MEA8000 has been designed for a vocal tract modelling technique of voice synthesis. This method gives the lowest possible bit rate for speech quality which is acceptable for most industrial applications.

Figure 3 shows a simplified electronic model of the human vocal tract as a formant synthesizer. A combination of a periodic signal, representing the pitch of the original speech, and an aperiodic signal, representing the unvoiced sound in the speech. Both these signals are fed to a variable filter comprising four resonators (via an amplifier which controls the amplitude of the synthesized sound). The resonators model the sound in accordance with the formants in the original speech. Each resonator is controlled by two parameters, one for the resonant frequency and one for the bandwidth.

The information required to control the synthesizer is:

- pitch
  - amplitude
  - voice/unvoiced source selector
  - filter control
- } excitation source (vocal cords)
- } spectrum shaping (vocal tract)

A good replica of the original speech is obtained by periodic updating of this control information.

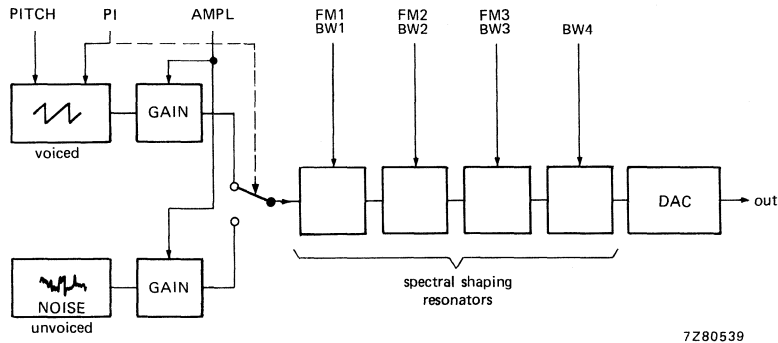

Fig. 3 Electronic model of human vocal tract.

## OPERATION

Speech is generated by suitable filtering of a relatively low frequency sawtooth waveform for voiced sounds, or of random noise for unvoiced sounds. New parameters for both the digital waveform generator and the digital filter are supplied to the synthesizer in coded groups of 4 bytes via the data bus. The code group also contains the duration of the next speech frame to be produced (8, 16, 32 or 64 ms).

The output sample rate is 64 kHz or 8 times the internal sample rate with linear interpolation in between. This greatly reduces the need for an external analogue output filter.

### Modes of operation

1. **STOP mode:** characterised by a silent output and the status  $\overline{REQ}$  bit set to '1'. This mode is entered from power up or by STOP command. The mode is entered automatically if at the end of an active speech frame the next four parameter bytes are not yet received while the CONT bit in the command register is a '0'. In the latter case the final speech frame will be repeated once but with a decaying amplitude and the same pitch.
2. **ACTIVE mode:** a speech sample is being produced.
3. **CONTINUOUS mode:** entered if an active speech frame is finished and new data is not supplied in time while the CONT bit in the command register is a '1'. The synthesizer will repeat the last speech frame indefinitely until all four new data bytes are received, or a STOP command, or a reset of the CONT bit.

**Speech code input buffer**

Speech code is written to the synthesizer when  $\overline{CE}$  and  $\overline{W}$  are both '0', while  $\overline{R}/W = '1'$  and  $A0 = '0'$ . Also the status  $REQ$  bit must read a '1', otherwise the synthesizer is still busy and will not react to a data write operation.

Starting from the STOP mode, the first data will be interpreted as a starting value for the PITCH. Thereafter every four successive data bytes are treated as a group of speech code. The coded speech frame format is shown in Fig. 4.

7Z80540

Fig. 4 Format of coded speech frame.

code	bits	parameter
PITCH	8	initial value for pitch
FD	2	speech frame duration
PI	5	pitch increment (rate of change) or noise selection
AMPL	4	amplitude
FM1	5	frequency of 1st formant
FM2	5	frequency of 2nd formant
FM3	3	frequency of 3rd formant
FM4	0	frequency of 4th formant (fixed)
BW1	2	bandwidth of 1st formant
BW2	2	bandwidth of 2nd formant
BW3	2	bandwidth of 3rd formant
BW4	2	bandwidth of 4th formant

During each data write operation, the status  $REQ$  bit will be cleared to '0'.

It appears within a few microseconds, requesting the next byte of the group.

The request for the first byte of the next group always appears shortly after the beginning of the current speech frame, and all four bytes must be provided before it finishes. This leaves the control circuit (i.e. microprocessor) enough time to use polling, instead of interrupts, as the minimum time of a speech is 8 ms.

When in the STOP mode the synthesizer will commence producing sound after receipt of 1 + 4 bytes.

**Status bit**

The status bit is accessed at  $\overline{CE} = \overline{R}/W = '0'$ .

The status of  $\overline{W}$  and  $A0$  are arbitrary.

Pin D7 reveals the request for a (next) speech code byte: '0' = busy, '1' = request for data.

**Command register**

A command is written to the synthesizer at  $\overline{CE} = \overline{W} = '0'$  while  $A0 = \overline{R}/W = '1'$ .

D7	D6	D5	D4	D3	D2	D1	D0
			STOP	CONT enable	CONT	ROE enable	ROE
NOT USED			'0' = INVALID  '1' = STOP	00 = INVALID 01 = INVALID 10 = SLOW STOP  11 = CONTINUE	00 = INVALID 01 = INVALID 10 = <u>DISABLE</u> REQ OUTPUT  11 = <u>ENABLE</u> REQ OUTPUT		

**STOP** Stop mode. This results in an immediate reset of the synthesizer to the STOP mode. The ROE and CONT are not affected by this command.

**CONT** Continuous mode. This bit can be set or cleared only if the corresponding CONT enable bit is programmed as a '1'. In the continuous mode the synthesizer will not revert to the STOP mode if all four parameters are not received before the end of the current speech frame, but repeat it indefinitely.

If CONT = '1' the last frame will be repeated once with decaying amplitude and the same pitch before the stop mode is entered.

**ROE** Request Output Enable. This can be set or cleared only if the corresponding ROE enable bit is a '1'. ROE determines whether the request in the status bit appears on the REQ pin.

Note: the same can be achieved by connecting the REQEN pin (request enable) to a '0'.

After power on, the command register bits CONT and ROE will both be zero. Thus power on equals the command 00011010 = 1 A (hexadecimal).

**Control signals**

With the three control signals  $\overline{CE}$ ,  $\overline{W}$  and  $\overline{R}/W$  the synthesizer is made compatible with most microprocessors and microcomputers.

$\overline{CR}$	$\overline{W}$	$\overline{R}/W$	A0	Operation
0	0	1	0	WRITE DATA
0	0	1	1	WRITE COMMAND
0	X	0	X	READ STATUS
0	1	1	X	} 3-STATE DATA BUS
1	X	X	X	

**Power supply**

During (slow) power up or power down the circuit will not produce any spurious sound. As soon as the supply is high enough for reliable operation, the circuit will be in the STOP mode with ROE = CONT = '0'.

**Timing diagrams**

The control signals  $\overline{CE}$ ,  $\overline{R/W}$  and  $\overline{W}$  have been specified to enable easy interface to most microprocessors and microcomputers. For instance, with connection to an MAB8048 microcomputer the  $\overline{R/W}$  and  $\overline{W}$  inputs can be used as the  $\overline{RD}$  and  $\overline{WR}$  strobe inputs.

## INTEGRATED AMPLIFIER

### for use in ear hearing aids

Monolithic integrated circuit amplifier in a plastic envelope, primarily intended for use in ear hearing aids.

#### QUICK REFERENCE DATA

For meaning of symbols see test circuit

Supply voltage	$V_{1-3}$	max.	5 V
Supply current	$I_2$	max.	5 mA
Total power dissipation up to $T_{amb} = 25\text{ }^{\circ}\text{C}$	$P_{tot}$	max.	25 mW

The following data are measured in test circuit

Total supply current	$I_{tot}$	typ.	1 mA
Transducer gain	$G_{tr}$	>	77 dB
		typ.	85 dB
Output power at $d_{tot} = 10\%$	$P_o$	>	0,2 mW
Cut-off frequency (-3 dB)	$f_c$	>	20 kHz

#### PACKAGE OUTLINE (Dimensions in mm)

SOT-20

#### CIRCUIT DIAGRAM

The sealing of the plastic envelope withstands the accelerated damp heat test of IEC recommendation 68-2 (test D, severity IV, 6 cycles).

**RATINGS** Limiting values in accordance with the Absolute Maximum System (IEC 134)

Voltages

Supply voltage	$V_{1-3}$	max.	5 V
Output voltage	$V_{2-3}$	max.	5 V <sup>1)</sup>
Input voltage	$-V_{4-3}$	max.	5 V

Currents

Output current	$I_2$	max.	5 mA
Input current	$I_4$	max.	5 mA

Power dissipation

Power derating curve

Temperatures

Storage temperature	$T_{stg}$	-20 to +80	$^{\circ}C$
Ambient temperature (see derating curve above)	$T_{amb}$	-20 to +80	$^{\circ}C$

1) This value may be exceeded during inductive switch-off for transient energies  $< 10\mu Ws$ .

**CHARACTERISTICS** at  $V_{1-3} = 1,3 \text{ V}$ ;  $I_2 = 0,7 \text{ mA}$  and  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$  unless otherwise specified

Supply currents (no signal)

$I_{\text{tot}}$	<	1,1	mA
$I_1$	typ.	0,30	mA

Transducer gain at  $f = 1 \text{ kHz}$

$G_{\text{tr}}$	>	77	dB 1)
	typ.	85	dB

Total distortion at  $f = 1 \text{ kHz}$

$P_o = 100 \text{ } \mu\text{W}$

$d_{\text{tot}}$	typ.	4	%
	<	6	%

$P_o = 200 \text{ } \mu\text{W}$

$d_{\text{tot}}$	<	10	%
------------------	---	----	---

Noise figure at  $R_S = 5 \text{ k}\Omega$

$B = 400 \text{ to } 3200 \text{ Hz}$

$F$	typ.	2,5	dB 2)
	<	6	dB

Cut-off frequency (-3 dB)

$f_c$	>	20	kHz
-------	---	----	-----

Value of  $R_F$  to adjust  $I_2$  at  $0,7 \text{ mA}$

$R_F$	170 to 1000	k $\Omega$	
	typ.	400	k $\Omega$

Test circuit

Note

$I_2 = 0,7 \text{ mA}$ ; adjusted by means of  $R_F$   
 $V_{1-3} = 1,3 \text{ V}$ ;  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$

1) The transducer gain is defined as the ratio of the output power in the load  $|Z| = 1,5 \text{ k}\Omega$  and the available input power of the source with  $R_S = 5 \text{ k}\Omega$ .

$$G_{\text{tr}} = \frac{P_o}{V_i^2 / 4 R_S}$$

2) Due to special processing and pre-measuring, the flutter-noise level is extremely low.

**SOLDERING RECOMMENDATIONS**

1. Iron soldering

At a maximum iron temperature of 300 °C the maximum permissible soldering time is 3 seconds, provided the solder spot is at least 0,5 mm from the seal and the leads are not soldered at the same time. Soldering in immediate subsequence is allowed.

2. Dipsoldering

At a maximum solder temperature of 250 °C the maximum permissible soldering time is 3 seconds, provided the soldered spot is at least 0,5 mm from the seal.

**CHARACTERISTICS**

The graph applies to test circuit on previous page.

## LOW COST SPEECH DEMONSTRATION BOARD

### GENERAL DESCRIPTION

The low cost speech demonstration board is designed to add voice output to existing card based electronic equipment with the minimum of additional effort and components. The majority of components used are of the CMOS type with low power consumption making the board suitable for battery operation.

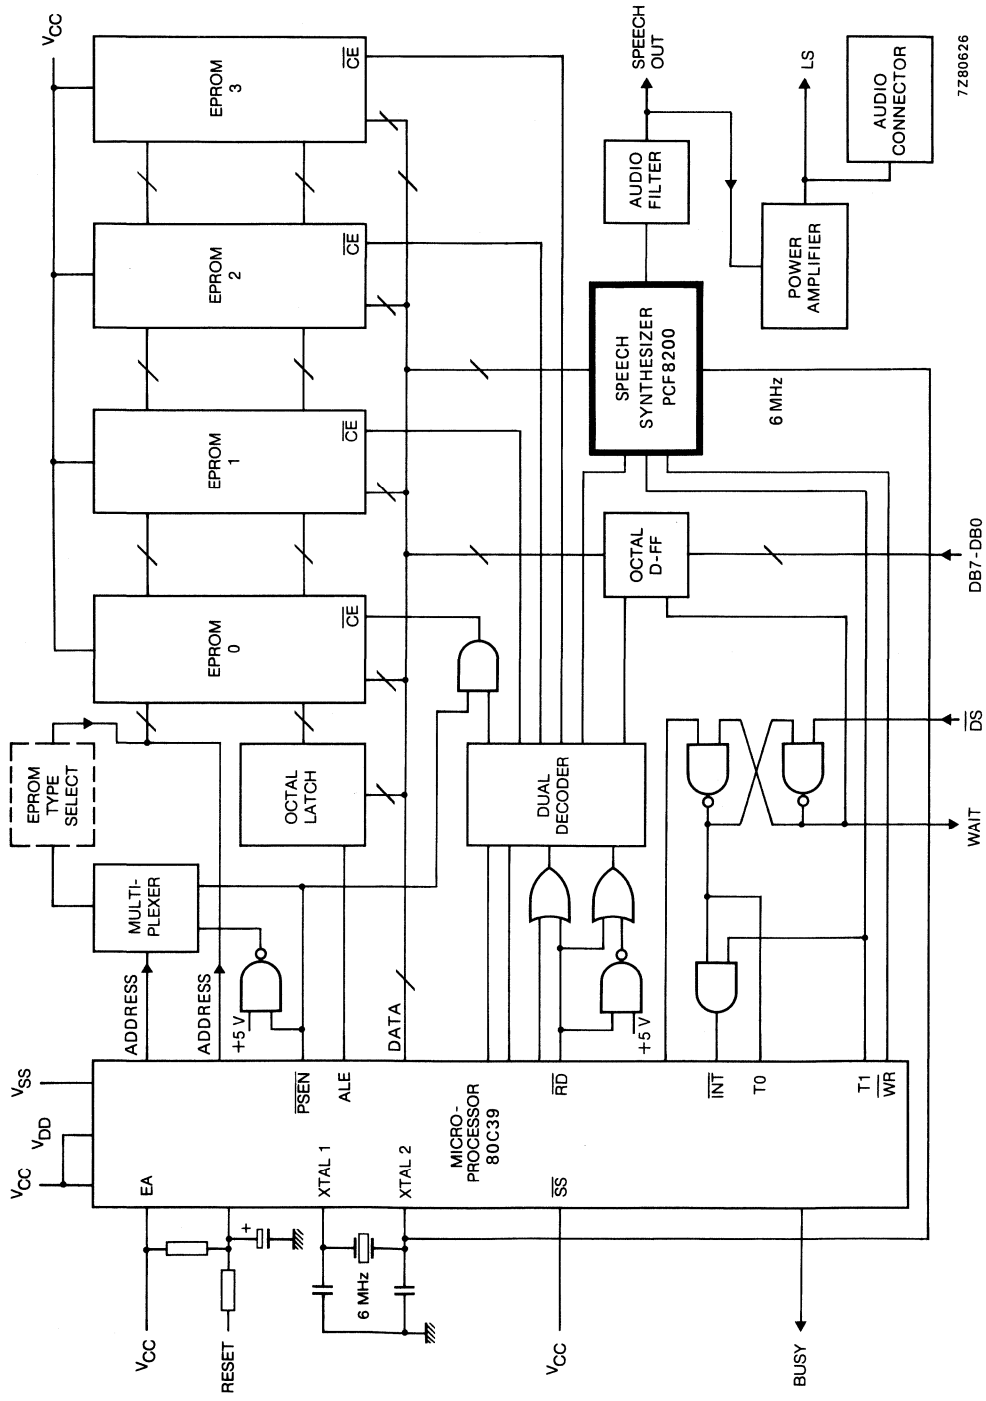

Applications include speech evaluation and speech demonstration.

### FEATURES

- PCF8200 speech synthesizer
  - Male and female speech of very high quality
  - CMOS technology
  - Extended operating temperature range
  - Programmable speaking speed
- Low current consumption
  - All major components use CMOS technology (PCF8200, 80C39 and 27C64)
- Very large vocabulary up to 12 minutes
  - 4 EPROM sockets
  - EPROM selection for 27C16 to 27C256
  - Low data rates for synthesizer (average 1500 bits per second)
- Easy interfacing
  - 8-bit parallel data bus/key switch input
  - Volume control, speaker connection
  - Control signals (e.g. RESET, BUSY etc etc)
- Simple operating modes
  - ROM selection
  - Word sequence within a ROM
  - Repeat last utterance
  - Control software is readily customizable
  - To implement parameter download from external source
- Single Eurocard size PC board
- Single + 5 V supply
- Low cost

### APPLICATIONS

- OEM design-in
- May be simply used with many card systems for speech evaluation
- Speech demonstration
  - Particularly simple when used with the OM8201 (Speech Demonstration Box)

7280626

Fig. 1 Block diagram.

## OPERATION

### HARDWARE DESCRIPTION

The main controlling microprocessor is an 80C39 running at 6 MHz. This device supplies all of the main controlling signals for the board operation and the interfacing to any external system. Four sockets are provided for EPROMS which contain speech coding. These may be 27C16 types, through to 27C256 types; the sockets will be a low insertion force type to allow for easy customizing. The board will be supplied with one socket occupied by a 27C64 which will contain the control program and some speech examples. All four EPROM sockets must contain the same EPROM type.

The speech synthesizer PCF8200 converts the coding into a speech output. This synthesizer has been designed to simulate the human vocal tract using five formants for male and four formants for female speech. Periodic updating of the parameters for these formants can produce very high quality speech.

The output of the synthesizer can be fed into an audio amplifier, TDA7050, via a resistor-capacitor filter network which provides a frequency cut-off above 5 kHz of about 25 dB. The configuration of the audio amplifier used on this board gives an output of 140 mW peak power into a 25  $\Omega$  speaker from a 5 V supply.

Connections are made to the board via a standard DIN/IEC connector. This allows access to the 8-bit parallel data bus so that speech coding from an external source may be used, if implemented, and allows the selection of speech phrases by an external system, such as a microcomputer or even a bank of switches. The same connector also permits the addition of a volume control, loudspeaker, a high impedance audio output, and power supply. The control signals RESET, BUSY, WAIT and DS are also taken to the outside of the board. There is also a loudspeaker plug on the board.

All components are contained on a standard single Eurocard, and therefore suitable for rack mounted equipment.

### SOFTWARE DESCRIPTION

All the software required to operate the board is contained in the only EPROM supplied. The software is written in modular form so that it is possible for a customer to alter or add to any particular function which suits his applications. An industrial standard microprocessor was chosen so that readily available development systems could be used to facilitate this modification.

There are four main modes of operation:

- ROM Selection
- Word Sequence
- Repeat Word
- Speaking Speed Selection

These modes are all controlled by software.

ROM Selection mode permits access to an individual EPROM and pronounces the first utterance from that EPROM.

Word Sequence gives the next word (activated by repeated access to the same EPROM) and if continually exercised will keep looping on the words in that EPROM.

The Repeat Word command allows indefinite repetition of the last utterance pronounced.

The Speaking Speed Selection allows the utterance to be pronounced at a different speed.

The software also controls the address sequencing within the utterance and ensures that the required data is supplied to the synthesizer.

There are also some examples of words/utterances encoded in the remainder of the supplied EPROM. These words are intended for demonstration purposes and will show the features of the synthesizer when selected. The main features being illustrated are:

- Male speech in several languages
- Female speech in several languages
- Programmable speaking speed

**ORDERING INFORMATION**

**Product name:** Low Cost Speech Demonstration Board

**Type number:** OM8200

**Ordering code:** 9337 541 30000

Orders should be placed with your local Philips/Signetics agency.

## SPEECH DEMONSTRATION BOX

### GENERAL DESCRIPTION

Speech demonstration box OM8201 is designed to be used in conjunction with the low cost speech demonstration board OM8200. The box contains all the necessary components to drive the board. The combination of these two components make an extremely attractive demonstration unit.

### FEATURES

- Low cost
- Can use unmodified OM8200 board which allows access to all features of the OM8200
- Single + 9 V supply
  - Low power consumption therefore permits battery operation
  - External power supplies may also be used
  - Voltage is regulated and dropped to a standard + 5 V for the OM8200 board
- Simple mechanical construction
  - Allows easy access to the OM8200 for changing EPROMS
- Contains all peripherals needed to drive the OM8200

### HARDWARE DESCRIPTION

The box contains a set of eight keypad switches which are connected to the data bus. Four switches can select which EPROM your speech data is derived from. Repeated pressing of an EPROM switch increments the expression number which will be uttered. To repeat the last expression, a separate switch must be activated.

It is possible in the PCF8200 to change the rate of speaking to 73%, 123% or 145% of the normal speed. A switch has been included on the box which will sequence through the speed options making the same utterance every time.

One of the two remaining switches is the master reset for the program and the other is for future enhancements of the box.

Included in the box are, the volume control for the amplifier, the loudspeaker, and a high impedance audio output.

The final piece of electronics is the power supply. This can be supplied from a +9 V internal battery or from a +9 V external supply. The +9 V is regulated to a +5 V supply which is then fed to other parts of the box and to the OM8200.

The box is of simple construction and allows easy access to the OM8200 for changing of EPROMS.

### SOFTWARE DESCRIPTION

There is no software in the OM8201. The software of the OM8200 may be used in an unmodified form without any problems. However, if changes have been made to the control program of the OM8200 then different functions for the switches of the box can be achieved.

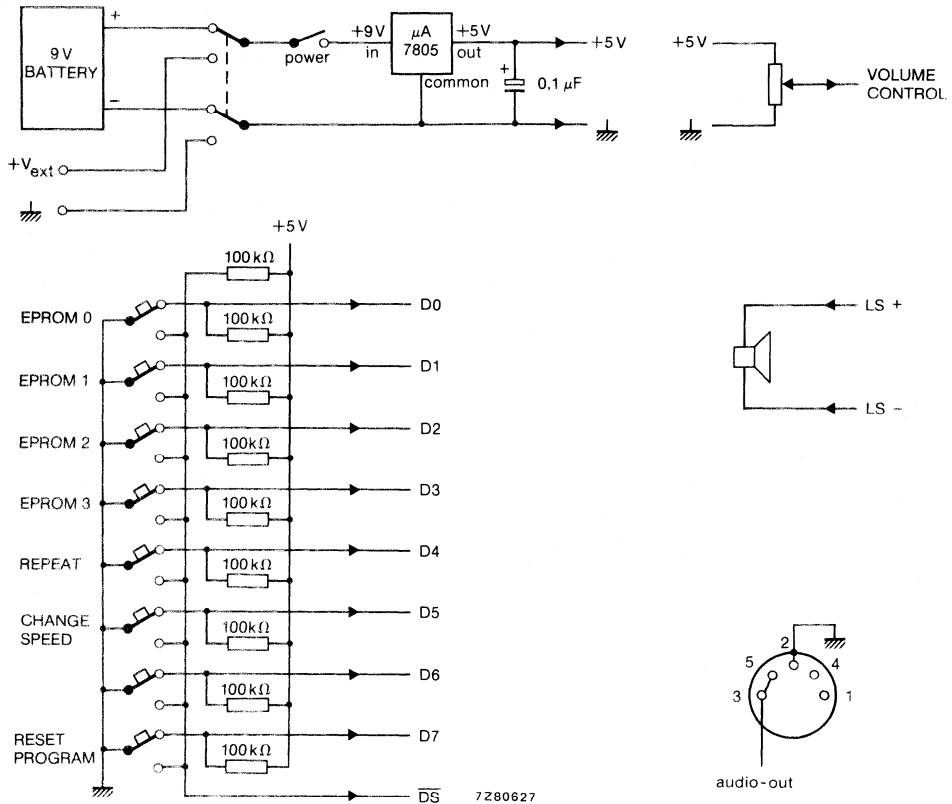

Fig. 1 Schematic diagram.

**ORDERING INFORMATION**

**Product name:** Speech Demonstration Box

**Type number:** OM8201

**Ordering code:** 9337 541 40000

**N.B.** OM8200 must be ordered as well if this box is to be used in demonstration mode.  
The order number for the OM8200 is 9337 541 30000.

Orders should be placed with your local Philips/Signetics agent.

### SPEECH ANALYSIS/EDITING SYSTEM

#### GENERAL DESCRIPTION

The OM8210 is a speech analysing/editing system, and comprises of a speech adapter box and associated software. The system uses either the HP9816S or IBM-PC personal computer.

The OM8210 and the computer function together to produce speech coding for the PCF8200.

The system has many commands available, mostly single key operations, which gives it flexibility.

#### FEATURES

- Input sampling of analogue speech signals
- Speech analysis
- Graphic parameter representation
- Parameter editing screen
- Conversion of parameters to PCF8200 synthesizer
- EPROM programming
- Parameter storage on floppy disc
- Speech output via PCF8200 voice synthesizer

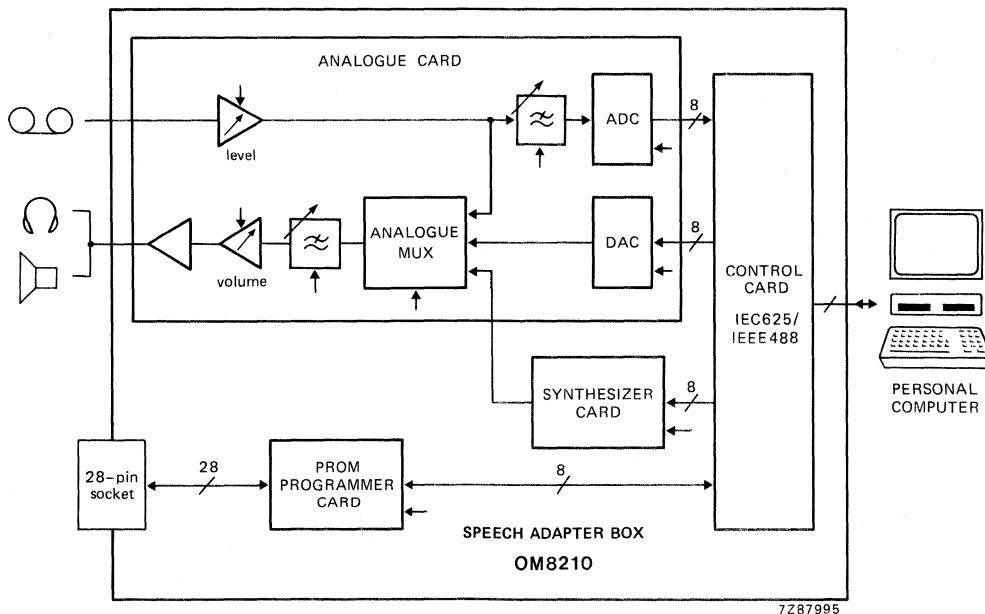

Fig. 1 Block diagram.

## HARDWARE DESCRIPTION

The hardware for the OM8210 is contained in an attractive box with access to all the interconnections (IEC 625, interface loudspeaker, headphones, tape input, and EPROM socket), from the front panel. There are four single Eurocards and a power supply forming the speech adapter box.

These cards are:

- Analogue Card
- Synthesizer Card
- EPROM Card
- Control Card

### Analogue Card

On this card, the level of the recorded audio input signal is adjusted by an electronic potentiometer. Before the audio is sampled, frequencies higher than half the sampling frequency are removed by a switched capacitor filter of the type normally used for codecs. A 12-bit analogue-to-digital converter (ADC) produces the digital samples that are sent to the control card. An 8-bit digital-to-analogue converter (DAC) on the analogue card allows the sampled speech to be output. The audio input signal, the sampled speech and the synthesized speech are selected by an analogue multiplexer, filtered, and adjusted for volume before reproduction by a loudspeaker.

The use of integrated electronic potentiometers and codec filters substantially reduces the number of components required while maintaining high performance.

### Synthesizer Card

This card accommodates the PCF8200 voice synthesizer and a small amount of peripheral components and a socket for the MEA8000 voice synthesizer.

### EPROM Programmer Card

This card allows four different types of EPROM (2716, 2732, 2732A and 2764) to be programmed under software control. All the hardware to generate the programming voltages and the programming waveforms are on this card.

### Control Card

This card performs three functions:

- IEC 625/IEEE 488 interface
- Control sequencer
- Clock generator

The IEC/IEEE interface is a simple talker/listener implementation with a HEF4738 circuit.

An FPLA control sequencer provides the handshake signals for IEC/IEEE interface and the chip enable signals for the rest of the system (the ADC, the DAC, the synthesizer and control circuits).

The filter sampling frequency is generated with a software programmable PLL frequency synthesizer. The speech sampling frequency is derived from the filter sampling frequency by frequency division. Hence, the filter frequency cut-off and the sample rate of the ADC and the DAC are automatically linked.

The hardware includes all the necessary cables, adapter plug, loudspeaker, headphone and power supply.

## SOFTWARE DESCRIPTION

The software for this speech coding system has been developed and arranged for optimum user convenience. There are eight modes available.

Each mode and each command in the mode is selected by single key entries. Commands that can destroy data have to be confirmed before they are executed. More than 100 commands are available. The modes are:

Sample Mode	Samples and digitizes the recorded speech, the amplitude can be checked and speech segments selected. The sampled speech is stored in a memory and can be displayed or made audible.
Analysis Mode	Generates speech parameters from samples. The analysis selects the voiced/unvoiced sections, extracts the formants (5 for male and 4 for female), amplitude, and the pitch, and quantizes the speech parameters.
Parameter Edit Mode	Speech parameters are displayed graphically on the VDU and can be edited to correct errors in the analysis, improve speech quality by altering contours, or amplitudes, concatenate sounds and optimize data rate by editing the frame duration.
Code Mode	Generates PCF8200 code and permits the arrangement of utterances in the optimum order of application. This mode also generates the address map at the head of the EPROM.
EPROM Mode	Used to program/read EPROMS with data for the code memory also possible is a new check, bit check and verification commands.
File Mode	Stores speech parameters or codes on disc, can also assemble code speech segment from an already existing library.
Media Mode	For diskette initialization and making back-up copies.
Option Mode	Allows the system configuration to be read or changed.

The software is supplied on two diskettes, one labelled 'BOOT' which wakes up the system and also contains the system library routines. The other diskette labelled 'SPEECH' contains the speech program, the disc initialization and the file handler programs. The 'BOOT' disc is not required during operation, giving a free disc drive with the system for a diskette to store speech parameter files.

### Computer System

The following equipment is required to make a complete Hewlett Packard based editing system:

- HP9816S-630 (optimum computer type) or HP9817
- HP9121D (dual floppy disc)
- Additional memory card for the HP9816S (512 K bytes total required)

The following equipment is required to make a complete IBM based editing system:

- IBM-PC or PC-XT or Philips P3100
- Additional memory (512 K recommended)
- Display graphics card (Hercules monochrome)
- IEEE488 card (Tecmar Rev. D.)

## ORDERING INFORMATION

<b>Product name:</b>	Speech Analysis/Editing System
<b>Type number:</b>	OM8210
<b>Ordering code:</b>	9337 561 50112

The computer system should be purchased from your local agents.  
The OM8210 should be ordered through your local Philips/Signetics agent.

## SINGLE-CHIP 8-BIT MICROCONTROLLER

### DESCRIPTION

The PCB80C51 family of single-chip 8-bit microcontrollers is manufactured in an advanced CMOS process. The family consists of the following members:

- PCB80C31: ROM-less version of the PCB80C51
- PCB80C51: 4 K bytes mask-programmable ROM, 128 bytes RAM

In the following, the generic term "PCB80C51" is used to refer to both family members.

The device provides hardware features, architectural enhancements and new instructions to function as a controller for applications requiring up to 64 K bytes of program memory and/or up to 64 K bytes of data storage.

The PCB80C51 contains a non-volatile 4 K x 8 read-only program memory (not ROM-less version); a volatile 128 x 8 read/write data memory; 32 I/O lines; two 16-bit timer/event counters; a five-source, two-priority-level, nested interrupt structure; a serial I/O port for either multi-processor communications, I/O expansion, or full duplex UART; and on-chip oscillator and timing circuits. For systems that require extra capability, the PCB80C51 can be expanded using standard TTL compatible memories and logic.

The PCB80C31/80C51 has two software selectable modes of reduced activity for further power reduction — Idle and Power Down.

The Idle modes freezes the CPU while allowing the RAM, timers, serial port and interrupt system to continue functioning.

The Power Down mode saves the RAM contents but freezes the oscillator causing all other chip functions to be inoperative.

The device also functions as an arithmetic processor having facilities for both binary and BCD arithmetic plus bit-handling capabilities. The instruction set consists of 255 instructions; 44% one-byte, 41% two-byte and 15% three-byte. With a 12 MHz crystal, 58% of the instructions are executed in 1  $\mu$ s and 40% in 2  $\mu$ s. Multiply and divide instructions require 4  $\mu$ s. Multiply, divide, subtract and compare are among the many instructions added to the standard PCB80C48 instruction set. Software development to be announced: PCB85C51 in piggy-back and 84 pin PLCC.

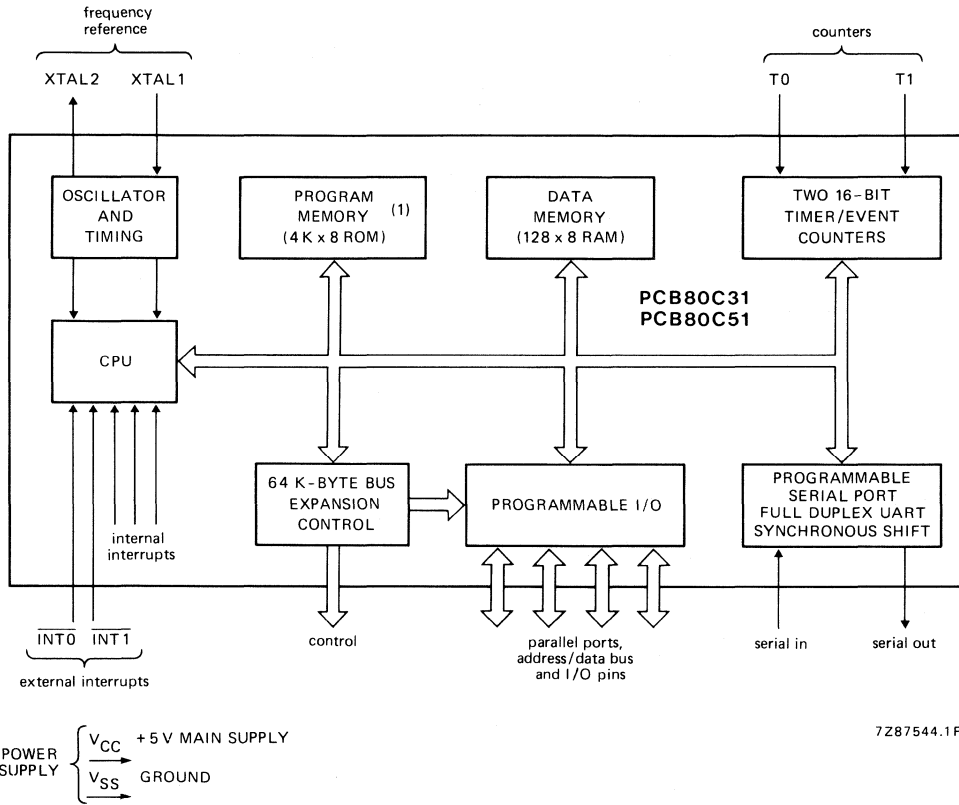

### Features

- 4 K x 8 ROM (80C51 only), 128 x 8 RAM
- Four 8-bit ports, 32 I/O lines
- Two 16-bit timer/event counters
- Full-duplex serial port
- External memory expandable to 128 K, external ROM up to 64 K and/or external RAM up to 64 K
- Boolean processing
- 218 bit-addressable locations
- On-chip oscillator
- Five-source interrupt structure with two priority levels
- 58% of instructions executed in 1  $\mu$ s; multiply and divide in 4  $\mu$ s; all others executed in 2  $\mu$ s (at 12 MHz clock)
- Enhanced architecture with:
  - non-page-oriented-instructions
  - direct addressing
  - four 8-byte + 1 byte register banks
  - stack depth up to 128-bytes
  - multiply, divide, subtract and compare instructions.

### PACKAGE OUTLINES

PCB80C31/51P: 40-lead DIL; plastic (SOT-129).

PCB80C31/51WP: 44-lead PLCC; plastic, leaded-chip-carrier (SOT-187A).

(1) PCB80C51 only.

Fig. 1 Block diagram.

## SINGLE-CHIP 8-BIT CMOS MICROCONTROLLER

### DESCRIPTION

The PC80CXX family of single-chip 8-bit CMOS microcontrollers consists of:

- The PCB80C49 with resident mask programmed ROM.
- The PCB80C39 without resident program memory for use with external EPROM/ROM.

All versions are pin and function compatible to their NMOS counter parts but with additional features and high performance.

The PC80CXX family are designed to be efficient control processors as well as arithmetic processors. Their instruction set allows the user to directly set and reset individual I/O lines as well as test individual bits within the accumulator. A large variety of branch and table look-up instructions enable efficient implementation of standard logic functions. Code efficiency is high; over 70% of the instructions are single byte; all others are two byte.

An on-chip 8-bit counter is provided, which can count either machine cycles ( $\div 32$ ) or external events. The counter can be programmed to cause an interrupt to the processor.

Program and data memories can be expanded using standard devices. Input/output capabilities can be expanded using standard devices.

The family has low power consumption and in addition a power down mode is provided.

### FEATURES

- 8-bit CPU, ROM, RAM, I/O in a single 40-pin package
- PCB80C49: 2K x 8 ROM, 128 x 8 RAM
- Internal counter/timer
- Internal oscillator, clock driver
- Single-level interrupts: external and counter/timer
- 17 internal registers: accumulator, 16 addressable registers
- Over 90 instructions: 70% single byte
- All instructions: 1 or 2 cycles
- Easily expandable memory and I/O
- TTL compatible inputs and outputs
- Single 5 V supply
- Wide frequency operating range
- Low current consumption
- Also available with extended temperature range;  
PCF 80CXX =  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$

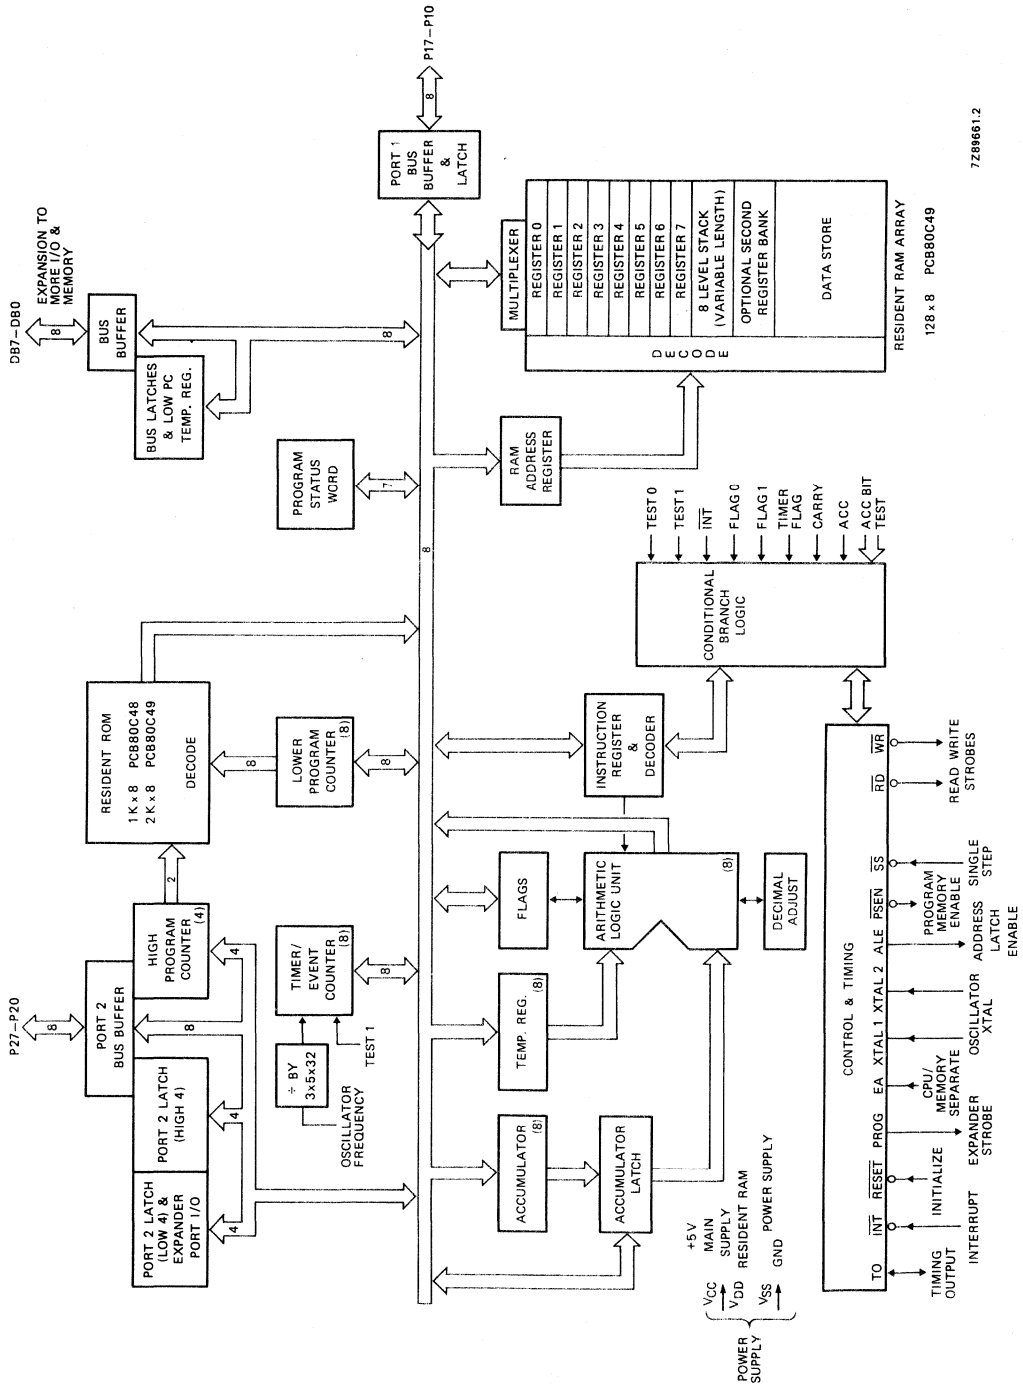

### APPLICATIONS

- Peripheral interfaces and controllers
- Test and measurement instruments
- Sequencers
- Audio/video systems
- Environmental control systems
- Modems and data enciphering

### PACKAGE OUTLINES

PCB/F80C39/C49P: 40-lead DIL; plastic (SOT-129).

PCB80C39/C49WP: 44-lead plastic leaded chip-carrier (PLCC); SOT-187A.

## DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

PCB8582

FOR DETAILED INFORMATION SEE RELEVANT DATA BOOK OR DATA SHEET

## STATIC CMOS EEPROM (256 x 8 BIT)

### GENERAL DESCRIPTION

The PCB8582 is a 2K-bit 5 V electrically erasable programmable read only memory (EEPROM) organized as 256 by 8 bits. It is designed in a floating gate CMOS technology.

As data bytes are received and transmitted via the serial I<sup>2</sup>C bus, an eight pin DIL package is sufficient. Up to eight PCB8582 devices may be connected to the I<sup>2</sup>C bus.

Chip select is accomplished by three address inputs.

### Features

- Non-volatile storage of 2K-bit organized as 256 x 8
- Only one power supply required (5 V)
- On chip voltage multiplier for erase/write
- Serial input/output bus (I<sup>2</sup>C)
- Automatic word address incrementing
- Low power consumption
- One point erase/write timer
- Power on reset
- 10 000 erase/write cycles per byte
- 10 years non-volatile data retention
- Infinite number of read cycles
- Pin and address compatible to PCF8570, PCF8571 and PCD8572

### PACKAGE OUTLINE

PCB8582P: 8-lead DIL; plastic (SOT-97A).

Fig. 1 Block diagram.

FOR DETAILED INFORMATION SEE RELEVANT DATA BOOK OR DATA SHEET

## LCD DUPLEX DRIVER

### GENERAL DESCRIPTION

The PCF2100 is a single chip, silicon gate CMOS circuit designed to drive an LCD (Liquid Crystal Display) with up to 40 segments in a duplex manner; specially for low voltage applications. A three-line bus structure enables serial data transfer with microcontrollers. All inputs are CMOS/NMOS compatible.

### Features

- 40 LCD-segment drive capability
- Supply voltage 2,25 to 6,5 V
- Low current consumption
- Serial data input
- CBUS control
- One-point built-in oscillator
- Expansion possibility

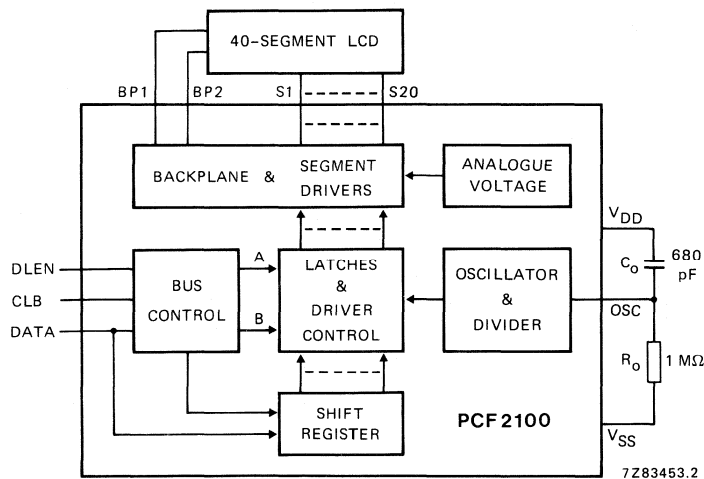

Fig. 1 Block diagram.

### PACKAGE OUTLINES

PCF2100P: 28-lead DIL; plastic (SOT-117D).

PCF2100T: 28-lead mini-pack; plastic (SO-28; SOT-136A).

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage with respect to $V_{SS}$	$V_{DD}$	-0,3 to 8 V
Voltage on any pin	$V_n$	$V_{SS} - 0,3$ to $V_{DD} + 0,3$ V
Operating ambient temperature range	$T_{amb}$	-40 to + 85 °C
Storage temperature range	$T_{stg}$	-55 to + 125 °C

**HANDLING**

Inputs and outputs are protected against electrostatic charge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices (see 'Handling MOS devices').

**CHARACTERISTICS**

$V_{DD} = 2,25$  to  $6,5$  V;  $V_{SS} = 0$  V;  $T_{amb} = -40$  to + 85 °C;  $R_o = 1$  M $\Omega$ ;  $C_o = 680$  pF; unless otherwise specified

## LCD DUPLEX DRIVER

### GENERAL DESCRIPTION

The PCF2110 is a single chip, silicon gate CMOS circuit designed to drive 2 LEDs (Light Emitting Diodes) and an LCD (Liquid Crystal Display) with up to 60 segments in a duplex manner; specially for low voltage applications. A three-line bus structure enables serial data transfer with microcontrollers. All inputs are CMOS/NMOS compatible.

### Features

- 60 LCD-segment drive capability
- Two LED-driver outputs
- Supply voltage 2,25 to 6,5 V
- Low current consumption
- Serial data input
- CBUS control
- One-point built-in oscillator
- Expansion possibility

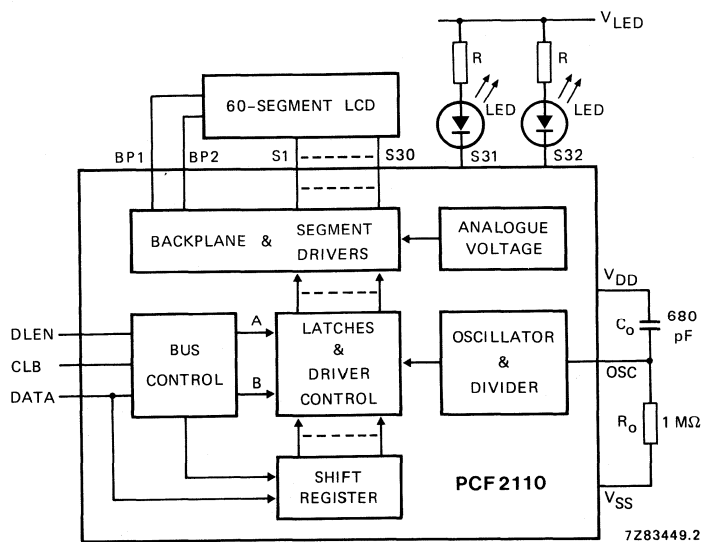

Fig. 1 Block diagram.

### PACKAGE OUTLINES

PCF2110P: 40-lead DIL; plastic (SOT-129).

PCF2110T: 40-lead mini-pack; plastic (VSO-40; SOT-158A).

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage with respect to $V_{SS}$	$V_{DD}$	-0,3 to 8 V
Voltage on any pin	$V_n$	$V_{SS} - 0,3$ to $V_{DD} + 0,3$ V
Operating ambient temperature range	$T_{amb}$	-40 to + 85 °C
Storage temperature range	$T_{stg}$	-55 to + 125 °C

**HANDLING**

Inputs and outputs are protected against electrostatic charge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices (see 'Handling MOS devices').

**CHARACTERISTICS**

$V_{DD} = 2,25$  to  $6,5$  V;  $V_{SS} = 0$  V;  $T_{amb} = -40$  to  $+ 85$  °C;  $R_O = 1$  M $\Omega$ ;  $C_O = 680$  pF; unless otherwise specified

## LCD DUPLEX DRIVER

### GENERAL DESCRIPTION

The PCF2111 is a single chip, silicon gate CMOS circuit designed to drive an LCD (Liquid Crystal Display) with up to 64 segments in a duplex manner; specially for low voltage applications. A three-line bus structure enables serial data transfer with microcontrollers. All inputs are CMOS/NMOS compatible.

### Features

- 64 LCD-segment drive capability
- Supply voltage 2,25 to 6,5 V
- Low current consumption
- Serial data input
- CBUS control
- One-point built-in oscillator
- Expansion possibility

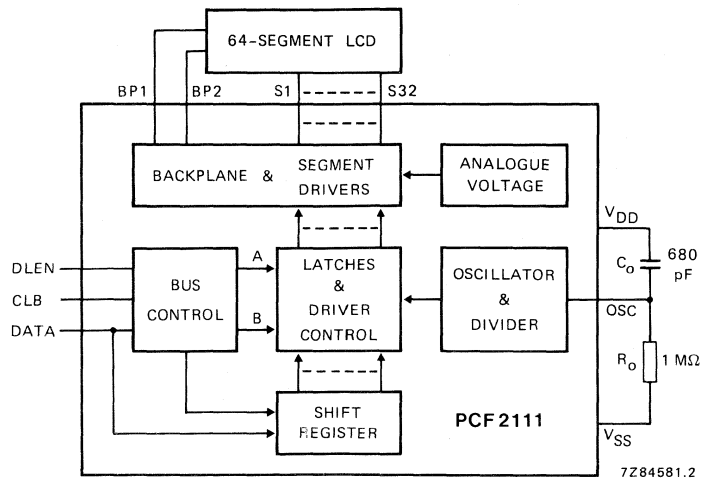

Fig. 1 Block diagram.

### PACKAGE OUTLINES

PCF2111P: 40-lead DIL; plastic (SOT-129).

PCF2111T: 40-lead mini-pack; plastic (VSO-40; SOT-158A).

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage with respect to $V_{SS}$	$V_{DD}$	-0,3 to 8 V
Voltage on any pin	$V_n$	$V_{SS} - 0,3$ to $V_{DD} + 0,3$ V
Operating ambient temperature range	$T_{amb}$	-40 to + 85 °C
Storage temperature range	$T_{stg}$	-55 to + 125 °C

**HANDLING**

Inputs and outputs are protected against electrostatic charge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices (see 'Handling MOS devices').

**CHARACTERISTICS**

$V_{DD} = 2,25$  to  $6,5$  V;  $V_{SS} = 0$  V;  $T_{amb} = -40$  to  $+ 85$  °C;  $R_o = 1$  M $\Omega$ ;  $C_o = 680$  pF; unless otherwise specified

## LCD DRIVER

### GENERAL DESCRIPTION

The PCF2112 is a single chip, silicon gate CMOS circuit designed to drive an LCD (Liquid Crystal Display) with up to 32 segments in direct drive; specially for low voltage applications. A three-line bus structure enables serial data transfer with microcontrollers. All inputs are CMOS/NMOS compatible.

### Features

- 32 LCD-segment drive capability.
- Supply voltage 2,25 to 6,5 V.
- Low current consumption.
- Serial data input.
- CBUS control.
- One-point built-in oscillator.
- Expansion possibility.

Fig. 1 Block diagram.

### PACKAGE OUTLINES

PCF2112P: 40-lead DIL; plastic (SOT-129).

PCF2112T: 40-lead mini-pack; plastic (VSO-40; SOT-158A).

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage with respect to $V_{SS}$	$V_{DD}$	-0,3 to 8 V
Voltage on any pin	$V_n$	$V_{SS}-0,3$ to $V_{DD} + 0,3$ V
Operating ambient temperature range	$T_{amb}$	-40 to +85 °C
Storage temperature range	$T_{stg}$	-55 to +125 °C

**HANDLING**

Inputs and outputs are protected against electrostatic charge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices (see 'Handling MOS devices').

**CHARACTERISTICS**

$V_{DD} = 2,25$  to  $6,5$  V;  $V_{SS} = 0$  V;  $T_{amb} = -40$  to  $+85$  °C;  $R_O = 1$  M $\Omega$ ;  $C_O = 1,5$  nF; unless otherwise specified.

### VOICE SYNTHESIZER

#### GENERAL DESCRIPTION

The PCF8200 is a CMOS integrated circuit for generating good quality speech from digital code with a programmable bit rate. The circuit is primarily intended for applications in microprocessor controlled systems, where the speech code is stored separately.

Applications include automotive, telephony, personal computers, annunciators, aids for the handicapped, and general industrial devices.

#### Features

- Male and female speech with good quality
- Speech-band from 0 to 5 kHz
- Bit-rate between 455 bits/second and 4545 bits/second
- Programmable frame duration
- Programmable speaking speed
- CMOS technology
- Operating temperature range  $-40$  to  $+85$  °C
- Single 5 V supply with low power consumption and power-down stand-by mode
- Interfaces easily with most popular microcomputers and microprocessors through 8 bit parallel bus or I<sup>2</sup>C bus
- Software readable status word (parallel bus or I<sup>2</sup>C bus)
- BUSY-signal and REQN-signal hardware readable
- Internal low-pass filter and 11-bit D/A converter

#### QUICK REFERENCE DATA

Operating ambient temperature range	T <sub>amb</sub>				-40 to + 85 °C
Storage temperature range	T <sub>stg</sub>				-55 to + 125 °C

\* Any pin with respect to V<sub>SS</sub>.

**FUNCTIONAL DESCRIPTION**

The synthesizer has been designed for a vocal tract modelling technique of voice synthesis. An excitation signal is fed to a series of resonators. Each resonator simulates one of the formants in the original speech. It is controlled by two parameters, one for the resonant frequency and one for the bandwidth. Five formants are needed for male speech and four for female speech. The output of this system is defined by the excitation signal, the amplitude values and the resonator settings. By periodic updating of all parameters very high quality speech can be produced.

**OPERATION**

Speech characteristics change quite slowly, therefore the control parameters for the speech synthesizer can be adequately updated every few tens of milliseconds with interpolation during the interval to ensure a smooth changeover from one parameter value to the next. In the PCF8200 the standard-frame duration can be set to 8,8 , 10,4, 12,8 or 17,6 milliseconds with the speed-option, speaking speed, in the command-register.

The duration of each individual speech frame is programmable to be 1, 2, 3 or 5 times the standard-frame duration.

	10	01	00	11	FS1, FS0
00	8,8	10,4	12,8	17,6	ms
01	17,6	20,8	25,6	35,2	ms
10	26,4	31,2	38,4	52,8	ms
11	44,0	52,0	64,0	88,0	ms
FD1, FDO					

Table 1. Frame duration as a function of speed-option (FS1, FS0) and frame-duration (FD1, FDO).

The excitation signal is a random noise source for unvoiced sounds and a programmable pulse generator for voiced sounds. Both sources have an amplitude modulator which is updated 8 times in one speech-frame by linear interpolation. The pitch is updated every 1/8 of a standard frame.

The excitation signal is filtered with a five formant filter for male speech and a four formant filter for female speech. The formant filter is a cascade of all second-order sections. The control parameters, formant-frequency and formant-bandwidth, are updated eight times per speech frame by linear interpolation. A block diagram of the formant synthesizer is shown in Fig. 3.

The filter output is upsampled to 80 kHz and filtered with a digital low-pass filter. Before the signal is digital to analogue converted (DAC), with an 11-bit switched capacitor DAC, the signal is multiplied with a DAC-amplitude factor. The use of a digital filter means that no external audio filtering is required for low-medium applications and minimal filtering is required for those applications requiring very high quality speech.

Fig. 3 Block diagram of formant synthesizer.

**DATA FORMAT**

Three types of format are used for data transfer to the synthesizer.

**DAC-amplitude factor**

The DAC-amplitude factor is one byte, which is used to optimize the digital speech signal to the 11-bit DAC. It is the first byte after a STOP or a BADSTOP or  $V_{DD}$  on. Table 2 indicates the amplitude factor.

byte	factor	dB
01110000	3,5	10,88
10110000	3,25	10,24
00110000	3,0	9,54
11010000	2,75	8,97
01010000	2,5	7,96
10010000	2,25	7,04
00010000	2,0	6,02
11100000	1,75	4,86
01100000	1,5	3,52
10100000	1,25	1,94
00100000	1,0	0,00
11000000	0,75	-2,50
01000000	0,5	-6,02
10000000	0,25	-12,04
00000000	0,0	
11110000	HEX code F0 and is not allowed as a DAC amplitude	

Table 2 DAC amplitude factor.

**Start pitch**

The second byte after a STOP or BADSTOP, or  $V_{DD}$  on is the start pitch. It is a one byte start value for the on-chip pitch-period generator.

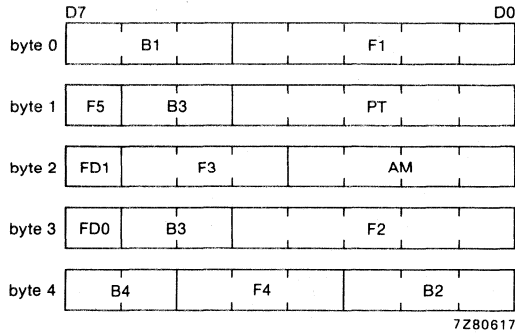

**Frame Data**

The frame data is a five byte block which contains the filter and source information:

pitch increment/decrement value	5 bits
amplitude	4 bits
frame duration	2 bits
frequency of 1st formant	5 bits
frequency of 2nd formant	5 bits
frequency of 3rd formant	3 bits
frequency of 4th formant	3 bits
frequency of 5th formant	1 bit
bandwidth of 1st formant	3 bits
bandwidth of 2nd formant	3 bits
bandwidth of 3rd formant	2 bits
bandwidth of 4th formant	2 bits
bandwidth of 5th formant	2 bits

40 bits = 5 bytes

The frame-data bits are organized as shown in Fig. 4.

It is not allowed to set byte 0 to the hexadecimal value E0.

Fig. 4 Format of frame-date.

**CONTROL FORMAT**

**Command Write**

A command write consists of two bytes, and it may occur before a data block. The four bits which can be written are shown in Fig. 5.

Fig. 5 Control write: first byte fixed, second byte control.

**FS0, FS1 speed option**

FS1	FS0	speech speed	standard-frame duration
0	0	100%	12,8 ms
0	1	123%	10,4 ms
1	0	145%	8,8 ms
1	1	73%	17,6 ms

**MN/F, male/female option**

MN/F = 0 male quantization table  
 = 1 female quantization table

**STOP**

STOP = 1 stop; repeat last complete frame with amplitude = 0 (no excitation signal)  
 = 0 if the frame data is not sent within the duration of a half frame, there will be a BADSTOP:

1. REQN = 1 STOP = 0
2. Repeat last frame with amplitude = 0
3. BUSY = 0

**Status Read**

Three status bits can be read out at any time without a preceding byte (E0). This is shown in Fig. 6.

Fig. 6 Status read.

- REQN = 1 No data required  
 = 0 Synthesizer requesting for new data  
 BUSY = 1 Busy (an utterance is pronounced)  
 = 0 Idle, REQN will set to 1; the synthesizer is in STOP or BADSTOP mode  
 STOP The STOP bit is the same as the stop bit written to the synthesizer during a command write.  
 STOP = 1, BUSY = 0 stopped by the user.  
 STOP = 0, BUSY = 0 BADSTOP because the data was not sent in time.

DEVELOPMENT DATA

After initial power-up the status/command register is set to the following status:

- FS0, FS1 = 0 Standard-frame duration of 12,8 ms  
 MN/F = 0 Male quantization table  
 STOP = 1  
 BUSY = 0 Idle  
 REQN = 1 No data required

**INTERFACE PROTOCOL**

Data can be written to the synthesizer when REQN = 0 or, when REQN = 1 and BUSY = 0. Figure 7 shows the interface protocol of the synthesizer.

In parallel mode the synthesizer is activated by sending the DAC-amplitude factor. In serial mode the DAC-amplitude factor can be sent as soon as the synthesizer is powered-up.

The I<sup>2</sup>C transmitter/receiver will then acknowledge. When the request for the pitch-byte occurs the byte must be provided within the duration of a half standard frame. If the byte is not provided in time a BADSTOP will be generated.

During each data write operation, the status bit REQN will be set to '1'.

Within a frame data block, it disappears within a few microseconds, asking for the next byte of that block. If the bytes of frame data are not provided within the time-duration of a half frame, a BADSTOP will be generated.

**I<sup>2</sup>C ADDRESS**

On chip there is a I<sup>2</sup>C slave receiver/transmitter with the address:

```

7 6 5 4 3 2 1 0
0 0 1 0 0 0 0 R/W

```

**POWER UP**

The synthesizer will be set to power-up on a parallel-write sequence.

PAR-mode: The input-latches are active so they can receive the first byte

SER-mode: The I<sup>2</sup>C transmitter/receiver will not acknowledge until the synthesizer has powered-up. To power up the synthesizer a parallel write sequence (Fig. 9) must be made to the synthesizer by using external logic for the control lines; at least one line must be toggled, CEN, while WN = 0 and RN/W = 1.

The synthesizer can be set to permanent power-up by hard-wired control pins (CEN = 0, RN/W = 1, WN = 0).

**POWER DOWN MODE**

When BUSY = 0 the synthesizer will be set to power-down. In the power-down mode the status/command register will be retained.

In power-down mode the clock-oscillator is switched off. After initial V<sub>DD</sub> the synthesizer is in power-down mode.

**SERN/PAR**

SERN/PAR is hard-wired to V<sub>DD</sub> or V<sub>SS</sub>.

**HANDLING**

All inputs and outputs are protected against electrostatic charge under normal handling conditions.

## CHARACTERISTICS

$T_{amb} = -45$  to  $+85$  °C; supply voltage ( $V_{DD}$  to  $V_{SS}$ ) = 4,5 V to 5,5 V with respect to  $V_{SS}$ , otherwise specified

**NOTES TO THE CHARACTERISTICS**

1. Timing reference level is 1,5 V; supply 5 V  $\pm$  10%; temperature range of  $-40^\circ\text{C}$  to  $85^\circ\text{C}$ .
2. Levels greater than 2 V for a '1' or less than 0,8 V for a '0' are reached with a load of one TTL input and 50 pF.
3. Rise and fall times between 0,6 V and 2,2 V levels.

## SINGLE-CHIP 8-BIT MICROCONTROLLER

### DESCRIPTION

The PCF84CXX family of microcontrollers is manufactured in CMOS technology. The family consists of the following devices:

- PCF84C00 – 256 RAM bytes, external program memory
- PCF84C20 – 2 K ROM/64 RAM bytes
- PCF84C40 – 4 K ROM/128 RAM bytes

I/O port lines, one serial I/O line, one single-level vectored interrupt, an 8-bit timer event counter and on-board clock oscillator and clock circuits.

This microcontroller family is an efficient controller as well as an arithmetic processor. The instruction set is based on that of the MAB8048 and is pin- and instruction set compatible with the MAB8400 family. The microcontrollers have extensive bit handling abilities and facilities for both binary and BCD arithmetic.

For detailed information see the "User manual Single-chip microcomputer".

### Features

- 8-bit CPU, ROM, RAM, I/O in a single 28-lead DIL or SO package
- 2 K or 4 K ROM bytes plus a ROM-less version
- 64 or 128 RAM bytes
- 20 quasi-bidirectional I/O port lines
- Two test inputs: one of which is also the external interrupt input
- Single-level vectored interrupts: external, timer/event counter, serial I/O
- Serial I/O which can be used in single or multi-master systems (serial I/O data via an existing port line and clock via a dedicated line)
- 8-bit programmable timer/event counter
- Clock frequency 100 kHz to 10 MHz
- Over 80 instructions (based on MAB8048) all of 1 or 2 cycles
- Single supply voltage from 2,5 V to 5,5 V
- STOP and IDLE mode
- Power-on-reset circuit and low supply voltage detection
- Operating temperature range: -40 to + 85 °C

### PACKAGE OUTLINES

- PCF84C20/40P : 28-lead DIL; plastic (SOT-117D).
- PCF84C20/40D : 28-lead DIL; ceramic (CERDIP) (SOT-135A).
- PCF84C20/40T : 28-lead mini-pack; plastic (SO-28; SOT-136A).
- PCF84C00B : 28-lead 'Piggy-back' package (with up to 28-pin EPROM on top).
- PCF84C00WP : 68-lead plastic leaded chip-carrier (PLCC) (SOT-188A).
- PCF84C00T : 56-lead mini-pack; plastic (VSO-56; SOT-190).

## 256 x 8-BIT STATIC RAM

### GENERAL DESCRIPTION

The PCF8570 is a low power 2048-bit static CMOS RAM organized as 256 words by 8-bits. Addresses and data are transferred serially via a two-line bidirectional bus (I<sup>2</sup>C). The built-in word address register is incremented automatically after each written or read data byte. Three address pins A0, A1, A2 are used for programming the hardware address, allowing the use of up to eight devices connected to the bus without additional hardware.

### Features

- Operating supply voltage      2.5 V to 6 V
- Low data retention voltage    min. 1.0 V
- Low standby current            max. 15  $\mu$ A
- Power saving mode            typ. 50 nA
- Serial input/output bus (I<sup>2</sup>C)
- Address by 3 hardware address pins
- Automatic word address incrementing
- 8-lead DIL package

### Applications

- Telephony                              RAM expansion for stored numbers in repertory dialling (e.g. PCD3343 applications) channel presets
- Radio and television
- Video cassette recorder
- General purpose                      RAM expansion for the microcontroller families MAB8400 and PCF84C00

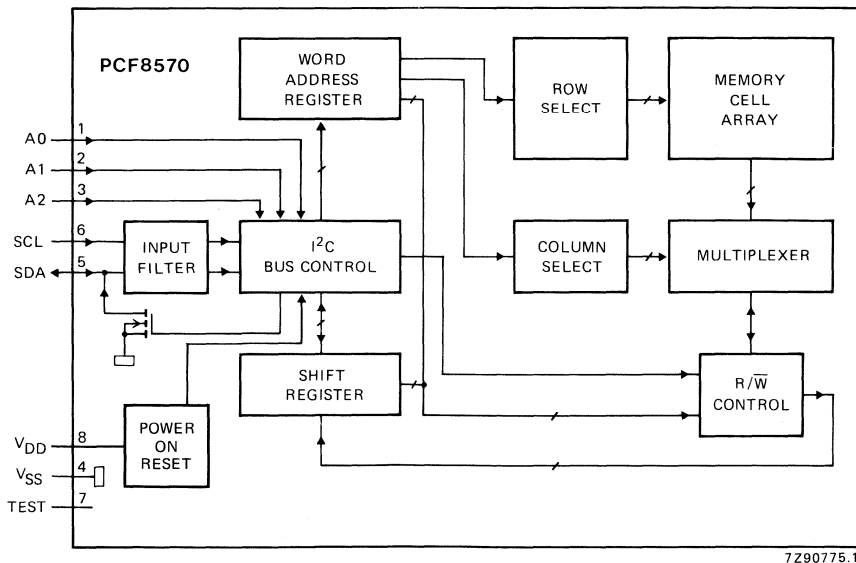

Fig. 1 Block diagram.

### PACKAGE OUTLINES

PCF8570P : 8-lead DIL; plastic (SOT-97A).

PCF8570T : 8-lead mini-pack plastic (SO-8L; SOT-176).

## PINNING

1 to 3	A0 to A2	address inputs
4	VSS	negative supply

## 128 x 8-BIT STATIC RAM

### GENERAL DESCRIPTION

The PCF8571 is a low power 1024-bit static CMOS RAM organized as 128 words by 8-bits. Addresses and data are transferred serially via a two-line bidirectional bus (I<sup>2</sup>C). The built-in word address register is incremented automatically after each written or read data byte. Three address pins A0, A1, A2 are used for programming the hardware address, allowing the use of up to eight devices connected to the bus without additional hardware.

### Features

- Operating supply voltage      2,5 V to 6 V
- Low data retention voltage      min. 1,0 V
- Low standby current              max. 5  $\mu$ A
- Power saving mode              typ. 50 nA
- Serial input/output bus (I<sup>2</sup>C)
- Address by 3 hardware address pins
- Automatic word address incrementing
- 8-lead DIL package

### Applications

- Telephony                              RAM expansion for stored numbers in repertory dialling (e.g. PCD3340 applications) channel presets
- Radio and television
- Video cassette recorder
- General purpose                      RAM expansion for the microcomputer families MAB8400 and PCF84C00

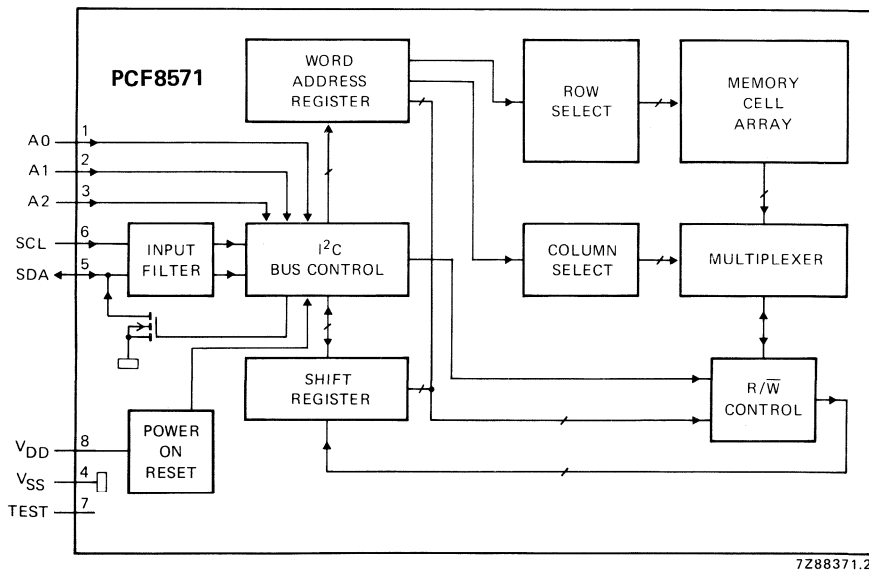

Fig. 1 Block diagram.

### PACKAGE OUTLINES

- PCF8571P : 8-lead DIL; plastic (SOT-9/A).
- PCF8571T : 8-lead mini-pack (SO-8L; SOT-176).

## CLOCK/CALENDAR WITH SERIAL I/O

### GENERAL DESCRIPTION

The PCF8573 is a low threshold, monolithic CMOS circuit that functions as a real time clock/calendar in the Inter IC ( $I^2C$ ) bus-oriented microcomputer systems. The device includes an addressable time counter and an addressable alarm register, both for minutes, hours, days and months. Three special control/status flags, COMP, POWF and NODA, are also available. Information is transferred serially via a two line bidirectional bus ( $I^2C$ ). Back-up for the clock during supply interruptions is provided by a 1,2 V nickel cadmium battery. The time base is generated from a 32,768 kHz crystal-controlled oscillator.

### Features

- Serial input/output bus ( $I^2C$ ) interface for minutes, hours, days and months
- Additional pulse outputs for seconds and minutes
- Alarm register for presetting a time for alarm or remote switching functions
- Battery back-up for clock function during supply interruption
- Crystal oscillator control (32,768 kHz)

### QUICK REFERENCE DATA

Supply voltage range (clock)	$V_{DD}-V_{SS1}$	1,1 to 6,0 V
Supply voltage range ( $I^2C$ interface)	$V_{DD}-V_{SS2}$	2,5 to 6,0 V
Crystal oscillator frequency	$f_{osc}$	typ. 32,768 kHz

### PACKAGE OUTLINES

PCF8573P: 16-lead DIL; plastic (SOT-38).

PCF8573T: 16-lead mini-pack; plastic (SO-16L; SOT-162A).

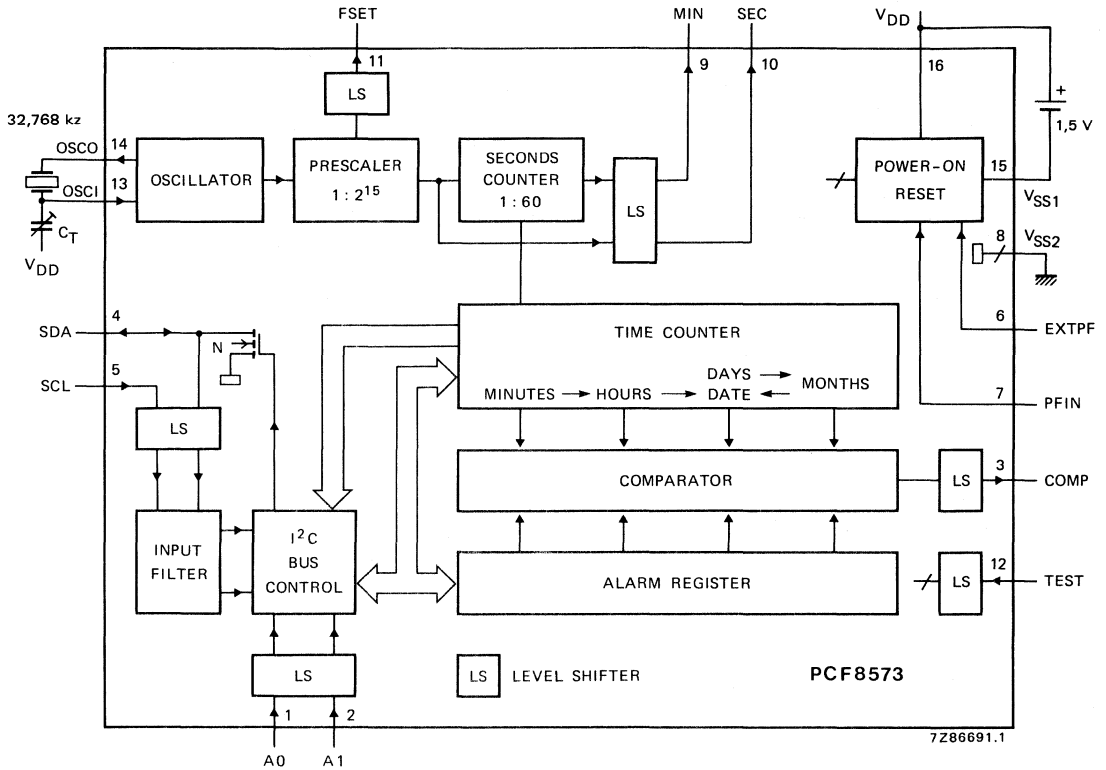

Fig. 1 Block diagram.

REMOTE 8-BIT I/O FOR I<sup>2</sup>C BUS

## GENERAL DESCRIPTION

The PCF8574 is a single-chip silicon gate CMOS circuit. It provides remote I/O expansion for the MAB8400 and PCF8500 microcomputer families via the two-line serial bidirectional bus (I<sup>2</sup>C). It can also interface microcomputers without a serial interface to the I<sup>2</sup>C bus (as a slave function only). The device consists of an 8-bit quasi-bidirectional port and an I<sup>2</sup>C interface.

The PCF8574 has low current consumption and includes latched outputs with high current drive capability for directly driving LEDs. It also possesses an interrupt line (INT) which is connected to the interrupt logic of the microcomputer on the I<sup>2</sup>C bus. By sending an interrupt signal on this line, the remote I/O can inform the microcomputer if there is incoming data on its ports without having to communicate via the I<sup>2</sup>C bus. This means that the PCF8574 can remain a simple slave device.

## Features

- Operating supply voltage 2,5 V to 6 V
- Low stand-by current consumption max. 10  $\mu$ A
- Bidirectional expander
- Open drain interrupt output
- 8-bit remote I/O port for the I<sup>2</sup>C bus
- Peripheral for the MAB8400 and PCF8500 microcomputer families
- Latched outputs with high current drive capability for directly driving LEDs
- Address by 3 hardware address pins for use of up to 8 devices (up to 16 possible with mask option)

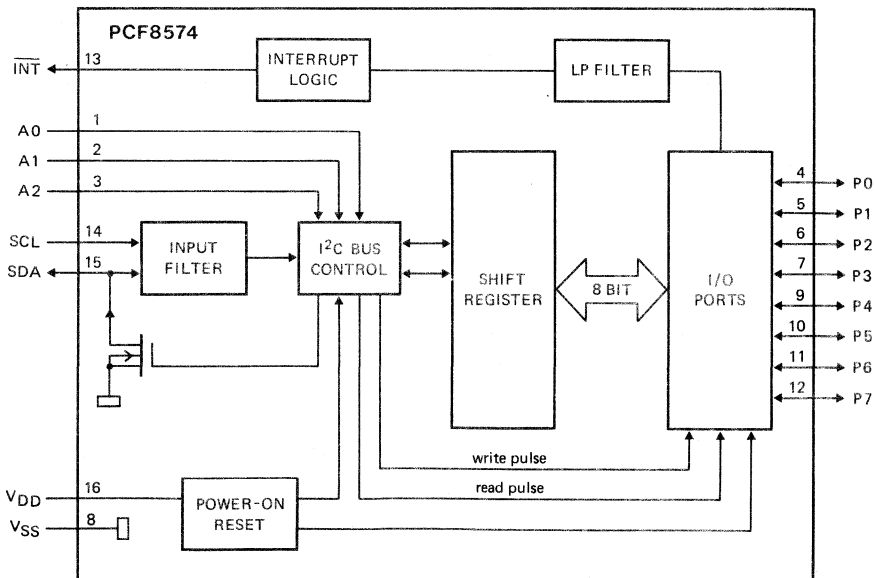

Fig. 1 Block diagram.

7285821.1

## PACKAGE OUTLINES

PCF8574P: 16-lead DIL; plastic (SOT-38).

PCF8574T: 16-lead mini-pack; plastic (SO-16L; SOT-162A).

PINNING

## UNIVERSAL LCD DRIVER FOR LOW MULTIPLEX RATES

### GENERAL DESCRIPTION

The PCF8576 is a peripheral device which interfaces to almost any liquid crystal display (LCD) having low multiplex rates. It generates the drive signals for any static or multiplexed LCD containing up to four backplanes and up to 40 segments and can easily be cascaded for larger LCD applications. The PCF8576 is compatible with most microprocessors and communicates via a two-line bidirectional bus (I<sup>2</sup>C). Communication overheads are minimized by a display RAM with auto-incremented addressing, by hardware subaddressing and by display memory switching (static and duplex drive modes).

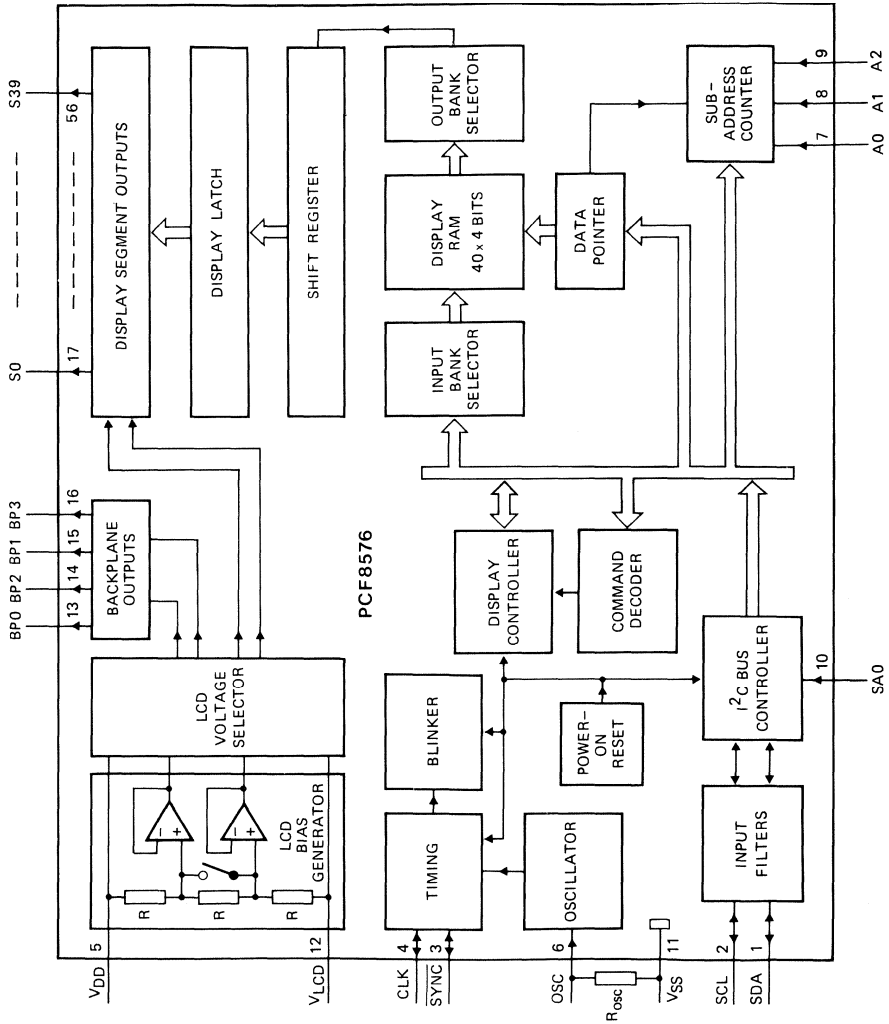

### Features

- Single-chip LCD controller/driver
- Selectable backplane drive configuration: static or 2/3/4 backplane multiplexing
- Selectable display bias configuration: static, 1/2 or 1/3
- Internal LCD bias generation with voltage-follower buffers
- 40 segment drives: up to twenty 8-segment numeric characters; up to ten 15-segment alphanumeric characters; or any graphics of up to 160 elements
- 40 x 4-bit RAM for display data storage
- Auto-incremented display data loading across device subaddress boundaries
- Display memory bank switching in static and duplex drive modes
- Versatile blinking modes
- LCD and logic supplies may be separated
- Wide power supply range: from 2 V for low-threshold LCDs and up to 9 V for guest-host LCDs and high-threshold (automobile) twisted nematic LCDs
- Low power consumption
- Power-saving mode for extremely low power consumption in battery-operated and telephone applications
- I<sup>2</sup>C bus interface
- TTL/CMOS compatible
- Compatible with any 4-bit, 8-bit or 16-bit microprocessors
- May be cascaded for large LCD applications (up to 2560 segments possible)
- Optimized pinning for single plane wiring in both single and multiple PCF8576 applications
- Space-saving 56-lead plastic mini-pack (VSO-56)
- Very low external component count (at most one resistor, even in multiple device applications)
- Compatible with Philips/Videlec chip-on-glass technology
- Manufactured in silicon gate CMOS process

### PACKAGE OUTLINES

PCF8576T: 56-lead mini-pack; plastic (VSO-56; SOT-190).

PCF8576U: uncased chip in tray

7291475.1

Fig. 1 Block diagram.

FOR DETAILED INFORMATION SEE RELEVANT DATA BOOK OR DATA SHEET

## LCD DIRECT/DUPLEX DRIVER WITH I<sup>2</sup>C BUS INTERFACE

### GENERAL DESCRIPTION

The PCF8577 is a single chip, silicon gate CMOS circuit. It is designed to drive liquid crystal displays with up to 32 segments directly, or 64 segments in a duplex manner.

The two-line I<sup>2</sup>C bus interface substantially reduces wiring overheads in remote display applications. Bus traffic is minimized in multiple IC applications by automatic address incrementing, hardware sub-addressing and display memory switching (direct drive mode).

The PCF8577 and PCF8577A differ only in their slave address.

### Features

- Direct/duplex drive modes with up to 32/64 LCD-segment drive capability per device
- Operating supply voltage: 2,5 to 9 V
- Low power consumption
- I<sup>2</sup>C bus interface
- Optimized pinning for single plane wiring
- Single-pin built-in oscillator
- Auto-incremented loading across device sub-address boundaries
- Display memory switching in direct drive mode
- May be used for I<sup>2</sup>C bus output expander
- System expansion up to 256 segments (512 segments with PCF8577A)
- Power-on-reset sets all segments off (to blank)

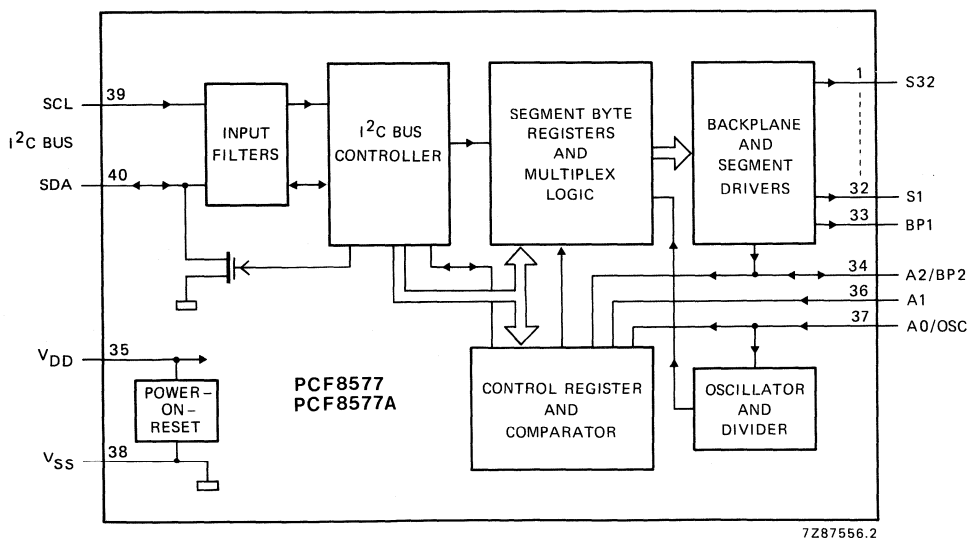

Fig. 1 Block diagram.

### PACKAGE OUTLINES

PCF8577P, PCF8577AP: 40-lead DIL; plastic (SOT-129).

PCF8577T, PCF8577AT: 40-lead mini-pack; plastic (VSO-40; SOT-158A).

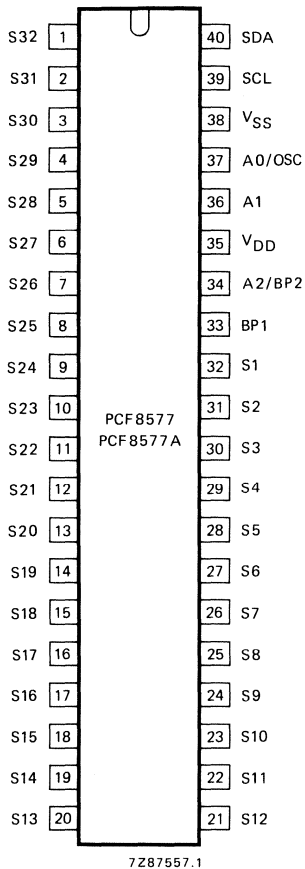

Fig. 2 Pinning diagram.

**PINNING**

**Supply**

35  $V_{DD}$  positive supply  
38  $V_{SS}$  negative supply

**I<sup>2</sup>C bus**

40 SDA I<sup>2</sup>C bus data line  
39 SCL I<sup>2</sup>C bus clock line

**Inputs**

36 A1 hardware address line  
37 A0/OSC hardware address line/oscillator pin

**Outputs**

1 – 32 S1 – S32 segment outputs

**Input – Output**

34 A2/BP2 hardware address line/cascade sync input/backplane output  
33 BP1 cascade sync input/backplane output

**FUNCTIONAL DESCRIPTION**

**Hardware sub-address A0, A1, A2**

The hardware sub-address lines A0, A1, A2 are used to program the device sub-address for each PCF8577 on the bus. Lines A0 and A2 are shared with OSC and BP2 respectively to reduce pin-out requirements.

**A0/OSC** Line A0 is defined as LOW (logic 0) when this pin is used for the local oscillator or when connected to  $V_{SS}$ . Line A0 is defined as HIGH (logic 1) when connected to  $V_{DD}$ .

**A1** Line A1 must be defined as LOW (logic 0) or as HIGH (logic 1) by connection to  $V_{SS}$  or  $V_{DD}$  respectively.

**A2/BP2** In the direct drive mode the second backplane signal BP2 is not used and the A2/BP2 pin is exclusively the A2 input. Line A2 is defined as LOW (logic 0) when connected to  $V_{SS}$  or, if this is not possible, by leaving it unconnected (internal pull-down). Line A2 is defined as HIGH (logic 1) when connected to  $V_{DD}$ .

In the duplex drive mode the second backplane signal BP2 is required and the A2 signal is undefined. In this mode device selection is made exclusively from lines A0 and A1.

### 7-BIT ANALOGUE-TO-DIGITAL CONVERTER (ADC 7)

#### GENERAL DESCRIPTION

The PNA7509 is a monolithic NMOS 7-bit analogue-to-digital converter (ADC) designed for video applications. The device converts the analogue input signal into 7-bit binary coded digital words at a sampling rate of 22 MHz.

The circuit comprises 129 comparators, a reference resistor chain, combining logic, transcoder stages, and TTL output buffers which are positive edge triggered and can be switched into 3-state mode. The digital output is selectable in two's complement or binary coding.

The use of separate outputs for overflow and underflow detection facilitates full-scale driving.

#### Features

- 7-bit resolution
- Digitizing rates up to 22 MHz
- No external sample and hold required
- High input impedance
- Binary or two's complement 3-state TTL outputs
- Overflow and underflow 3-state TTL outputs
- Low reference current (250  $\mu$ A typ.)
- Positive supply voltages (+ 5 V/+ 10 V)
- Low power consumption (400 mW typ.)
- Standard 24-pin package

#### Applications

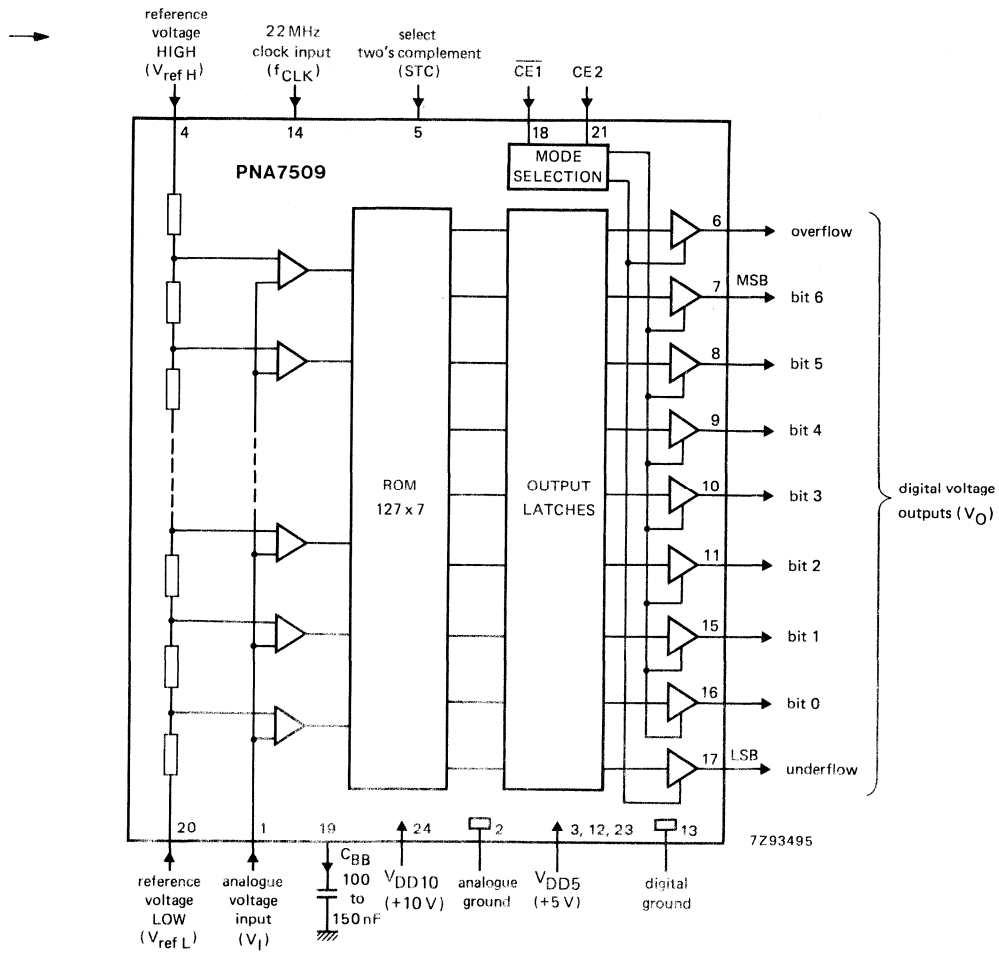

- High-speed A/D conversion
- Video signal digitizing
- Radar pulse analysis
- Transient signal analysis
- High energy physics research

#### QUICK REFERENCE DATA

Supply voltage range (pins 3, 12, 23)	V <sub>DD5</sub>	4,5 to 5,5 V
Supply voltage range (pin 24)	V <sub>DD10</sub>	9,5 to 10,5 V
Supply current (pins 3, 12, 23)	I <sub>DD5</sub>	typ. 60 mA
Supply current (pin 24)	I <sub>DD10</sub>	typ. 10 mA
Reference voltage LOW (pin 20)	V <sub>refL</sub>	min. 2,4 V
Reference voltage HIGH (pin 4)	V <sub>refH</sub>	max. 5,2 V
Differential non-linearity		$\pm \frac{1}{2} \triangleq 0,4\%$ LSB
Bandwidth (−3 dB)	B	min. 10 MHz
Clock frequency	f <sub>CLK</sub>	max. 22 MHz
Total power dissipation	P <sub>tot</sub>	typ. 400 mW

#### PACKAGE OUTLINE

24-lead DIL; plastic (SOT-101).

**Note**

All three pins 3, 12 and 23 must be connected to positive supply voltage + 5 V.

**Notes to timing characteristics**

1. Clock input rise and fall times are at the maximum clock frequency (10% and 90% levels).
2. Low frequency sinewave (peak-to-peak value of the analogue input voltage at  $V_{I(p-p)} = 1,8 \text{ V}$ ) amplitude modulated with a sinewave voltage ( $V_{I(p-p)} = 0,7 \text{ V}$ ) at  $f_i \leq 4,5 \text{ MHz}$ .
3. Sinewave voltage with increasing amplitude at  $f_i \leq 4,5 \text{ MHz}$  (minimum amplitude  $V_{I(p-p)} = 0,25 \text{ V}$ ; maximum amplitude  $V_{I(p-p)} = 2,5 \text{ V}$ ).
4. The timing values of the digital outputs at pins 6 to 11 and 15 to 17 are measured with the clock input reference level at 1,5 V.

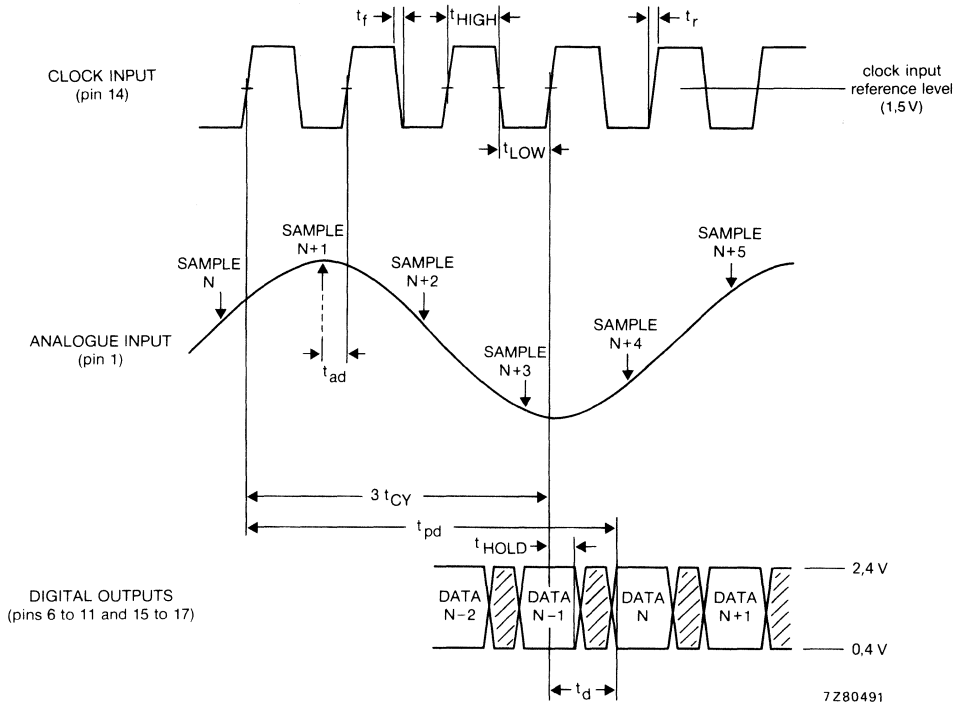

Fig. 3 Timing diagram.

Fig. 4 Timing diagram for 3-state delay.

## 8-BIT MULTIPLYING DAC

## GENERAL DESCRIPTION

The PNA7518 is a NMOS 8-bit multiplying digital-to-analogue converter (DAC) designed for video applications. The device converts a digital input signal into a voltage-equivalent analogue output at a sampling rate of 30 MHz.

The input signal is latched, then fed to a decoder which switches a transfer gate array (1 out of 256) to select the appropriate analogue signal from a resistor chain. Two external reference voltages supply the resistor chain.

The input latches are positive-edge triggered. The output impedance is approximately 0,5 k $\Omega$  depending on the applied digital code. An additional operational amplifier is required for the 75  $\Omega$  output impedance. Two's complement is selected when STC (pin 11) is HIGH or is not connected.

## Features

- TTL input levels
- Positive-edge triggered
- Analogue voltage output at 30 MHz sampling rate
- Binary or two's complement input
- Output voltage accuracy to within  $\pm \frac{1}{2}$  of the input LSB

## QUICK REFERENCE DATA

Supply voltage range (pin 16)	$V_{DD}$	4,5 to 5,5 V
Supply current (pin 16)	$I_{DD}$	typ. 50 mA
Reference voltage LOW (pin 2)	$V_{refL}$	min. 0 V
Reference voltage HIGH (pin 9)	$V_{refH}$	max. 2 V
Linearity at $R_L = 200 \text{ k}\Omega$ ; $V_O = 2 \text{ V}$ (peak-to-peak value)		$\pm \frac{1}{2}$ LSB
Bandwidth (-3 dB) at $C_L = 6 \text{ pF}$	B	min. 12 MHz
Clock frequency	$f_{CLK}$	max. 30 MHz
Total power dissipation	$P_{tot}$	typ. 300 mW

## Applications

- Video data conversion
- CRT displays
- Waveform/test signal generation
- Colour/black-and-white graphics

## PACKAGE OUTLINE

16-lead DIL; plastic (SOT-38WE-1).

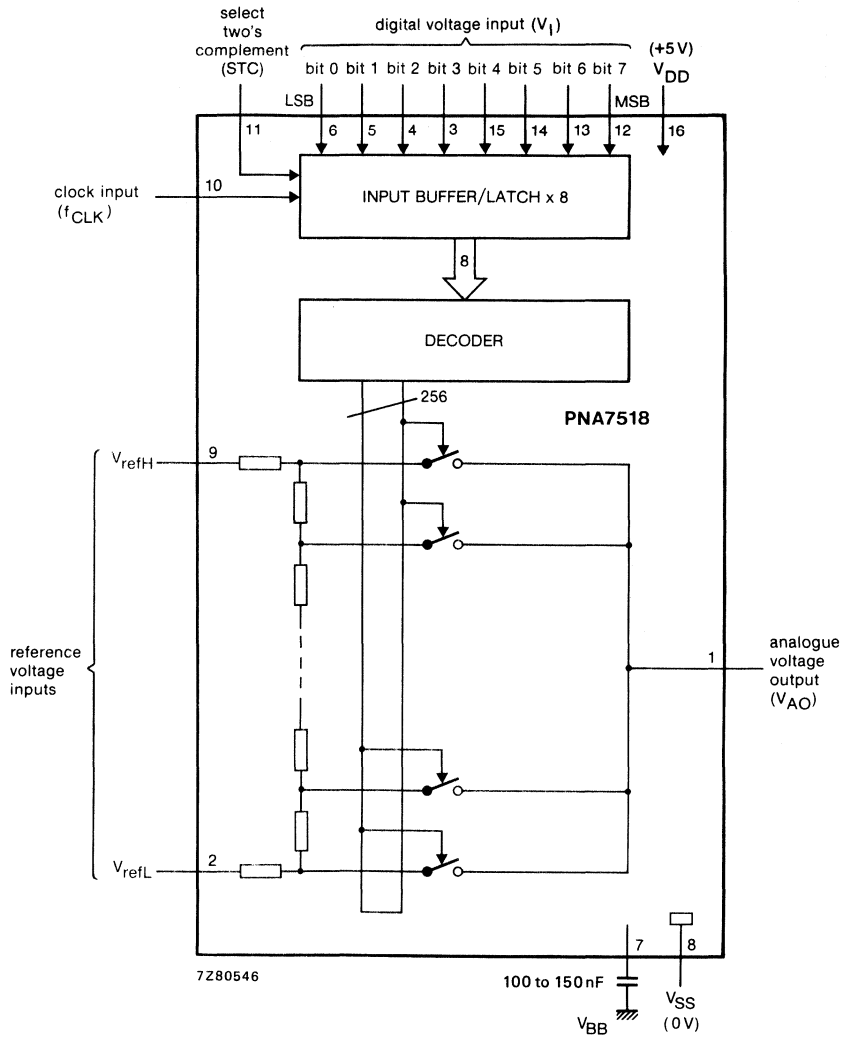

Fig. 1 Block diagram.

Generally:					
Maximum occurring at step 00-AA (HEX) are amplitude	$V_g$	—	5 41	—	LSB LSB.ns
<b>Influence of clock frequency (note 2)</b>					
Cross-talk at $2 \times f_{CLK}$ amplitude		—	2	—	LSB
area		—	8	—	LSB.ns

**Notes to the characteristics**

- Inputs bit 0 to bit 7 are positive-edge triggered.
- Measured at  $V_{refH} - V_{refL} = 2,0 \text{ V}$ ;  $1 \times \text{LSB} = 7,8 \text{ mV}$ . The energy equivalent of output transients is given as the area contained by the graph of output amplitude (LSB) against time (ns). The glitch area is independent of the value of  $V_{ref}$ . Glitch amplitudes and clock cross-talk can be reduced by using a shielded printed circuit board.

DEVELOPMENT DATA

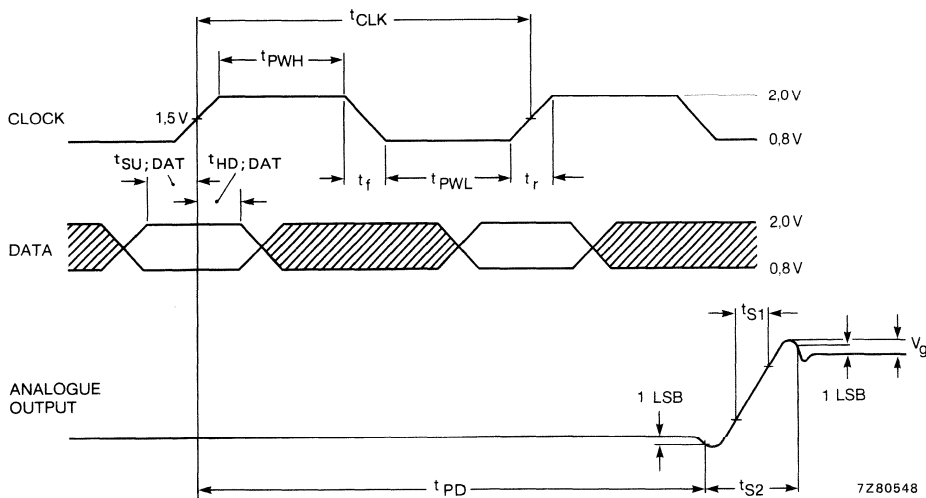

Fig. 3 Switching characteristics.

## RADIO TUNING PLL FREQUENCY SYNTHESIZER

The SAA1057 is a single chip frequency synthesizer IC in I<sup>2</sup>L technology, which performs all the tuning functions of a PLL radio tuning system. The IC is applicable to all types of radio receivers, e.g. car radios, hi-fi radios and portable radios.

### Features

- On-chip prescaler with up to 120 MHz input frequency.
- On-chip AM and FM input amplifiers with high sensitivity (30 mV and 10 mV respectively).
- Low current drain (typically 16 mA for AM and 20 mA for FM) over a wide supply voltage range (3,6 V to 12 V).
- On-chip amplifier for loop filter for both AM and FM (up to 30 V tuning voltage).
- On-chip programmable current amplifier (charge pump) to adjust the loop gain.
- Only one reference frequency for both AM and FM.
- High signal purity due to a sample and hold phase detector for the in-lock condition.
- High tuning speed due to a powerful digital memory phase detector during the out-lock condition.
- Tuning steps for AM are: 1 kHz or 1,25 kHz for a VCO frequency range of 512 kHz to 32 MHz.
- Tuning steps for FM are: 10 kHz or 12,5 kHz for a VCO frequency range of 70 MHz to 120 MHz.
- Serial 3-line bus interface to a microcomputer.
- Test/features.

### QUICK REFERENCE DATA

Supply voltage ranges	V <sub>CC1</sub>	3,6 to 12 V
	V <sub>CC2</sub>	3,6 to 12 V
	V <sub>CC3</sub>	V <sub>CC2</sub> to 31 V
Supply currents	I <sub>CC1</sub> + I <sub>CC2</sub>	typ. 18 mA
	I <sub>CC3</sub>	typ. 0,8 mA
Input frequency ranges		
at pin FAM	f <sub>FAM</sub>	512 kHz to 32 MHz
at pin FFM	f <sub>FFM</sub>	70 to 120 MHz
Maximum crystal input frequency	f <sub>XTAL</sub>	> 4 MHz
Operating ambient temperature range	T <sub>amb</sub>	-25 to +80 °C

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102HE).

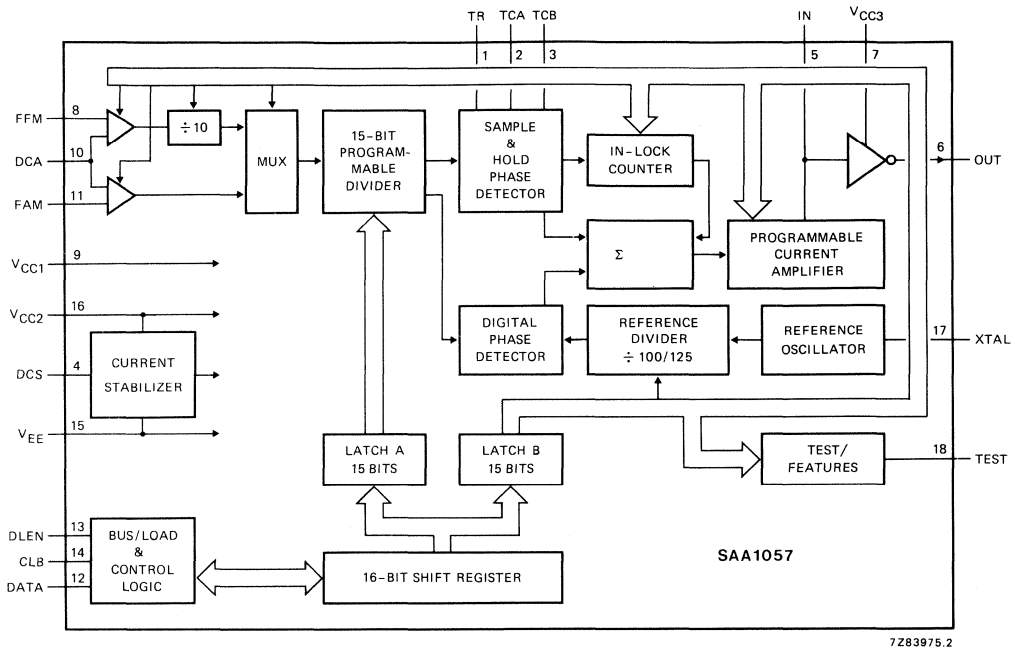

Fig. 1 Block diagram.

## GENERAL DESCRIPTION

The SAA1057 performs the entire PLL synthesizer function (from frequency inputs to tuning voltage output) for all types of radios with the AM and FM frequency ranges.

The circuit comprises the following:

- Separate input amplifiers for the AM and FM VCO-signals.
- A divider-by-10 for the FM channel.
- A multiplexer which selects the AM or FM input.
- A 15-bit programmable divider for selecting the required frequency.
- A sample and hold phase detector for the in-lock condition, to achieve the high spectral purity of the VCO signal.
- A digital memory frequency/phase detector, which operates at a 32 times higher frequency than the sample and hold phase detector, so fast tuning can be achieved.
- An in-lock counter detects when the system is in-lock. The digital phase detector is switched-off automatically when an in-lock condition is detected.
- A reference frequency oscillator followed by a reference divider. The frequency is generated by a 4 MHz quartz crystal. The reference frequency can be chosen either 32 kHz or 40 kHz for the digital phase detector (that means 1 kHz and 1,25 kHz for the sample and hold phase detector), which results in tuning steps of 1 kHz and 1,25 kHz for AM, and 10 kHz and 12,5 kHz for FM.
- A programmable current amplifier (charge pump), which controls the output current of both the digital and the sample/hold phase detector in a range of 40 dB. It also allows the loop gain of the tuning system to be adjusted by the microcomputer.
- A tuning voltage amplifier, which can deliver a tuning voltage of up to 30 V.
- BUS; this circuitry consists of a format control part, a 16-bit shift register and two 15-bit latches. Latch A contains the to be tuned frequency information in a binary code. This binary-coded number, multiplied by the tuning spacing, is equal to the synthesized frequency. The programmable divider (without the fixed divide-by-10 prescaler for FM) can be programmed in a range between 512 and 32 767 (see Fig. 3). Latch B contains the control information.

## OPERATION DESCRIPTION

## Control information

The following functions can be controlled with the data word bits in latch B. For data word format and bit position see Fig. 3.

FM FM/AM selection; '1' = FM, '0' = AM

REFH reference frequency selection; '1' = 1,25 kHz, '0' = 1 kHz (sample and hold phase detector)

CP3 |

CP2 | control bits for the programmable current amplifier

CP1 | (see section Characteristics)

CP0 |

SB2 enables last 8 bits (SLA to T0) of data word B;  
'1' = enables, '0' = disables; when programmed '0', the last 8 bits of data word B will be set to '0' automatically

SLA load mode of latch A; '1' = synchronous, '0' = asynchronous

PDM1 | phase detector mode

PDM0 |

PDM1	PDM0	digital phase detector
0	X	automatic on/off
1	0	on
1	1	off

BRM bus receiver mode bit; in this mode the supply current of the BUS receiver will be switched-off automatically after a data transmission (current-draw is reduced); '1' = current switched; '0' = current always on

T3 test bit; must be programmed always '0'

T2 test bit; selects the reference frequency (32 or 40 kHz) to the TEST pin

T1 test bit; must be programmed always '0'

T0 test bit; selects the output of the programmable counter to the TEST pin

T3	T2	T1	T0	TEST (pin 18)
0	0	0	0	1
0	1	0	0	reference frequency
0	0	0	1	output programmable counter
0	1	0	1	output in-lock counter '0' = out-lock '1' = in-lock

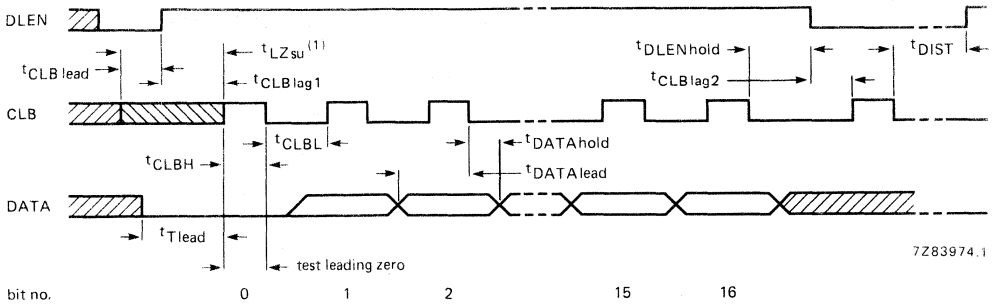

Fig. 2 BUS format.

(1) During the zero set-up time ( $t_{LZsu}$ ) CLB can be LOW or HIGH, but no transient of the signal is permitted. This can be of use when an I<sup>2</sup>C bus is used for other devices on the same data and clock lines.

\* Open collector output.

\*\* Measured in Fig. 6.

**NOTES**

1. Pin 17 (XTAL) can also be used as input for an external clock.

The circuit for that is given in Fig. 5. The values given in Fig. 5 are a typical application example.

Fig. 5 Circuit configuration showing external 4 MHz clock.

2. See BUS information in section 'operation description'.
3. The output voltage at TCB and TCA is typically  $\frac{1}{2} V_{CC2} + 0,3 \text{ V}$  when the tuning system is in-lock via the sample and hold phase detector. The control voltage at TCB is defined as the difference between the actual voltage at TCB and the value calculated from the formula  $\frac{1}{2} V_{CC2} + 0,3 \text{ V}$ .
4. Crystal oscillator frequency  $f_{XTAL} = 4 \text{ MHz}$ .
5. The busy-time after word "A" to another device which has more clock pulses than the SAA1057 (> 17) must be the same as the busy-time for a next transmission to the SAA1057. When the other device has a separate DLEN or has less clock pulses than the SAA1057 it is not necessary to keep to this busy-time,  $5 \mu\text{s}$  will be sufficient.

**APPLICATION INFORMATION****Initialize procedure**

Either a train of at least 10 clock pulses should be applied to the clock input (CLB) or word B should be transmitted, to achieve proper initialization of the device.

For the complete initialization (defining all control bits) a transmission of word B should follow. This means that the IC is ready to accept word A.

**Synchronous/asynchronous operation**

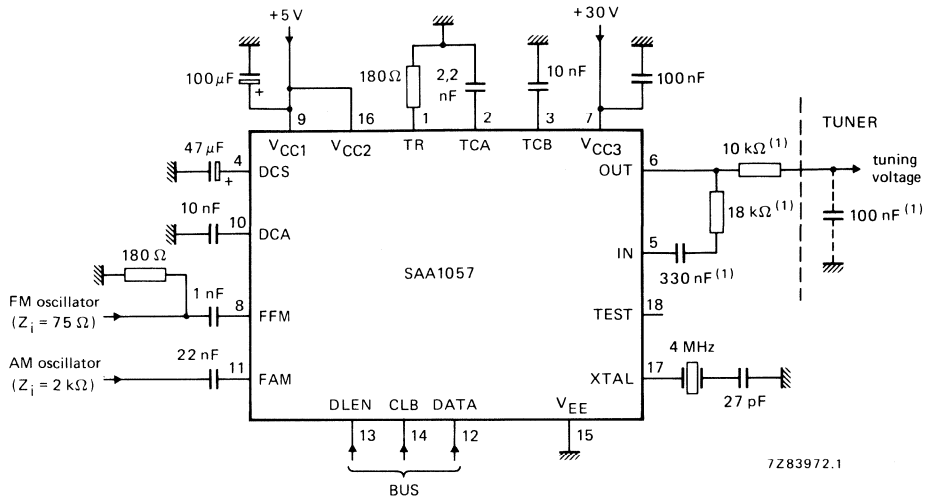

Synchronous loading of the frequency word into the programmable counter can be achieved when bit 'SLA' of word B is set to '1'. This mode should be used for small frequency steps where low tuning noise is important (e.g. search and manual tuning). This mode should not be used for frequency changes of more than 31 tuning steps. In this case asynchronous loading is necessary. This is achieved by setting bit 'SLA' to '0'. The in-lock condition will then be reached more quickly, because the frequency information is loaded immediately into the divider.

**Restrictions to the use of the programmable current amplifier**

The lowest current gain (0,023) must not be used in the in-lock condition when the supply voltage  $V_{CC2}$  is below 5 V (CP3, CP2, CP1 and CP0 are all set to '0'). This is to avoid possible instability of the loop due to a too small range of the sample and hold phase detector in this condition (see also section 'Characteristics').

**Transient times of the bus signals**

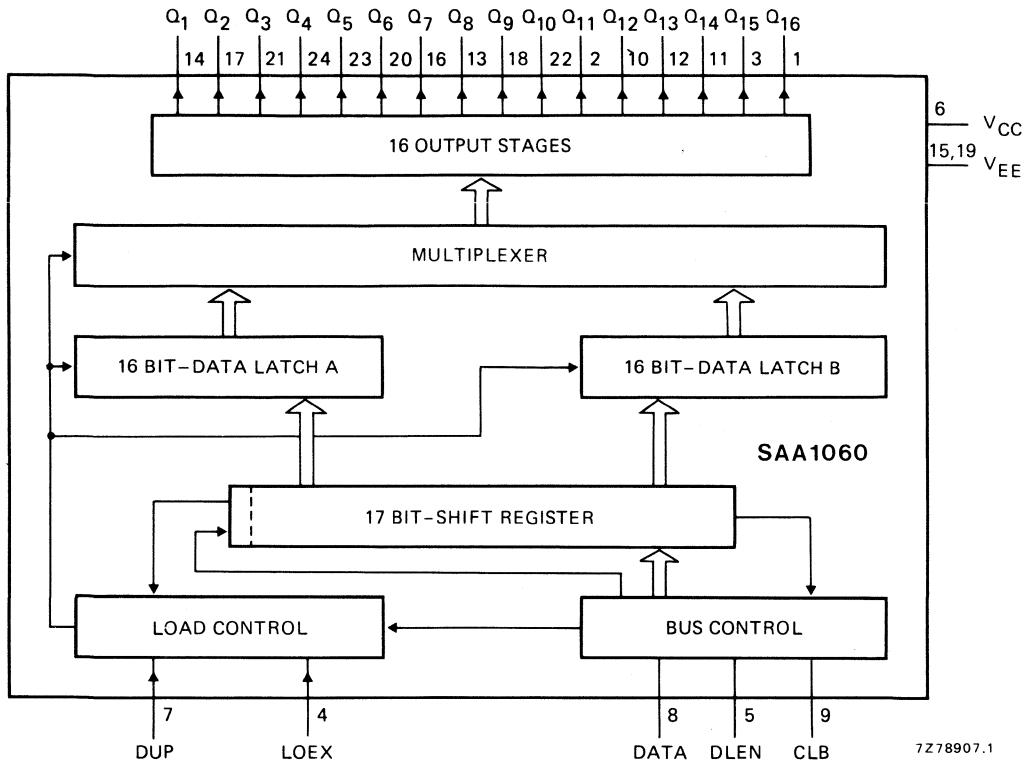

When the SAA1057 is operating in a system with continuous activity on the bus lines, the transient times at the bus inputs should not be less than 100 ns. Otherwise the signal-to-noise ratio of the tuning voltage is reduced.

(1) Values depend on the tuner diode characteristics.

Fig. 6 Application example of the SAA1057PLL frequency synthesizer module.

LED DISPLAY/INTERFACE CIRCUIT

**Features**

Fig. 1 Block diagram.

- Driving 7, 14, 16-segment displays.
- Driving linear displays, bar graph displays for analogue functions.
- Serial to parallel decoder.
- Bus control for the selection of 18-bit words.
- 2 x 16-bit latch.
- Duplex operation for two modes of output: static (16 bit) or dynamic (2 x 16 bit).
- Data transfer control.
- 2 outputs for higher output current (80 mA).

**QUICK REFERENCE DATA**

Supply voltage range	$V_{CC}$	4 to 6 V	
Operating ambient temperature range	$T_{amb}$	-20 to +80 °C	
-----			
Maximum input frequency	$f_I$	typ.	50 kHz
Supply current	$I_{CC}$	typ.	60 mA
Output current	$I_Q$	<	40 mA
Output current ( $Q_8$ and $Q_{16}$ only)	$I_Q$	<	80 mA

**PACKAGE OUTLINE**

24-lead DIL; plastic (SOT-101A).

**GENERAL DESCRIPTION**

The integrated circuit SAA1060 is primarily designed to drive the display unit of a digital tuning system. It can also be used as a 16-bit serial to parallel decoder. Since the device has no decoder (this is handled by a microcomputer), it has many applications:

- driving 7-segment displays
- driving 14-segment displays
- driving linear displays, e.g. pointer, bar graph
- static output of switch-functions
- digital to analogue converter, with external R-2R network
- extension of the number of outputs for microprocessors or microcomputers.

Data transmission is initiated by means of a burst of clock pulses (CLB), a data line enable signal (DLEN) and the data signal (DATA). The bus control circuit distinguishes between interference and valid data by checking word length (17 bits) and the leading zero. This allows different bus information to be supplied on the same bus lines for other circuits (e.g. SAA1056 with 16 bits).

The last bit (bit 17) of the data word contains the information which of the two internal latches will be loaded. The input LOEX determines if the latched data of selected latches is presented directly to the outputs, or synchronized with the data select signal DUP.

The output stages are n-p-n transistors with open collectors. The current capability is designed for the requirements of duplex operation. Two of the outputs (Q<sub>8</sub> and Q<sub>16</sub>) are arranged for double current, so that 2 x 2 segments can be connected in parallel.

**OPERATION DESCRIPTION**

**Data inputs (DLEN, DATA)**

The SAA1060 processes serially the 18-bit data words synchronized with the clock burst (CLB) and applied to the data input DATA. A command will be accepted only when the data line enable input (DLEN) is HIGH (see Fig. 3).

Fig. 2 Organization of a data word.

**Condition for 17th bit:**

- 0 = load data latch B
- 1 = load data latch A

The loading of the accepted information in one of the data latches is done by the 19th clock pulse, when DLEN is LOW.

FOR DETAILED INFORMATION SEE RELEVANT DATA BOOK OR DATA SHEET

## LCD DISPLAY/INTERFACE CIRCUIT

## GENERAL DESCRIPTION

The SAA1062A is designed to drive a Liquid Crystal Display (LCD) of a digital tuning system. It contains a shift register with programmable length (18 or 21 bits), latches, both synchronized or static, exclusive-OR segment drivers (17 or 20 bits), an l.f. oscillator and a backplane driver for the LCD. The circuit is designed to be driven by a 3 bus structure from a microcomputer and can also be used as a programmable 17 or 20 bits serial-to-parallel decoder. It is also capable of storing 40 bits of information.

## Features

- Driving 7 to 20-segment displays.
- Driving linear displays.
- Serial to parallel decoder of digital signals.
- Bus control for the selection of 18/21-bit words.
- 17/20-bit latch.
- A.C. segment drive.
- On-chip oscillator.

## QUICK REFERENCE DATA

Supply voltage range	$V_{CC}$		4,2 to 5,5 V
Operating ambient temperature range	$T_{amb}$		-20 to + 70 °C
-----			
Maximum input frequency	$f_i$	typ.	50 kHz
Supply current	$I_{CC}$	typ.	3,5 mA
Output current ( $Q_1$ to $Q_{20}$ )	$I_Q$	>	60 $\mu$ A

## PACKAGE OUTLINES

SAA1062A : 28-lead DIL; plastic (SOT-117).

SAA1062AT: 28-lead mini-pack; plastic (SO-28; SOT-136A).

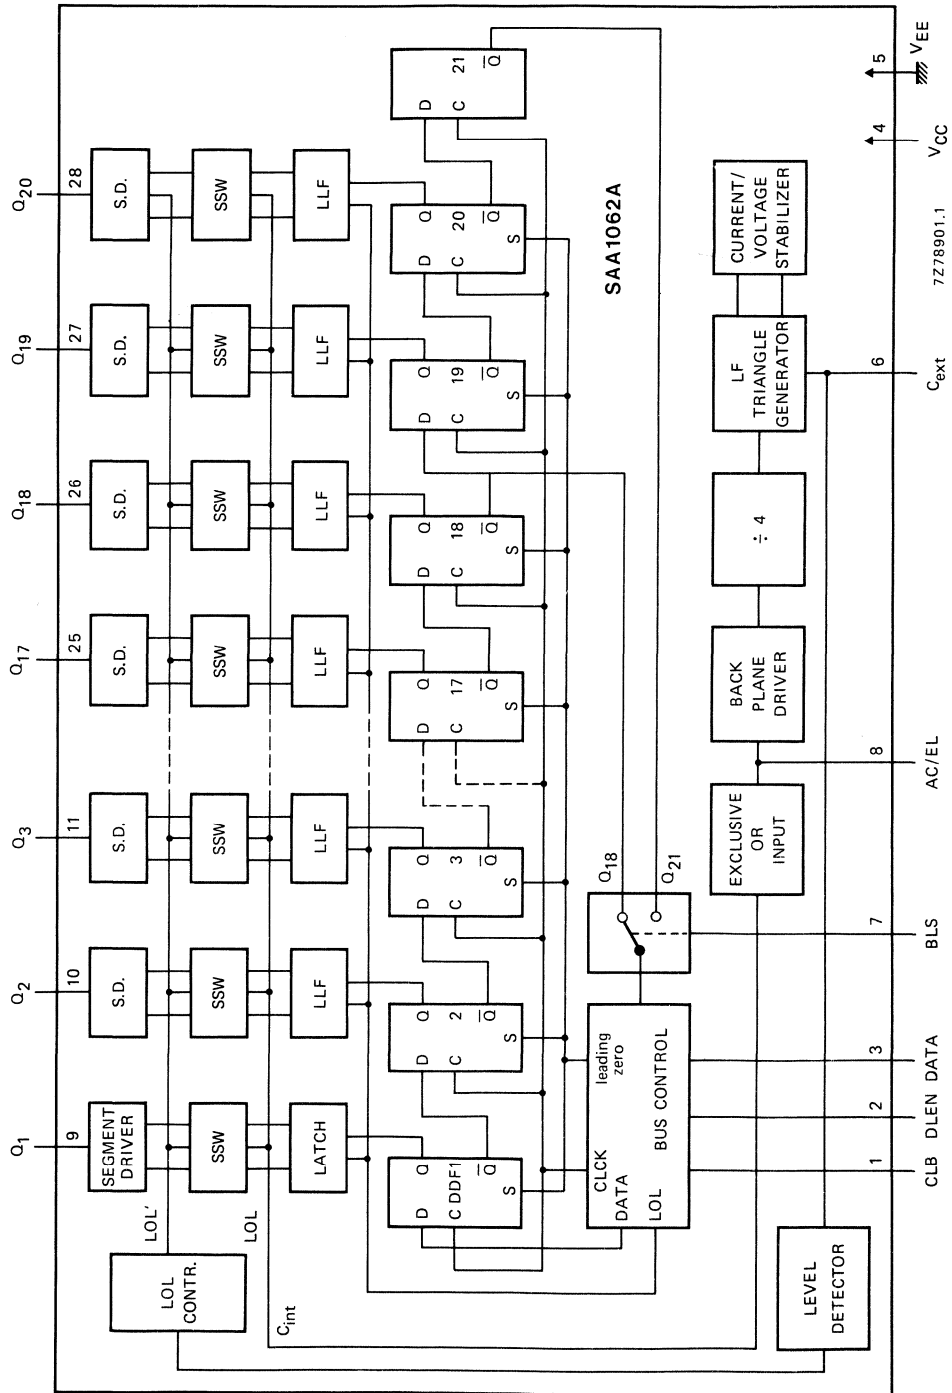

Fig. 1 Block diagram.

## FLUORESCENT DISPLAY/INTERFACE CIRCUIT

### GENERAL DESCRIPTION

The SAA1063 is designed to drive the display unit of a digital tuning system. It contains a 17-bit shift register, latches, display multiplexers and output stages, capable of driving 4½ decades of a 7 segment fluorescent display in duplex mode. The decoding for the display is carried out in the data input (microcomputer).

### Features

- Driving 4½ decades of a seven segment display in duplex mode.
- Microcomputer compatible.
- 17-bit shift register.
- D.C. and duplex operation.

### QUICK REFERENCE DATA

Supply voltage range	$V_{CC}$		4 to 5,5	V
Operating ambient temperature range	$T_{amb}$		-20 to +80	°C

## OPERATION DESCRIPTION

The input information for this device consists of a data bus with 17 bit words, an external clock synchronized with the data bus and an enable signal. The data format of these signals is given in Fig. 3. These signals are handled by the BUS CONTROL circuit in which the decision is taken as to whether these signals are valid for this device. It contains a leading zero detector (start condition of reception) and a data-length control. Leading zero is detected when the data signal is LOW and the DLEN signal HIGH, during the first HIGH period of the clock signal. During the HIGH period of the DLEN signal, the length control determines if the clock signal consists of 18 pulses. This last function permits the user to supply other information on the same signal lines.

Furthermore the bus control prevents the device accepting interference on the signal lines. If leading zero is detected the shift register is reset and then the data is written into this register. The reset position of the first bit of the register is shifted into the last bit, if the length of the data and the clock input is correct. Incorrect length of the information is detected by checking the value of the last bit of the register. If the data transmission has been accepted properly, the bus control stage generates a valid pulse (LOVP). This pulse enables the load control circuit to load the contents of the register into one of the two latches. When the load bit of the data word is HIGH the register contents are loaded into latch A; when this load bit is LOW the register contents are loaded into latch B. When the data information is accepted this load bit is written into the first bit of the shift register.

In duplex mode the load pulse is synchronised by the duplex signal, to avoid current transients in the output stages during the loading of the latches. The duplex mode operates in one of two mode conditions. When LOEX (pin 4) is LOW the duplex mode condition is selected; when LOEX is HIGH the d.c. mode condition is selected. The output stages are switched to the contents of latch A and latch B respectively.

When the duplex input (pin 7) is LOW the contents of latch A can be found on the output, when this input is HIGH the contents of latch B are found on the output.

In the duplex mode condition the output stages are capable of driving 32 duplexed segments of a fluorescent display. However, in the d.c. mode condition the output stages can only drive 16 segments of the display and two SAA1063 devices are required to drive a 4½ decade display unit.

Fig. 3 Organisation of 18-bit data word.

Notes

1. The display segment is blanked by a HIGH data bit.
2. In duplex mode the period between the two data words must be greater than 21 ms.
3. Shaded timing periods are 'don't care' levels.
4.  $\tau_1 > 4 \mu s$  if a continuous clock is used.  $\tau_2$  and  $\tau_3 > 4 \mu s$ .  $\tau_4 > 2 \mu s$ .

SAA1099

## MICROPROCESSOR CONTROLLED STEREO SOUND GENERATOR FOR SOUND EFFECTS AND MUSIC SYNTHESIS

### GENERAL DESCRIPTION

The SAA1099 is a monolithic integrated circuit designed for generation of stereo sound effects and music synthesis.

#### Features

- Six frequency generators  
eight octaves per generator  
256 tones per octave
- Two noise generators
- Six noise/frequency mixers
- Twelve amplitude controllers
- Two envelope controllers
- Two 6-channel mixers/current sink analogue output stages
- TTL input compatible
- Readily interfaces to 8-bit microcontroller
- Minimal peripheral components
- Simple output filtering

#### Applications

- Consumer games systems
- Home computers
- Electronic organs
- Arcade games
- Toys
- Chimes/alarm clocks

### QUICK REFERENCE DATA

---

Supply voltage (pin 18)	$V_{DD}$	typ.	5 V
Supply current (pin 18)	$I_{DD}$	typ.	70 mA
Reference current (pin 6)	$I_{ref}$	typ.	250 $\mu$ A
Total power dissipation	$P_{tot}$		500 mW
Operating ambient temperature range	$T_{amb}$		0 to + 70 °C

---

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102CS).

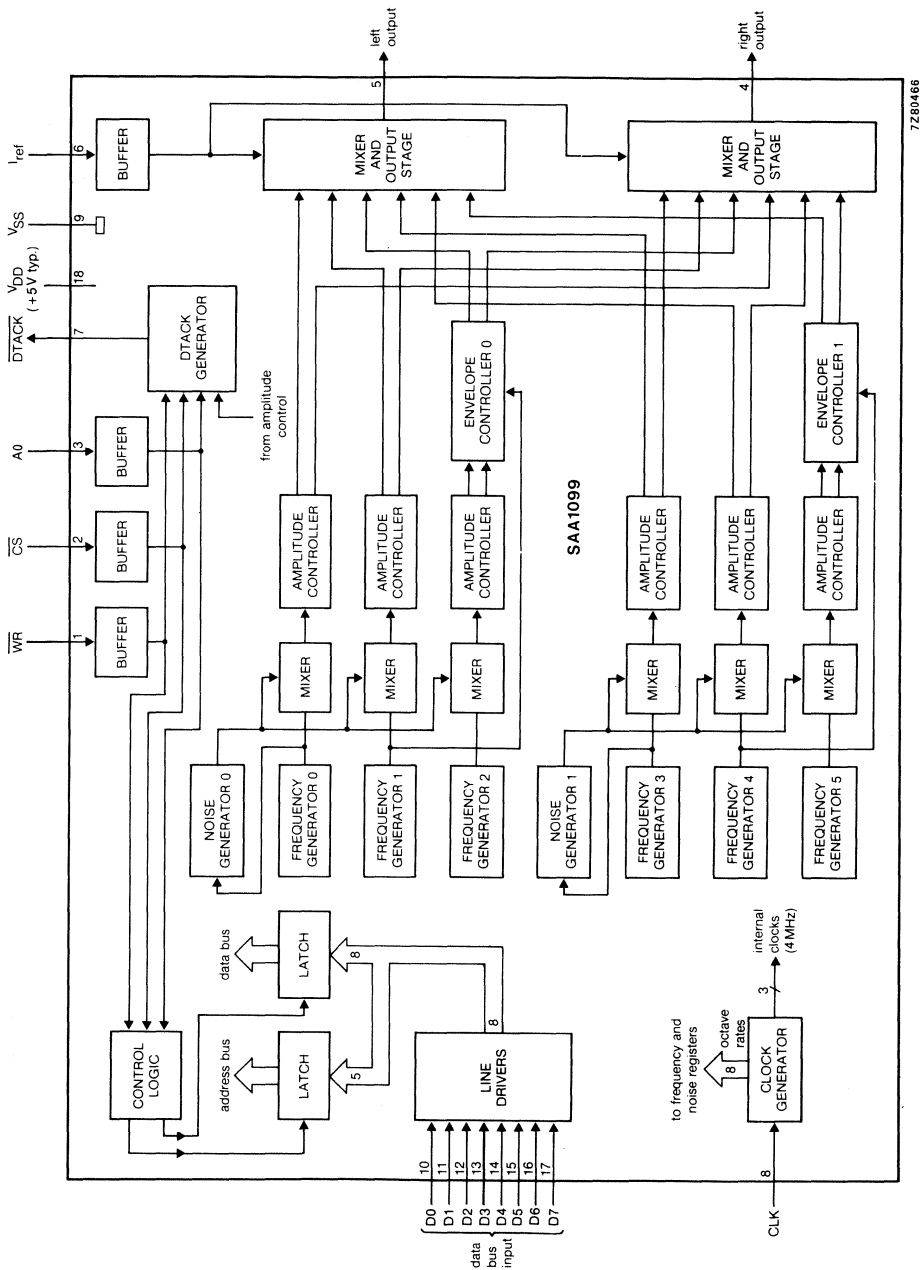

Fig. 1 Block diagram.

PINNING

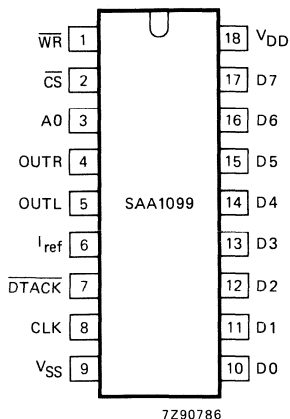

Fig. 2 Pinning diagram.

DEVELOPMENT DATA

PIN DESIGNATION

1	$\overline{WR}$	<b>Write Enable:</b> active LOW input which operates in conjunction with $\overline{CS}$ and A0 to allow writing to the internal registers.
2	$\overline{CS}$	<b>Chip Select:</b> active LOW input to identify valid $\overline{WR}$ inputs to the chip. This input also operates in conjunction with $\overline{WR}$ and A0 to allow writing to the internal registers.
3	A0	<b>Control/Address select:</b> input used in conjunction with $\overline{WR}$ and $\overline{CS}$ to load data to the control register (A0 = 0) or the address buffer (A0 = 1).
4	OUTR	<b>Right channel output:</b> a 7-level current sink analogue output for the 'right' component. This pin requires an external load resistor.
5	OUTL	<b>Left channel output:</b> a 7-level current sink analogue output for the 'left' component. This pin requires an external load resistor.
6	$I_{ref}$	<b>Reference current supply:</b> used to bias the current sink outputs.
7	$\overline{DTACK}$	<b>Data Transfer Acknowledge:</b> open drain output, active LOW to acknowledge successful data transfer. On completion of the cycle $\overline{DTACK}$ is set to inactive.
8	CLK	<b>Clock:</b> input for an externally generated clock at a nominal frequency of 8 MHz.
9	$V_{SS}$	<b>Ground:</b> 0 V.
10-17	D0-D7	<b>Data:</b> Data bus input.
18	$V_{DD}$	<b>Power supply:</b> + 5 V typical.

## FUNCTIONAL DESCRIPTION

The following sections provide a detailed functional description of the SAA1099 as shown in the block diagram, Fig. 1.

### Frequency generators

Six frequency generators can each select one of 8 octaves and one of 256 tones within an octave. A total frequency range of 31 Hz to 7,81 kHz is available. The outputs may also control noise or envelope generators. All frequency generators have an enable bit which switches them on and off, making it possible to preselect a tone and to make it inaudible when required. The frequency generators may be synchronized using the frequency reset bit.

The frequency ranges per octave are:

Octave	Frequency range
0	31 Hz to 61 Hz
1	61 Hz to 122 Hz
2	122 Hz to 244 Hz
3	245 Hz to 488 Hz
4	489 Hz to 977 Hz
5	978 Hz to 1,95 kHz
6	1,96 kHz to 3,91 kHz
7	3,91 kHz to 7,81 kHz

### Noise generators

The two noise generators both have a programmable output. This may be a software controlled noise via one of the frequency controlled generators or one of three pre-defined noises. There is no tone produced by the frequency generator when it is controlling the noise generator. The noise produced is based on double the frequency generator output, i.e. a range of 61 Hz to 15,6 kHz.

In the event of a pre-defined noise being chosen, the output of noise generator 0 can be mixed with frequency generator 0, 1 and 2; and the output of noise generator 1 can be mixed with frequency generator 3, 4 and 5. In order to produce an equal level of noise and tone outputs (when both are mixed) the amplitude of the tone is increased. The three pre-defined noises are based on a clock frequency of 7,8 kHz, 15,6 kHz or 31,25 kHz.

### Noise/frequency mixers

Six noise/frequency mixers each with four selections

- Channel off
- Frequency only
- Noise only
- Noise and frequency

Each mixer channel has one of the frequency generator outputs fed to it, three channels use noise generator 0 and the other three use noise generator 1.

### Amplitude controllers

Each of the six channel outputs from the mixer is split up into a right and left component giving effectively twelve amplitude controllers. An amplitude of 16 possible levels is assigned to each of the twelve signals. With this configuration a stereo effect can be achieved by varying only the amplitude component. The moving of a sound from one channel to the other requires, per tone, only one update of the amplitude register contents.

When an envelope generator is used, the amplitude levels are restricted. The number of levels available is then reduced to eight. This is achieved by disabling the least significant bit (LSB) of the amplitude control.

### Envelope controllers

Two of the six tone generators are under envelope control. This applies to both the left and right outputs from the tone generator.

The envelope has the following eight possible modes:

- Amplitude is zero
- Single attack
- Single decay
- Single attack-decay (triangular)
- Maximum amplitude
- Continuous attack
- Continuous decay
- Continuous attack-decay

The timing of the envelope controllers is programmable using one of the frequency generators (see Fig. 1). When the envelope mode is selected for a channel its control resolution is halved for that channel from 16 levels to 8 levels by rounding down to the nearest even level.

There is also the capability of controlling the 'right' component of the channel with inverse of the 'left' component, which remains as programmed.

A direct enable permits the start of an envelope to be defined, and also allows termination of an envelope at any time. The envelope rate may be controlled by a frequency channel (see Fig. 1), or by the microprocessor writing to the address buffer register. If the frequency channel controlled is OFF ( $NE = FE = 0$ ) the envelope will appear at the output, which provides an alternative 'non-square' tone capability. In this event the frequency will be the envelope rate, which provided the rate is from the frequency channel, will be a maximum of 1 kHz. Higher frequencies of up to 2 kHz can be obtained by the envelope resolution being halved from 16 levels to 8 levels. Rates quoted are based on the input of a 8 MHz clock.

### Six-channel mixers/current sink analogue output stages

Six channels are mixed together by the two mixers allowing each one to control one of six equally weighted current sinks, to provide a seven level analogue output.

### Command/control select

In order to simplify the microprocessor interface the command and control information is multiplexed. To select a register in order to control frequencies, amplitudes, etc. the command-register has to be loaded. The contents of this register determines to which register the data is written in the next control-cycle. If a continuous update of the control-register is necessary, only the control-information has to be written (the command-information does not change).

If the command/control select (A0) is logic 0, the byte transfer is control; if A0 is logic 1, the byte transfer is command.

### Interface to microprocessor

The SAA1099 is a data bus based I/O peripheral. Depending on the value of the command/control signal (A0) the CS and WR signals control the data transfer from the microprocessor to the SAA1099. The data-transfer-acknowledge ( $\overline{DTACK}$ ) indicates that the data transfer is completed. When, during the write cycle, the microprocessor recognizes the  $\overline{DTACK}$ , the bus cycle will be completed by the processor.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 18)	$V_{DD}$	-0,3 to + 7,5 V
Maximum input voltage	$V_I$	-0,3 to + 7,5 V

## Notes to the characteristics

- Using an external constant current generator to provide a nominal  $I_{ref}$  or external resistor connected to  $V_{DD}$ .
- This output is short-circuit protected to  $V_{DD}$  and  $V_{SS}$ .
- Measured with  $I_{ref}$  a constant value between 100 and 400  $\mu\text{A}$ ; load resistance ( $R_L$ ) allowed to match E12 (5%) in all applications via:

$$R_L = 0,6 [I_{ref}]^{-1} - 16 [I_{ref}]^{-0,5} \pm 12\%$$

- Measured with  $R_{ref} = 10\text{ k}\Omega$  ( $\pm 5\%$ ) connected between  $I_{ref}$  and  $V_{DD}$ ;  $R_L = 1,5\text{ k}\Omega$  ( $\pm 5\%$ ); OUTR and OUTL short-circuit protected to  $V_{SS}$ .
- Left and right outputs must be driven with identical configuration.
- Sample tested value only.
- This timing parameter only applies when no wait states are required; otherwise parameter is invalid.
- The minimum bus cycle time of four clock periods is for loading all registers except the amplitude registers.
- The minimum bus cycle time of 16 clock periods is for loading the amplitude registers. In a system using  $\overline{\text{DTACK}}$  it is possible to achieve minimum times of 500 ns. Without  $\overline{\text{DTACK}}$  the parameter given must be used.

## APPLICATION INFORMATION

### Device operation

The SAA1099 uses pulse width modulation to achieve amplitude and envelope levels. The twelve signals are mixed in an analogue format (6 'left' and 6 'right') before leaving the chip. The amplitude and envelope signals chop the output at a minimum rate of 62,5 kHz, compared with the highest tone output of 7,81 kHz. Simple external low-pass filtering is used to remove the high frequency components.

Rates quoted are based on the input of a 8 MHz clock.

A data bus based write only structure is used to load the on-board registers. The data bus is used to load the address for a register, and subsequently the data to that register. Once the address is loaded multiple data loads to that register can be performed.

The selection of address or data is made by the single address bit A0, as shown in register maps Table 1 and Table 2.

The bus control signals  $\overline{WR}$  and  $\overline{CS}$  are designed to be compatible with a wide range of microprocessors, a  $\overline{DTACK}$  output is included to optimise the interface with an S68000 series microprocessor. In most bus cycles  $\overline{DTACK}$  will be returned immediately, this applies to all register address load cycles and all except amplitude data load cycles. With respect to amplitude data, a number of wait cycles may need to be performed, depending on the time since the previous amplitude load.  $\overline{DTACK}$  will indicate the number of required waits.

### Register description (see Tables 2 and 3)

The amplitudes are assigned with 'left' and 'right' components in the same byte, on a channel by channel basis. The spare locations that are left between blocks of registers is to allow for future expansion, and should be written as zero's. The tone within an octave is defined by eight bits and the octave by three bits. Note that octaves are paired (0/1, 2/3 etc.). The frequency and noise enables are grouped together for ease of programming. The controls for noise 'colour' (clock rate) are grouped in one byte.

The envelope registers are positioned in adjacent locations. There are two types of envelope controls, direct acting controls and buffered controls. The direct acting controls always take immediate effect, and are:

- Envelope enable (reset)
- Envelope resolution (16/8 level)

The buffered controls are acted upon only at the times shown in Fig. 5 and control selection of:

- Envelope clock source
- Waveform type
- Inverted/non-inverted 'right' component

Fig. 5 Envelope waveforms.

Notes to Fig. 5

- (1) The level at this time is under amplitude control only ( $En7 = 0$ ; no envelope).
  - (2) When the generator is active ( $En7 = 1$ ) the maximum level possible is  $7/8$ ths of the amplitude level.
  - (3) After position (3) the buffered controls will be acted upon when loaded.
  - (4) At positions (4) the buffered controls will be acted upon if already loaded.
  - (5) Waveforms 'a' to 'h' show the left channel ( $En0 = 0$ ; left and right components have the same envelope).
- Waveform 'i' shows the right channel ( $En0 = 1$ ; right component inverse of envelope applied to left).

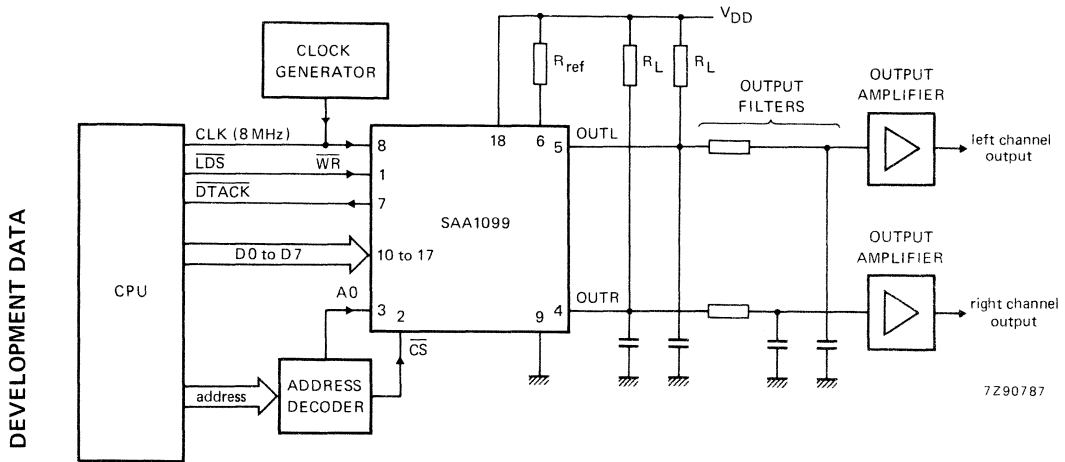

Fig. 6 Typical application circuit diagram.

## TUNER SWITCHING CIRCUIT

The SAA1300 is for switching on and off the supply lines of various circuit parts via an I<sup>2</sup>C bus signal. Furthermore, it can be used to supply current for switching diodes in radio and television tuners. It contains 5 output stages, which are capable of supplying up to 100 mA in the ON state or sinking up to -100  $\mu$ A in the OFF state.

Current limiting and short-circuit protection are included. The output stages are driven by a shift register/latch combination which is loaded via data from the I<sup>2</sup>C bus. A power-on reset of the latches ensures the OFF state of the output stages (OUT 2 to OUT 5) without data reception from the I<sup>2</sup>C bus. A subaddressing system allows the connection of up to three circuits on the same I<sup>2</sup>C bus lines; one of the outputs (OUT 1, pin 7) can also be used as an input to select the device via a simple internal A/D converter.

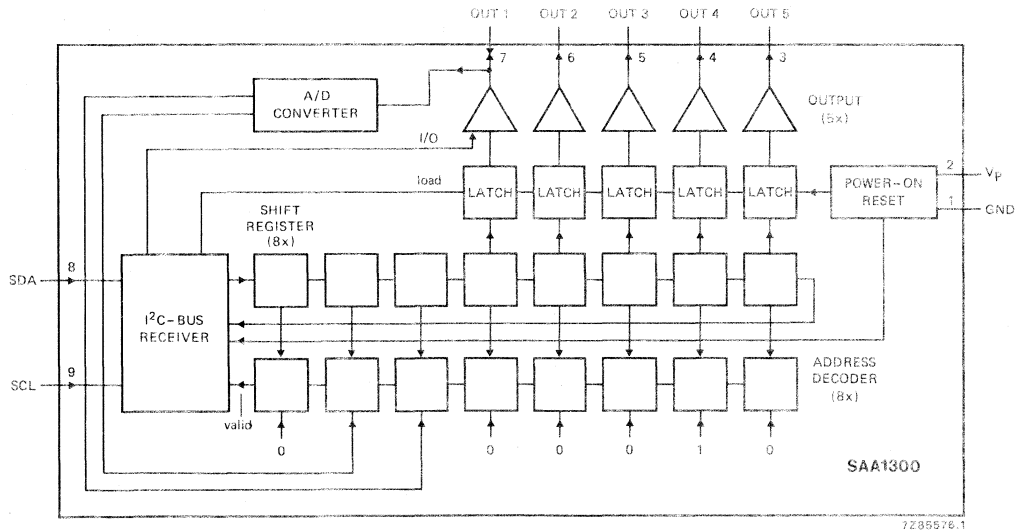

Fig. 1 Block diagram.

## REMOTE CONTROL TRANSMITTER

### GENERAL DESCRIPTION

The SAA3004 transmitter IC is designed for infrared remote control systems. It has a total of 448 commands which are divided into 7 sub-system groups with 64 commands each. The sub-system code may be selected by a press button, a slider switch or hard wired.

The SAA3004 generates the pattern for driving the output stage. These patterns are pulse distance coded. The pulses are infrared flashes or modulated. The transmission mode is defined in conjunction with the sub-system address. Modulated pulses allow receivers with narrow-band preamplifiers for improved noise rejection to be used. Flashed pulses require a wide-band preamplifier within the receiver.

The SAA3004 has the following features:

- Flashed or modulated transmission
- 7 sub-system addresses
- Up to 64 commands per sub-system address
- High-current remote output at  $V_{DD} = 6\text{ V}$  ( $-I_{OH} = 40\text{ mA}$ )
- Low number of additional components
- Key release detection by toggle bits
- Very low stand-by current ( $< 2\text{ }\mu\text{A}$ )
- Operational current  $< 2\text{ mA}$  at 6 V supply
- Wide supply voltage range (4 to 11 V)
- Ceramic resonator controlled frequency (typ. 450 kHz)
- Encapsulation: 20-lead plastic DIL or 20 lead plastic mini-pack (SO-20)

### PACKAGE OUTLINES

20-lead DIL; plastic (SOT-146C1).

20-lead mini-pack; plastic (SO-20; SOT-163AC3).

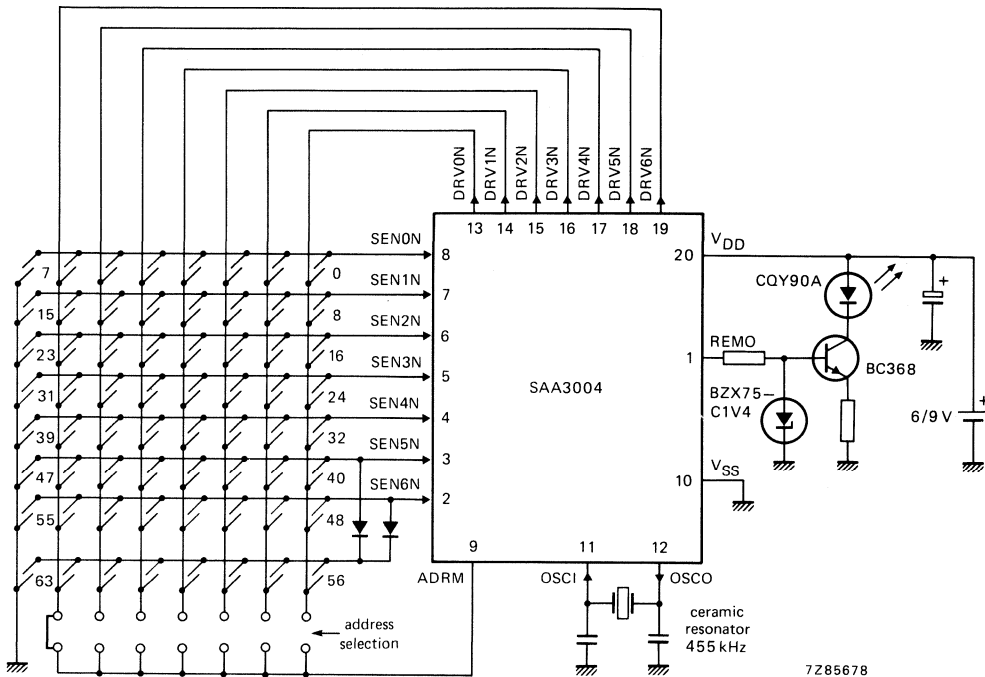

Fig. 1 Transmitter with SAA3004.

**INPUTS AND OUTPUTS**

**Key matrix inputs and outputs (DRV0N to DRV6N and SEN0N to SEN6N)**

The transmitter keyboard is arranged as a scanned matrix. The matrix consists of 7 driver outputs and 7 sense inputs as shown in Fig. 1. The driver outputs DRV0N to DRV6N are open drain N-channel transistors and they are conductive in the stand-by mode. The 7 sense inputs (SEN0N to SEN6N) enable the generation of 56 command codes. With 2 external diodes all 64 commands are addressable. The sense inputs have P-channel pull-up transistors, so that they are HIGH until they are pulled LOW by connecting them to an output via a key depression to initiate a code transmission.

**Address mode input (ADRM)**

The sub-system address and the transmission mode are defined by connecting the ADRM input to one or more driver outputs (DRV0N to DRV6N) of the key matrix. If more than one driver is connected to ADRM, they must be decoupled by a diode. This allows the definition of seven sub-system addresses as shown in Table 3. If driver DRV6N is connected to ADRM the data output format of REMO is modulated or if not connected, flashed.

The ADRM input has switched pull-up and pull-down loads. In the stand-by mode only the pull-down device is active. Whether ADRM is open (sub-system address 0, flashed mode) or connected to the driver outputs, this input is LOW and will not cause unwanted dissipation. When the transmitter becomes active by pressing a key, the pull-down device is switched off and the pull-up device is switched on, so that the applied driver signals are sensed for the decoding of the sub-system address and the mode of transmission.

FOR DETAILED INFORMATION SEE RELEVANT DATA BOOK OR DATA SHEET

## LOW VOLTAGE INFRARED REMOTE CONTROL TRANSMITTER (RC-5)

### GENERAL DESCRIPTION

The SAA3006 is intended as a general purpose (RC-5) infrared remote control system for use where only low supply voltages are available. The device can generate 2048 different commands and utilizes a keyboard with a single-pole switch per key. The commands are arranged so that 32 systems can be addressed, each system containing 64 different commands.

The circuit response to legal (one key pressed at a time) and illegal (more than one key pressed at a time) keyboard operation is specified later in this publication (see KEY ACTIVITIES).

### Features

- Low supply voltage requirements
- Very low current consumption
- For infrared transmission link
- Transmitter for 32 x 64 commands
- One transmitter controls 32 systems
- Transmission biphasic technique
- Short transmission times; speed-up of system reaction time
- Single-pin oscillator input
- Input protection
- Test mode facility

### QUICK REFERENCE DATA

Supply voltage range	$V_{DD}$	2 to 7	V
Input voltage range	$V_I$	0,5 to ( $V_{DD} + 0,5$ )	V*
Input current	$\pm I_I$	max. 10	mA
Output voltage range	$V_O$	-0,5 to ( $V_{DD} + 0,5$ )	V*
Output current	$\pm I_O$	max. 10	mA
Operating ambient temperature range	$T_{amb}$	-25 to +85	°C

\*  $V_{DD} + 0,5$  V not to exceed 9 V.

## INFRARED REMOTE CONTROL TRANSMITTER (LOW VOLTAGE)

### GENERAL DESCRIPTION

The SAA3007 transmitter IC for infrared remote control systems has a capacity for 1280 commands arranged in 20 subsystem address groups of 64 commands each. The subsystem address may be selected by press-button or slider switches, or be hard-wired.

Commands are transmitted in patterns of pulses coded by the pulse spacing. The pulses can be infrared flashed (single pulse) or modulated. Flashed infrared transmissions require a wideband preamplifier at the receiver, but modulated transmissions allow a narrow band receiver to be used for improved noise rejection. The modulation frequency of the SAA3007 is 455 kHz which allows disturbance-free infrared operation in the presence of 10 - 100 kHz fluorescent lamps.

### Features

- Flashed or modulated transmission modes
  - Immune from fluorescent lamp disturbance in modulated mode
  - Supply voltage range 2 V to 6,5 V
  - 40 mA output current capability
  - Very low standby current ( $< 4 \mu\text{A}$  at  $V_{DD} = 6 \text{ V}$ )
  - Up to 20 subsystem address groups
  - Up to 64 commands per subsystem address
  - Requires few additional components
- } up to 1280 commands

### PACKAGE OUTLINES

SAA3007P: 20-lead DIL; plastic (SOT-146C1).

SAA3007T: 20-lead mini-pack; plastic (SO-20; SOT-163A).

## INFRARED REMOTE CONTROL TRANSCODER (RC-5)

### GENERAL DESCRIPTION

The SAA3028 is intended for use in general purpose (RC-5) remote control systems. The main function of this integrated circuit is to convert RC-5 biphas coded signals into equivalent binary values. Two input circuits are available: one for RC-5 coded signals only; the other is selectable to accept (1) RC-5 coded signals only, or (2) RC-5 (extended) coded signals only. The input used is that at which an active code is first detected. Coded signals not in RC-5/RC-5(ext) format are rejected. Data input and output is by serial transfer, the output interface being compatible for I<sup>2</sup>C bus operation.

### Features

- Converts RC-5 or RC-5(ext) biphas coded signals into binary equivalents
- Two data inputs, one fixed (RC-5), one selectable (RC-5/RC-5(ext))
- Rejects all codes not in RC-5/RC-5(ext) format
- I<sup>2</sup>C output interface capability
- Power-off facility
- Master/slave addressable for multi-transmitter/receiver applications in RC-5(ext) mode
- Power-on-reset for defined start-up

### QUICK REFERENCE DATA

Supply voltage range	V <sub>DD</sub>	4,5 to	5,5 V

## INTERPOLATION AND MUTING CIRCUIT FOR COMPACT DISC DIGITAL AUDIO SYSTEM

### GENERAL DESCRIPTION

The SAA7000 interpolation and muting circuit descrambles and separates data into left and right channels and minimizes the effects of erroneous data on the performance of the Compact Disc Digital Audio System. Minor errors (those present in one data sample only) are replaced with audio data obtained by interpolation; more persistent errors are removed by muting.

### Features

- Descrambles data from error corrector SAA7020 and formats into left and right channels
- Minimizes the effect of erroneous data samples
- 16-bit serial data input (two's complement)
- Smoothed transitions before and after muting
- Interpolated data replaces single erroneous data samples
- Serial output for digital-to-analogue converters (DACs) or filter circuits
- Generates crystal-derived timing signals for system master data clock (4,2336 MHz), serving error corrector SAA7020 and digital filter SAA7030
- Selectable output format: offset binary or two's complement; 14 or 16-bit word

18-lead DIL; plastic (SOT-102CS).

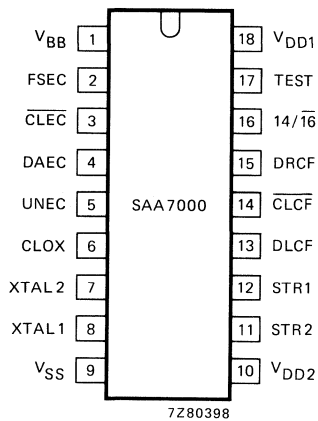

Fig. 2 Pinning diagram.

## PINNING

1	$V_{BB}$	back bias supply
2	FSEC	frame sync pulse input
3	$\overline{CLEC}$	input data clock
4	DAEC	data input (two's complement) and output format selector
5	UNEC	error flag input
6	CLOX	buffered clock output (XTAL1)
7	XTAL2	drive output to clock crystal
8	XTAL1	external clock input
9	$V_{SS}$	ground
10	$V_{DD2}$	+ 12 V supply
11	STR2	strobe 2 output
12	STR1	strobe 1 output
13	DLCF	left channel data output (format selected by DAEC)
14	$\overline{CLCF}$	14/16-bit clock burst output
15	DRCF	right channel data output (format selected by DAEC)
16	14/ $\overline{16}$	selects bit length of clock burst output from $\overline{CLCF}$
17	TEST	test input
18	$V_{DD1}$	+ 5 V supply

## FUNCTIONAL DESCRIPTION

The SAA7000 is used in the Compact Disc system to reconstruct audio data by interpolation if the error corrector SAA7020 is unable to correct a data sample, or mutes the data when it passes consecutive erroneous data samples. Errors are indicated by an error flag (UNEC) from the SAA7020; when no error flag occurs, the data value through SAA7000 is unaffected.

Data samples (at DAEC, clocked in by  $\overline{CLEC}$ ) are first descrambled and then separated into left and right channels. A similar descramble and separation is performed on the error flag (UNEC).

If, for either left or right channels, a single 'error' is flagged between two 'good' data samples then linear interpolation is used to replace the erroneous value. If two or more adjacent samples are flagged, then the samples in error are muted. Beginning thirty samples before the first of the consecutive errors, the data value of the samples is attenuated smoothly to zero following a (0 to  $\pi$ ) cosine curve. After the error burst, the next thirty samples are smoothly returned to full level following a ( $\pi$  to  $2\pi$ ) cosine curve. The muting is applied simultaneously to data in both left and right channels regardless of the source of the error.

The data (good or processed) is formatted into two's complement or offset binary to match the DACs in use. This selection is made with a special function of the data input (DAEC, see Fig. 6). The data is then fed to the left and right outputs (DLCF and DRCF) and is clocked out by the output clock ( $\overline{CLCF}$ ). Strobes (STR1 and STR2) are generated for the DACs and the digital filter (SAA7030). Fourteen or sixteen-bit DACs can be accommodated by the use of the select input (14/ $\overline{16}$ ).

The SAA7000 automatically synchronizes to the error detector SAA7020 output using the frame sync pulse (FSEC) for internal timing reset and feeds a 2 x bit-rate clock (CLOX) to the system.

Pin functions

pin no.	mnemonic	description
1	V <sub>BB</sub>	Back bias supply voltage: $-2,5 \text{ V} \pm 20\%$ .
2	FSEC	Frame sync pulse (active HIGH) received from SAA7020 at the start of a data frame (12 data samples). FSEC is used to synchronize the descrambler to the data frames. For re-synchronization to occur, two consecutive FSEC pulses must be received each having a pulse width of approximately 6 CLOX cycles and the leading edge of the second pulse must be one data frame later than that of the first. FSEC is also used to synchronize the internal clock to the CLEC clock input, so aligning the gap in the internal clock to the FSEC pulse (see Fig. 4).
3	$\overline{\text{CLEC}}$	Input data clock used to load serial data at DAEC into the input shift register. After a data sample has been loaded $\overline{\text{CLEC}}$ is held LOW to give a gap of 16 CLOX cycles (see Fig. 4). The period of the $\overline{\text{CLEC}}$ clock is 2 x the period of a CLOX cycle.
4	DAEC	Serial data samples are received at DAEC in two's complement form. The data is in 16-bit words separated by gaps; each word comprising two 8-bit symbols. The DAEC input is also used to select the output format; during the $\overline{\text{CLEC}}$ gap, a HIGH level at DAEC selects two's complement and a LOW level selects offset binary format (see Fig. 4).
5	UNEC	Error flag indicating unreliable data from SAA7020. During the period when data is clocked in at DAEC, UNEC is LOW only if the present 8-bit symbol is valid. During the period of the $\overline{\text{CLEC}}$ gap, UNEC is LOW only if the whole of the data word due to arrive 5 frames later is valid.
6	CLOX	Buffered XTAL1 clock output.
7	XTAL2	Main clock crystal drive output. This pin should remain disconnected if a crystal is not used.
8	XTAL1	Clock input from crystal circuit or for externally derived clock.
9	V <sub>SS</sub>	Ground (0 V).
10	V <sub>DD2</sub>	Positive supply voltage: $+ 12 \text{ V} \pm 10\%$ .
11	STR2	Active HIGH strobe pulse of 2 CLOX cycles duration occurring every 24 CLOX cycles and used to strobe data to the DACs. This pin should be left disconnected if SAA7030 is not used.
12	STR1	Active HIGH strobe pulse of 2 CLOX cycles duration occurring every 96 CLOX cycles – after each pair of data words have been clocked out. It is used to strobe data to SAA7030, or to the DACs if SAA7030 is not used. Both STR1 and STR2 are re-synchronized to XTAL1 to minimize jitter.
13	DLCF	Left channel data output; format in two's complement or offset binary, as selected at DAEC.
14	$\overline{\text{CLCF}}$	Clock burst output of either 14 or 16 bits, as selected at pin 16. It is used to clock data from DLCF and DRCF (data is valid on $\overline{\text{CLCF}}$ falling edge, see Fig. 5).
15	DRCF	Right channel data output; format is two's complement or offset binary, as selected at DAEC.
16	14/ $\overline{16}$	Selects 14 or 16-bit bursts of output clock $\overline{\text{CLCF}}$ .
17	TEST	This pin should be held LOW to ensure normal operation.
18	V <sub>DD1</sub>	Positive supply voltage: $+ 5 \text{ V} \pm 10\%$ .

**HANDLING**

Inputs and outputs are protected against electrostatic charge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices (see 'Handling MOS Devices').

**RATINGS**

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134);  $V_{SS} = 0$  V

Supply voltage 1 range (pin 18)	$V_{DD1}$	-0,3 to +7,5 V
Supply voltage 2 range (pin 10)	$V_{DD2}$	-0,3 to +15 V

NOTES TO THE CHARACTERISTICS

- $V_I = -0,3$  to  $+6,5$  V;  $T_{\text{amb}} = 25$  °C.
- All outputs, except XTAL2, are short-circuit protected to  $V_{\text{DD1}}$  and  $V_{\text{SS}}$ . Output XTAL2 is protected to  $V_{\text{SS}}$  only.
- Input timings assume that CLOX output (pin 6) is used to drive SAA7020 CLOX input.  $\overline{\text{CLEC}}$  period is twice the CLOX period.
- Output load capacitance is 50 pF.
- XTAL1 (pin 8) is driven by an external clock.
- Output load capacitance is 30 pF on STR1, STR2 outputs.

(1) Catalogue number of crystal is 6416 009 00111.

Fig. 3 Crystal oscillator circuit.

(1) When HIGH indicates unreliability of data word that will follow five frames later.  
 (2) When HIGH indicates unreliability of current symbol.

Fig. 4 Typical input waveforms.

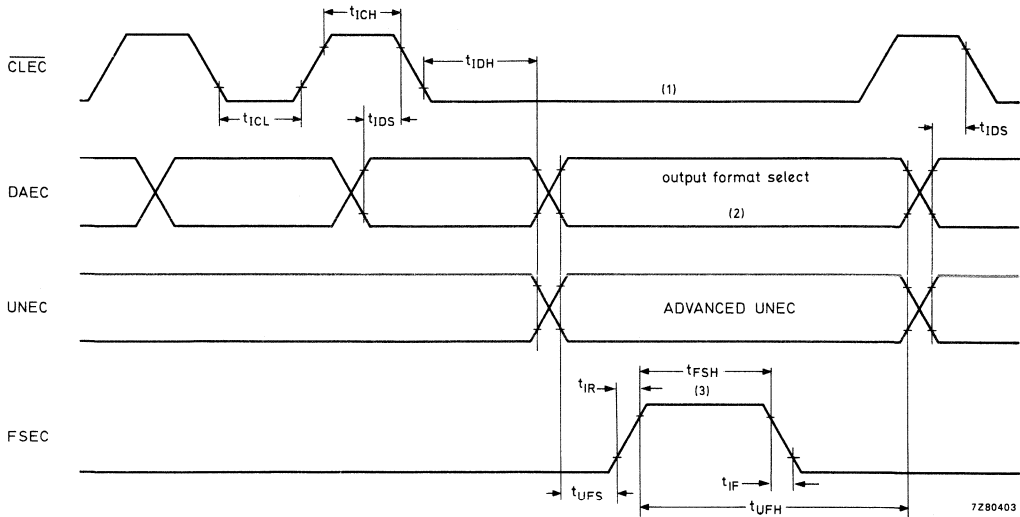

Fig. 5 Typical output waveforms.

- (1)  $\overline{\text{CLEC}}$  remains LOW for a minimum period of approximately 16 CLOX periods.
- (2) Data during this time is used to determine the format of the output from SAA7000; when DAEC is HIGH a two's complement format is selected, when LOW an offset binary format is selected.
- (3) Input timings assume that CLOX output (pin 6) is used to drive SAA7020 CLOX input.  $\overline{\text{CLEC}}$  period is twice the CLOX period.

Fig. 6 Input waveforms. Reference levels are 0,8 V and 2,4 V;  $t_{1R}$  and  $t_{1F}$  apply to FSEC waveform only.

## DEMODULATOR FOR COMPACT DISC DIGITAL AUDIO SYSTEM

### GENERAL DESCRIPTION

The SAA7010 demodulates and decodes the pulse code modulated input signal into digital data for the Compact Disc Digital Audio system. A 4,3 MHz (typical) clock locked to the disc rate is also produced.

### Features

- Phase-locked loop clock regenerator with frequency detector for locking
- High-frequency level detector with adaptive slicer for input data
- Built-in drop-out detector to prevent error propagation in adaptive slicer
- Outputs to subcoding microprocessor
- Fully protected timing synchronization to incoming data

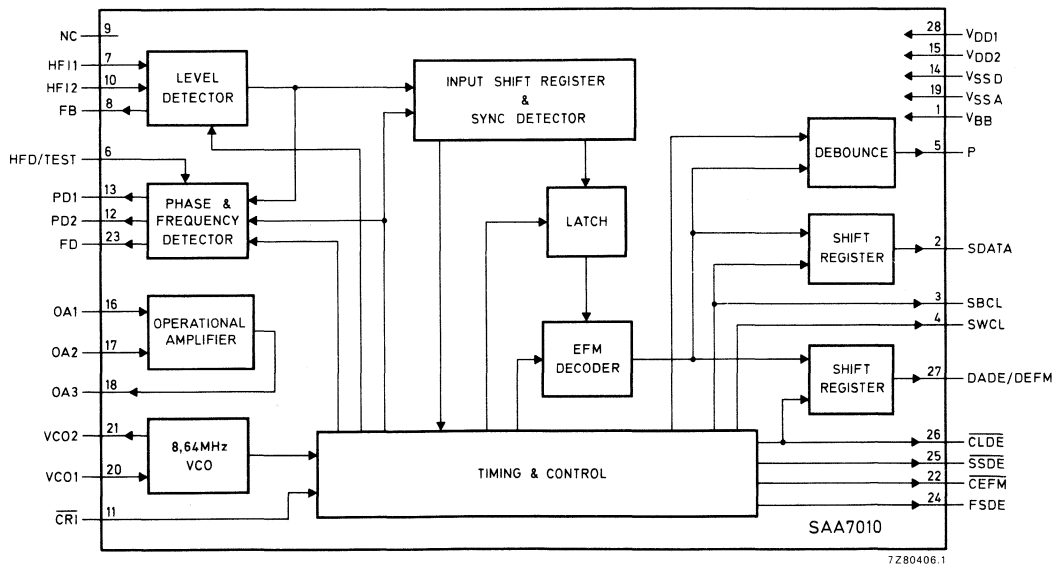

Fig. 1 Block diagram.

### PACKAGE OUTLINE

28-lead DIL; package (SOT-117).

28	V <sub>DD1</sub>	+ 5 V supply

## FUNCTIONAL DESCRIPTION

The SAA7010 demodulator forms the front-end of the Compact Disc Digital Audio system, supplying demodulated data and timing signals to the error corrector (SAA7020) and to the subcoding micro-processor.

The detected signal from the disc is amplified and filtered externally and then converted to a digital signal via the level detector. The level detector is an adaptive data slicer which relies on the nature of the modulation system to determine the optimum slicing level.

A frequency detector and a phase detector provide the coarse and fine control signals for the phase-locked loop (PLL) system. The loop gain is supplied by an internal operational amplifier which drives a voltage-controlled oscillator (VCO) running at twice the input data rate (typically 8,6436 MHz). The VCO output is divided by two by a clock generator in the timing and control circuits and the resulting output is used to clock the input shift register and the timing chain. This clock signal completes the PLL loop when it is compared with the incoming data in the phase detector.

After phase detection the data is clocked into the 23-bit shift register which then detects the frame sync pattern. Within the timing and control circuits are minimum and maximum data length detectors which provide frequency limit signals for the frequency detector.

Also within the timing and control circuits are two divide-by-588 counters, one master and one slave, two divide-by-17 symbol rate counters and a lock indication counter. The frame sync signal is used to reset the divide-by-588 slave counter. This counter and one divide-by-17 symbol rate counter supply timing signals for clocking the EFM (eight-to-fourteen modulation) decoder and the subcoding output circuits. The data is read from the input shift register in 14-bit symbols which are first latched and then decoded into 8-bit data words. The subcoding part of the data consists of one word per frame (Fig. 3), so the output SDATA comprises a burst of 8 data bits accompanied by a 2,1906 MHz clock burst signal SBCL (Fig. 4). One bit of this subcoding output data is replaced by a subcoding frame sync bit which is decoded from one of two special EFM codes. The displaced bit (the pause (P) bit) is latched to its own output via a debounce circuit to remove erroneous changes.

The divide-by-588 slave counter also provides a sync coincidence pulse which occurs when two detected sync pulses are precisely one frame apart (588 clock cycles). The sync coincidence pulse is used to reset the lock indication counter and disable the FD output from the frequency detector. If the system goes out of lock, the sync pulses cease and the lock indication counter counts frame periods. After 63 frame periods with no sync coincidence pulse, the lock indication counter enables the frequency detector output.

Fig. 3 Data input signal.

FUNCTIONAL DESCRIPTION (continued)

(1) The sync bit is LOW when a subcoding sync word is detected.

Fig. 4 Typical subcoding waveform outputs.

7280412.1

Fig. 5 Typical waveform outputs to SAA7020.

**FUNCTIONAL DESCRIPTION** (continued)

A delayed version of the sync coincidence pulse resets the divide-by-588 master counter. This counter is reset only by coincident sync pulses or sync pulses which occur during a predetermined 'window' at the start of each frame and is therefore protected from accidental reset by erroneous sync patterns. The window is wide enough to allow PLL bit-slips but narrow enough to avoid false sync signals generated by corrupt data. The divide-by-588 master counter may be allowed to free-run by taking CRI input (pin 11) LOW to inhibit the reset signal.

The divide-by-588 master counter and the second divide-by-17 symbol rate counter are used to time the data and clock outputs to the error corrector SAA7020 (Fig. 5). In this way, even if the data has been corrupted, the timing signals will be correct and are only re-synchronized after a complete frame has been sent to SAA7020.

The data output to SAA7020 comprises thirty-two 8-bit symbols per frame, with half-bit gaps between each symbol and a much longer gap during the frame sync period. It is this longer gap that changes in length when corrupt data upsets the timing system.

**Pin functions**

pin no.	mnemonic	description
1	V <sub>BB</sub>	Back bias supply voltage: $-2,5 \text{ V} \pm 20\%$ .
2	SDATA	Subcoding data push-pull output. An 8-bit burst of data (including a 1-bit subcoding frame sync) is output serially once per frame coincident with SBCL.
3	SBCL	Subcoding bit clock push-pull output. An 8-bit burst clock, typically at 2,1609 MHz, is used to synchronize the subcoding data.
4	SWCL	Subcoding word clock push-pull output. A square-wave signal at data frame rate (7,35 kHz) used to synchronize the subcoding words and the pause (P) bit.
5	P	Subcoding pause bit push-pull output. This signal is derived from the encoded subcoding word and is used to indicate a music pause. A debounce circuit is incorporated to eliminate erroneous data.
6	HFD/TEST	External high-frequency detector input. When this signal is HIGH the frequency detector output (FD) and phase detector are enabled. When pin 6 is connected to V <sub>DD2</sub> , the device enters TEST mode.
7	HF1	Level detector input. A signal of between 0,25 and 2,5 V (peak-to-peak value) is required to drive the level detector correctly.
8	FB	Current feedback from the level detector.
9	n.c.	Not connected.
10	HF12	Alternative input to the level detector.
11	$\overline{\text{CRI}}$	Counter reset inhibit signal input. When LOW, this signal allows the divide-by-588 master counter to free-run and causes pin 27 output to be converted to DEFM. During power-up, pin 11 should be held HIGH for 10 ms.
12	PD2	Phase detector reference signal, maximum impedance 10 k $\Omega$ .
13	PD1	Phase detector output signal, maximum impedance 10 k $\Omega$ . The differential d.c. content of PD1 and PD2 signals is a measure of the phase difference between the data and the internal 4,3218 MHz clock.
14	V <sub>SSD</sub>	Digital ground. Main ground terminal.
15	V <sub>DD2</sub>	Positive supply voltage: $+12 \text{ V} \pm 10\%$ .

pin no.	mnemonic	description
16	OA1	Operational amplifier non-inverting input.
17	OA2	Operational amplifier inverting input.
18	OA3	Operational amplifier source follower output.
19	V <sub>SSA</sub>	Analogue ground. Ground terminal for operational amplifier and VCO only. Connected internally to V <sub>SSD</sub> via a 25 Ω (nominal) resistor.
20	VCO1	Voltage-controlled oscillator amplifier input. The amplifier is a simple inverter operating up to 10 MHz. Frequency control is achieved via an external tuned circuit using variable capacitance diodes.
21	VCO2	Voltage-controlled oscillator amplifier output. The load for the inverting transistor may be turned off for test purposes by reducing V <sub>DD2</sub> to 0 V.
22	$\overline{\text{CEFM}}$	Internal 4,3218 MHz clock generator push-pull output.
23	FD	Frequency detector three-state push-pull output. This output has a 1 kΩ (typical) impedance when active but assumes a high impedance state once the system is in lock.
24	FSDE	Frame sync signal push-pull output (to SAA7020). It provides a positive-going pulse at the end of each data frame. Typical frequency = 7,35 kHz.
25	$\overline{\text{SSDE}}$	Symbol sync signal push-pull output for each data symbol. Typical frequency = 254 kHz.
26	$\overline{\text{CLDE}}$	Data bit clock push-pull output (to SAA7020). An 8-bit clock burst at 2,1609 MHz (typical) which is used to synchronize the data to SAA7020 (see Fig. 5).
27	DADE/DEFM	Data push-pull output (to SAA7020). Serial data comprising 32 x 8-bit symbols per frame, synchronized to $\overline{\text{CLDE}}$ (see Fig. 5). This output is converted to DEFM when $\overline{\text{CRI}}$ (pin 11) is LOW. DEFM is the digital signal appearing at the output of the level detector.
28	V <sub>DD1</sub>	Positive supply voltage: + 5 V ± 10%.

### HANDLING

Inputs and outputs are protected against electrostatic charge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices (see 'Handling MOS Devices').

**NOTES TO THE CHARACTERISTICS**

1. At  $T_{\text{amb}} = 25\text{ }^{\circ}\text{C}$ ;  $V_{\text{IN}} = -0,3$  to  $+6,5\text{ V}$ ;  $V_{\text{DD1}} = 6,5\text{ V}$ .
2. Short-circuit protected to  $V_{\text{DD1}}$  and  $V_{\text{SS}}$ . The maximum load capacitance that can be applied before short-circuit protection becomes operative is 150 pF.
3. At  $T_{\text{amb}} = 25\text{ }^{\circ}\text{C}$ ; output in high impedance state.
4. All tests performed within common-mode voltage range.
5. At  $T_{\text{amb}} = 25\text{ }^{\circ}\text{C}$ .
6. Output loading = 50 pF.
7.  $\overline{\text{SSDE}}$  remains LOW for only one negative edge of  $\overline{\text{CLDE}}$ .
8. Excessive bit slip may cause gap to disappear.  $\overline{\text{CLDE}}$  remains LOW when FSDE is HIGH.
9. Output loading = 150 pF.
10. Free running VCO frequency tuned to nominal and PLL in lock with a typical application circuit.

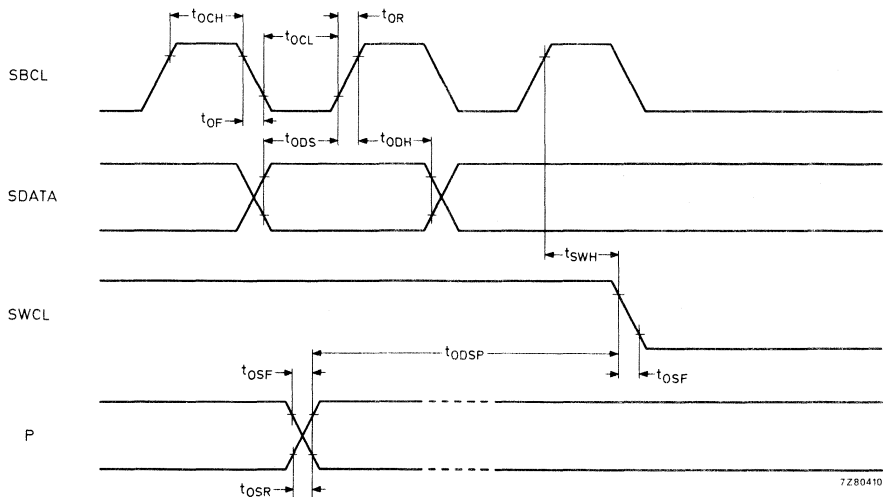

Fig. 7 Timing of waveform outputs for subcoding: reference levels are 0,8 and 2,4 V; SBCL and SDATA output loading = 50 pF; SWCL and P output loading = 150 pF; SWCL has a 50% duty cycle.

Fig. 8 Timing of EFM output waveforms: output loading = 50 pF; reference levels are 0,8 and 2,4 V.

## ERROR CORRECTOR FOR COMPACT DISC DIGITAL AUDIO SYSTEM

### GENERAL DESCRIPTION

The SAA7020 detects and corrects errors in digital data received from the demodulator (SAA7010). The data is received serially in frames of 32 x 8-bit symbols and, after processing, is transmitted in a 16-bit serial format to the interpolating and muting circuit (SAA7000). An error flag is generated to warn of data in which errors have not been corrected.

### Features

- Internal timing and control circuits
- Serial data input and output
- 8-bit bidirectional data bus to external RAM (2K x 8 bits)
- Corrects up to seven erroneous frames of data
- Generates error flag to identify unreliable data
- Provides a motor speed control output which stabilizes the input data rate and eliminates wow and flutter.

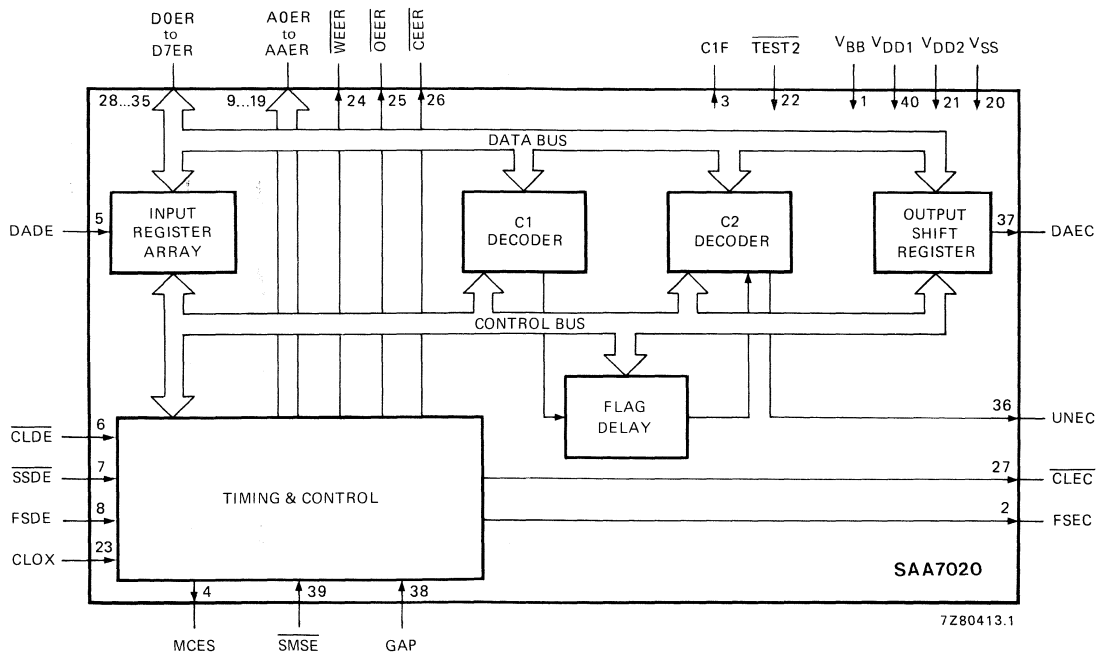

Fig. 1 Block diagram.

### PACKAGE OUTLINE

40-lead DIL; plastic (SOT-129).

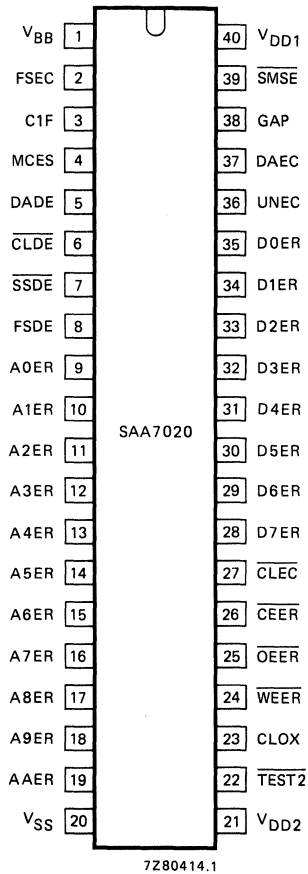

Fig. 2 Pinning diagram.

PINNING

1	V <sub>BB</sub>	back bias supply
2	FSEC	frame sync pulse output
3	C1F	C1 decoder error flag
4	MCES	motor speed control output
5	DADE	serial data input
6	CLDE	data bit clock input
7	SSDE	symbol sync signal input
8	FSDE	frame sync signal input
9-19	AOER- AAER	address outputs to external RAM
20	V <sub>SS</sub>	ground
21	V <sub>DD2</sub>	+ 12 V supply
22	TEST2	test input
23	CLOX	basic clock input
24	WEER	write enable output to external RAM
25	OEER	output enable signal to external RAM
26	CEER	chip enable output to external RAM
27	CLEC	output data clock
28-35	DOER- D7ER	data bus to/from external RAM
36	UNEC	error flag output
37	DAEC	data output (two's complement) and SAA7000 output format control
38	GAP	input to determine DAEC control output to SAA7000
39	SMSE	mute signal from servo
40	V <sub>DD1</sub>	+ 5 V supply

## FUNCTIONAL DESCRIPTION

The SAA7020 error corrector receives data samples from the Compact Disc Digital Audio demodulating system (SAA7010), processes the data samples and then passes them to the interpolating and muting circuit (SAA7000). The processing detects erroneous data and then, if possible, corrects the errors. If error correction is not possible, a flag (UNEC) is generated to warn of unreliable data output. The SAA7020 also controls the motor speed of the disc drive servo.

Serial data received from the demodulator (SAA7010) is arranged in frames of 32 x 8-bit symbols; 24 of the symbols contain audio samples, the remaining eight symbols contain parity information for error detection/correction. The data (DADE) is clocked into the input register array at the demodulator rate by CLDE. The input register array comprises a register which accumulates symbols ready for parallel output to an external RAM and a FIFO register which acts as a jitter reduction circuit.

The jitter reduction circuit uses the difference between the input data rate ( $\overline{\text{CLDE}}$ ) and the system data rate (derived from CLOX) to generate the motor speed control signal  $\overline{\text{MCES}}$  (Fig. 3). This forms a feedback loop with the disc drive motor to control the disc speed and hence the input data rate. In this way unwanted effects such as wow and flutter are eliminated from the Compact Disc system, the FIFO being capable of handling deviations from the system data rate of up to  $\pm 2$  frames.

An 8-bit bidirectional bus is used for transferring data to and from the external RAM (2K x 8 bits) and an 11-bit bus for addressing. Three bits control the RAM; write enable  $\overline{\text{WEER}}$ , output enable  $\overline{\text{OEER}}$  and chip enable CEER (the latter is for operation with dynamic RAMs).

The error correction process makes use of data interleaving and two Reed-Solomon codes, C1 and C2. The C1 decoder can correct one erroneous symbol in a 32-symbol frame after de-interleaving; the C2 decoder can correct two erroneous symbols in a group of 28 symbols. Input data is de-interleaved and read from the RAM by the C1 decoder where syndromes are formed to check for erroneous symbols. If one error is detected it is corrected and the data is written back to the RAM with some parity symbols being discarded. If more than one error is detected the data is written back to the RAM unchanged but internal C1 flags are set to mark these symbols as unreliable. The data in the RAM is then further de-interleaved and read back to the C2 decoder. The symbols are then checked for errors as previously, if one error is detected it is corrected and the symbols are again written back to the RAM. If two error flags are detected erasure correction is attempted when the flags are received from C1. The corrected data is then written back to the RAM. If more than two symbols are in error the data is written back to the RAM unchanged but a flag is set to mark these symbols as unreliable. At this stage the remaining parity bits are discarded.

After processing, the data is held in the RAM to give a 5-frame delay so that the error warning flag UNEC can be sent to the interpolation and muting circuit (SAA7000). The UNEC flag is also output when  $\overline{\text{SMSE}}$  is active, this warns of data to be immediately muted. At the end of the 5-frame delay, the data is read back to the output shift register to be serially shifted out at DAEC.

## Pin functions

pin no.	mnemonic	description
1	V <sub>BB</sub>	Back bias supply voltage: $-2,5 \text{ V} \pm 20\%$ .
2	FSEC	Frame sync pulse output, data is valid on the falling edge (Figs 5 and 9).
3	C1F	↑ This output pin flags uncorrectable C1 errors.
4	MCES	Motor control error signal; this open drain output provides a pulse width modulated signal to control the rate of data entry. If the data rate has been correct for a period, MCES duty cycle = 50%; if low, the duty cycle < 50%; if high, the duty cycle > 50% (Fig. 3).
5	DADE	Serial data input. The data is clocked in by $\overline{\text{CLDE}}$ in 8-bit symbols, the most-significant bit first (Figs 4 and 6).
6	$\overline{\text{CLDE}}$	Data clock input, data is accepted into DADE on the negative transition of $\overline{\text{CLDE}}$ (Figs 4 and 6).
7	$\overline{\text{SSDE}}$	Input indicating the last bit of a symbol. A symbol is counted and clocked in when $\overline{\text{SSDE}}$ is LOW during the negative transition of $\overline{\text{CLDE}}$ ; for correct operation, $\overline{\text{SSDE}}$ must remain LOW for only one negative transition in eight (Figs 4 and 6).
8	FSDE	Input indicating the end of a data frame. Indication is given when FSDE is HIGH during a negative transition of $\overline{\text{CLDE}}$ .
9-19	A0ER-AAER	Eleven address outputs to the external RAM. When data is being received at DADE, $\overline{\text{CLDE}}$ , etc. then addresses A0ER to AAER are completely exercised every four frames allowing refresh to be automatic for dynamic RAMs (Figs 7 and 8).
20	V <sub>SS</sub>	Ground.
21	V <sub>DD2</sub>	Positive supply voltage: $+12 \text{ V} \pm 10\%$ .
22	$\overline{\text{TEST2}}$	Test input. Connect to V <sub>DD1</sub> or V <sub>DD2</sub> for normal operation.
23	CLOX	System clock input, typical frequency = 4,2336 MHz (Fig. 6).
24	$\overline{\text{WEER}}$	Write enable output to external RAM; when LOW, SAA7020 is writing to the RAM (Fig. 7).
25	$\overline{\text{OEER}}$	Output enable to external RAM; when HIGH, memory output buffers must be in the high impedance state (Figs 7 and 8).
26	$\overline{\text{CEER}}$	Chip enable output for use with dynamic memories (Figs 7 and 8).
27	$\overline{\text{CLEC}}$	Output data clock; data is valid on the falling edge (Figs 5 and 9).
28-35	D0ER-D7ER	Input/output ports for 8-bit bidirectional bus from/to external RAM. The outputs are in the high impedance state when $\overline{\text{OEER}}$ is LOW (Figs 7 and 8).
36	UNEC	Error flag output; when HIGH, indicates that output data is unreliable. During active data output (i.e. when $\overline{\text{CLEC}}$ is operating) UNEC applies to each symbol of 8 bits of data output at that time. Before each data word of two symbols is output, UNEC applies to the whole data word that will follow in five frames time.

**FUNCTIONAL DESCRIPTION** (continued)

pin no.	mnemonic	description
37	DAEC	Serial data output. Data is clocked out by $\overline{\text{CLEC}}$ and is in 16-bit words separated by gaps. Each word is in two's complement format with the most-significant bit first and comprises two 8-bit symbols. Data is valid on the falling edge of $\overline{\text{CLEC}}$ . During the gap between the data words, the state of pin 38 (GAP) acts as an output from DAEC (Figs 5 and 9).
38	GAP	The input level at this pin is reflected in the state of the output from DAEC between data words and is used to control the output format of the SAA7000. When GAP is HIGH, DAEC gap level is HIGH, and vice versa (Fig. 5).
39	$\overline{\text{SMSE}}$	Select muting input. If $\overline{\text{SMSE}}$ is held LOW, the UNEC output will be held HIGH causing the interpolation and muting circuit (SAA7000) to mute the data.
40	V <sub>DD1</sub>	Positive supply voltage: + 5 V $\pm$ 10%.

**HANDLING**

Inputs and outputs are protected against electrostatic charge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices (see 'Handling MOS Devices').

**RATINGS**

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134); V<sub>SS</sub> = 0 V

Supply voltage 1 range (pin 40)	V <sub>DD1</sub>	-0,3 to + 7,5 V
Supply voltage 2 range (pin 21)	V <sub>DD2</sub>	-0,3 to + 15 V
Back bias supply voltage range (pin 1)	V <sub>BB</sub>	-4 to + 0,3 V
Input voltage range (except TEST)	V <sub>I</sub>	-0,3 to + 7,5 V
Input voltage range (TEST only)	V <sub>I</sub>	-0,3 to + 15 V
Output voltage range (except MCES)	V <sub>O</sub>	-0,3 to + 7,5 V
Output voltage range (MCES only) applied through a 10 k $\Omega$ resistor	V <sub>O</sub>	-0,35 to + 15 V
Output current	I <sub>O</sub>	max. 10 mA
Operating ambient temperature range	T <sub>amb</sub>	-20 to + 70 °C
Storage temperature range	T <sub>stg</sub>	-55 to + 125 °C

$\overline{\text{OEER}}$ to D0ER-D7ER output in high impedance state	t <sub>ODZ</sub>	20	—	—	ns

**NOTES TO THE CHARACTERISTICS**

1. Measured from  $-0,3$  to  $+6,5$  V at  $T_{amb} = 25$  °C;  $V_{DD1} = 6,5$  V.
2. Input/output port in high impedance state (OFF); measured from 0 to 6 V at  $T_{amb} = 25$  °C.
3. Output loading: 1 TTL gate +  $C_L = 50$  pF.
4. All outputs are protected against short-circuit to  $V_{SS}$  and  $V_{DD1}$ . The maximum load capacitance that can be applied before the short-circuit protection becomes active is 150 pF.
5. Phase detector gain for average MCES output voltage = 1,1 V per frame. Phase detector control range =  $\pm 2$  frames.
6. All maximum or minimum values assume respective frequency where appropriate.
7. Reference levels = 0,8 V and 2,4 V.
8. The DAEC level during the advanced UNEC period is defined by the state at pin 38 (GAP). If this state changes during  $\overline{CLEC}$  LOW, the timings are applicable. If the state at pin 38 changes at other times, DAEC follows with a delay of between 20 and 500 ns.

Fig. 3 MCES output waveforms: waveforms are updated each frame (576 CLOX periods); open drain output, rise times depend on external pull-up circuit. This output has an internal clamp to prevent the voltage at pin 4 (MCES) rising above  $V_{DD2} + 1.8\text{ V}$  maximum.

## DIGITAL FILTER FOR COMPACT DISC DIGITAL AUDIO SYSTEM

### GENERAL DESCRIPTION

The SAA7030 is a stereo interpolating digital filter designed for the Compact Disc Digital Audio system. The circuit incorporates two interpolating filters, each with a sampling rate of four times that of the normal digital audio sampling.

### Features

- Suppresses spurious lobes in the audio spectrum
- Improves the signal quality for digital-to-analogue conversion
- Allows a low-order analogue post filter to be used after the digital-to-analogue converter (DAC)
- Option of offset binary or two's complement data output format
- Electrically-selectable d.c. offset/no offset on data output
- Overflow detection and protection
- Directly compatible with the interpolation and muting circuit (SAA7000)
- Generates a latch output strobe to the DAC

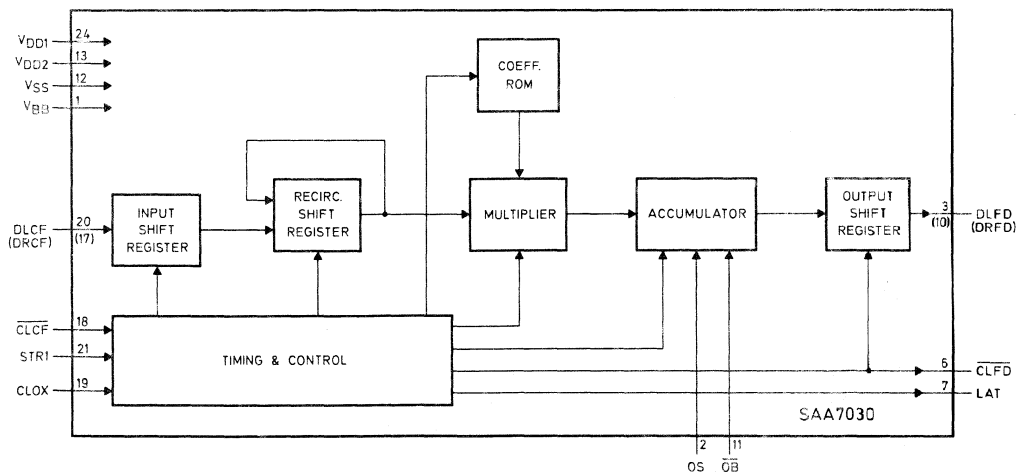

Fig. 1 Block diagram.

## FUNCTIONAL DESCRIPTION

The SAA7030 is a stereo interpolating filter which quadruples the data sample rate from 44,1 to 176,4 kHz and thus achieves the following:

1. It suppresses spurious spectrum lobes in the output data that occur between the baseband frequency and  $176,4 \pm 20$  kHz. This allows the DAC to be followed by a low-cost filter of the linear phase, low order, analogue post filter type (a very high order, low-pass filter would otherwise be required to suppress the  $44,1 \pm 20$  kHz lobe).
2. It performs noise-shaping so that a 14-bit DAC yields the same in-band quantizing signal-to-noise ratio as from a 16-bit DAC supplied with unprocessed 44,1 kHz samples.

The circuit incorporates two identical filters (one per channel). Each is a finite impulse response, linear phase transversal filter. The filter length is 96 bits with 16-bit data words and 12-bit coefficients. The composition of each filter is as follows:

- serial-to-parallel input shift register;
- sixteen 24-bit shift registers for data storage;
- 96 × 12-bit coefficient ROM;
- 12 × 16-bit array multiplier;
- 28-bit accumulator;
- parallel-to-serial output shift register.

Overflow protection is incorporated in the filters so that, in the unlikely event of accumulator overflow, the output limits cleanly. Overflow only occurs if the input samples continuously reverse sign coincidentally with the coefficients, so that the products of the two entered into the accumulator are continually of the same sign.

The data inputs may run asynchronously with the master clock (CLOCK) provided that the data inputs are always complete before the rising edge of the 44,1 kHz input strobe (STR1). A 176,4 kHz output strobe (LAT) is provided, the rising edge of which follows the completion of the serial output data stream. This strobe pulse is timed to be used to gate the master clock (CLOCK) if required.

The input OS provides selection of -3% d.c. offset or no offset of the data output voltage level. The format of the output data is selected via the input  $\overline{OB}$  to be in offset binary or two's complement form.

#### Pin functions

pin no.	mnemonic	description
1	V <sub>BB</sub>	Back bias supply voltage: -2,5 V ± 20%.
2	OS	Offset select input. When connected to V <sub>DD1</sub> , the data output has a fixed d.c. offset of -3%. When connected to V <sub>SS</sub> , the data output has no offset.
3	DLFD	Left channel data output. The data is 14-bit serial with most-significant bit first and is valid on the falling edge of the output clock ( $\overline{CLFD}$ ).
6	$\overline{CLFD}$	Data clock output. Typical frequency = 4,2336 MHz (= CLOCK). The falling edge of this clock defines output data valid.
7	LAT	Strobe output at 176,4 kHz. The rising edge of this pulse indicates that the output of a 14-bit data word is complete.
10	DRFD	Right channel data output (see DLFD).
11	$\overline{OB}$	Offset binary/two's complement select input. When connected to V <sub>SS</sub> , the output data is coded in offset binary. When connected to V <sub>DD1</sub> , the output data is coded in two's complement.
12	V <sub>SS</sub>	Ground (0 V).
13	V <sub>DD2</sub>	Positive supply voltage: + 12 V ± 10%.
14	TEST1	Test output; not used in normal operation.
15	TEST2	Test input; in normal operation this pin should be connected to V <sub>SS</sub> or V <sub>DD1</sub> .
16	TEST3	Test input; in normal operation this pin should be connected to V <sub>SS</sub> or V <sub>DD1</sub> .
17	DRCF	Right channel data input. Data should be 16-bit serial with most-significant-bit first and in offset binary code. It is valid on the falling edge of the input data clock ( $\overline{CLCF}$ ).
18	$\overline{CLCF}$	Input data clock. The falling edge of this clock defines input data valid.
19	CLOCK	Master clock input. Runs continuously at a typical frequency of 4,2336 MHz.
20	DLCF	Left channel data input (see DRCF).

**FUNCTIONAL DESCRIPTION** (continued)

pin no.	mnemonic	description
21	STR1	Strobe input at 44,1 kHz. The internal timing chain of the SAA7030 is synchronized by the rising edge of STR1 which must be synchronous with CLOX within the tolerance specified in CHARACTERISTICS. The rising edge should follow the completion of the input data stream.
22	TEST4	Test input; in normal operation this pin should be connected to V <sub>DD1</sub> .
23	TEST5	Test input; in normal operation this pin should be connected to V <sub>DD1</sub> .
24	V <sub>DD1</sub>	Positive supply voltage: + 5 V ± 10%.

Pins 4, 5, 8 and 9 have no internal connection.

**HANDLING**

Inputs and outputs are protected against electrostatic charge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices (see 'Handling MOS Devices').

**RATINGS**Limiting values in accordance with the Absolute Maximum Rating System (IEC 134);  $V_{SS} = 0$  V

Supply voltage 1 range (pin 24)	$V_{DD1}$	-0,3 to +7,5 V

## NOTES TO THE CHARACTERISTICS

1. All outputs are protected against short-circuit to  $V_{\text{SS}}$  and  $V_{\text{DD1}}$ . The maximum load capacitance that can be applied before the short-circuit protection becomes active is 150 pF.
2. Output loading  $C_{\text{L}} = 50$  pF.
3. Reference levels are 0,8 and 2 V.
4. Rising edge of  $\text{LAT}$  occurs in the first CLOX LOW period following the rising edge to  $\text{STR1}$  and then recurs at every 24th CLOX cycle.

Fig. 3 Typical input and output waveforms (for illustration only).

- (1) CLCF frequency ( $f_{IC}$ ) =  $1/t_{ICP}$ . The trailing edge of  $\overline{CLCF}$  must occur 16 times between consecutive rising edges of STR1.
- (2) CLOX frequency ( $f_{IX}$ ) =  $1/t_{IXP}$ .

Fig. 4 Input waveform timing; reference levels are 0,8 and 2 V.

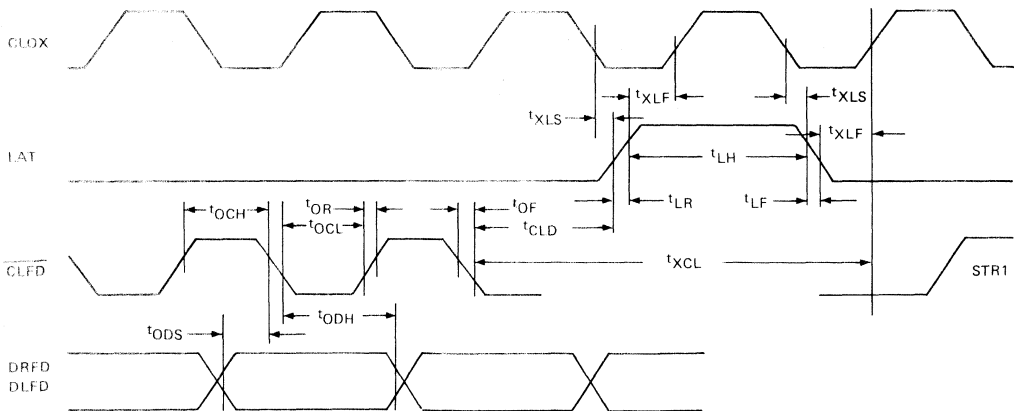

Fig. 5 Output waveform timing: reference levels are 0,8 and 2 V; output loading = 50 pF.

### DECODER FOR COMPACT DISC DIGITAL AUDIO SYSTEM

#### GENERAL DESCRIPTION

The SAA7210 incorporates the functions of demodulator, subcoding processor, error corrector and concealment in one chip. The device accepts data from the disc and outputs serial data directly to a dual 16-bit digital-to-analogue converter TDA1541 (DAC) via the Inter IC signal bus ( $I^2S$ ). The  $I^2S$  output can also be fed via the stereo interpolating digital filter SAA7220 which provides additional concealment plus over-sampling digital filtering. For descriptive purposes, the SAA7210 is referred to as the A-chip and the SAA7220 as the B-chip.

#### Features

- Adaptive slicer with high-frequency level detector for input data
- Built-in drop-out detector to prevent error propagation in adaptive slicer
- Fully protected timing synchronization to incoming data
- Eight-to-Fourteen Modulation (EFM) decoding
- Cross-Interleaved Reed-Solomon Code (CIRC) used for error correction system
- Subcoding microprocessor handshaking protocol
- Motor speed control logic which stabilizes the input data rate
- Error flag processing to identify unreliable data
- Concealment to replace uncorrectable data
- $I^2S$  bus for data exchange between A-chip, B chip and DAC
- Bidirectional data bus to external RAM (16 K x 4 bits)

#### QUICK REFERENCE DATA

Supply voltage (pin 40)	$V_{DD}$	typ.	5 V
Supply current (pin 40)	$I_{DD}$	typ.	200 mA
Data slicer input voltage range	$V_{I(p-p)}$		0,25 to 2,5 V
Oscillator operating frequency			
XTAL	$f_{XTAL}$	typ.	11,2896 MHz
VCO	$f_{VCO}$	typ.	8,6436 MHz
Maximum output current (each output)	$I_O$	max.	10 mA
Operating ambient temperature range	$T_{amb}$		-20 to +70 °C

#### PACKAGE OUTLINE

40-lead DIL; plastic (SOT-129).

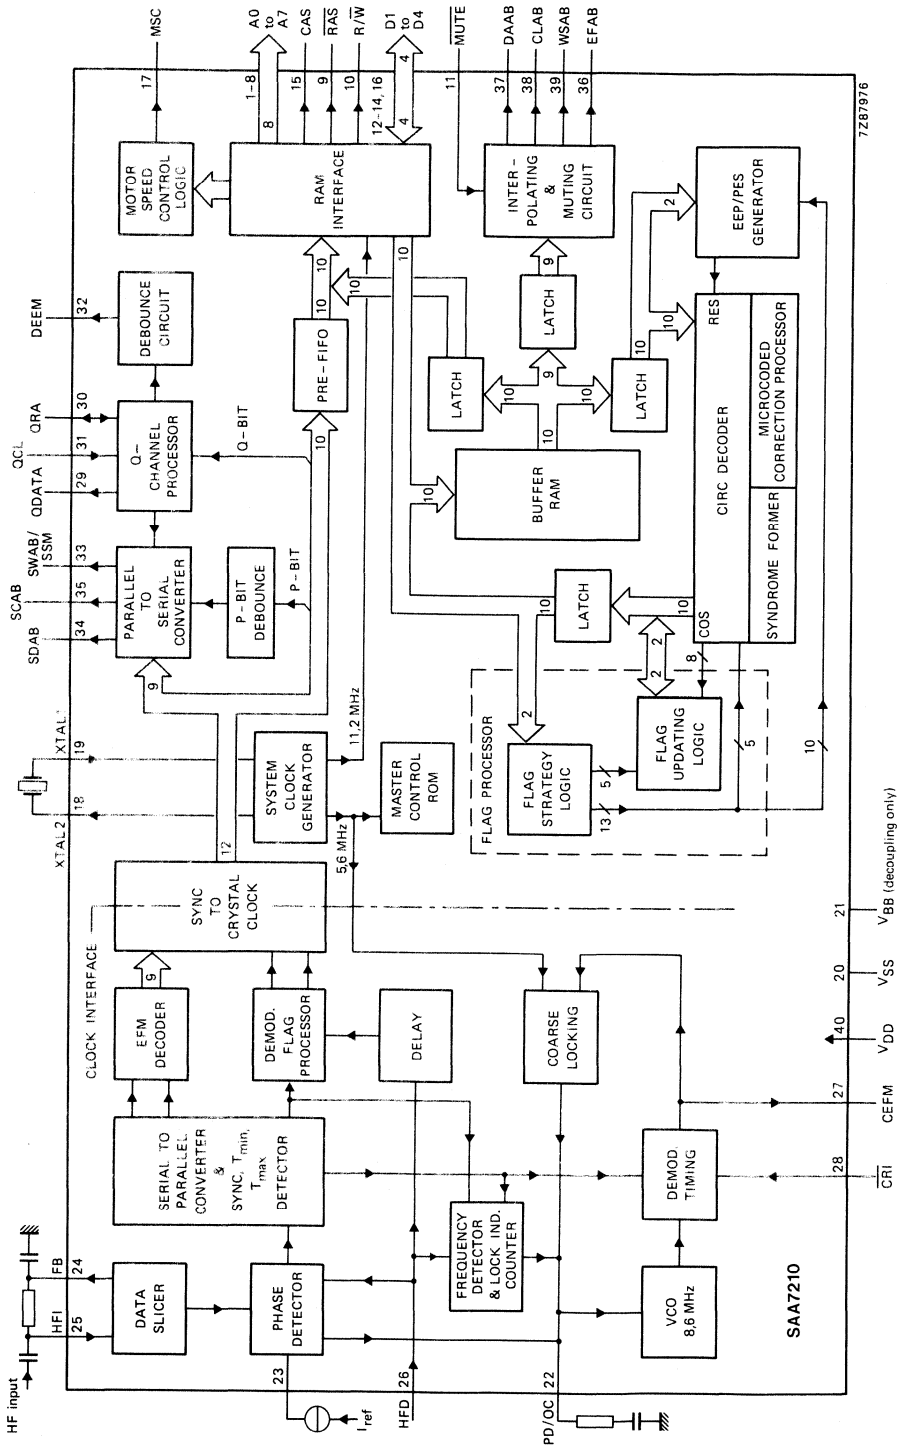

Fig. 1 Block diagram.

PINNING

DEVELOPMENT DATA

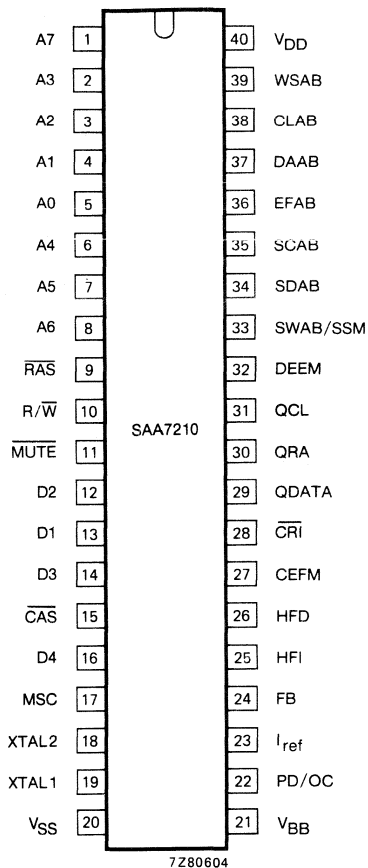

Fig. 2 Pinning diagram; for pin functions see next page.

## Pin functions

pin no.	mnemonic	description
1-8	A0-A7	<b>Address:</b> address outputs to external RAM.
9	$\overline{\text{RAS}}$	<b>Row Address Select:</b> output to external RAM (4416) which uses multiplexed address inputs.
10	$\overline{\text{R/W}}$	<b>Read/Write:</b> output signal to external RAM.
11	$\overline{\text{MUTE}}$	<b>Mute:</b> input from the microprocessor. When mute is LOW the data output DAAB (pin 37) is attenuated to zero in 15 successive divide-by-2 steps. On the rising edge of mute the data output is incremented to the first "good" value in 2 steps. This input has an internal pull-up of 50 k $\Omega$ (typ.).
12-14	D1-D3	<b>Data:</b> data inputs/outputs to external RAM.
15	$\overline{\text{CAS}}$	<b>Column Address Select:</b> output signal to external RAM.
16	D4	<b>Data:</b> data input/output to external RAM.
17	MSC	<b>Motor Speed Control:</b> open drain output which provides a pulse width modulated signal with a pulse rate of 88 kHz to control the rate of data entry. The duty factor varies from 1,6% to 98,4% in 62 steps. When a motor-start signal is detected via pin 33 (SWAB/SSM) the duty factor is forced to 98,4% for 0,2 seconds followed by a normal calculated signal. After a motor-stop signal is detected the duty factor is forced to 1,6% for 0,2 seconds, followed by a continuous 50% duty factor.
18	XTAL2	<b>Crystal oscillator output:</b> drive output to clock crystal (11,2896 MHz typ.).
19	XTAL1	<b>Crystal oscillator input:</b> input from crystal oscillator or slave clock.
20	VSS	<b>Ground:</b> circuit earth potential.
21	VBB	<b>Back Bias supply voltage:</b> back bias output voltage ( $-2,5 \text{ V} \pm 20\%$ ). The internal back bias generator can be decoupled at this pin.
22	PD/OC	<b>Phase Detector output/Oscillator Control input:</b> outputs of the frequency detector and phase detector are summed internally, then filtered at this pin to provide the frequency control signal for the VCO.
23	$I_{\text{ref}}$	<b>Current reference:</b> external reference input to the phase detector. This input is required to minimize the spread in the charge pump output of the phase detector. An internal clamp prevents the voltage on this pin rising above 3,5 V.
24	FB	<b>Feedback:</b> output from the input data slicer. This output is a current source of 100 $\mu\text{A}$ (typ.) which changes polarity when the level detector input at pin 25 (HFI) rises above the threshold voltage of 2 V (typ.). When a data run length violation is detected (e.g. during drop-out), or when HFD (pin 26) is LOW, this output goes to high impedance state.
25	HFI	<b>High-Frequency Input:</b> level detector input to the data slicer. A differential signal of between 0,25 and 2,5 V (peak-to-peak value) is required to drive the data slicer correctly. When a $T_{\text{max}}$ violation is detected or when HFD is LOW, this input is biased directly to its threshold voltage.
26	HFD	<b>High-Frequency Detector:</b> when HIGH this input signal enables the frequency and phase detector inputs, also the feedback output (FB) from the data slicer. An internal voltage clamp of 3 V (typ.) requires the HFD input to be fed via a high impedance. This input has an internal pull-up of 50 k $\Omega$ (typ.).

pin no.	mnemonic	description
27	CEFM	<b>Clock Eight-to-Fourteen Modulation:</b> demodulator clock output 4,3218 MHz (typ.).
28	$\overline{\text{CRI}}$	<b>Counter Reset Inhibit:</b> when LOW this input signal allows the divide-by-588 master counter in the DEMOD timing to run-free. This input has an internal pull-up of 50 k $\Omega$ (typ.).
29	QDATA	<b>Q-channel Data:</b> this subcoding output is parity checked and changes in response to the Q-channel clock input (see subcoding microprocessor handshaking protocol).
30	QRA	<b>Q-channel Request input/Acknowledge output:</b> the output has an internal pull-up of nominally 10 k $\Omega$ . (see subcoding microprocessor handshaking protocol).
31	QCL	<b>Q-channel Clock:</b> clock input generated by the micro-processor when it detects a QRA LOW signal.
32	DEEM	<b>De-emphasis:</b> signal derived from one bit of the parity-checked Q-channel and fed out via the debounce circuit.
33	SWAB/SSM	<b>Subcoding Word clock output &amp; Start/Stop Motor input:</b> open drain output which is sensed during each HIGH period and if externally forced LOW a motor-stop condition will be decoded and fed to the motor control logic circuit.
34	SDAB	<b>Subcoding Data:</b> a 10-bit burst of data, including flags and sync bits, is output serially to the B-chip once per frame clocked by burst clock output SCAB (see Fig. 4).
35	SCAB	<b>Subcoding Clock:</b> a 10-bit burst clock 2,8224 MHz (typ.) output which is used to synchronize the subcoding data.
36	EFAB	<b>Error Flag:</b> output from interpolation and mute circuit to B-chip indicating unreliable data.
37	DAAB	<b>Data:</b> this output which is fed to the B-chip or DAC, together with its clock (CLAB) and word select (WSAB) outputs, conforms to the I <sup>2</sup> S bus format (see Fig. 5).
38	CLAB	<b>Clock:</b> output to B-chip or DAC.
39	WSAB	<b>Word Select:</b> output to B-chip or DAC.
40	VDD	<b>Power Supply:</b> positive supply voltage(+ 5 V).

#### Note to the pin functions

The pin sequence of the address outputs (A0-A7) and the data outputs (D1-D4) has been selected to be compatible with various dynamic 16 K x 4-bit RAMs including the 4416.

## FUNCTIONAL DESCRIPTION

### Demodulation

Data read from the disc is amplified and filtered externally and then converted into a clean digital signal by the data slicer. The data slicer is an adaptive level detector which relies on the nature of the eight-to-fourteen modulation system (EFM) to determine the optimum slicing level. When a signal drop-out is detected (via the HFD input, or internally when a data run length violation is detected) the feedback (FB) to the data slicer is disabled to stop drift of the slicing level.

Two frequency detectors, a phase detector and a voltage-controlled oscillator (VCO) form an internal phase-lock loop (PLL) system. The voltage-controlled oscillator (VCO) runs at twice the input data rate (typically at 8,6436 MHz), its frequency being dependent on the voltage at pin 22 (PD/OC). One of the frequency detectors compares the VCO frequency with that of the crystal clock to provide coarse frequency-control signals which pull the VCO to within the capture range of fine frequency control. Signals for fine frequency control are provided by the second frequency detector which uses data run length violations to pull the VCO within the capture range of the PLL. When the system is phase-locked the frequency detector output stage is disabled via a lock indication signal. The VCO output is divided by two to provide the main demodulator clock signal which is compared with the incoming data in the phase detector. The output of the phase detector, which is combined internally with the frequency detector outputs at pin 22 (PD/OC), is a positive and negative current pulse with a net charge that is dependent on the phase error. The current amplitude is determined by the current source connected to pin 23 ( $I_{ref}$ ).

The demodulator uses a double timing system to protect the EFM decoder from erroneous sync patterns in the data. The protected divide-by-588 master counter is reset only if a sync pattern occurs exactly one frame after a previous sync pattern (sync coincidence) or if the new sync pattern occurs within a safe window determined by the divide-by-588 master counter. If track jumping occurs the divide-by-588 master counter is allowed to free-run to minimize interference to the motor speed controller; this is achieved by taking the CRI input (pin 28) LOW to inhibit the reset signal.

The sync coincidence pulse is also used to reset the lock indication counter and disable the output from the fine frequency detector. If the system goes out of lock, the sync pulses cease and the lock indication counter counts frame periods. After 63 frame periods with no sync coincidence pulse, the lock indication counter enables the frequency detector output.

The EFM decoder converts each symbol (14 bits of disc data + 3 merging bits) into one of 256 8-bit digital words which are then passed across the clock interface to the subcoding section. An additional output from the decoder senses one of two extra symbol patterns which indicate a subcoding frame sync. This signal together with a data strobe and two error flags are also passed across the clock interface. The error flags are derived from the HFD input and from detected run length violations.

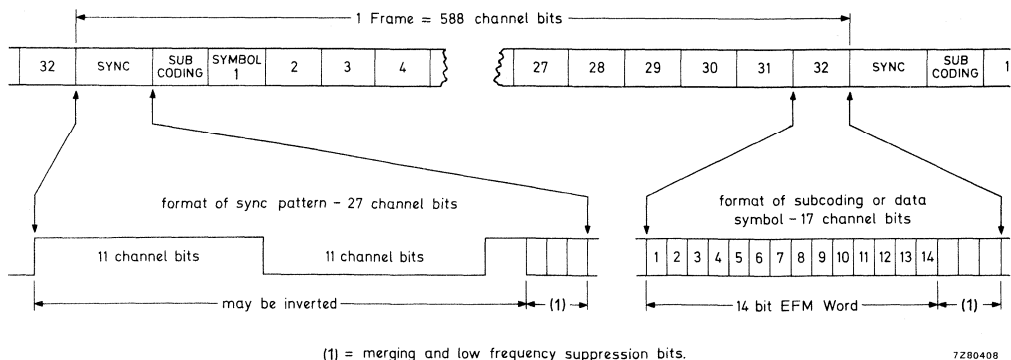

Fig. 3 Data input signal.

**FUNCTIONAL DESCRIPTION** (continued)**Subcoding**

The subcoding section has four main functions

- Q-channel processor
- De-emphasis output
- Pause (P-bit) output
- Serial subcoding output to B-chip

The Q-channel processor accumulates a subcoding word of 96 bits from the Q-bit of successive subcoding symbols, performs a cyclic redundancy check (CRC) using 16 bits and then outputs the remaining 80 bits to a microprocessor on an external clock. The de-emphasis signal (DEEM) is derived from one bit of the CRC-checked Q-channel. The DEEM output (pin 32) is additionally protected by a debounce circuit.

The P-bit from the subcoding symbol, also protected by a debounce circuit, is output via the serial subcoding signal (SDAB) at pin 34. The protected timing used for the EFM decoder makes this output unreliable during track jumping.

The serial output to the B-chip consists of a burst of 10 bits of data clocked by a burst clock (SCAB). The 10 bits are made up from subcoding signal bits Q to W, the Q-channel parity check flag, a demodulator error flag and the subcoding sync signal. At the end of the clock burst this output delivers the debounced P-bit signal which can be read externally on the rising edge of SWAB at pin 33 (see Fig. 4).

DEVELOPMENT DATA

Fig. 4 Typical subcoding waveform outputs.

**Pre-FIFO**

The 10 bits (8 bits of symbol data + 2 error flag bits) which are passed from the demodulator across the clock interface to the subcoding section are also fed to the pre-FIFO with the addition of two timing signals. These two timing signals indicate:

- (1) That a new data symbol is valid
- (2) Whether the new data symbol is the first symbol of a frame

The pre-FIFO stores up to 4 symbols (including flags) and acts as a time buffer between data input and data output. Data passes into the pre-FIFO at the rate of 32 symbols per demodulator frame and the symbols are called from the pre-FIFO into RAM storage at the rate of 32 symbols per error-correction frame. The timing, organized by the master controller, allows up to 40 attempts to write 32 symbols into the RAM per error-correction frame. The 8 extra attempts allow for transient changes in clock frequency (e.g. pitch control).

### Data control

This section controls the flow of data between the external RAM and the error corrector. Each symbol of data passes through the error corrector two times (correction processes C1 and C2) before entering the concealment section.

The RAM interface uses the full crystal frequency of 11,2 MHz to determine the RAM access wave-forms (the main clock for the system is 5,6 MHz). One RAM access (READ or WRITE) uses 12 crystal clock cycles which is approximately 1  $\mu$ s. The timing (see Fig. 6) is based upon the specification for the dynamic 16 K x 4-bit RAM (4416). This RAM requires multiplexed address signals and therefore, in each access cycle, a row address ( $\overline{\text{RAS}}$  pin 9) is set up first and then three 4-bit nibbles are accessed using sequential column addresses (CAS pin 15). As only 10 bits are used for each symbol (including flags), the fourth nibble is not accessible.

There are 4 different modes of RAM access:

- WRITE 1
- READ 1
- WRITE 2
- READ 2

During WRITE 1, data is taken from pre-FIFO at regular intervals and written into one half of the RAM. This half of the RAM acts as the main FIFO and has a capacity of up to 64 frames. During READ 1, the 32 symbols of the next frame due out are read from the FIFO. The numerical difference between the WRITE 1 and READ 1 addresses is used to control the speed of the disc drive motor.

When a frame of data has been read from the FIFO it is stored in a buffer RAM until it can be accepted by the CIRC error correction system. At this time the error correcting strategy of the CIRC decoder for the frame is determined by the flag processor. The frame for correction is then loaded into the decoder one symbol at a time and the 32 symbols from the previous correction are returned to the buffer RAM.

After the first correction (C1), only 28 of the symbols are required per frame. The symbols are stored in the buffer RAM together with new flags generated after the correction cycle by the flag updating logic. This partially-corrected frame is then passed to the external RAM by a WRITE 2 instruction. The de-interleaving process is carried out during this second passage through the external RAM. The WRITE 2 and READ 2 addresses for each symbol provide the correct delay of 108 frames for the first symbol and zero delay for the last symbol.

After execution of the READ 2 instruction, the frame of 28 symbols is again stored in the buffer RAM pending readiness of the CIRC decoder and calculation of decoding strategy. Following the second correction (C2), 24 symbols including unreliable data flags (URD) are stored in the buffer RAM and then output to the concealment section at regular intervals.

### Flag processing

Flag processing is carried out in two parts as follows:

- Flag strategy logic
- Flag updating logic.

While a frame of data from the external memory is being written into the buffer RAM, the error flags associated with that frame are counted. Two bits are used for the flags, thus 'good' data (flags = 00) and three levels of error can be indicated.

The optimum strategy to be used by the CIRC error corrector is determined by the 2-bit flag information used by the flag strategy logic ROM in conjunction with its associated arithmetic unit (ALU). The flags for the C1 correction are generated in the demodulator and are based on detected signal drop-outs and data run length violations. Updating of the flags after C1 is dependent on the CIRC decoder correction of that frame. The updated flags are used to determine the C2 strategy. After C2 correction a single flag (URD) is generated to accompany the data into the concealment section.

**FUNCTIONAL DESCRIPTION** (continued)**CIRC Decoding**

Data on the compact disc is encoded according to a cross-interleaved Reed-Solomon code (CIRC) and this decoder exploits fully the error-correction capabilities of the code.

Decoding is performed in two cycles and in each cycle the CIRC decoder corrects data in accordance with the following formula:

$$2t + e = 4$$

Where:

e = the number of erasures (erroneous symbols whose position is known).

t = allowed number of additional failures which the decoder program has to find.

The flag processor points to the erasure symbols and tells the CIRC decoder how many additional failures are allowed. If the error corrector is presented with more than the maximum it will stop and flag all symbols as unreliable.

The CIRC decoder is comprised of two sections:

**Syndrome formation**

Four correction syndromes are calculated while the frame of data is being written into a symbol memory. From these syndromes errors can be detected and corrected.

**Microcoded correction processing**

The processor uses an Arithmetic Logic Unit (ALU) which includes a multiplier based on logarithms. The correction algorithm follows the microcode program stored in a ROM.

**Concealment**

This section combines 8-bit data symbols into left and right stereo channels. Each channel has a 16-bit capacity and holds two symbols (a stereo sample). The channels operate independently. A concealment operation is performed when a URD flag accompanies either symbol in a stereo sample. If a single erroneous sample is flagged between two 'good' samples then linear interpolation is used to replace the erroneous value. If two or more successive samples are flagged, a sample and hold is applied and the last of the erroneous samples is interpolated to a value between that of the hold and that of the following 'good' sample.

If MUTE is requested, the data in each channel is attenuated to zero in 15 successive divide-by-two steps. At the end of a mute period the output is incremented to the first 'good' value in two steps using the interpolator.

All erroneous data supplied to the concealment section continues to be flagged when it is output to the B-chip where it receives additional and more efficient concealment.

**Motor speed control** (see Fig. 7)

The motor speed control (MSC) output from pin 17 is a pulse-width modulated signal. The duty factor of the pulse-width modulation is calculated from the difference in numerical value between the WRITE 1 and READ 1 addresses, the difference being nominally half of the FIFO space. The calculation is performed at a rate of 88,2 kHz.

The duty factor of MSC varies in 62 steps from 1,6% (FIFO full) to 98,4% (FIFO empty). When a motor-start signal is detected (via SWAB/SSM) the duty factor is forced to 98,4% for 0,2 seconds followed by a normal, calculated signal. After a motor-stop signal is detected the duty factor is forced to 1,6% for 0,2 seconds followed by a continuous 50% duty factor. A change in motor start/stop status occurring within the 0,2 second periods overrides the previous condition and resets the data control timer.

Fig. 7 Motor speed control.

DEVELOPMENT DATA

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage range (pin 40)	$V_{DD}$	-0,5 to +7,0 V
Maximum input voltage range	$V_I$	-0,5 to $V_{DD}$ +0,5 V
Input current (pin 23)	$I_I$	max. 5 mA
Maximum output voltage range (pin 17, 33)	$V_O$	-0,5 to +7,0 V
Output current (each output)	$I_O$	max. 10 mA
Storage temperature range	$T_{stg}$	-55 to +125 °C
Operating ambient temperature range	$T_{amb}$	-20 to +70 °C
Electrostatic handling *	$V_{es}$	-1000 to +1000 V

\* Equivalent to discharging a 100 pF capacitor through a 1,5 kΩ series resistor with a rise time of 15 ns.

## CHARACTERISTICS

$V_{DD} = 4,5$  to  $5,5$  V;  $V_{SS} = 0$  V;  $T_{amb} = -2$  to  $+70$  °C unless otherwise specified

## Notes to the characteristics

1.  $1 \text{ rad} = \frac{180^\circ}{(3,14)}$ .

2. Coarse frequency detector output PD/OC active for VCO frequencies  $> f_{\text{XTAL}}$  and  $< \frac{f_{\text{XTAL}}}{2}$ .

3. Reference levels = 1 V and 2,4 V.

4. Output rise and fall times measured with load capacitance ( $C_L$ ) = 50 pF.

5. Q-channel access times dependent on cyclic redundancy check (CRC).

Fig. 8 Typical data output waveforms to B-chip or DAC: reference levels = 0,8 V and 2,0 V.

DEVELOPMENT DATA

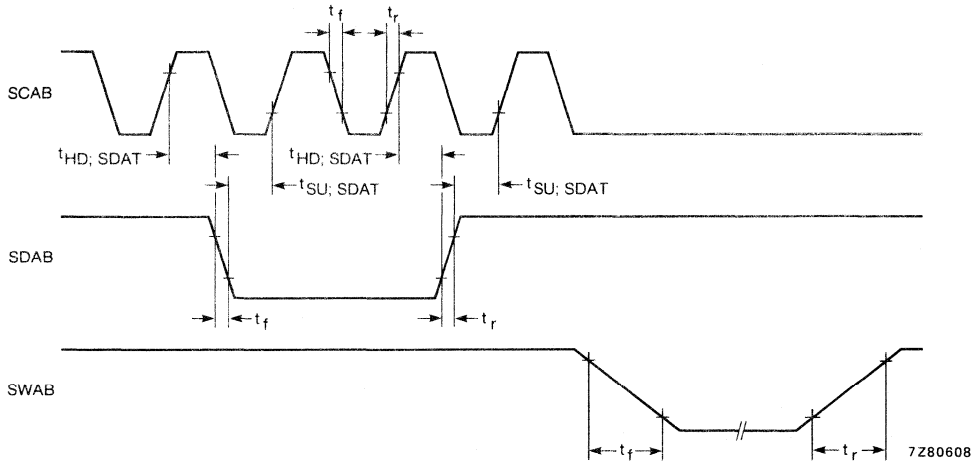

Fig. 9 Typical subcoding data output waveforms: reference levels for SCAB and SDAB = 0,8 V and 2,0 V; reference levels for SWAB = 0,8 V and 4,0 V.

## APPLICATION INFORMATION

## EFM Encoding system

The Eight-to-Fourteen Modulation (EFM) code used in the Compact Disc Digital Audio system is designed to restrict the bandwidth of the data on the disc and to present a d.c. free signal to the demodulator. In this modulation system the data run length between transitions is  $\geq 3$  clock periods and  $\leq 11$  clock periods. The number of bits per symbol is 17, including three merging and low frequency suppression bits which also assist in the removal of the d.c. content.

The conversion from 8-bit, non-return-to-zero (NRZ) symbols to equivalent 14-bit code words is shown in Table 2. C1 is the first bit of a 14-bit code word read from the disc and D1 is the Most Significant Bit (MSB) of the data sent to the error corrector. The 14-bit code words are given in NRZ-I representation in which a logic 1 means a transition at the beginning of that bit from HIGH-to-LOW or LOW-to-HIGH (see Fig. 10).

Fig. 10 Non Return to Zero (NRZ) representation.

The codes shown in Table 2 cover the normal 256 possibilities for an 8-bit data symbol. There are other combinations of 14-bit codes which, although they obey the EFM rules for maximum and minimum run length ( $T_{max}$ ,  $T_{min}$ ), produce unspecified data output symbols. Two of these extra codes are used in the subcoding data to define a subcoding frame sync and are as shown in Table 1.

**Table 1** Codes used to define subcoding frame sync

8-bit NRZ data symbol								14-bit equivalent code word													
D1	D2	D3	D4	D5	D6	D7	D8	C1	C2	C3	C4	C5	C6	C7	C8	C9	C10	C11	C12	C13	C14
x	0	0	1	1	1	1	1	0	0	1	0	0	0	0	0	0	0	0	0	0	1
x	1	1	1	1	1	0	1	0	0	0	0	0	0	0	0	0	1	0	0	1	0
P	Q	R	S	T	U	V	W														

Where: X = don't care state.

When a subcoding frame sync is detected the P-bit (Pause-bit) of the data is ignored by the debounce circuitry. The remaining bits (Q to W) are not specified in the system but always appear at the serial output as shown in Table 1.

**APPLICATION INFORMATION** (continued)

**Subcoding microprocessor handshaking protocol** (see Figs. 11, 12 and 13)

The QRA line is normally held LOW by the microprocessor.

When the microprocessor needs data (Request) it releases the QRA line and allows it to be pulled HIGH by the pull-up resistor in the SAA7210.

The SAA7210 is continuously collecting Q-channel data and when it detects that QRA is HIGH it holds the first frame of Q-channel data for which the Cyclic Redundancy Check (CRC) is 'good'. Then the SAA7210 pulls QRA LOW to tell the microprocessor that the data is ready (Acknowledge) and enables the QDATA output.

When the microprocessor detects a QRA LOW signal it generates a clock signal (QCL) to shift the data out from the SAA7210 to the microprocessor via the QDATA output. The first negative edge of QCL also resets the acknowledge signal and thus releases the QRA line.

As soon as the microprocessor has received sufficient data (not necessarily 80 bits) it pulls the QRA line LOW again. The SAA7210 now disables the QDATA output and resumes collecting new Q-channel data.

If the microprocessor does not generate a QCL signal within 10,8 ms from the start of the acknowledge (QRA LOW), the SAA7210 resets the acknowledge signal and allows the QRA line to go HIGH again. The microprocessor still has 2,3 ms to accept the data, which allows for a long propagation delay in the microprocessor. After a further 13,33 ms the SAA7210 will have received a new frame of Q-channel data and, provided the CRC is 'good', will give a fresh acknowledge signal. This refreshing process is repeated until the microprocessor accepts the data or stops the request.

When the microprocessor has a requirement to hold the data for a long period before acceptance, it prevents the refreshing process by setting QCL LOW after any acknowledge signal.

SAA7220

## DIGITAL FILTER FOR COMPACT DISC DIGITAL AUDIO SYSTEM

### GENERAL DESCRIPTION

The SAA7220 is a stereo interpolating digital filter designed for the Compact Disc Digital Audio system. For descriptive purposes, the SAA7220 is referred to as the B-chip and the SAA7210 as the A-chip.

### Features

- 16-bit serial data input (two's complement)
- Interpolated data replaces erroneous data samples
- -12 dB attenuation via the active LOW attenuation input control (ATSB)
- Smoothed transitions before and after muting
- Two identical finite impulse response transversal filters each with a sampling rate of four times that of the normal digital audio data
- Digital audio output of 32-bit words transmitted in biphase-mark code
- I<sup>2</sup>S data transfer between SAA7210 and 16-bit dual DAC (TDA1541)

### QUICK REFERENCE DATA

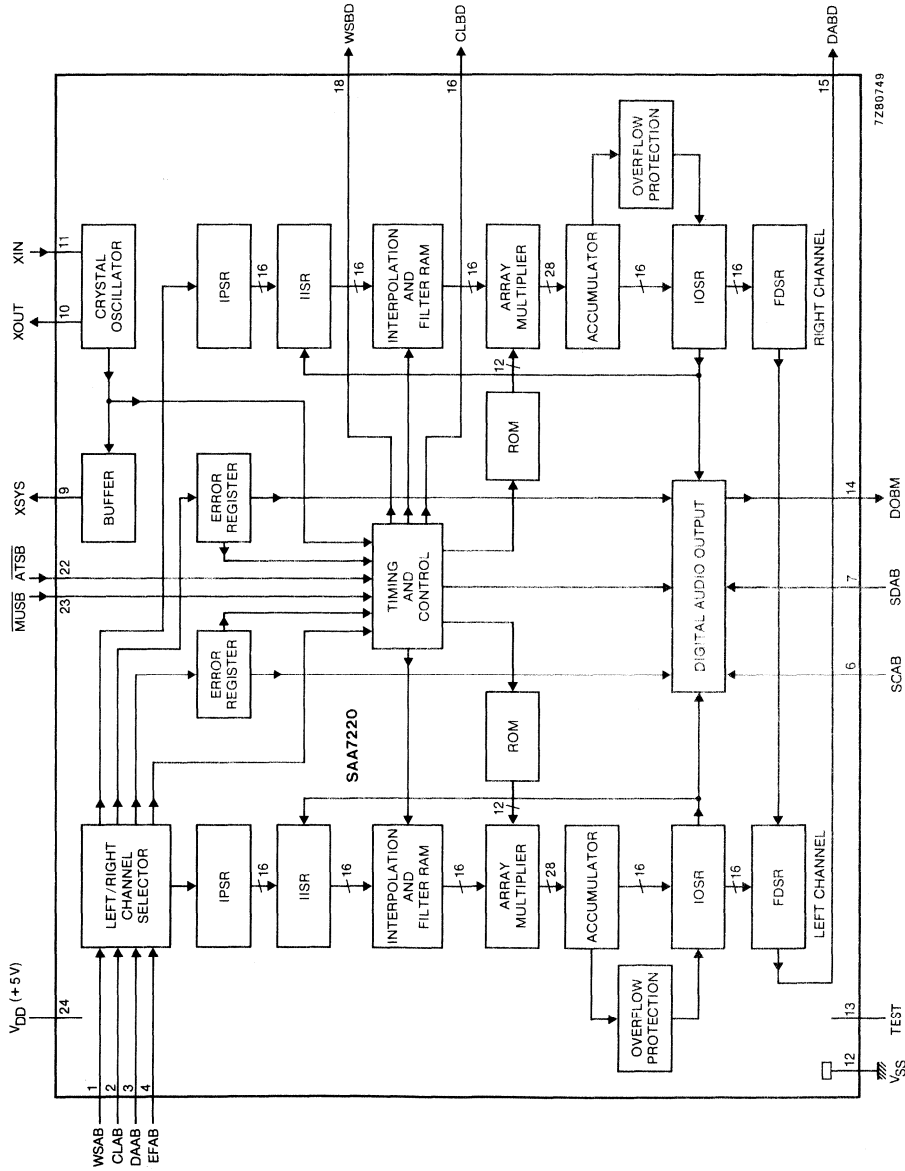

Supply voltage (pin 24)	V <sub>DD</sub>	typ.	5 V
Supply current (pin 24)	I <sub>DD</sub>	typ.	180 mA
Input voltage ranges WSAB, DAAB, EFAB, SDAB, CLAB, SCAB, $\overline{\text{ATSB}}$ , $\overline{\text{MUSB}}$			
Input voltage LOW	V <sub>IL</sub>		-0,3 to +0,8 V
Input voltage HIGH	V <sub>IH</sub>		2,0 to V <sub>DD</sub> +0,5 V
Output voltage ranges DABD, CLBD, WSBD			
Output voltage LOW	V <sub>OL</sub>		0 to 0,4 V
Output voltage HIGH	V <sub>OH</sub>		2,4 to V <sub>DD</sub> V
DOBM			
Voltage across a 75 $\Omega$ load via attenuator; see Fig. 10 (peak-to-peak value)	V <sub>L(p-p)</sub>		0,4 to 0,6 V
Oscillator operating frequency XTAL	f <sub>XTAL</sub>	typ.	11,2896 MHz
Operating ambient temperature range	T <sub>amb</sub>		-20 to +70 °C

### Note

All outputs are short-circuit protected except crystal oscillator output.

### PACKAGE OUTLINE

24-lead DIL; plastic (SOT-101A).

## PINNING

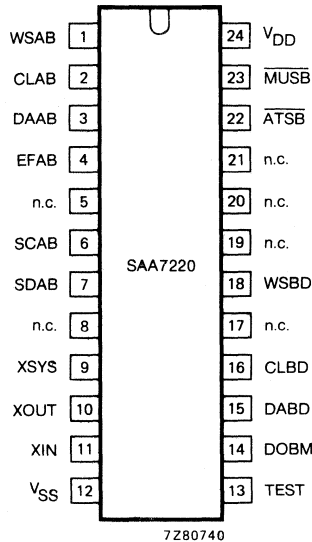

Fig. 3 Pinning diagram.

## Pin functions

pin no.	mnemonic	description
1	WSAB	<b>Word Select:</b> input from A-chip.
2	CLAB	<b>Clock:</b> input from A-chip; has an internal pull-up.
3	DAAB	<b>Data:</b> input from A-chip.
4	EFAB	<b>Error Flag:</b> active HIGH input from A-chip indicating unreliable data. This input has an internal pull-down.
5	n.c.	not connected.
6	SCAB	<b>Subcode Clock:</b> a 10-bit burst clock 2,8224 MHz (typ.) input which synchronizes the subcode data. This input has an internal pull-up.
7	SDAB	<b>Subcode Data:</b> a 10-bit burst of data, including flags and sync bits serially input from the A-chip once per frame clocked by burst clock input SCAB (see Fig. 8). This input has an internal pull-down.
8	n.c.	not connected.
9	XSYS	<b>System clock output:</b> 11,2896 MHz (typ.) output to DAC and to A-chip as slave clock input.
10	XOUT	<b>Crystal oscillator output:</b> drive output to clock crystal (11,2896 MHz typ.).
11	XIN	<b>Crystal oscillator input:</b> input from crystal oscillator or slave clock.

pin no.	mnemonic	description
12	V <sub>SS</sub>	<b>Ground:</b> circuit earth potential.
13	TEST	<b>Test input:</b> this input has an internal pull-down. In normal operation pin 13 should be open-circuit or connected to V <sub>SS</sub> .
14	DOBM	<b>Digital audio output:</b> this output contains digital audio samples which have received interpolation, attenuation and muting plus subcode data. Transmission is by biphase-mark code.
15	DABD	<b>Data:</b> this output which is fed to the DAC, together with its clock (CLBD) and word select (WSBD) outputs, conforms to the I <sup>2</sup> S format (see Fig. 7).
16	CLBD	<b>Clock:</b> output to DAC.
17	n.c.	not connected.
18	WSBD	<b>Word Select:</b> output to DAC.
19	n.c.	not connected.
20	n.c.	not connected.
21	n.c.	not connected.
22	$\overline{\text{ATSB}}$	<b>Attenuation:</b> when active LOW this control input provides -12 dB attenuation. This input has an internal pull-up.
23	$\overline{\text{MUSB}}$	<b>Mute:</b> active LOW control input with internal pull-up.
24	V <sub>DD</sub>	<b>Power Supply:</b> positive supply voltage (+ 5 V).

## FUNCTIONAL DESCRIPTION

### General

The SAA7220 incorporates the following functions:

- Interpolation of data in error
- Attenuation
- Muting
- Finite impulse response transversal filtering with a four times increased sampling rate
- A digital audio output

Serial data formatted in two's complement (DAAB; pin 3) is clocked in by its bit clock (CLAB; pin 2) together with word select (WSAB; pin 1) and error flag (EFAB; pin 4) as shown in Fig. 1. After resynchronization with the internal clocks the data is separated into left and right channels and fed to two identical Input Shift Registers (IPSR). Internal timing and control loads the data into the interpolation RAM via the Intermediate Input Shift Register (IISR).

After interpolation, attenuation and muting the data is fed serially from the Intermediate Output Shift Register (IOSR) to the Audio Output Shift Register (AOSR) and to the IISR. From the IISR it is loaded into the filter RAM.

After filtering the data is passed to the Filter Data Shift Register (FDSR). From the FDSR it is transmitted serially to the data output (DABD; pin 15) together with the appropriate word select (WSBD; pin 18) and bit clock (CLBD; pin 16), in accordance with the I<sup>2</sup>S bus specification. Data is again formatted in two's complement. Outputs DABD, WSBD and CLBD are strobed to maintain the correct timing relationship with the system clock output (XSYS) at pin 9 (see Fig. 12).

**FUNCTIONAL DESCRIPTION** (continued)

The subcode data (SDAB; pin 7) and 10-bit burst clock (SCAB; pin 6) are resynchronized to the internal clocks within the digital audio output block. SCAB clocks the data into the Subcode Input Shift Register (SISR; Fig. 2). Data is transferred to the Subcode Output Shift Register (SOSR) on receipt of all of the 10-bit burst clocks. The subcode data is then mixed with the data from the AOSR and the error flag to provide the output DOBM at pin 14. SISR is reset when no clocks are detected on the SCAB input.

**Interpolation**

When, for either left or right channel, unreliable samples are flagged between two correct samples, linear interpolation is used to replace the erroneous samples (up to a maximum of 8 consecutive errors).

When the error flag is set, the sample is replaced by a value calculated by the following formula:

$$S(n) = \frac{x}{x+1} \cdot S(n-1) + \frac{1}{x+1} \cdot S(n+x)$$

Where:  $S(n)$  = new sample value  
 $x$  = number of successive erroneous samples following  $S(n-1)$   
 $S(n-1)$  = the preceding sample  
 $S(n+x)$  = the first following correct sample

The value of  $x$  is detected (1 to 8) to determine the coefficients for the multiplications. Eight coefficient pairs are stored in the ROM. If  $x = 0$  or  $\geq 9$  then  $S(n)$  will remain unchanged.

Fig. 4 Example of an eight sample linear interpolation.

**Attenuation**

Attenuation is controlled by the ATSB input at pin 22. When the input is active LOW the sample is multiplied by a coefficient that provides  $-12$  dB attenuation. If the input is HIGH the multiplication factor is 1.

**Mute**

Mute is controlled by the MUSB input at pin 23. When the input is active LOW the value of the samples is decreased smoothly to zero following a cosine curve. 32 coefficients are used to step down the value of the data, each one being used 31 times before stepping onto the next. When MUSB is released (pin 23 HIGH) the samples are returned to the full level again following a cosine curve with the same coefficients being used in the reverse order.

**Filtering**

The SAA7220 incorporates two identical finite impulse response transversal filters with the equivalent of 120 taps, one filter for each stereo channel. The corresponding 120 coefficients are structured as 4 sections of 30 coefficients.

(Each ROM contains only 60 filter coefficients, the same 60 being used a second time, but in the reverse order, to make a total of 120.)

Data is stored in a 480-bit RAM (30 words x 16 bits). The 30 words are sequentially addressed 4 times to generate the 4 output samples.

When a new word is moved from the interpolation RAM to the filter RAM, the oldest word is discarded and all other words moved one position with respect to the ROM coefficients. The data storage effectively forms a 30 sample wide moving window on the input data. The samples move within this window at 5,6448 MHz and the window moves one sample every 22,6  $\mu$ s.

An output word is formed by multiplying 30 samples from the filter RAM with 30 coefficients from the ROM using a 16 x 12 array multiplier. The result is added in an accumulator. At the end of the 30 multiplications the 16 MSB's are passed from the accumulator via the IOSR to the FDSR, and the accumulator is reset. Overflow protection is incorporated so that the output always limits cleanly in the event of accumulator overflow. Also, to simplify the design of the digital-to-analogue converter a d.c. offset of + 5% is added to the accumulator.

The filtered data is output in the  $I^2S$  format at a 5,6448 MHz bit rate and a sample rate of 176 kHz.

**Digital audio output**

The digital audio output (DOBM; pin 14) consists of 32-bit words transmitted in biphase-mark code. That is, two transitions for a logic 1 and one transition for a logic 0. The 32-bit words are transmitted in blocks of 384 words. Table 1 shows the information contained in each word.

The sync word is formed by violation of the biphase rule and therefore does not contain any data. Its length is equivalent to 4 data bits. The three different sync patterns (B, M and W) indicate the following situations:

- Sync B; start of a block of 384 words, contains left sample (11101000)
- Sync M; word contains left sample, but is not a block start (11100010)
- Sync W; word contains right sample (11100100)

In the SAA7220 sync words are always preceded by 0.

Left and right samples are transmitted alternately.

Audio samples are available for digital audio output after interpolation, attenuation and muting, but before filtering.

Data held in the Subcode Output Shift Register (SOSR) is transmitted via the user data bit and is asynchronous with the block rate.

**Digital audio output (continued)****Table 1** Composition of the 32-bit digital audio output word

bit number	description	information
1 to 4	sync	—
5 to 8	auxiliary	not used (always zero)
9 to 28	audio sample	bits 9 to 12 not used (always zero). bits 13 (LSB) to 28 (MSB) two's complement
29	audio valid	copy of the error flag
30	user data	used for subcode data
31	channel status	indication of control bits and category code
32	parity bit	even parity for all word bits excluding sync pattern

**Channel status**

The channel status bit is the same for both left and right words. Therefore a block of 384 words contains 192 channel status bits as shown in Table 2.

When there is no subcode the channel status will switch over to the general format. 'No subcode' is identified by the subcode detector when SCAB is a continuous HIGH or LOW.

**Table 2** Channel status bit assignment

bit number	description	subcode provided	no subcode provided
1 to 4	control	copy of Q channel	bits 1 and 2 zero bit 3 image of SCAB bit 4 image of SDAB
5 to 8	reserved	always zero	always zero
9 to 16	category code	CD category bit 9 logic 1	general category
17 to 192		always zero	all bits zero always zero

If a subcode clock is provided but there is no subcode data (SDAB is a continuous HIGH or LOW) the control bits will be zero and the category code will be CD.

The SYNC bit and the cyclic redundancy check bit (CRC) in the subcode data from the A-chip to the B-chip have the format shown by Fig. 5. Typical subcode data output waveforms are shown by Fig. 8.

Fig. 5 Subcode data format for SYNC and CRC bits.

SYNC is active LOW and indicates the start of a subcode block, which contains 98 words including 2 sync words, S0 and S1.

CRC is always LOW except during SYNC S1 when:

- CRC = logic 1; previous Q block was true
- CRC = logic 0; previous Q block was false

Two 32-bit words are transmitted at the sample frequency of 44,1 kHz ( $2 \times 32 \times 44,1 \text{ kHz} = 2,8224 \text{ Mbits/s}$  data rate). An internal 5,6448 MHz clock ( $XSYS/2$ ) is used in the biphas modulator.

#### RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage range (pin 24)	$V_{DD}$	-0,5 to + 7,0 V
Maximum input voltage range	$V_I$	-0,5 to $V_{DD} + 0,5$ V
Storage temperature range	$T_{stg}$	-55 to + 125 °C
Operating ambient temperature range	$T_{amb}$	-20 to + 70 °C
Electrostatic handling*	$V_{es}$	-1000 to + 1000 V

All outputs are short-circuit protected except the crystal oscillator output.

\* Equivalent to discharging a 100 pF capacitor through a 1,5 k $\Omega$  series resistor with a rise time of 15 ns.

## CHARACTERISTICS

$V_{DD} = 4,5$  to  $5,5$  V;  $V_{SS} = 0$  V;  $T_{amb} = -20$  to  $+70$  °C unless otherwise specified

DEVELOPMENT DATA

**Notes to the characteristics**

1. Inputs EFAB and SDAB both have internal pull-downs.
2. Inputs CLAB, SCAB,  $\overline{\text{ATSB}}$  and  $\overline{\text{MUSB}}$  have internal pull-ups.
3.  $I_G$  used in a.c. coupled mode.
4.  $V_{IH} - V_{IL} \geq 1,6 \text{ V}$ .
5. Reference levels = 2,4 V.
6. The output current conditions are dependent on the drive conditions.  
When a crystal oscillator is being used the output current capability is  $I_{OL} = + 1,6 \text{ mA}$ ;  
 $I_{OH} = -0,2 \text{ mA}$ ; But if a slave input is being used the output currents are reduced to  
 $I_{OL} = +0,2 \text{ mA}$ ;  $I_{OH} = -0,2 \text{ mA}$ .
7. Reference levels = 0,8 V and 2,0 V.
8. The signal CLAB can run at either 2,8 MHz (1/4 system clock) or 1,4 MHz (1/8 system clock) under typical conditions. It does not have a minimum or maximum frequency, but is limited to being 1/4 or 1/8 of the system clock frequency.
9. Input set-up and hold times measured with respect to clock input from A-chip (CLAB). Reference levels = 0,8 V and 2,0 V.
10. Input set-up and hold times measured with respect to subcode burst clock input from A-chip (SCAB). Reference levels = 0,8 V and 2,0 V.
11. Output set-up and hold times measured with respect to system clock output (XSYS).
12. Output set-up and hold times measured with respect to clock output (CLBD).
13. Output rise and fall times measured between the 10% and 90% levels; the data bit pulse width measured at the 50% level.

## DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

SAA7250

# AUDIO SIGNAL PROCESSOR

## GENERAL DESCRIPTION

The SAA7250 is a high-speed general purpose arithmetic processor, optimized for the execution of digital audio algorithms.

The device handles 24-bit signal data and 12-bit coefficients while multi-precision operations on both are supported by the Audio Signal Processor (ASP) hardware, thus avoiding the processing overhead that is required with other digital signal processors.

## Features

- 24-bit data stored in 64 word RAM
- 12-bit coefficients stored in 2 x 64 word RAM
- Programs contained in 256 word (34-bit) ROM
- Computations by 24 x 12 two's complement array multiplier and 40-bit ALU
- 4 serial I<sup>2</sup>S Ports for data exchange with A/D and D/A converters
- I<sup>2</sup>C bus interface for control purposes
- 11,3 MHz clock-rate to perform an instruction with a cycle time of 177 ns
- 2 synchronization inputs for processing independent of 11,28 MHz system clock
- Standard 40-pin package

## PACKAGE OUTLINES

SAA7250AP; SAA7250BP; SAA7250CP: 40-lead DIL; plastic (SOT-129).

PINNING

DEVELOPMENT DATA

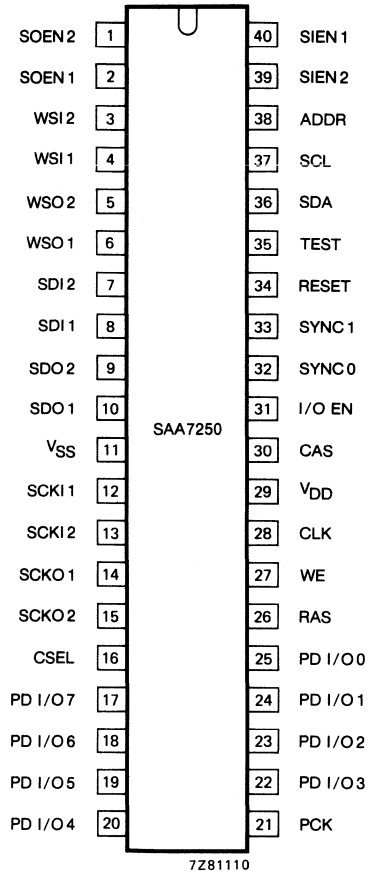

Fig. 2 Pinning diagram; for pin functions see next page.

**Pin functions**

pin no.	mnemonic	description
1	SOEN 2	<b>Serial Output ENable 2:</b>
2	SOEN 1	<b>Serial Output ENable 1:</b> When these inputs are HIGH data is shifted out of the relevant I <sup>2</sup> S serial output port. When these inputs are LOW the output is in the high impedance state, the internal data clock is disabled and data will not shift.
3	WSI 2	<b>Word Select Input 2:</b>
4	WSI 1	<b>Word Select Input 1:</b> A rising or falling edge on these inputs indicates the start of a new word. This follows after the next falling edge of the serial clock inputs 1 and 2 (SCK 1/SCK 2). for the I <sup>2</sup> S serial data inputs.
5	WSO 2	<b>Word Select input 2:</b>
6	WSO 1	<b>Word Select input 1:</b> Rising and falling edges on these ports indicate the start of the next word. for I <sup>2</sup> S serial data output.
7	SDI 2	<b>Serial Data Input 2:</b>
8	SDI 1	<b>Serial Data Input 1:</b> Up to 24 bits of two's complement data can be written in to these I <sup>2</sup> S inputs. Any additional bits are ignored.
9	SDO 2	<b>Serial Data Output 2:</b>
10	SDO 1	<b>Serial Data Output 1:</b> Up to 24 bits of two's complement data is shifted out, the most significant bit (MSB) first. If less than 24 bits are supplied, the extra least significant bits (LSB) are made up with zero's.
11	V <sub>SS</sub>	<b>Ground:</b> circuit earth potential.
12	SCK1 1	<b>Serial ClOcK Input 1:</b>
13	SCK1 2	<b>Serial ClOcK Input 2:</b> On the rising edge of these clocks the data bits on the I <sup>2</sup> S serial data inputs (SDI 1/2) and on the control lines (WSO 1/2; SOEN 1/2) are strobed into the input buffer. These clocks can be asynchronous to the main internal clock and to each other.
14	SCKO 1	<b>Serial ClOcKed Output 1:</b>
15	SCKO 2	<b>Serial ClOcKed Output 2:</b> These clocks shift serial data out of the I <sup>2</sup> S serial port. The clocks can be asynchronous to the main internal clock and to each other. A rising edge of the clock causes a data bit to become available at the output, at least 20 ns before the next rising edge. The control lines (WSO 1/2 and SOEN 1/2) are strobed into an input buffer on the rising edge of the clock.
16	CSEL	<b>Carry SElect:</b> input used to control an internal carry select of the parallel port I/O address generator adder. When the input is HIGH the SAA7250 operates with a 64 K RAM, when LOW with a 16 K RAM. The selection is dependent on the length and number of delay lines required when in the reverberation mode.

pin no.	mnemonic	description
17-20	PD I/O 7-4	<b>Parallel Data Input/Output:</b> These are the first 4 bits of the 8-bit parallel port. The port operates in conjunction with the RAS, CAS, WE and I/O EN outputs as handshake signals. Further details of the possible modes of operation are described in application information.
21	PCK	<b>Parallel Clock input:</b> on the rising edge of this clock 4-bit or 8-bit wide data is strobed into the parallel port. This input is also the acknowledge to I/O EN in the byte I/O modes. In the delay mode it can be connected to CAS for column address timing.
22-25	PD I/O 3-0	<b>Parallel Data Input/Output:</b> These are the second 4 bits of the 8-bit parallel port (for description see pins 17-20).
26	RAS	<b>Row Address:</b> active LOW output strobe for dynamic RAM row address.
27	WE	<b>Write Enable:</b> data is clocked to the external buffer on the rising edge of this output, on the falling edge data is transferred to the external dynamic RAM.
28	CLK	<b>CLock:</b> 11,28 MHz ( $\pm 10\%$ ) main clock input.
29	V <sub>DD</sub>	<b>Power Supply:</b> positive supply voltage (+ 5 V).
30	CAS	<b>Column Address:</b> active LOW output strobe for dynamic RAM column address.
31	I/O EN	<b>Input/Output ENable:</b> output which enables the parallel port. In the delay mode it indicates that PD I/O 3-0 are in the high impedance state. In the byte in/out mode it is LOW to indicate that data can be input or output, going HIGH after PCK has gone HIGH.
32	SYNC 0	<b>SYNChronize 0:</b>
33	SYNC 1	<b>SYNChronize 1:</b> Inputs used to synchronize the SAA7250 with other audio signal processors or with a microprocessor. This is achieved by re-activating the SAA7250 after it has executed a HALT instruction.
34	RESET	<b>Power-on RESET:</b> for correct reset of the SAA7250 this input must be held LOW for 100 ms while a stable clock is applied to CLK. This pin has a schmitt trigger input and can be fed from an RC network with a time constant not less than 100 ms. After reset no data is available at the serial output ports.
35	TEST	<b>TEST:</b> input to test the device at the factory. In normal operation the input must be tied to ground.
36	SDA	<b>Serial DAta:</b> this is the serial data input/output for the I <sup>2</sup> C bus. The output is open-drain and is used in conjunction with an external pull-up resistor.
37	SCL	<b>Serial CLock:</b> serial clock input for the I <sup>2</sup> C bus, and is asynchronous to the main internal clock.
38	ADDR	<b>ADDRes:</b> an additional address input to provide the SAA7250 with two possible I <sup>2</sup> C addresses.
39	SIEN 2	<b>Serial Input ENable 2:</b>
40	SIEN 1	<b>Serial Input ENable 1:</b> When HIGH these two inputs enable the relevant serial input port. When LOW data is not shifted in.

## FUNCTIONAL DESCRIPTION

The Audio Signal Processor (ASP) is a high-speed arithmetic processor, dedicated to the execution of digital audio algorithms.

The ASP handles 24-bit signal data and 12-bit coefficients while multi-precision operations on both are supported by the ASP hardware, thus avoiding the processing overhead that is currently necessary in other digital signal processors.

Data (24-bit) and coefficients (12-bit) are stored in two separate RAMs. The data RAM has 64 words, the coefficient RAM counts 2 x 64 words. The programs are contained in a 256 word (34-bit) ROM.

Computations are performed by a 24 x 12 two's complement array multiplier and a 40-bit ALU. Intermediate results are stored in an accumulator register of the same width. This allows high precision operation and temporary magnitude overshoot on intermediate data, before results are truncated to 24 bits.

The main task of the ALU is the accumulation of the multiplier output, input multiplexers ensure correct scaling of the inputs. The ALU can also perform the task of truncating the results to 24 bits but this will reduce the available processing time.

Interfaces are included to interact both at the audio signal data rate and at a lower control data rate according to respective I<sup>2</sup>S and I<sup>2</sup>C protocols.

Four separate serial input/output ports provide the facility for data exchange based on the I<sup>2</sup>S protocol which is compatible with A/D, D/A converters and other peripheral circuits, such as digital filters and compact disc ICs. I<sup>2</sup>S also provides the required interaction for configurations in which processing functions are implemented with a number of communicating ASPs.

A parallel interface may connect RAM chips for the implementation of memory intensive algorithms (behaving as separate 4-bit input and 4-bit output ports) or may interface to a microprocessor bus (for this purpose it is configured as an 8-bit bidirectional interface).

An I<sup>2</sup>C interface is connected to the coefficient RAM for the downloading of the coefficients by a control processor. This interface also facilitates the monitoring of the ASP status and signal data by the control processor.

The SAA7250 is capable of performing cycles of 128 instructions (one new result each cycle) at a rate of 44,1 kHz per second, the same sampling rate used in the Compact Disc Digital Audio System. The intended program size allows the execution of algorithms at the lower sampling rate of 22,05 kHz.

Data rates of the interfaces are not coupled to the ASP clock. Each interface carries its own clock. There are also two synchronization inputs by which the processing becomes more independent of the 11,28 MHz SAA7250 system clock.

The following sections give a detailed description of the sub-sections as shown in the block diagram Fig. 1.

### Data RAM

Data is contained in a 64 word, 24-bit data RAM. The addresses of the data RAM are generated from data that is stored in the program ROM.

### Coefficient RAM

Coefficients are held in a coefficient RAM, which actually is two 64 word, 12-bit RAMs. The coefficients can be written asynchronously to the first RAM over many cycles via the I<sup>2</sup>C interface, then downloaded to the second RAM in one internal program cycle in order not to interfere with program execution. The second RAM is then used to supply the "X" selector.

### Program ROM

The program for a particular device function is held in a 256 word 34-bit ROM. This ROM can hold several programs which are decoded in the ROM decoder.

### Program counter

The program ROM addresses are contained in the program counter, which operates in conjunction with the I<sup>2</sup>C program counter latch to determine the position in the program.

### Arithmetic Logic Unit

The arithmetic part of the SAA7250 consists of a 24 x 12 two's complement array multiplier and a 40-bit ALU. The "X" selector holds 12-bit wide data from the "Q" selector, the sign register, or 12-bit wide coefficients from the coefficient RAM. This data is processed by the multiplier to provide 36-bit (35-bit sign + 1 overflow bit) wide data that is handled by the ALU.

### Adder

The data from the multiplier is shifted through the right selector which is a barrel shifter to give it the correct weighting. This weighted data is passed, with weighted data from the left selector, to the 40-bit adder. Data is summed in the adder and passed to the accumulator, overflow and data latches.

### Result selector

The data is then passed to the result selector and the overflow detector from where the selected results are returned to one of the internal ports for further processing or to one of the output ports.

### Interfaces

Various interfaces are included in the SAA7250 that interact at the audio signal rate and at a lower control data rate.

### I<sup>2</sup>S serial ports

Two separate serial input ports and two separate output ports are used to interface with A/D and D/A converters. These ports are part of the main data bus structure with a communication protocol according to the I<sup>2</sup>S format for digital audio data.

The I<sup>2</sup>S implementation is a 3-line interface comprising:

- clock, serial data line and a control line used to select left and right channel words.

The SAA7250 has its own independent asynchronous clock systems (i.e. 4 clocks) and can handle up to 24-bit variable length words.

### Parallel I/O

An 8-bit parallel I/O can be used to interface the SAA7250 with RAM for implementing memory intensive algorithms. In this mode the port acts as a 4-bit input and 4-bit output, but may also be used as an 8-bit bidirectional bus to interface with a microprocessor.

This port is also part of the main data bus structure and has its own independent asynchronous clock system.

### I<sup>2</sup>C interface

An Inter I.C. interface is used for downloading of coefficients by a control processor. Through this interface the control processor is able to monitor status and signal data and to switch off the power-on muting. It also loads the start address of the program counter thereby determining which of the programs contained in the ASP is to be used.

**FUNCTIONAL DESCRIPTION** (continued)**Synchronization and clock generator**

The main internal clocking rate for the ALU is 5,64 MHz. This allows the SAA7250 to execute 128 instructions, with a new stereo result, at a sampling rate of 44,1 kHz the same as that of the Compact Disc Digital Audio System, or 256 instructions at a sampling rate of 22,05 kHz. This internal clock is generated from an 11,28 MHz external signal by the synchronization and clock generator circuits which facilitates the SAA7250 being synchronized with other Audio Signal Processors via external programming.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage range (pin 29)	$V_{DD}$	-0,5 to + 7,0 V
Maximum input voltage range	$V_I$	-0,5 to $V_{DD} + 0,5$ V
Maximum output voltage range (open-drain only)	$V_O$	-0,5 to + 7,0 V
Output current (each output)	$I_O$	max. 10 mA
Storage temperature range	$T_{stg}$	-55 to + 125 °C
Operating ambient temperature range	$T_{amb}$	-20 to + 70 °C
Electrostatic handling*	$V_{es}$	-1000 to + 1000 V

\* Equivalent to discharging a 100 pF capacitor through a 1,5 k $\Omega$  series resistor with a rise time of 15 ns.

## CHARACTERISTICS

 $V_{DD} = 4,5$  to  $5,5$  V;  $V_{SS} = 0$  V;  $T_{amb} = -20$  to  $+70$  °C unless otherwise specified

Purchase of Philips' I<sup>2</sup>S components conveys a license under the Philips' I<sup>2</sup>S patent to use the components in the I<sup>2</sup>S-system provided the system conforms to the I<sup>2</sup>S specification defined by Philips.

Purchase of Philips' I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C-system provided the system conforms to the I<sup>2</sup>C specifications defined by Philips.

**APPLICATION INFORMATION**

There are three versions of the SAA7250:

**"A" version** (see Fig. 6)

The SAA7250A can be selected as a high-pass filter or a low-pass filter. It also supplies addresses for the external RAM in a reverberation system (see Fig. 10).

**"B" version** (see Fig. 7)

The SAA7250B can be used in a reverberation system in conjunction with external RAM and a SAA7250A. If the application is without a SAA7250A an external counter is used to generate the RAM addresses.

**"C" version** (see Fig. 8)

The SAA7250C offers either dynamic compression and expansion, or equalization. It can operate in isolation from the "A" and "B" versions.

Dynamic range control is shown in figure 9 and a reverberation system with two ASPs (ASP-updown, ASP-reverberation) is shown in figure 10.

**I<sup>2</sup>C bus protocol**

For correct operation of the ASP certain functions have to be performed by I<sup>2</sup>C bus commands before the actual processing of signals can be started. There are some functions which can be used during program execution.

To perform these functions a master microcontroller sends messages to the ASP via the I<sup>2</sup>C bus (see I<sup>2</sup>C bus syntax). The I<sup>2</sup>C bus interface of the ASP (slave) receives, converts to parallel format and, if correctly addressed, executes the commands.

For further detailed information see 'Single-chip 8-bit microcontroller family user manual', Chapter 8.

*Load program counter*

As one ASP may contain one or more programs, the program counter (PC) must be initialized with the <start address> of that program before using it. The default value is zero, in which event a transmission is not required.

*Load coefficient RAM*

This message is used to initialize the coefficient RAM after power-on and for updating one or more coefficients during program execution to change the processing characteristics. The coefficients are written into the first of two banks of RAM, starting at the location specified by <coefficient address>. After a coefficient has been written, the address is automatically incremented by one. Thus, subsequent coefficients can be transferred without repeating <coefficient address>.

The RAM address is part of <ASP function>.

The copying of the contents of the first bank to the second bank is controlled by the stop condition <STO> at the end of a "load coefficient RAM" message ("fast" bank switching) or by the "bank switch coefficient RAM" message and the start of the program.

*Switch off mute*

At power-on the serial output channels are automatically muted. This means they will send a value of zero whenever output is requested.

After the ASP has been initialized, this muting can be switched off to allow data in the output registers to be sent.

**APPLICATION INFORMATION** (continued)**I<sup>2</sup>C bus protocol** (continued)*Bank switch coefficient RAM*

This message is used to copy the contents of the first RAM bank to the second RAM bank. The ASP program always reads from the second RAM bank.

*Enable data bus and overflow monitor*

This message is used to enable monitoring of the internal data bus and the overflow latch. A <compare address> defines the time slot at which monitoring is required. Each time a match between the <compare address> and the program counter is detected, the contents of the overflow latch at instruction "PC" and data at instruction "PC + 1" are clocked into a special I<sup>2</sup>C bus read register. When this special register is read via the I<sup>2</sup>C bus clocking is inhibited. After power-on reset, data and overflow information is clocked at every instruction until the first <compare address> is sent.

The overflow bit is set to zero when an overflow is detected.

This message may be used only to define a <compare address> or be followed by a 'read data' message.

After the special read register has been read it will be cleared.

**I<sup>2</sup>C bus syntax**

The general syntax for I<sup>2</sup>C bus messages is given by the following description

<I<sup>2</sup>C message>

<I<sup>2</sup>C message for ASP>

<I<sup>2</sup>C message for other device> (no further specification)

<I<sup>2</sup>C message for ASP>

<STA><ASP address> 0 <A> <ASP function> <A> <parameter list 1> <A> <STO>

<STA><ASP address> 1 <A> <parameter list 2> <STO>

<STA> start condition

<ASP address> 001100X (X is programmable via pin 38; ADDR)

<A> acknowledge bit

<ASP function>

<coefficient address> 00 (load coefficient RAM)

XXXXX001 (load program counter)

## SENSITIVE 1 GHz DIVIDER-BY-64

This silicon monolithic integrated circuit is a prescaler in current-mode logic. It contains an amplifier, a divide-by-64 scaler and an output stage. It has been designed to be driven by a sinusoidal signal from the local oscillator of a television tuner, with frequencies from 70 MHz up to 1 GHz, for a supply voltage of  $5\text{ V} \pm 10\%$  and an ambient temperature of 0 to 70 °C. It features a high sensitivity and low harmonic contents of the output signal. The difference between SAB1164 and SAB1165 is the output resistance (see Fig. 7)

Fig. 1 Block diagram. CTR6 = 6 binary dividers = ( $\div 64$ ).

### QUICK REFERENCE DATA

Supply voltage (pin 8)	$V_{CC}$	$5 \pm 10\% \text{ V}$
Input frequency range (pins 2 and 3)	$f_i$	70 to 1000 MHz
Output voltage swing (pins 6 and 7)	$V_{o(p-p)}$	typ. 1 V
Supply current; unloaded (pin 8)	$I_{CC}$	typ. 42 mA
Operating ambient temperature	$T_{amb}$	0 to + 70 °C

### PACKAGE OUTLINES

SAB1164P: 8-lead DIL; plastic (SOT-97A).

SAB1165P: 8-lead DIL; plastic (SOT-97A).

**PINNING**

$V_{CC}$	positive supply
$V_{EE}$	0 V; ground
$C_1, C_2$	differential inputs
$Q_H, Q_L$	complementary outputs
i.c.	internally connected

**FUNCTIONAL DESCRIPTION**

The circuit contains an amplifier, a divide-by-64 scaler and an output stage. It has been designed to be driven by a sinusoidal signal from the local oscillator of a TV tuner, with frequencies from 70 MHz up to 1 GHz, for a supply voltage of  $5\text{ V} \pm 10\%$  and an ambient temperature of 0 to 70 °C.

The inputs are differential and are internally biased to permit capacitive coupling. For asymmetrical drive the unused input should be connected to ground via a capacitor.

The first divider stage will oscillate in the absence of an input signal; an input signal within the specified range will suppress this oscillation.

The output differential stage has two complementary outputs. The output voltage edges are slowed down internally to reduce the harmonic contents of the signal.

Wide, low-impedance ground connections and a short capacitive bypass from the  $V_{CC}$  pin to ground are recommended.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (d.c.)	$V_{CC}$	max.	7 V
Input voltage	$V_i$		0 to $V_{CC}$ V
Storage temperature	$T_{stg}$		-55 to + 125 °C
Junction temperature	$T_j$	max.	125 °C

**THERMAL RESISTANCE**

## SENSITIVE 1 GHz DIVIDE-BY-64/DIVIDE-BY-256 SWITCHABLE PRESCALER

### GENERAL DESCRIPTION

The SAB6456/SAB6456T is a prescaler for UHF/VHF tuners. It can be switched to divide-by-64 or divide-by-256 by the mode-control (MC) pin. The circuit has an input frequency range of 70 MHz to 1 GHz, has high input sensitivity and good harmonic suppression.

Fig. 1 Block diagram.

### QUICK REFERENCE DATA

| 7. | QL   |                         |
| 8. | VCC  | positive supply voltage |

**FUNCTIONAL DESCRIPTION**

The circuit comprises an input amplifier, a divider stage with selectable division ratio and an output stage.

The input amplifier is driven by a sinusoidal signal from the local oscillator of a television tuner. The inputs (C1, C2) are differential and are biased internally to permit capacitive coupling. When driven asymmetrically the unused input should be connected to ground via a capacitor.

The mode-control (MC) input to the divider stage is intended for static control of the division ratio, selection is made as follows:

divide-by-64 : MC pin open-circuit

divide-by-256: MC pin connected to ground

The divider stage may oscillate during no-signal conditions but this oscillation is suppressed when input signals are received.

Two complementary signals (QH, QL) are provided by the output differential amplifier stage. The voltage-edges of the output signals are slowed internally to reduce harmonics in the television intermediate frequency band.

FOR DETAILED INFORMATION SEE RELEVANT DATA BOOK OR DATA SHEET

## REMOTE CONTROL SYSTEM FOR INFRARED OPERATION

The SAF1032P (receiver/decoder) and the SAF1039P (transmitter) form the basic parts of a sophisticated remote control system (pcm: pulse code modulation) for infrared operation. The ICs can be used, for example, in TV, audio, industrial equipment, etc.

Features:

### SAF1032P receiver/decoder:

- 16 programme selection codes
- automatic preset to stand-by at power 'ON', including automatic analogue base settings to 50% and automatic preset of programme selection '1' code
- 3 analogue function controls, each with 63 steps
- single supply voltage
- protection against corrupt codes.

### SAF1039P transmitter:

- 32 different control commands
- static keyboard matrix
- current drains from battery only during key closure time
- two transmission modes selectable.

The devices are implemented in LOCMOS (Local Oxidation Complementary MOS) technology to achieve an extremely low power consumption.

Inputs and outputs are protected against electrostatic effects in a wide variety of device-handling situations. However, to be totally safe, it is desirable to take handling precautions into account.

Fig. 1 Pin designations.

### PACKAGE OUTLINES

SAF1032P: 18-lead DIL; plastic (SOT-102).

SAF1039P: 16-lead DIL; plastic (SOT-38Z).

**PINNING**

To facilitate easy function recognition, each integrated circuit pin has been allocated a code as shown below.

**SAF1032P**

## SERVO-MOTOR CONTROL CIRCUIT

### GENERAL DESCRIPTION

The SAK150BT is a bipolar integrated circuit intended for remote control applications in digital proportional systems or other closed loop position control applications, in which it will translate the width of its input pulses into a mechanical position. It incorporates a linear one-shot for improved positional accuracy. The circuit has additional outputs for driving external p-n-p transistors to form a bidirectional bridge.

### Features

- high output current
- bidirectional bridge output facility with single power supply
- adjustable deadband
- adjustable proportional range
- high linearity
- wide supply voltage range
- low standby supply current
- provides stabilized supply for external circuit

### QUICK REFERENCE DATA

Supply voltage range	$V_{CC}$		3 to 9 V
Supply current, standby, at $V_{CC} = 4,8$ V	$I_{CC}$	typ.	3 mA
Stabilized supply voltage for external circuit	$V_Z$	typ.	2 V
Output current at $V_{CC} = 4,8$ V	$I_Q$	max.	500 mA
Operating ambient temperature range	$T_{amb}$		-20 to + 70 °C

### PACKAGE OUTLINE

14-lead mini-pack; plastic (SO-14; SOT-108A).

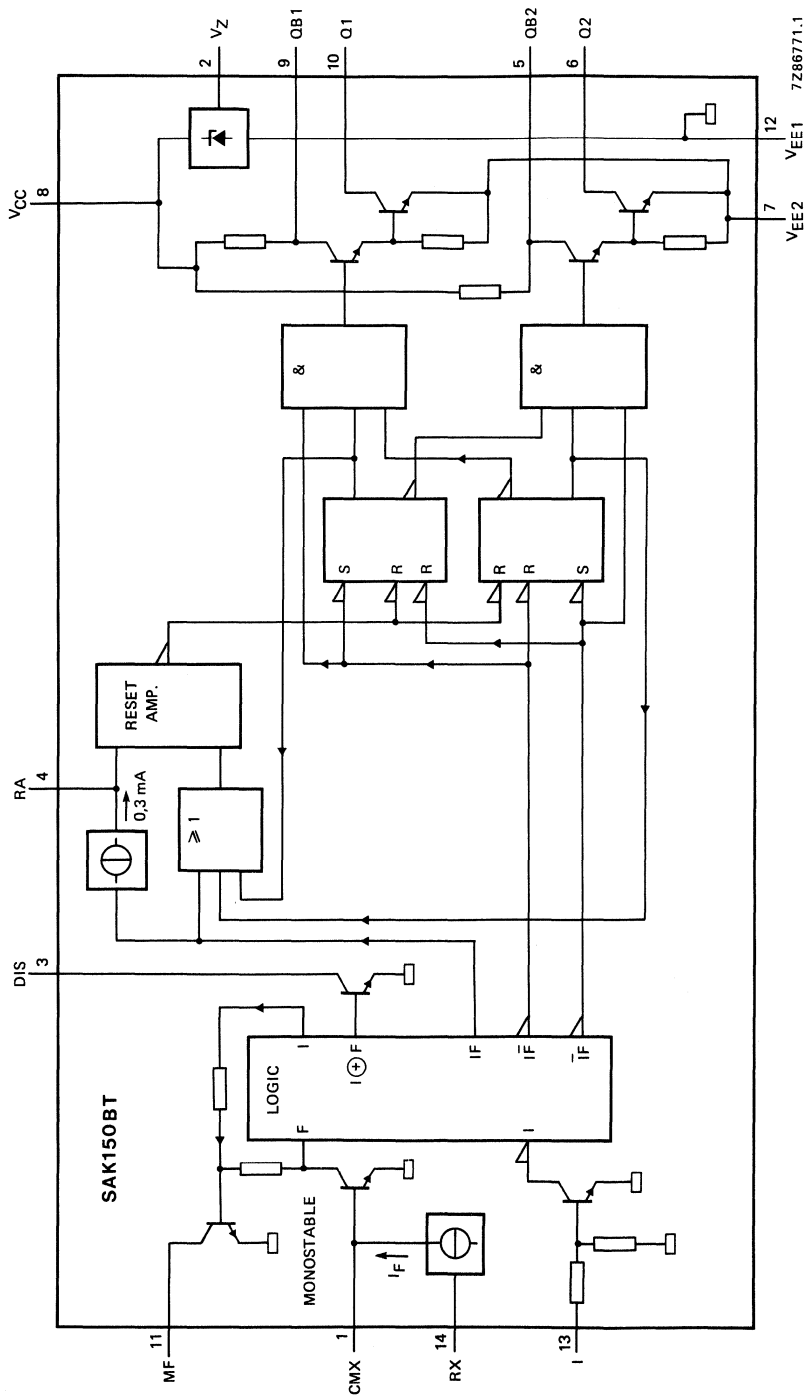

Fig. 1 Block diagram. The blocks marked "&" are AND gates, the block marked " $\geq 1$ " is an OR gate, the blocks with inputs marked S and R are set-reset flip-flops and the block marked "RESET AMP" may be considered as a high-gain amplifier for the upper input with the lower input giving a small shift of the switching level of the upper input. The triangles at some of the inputs and outputs are polarity indicators showing that the internal logic 1-state at that input or output corresponds with the external logic L-level (LOW). At inputs and outputs without polarity indicator the internal logic 1-state corresponds with the external logic H-level (HIGH).

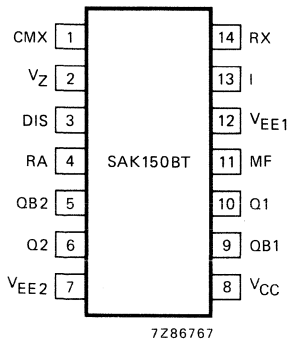

Fig. 2 Pinning diagram.

4	RA	reset amplifier
5	QB2	p-n-p driver output
6	Q2	power output
7	VEE2	ground of output stage
8	VCC	positive supply
9	QB1	p-n-p driver output
10	Q1	power output
11	MF	monostable feedback
12	VEE1	ground of circuit (except output stage)
13	I	input
14	RX	external resistor

**FUNCTIONAL DESCRIPTION** (See also Fig. 5)

The SAK150BT has two sets of outputs on which it is capable of producing output pulses of variable width. The output arrangement is such that these output pulses can drive a servo-motor in both directions. The servo-motor actuates a potentiometer. The width of the output pulses is reduced to zero when the position of the potentiometer slider corresponds with the width of the input pulses.

The circuit operates as follows. The positive-going leading edges of the input pulses trigger a monostable element. Its output pulses have a duration that is a linear function of the position of the potentiometer slider. These pulses therefore will be referred to as feedback pulses.

The presence of both the input pulse and the feedback pulse switches on a current source of approx. 0,3 mA which charges an external capacitor C2 connected from RA (pin 4) to ground. The variation of the voltage on this capacitor after some time causes the output of the high-gain reset amplifier to change state and reset the two output flip-flops.

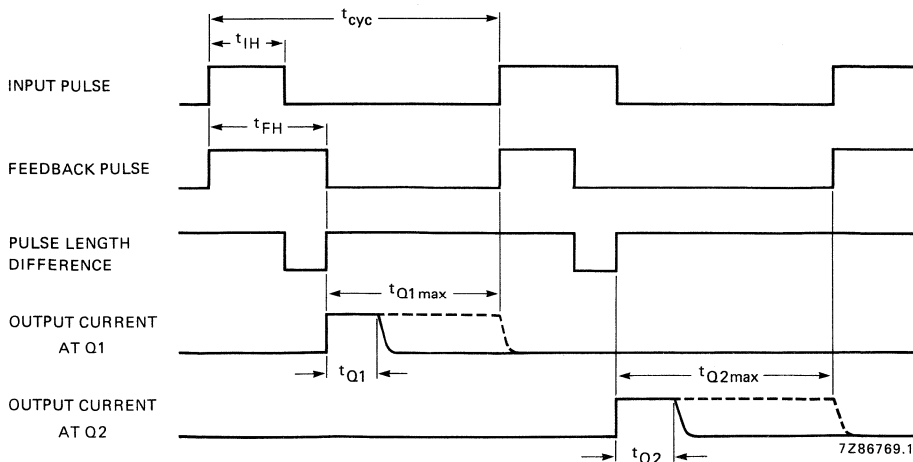

Fig. 3 Timing diagram.

Depending on the relative durations of input pulse and feedback pulse the following happens.

1. Difference in duration of input pulse and feedback pulse less than the deadband time: no output signals generated.
2. Input pulse shorter than feedback pulse: outputs Q1 and QB1 activated.
3. Input pulse longer than feedback pulse: outputs Q2 and QB2 activated.

The trailing (negative-going) edge of the shorter of the two pulses (input pulse or feedback pulse) switches off the current source that charged C2. It further switches on the discharging of C2 via R2, connected to DIS (pin 3). As a consequence the output of the reset amplifier changes state after a short delay and no longer resets the flip-flops. Finally the logic bloc generates a signal which sets the appropriate output flip-flop but inhibits the output.

At the trailing edge of the longer of the two pulses the signal that has set one of the flip-flops changes state. This enables the corresponding output. It further finishes the discharging of C2 via R2. C2 will now be charged via R32. When the voltage on C2 reaches the switching level of the reset amplifier its output signal will reset the flip-flops again and this will terminate the output pulse (see Fig. 3). The duration of the output pulse is proportional with the charge required by C2 to reach the switching level of the reset amplifier, and this charge is proportional to the time that C2 has been discharged via R2, i.e. the difference in duration of the input pulse and the feedback pulse.

The maximum output pulse duration is reached when the output pulse is terminated by the next input pulse.

**Supply:  $V_{CC}$ ,  $V_{EE1}$ ,  $V_{EE2}$  and  $V_Z$**  (pins 8, 12, 7 and 2)

The SAK150BT contains a voltage stabilizer. This permits the circuit to be used over a very wide supply voltage range without substantial variation of its performance. The stabilized supply voltage is available at  $V_Z$  (pin 2) to supply an external peripheral circuit, e.g. a feedback potentiometer.

The circuit has two ground pins, one for the output stage ( $V_{EE2}$ ) and one for the rest of the circuit ( $V_{EE1}$ ).

#### Input I (pin 13)

Input pulses should be positive-going, i.e. the time that the input signal is HIGH is the input parameter. Usual values are 1 to 2 ms for the pulse to be HIGH and 20 ms for the pulse repetition time.

**Feedback pulse duration: CMX, MF and RX** (pins 1, 11 and 4)

The duration of the feedback pulse is determined by external capacitor C1 connected between CMX and MF. This capacitor is charged by a current source whose current is determined by external resistor R1 connected between RX and ground.

Fig. 4 Output current pulse duration.

The output current pulse duration  $t_Q$  as a function of the difference between input pulse duration  $t_{IH}$  and feedback pulse duration  $t_{FH}$  in Fig. 4. There is no output signal for differences less than the deadband time  $t_{db}$ . The maximum output pulse duration ( $t_{Qmax}$ ) at outputs Q1 and Q2 is equal to  $t_{cyc} - t_{db}$ . The maximum pulse duration is reached at a pulse duration difference  $t_{prop}$  minus  $t_{IH}$  respectively  $t_{FH}$ .

#### Deadband time

The deadband time is the maximum difference in duration between the input pulse and the feedback pulse that will not give an output signal (see Fig. 4). The deadband time is determined by external resistor and capacitor R2 and C2 connected to RA and by the switching level  $V_{SW}$  of the reset amplifier and by its switching level shift  $\Delta V_{SW}$ , according to the following approximative formula:

$$t_{db} \approx R2 \times C2 \times \ln \left( \frac{V_{SW} + \Delta V_{SW}}{V_{SW}} \right) \approx \frac{R2 \times C2}{50}$$

#### Proportional range

The output pulse width is proportional to the difference of the input pulse and the internal pulse. The range is

$$t_{prop} \approx R2 \times C2 \times \ln \left( 1 - \frac{(V_{CC}^* - V_{SW}) (e^{t_{CVC}/R3 \times C2} - 1)}{V_{SW}} \right)$$

$$\text{in which: } V_{CC}^* = \frac{V_{CC} - V_Z}{R31 + R32} \times R31 + V_Z \text{ and } R3 = \frac{R31 \times R32}{R31 + R32}$$

The maximum pulse width is limited by the beginning of the new input pulse. The minimum pulse width is

$$t_{Qmin} \approx R3 \times C2 \times \ln \left( 1 - \frac{\Delta V_{SW}}{V_{CC}^* - V_{SW} + \Delta V_{SW}} \right)$$

#### Outputs Q1, CB1, Q2 and QB2 (pins 10, 9, 6 and 5)

The outputs Q1 and Q2 are open-collector outputs capable of sinking up to 500 mA. The outputs QB1 and QB2 are intended to drive external p-n-p transistors. Together with the Q outputs these p-n-p transistors may form a bidirectional bridge output with a single power supply, see Fig. 4.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage, d.c.	$V_{CC}$	max.	12 V

## CIRCUIT DIAGRAM

**RATINGS** Limiting values in accordance with the Absolute Maximum System (IEC134)

Voltages

Supply voltage	$V_B$	max.	8 V
Output voltage	$V_{3-4}$	max.	7 V
Input voltage	$-V_{1-4}$	max.	5 V

Currents

Output current	$I_3$	max.	25 mA
Input current	$I_1$	max.	10 mA

Power dissipation

Total power dissipation up to $T_{amb} = 65^\circ\text{C}$	$P_{tot}$	max.	70 mW
--	-----------	------	-------

Temperatures

Storage temperature	$T_{stg}$	-55 to +125	$^\circ\text{C}$
Operating ambient temperature (see derating curve above)	$T_{amb}$	-20 to +100	$^\circ\text{C}$

## CHARACTERISTICS

$T_{\text{amb}} = 25\text{ }^{\circ}\text{C}$

Test circuit:

Currents

Output current	$I_3$	typ.	12 mA
Total current drain (no signal)	$I_2 + I_3$	<	16 mA

Over-all small signal current gain

$f = 1\text{ kHz}$	$h_{f\text{ tot}}$	typ.	$5 \cdot 10^5$
--------------------	--------------------	------	----------------

Transducer gain

$f = 1\text{ kHz}; P_O = 10\text{ mW}$	$G_{\text{tr}}$	>	70 dB
		typ.	77 dB

<u>Output power</u> at $f = 1\text{ kHz}; d_{\text{tot}} = 10\%$	$P_O$	>	10 mW
$d_{\text{tot}} = 5\%$	$P_O$	>	8 mW

Noise figure

$f = 400\text{ Hz to } 6\text{ kHz}$	$F$	typ.	5 dB
		<	10 dB
$f = 450\text{ kHz}; \Delta f = 5\text{ kHz}$	$F$	typ.	2.7 dB

<sup>1)</sup>  $Z \leq 10\text{ }\Omega$  at  $f = 1\text{ kHz}$

**CHARACTERISTICS** (continued) $T_{\text{amb}} = 25\text{ }^{\circ}\text{C}$ y parameters (point 4 common connection) $V_B = 6\text{ V}; I_3 = 3\text{ mA}; V_{3-4} = 4.2\text{ V}$  $f = 1\text{ kHz}$ 

Input admittance	$y_i = g_i$	typ.	20 $\mu\Omega^{-1}$
Transfer admittance	$y_f = g_f$	typ.	11 $\Omega^{-1}$
Output admittance	$y_o = g_o$	typ.	60 $\mu\Omega^{-1}$

 $f = 450\text{ kHz}$ 

Input conductance	$g_i$	typ.	15 $\mu\Omega^{-1}$
Input capacitance	$C_i$	typ.	14 pF
Transfer admittance	$ y_f $	typ.	9.4 $\Omega^{-1}$
Phase angle of transfer admittance	$\varphi_f$	typ.	$125^{\circ}$
Output conductance	$g_o$	typ.	20 $\mu\Omega^{-1}$
Output capacitance	$C_o$	typ.	13 pF

## INTEGRATED MOST AMPLIFIER

The TAA320 is a silicon monolithic integrated circuit, consisting of a MOS transistor and an n-p-n transistor in a TO-18 metal envelope.

The device is primarily intended for audio amplifiers with a very high input resistance (e.g. for crystal pick-ups).

Besides this application the TAA320 is also suitable for other applications where a high input resistance is required, like impedance converters, timing circuits, microphone-amplifiers, etc.

QUICK REFERENCE DATA			
Drain-source voltage ( $V_{GS} = 0$ )	$-V_{DSS}$	max.	20 V
Drain current	$-I_D$	max.	25 mA
Gate-source voltage $-I_D = 10$ mA; $-V_{DS} = 10$ V	$-V_{GS}$	typ.	11 V
Gate-source resistance $-V_{GS}$ up to 20 V; $T_j$ up to 125 °C	$r_{GS}$	>	100 GΩ
Transfer admittance at $f = 1$ kHz $-I_D = 10$ mA; $-V_{DS} = 10$ V	$ Y_{fs} $	typ.	75 $m\Omega^{-1}$

### PACKAGE OUTLINE

Dimensions in mm

TO-18 (SOT-18/13)

$-C_{rs}$	typ.	1.5	pF
-----------	------	-----	----

Output conductance

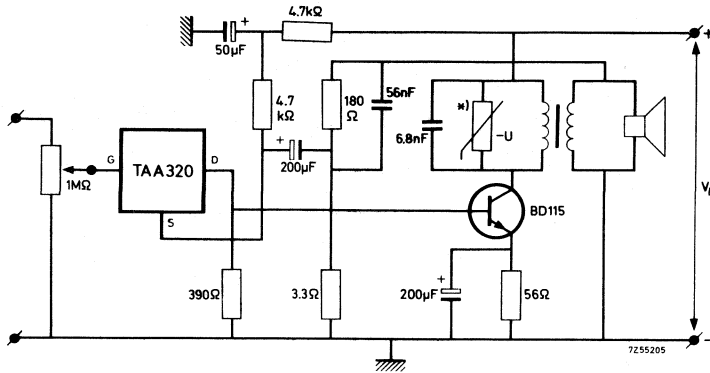

$g_{os}$	typ.	0.65	$\text{m}\Omega^{-1}$
----------	------	------	-----------------------

**NOTE**

To exclude the possibility of damage to the gate oxide layer by an electrostatic charge building up on the high resistance gate electrode, the leads of the device have been short circuited by a clip. The clip has been arranged so that it need not be removed until the device has been mounted in the circuit.

1)  $-V_{GS}$  decreases about 6 mV/ $^\circ\text{C}$  with increasing ambient temperature at a constant  $-I_D$ .

**APPLICATION INFORMATION** 2 W audio amplifier with TAA320 and BD115

\* The voltage dependent resistor (2322 552 03381) suppresses voltage transients that might otherwise exceed the safe operating limits of the BD115.

Supply voltage	$V_B$	=	100 V
Collector current of BD115	$I_C$	typ.	50 mA
Drain current of TAA320	$-I_D$	typ.	9.5 mA
Primary d.c. resistance of output transformer			140 $\Omega$
Primary inductance of output transformer			2.7 H
A.C. collector load for BD115			1.8 k $\Omega$

Performance at f = 1 kHz; feedback = 16 dB

Output power at $d_{tot} = 10\%$ (on primary of the output transformer)	$P_O$	typ.	2.6 W
Input voltage for $P_O = 50$ mW	$V_i(rms)$	typ.	13.5 mV
Input voltage for $P_O = 2$ W	$V_i(rms)$	typ.	86 mV
Total distortion at $P_O = 2$ W	$d_{tot}$	typ.	3.6 %
Minimum frequency response (-3 dB)			60 Hz to 20 kHz
Signal-noise ratio at $P_O = 2$ W		typ.	73 dB

Mounting instruction for BD115

Proper continuous operation is ensured up to  $T_{amb} = 50$  °C, provided the BD115 is directly mounted on a 1.5 mm blackened Al. heatsink of 30 cm<sup>2</sup> with a clamping washer of type 56218.

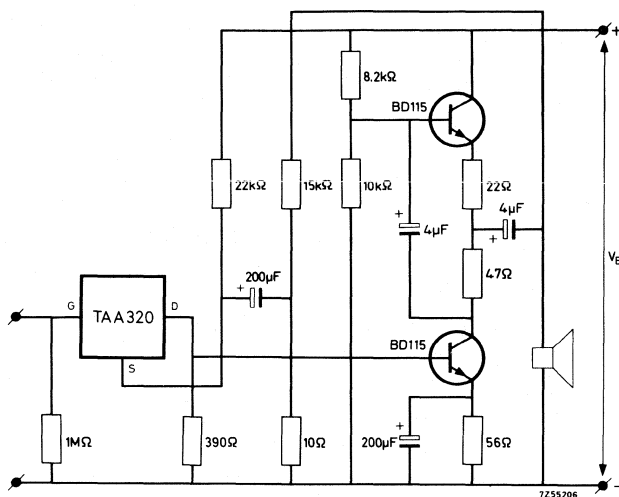

If the transistor is mounted on a heatsink with a mica washer, the heatsink should have an area of 50 cm<sup>2</sup>.

Recommended diameter of hole in heatsink: 7.7 mm.

## APPLICATION INFORMATION (continued)

4 W audio amplifier with TAA320 and 2 transistors of type BD115.

Supply voltage	$V_B$	=	200 V
Collector current of a BD115	$I_C$	typ.	52 mA
Drain current of TAA320	$-I_D$	typ.	8.6 mA
<u>Performance</u> at $f = 1$ kHz; feedback = 12 dB			
Output power at $d_{tot} = 10\%$	$P_O$	typ.	4.5 W
Input voltage for $P_O = 50$ mW	$V_i(\text{rms})$	typ.	7.5 mV
Input voltage for $P_O = 4$ W	$V_i(\text{rms})$	typ.	67 mV
Total distortion at $P_O = 4$ W	$d_{tot}$	typ.	6 %
Minimum frequency response (-3 dB)			50 Hz to 20 kHz
Signal-noise ratio at $P_O = 4$ W		typ.	73 dB

$-V_{GS} = 20\text{ V}; V_{DS} = 0$	$-I_{GSS}$	typ.	1	$\text{pA}^2$

**NOTES**

- The leads are short-circuited by a clip to protect the oxide layer against damage due to accumulation (or build-up) of electrostatic charge on the high resistance gate electrode. The clip should not be removed until after the device is mounted.
- As a service to the customer the  $-V_{GS}$  group to which a device belongs is identified by a numerical suffix (1, 2, 3 or 4), however, individual groups cannot be ordered separately.

---

1. See also upper graph on next page.

2. Being dependent on handling and ambient humidity. the quoted value applies only up to the time of shipping.  
Efficient drying treatment is advised before the device is mounted, provided the application requires this low current.

## HI-FI F.M./I.F. AMPLIFIER

The TCA420A is a monolithic integrated f.m./i.f. amplifier for car and hi-fi equipment provided with the following functions:

- limiter amplifier
- symmetrical quadrature detector
- symmetrical a.f.c. output
- field-strength indication output
- stereo decoder switching voltage
- adjustable side response suppression
- muting

## QUICK REFERENCE DATA

Supply voltage (pin 11)	$V_p$	typ.	15 V
Supply current (pin 11)	$I_p$	typ.	26 mA
Input limiting voltage ( $-3$ dB); $f_o = 10,7$ MHz	$V_{i \text{ lim}}$	typ.	20 $\mu$ V
A.F. output voltage (pin 5); $\Delta f = \pm 15$ kHz; r.m.s. value	$V_{o(\text{rms})}$	typ.	115 mV
Signal plus noise-to-noise ratio; $V_i > 1$ mV; $\Delta f = \pm 15$ kHz	S+N/N	typ.	72 dB
I.F. input voltage; $\Delta f = \pm 15$ kHz

Fig. 15 Output voltage range.

Fig. 16 A.F. output voltage;  $\Delta f = \pm 15$  kHz;  $f_m = 1$  kHz;  $V_i = 1$  mV.

Fig. 17 Total distortion;  $f_m = 1$  kHz;  $V_i = 1$  mV;  $C_{5-6} = 220$  pF.

Fig. 18 Example of the TCA420A when using a detector with two tuned circuits;  $f_o = 10,7$  MHz;  $L1 = L2 \approx 0,4 \mu\text{H}$ ;  $Q_o = 70$ .

Adjustment of the detector:

When having an i.f. input signal on top of the limiter capability, L2 should be detuned, L1 should be adjusted to minimum distortion, and then L2 to minimum distortion.

Fig. 19 Total distortion as a function of detuning; circuit as Fig. 18;  $f_m = 1$  kHz;  $C_{5-6} = 220$  pF.  $V_o = 500$  mV for a frequency deviation  $\Delta f = \pm 75$  kHz and  $d_{tot} < 0,1\%$ .

## INTERFERENCE AND NOISE SUPPRESSION CIRCUIT FOR FM RECEIVERS

### GENERAL DESCRIPTION

The TDA1001B is a monolithic integrated circuit for suppressing interference and noise in FM mono and stereo receivers.

#### Features

- Active low-pass and high-pass filters
- Interference pulse detector with adjustable and controllable response sensitivity
- Noise detector designed for FM i.f. amplifiers with ratio detectors or quadrature detectors
- Schmitt trigger for generating an interference suppression pulse
- Active pilot tone generation (19 kHz)
- Internal voltage stabilization

### QUICK REFERENCE DATA

Supply voltage (pin 9)	$V_P$	typ.	12 V
Supply current (pin 9)	$I_P$	typ.	14 mA
A.F. input signal handling (pin 1) (peak-to-peak value)	$V_{i(p-p)}$	typ.	1 V
Input resistance (pin 1)	$R_i$	min.	35 k $\Omega$
Voltage gain ( $V_{1-16}/V_{6-16}$ )	$G_V$	typ.	0,5 dB
Total harmonic distortion	THD	typ.	0,25 %
Bandwidth	B	typ.	70 kHz
Suppression pulse threshold voltage (peak value); $R_{13} = 0$	$V_{i(tr)OM}$	typ.	19 mV
Suppression pulse duration	$t_s$	typ.	27 $\mu$ s
Supply voltage range (pin 9)	$V_P$		7,5 to 16 V
Operating ambient temperature range	$T_{amb}$		-30 to +80 $^{\circ}$ C

### PACKAGE OUTLINE

TDA1001B: 16-lead DIL; plastic (SOT-38).

TDA1001BT: 16-lead mini-pack; plastic (SO-16; SOT-109A).

at repetition frequency $f_r = 16$ kHz	$V_{o6(rms)}$	45	—	65	mV

Notes to application information

1. The interference suppression and noise feedback control thresholds can be determined by R13 or a capacitive voltage divider at the input of the high-pass filter and they are defined by the following formulae:  

$$V_{i(tr)} = (1 + R_{13}/R_S) \times V_{i(tr)O}$$
 in which  $R_S = 2 \text{ k}\Omega$ ;  

$$V_{ni} = (1 + R_{13}/R_S) \times V_{niO}$$
 in which  $R_S = 2 \text{ k}\Omega$ .
2. The suppression pulse duration is determined by C11 = 2,2 nF and R11 = 6,8 k $\Omega$ .
3. The characteristic of the noise feedback control is determined by R12 (and R10).
4. The feedback control of the interference suppression threshold at higher repetition frequencies is determined by R10 (and R12).
5. The 19 kHz generator can be adjusted with R7.16 (and R7.8). Adjustment is not required if components with small tolerances are used e.g.  $\Delta R < 1\%$  and  $\Delta C < 2\%$ .
6. Measuring conditions:  
 The peak output noise voltage ( $V_{no m}$ , CCITT filter) shall be measured at the output with a de-emphasizing time  $T = 50 \mu\text{s}$  ( $R = 5 \text{ k}\Omega$ ,  $C = 10 \text{ nF}$ ); the reference value of 0 dB is  $V_{Oint}$  with the 19 kHz generator short-circuited (pin 7 grounded).

Fig. 3 Measuring signal for interference suppression; at the input (pin 1) a square-wave is applied with a duration of  $t_{tr} = 10 \mu\text{s}$  and with rise and fall times  $t_r = t_f = 10 \text{ ns}$ .

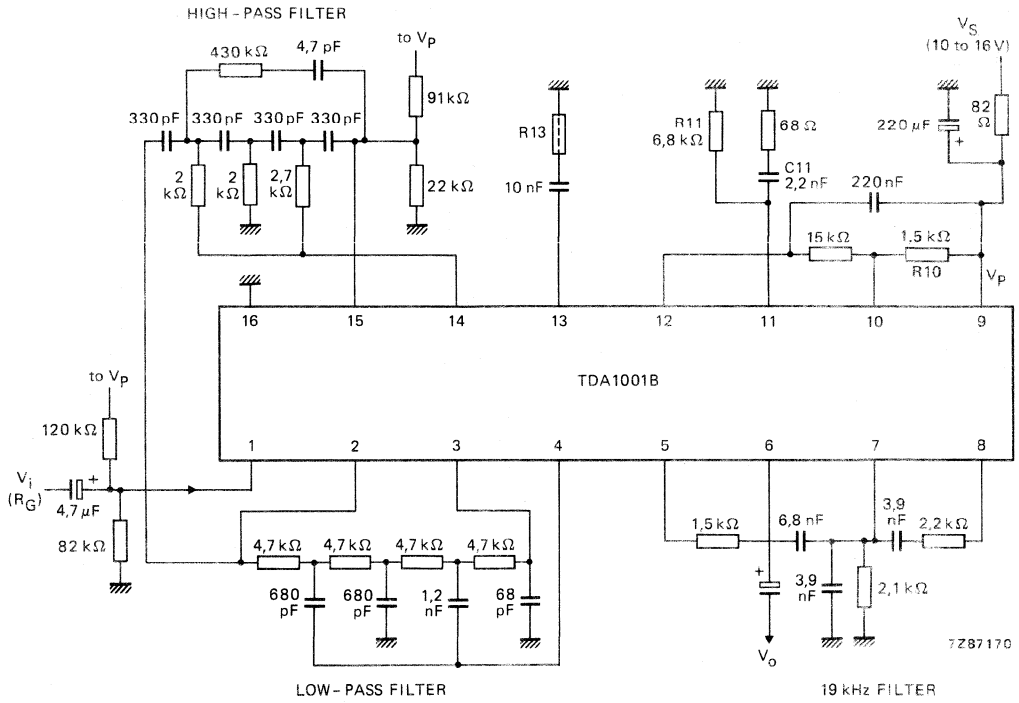

Fig. 4 Application circuit diagram.

## RECORDING AND PLAYBACK AMPLIFIER

This integrated circuit incorporates all amplifier circuits necessary for the record/playback functions, with the exception of the audio power output amplifier. It comprises:

- a preamplifier for microphone or playback,
- a recording amplifier with automatic level control,
- a dynamic limiter with a short limiting time.

Compared to its predecessor TDA1002, this type features an improved automatic level control circuit; the control range has been enlarged from 40 to 55 dB and the spread in control characteristic has been reduced to less than 2 dB.

### QUICK REFERENCE DATA

Supply voltage range	$V_P$		4 to 12 V
Operating ambient temperature	$T_{amb}$		-25 to + 125 °C

## FREQUENCY MULTIPLEX PLL STEREO DECODER

The TDA1005A is a high quality PLL stereo decoder based on the frequency-division multiplex (f.d.m.) principle, performing:

- excellent ACI (Adjacent Channel Interference) and SCA (Storecast) rejection
- very low BFC (Beat-Frequency Components) distortion in the higher frequency region

The circuit incorporates the following features:

- with simplified peripheral circuitry the circuit can perform as a time-division multiplex (t.d.m.) decoder, for use in economic medium and low-class apparatus
- for car radios: operation at a supply voltage of 8 V
- extra pin for smooth mono/stereo take-over without “clicks”
- automatic mono/stereo switching (minimum switching level is 16 mV), controlled by both pilot signal and field strength level
- low distortion in the loop resonance frequency region ( $\approx 300$  Hz; THD = 0,2% typ.)
- external adjustment for obtaining optimum channel separation in the complete receiver
- internal amplification: t.d.m., 7 dB; f.d.m., 10 dB
- driver for stereo indicator lamp
- externally switchable: VCO-off or mono condition
- guaranteed VCO capture range ( $> 3,5\%$  or 2,7 kHz)

## Notes

- $V_i(p-p) = 1$  V (MUX signal with 8% pilot level).
- $f_m = 1$  kHz.
- At supply voltages of 8 to 11 V, resistors of 5,6 k $\Omega$  have to be connected from ground to pins 2 and 3.
- Measured with a composite input signal: L = R;  $f_m = 1$  kHz; 90% M-signal; 9% pilot signal; 1% spurious signal of 110 kHz (for  $\alpha_{114}$ ) or 186 kHz (for  $\alpha_{190}$ ).  
ACI suppression is defined as:  $20 \log \frac{V_o \text{ (at 4 kHz)}}{V_o \text{ (at 1 kHz)}}$
- Measured with a composite input signal: L = R;  $f_m = 1$  kHz; 80% S-signal; 9% pilot signal; 10% SCA carrier (67 kHz);  $d_{13} = 20 \log \frac{V_o \text{ (at 9 kHz)}}{V_o \text{ (at 1 kHz)}}$ .
- See also Figs 7 and 10; compensated with RC network on pin 7.
- Adjustable with R13-8; see also Fig. 28; for field strength dependent input (pin 14) see next page.
- $\Delta V_i = 20 \log \frac{V_{11-16} \text{ (mono/stereo)}}{V_{11-16} \text{ (stereo/mono)}}$   
For additional circuitry on pin 6 see Figs 7 and 10; for graph see Fig. 29.
- For example of notch filter see Fig. 6.

### D.C. CHARACTERISTICS

$T_{amb} = 25\text{ }^{\circ}\text{C}$ ;  $V_{8-16} = 15\text{ V}$  (unless otherwise specified)

Saturation voltage of lamp driver at $I_{15} = 100\text{ mA}$	$V_{15-16}$	typ.	0,9 V
Maximum lamp driver voltage	$V_{15-16}$	<	22 V
Switching voltage to mono	$V_{14-16}$	>	1,2 V **
to stereo	$V_{14-16}$	<	0,65 V
hysteresis	$V_{14-16}$	typ.	0,2 V

### APPLICATION NOTES

#### 1. Switching-off the VCO

If the internal gain is used with A.M. reception, the VCO can be switched off by connecting pin 9 via a 100 k $\Omega$  resistor to ground (no h.f. signal on the leads), or connecting pin 7 to ground.

#### 2. Mono button

The decoder can be switched to the mono position by connecting pin 12 to ground. The VCO then remains operational so this possibility cannot be used with A.M. reception.

#### 3. Economic periphery

- For a fixed stereo switching level of  $\leq 16\text{ mV}$  a resistor of 620 k $\Omega$  can be connected between pin 13 and positive supply (+) instead of a potentiometer in series with a resistor.
- The 10 k $\Omega$  resistor connected in parallel with the stereo indicator lamp can be omitted, however, some TDA1005A circuits will switch to mono during lamp failure.
- The 10  $\mu\text{F}$  capacitor in series with a 1 k $\Omega$  resistor at pin 9 can be decreased to a 1  $\mu\text{F}$  capacitor, bearing in mind that the distortion will increase, especially around loop resonance.
- A MUX-input filter is not needed, if i.f. roll-off starts at a frequency of 62 kHz.

#### 4. Printed-circuit boards

For both the f.d.m. and t.d.m. stereo decoder circuits a printed-circuit board layout is given as an example (Figs 8 and 11). Also for an active filter, which is mainly used with a t.d.m. decoder, a printed-circuit board layout is given in Fig. 4.

#### 5. Notch filter

If attention has to be paid for suppression of the 57 kHz signal (T.W.S. = Traffic Warning System) and the 19 kHz signal, an input filter can be used as given in Fig. 6.

\* At supply voltages of 8 to 11 V, resistors of 5,6 k $\Omega$  have to be connected from ground to pins 2 and 3.

\*\* Maximum voltage for safe operation:  $V_{14-16} < 4\text{ V}$ .

## 6 W AUDIO POWER AMPLIFIER IN CAR APPLICATIONS

### 10 W AUDIO POWER AMPLIFIER IN MAINS-FED APPLICATIONS

The TDA1010A is a monolithic integrated class-B audio amplifier circuit in a 9-lead single in-line (SIL) plastic package. The device is primarily developed as a 6 W car radio amplifier for use with 4  $\Omega$  and 2  $\Omega$  load impedances. The wide supply voltage range and the flexibility of the IC make it an attractive proposition for record players and tape recorders with output powers up to 10 W.

Special features are:

- single in-line (SIL) construction for easy mounting
- separated preamplifier and power amplifier
- high output power
- low-cost external components
- good ripple rejection
- thermal protection

#### QUICK REFERENCE DATA

Supply voltage range	$V_P$		6 to 24 V
Repetitive peak output current	$I_{ORM}$	max.	3 A
Output power at pin 2; $d_{tot} = 10\%$			
$V_P = 14,4$ V; $R_L = 2$ $\Omega$	$P_O$	typ.	6,4 W
$V_P = 14,4$ V; $R_L = 4$ $\Omega$	$P_O$	typ.	6,2 W
$V_P = 14,4$ V; $R_L = 8$ $\Omega$	$P_O$	typ.	3,4 W
$V_P = 14,4$ V; $R_L = 2$ $\Omega$ ; with additional bootstrap resistor of 220 $\Omega$ between pins 3 and 4	$P_O$	typ.	9 W
Total harmonic distortion at $P_O = 1$ W; $R_L = 4$ $\Omega$	$d_{tot}$	typ.	0,2 %
Input impedance			
preamplifier (pin 8)	$ Z_i $	typ.	30 k $\Omega$
power amplifier (pin 6)	$ Z_i $	typ.	20 k $\Omega$
Total quiescent current at $V_P = 14,4$ V	$I_{tot}$	typ.	31 mA
Sensitivity for $P_O = 5,8$ W; $R_L = 4$ $\Omega$	$V_i$	typ.	10 mV
Operating ambient temperature	$T_{amb}$		-25 to + 150 $^{\circ}$ C
Storage temperature	$T_{stg}$		-55 to + 150 $^{\circ}$ C

#### PACKAGE OUTLINE

9-lead SIL; plastic (SOT-110B).

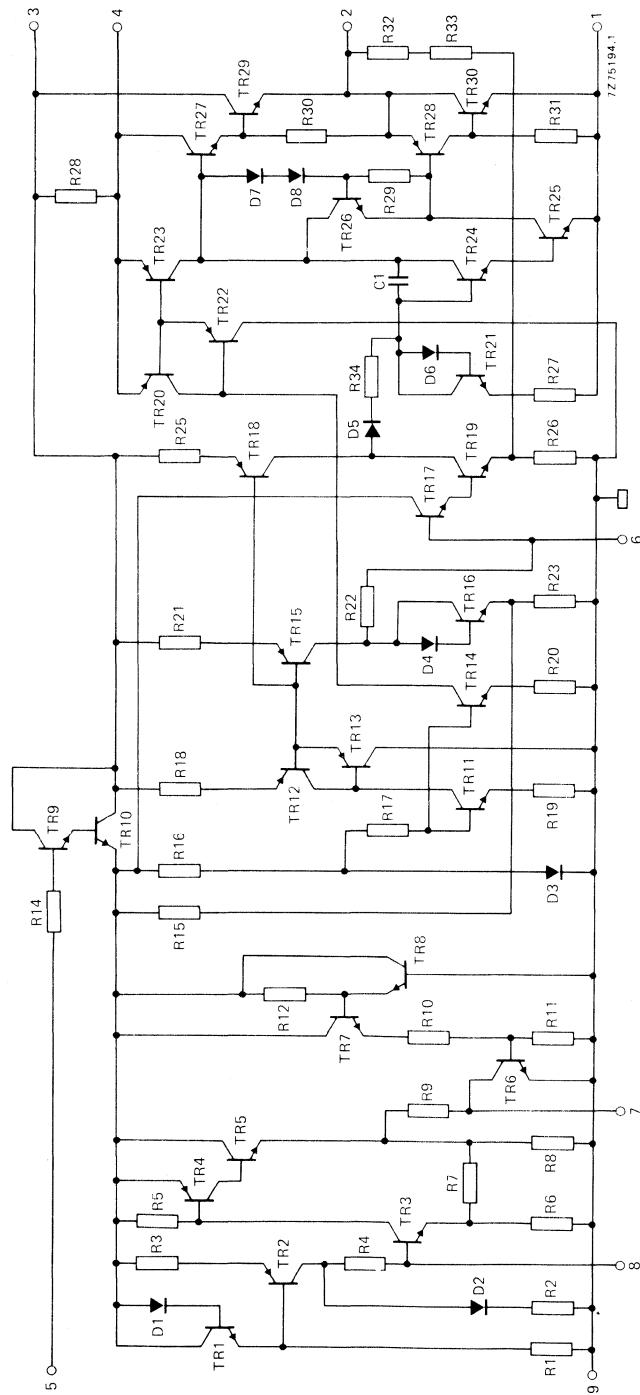

Fig. 1 Circuit diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	$V_P$	max.	24 V
Peak output current	$I_{OM}$	max.	5 A
Repetitive peak output current	$I_{ORM}$	max.	3 A
Total power dissipation			see derating curve Fig. 2
Storage temperature	$T_{stg}$		-55 to + 150 °C
Operating ambient temperature	$T_{amb}$		-25 to + 150 °C
A.C. short-circuit duration of load during sine-wave drive; without heatsink at $V_P = 14,4$ V	$t_{sc}$	max.	100 hours

Fig. 2 Power derating curve.

**HEATSINK DESIGN**

Assume  $V_P = 14,4$  V;  $R_L = 2 \Omega$ ;  $T_{amb} = 60$  °C maximum; thermal shut-down starts at  $T_j = 150$  °C. The maximum sine-wave dissipation in a  $2 \Omega$  load is about 5,2 W. The maximum dissipation for music drive will be about 75% of the worst-case sine-wave dissipation, so this will be 3,9 W. Consequently, the total resistance from junction to ambient

$$R_{th\ j-a} = R_{th\ j-tab} + R_{th\ tab-h} + R_{th\ h-a} = \frac{150 - 60}{3,9} = 23 \text{ K/W.}$$

Since  $R_{th\ j-tab} = 10$  K/W and  $R_{th\ tab-h} = 1$  K/W,

$$R_{th\ h-a} = 23 - (10 + 1) = 12 \text{ K/W.}$$

**D.C. CHARACTERISTICS**

Supply voltage range	$V_P$	6 to 24 V
Repetitive peak output current	$I_{ORM}$	< 3 A
Total quiescent current at $V_P = 14,4$ V	$I_{tot}$	typ. 31 mA

**A.C. CHARACTERISTICS**

$T_{amb} = 25$  °C;  $V_P = 14,4$  V;  $R_L = 4$   $\Omega$ ;  $f = 1$  kHz unless otherwise specified; see also Fig. 3.

Sensitivity for $P_O = 5,8$ W	$V_i$	typ. 10 mV
Bootstrap current at onset of clipping; pin 4 (r.m.s. value)	$I_{4(rms)}$	typ. 30 mA

Notes

1. Measured with an ideal coupling capacitor to the speaker load.
2. Up to  $P_O \leq 3 \text{ W}$  :  $d_{tot} \leq 1\%$ .
3. Measured with a load impedance of  $20 \text{ k}\Omega$ .
4. Independent of load impedance of preamplifier.
5. Output impedance of preamplifier ( $|Z_O|$ ) is correlated (within 10%) with the input impedance ( $|Z_i|$ ) of the power amplifier.
6. Unweighted r.m.s. noise voltage measured at a bandwidth of 60 Hz to 15 kHz (12 dB/octave).
7. Ripple rejection measured with a source impedance between 0 and  $2 \text{ k}\Omega$  (maximum ripple amplitude: 2 V).
8. The tab must be electrically floating or connected to the substrate (pin 9).

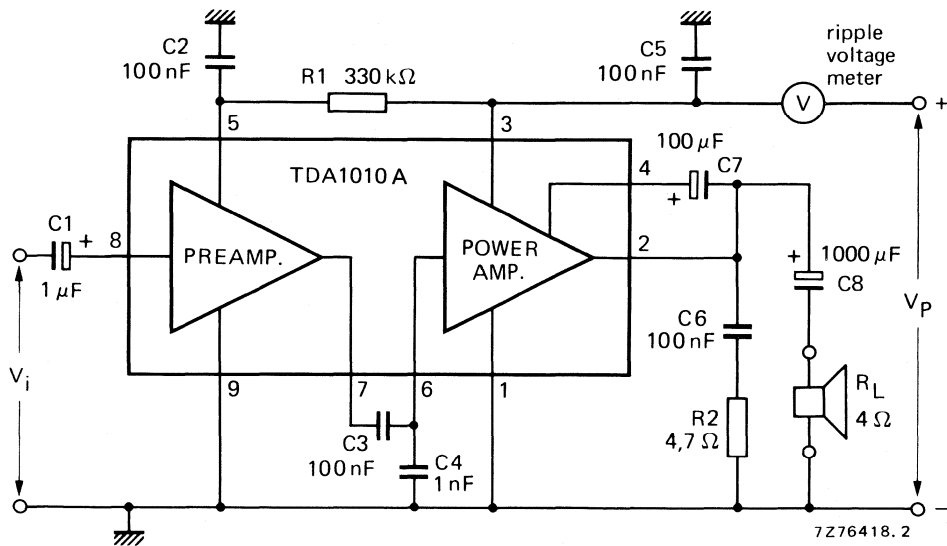

Fig. 3 Test circuit.

Fig. 4 Output power of the circuit of Fig. 3 as a function of the supply voltage with the load impedance as a parameter; typical values. Solid lines indicate the power across the load, dashed lines that available at pin 2 of the TDA1010.  $R_L = 2 \Omega$  (1) has been measured with an additional  $220 \Omega$  bootstrap resistor between pins 3 and 4. Measurements were made at  $f = 1 \text{ kHz}$ ,  $d_{\text{tot}} = 10\%$ ,  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$ .

Fig. 5 See next page.

Total harmonic distortion in the circuit of Fig. 3 as a function of the output power with the load impedance as a parameter; typical values. Solid lines indicate the power across the load, dashed lines that available at pin 2 of the TDA1010.  $R_L = 2 \Omega$  (1) has been measured with an additional  $220 \Omega$  bootstrap resistor between pins 3 and 4. Measurements were made at  $f = 1 \text{ kHz}$ ,  $V_p = 14,4 \text{ V}$ .

## 2 TO 6 W AUDIO POWER AMPLIFIER

The TDA1011 is a monolithic integrated audio amplifier circuit in a 9-lead single in-line (SIL) plastic package. The device is especially designed for portable radio and recorder applications and delivers up to 4 W in a  $4\ \Omega$  load impedance. The device can deliver up to 6 W into  $4\ \Omega$  at 16 V loaded supply in mains-fed applications. The maximum permissible supply voltage of 24 V makes this circuit very suitable for d.c. and a.c. apparatus, while the very low applicable supply voltage of 3,6 V permits 6 V applications. Special features are:

- single in-line (SIL) construction for easy mounting
- separated preamplifier and power amplifier
- high output power
- thermal protection
- high input impedance
- low current drain
- limited noise behaviour at radio frequencies

### QUICK REFERENCE DATA

Supply voltage range	$V_P$	3,6 to 20 V
Peak output current	$I_{OM}$	max. 3 A
Output power at $d_{tot} = 10\%$		
$V_P = 16\text{ V}; R_L = 4\ \Omega$	$P_O$	typ. 6,5 W
$V_P = 12\text{ V}; R_L = 4\ \Omega$	$P_O$	typ. 4,2 W
$V_P = 9\text{ V}; R_L = 4\ \Omega$	$P_O$	typ. 2,3 W
$V_P = 6\text{ V}; R_L = 4\ \Omega$	$P_O$	typ. 1,0 W
Total harmonic distortion at $P_O = 1\text{ W}; R_L = 4\ \Omega$	$d_{tot}$	typ. 0,2 %
Input impedance		
preamplifier (pin 8)	$ Z_i $	> 100 k $\Omega$
power amplifier (pin 6)	$ Z_i $	typ. 20 k $\Omega$
Total quiescent current	$I_{tot}$	typ. 14 mA
Operating ambient temperature	$T_{amb}$	-25 to + 150 °C
Storage temperature	$T_{stg}$	-55 to + 150 °C

### PACKAGE OUTLINE

9-lead SIL; plastic (SOT-110B).

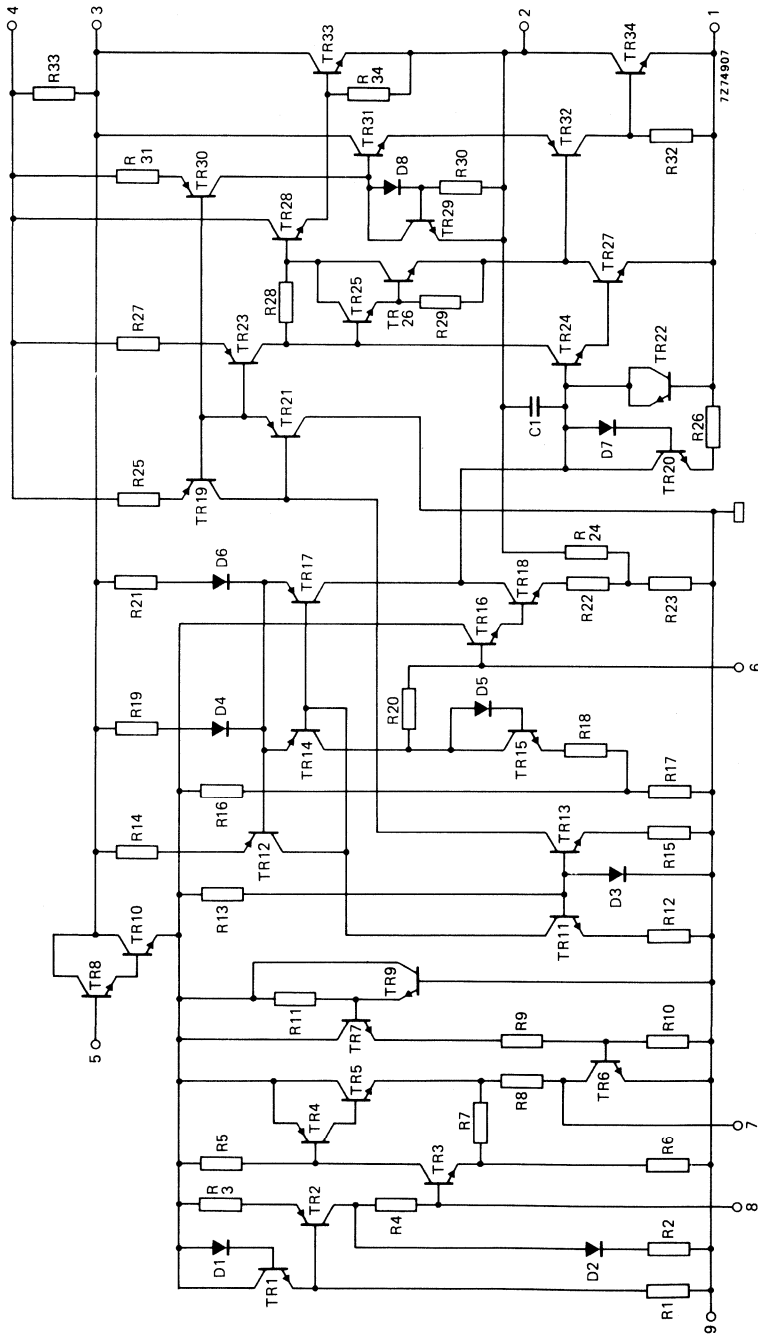

Fig. 1 Circuit diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	$V_p$	max.	24 V
Peak output current	$I_{OM}$	max.	3 A
Total power dissipation			see derating curve Fig. 2
Storage temperature	$T_{stg}$		-55 to + 150 °C
Operating ambient temperature	$T_{amb}$		-25 to + 150 °C
A.C. short-circuit duration of load during sine-wave drive; $V_p = 12 V$	$t_{sc}$	max.	100 hours

Fig. 2 Power derating curve.

**HEATSINK DESIGN**

Assume  $V_p = 12 V$ ;  $R_L = 4 \Omega$ ;  $T_{amb} = 60 \text{ }^\circ\text{C}$  maximum;  $P_O = 3,8 W$ .

The maximum sine-wave dissipation is 1,8 W.

The derating of 10 K/W of the package requires the following external heatsink (for sine-wave drive):

$$R_{th j-a} = R_{th j-tab} + R_{th tab-h} + R_{th h-a} = \frac{150 - 60}{1,8} = 50 \text{ K/W.}$$

Since  $R_{th j-tab} = 10 \text{ K/W}$  and  $R_{th tab-h} = 1 \text{ K/W}$ ,  $R_{th h-a} = 50 - (10 + 1) = 39 \text{ K/W}$ .

**D.C. CHARACTERISTICS**

Supply voltage range	$V_p$	3,6 to 20 V
Repetitive peak output current	$I_{ORM}$	< 2 A
Total quiescent current at $V_p = 12$ V	$I_{tot}$	typ. 14 mA < 22 mA

**A.C. CHARACTERISTICS**

$T_{amb} = 25$  °C;  $V_p = 12$  V;  $R_L = 4$   $\Omega$ ;  $f = 1$  kHz unless otherwise specified; see also Fig. 3.

A.F. output power at  $d_{tot} = 10\%$  (note 1)

with bootstrap:

$V_p = 16$  V;  $R_L = 4$   $\Omega$   $P_o$  typ. 6,5 W

$V_p = 12$  V;  $R_L = 4$   $\Omega$   $P_o$  > 3,6 W

typ. 4,2 W

$V_p = 9$  V;  $R_L = 4$   $\Omega$   $P_o$  typ. 2,3 W

$V_p = 6$  V;  $R_L = 4$   $\Omega$   $P_o$  typ. 1,0 W

without bootstrap:

$V_p = 12$  V;  $R_L = 4$   $\Omega$   $P_o$  typ. 3,0 W

Voltage gain:

preamplifier (note 2)  $G_{v1}$  typ. 23 dB  
21 to 25 dB

power amplifier  $G_{v2}$  typ. 29 dB  
27 to 31 dB

total amplifier  $G_{v\ tot}$  typ. 52 dB  
50 to 54 dB

Total harmonic distortion at  $P_o = 1,5$  W

$d_{tot}$  typ. 0,3 %  
< 1 %

Frequency response; -3 dB (note 3)

B 60 Hz to 15 kHz

Input impedance:

preamplifier (note 4)  $|Z_{i1}|$  > 100 k $\Omega$   
typ. 200 k $\Omega$

power amplifier  $|Z_{i2}|$  typ. 20 k $\Omega$

Output impedance preamplifier  $|Z_{o1}|$  typ. 1 k $\Omega$

Output voltage preamplifier (r.m.s. value)

$d_{tot} < 1\%$  (note 2)  $V_{o(rms)}$  > 0,7 V

Noise output voltage (r.m.s. value; note 5)

$R_S = 0$   $\Omega$   $V_{n(rms)}$  typ. 0,2 mV

$R_S = 10$  k $\Omega$   $V_{n(rms)}$  typ. 0,6 mV  
< 1,4 mV

Noise output voltage at  $f = 500$  kHz (r.m.s. value)

B = 5 kHz;  $R_S = 0$   $\Omega$   $V_{n(rms)}$  typ. 8  $\mu$ V

Ripple rejection (note 6)

$f = 1$  to 10 kHz RR typ. 42 dB

$f = 100$  Hz;  $C_2 = 1$   $\mu$ F RR > 35 dB

Bootstrap current at onset of clipping; pin 4 (r.m.s. value)

$I_{4(rms)}$  typ. 35 mA

## Notes

1. Measured with an ideal coupling capacitor to the speaker load.
2. Measured with a load resistor of 20 k $\Omega$ .
3. Measured at  $P_O = 1$  W; the frequency response is mainly determined by C1 and C3 for the low frequencies and by C4 for the high frequencies.
4. Independent of load impedance of preamplifier.
5. Unweighted r.m.s. noise voltage measured at a bandwidth of 60 Hz to 15 kHz (12 dB/octave).
6. Ripple rejection measured with a source impedance between 0 and 2 k $\Omega$  (maximum ripple amplitude : 2 V).
7. The tab must be electrically floating or connected to the substrate (pin 9).

## RECORDING / PLAY-BACK AND 2 W AUDIO POWER AMPLIFIER

The TDA1012 is a monolithic integrated audio power amplifier, preamplifier and A.L.C. circuit designed for applications in radio-recorders and recorders. The wide supply voltage range makes this circuit very suitable for d.c. and a.c. apparatus. The circuit is thermal protected and contains the following functions:

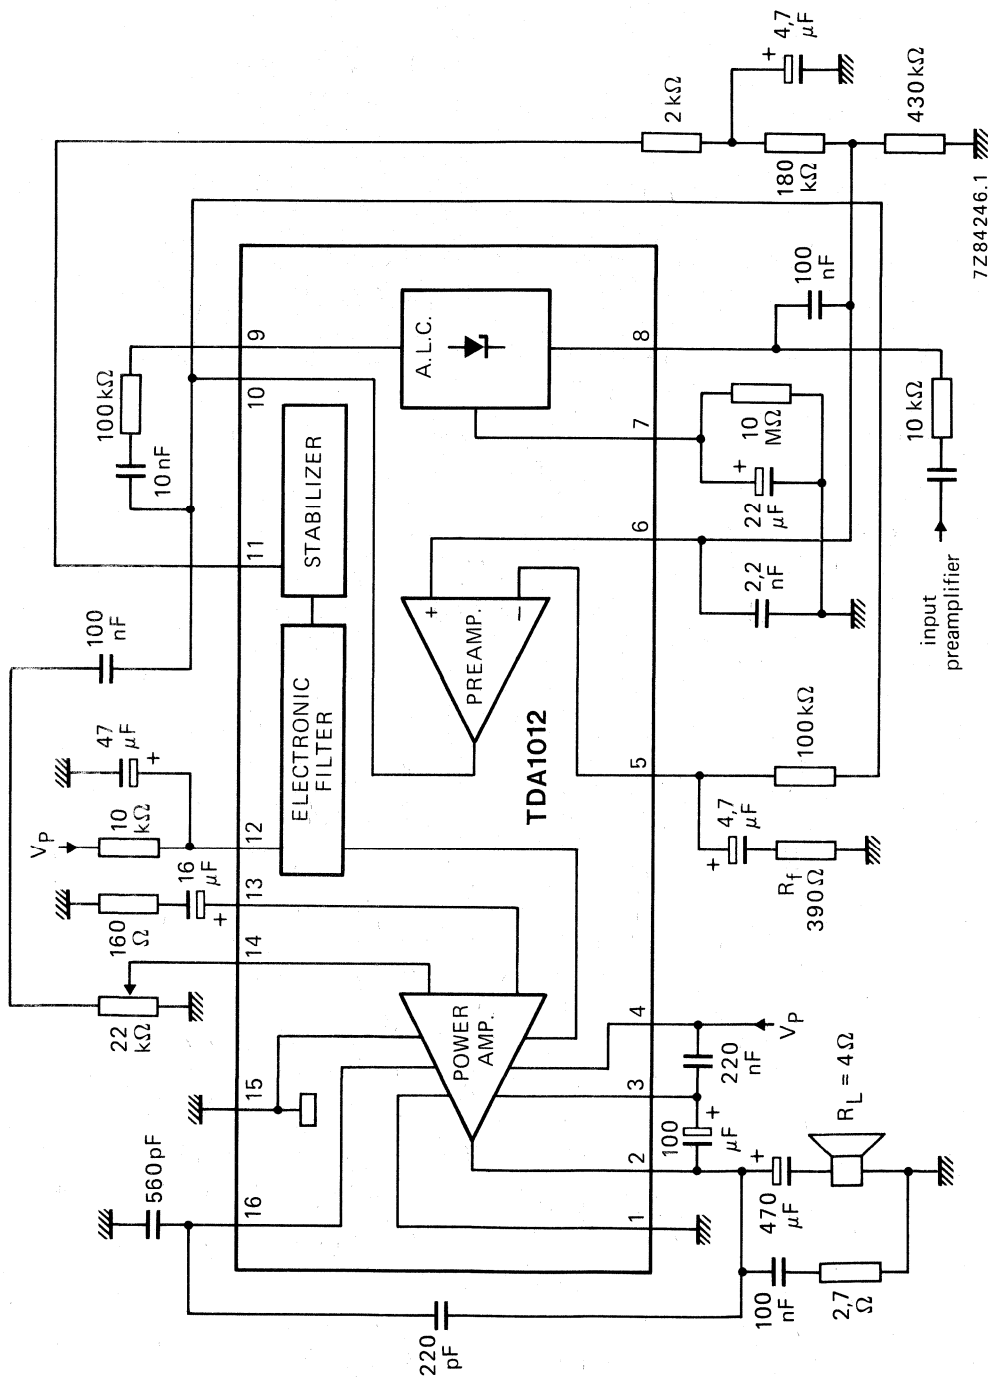

- Power amplifier
- Preamplifier
- Automatic Level Control (A.L.C.) circuit
- Voltage stabilizer

### QUICK REFERENCE DATA

Supply voltage range	$V_P$		3,6 to 18 V
Total quiescent current at $V_P = 9$ V	$I_{tot}$	typ.	14 mA
<b>Power amplifier</b>			
Output power at $d_{tot} = 10$ % $V_P = 9$ V; $R_L = 4 \Omega$	$P_O$	typ.	2 W
Closed loop voltage gain	$G_C$	typ.	36 dB
<b>Preamplifier</b>			
Open loop voltage gain	$G_O$	>	66 dB
Minimum closed loop voltage gain	$G_{C \min}$		31 dB
Output voltage at $d_{tot} = 1$ %	$V_O$	>	2 V
<b>Automatic Level Control (A.L.C.)</b>			
Gain variation for $\Delta V_i = 40$ dB	$\Delta G_V$	typ.	2 dB
<b>Stabilized supply voltage</b>			
Output voltage	$V_{11-15}$	typ.	4,2 V

### PACKAGE OUTLINE

16-lead DIL; plastic with internal heat spreader (SOT-38WE-2).

7Z84246.1

Fig. 1 Block diagram/test circuit.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 4)	$V_P = V_{4-1}$	max.	18 V
Non-repetitive peak output current (pin 2)	$I_{OSM}$	max.	2 A
Storage temperature	$T_{stg}$		-55 to +150 °C
Crystal temperature	$T_c$	max.	150 °C
Total power dissipation	see derating curve Fig. 2		
A.C. short-circuit duration of load during sine-wave drive; $V_P = 12$ V	$t_{sc}$	max.	100 hours

Fig. 2 Power derating curve.

**THERMAL RESISTANCE**

From junction to ambient  $R_{thj-a} = 55$  K/W

**CHARACTERISTICS**

$V_P = 9\text{ V}$ ;  $R_L = 4\ \Omega$ ;  $f = 1\text{ kHz}$ ;  $T_{\text{amb}} = 25\text{ }^\circ\text{C}$ ; measured in test circuit of Fig. 1;  
unless otherwise specified.

**Power amplifier**

Output power at $d_{\text{tot}} = 10\%$	$P_O$	typ.	2 W
Closed loop voltage gain	$G_C$	typ.	36 dB
Total harmonic distortion at $P_O = 1\text{ W}$	$d_{\text{tot}}$	<	1 %
Input impedance	$ Z_i $	>	1 M $\Omega$
Ripple rejection at $f = 100\text{ Hz}$	RR	>	40 dB
Noise output voltage (r.m.s. value) $R_S = 0\ \Omega$ ; $B = 60\text{ Hz to }15\text{ kHz}$	$V_{n(\text{rms})}$	typ.	150 $\mu\text{V}$

**Preamplifier**

Open loop voltage gain	$G_O$	>	66 dB
Closed loop voltage gain	$G_C$	typ.	48 dB
Minimum closed loop voltage gain (when changing $R_f$ )	$G_C\text{ min}$		31 dB
Output voltage at $d_{\text{tot}} = 1\%$	$V_O$	>	2 V
Output voltage with A.L.C. $V_i = 4,8\text{ mV}$	$V_O$	typ.	1,1 V
Total harmonic distortion with A.L.C. $V_i = 4,8\text{ mV}$ $V_i = 480\text{ mV}$	$d_{\text{tot}}$ $d_{\text{tot}}$	< <	1 % 3 %
Signal-to-noise ratio related to $V_i = 1,2\text{ mV}$ ; $R_S = 0\ \Omega$ ; $B = 60\text{ Hz to }15\text{ kHz}$	S/N	typ.	60 dB
Input impedance	$ Z_i $	>	100 k $\Omega$
Ripple rejection at $f = 100\text{ Hz}$	RR	>	52 dB
Output impedance	$ Z_O $	<	50 $\Omega$

**Automatic Level Control (A.L.C.)**

Gain variation for $\Delta V_i = 40\text{ dB}$	$\Delta G_V$	typ.	2 dB
Limiting time at $\Delta V_i = 40\text{ dB}$	$t_l$	<	50 ms
Level setting time at $\Delta V_i = 40\text{ dB}$	$t_s$	<	50 ms
Recovery time at $\Delta V_i = 40\text{ dB}$	$t_r$	typ.	100 s

**Voltage stabilizer**

Output voltage	$V_{11-15}$	typ.	4,2 V
Load current	$I_{11}$	<	1 mA
Ripple rejection at $f = 100\text{ Hz}$	RR	>	40 dB

## 4 W AUDIO POWER AMPLIFIER WITH D.C. VOLUME CONTROL

The TDA1013A is a monolithic integrated audio amplifier circuit with d.c. volume control in a 9-lead single in-line (SIL) plastic package. The wide supply voltage range makes this circuit very suitable for applications in mains-fed apparatus such as television receivers and record players.

The d.c. volume control stage has a logarithmic control characteristic with a range of more than 80 dB; control can be obtained by means of a variable d.c. voltage between 3,5 and 8 V.

The audio amplifier has a well defined open loop gain and a fixed integrated closed loop gain. This offers an optimum in number of external components, performance and stability.

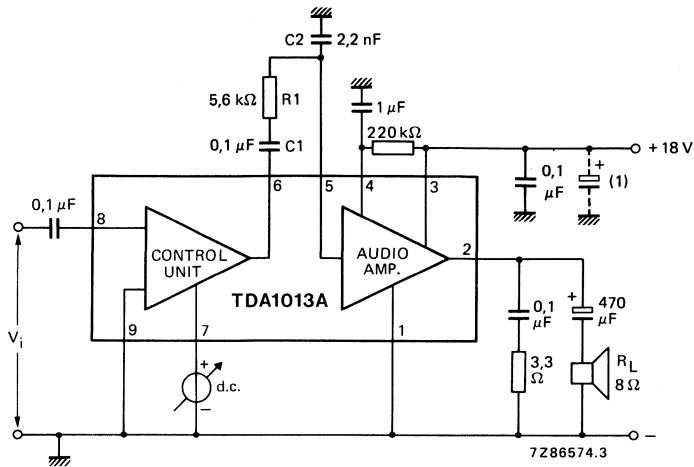

The SIL package (SOT-110B) offers a simple and low-cost heatsink connection.

### QUICK REFERENCE DATA

Supply voltage range	$V_P$		15 to 35 V
Repetitive peak output current	$I_{ORM}$	max.	1,5 A
Total sensitivity (d.c. control at max. gain) for $P_O = 2,5$ W	$V_i$	typ.	55 mV
<b>Audio amplifier</b>			
Output power at $d_{tot} = 10\%$ $V_P = 18$ V; $R_L = 8 \Omega$	$P_O$	typ.	4,5 W
Total harmonic distortion at $P_O = 2,5$ W; $R_L = 8 \Omega$	$d_{tot}$	typ.	0,5 %
Sensitivity for $P_O = 2,5$ W	$V_i$	typ.	125 mV
<b>D.C. volume control unit</b>			
Gain control range	$\phi$	>	80 dB
Signal handling at $d_{tot} < 1\%$ (d.c. control at 0 dB)	$V_i$	>	1,2 V
Sensitivity for $V_O = 125$ mV at max. voltage gain	$V_i$	typ.	55 mV
Input impedance (pin 8)	$ Z_i $	typ.	250 k $\Omega$

### PACKAGE OUTLINE

9-lead SIL; plastic (SOT-110B).

(1) Belongs to power supply.

Fig. 1 Basic application diagram also used as test circuit with  $R_1 = 5,1 \text{ k}\Omega$  and  $C_1 = 22 \text{ nF}$ .

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	$V_p$	max.	35 V
Non-repetitive peak output current	$I_{OSM}$	max.	3 A
Repetitive peak output current	$I_{ORM}$	max.	1,5 A
Storage temperature	$T_{stg}$		-55 to + 150 °C
Crystal temperature	$T_j$		-25 to + 150 °C
Total power dissipation			see derating curve Fig. 2

**HEATSINK DESIGN**

Assume  $V_p = 18 \text{ V}$ ;  $R_L = 8 \Omega$ ;  $T_{amb} = 60 \text{ }^\circ\text{C}$  (max.);  $T_j = 150 \text{ }^\circ\text{C}$  (max.); for a 4 W application into an 8 Ω load, the maximum dissipation is about 2,5 W.

The thermal resistance from junction to ambient can be expressed as:

$$R_{th \text{ j-a}} = R_{th \text{ j-tab}} + R_{th \text{ tab-h}} + R_{th \text{ h-a}} = \frac{T_j \text{ max} - T_{amb \text{ max}}}{P_{\text{max}}} = \frac{150 - 60}{2,5} = 36 \text{ K/W.}$$

Since  $R_{th \text{ j-tab}} = 9 \text{ K/W}$  and  $R_{th \text{ tab-h}} = 1 \text{ K/W}$ ,  $R_{th \text{ h-a}} = 36 - (9 + 1) = 26 \text{ K/W}$ .

Fig. 2 Power derating curve.  
 ——— infinite heatsink;  
 - - - without heatsink.

### CHARACTERISTICS

$V_P = 18 \text{ V}$ ;  $R_L = 8 \Omega$ ;  $f = 1 \text{ kHz}$ ;  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$ ; unless otherwise specified

Supply voltage	$V_P$	typ. 18 V 15 to 35 V
Total quiescent current	$I_{\text{tot}}$	typ. 35 mA
Noise output voltage (see also note)	$V_n$	< 1,4 mV
Total sensitivity (d.c. control at maximum gain) for $P_O = 2,5 \text{ W}$	$V_i$	38 to 69 mV typ. 55 mV
Frequency response (-3 dB)	$f$	35 Hz to 20 kHz
<b>Audio amplifier</b>		
Repetitive peak output current	$I_{\text{ORM}}$	< 1,5 A
Output power at $d_{\text{tot}} = 10\%$	$P_O$	> 4 W typ. 4,5 W
Total harmonic distortion at $P_O = 2,5 \text{ W}$	$d_{\text{tot}}$	typ. 0,5 % < 1 %
Voltage gain	$G_V$	typ. 30 dB
Sensitivity for $P_O = 2,5 \text{ W}$	$V_i$	typ. 125 mV
Input impedance (pin 5)	$ Z_i $	> 100 k $\Omega$ typ. 250 k $\Omega$

### Note

Measured in a bandwidth according to IEC 179-curve 'A';  $R_S = 5 \text{ k}\Omega$  and d.c. control at minimum gain.

### PACKAGE OUTLINE

9-lead SIL; plastic (SOT-110B).

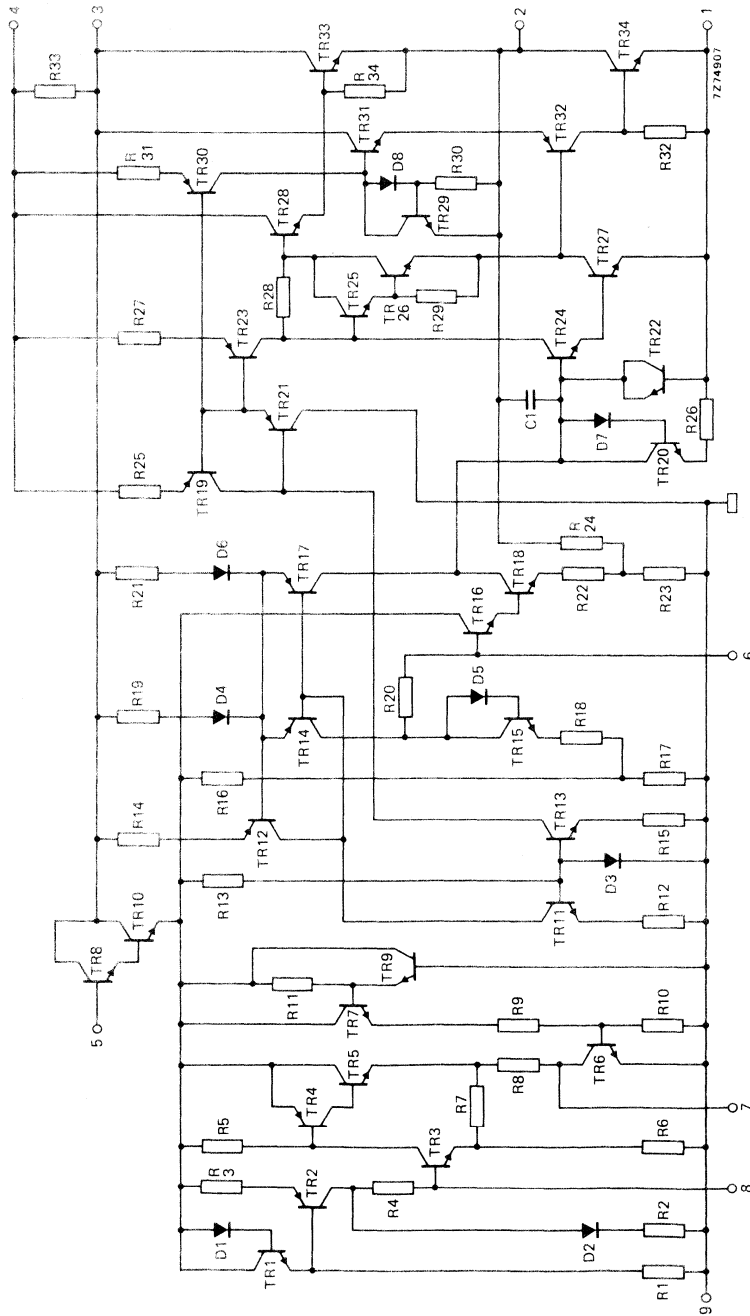

Fig. 1 Circuit diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	$V_p$	max.	18 V
Peak output current	$I_{OM}$	max.	2,5 A
Total power dissipation	see derating curve Fig. 2		
Storage temperature	$T_{stg}$	-55 to +150 °C	
Operating ambient temperature	$T_{amb}$	-25 to +150 °C	
A.C. short-circuit duration of load during sine-wave drive; $V_p = 12$ V	$t_{sc}$	max.	100 hours

Fig. 2 Power derating curve.

**HEATSINK DESIGN**Assume  $V_p = 12$  V;  $R_L = 4 \Omega$ ;  $T_{amb} = 45$  °C maximum.

The maximum sine-wave dissipation is 1,8 W.

$$R_{thj-a} = R_{thj-tab} + R_{th tab-h} + R_{th h-a} = \frac{150 - 45}{1,8} = 58 \text{ K/W.}$$

Where  $R_{thj-a}$  of the package is 45 K/W, so no external heatsink is required.

**D.C. CHARACTERISTICS**

Supply voltage range	$V_P$	3,6 to 18 V
Repetitive peak output current	$I_{ORM}$	< 2 A
Total quiescent current at $V_P = 12$ V	$I_{tot}$	typ. 14 mA
		< 25 mA

**A.C. CHARACTERISTICS**

$T_{amb} = 25$  °C;  $V_P = 12$  V;  $R_L = 4$   $\Omega$ ;  $f = 1$  kHz unless otherwise specified; see also Fig. 3.

A.F. output power at  $d_{tot} = 10\%$  (note 1)

with bootstrap:

$V_P = 12$  V;  $R_L = 4$   $\Omega$   $P_O$  typ. 4,2 W

$V_P = 9$  V;  $R_L = 4$   $\Omega$   $P_O$  typ. 2,3 W

$V_P = 6$  V;  $R_L = 4$   $\Omega$   $P_O$  typ. 1,0 W

without bootstrap:

$V_P = 12$  V;  $R_L = 4$   $\Omega$   $P_O$  typ. 3,0 W

Voltage gain:

preamplifier (note 2)  $G_{V1}$  typ. 23 dB

power amplifier  $G_{V2}$  typ. 29 dB

$d_{tot} < 1\%$  (note 2)  $V_{O(rms)}$  typ. 0,8 V

Noise output voltage (r.m.s. value; note 5)

$R_S = 0$   $\Omega$   $V_{n(rms)}$  typ. 0,2 mV

$R_S = 10$  k $\Omega$   $V_{n(rms)}$  typ. 0,5 mV

Noise output voltage at  $f = 500$  kHz (r.m.s. value)

$B = 5$  kHz;  $R_S = 0$   $\Omega$   $V_{n(rms)}$  typ. 8  $\mu$ V

Ripple rejection (note 6)

$f = 100$  Hz RR typ. 38 dB

## Notes

1. Measured with an ideal coupling capacitor to the speaker load.
2. Measured with a load resistor of  $20\text{ k}\Omega$ .
3. Measured at  $P_O = 1\text{ W}$ ; the frequency response is mainly determined by C1 and C3 for the low frequencies and by C4 for the high frequencies.
4. Independent of load impedance of preamplifier.
5. Unweighted r.m.s. noise voltage measured at a bandwidth of 60 Hz to 15 kHz (12 dB/octave).
6. Ripple rejection measured with a source impedance between 0 and  $2\text{ k}\Omega$  (maximum ripple amplitude : 2 V).
7. The tab must be electrically floating or connected to the substrate (pin 9).

## 0,5 W AUDIO POWER AMPLIFIER

### GENERAL DESCRIPTION

The TDA1015T is a low-cost audio amplifier which can deliver up to 0,5 W output power into a  $16 \Omega$  load impedance at a supply voltage of 9 V. The amplifier is specially designed for portable applications such as radios and recorders. The IC has a very low supply voltage requirement (3,6 V min.).

### Features

- High input impedance
- Separated preamplifier and power amplifier
- Limited noise behaviour at radio frequencies
- Short-circuit protected
- Miniature encapsulation

### QUICK REFERENCE DATA

Supply voltage range	V <sub>p</sub>	3,6 to 12 V
Peak output current	I <sub>OM</sub>	max. 1 A
Output power	P <sub>o</sub>	typ. 0,5 W
Voltage gain power amplifier	G <sub>v1</sub>	typ. 29 dB
Voltage gain preamplifier	G <sub>v2</sub>	typ. 23 dB
Total quiescent current	I <sub>tot</sub>	max. 22 mA
Operating ambient temperature range	T <sub>amb</sub>	-25 to +150 °C
Storage temperature range	T <sub>stg</sub>	-55 to +150 °C

### PACKAGE OUTLINE

## RECORDING/PLAYBACK AND 2 W AUDIO POWER AMPLIFIER

### GENERAL DESCRIPTION

The TDA1016 is a monolithic integrated audio power amplifier, preamplifier and A.L.C. circuit designed for applications in radio-recorders and recorders. The wide supply voltage range makes this circuit very suitable for d.c. and a.c. apparatus. The circuit incorporates the following features:

#### Features

- Power amplifier/monitor amplifier
- Preamplifier/record and playback amplifier
- Automatic Level Control (A.L.C.) circuit
- Voltage stabilizer
- Short-circuit (up to 12 V a.c.) and thermal protection.

### QUICK REFERENCE DATA

Supply voltage range	$V_P$		3,6 to 15 V
Supply current; total quiescent at $V_P = 6$ V	$I_{tot}$	typ.	10 mA
Operating ambient temperature range	$T_{amb}$		-25 to 150 °C
<b>Power amplifier</b>			
Output power at $d_{tot} = 10\%$ $V_P = 6$ V; $R_L = 4 \Omega$	$P_O$	typ.	1 W
$V_P = 9$ V; $R_L = 4 \Omega$	$P_O$	typ.	2 W
Closed loop gain	$G_C$	typ.	36 dB
<b>Preamplifier</b>			
Open loop gain	$G_O$	min.	70 dB
Minimum closed loop voltage gain	$G_{C min}$	min.	35 dB
Output voltage at $d_{tot} = 1\%$	$V_O$	min.	1 V
<b>Automatic Level Control (A.L.C.)</b>			
Gain variation for $\Delta V_i = 40$ dB	$\Delta G_v$	typ.	2 dB
<b>Stabilized supply voltage</b>			
Output voltage	$V_{5-16}$	typ.	2,6 V

### PACKAGE OUTLINE

16-lead DIL; plastic, with internal heat spreader (SOT-38WE-2).

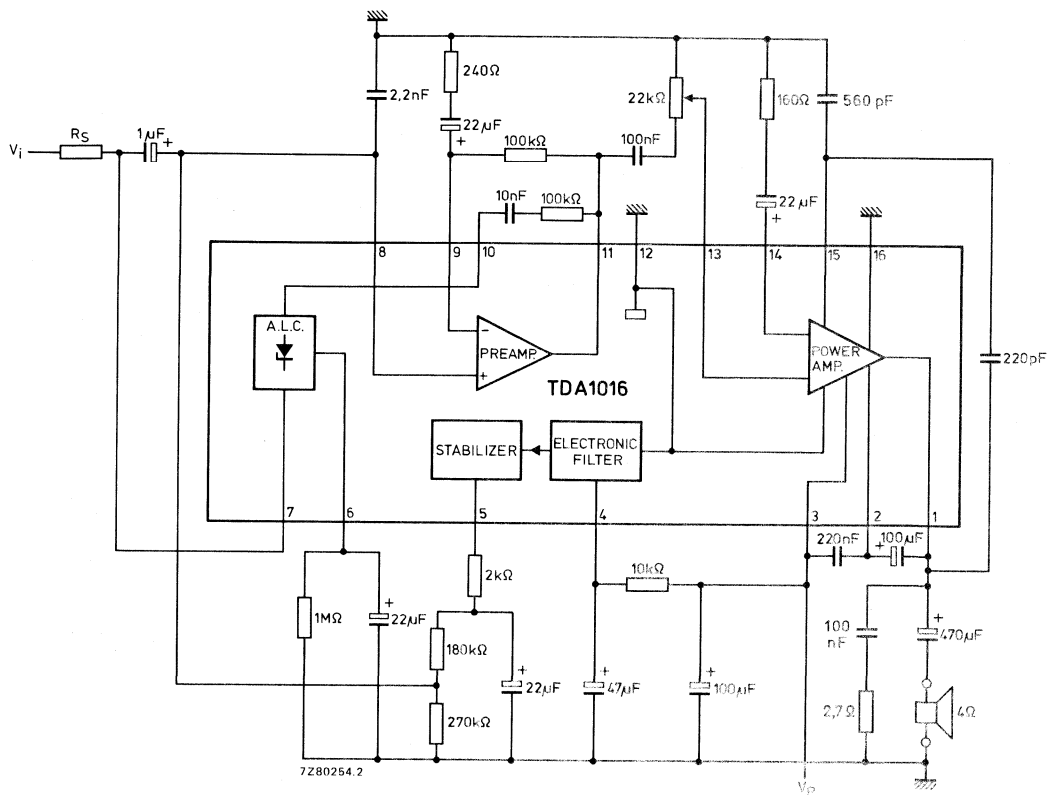

Fig. 1 Block diagram with external components; also used as test circuit.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 3)	$V_p$	max.	18 V
Repetitive peak output current	$I_{ORM}$	max.	1 A
Non-repetitive peak output current (pin 1)	$I_{OSM}$	max.	2 A
Total power dissipation	see derating curve Fig. 2		
A.C. short-circuit duration of load during sinewave drive; $V_p = 12$ V	$t_{sc}$	max.	100 hours
Crystal temperature	$T_c$	max.	150 °C
Storage temperature range	$T_{stg}$	-55 to + 150 °C	
Operating ambient temperature range	$T_{amb}$	-25 to + 150 °C	

**THERMAL RESISTANCE**

The power derating curve (Fig. 2) is based on the following data

From junction to ambient

$$R_{thj-a} = 55 \text{ K/W}$$

Fig. 2 Power derating curve.

## CHARACTERISTICS

$V_P = 6\text{ V}$ ;  $R_L = 4\ \Omega$ ;  $f = 1\text{ kHz}$ ;  $T_{\text{amb}} = 25\text{ }^\circ\text{C}$ ; measured in test circuit Fig. 1; unless otherwise specified

- ▲ Without a shunt resistor across A.L.C.  
With 1 M $\Omega$  or 2,2 M $\Omega$  across A.L.C. recovery time becomes 22 or 50 seconds.

## 12 W CAR RADIO POWER AMPLIFIER

The TDA1020 is a monolithic integrated 12 W audio amplifier in a 9-lead single in-line (SIL) plastic package. The device is primarily developed as a car radio amplifier. At a supply voltage of  $V_P = 14,4$  V, an output power of 7 W can be delivered into a  $4 \Omega$  load and 12 W into  $2 \Omega$ .

To avoid interferences and car ignition signals coming from the supply lines into the IC, frequency limiting is used beyond the audio spectrum in the preamplifier and the power amplifier.

The maximum supply voltage of 18 V makes the IC also suitable for mains-fed radio receivers, tape recorders or record players. However, if the supply voltage is increased above 18 V ( $< 45$  V), the device will not be damaged (load dump protected). Also a short-circuiting of the output to ground (a.c.) will not destroy the device. Thermal protection is built-in. As a special feature, the circuit has a low stand-by current possibility.

The TDA1020 is pin-to-pin compatible with the TDA1010.

### QUICK REFERENCE DATA

Supply voltage range	$V_P$		6 to 18 V
Repetitive peak output current	$I_{ORM}$	<	4 A
Output power at $d_{tot} = 10\%$ (with bootstrap)		>	10 W
$V_P = 14,4$ V; $R_L = 2 \Omega$	$P_o$	typ.	12 W
$V_P = 14,4$ V; $R_L = 4 \Omega$	$P_o$	typ.	7 W
$V_P = 14,4$ V; $R_L = 8 \Omega$	$P_o$	typ.	3,5 W
Output power at $d_{tot} = 10\%$ (without bootstrap)		>	4,5 W
$V_P = 14,4$ V; $R_L = 4 \Omega$	$P_o$		
Input impedance			
preamplifier (pin 8)	$ Z_i $	typ.	40 k $\Omega$
power amplifier (pin 6)	$ Z_i $	typ.	40 k $\Omega$
Total quiescent current at $V_P = 14,4$ V	$I_{tot}$	typ.	30 mA
Stand-by current	$I_{sb}$	<	1 mA
Storage temperature range	$T_{stg}$		-55 to + 150 °C
Crystal temperature	$T_c$	max.	150 °C

### PACKAGE OUTLINE

9-lead SIL; plastic (SOT-110B).

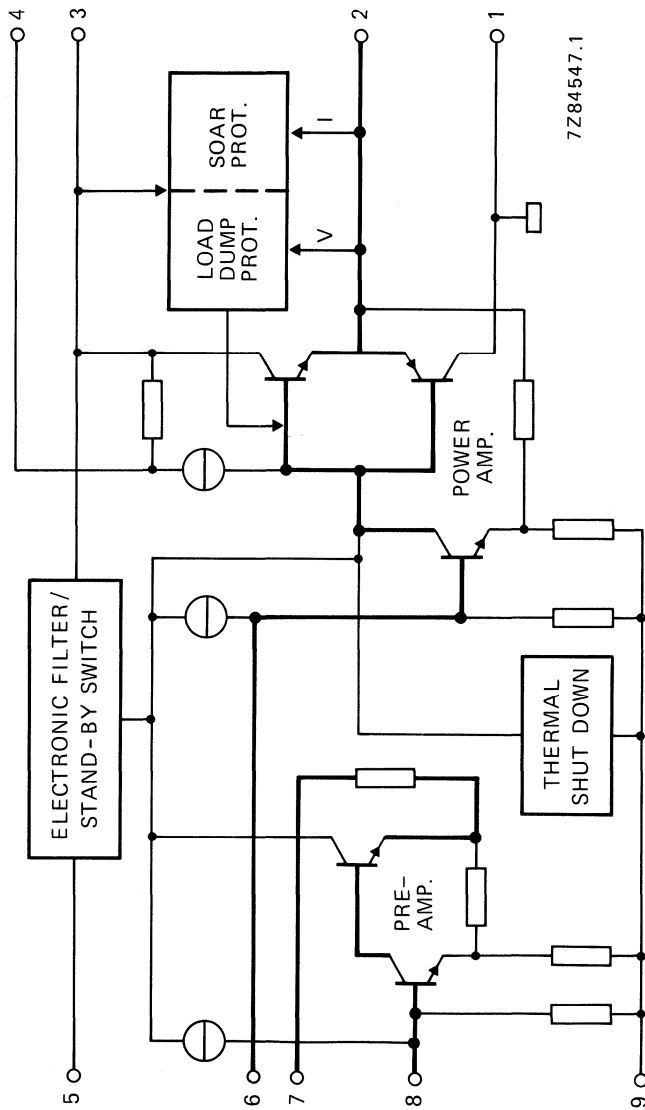

Fig. 1 Internal block diagram; the heavy lines indicate the signal paths.

**PINNING**

- 1. Negative supply (substrate)
- 2. Output power stage
- 3. Positive supply (Vp)
- 4. Bootstrap
- 5. Ripple rejection filter
- 6. Input power stage
- 7. Output preamplifier
- 8. Input preamplifier
- 9. Negative supply

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage; operating (pin 3)	$V_P$	max.	18 V
Supply voltage; non-operating	$V_P$	max.	28 V
Supply voltage; load dump	$V_P$	max.	45 V
Non-repetitive peak output current	$I_{OSM}$	max.	6 A
Total power dissipation			see derating curves Fig. 2
Storage temperature range	$T_{stg}$		-55 to + 150 °C
Crystal temperature	$T_c$	max.	150 °C
Short-circuit duration of load behind output electrolytic capacitor at 1 kHz sine-wave overdrive (10 dB); $V_P = 14,4$ V	$t_{sc}$	max.	100 hours

Fig. 2 Power derating curves.

**HEATSINK DESIGN EXAMPLE**

The derating of 8 K/W of the encapsulation requires the following external heatsink (for sine-wave drive):

10 W in 2 Ω at  $V_P = 14,4$  V  
 maximum sine-wave dissipation: 5,2 W  
 $T_{amb} = 60$  °C maximum

$$R_{th j-a} = R_{th j-tab} + R_{th tab-h} + R_{th h-a} = \frac{150 - 60}{5,2} = 17,3 \text{ K/W}$$

Since  $R_{th j-tab} + R_{th tab-h} = 8 \text{ K/W}$ ,  $R_{th h-a} = 17,3 - 8 \approx 9 \text{ K/W}$ .

**D.C. CHARACTERISTICS**

Supply voltage range (pin 3)	$V_P$		6 to 18 V
Repetitive peak output current	$I_{ORM}$	<	4 A
Total quiescent current			
at $V_P = 14,4$ V	$I_{tot}$	typ.	30 mA
at $V_P = 18$ V	$I_{tot}$	typ.	40 mA

Stand-by current (note 5)

$I_{sb}$  < 1 mA

Crystal temperature for  $-3 \text{ dB}$  gain

$T_c$  > 150 °C

Notes

1. Measured with an ideal coupling capacitor to the speaker load.
2. Measured with a load resistor of  $40 \text{ k}\Omega$ .
3. Measured according to IEC curve-A.
4. Maximum ripple amplitude is  $2 \text{ V}$ ; input is short-circuited.
5. Total current when disconnecting pin 5 or short-circuited to ground (pin 9).
6. The tab must be electrically floating or connected to the substrate (pin 9).

(1) With  $R_L = 2 \Omega$ , preferred value of  $C_8 = 2200 \mu\text{F}$ .

Fig. 3 Test circuit.

## SIGNAL-SOURCES SWITCH

The TDA1029 is a dual operational amplifier (connected as an impedance converter) each amplifier having 4 mutually switchable inputs which are protected by clamping diodes. The input currents are independent of switch position and the outputs are short-circuit protected.

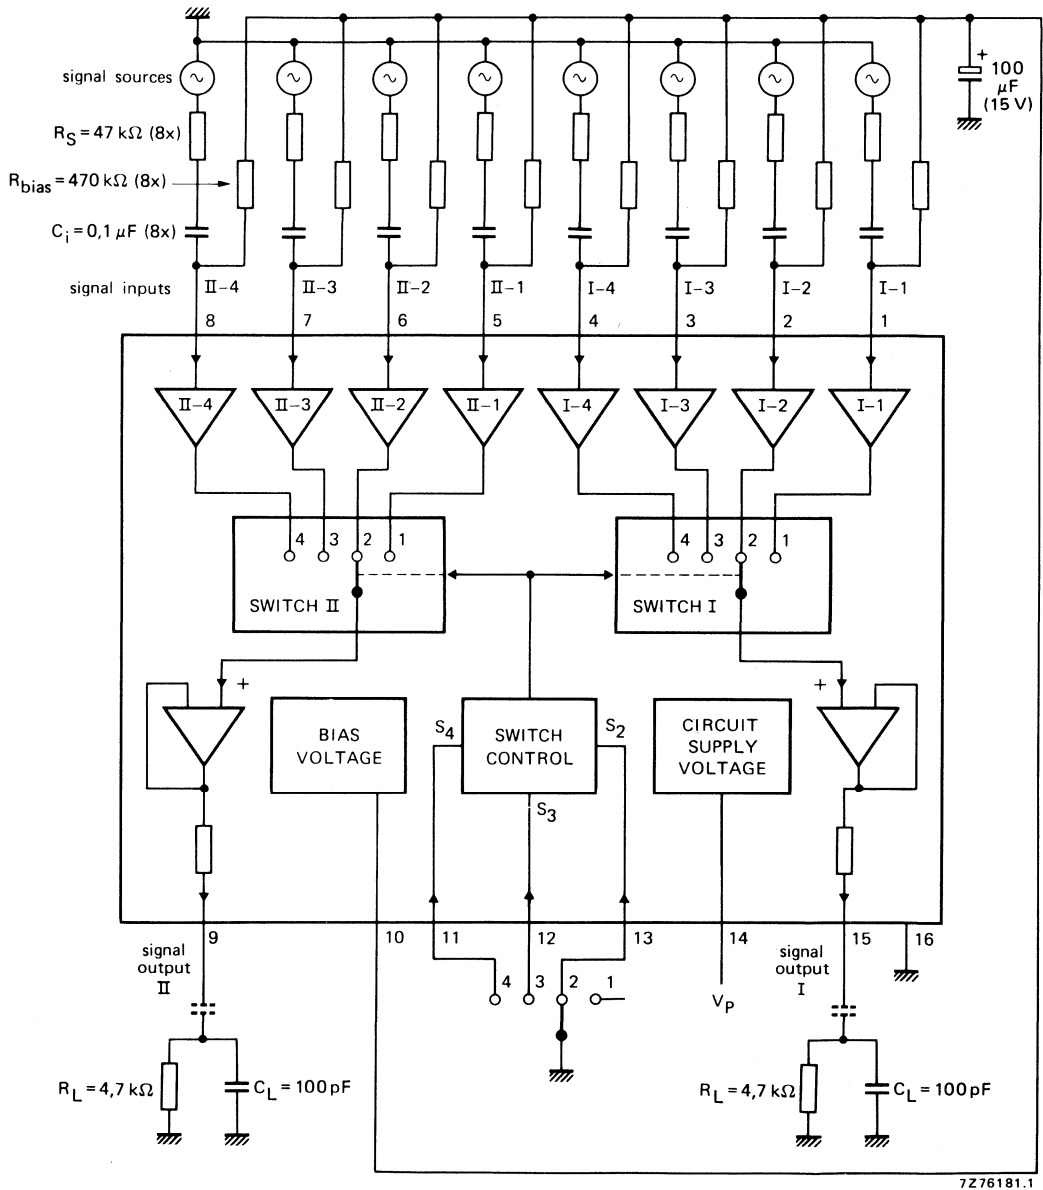

The device is intended as an electronic two-channel signal-source switch in a.f. amplifiers.

### QUICK REFERENCE DATA

Supply voltage range (pin 14)	$V_P$		6 to 23 V
Operating ambient temperature	$T_{amb}$		-30 to +80 °C
Supply voltage (pin 14)	$V_P$	typ.	20 V
Current consumption	$I_{14}$	typ.	3,5 mA
Maximum input signal handling (r.m.s. value)	$V_{i(rms)}$	typ.	6 V
Voltage gain	$G_V$	typ.	1
Total harmonic distortion	$d_{tot}$	typ.	0,01 %

Capacitance between adjacent inputs	C	typ.	0,5 pF
D.C. input voltage range	$V_I$		3 to 19 V
Supply voltage rejection ratio; $R_S \leq 10$ k $\Omega$	SVRR	typ.	100 $\mu$ V/V
Equivalent input noise voltage $R_S = 0$ ; $f = 20$ Hz to 20 kHz (r.m.s. value)	$V_{n(rms)}$	typ.	3,5 $\mu$ V
Equivalent input noise current $f = 20$ Hz to 20 kHz (r.m.s. value)	$I_{n(rms)}$	typ.	0,05 nA
Crosstalk between a switched-on input and a non-switched-on input; measured at the output at $R_S = 1$ k $\Omega$ ; $f = 1$ kHz	$\alpha$	typ.	100 dB

**CHARACTERISTICS** (continued)**Signal amplifier**

Voltage gain of a switched-on input at $I_g = I_{15} = 0$ ; $R_L = \infty$	$G_V$	typ.	1
Current gain of a switched-on amplifier	$G_i$	typ.	$10^5$

**Signal outputs**

Output resistance (pins 9 and 15)	$R_O$	typ.	400 $\Omega$
Output current capability at $V_P = 6$ to 23 V	$\pm I_g$ ; $\pm I_{15}$	typ.	5 mA
Frequency limit of the output voltage $V_{i(p-p)} = 1$ V; $R_S = 1$ k $\Omega$ ; $R_L = 10$ M $\Omega$ ; $C_L = 10$ pF	f	typ.	1,3 MHz
Slew rate (unity gain); $\Delta V_{9-16}/\Delta t$ ; $\Delta V_{15-16}/\Delta t$ $R_L = 10$ M $\Omega$ ; $C_L = 10$ pF	S	typ.	2 V/ $\mu$ s

**Bias voltage**

D.C. output voltage	$V_{10-16}$	typ.	11 V *
			10,2 to 11,8 V
Output resistance	$R_{10-16}$	typ.	8,2 k $\Omega$

**Switch control**

switched-on inputs	interconnected pins	control voltages		
		$V_{11-16}$	$V_{12-16}$	$V_{13-16}$
I-1, II-1	1-15, 5-9	H	H	H
I-2, II-2	2-15, 6-9	H	H	L
I-3, II-3	3-15, 7-9	H	L	H
I-4, II-4	4-15, 8-9	L	H	H
I-4, II-4	4-15, 8-9	L	L	H
I-4, II-4	4-15, 8-9	L	H	L
I-4, II-4	4-15, 8-9	L	L	L
I-3, II-3	3-15, 7-9	H	L	L

In the case of offset control, an internal blocking circuit of the switch control ensures that not more than one input will be switched on at a time. In that case safe switching-through is obtained at  $V_{SL} \leq 1,5$  V.

**Control inputs** (pins 11, 12 and 13)

Required voltage			
HIGH	$V_{SH}$	>	3,3 V **
LOW	$V_{SL}$	<	2,1 V
Input current			
HIGH (leakage current)	$I_{SH}$	<	1 $\mu$ A
LOW (control current)	$-I_{SL}$	<	250 $\mu$ A

\*  $V_{10-16}$  is typically  $0,5 \cdot V_{14-16} + 1,5 \cdot V_{BE}$ .

\*\* Or control inputs open ( $R_{11,12,13-16} > 33$  M $\Omega$ ).

## APPLICATION INFORMATION

$V_P = 20 \text{ V}$ ;  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$ ; measured in Fig. 1;  $R_S = 47 \text{ k}\Omega$ ;  $C_i = 0,1 \text{ }\mu\text{F}$ ;  $R_{\text{bias}} = 470 \text{ k}\Omega$ ;  $R_L = 4,7 \text{ k}\Omega$ ;  $C_L = 100 \text{ pF}$  (unless otherwise specified)

Voltage gain	$G_V$	typ.	-1,5 dB
Output voltage variation when switching the inputs	$\Delta V_{9-16}$	}	typ. 10 mV
	$\Delta V_{15-16}$		< 100 mV
Total harmonic distortion over most of signal range (see Fig. 4) $V_i = 5 \text{ V}$ ; $f = 1 \text{ kHz}$ $V_i = 5 \text{ V}$ ; $f = 20 \text{ Hz to } 20 \text{ kHz}$	$d_{\text{tot}}$	typ.	0,01 %
	$d_{\text{tot}}$	typ.	0,02 %
	$d_{\text{tot}}$	typ.	0,03 %
Output signal handling $d_{\text{tot}} = 0,1\%$ ; $f = 1 \text{ kHz}$ (r.m.s. value)	$V_{O(\text{rms})}$	>	5,0 V
		typ.	5,3 V
Noise output voltage (unweighted) $f = 20 \text{ Hz to } 20 \text{ kHz}$ (r.m.s. value)	$V_{n(\text{rms})}$	typ.	5 $\mu\text{V}$
Noise output voltage (weighted) $f = 20 \text{ Hz to } 20 \text{ kHz}$ (in accordance with DIN 45405)	$V_n$	typ.	12 $\mu\text{V}$
Amplitude response $V_i = 5 \text{ V}$ ; $f = 20 \text{ Hz to } 20 \text{ kHz}$ ; $C_i = 0,22 \text{ }\mu\text{F}$	$\Delta V_{9-16}$	}	< 0,1 dB *
Crosstalk between a switched-on input and a non-switched-on input; measured at the output at $f = 1 \text{ kHz}$	$\alpha$	typ.	75 dB **
		typ.	90 dB **

\* The lower cut-off frequency depends on values of  $R_{\text{bias}}$  and  $C_i$ .

\*\* Depends on external circuitry and  $R_S$ . The value will be fixed mostly by capacitive crosstalk of the external components.

## APPLICATION NOTES

## Input protection circuit and indication

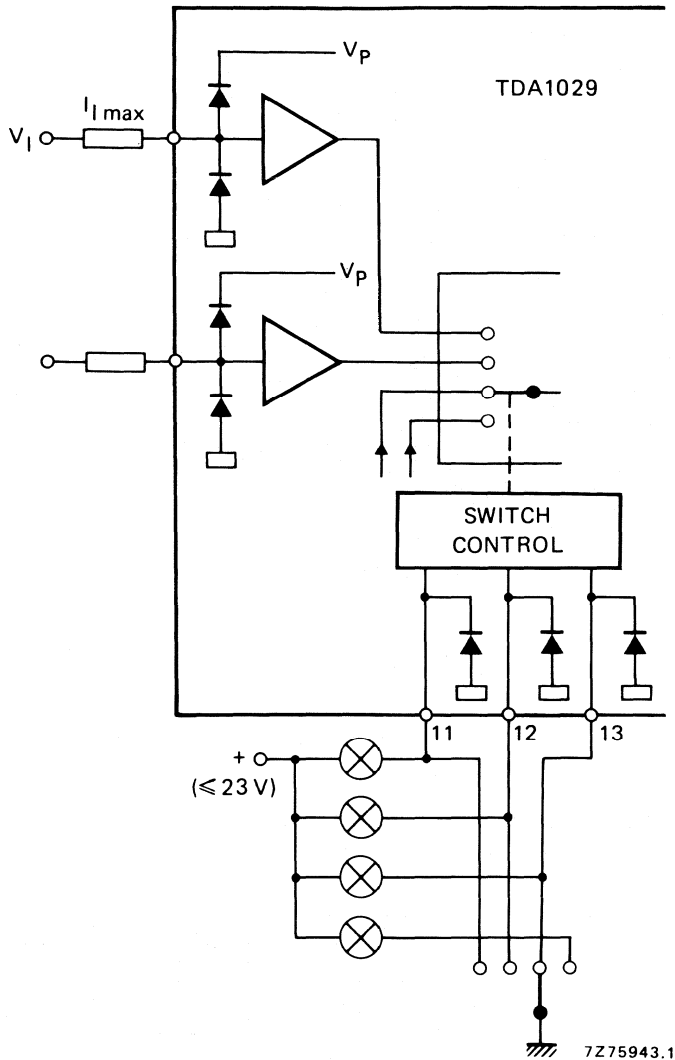

Fig. 7 Circuit diagram showing input protection and indication.

**Unused signal inputs**

Any unused inputs must be connected to a d.c. (bias) voltage, which is within the d.c. input voltage range; e.g. unused inputs can be connected directly to pin 10.

**Circuits with standby operation**

The control inputs (pins 11, 12 and 13) are high-ohmic at  $V_{SH} \leq 20\text{ V}$  ( $I_{SH} \leq 1\ \mu\text{A}$ ), as well as, when the supply voltage (pin 14) is switched off.

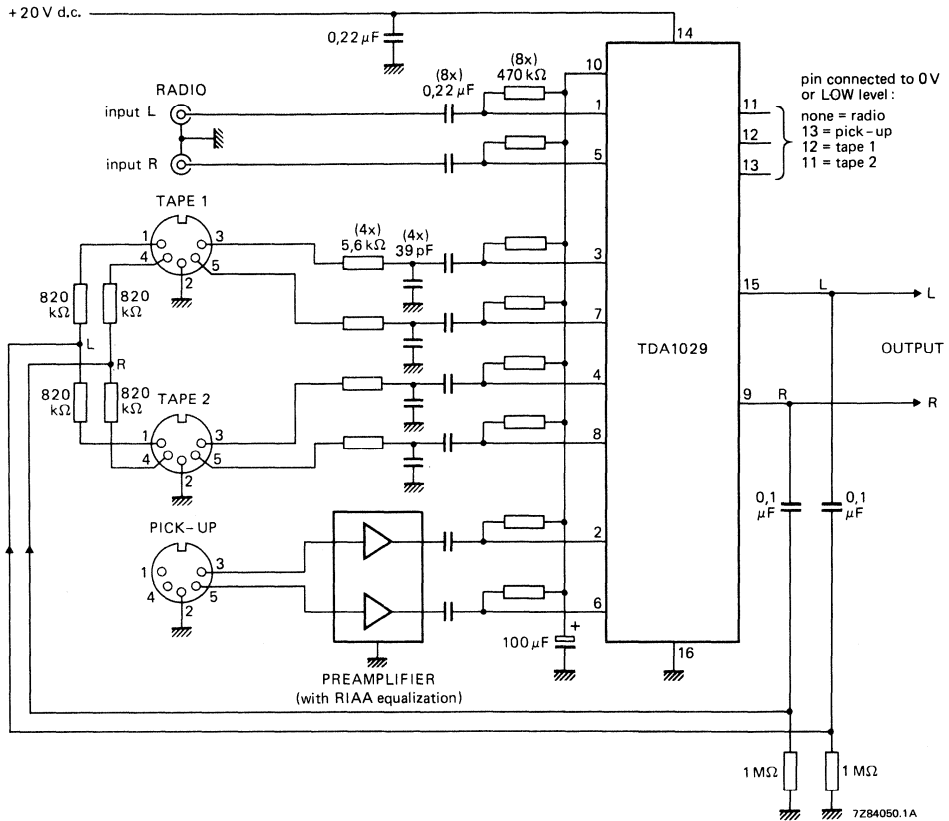

Fig. 8 TDA1029 connected as a four input stereo source selector.

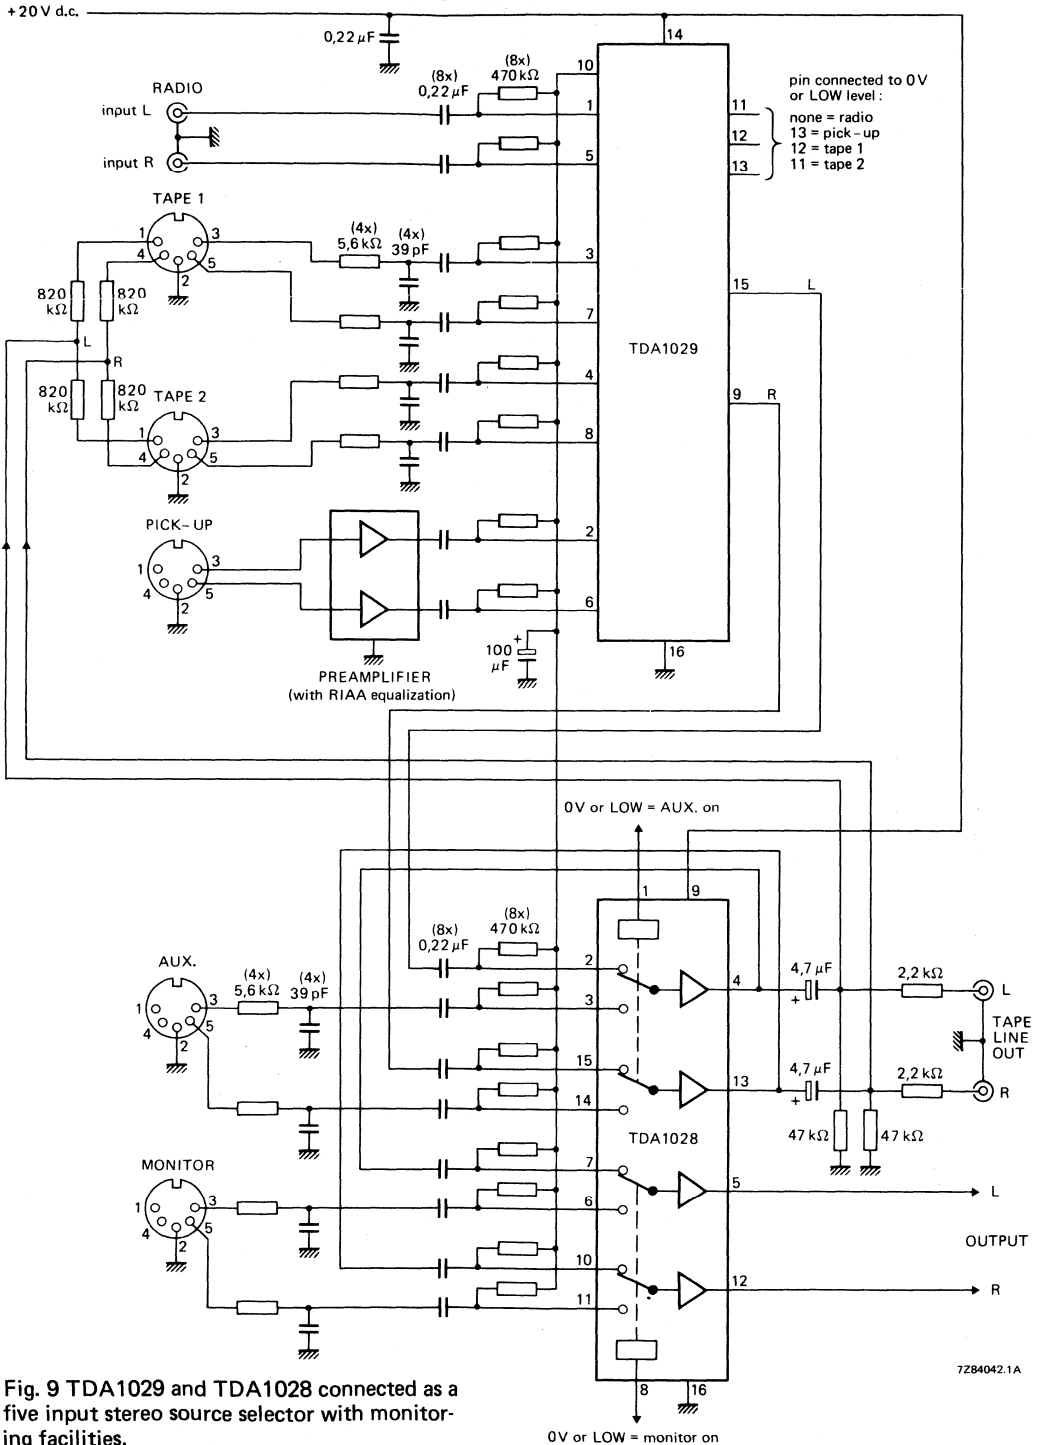

Fig. 9 TDA1029 and TDA1028 connected as a five input stereo source selector with monitoring facilities.

7Z84042.1A

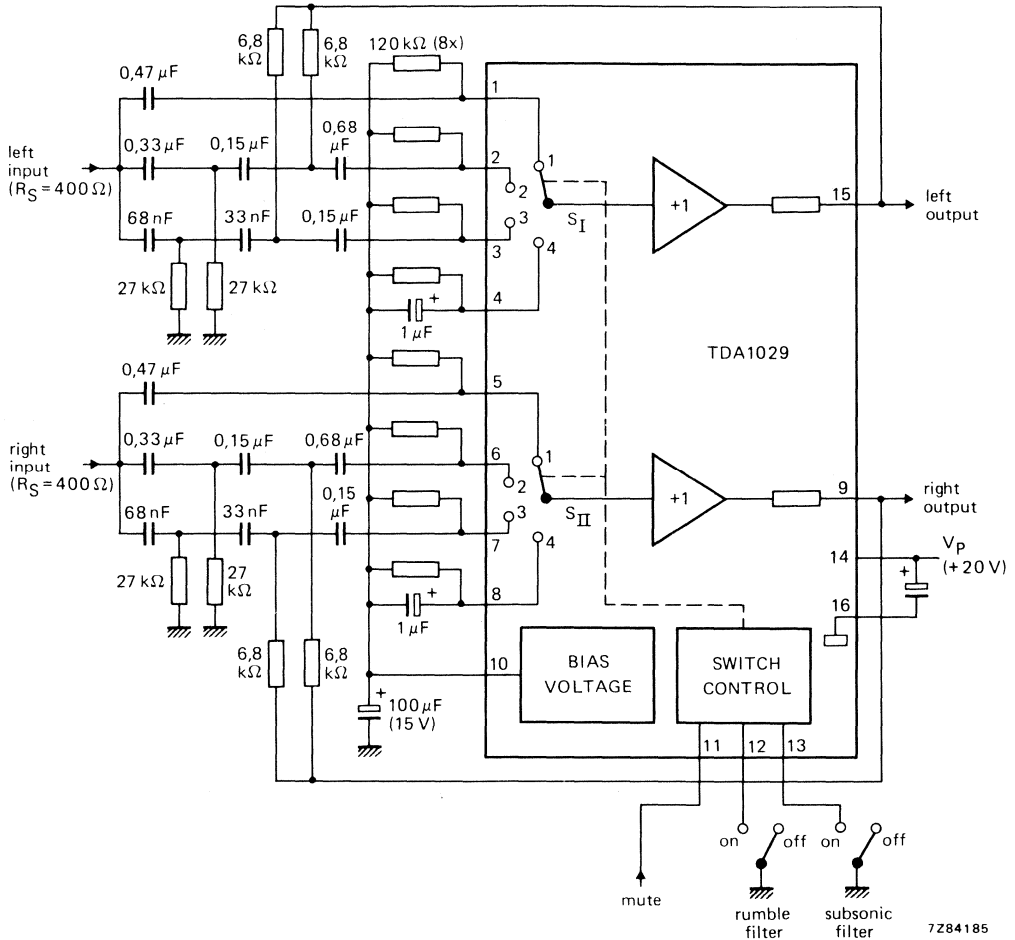

Fig. 10 TDA1029 connected as a third-order active high-pass filter with Butterworth response and component values chosen according to the method proposed by Fjällbrant. It is a four-function circuit which can select mute, rumble filter, subsonic filter and linear response.

Switch control

function	V <sub>11-16</sub>	V <sub>12-16</sub>	V <sub>13-16</sub>
linear	H	H	H
subsonic filter 'on'	H	H	L
rumble filter 'on'	H	L	X
mute 'on'	L	X	X

Fig. 11 Frequency response curves for the circuit of Fig. 10.

## MOTOR SPEED REGULATOR WITH THERMAL SHUT-DOWN

The TDA1059B is a monolithic integrated circuit with a current limiter and with good thermal characteristics in a TO-126 plastic package for easy mounting. It is intended to regulate the speed of d.c. motors in record players, cassette recorders and car cassette recorders.

### QUICK REFERENCE DATA

Supply voltage	$V_P = V_{2-1}$	typ.	9 V 3,3 to 16 V
Internal reference voltage	$V_{ref}$	typ.	1,3 V
Drop-out voltage	$V_{3-1}$	typ.	1,8 V
Limited output current	$I_{lim}$	typ.	0,6 A
Multiplication coefficient	k	typ.	9

### PACKAGE OUTLINE

Dimensions in mm

Fig. 1 TO-126 (SOT-32).

Pin 1 connected to metal part of mounting surface.

(1) Within this region the cross-section of the leads is uncontrolled.

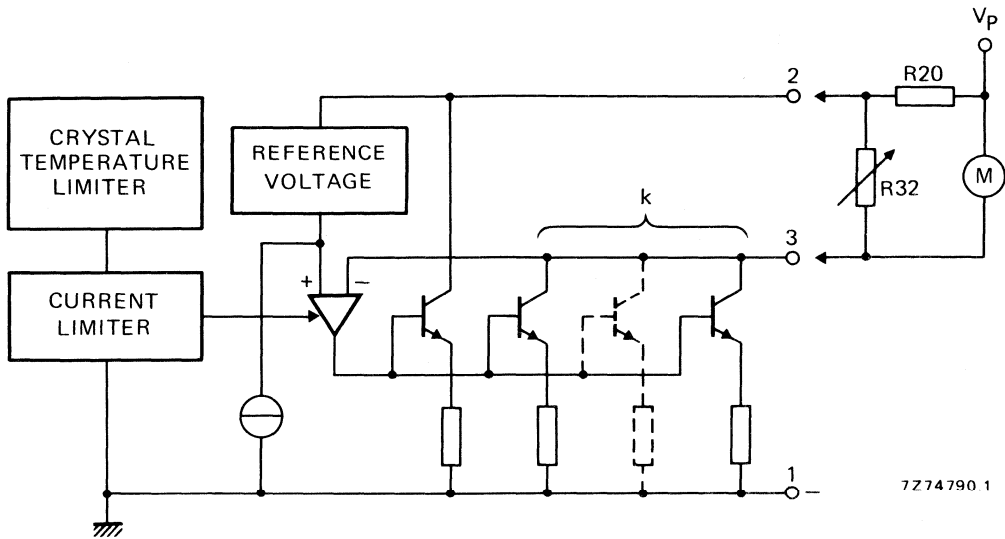

Fig. 2 Functional diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	$V_p = V_{2.1}$	max.	16 V
Storage temperature	$T_{stg}$		-55 to + 150 °C
Operating ambient temperature (see Fig. 3 and note)	$T_{amb}$		-25 to + 130 °C

**THERMAL RESISTANCE**

From junction to case	$R_{th j-c}$	=	10 K/W
From junction to ambient	$R_{th j-a}$	=	100 K/W

Fig. 3 Power derating curve.

**Note**

At ambient temperatures above 130 °C, the crystal temperature limiter decreases the internal power consumption.

## CHARACTERISTICS

$V_P = 9\text{ V}$ ;  $T_{\text{amb}} = 25\text{ }^\circ\text{C}$ ;  $R_{20} = 0$ ; heatsink with  $R_{\text{th}} = 100\text{ K/W}$  and after thermal stabilization; unless otherwise specified; see test circuit Fig. 4.

		min.	typ.	max.
Supply voltage	$V_P = V_{2-1}$	3,3	9	16 V
Internal reference voltage $V_P = 3,3\text{ V}$ ; $I_3 = 80\text{ mA}$	$V_{\text{ref}}$	1,24	1,3	1,36 V
Drop-out voltage $I_3 = 80\text{ mA}$ ; $\Delta V_{\text{ref}} = 5\%$	$V_{3-1}$	—	1,8	2,06 V
Quiescent current; $I_3 = 0$	$I_q$	1,8	2,3	2,8 mA

input current variation	$\frac{\Delta I_2}{\Delta T_{\text{amb}}}$	-2	0	+2 $\mu\text{A/K}$

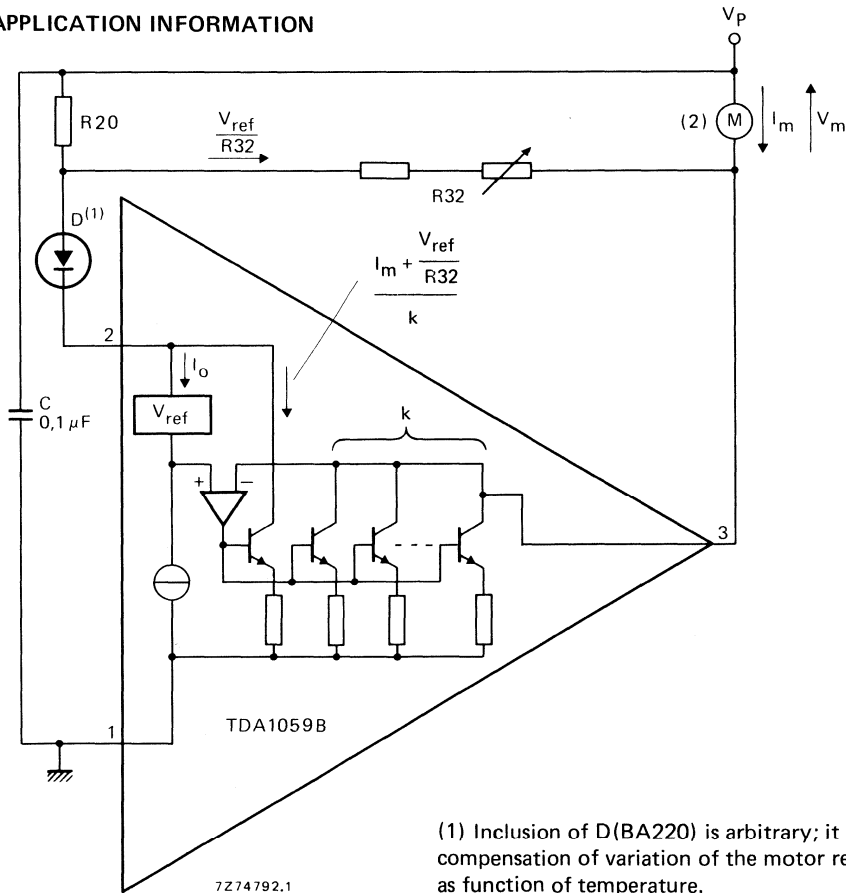

\* If the motor is stopped by a mechanical brake, the current limitation is effective in the supply voltage range. If the motor is short-circuited, the TDA1059B will be damaged if the supply voltage is higher than 10 V due to parasitic oscillations.

Note  
 For start operation:  $V_{ref}$  must start with final  $V_p = 6,7\text{ V}$  and a time constant of  $3\tau = 100\text{ ms}$  in which  $\tau = R.C$ ;  $R$  = source impedance,  $C$  = by-pass capacitor.

Fig. 4 Test circuit.

APPLICATION INFORMATION

(1) Inclusion of D(BA220) is arbitrary; it permits compensation of variation of the motor resistance as function of temperature.

(2) Motor example (without diode D):

Catalogue no. 9904 120 01806;  $n = 2000\text{ rev/min}$ ;  $R_{20} = 180\ \Omega (\pm 2\%)$ ;  $R_{32} = 100\ \Omega + 100\ \Omega$  (variable).

Fig. 5 Example of using the TDA1059B in a d.c. motor speed regulation circuit.

**Motor equations**

$$\begin{aligned}
 E_m &= \alpha_1 n && \text{where: } \alpha_1, \alpha_2 = \text{motor constant} \\
 I_m &= \alpha_2 r && n = \text{number of revolutions} \\
 V_m &= E_m + R_m I_m && r = \text{motor torque} \\
 &&& E_m = \text{back electromotive force} \\
 &&& R_m = \text{motor resistance}
 \end{aligned}$$

The back electromotive force ( $E_m$ ) in Fig. 5 can be expressed (excluding diode D) as:

$$E_m = \left( \frac{R_{20}}{k} - R_m \right) I_m + V_{\text{ref}} \left\{ 1 + \frac{R_{20}}{R_{32}} \left( 1 + \frac{1}{k} \right) \right\} + R_{20} \cdot I_o$$

and including diode D, as:

$$E_m = \left( \frac{R_{20}}{k} - R_m \right) I_m + (V_{\text{ref}} + V_D) \left\{ 1 + \frac{R_{20}}{R_{32}} \left( 1 + \frac{1}{k} \right) \right\} + R_{20} \cdot I_o$$

Speed regulation is constant when  $E_m$  is independent of  $I_m$  variations; this will be obtained when  $R_{20} = kR_m$ .

$E_m$ , and therefore the motor speed, is regulated by  $R_{32}$ . A practical condition for stability is  $R_{20} < kR_m$ .

## MOTOR SPEED REGULATOR

The TDA1059C is a monolithic integrated circuit with a current limiter and with good thermal characteristics in a TO-126 plastic package for easy mounting. It is intended to regulate the speed of d.c. motors in record players, cassette recorders and car cassette recorders.

 & & E_m &= \text{back electromotive force} \\
 & & R_m &= \text{motor resistance}
 \end{aligned}$$

The back electromotive force ( $E_m$ ) in Fig. 5 can be expressed (excluding diode D) as:

$$E_m = \left( \frac{R_{20}}{k} - R_m \right) I_m + V_{ref} \left\{ 1 + \frac{R_{20}}{R_{32}} \left( 1 + \frac{1}{k} \right) \right\} + R_{20} \cdot I_o$$

and including diode D, as:

$$E_m = \left( \frac{R_{20}}{k} - R_m \right) I_m + \left( V_{ref} + V_D \right) \left\{ 1 + \frac{R_{20}}{R_{32}} \left( 1 + \frac{1}{k} \right) \right\} + R_{20} \cdot I_o$$

Speed regulation is constant when  $E_m$  is independent of  $I_m$  variations; this will be obtained when  $R_{20} = kR_m$ .

$E_m$ , and therefore the motor speed, is regulated by  $R_{32}$ . A practical condition for stability is  $R_{20} < kR_m$ .

## AM RECEIVER CIRCUIT

### GENERAL DESCRIPTION

The TDA1072A integrated AM receiver circuit performs the active and part of the filtering functions of an AM radio receiver. It is intended for use in mains-fed home receivers and car radios. The circuit can be used for oscillator frequencies up to 50 MHz and can handle r.f. signals up to 500 mV. R.F. radiation and sensitivity to interference are minimized by an almost symmetrical design. The voltage-controlled oscillator provides signals with extremely low distortion and high spectral purity over the whole frequency range even when tuning with variable capacitance diodes. If required, band switching diodes can easily be applied. Selectivity is obtained using a block filter before the i.f. amplifier.

### Features

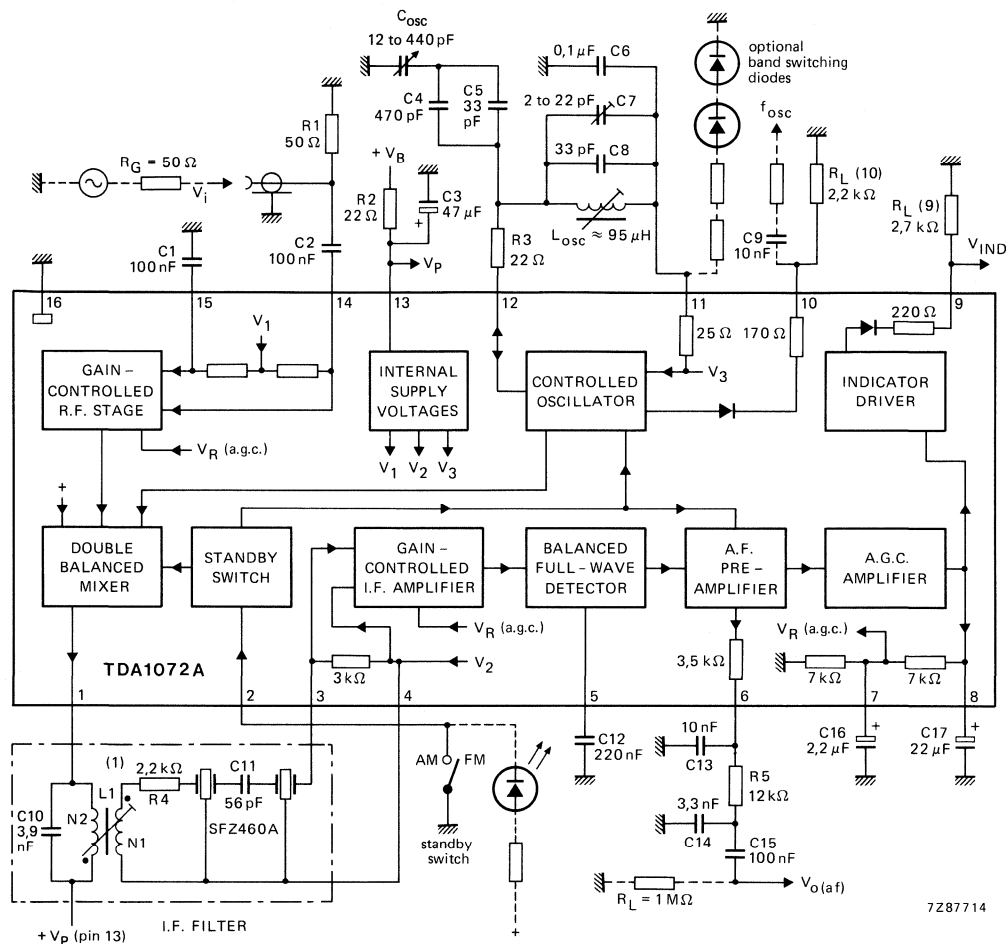

- Inputs protected against damage by static discharge
- Gain-controlled r.f. stage
- Double balanced mixer
- Separately buffered, voltage-controlled and temperature-compensated oscillator, designed for simple coils
- Gain-controlled i.f. stage with wide a.g.c. range
- Full-wave, balanced envelope detector
- Internal generation of a.g.c. voltage with possibility of second-order filtering
- Buffered field strength indicator driver with short-circuit protection
- A.F. preamplifier with possibilities for simple a.f. filtering
- Electronic standby switch

### QUICK REFERENCE DATA

Supply voltage range	$V_p$	7,5 to 18 V
Supply current range	$I_p$	15 to 30 mA
R.F. input voltage for $S + N/N = 6$ dB at $m = 30\%$	$V_i$	typ. 1,5 $\mu$ V
R.F. input voltage for 3% total harmonic distortion (THD) at $m = 80\%$	$V_i$	typ. 500 mV
A.F. output voltage with $V_i = 2$ mV; $f_i = 1$ MHz; $m = 30\%$ and $f_m = 400$ Hz	$V_{o(af)}$	typ. 310 mV
A.G.C. range: change of $V_i$ for 1 dB change of $V_{o(af)}$		typ. 86 dB
Field strength indicator voltage at $V_i = 500$ mV; $R_{L(g)} = 2,7$ k $\Omega$	$V_{IND}$	typ. 2,8 V

### PACKAGE OUTLINE

16-lead DIL; plastic (SOT-38).

(1) Coil data: TOKO sample no. 7XNS-A7523DY; L1 : N1/N2 = 12/32; Q<sub>O</sub> = 65; Q<sub>B</sub> = 57.  
 Filter data: Z<sub>F</sub> = 700 Ω at R<sub>3,4</sub> = 3 kΩ; Z<sub>I</sub> = 4,8 kΩ.

Fig. 1 Block diagram and test circuit (connections shown in broken lines are not part of the test circuit).

## FUNCTIONAL DESCRIPTION

### Gain-controlled r.f. stage and mixer

The differential amplifier in the r.f. stage employs an a.g.c. negative feedback network to provide a wide dynamic range. Very good cross-modulation behaviour is achieved by a.g.c. delays at the various signal stages. Large signals are handled with low distortion and the S/N ratio of small signals is improved. Low noise working is achieved in the differential amplifier by using transistors with low base resistance.

A double balanced mixer provides the i.f. output signal to pin 1.

### Oscillator

The differential amplifier oscillator is temperature compensated and is suitable for simple coil connection. The oscillator is voltage-controlled and has little distortion or spurious radiation. It is specially suitable for electronic tuning using variable capacitance diodes. Band switching diodes can easily be applied using the stabilized voltage  $V_{11-16}$ . An extra buffered oscillator output (pin 10) is available for driving a synthesizer. If this is not needed, resistor  $R_{L(10)}$  can be omitted.

### Gain-controlled i.f. amplifier

This amplifier comprises two cascaded, variable-gain differential amplifier stages coupled by a band-pass filter. Both stages are gain-controlled by the a.g.c. negative feedback network.

### Detector

The full-wave, balanced envelope detector has very low distortion over a wide dynamic range. Residual i.f. carrier is blocked from the signal path by an internal low-pass filter.

### A.F. preamplifier

This stage preamplifies the audio frequency output signal. The amplifier output has an emitter follower with a series resistor which, together with an external capacitor, yields the required low-pass for a.f. filtering.

### A.G.C. amplifier

The a.g.c. amplifier provides a control voltage which is proportional to the carrier amplitude. Second-order filtering of the a.g.c. voltage achieves signals with very little distortion, even at low audio frequencies. This method of filtering also gives fast a.g.c. settling time which is advantageous for electronic search tuning. The a.g.c. settling time can be further reduced by using capacitors of smaller value in the external filter (C16 and C17). The a.g.c. voltage is fed to the r.f. and i.f. stages via suitable a.g.c. delays. The capacitor at pin 7 can be omitted for low-cost applications.

### Field strength indicator output

A buffered voltage source provides a high-level field strength output signal which has good linearity for logarithmic input signals over the whole dynamic range. If the field strength information is not needed,  $R_{L(9)}$  can be omitted.

### Standby switch

This switch is primarily intended for AM/FM band switching. During standby mode the oscillator, mixer and a.f. preamplifier are switched off.

### Short-circuit protection

All pins have short-circuit protection to ground.

**RATINGS**

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)

Supply voltage	$V_P = V_{13-16}$	max.	20 V
Total power dissipation	$P_{tot}$	max.	875 mW
Input voltage	$ V_{14-15} $	max.	12 V
	$-V_{14-16}, -V_{15-16}$	max.	0,6 V
	$V_{14-16}, V_{15-16}$	max.	$V_P$ V
Input current	$ I_{14} ,  I_{15} $	max.	200 mA
Operating ambient temperature range	$T_{amb}$	-40 to	+ 80 °C
Storage temperature range	$T_{stg}$	-55 to	+ 150 °C
Junction temperature	$T_j$	max.	+ 125 °C

**THERMAL RESISTANCE**

## DUAL TANDEM ELECTRONIC POTENTIOMETER CIRCUIT

### GENERAL DESCRIPTION

The TDA1074A is a monolithic integrated circuit designed for use as volume and tone control circuit in stereo amplifiers. This dual tandem potentiometer IC consists of two ganged pairs of electronic potentiometers with the eight inputs connected via impedance converters, and the four outputs driving individual operational amplifiers. The setting of each electronic potentiometer pair is controlled by an individual d.c. control voltage. The potentiometers operate by current division between the arms of cross-coupled long-tailed pairs. The current division factor is determined by the level and polarity of the d.c. control voltage with respect to an externally available reference level of half the supply voltage. Since the electronic potentiometers are adjusted by a d.c. control voltage, each pair can be controlled by single linear potentiometers which can be located in any position dictated by the equipment styling. Since the input and feedback impedances around the operational amplifier gain blocks are external, the TDA1074A can perform bass/treble and volume/loudness control. It also can be used as a low-level fader to control the sound distribution between the front and rear loudspeakers in car radio installations.

### Features

- High impedance inputs to both 'ends' of each electronic potentiometer
- Ganged potentiometers track within 0,5 dB
- Electronic rejection of supply ripple
- Internally generated reference level available externally so that the control voltage can be made to swing positively and negatively around a well-defined 0 V level
- The operational amplifiers have push-pull outputs for wide voltage swing and low current consumption
- The operational amplifier outputs are current limited to provide output short-circuit protection
- Although designed to operate from a 20 V supply (giving a maximum input and output signal level of 6 V), the TDA1074A can work from a supply as low as 7,5 V with reduced input and output signal levels

### QUICK REFERENCE DATA

Supply voltage (pin 11)	$V_p$	typ.	20 V
Supply current (pin 11)	$I_p$	typ.	22 mA
Input signal voltage (r.m.s. value)	$V_{i(rms)}$	max.	6 V
Output signal voltage (r.m.s. value)	$V_{o(rms)}$	max.	6 V
Total harmonic distortion	THD	typ.	0,05 %
Output noise voltage (r.m.s. value)	$V_{no(rms)}$	typ.	50 $\mu$ V
Control range	$\Delta\alpha$	typ.	110 dB
Cross-talk attenuation (L/R)	$\alpha_{ct}$	typ.	80 dB
Ripple rejection (100 Hz)	$\alpha_{100}$	typ.	46 dB
Tracking of ganged potentiometers	$\Delta G_v$	typ.	0,5 dB
<hr/>			
Supply voltage range	$V_p$		7,5 to 23 V
Operating ambient temperature range	$T_{amb}$		-30 to + 80 °C

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102HE).

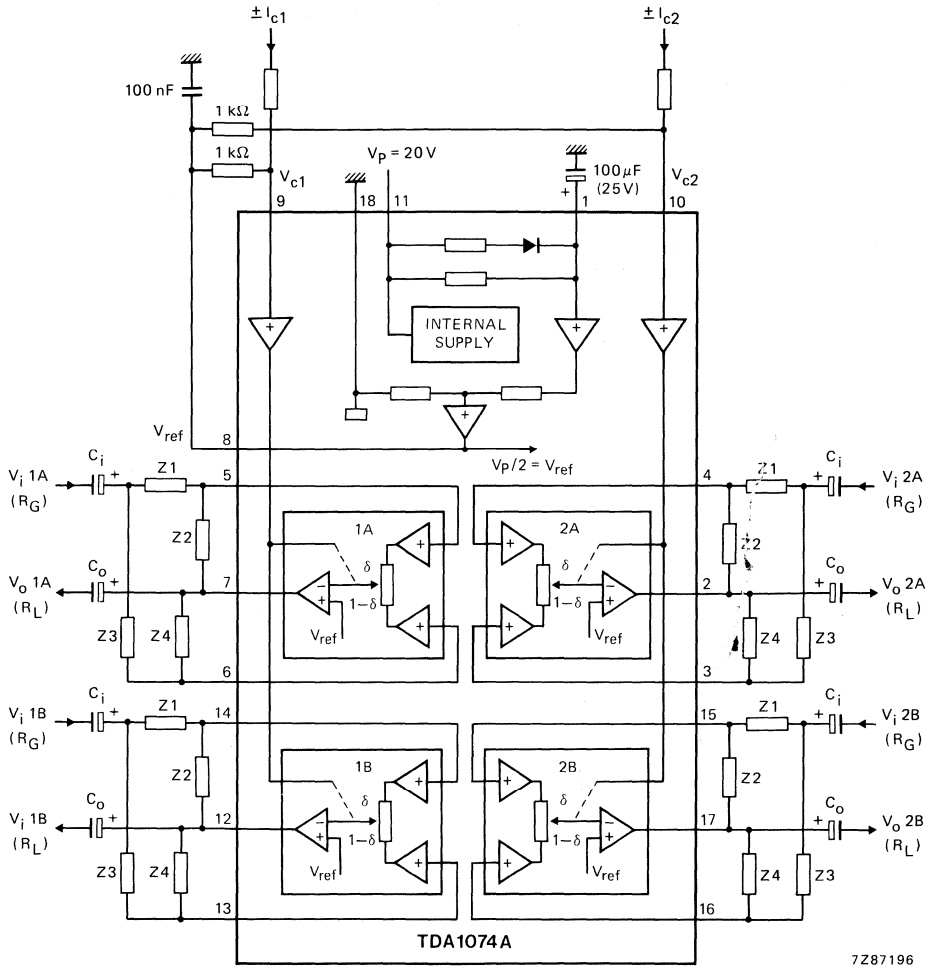

Fig. 1 Block diagram and basic external components;  $I_{c1}$  (at pin 9) and  $I_{c2}$  (at pin 10) are control input currents;  $V_{c1}$  (at pin 9) and  $V_{c2}$  (at pin 10) are control input voltages with respect to  $V_{ref} = V_p/2$  at pin 8;  $Z1 = Z2 = Z3 = Z4 = 22 \text{ k}\Omega$ ; the input generator resistance  $R_G = 60 \text{ }\Omega$ ; the output load resistance  $R_L = 4,7 \text{ k}\Omega$ ; the coupling capacitors at the inputs and outputs are  $C_i = 2,2 \text{ }\mu\text{F}$  and  $C_o = 10 \text{ }\mu\text{F}$  respectively.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 11)	$V_P$	max.	23 V
Control voltages (pins 9 and 10)	$\pm V_{C1}; \pm V_{C2}$	max.	1 V
Input voltage ranges (with respect to pin 18) at pins 3, 4, 5, 6, 13, 14, 15, 16	$V_i$		0 to $V_P$ V
Total power dissipation	$P_{tot}$	max.	800 mW
Storage temperature range	$T_{stg}$		-55 to +150 °C
Operating ambient temperature range	$T_{amb}$		-30 to +80 °C

**THERMAL RESISTANCE**

From crystal to ambient	$R_{th\ cr-a}$	=	80 K/W
-------------------------	----------------	---	--------

**REMARK**

The difference between the TDA1074 and its successor the TDA1074A is shown in Fig. 2 as the different component configuration at pin 8.

Fig. 2 Component configuration at pin 8 showing the difference between the TDA1074 and the TDA1074A.

## APPLICATION INFORMATION

## Treble and bass control circuit

Fig. 12 Cross-talk as a function of frequency; linear treble/bass setting ( $V_{c1} = V_{c2} = 0\text{ V}$ );  $V_i = 5\text{ V}$ ;  $R_G = 60\ \Omega$ ;  $R_L = 4,7\text{ k}\Omega$ .

## Application recommendations

1. If one or more electronic potentiometers in an IC are not used, the following is recommended:
  - a. Unused signal inputs of an electronic potentiometer should be connected to the associated output, e.g. pins 3 and 4 to pin 2.
  - b. Unused control voltage inputs should be connected directly to pin 8 ( $V_{ref}$ ).
2. Where more than one TDA1074A IC are used in an application, pins 1 can be connected together; however, pins 8 ( $V_{ref}$ ) may not be connected together directly.
3. Additional circuitry for limiting the frequency response in the ultrasonic range.

(1)  $f_{-3\text{dB}} = 110\text{ kHz}$  at linear setting

Fig. 13 Circuit diagram for frequency response limiting.

4. Alternative circuitry for limiting the gain of the treble control circuit in the ultrasonic range.

For  $R_{S1} = R_{S2} = 3,3\text{ k}\Omega$ ;  $f_{-3\text{dB}} \cong 1\text{ MHz}$  at linear setting

For  $R_{S1} = R_{S2} = 0\ \Omega$ ;  $f_{-3\text{dB}} \cong 100\text{ kHz}$  at linear setting

Fig. 14 Circuit diagram for limiting gain of treble control circuit.

## 24 W BTL OR 2 x 12 W STEREO CAR RADIO POWER AMPLIFIER

The TDA1510 is a monolithic integrated class-B output amplifier in a 13-lead single in-line (SIL) plastic power package. The device is primarily developed for car radio applications, and also to drive low-impedance loads (down to  $1,6 \Omega$ ). At a supply voltage  $V_p = 14,4 \text{ V}$ , an output power of 24 W can be delivered into a  $4 \Omega$  BTL (Bridge Tied Load), or, when used as stereo amplifier, it delivers  $2 \times 12 \text{ W}$  into  $2 \Omega$  or  $2 \times 7 \text{ W}$  into  $4 \Omega$ .

Special features are:

- flexibility in use – stereo as well as mono BTL
- high output power
- low offset voltage at the output (important for BTL)
- large useable gain variation
- very good ripple rejection
- load dump protection
- a.c. short-circuit safe to ground
- thermal protection
- internal limited bandwidth for high frequencies
- low stand-by current possibility, to simplify required switches
- low number and small sized external components
- high reliability

### QUICK REFERENCE DATA

Supply voltage range (operating)	$V_p$		6 to 18 V
Supply voltage (non-operating)	$V_p$	max.	28 V
Supply voltage (non-operating; load dump protection)	$V_p$	max.	45 V
Repetitive peak output current	$I_{ORM}$	max.	4 A
Total quiescent current	$I_{tot}$	typ.	75 mA
Stand-by current	$I_{sb}$	<	2 mA
Switch-on current	$I_{so}$	typ.	0,35 mA
Input impedance	$ Z_i $	>	1 M $\Omega$
Storage temperature range	$T_{stg}$		-55 to + 150 °C
Crystal temperature	$T_c$	max.	150 °C
<b>Bridge tied load application (BTL)</b>	$V_p$	=	14,4   13,2 V
Output power at $R_L = 4 \Omega$ (with bootstrap)	$P_o$	typ.	18   15 W

### PACKAGE OUTLINE

13-lead SIL-bent-to-DIL; plastic power (SOT-141B).

Fig. 1 Internal block diagram; the heavy lines indicate the signal paths. Pin 4 is internally connected.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage; operating (pin 10)	$V_P$	max.	18 V
Supply voltage; non-operating	$V_P$	max.	28 V
Supply voltage; during 50 ms (load dump protection)	$V_P$	max.	45 V
Peak output current	$I_{OM}$	max.	6 A
Total power dissipation			see derating curve Fig. 2
Storage temperature range	$T_{stg}$		-55 to + 150 °C
Crystal temperature	$T_C$	max.	150 °C

Fig. 2 Power derating curves.

**HEATSINK DESIGN EXAMPLE**

The derating of 3 K/W of the encapsulation requires the following external heatsink (for sine-wave drive):

24 W BTL (4  $\Omega$ ) or 2 x 12 W stereo (2  $\Omega$ )

maximum sine-wave dissipation: 12 W

$T_{amb} = 65$  °C maximum

$$R_{th\ h-a} = \frac{150 - 65}{12} - 3 = 4 \text{ K/W.}$$

2 x 7 W stereo (4  $\Omega$ )

maximum sine-wave dissipation: 6 W

$T_{amb} = 65$  °C maximum

$$R_{th\ h-a} = \frac{150 - 65}{6} - 3 = 11 \text{ K/W.}$$

**D.C. CHARACTERISTICS**

Supply voltage range (pin 10)	$V_P$		6 to 18 V
Repetitive peak output current	$I_{ORM}$	<	4 A
Total quiescent current	$I_{tot}$	typ. <	75 mA 150 mA
Stand-by current	$I_{sb}$	<	2 mA
Switch-on current (pin 11) at $V_{11} \leq V_{10}$ (note 1)	$I_{so}$	typ. <	0,35 mA 0,8 mA

**A.C. CHARACTERISTICS**

$T_{amb} = 25\text{ }^\circ\text{C}$ ;  $V_P = 14,4\text{ V}$ ;  $f = 1\text{ kHz}$ ; unless otherwise specified

**Bridge tied load application (BTL); see Fig. 3**

$$R_S = 0 \Omega$$

$V_{n(\text{rms})}$	typ.	0,15 mV
---------------------	------	---------

$$R_S = 10 \text{ k}\Omega$$

$V_{n(\text{rms})}$	typ.	0,25 mV
---------------------	------	---------

$$R_S = 10 \text{ k}\Omega; \text{ according to IEC curve A}$$

$V_n$	typ.	0,2 mV
-------	------	--------

**Notes**

1. If  $V_{11} > V_{10}$ , then  $I_{11}$  must be  $\leq 10 \text{ mA}$ .
2. Closed loop voltage gain can be chosen between 32 and 56 dB (BTL), and is determined by external components.
3. Frequency response externally fixed.
4. The input impedance in the test circuit (Fig. 3) is typ.  $100 \text{ k}\Omega$ .
5. Supply voltage ripple rejection measured with a source impedance of  $0 \Omega$  (maximum ripple amplitude:  $2 \text{ V}$ ).
6. Output power is measured directly at the output pins of the IC.
7. Closed loop voltage gain can be chosen between 26 and 50 dB (stereo), and is determined by external components.
8. A resistor of  $56 \text{ k}\Omega$  between pins 3 and 7 to reach symmetrical clipping.
9. Without bootstrap the  $100 \mu\text{F}$  capacitor between pins 5 and 6 (or 8 and 9) can be omitted. Pins 6, 8 and 10 have to be interconnected.

(1) Belongs to power supply.

## 12 to 20 W HI-FI AUDIO POWER AMPLIFIER

The TDA1512 is a monolithic integrated hi-fi audio power amplifier designed for asymmetrical power supplies for mains-fed apparatus.

Special features are:

- Thermal protection
- Low intermodulation distortion
- Low transient intermodulation distortion
- Built-in output current limiter
- Low input offset voltage
- Output stage with low cross-over distortion
- Single in-line (SIL) power package

### QUICK REFERENCE DATA

# DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

TDA1514

## 40 W HIGH-PERFORMANCE HI-FI AMPLIFIER

The TDA1514 integrated circuit is a hi-fi power amplifier for use as a building block in radio, tv and audio recorder applications. The high performance of the IC meets the requirements of digital sources (e.g. Compact Disc equipment).

The circuit is totally protected, the two output transistors both having thermal and SOAR protection. The circuit also has a mute function that can be arranged to operate for a period after power-on with a delay time fixed by external components.

The device is intended for symmetrical power supplies but an asymmetrical supply may also be used.

The theoretical maximum power dissipation with a stabilized power supply is  $(V_P - V_N)^2 / 2\pi^2 R_L = 19 \text{ W}$ , where  $V_P = +27,5 \text{ V}$ ,  $V_N = -27,5 \text{ V}$  and  $R_L = 8 \Omega$ . Considering, for example, a maximum ambient temperature of  $50^\circ\text{C}$  and a maximum junction temperature of  $150^\circ\text{C}$ , the total thermal resistance  $R_{thj-a}$  is  $(150 - 50) / 19 = 5,3 \text{ K/W}$ . Since the thermal resistance of the SOT-131A encapsulation is  $< 1,5 \text{ K/W}$ , the thermal resistance required of the heatsink is  $< 3,8 \text{ K/W}$ . Thus the maximum output power, and therefore the music power output, is limited only by the supply voltage and not by the heatsink.

### QUICK REFERENCE DATA

Supply voltage range (pin 6 to pin 4)	$V_P - V_N$		15 to 60 V
Total quiescent current at $V_P - V_N = 55 \text{ V}$	$I_{tot}$	typ.	60 mA
Output power at THD = -60 dB; $V_P - V_N = 55 \text{ V}$ ; $R_L = 8 \Omega$	$P_O$	typ.	40 W
Closed loop voltage gain (determined externally)	$G_c$	typ.	30 dB
Input resistance (determined externally)	$R_I$	typ.	20 k $\Omega$
Signal-to-noise ratio at $P_O = 50 \text{ mW}$	$(S+N)/N$	typ.	82 dB
Supply voltage ripple rejection at $f = 100 \text{ Hz}$	RR	typ.	72 dB

Input offset bias current	$\pm I_{io(b)}$	—	0,2	1	$\mu\text{A}$
Input bias current	$+ I_{ib}$	—	1	5	$\mu\text{A}$
Output impedance	$Z_o$	—	—	0,1	$\Omega$
Supply voltage ripple rejection at ripple frequency = 100 Hz; ripple voltage (r.m.s. value) = 500 mV; source resistance = 2 k $\Omega$	RR	70	—	—	dB
Mute time (note 5)	$t_M$	—	1,25	—	s
Mute-on voltage (pin 3 to pin 4)	$V_{M(on)}$	0	—	5	V
Mute-off voltage (pin 3 to pin 4)	$V_{M(off)}$	6	—	7	V
Quiescent current into pin 2 (note 6)	$I_{2\ tot}$	tbf	20	tbf	$\mu\text{A}$

**Notes to the characteristics**

1. Measured with two superimposed signals of 50 Hz and 7 kHz with an amplitude relationship of 4 : 1.
2. The closed loop gain is determined by external resistors (Fig. 1, R2 and R3) and is variable between 20 and 46 dB.
3. The input impedance in the test circuit (Fig. 1) is determined by the bias resistor R1.
4. The noise voltage at the output is measured in the band 20 Hz to 20 kHz and source resistance  $R_S = 2 \text{ k}\Omega$ .
5. Determined by R4 and C1.
6. The quiescent current into pin 2 determines (with the value of R4) the minimum power supply voltage at which the mute function remains in operation:

$$V_P - V_N = I_{2 \text{ tot}} \times R4 + V_{m(\text{on})\text{max}}$$

DEVELOPMENT DATA

## 24 W BTL OR 2 x 12 W STEREO CAR RADIO POWER AMPLIFIER

The TDA1515A is a monolithic integrated class-B output amplifier in a 13-lead single in-line (SIL) plastic power package. The device is primarily developed for car radio applications, and also to drive low impedance loads (down to  $1,6 \Omega$ ). At a supply voltage  $V_p = 14,4 \text{ V}$ , an output power of 24 W can be delivered into a  $4 \Omega$  BTL (Bridge Tied Load), or, when used as stereo amplifier, it delivers  $2 \times 12 \text{ W}$  into  $2 \Omega$  or  $2 \times 7 \text{ W}$  into  $4 \Omega$ .

Special features are:

- flexibility in use — mono BTL as well as stereo
- high output power
- low offset voltage at the output (important for BTL)
- large usable gain variation
- very good ripple rejection
- internal limited bandwidth for high frequencies
- low stand-by current possibility (typ.  $1 \mu\text{A}$ ), to simplify required switches; TTL drive possible
- low number and small sized external components
- high reliability

The following currently required protections are incorporated in the circuit. These protections also have positive influence on reliability in the applications.

- load dump protection
- a.c. and d.c. short-circuit safe to ground up to  $V_p = 18 \text{ V}$
- thermal protection
- speaker protection in bridge configuration
- SOAR protection
- outputs short-circuit safe to ground in BTL
- reverse polarity safe

### QUICK REFERENCE DATA

Supply voltage range (operating)	$V_p$		6 to 18 V
Supply voltage (non-operating)	$V_p$	max.	28 V

Supply voltage; non-operating	$V_P$	max.	28 V
Supply voltage; during 50 ms (load dump protection)	$V_P$	max.	45 V
Peak output current	$I_{OM}$	max.	6 A
Total power dissipation	see derating curve Fig. 2		
Storage temperature range	$T_{stg}$	-55 to + 150 °C	
Crystal temperature	$T_C$	max.	150 °C
A.C. and d.c. short-circuit safe voltage			max. 18 V
Reverse polarity			max. 10 V

Fig. 2 Power derating curves.

**HEATSINK DESIGN EXAMPLE**

The derating of 3 K/W of the encapsulation requires the following external heatsink (for sine-wave drive):

24 W BTL (4  $\Omega$ ) or 2 x 12 W stereo (2  $\Omega$ )

maximum sine-wave dissipation: 12 W

$T_{amb} = 65$  °C maximum

$$R_{th\ h-a} = \frac{150-65}{12} - 3 = 4 \text{ K/W.}$$

2 x 7 W stereo (4  $\Omega$ )

maximum sine-wave dissipation: 6 W

$T_{amb} = 65$  °C maximum

$$R_{th\ h-a} = \frac{150-65}{6} - 3 = 11 \text{ K/W.}$$

**D.C. CHARACTERISTICS**

Supply voltage range (pin 10)	$V_p$		6 to 18 V
Repetitive peak output current	$I_{ORM}$	<	4 A
Total quiescent current	$I_{tot}$	typ.	75 mA
Switching level 11 : OFF	$V_{11}$	<	1,8 V
ON	$V_{11}$	>	3 V
Impedance between pins 10 and 6; 10 and 8 (stand-by position $V_{11} < 1,8$ V)	$ Z_{OFF} $	>	100 k $\Omega$
Stand-by current at $V_{11} = 0$ to 0,8 V	$I_{sb}$	typ. <	1 $\mu$ A 100 $\mu$ A
Switch-on current (pin 11) at $V_{11} \leq V_{10}$ (note 1)	$I_{so}$	typ. <	10 $\mu$ A 100 $\mu$ A

**A.C. CHARACTERISTICS**

$T_{amb} = 25$  °C;  $V_p = 14,4$  V;  $f = 1$  kHz; unless otherwise specified

**Bridge tied load application (BTL); see Fig. 3**

Output power at $R_L = 4$ $\Omega$ (with bootstrap) $V_p = 14,4$ V; $d_{tot} = 0,5\%$	$P_o$	> typ.	15,5 W 18 W
$V_p = 14,4$ V; $d_{tot} = 10\%$	$P_o$	> typ.	20 W 24 W
$V_p = 13,2$ V; $d_{tot} = 0,5\%$	$P_o$	typ.	15 W
$V_p = 13,2$ V; $d_{tot} = 10\%$	$P_o$	typ.	20 W
Open loop voltage gain	$G_o$	typ.	75 dB
Closed loop voltage gain (note 2)	$G_c$	typ.	40 ( $\pm 0,5$ ) dB
Output power without bootstrap (note 9) $V_p = 14,4$ V; $d_{tot} = 10$ %	$P_o$	typ.	15 W
$V_p = 14,4$ V; $d_{tot} = 0,5$ %	$P_o$	typ.	12 W
$V_p = 13,2$ V; $d_{tot} = 10$ %	$P_o$	typ.	12 W
$V_p = 13,2$ V; $d_{tot} = 0,5$ %	$P_o$	typ.	9 W
Frequency response at $-3$ dB (note 3)	B		20 Hz to min. 20 kHz
Input impedance (note 4)	$ Z_i $	>	1 M $\Omega$
Noise input voltage (r.m.s. value) at $f = 20$ Hz to 20 kHz $R_S = 0$ $\Omega$	$V_{n(rms)}$	typ.	0,2 mV
$R_S = 10$ k $\Omega$	$V_{n(rms)}$	typ. <	0,35 mV 0,8 mV
$R_S = 10$ k $\Omega$ ; according to IEC 179 curve A	$V_n$	typ.	0,25 mV
Supply voltage ripple rejection (note 5) $f = 100$ Hz	RR	> typ.	42 dB 50 dB
D.C. output offset voltage between the outputs	$ \Delta V_{5,g} $	< typ.	50 mV 2 mV
Loudspeaker protection (all conditions) maximum d.c. voltage (across the load)	$ \Delta V_{5,g} $	<	1 V
Power bandwidth; $-1$ dB; $d_{tot} = 0,5\%$	B		30 Hz to 40 kHz

**Stereo application; see Fig. 4**

Output power at $d_{tot} = 10\%$ ; with bootstrap (note 6)			
$V_P = 14,4 \text{ V}; R_L = 4 \Omega$	$P_O$	>	6 W
		typ.	7 W
$V_P = 14,4 \text{ V}; R_L = 2 \Omega$	$P_O$	>	10 W
		typ.	12 W
$V_P = 13,2 \text{ V}; R_L = 4 \Omega$	$P_O$	typ.	6 W
$V_P = 13,2 \text{ V}; R_L = 2 \Omega$	$P_O$	typ.	10 W
Output power at $d_{tot} = 0,5\%$ ; with bootstrap (note 6)			
$V_P = 14,4 \text{ V}; R_L = 4 \Omega$	$P_O$	typ.	5,5 W
$V_P = 14,4 \text{ V}; R_L = 2 \Omega$	$P_O$	typ.	9 W
$V_P = 13,2 \text{ V}; R_L = 4 \Omega$	$P_O$	typ.	4,5 W
$V_P = 13,2 \text{ V}; R_L = 2 \Omega$	$P_O$	typ.	7,5 W
Output power at $d_{tot} = 10\%$ ; without bootstrap			
$V_P = 14,4 \text{ V}; R_L = 4 \Omega$ (notes 6, 8 and 9)	$P_O$	typ.	6 W
Frequency response at $-3 \text{ dB}$ (note 3)	B		40 Hz to min. 20 kHz
Supply voltage ripple rejection (note 5)	RR	typ.	50 dB
Channel separation; $R_S = 10 \text{ k}\Omega; f = 1 \text{ kHz}$	$\alpha$	>	40 dB
		typ.	50 dB
Closed loop voltage gain (note 7)	$G_C$	typ.	40 dB
Noise output voltage (r.m.s. value) at $f = 20 \text{ Hz to } 20 \text{ kHz}$			
$R_S = 0 \Omega$	$V_{n(rms)}$	typ.	0,15 mV
$R_S = 10 \text{ k}\Omega$	$V_{n(rms)}$	typ.	0,25 mV
$R_S = 10 \text{ k}\Omega$ ; according to IEC 179 curve A	$V_n$	typ.	0,2 mV

**Notes**

1. The internal circuit impedance at pin 11 is  $> 5 \text{ k}\Omega$  if  $V_{11} > V_{10}$ .
2. Closed loop voltage gain can be chosen between 32 and 56 dB (BTL), and is determined by external components. For further gain reduction see Application Report.
3. Frequency response externally fixed.
4. The input impedance in the test circuit (Fig. 3) is typ.  $100 \text{ k}\Omega$ .
5. Supply voltage ripple rejection measured with a source impedance of  $0 \Omega$  (maximum ripple amplitude: 2 V).
6. Output power is measured directly at the output pins of the IC.
7. Closed loop voltage gain can be chosen between 26 and 50 dB (stereo), and is determined by external components.
8. A resistor of  $56 \text{ k}\Omega$  between pins 3 and 7 to reach symmetrical clipping.
9. Without bootstrap the  $100 \mu\text{F}$  capacitor between pins 5 and 6 (8 and 9) can be omitted. Pins 6, 8 and 10 have to be interconnected.

## 20 W HI-FI AUDIO POWER AMPLIFIER

The TDA1520 is a monolithic integrated hi-fi audio power amplifier designed for asymmetrical or symmetrical power supplies for mains-fed apparatus.

Special features are:

- Thermal protection
- Very low intermodulation distortion
- Very low transient intermodulation distortion
- Built-in output current limiter
- Low input offset voltage
- Output stage with low cross-over distortion
- Single in-line (SIL) power package
- A.C. short-circuit protected

### QUICK REFERENCE DATA

Supply voltage range	$V_P$	15 to 40 V

## 20 W HI-FI AUDIO POWER AMPLIFIER

### GENERAL DESCRIPTION

The TDA1520A is a monolithic integrated hi-fi audio power amplifier designed for asymmetrical or symmetrical power supplies for mains-fed apparatus.

### Features

- Low input offset voltage
- Output stage with low cross-over distortion
- Single in-line (SIL) power package
- A.C. short-circuit protected
- Very low internal thermal resistance
- Thermal protection
- Very low intermodulation distortion
- Very low transient intermodulation distortion
- Complete SOAR protection

### QUICK REFERENCE DATA

Supply voltage range	$V_p$	15 to 50 V

# DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

TDA1521

## 2 x 12 W HI-FI AUDIO POWER AMPLIFIER

### GENERAL DESCRIPTION

The TDA1521 is a dual hi-fi audio power amplifier in a 9-lead single in-line (SIL-9) plastic power package. The device is especially designed for mains fed applications (e.g. stereo tv sound and stereo radio).

### Features

- Requires very few external components
- Input muted during power-on and off (no switch-on or switch-off sounds)
- Low offset voltage between output and ground
- Excellent gain balance between channels
- Hi-fi according to IEC 268 and DIN 45500
- Short-circuit-proof
- Thermally protected

### QUICK REFERENCE DATA

#### Stereo applications

Supply voltage range	$V_P$	$\pm 7,5$ to $\pm 20$ V
Output power at THD = 0,5%, $V_P = \pm 16$ V	$P_O$	typ. 12 W
Voltage gain	$G_V$	typ. 30 dB
Gain balance between channels	$\Delta G_V$	typ. 0,2 dB
Ripple rejection	RR	typ. 60 dB
Channel separation	$\alpha$	typ. 70 dB
Noise output voltage	$V_{no(rms)}$	typ. 70 $\mu$ V

### PACKAGE OUTLINE

9-lead SIL; plastic power (SOT-131B).

| 5. | -Vp   | negative supply       |    |       |                       |

**FUNCTIONAL DESCRIPTION**

This hi-fi stereo power amplifier is designed for mains fed applications. The circuit is optimal for symmetrical power supplies but it is also well suited to asymmetrical power supply systems. An output power of 2 x 12 watts (THD = 0,5%) can be delivered into an 8  $\Omega$  load with a symmetrical power supply of  $\pm 16$  V.

The gain is fixed internally at 30 dB, but can be changed externally if required. Internal gain fixing gives low gain spread and very good balance between the amplifiers (0,2 dB).

A special feature is an input mute circuit which provides suppression of unwanted signals at the inputs during switching-on and off. This circuit disconnects the non-inverting inputs when the supply voltage is below  $\pm 6$  V, whilst allowing the amplifiers to remain in their d.c. operating condition.

Two thermal protection circuits are provided, one monitors the average junction temperature and the other the instantaneous temperature of the power transistors. Both protection circuits activate at 150  $^{\circ}\text{C}$  allowing safe operation to a maximum junction temperature of 150  $^{\circ}\text{C}$  without added distortion.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

**DEVELOPMENT DATA**

parameter	conditions	symbol	min.	max.	unit
Supply voltage	pins 5 and 7	$V_p = V_{5, 7-3}$	—	+20	V
Non-repetitive peak output current	pins 4 and 6	$I_{OSM}$	—	4	A

Junction temperature		$T_j$	—	150	$^{\circ}\text{C}$
Short-circuit time: outputs short-circuited to ground	symmetrical power supply	$t_{sc}$	—	1	hour
	asymmetrical power supply; $V_p < * V$ (unloaded); $R_i \geq * \Omega$	$t_{sc}$	—	1	hour

\* Value under investigation.

Fig. 2 Power derating curve.

**THERMAL RESISTANCE**

From junction to case

$$R_{th\ j-c} = 2,5\ K/W$$

**HEATSINK DESIGN EXAMPLE**

With derating of 2,5 K/W, the value of heatsink thermal resistance is calculated as follows:

given  $R_L = 8\ \Omega$  and  $V_p = \pm 16\ V$ , the measured maximum dissipation is 14,6 W; then, for a maximum ambient temperature of 65 °C, the required thermal resistance of the heatsink is

$$R_{th\ h-a} = \frac{150 - 65}{14,6} - 2,5 = 3,3\ K/W$$

## STEREO CASSETTE HEAD PREAMPLIFIER AND EQUALIZER

### GENERAL DESCRIPTION

The TDA1522 is a playback amplifier for car radio/cassette players.

#### Features

- Two independent amplifiers with open loop gain of typ. 90 dB
- Internal d.c. feedback via a 140 k $\Omega$  resistor from output to feedback point
- A.C. characteristics that can be determined externally by an RC network
- Electronic on/off switching with transient suppression for switch on
- Head input at d.c. ground that eliminates the input coupling capacitor
- Minimal external component requirement
- Stability down to a gain of 30 dB
- Low input noise
- Low distortion
- D.C. input current < 2  $\mu$ A
- Wide supply voltage range

### QUICK REFERENCE DATA

Supply voltage range (pin 8)	V <sub>p</sub>	7,5 to 23 V
Supply current (pin 8)	I <sub>p</sub>	typ. 5 mA
Operating ambient temperature range	T <sub>amb</sub>	-30 to +85 °C
Total harmonic distortion	THD	typ. 0,05 %
Channel separation at R <sub>S</sub> = 10 k $\Omega$ ; L <sub>S</sub> = 0	$\alpha$	min. 45 dB

### PACKAGE OUTLINE

9-lead SIL; plastic (SOT-142).

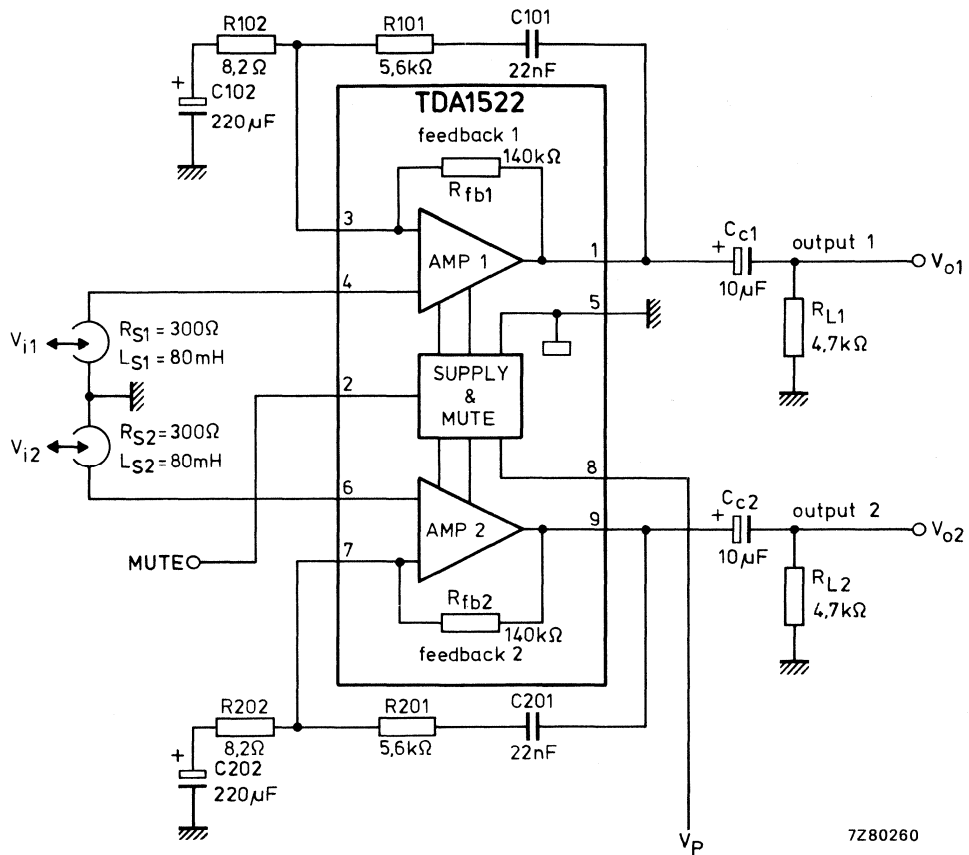

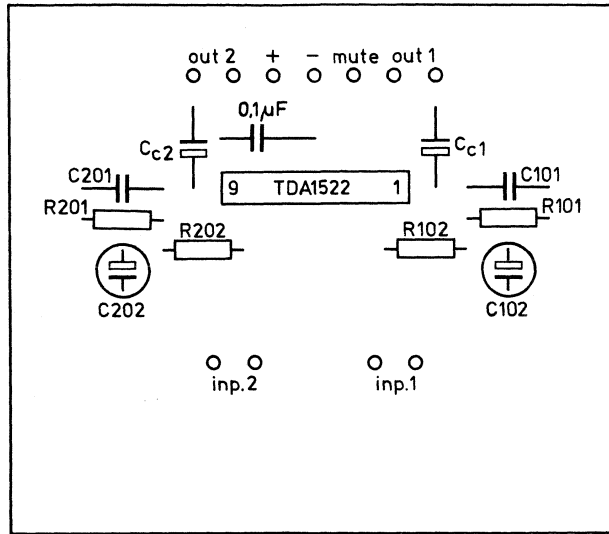

Fig. 1 Block diagram with external components; also used as test circuit.

## STEREO-TONE/VOLUME CONTROL CIRCUIT

### GENERAL DESCRIPTION

The device is designed as an active stereo-tone/volume control for car radios, TV receivers and mains-fed equipment. It includes functions for bass and treble control, volume control with built-in contour (can be switched off) and balance. All these functions can be controlled by d.c. voltages or by single linear potentiometers.

### Features

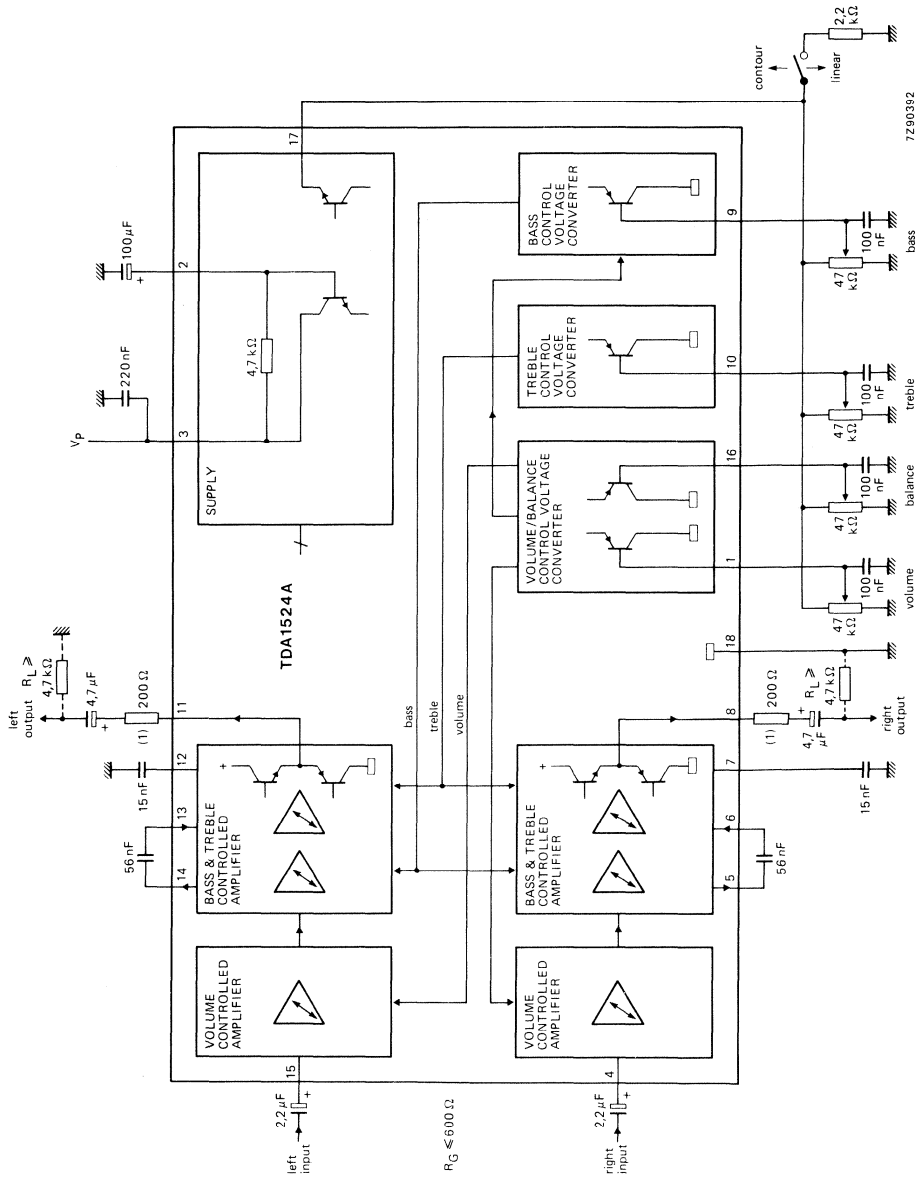

- Few external components necessary
- Low noise due to internal gain
- Bass emphasis can be increased by a double-pole low-pass filter
- Wide power supply voltage range

### QUICK REFERENCE DATA

Supply voltage (pin 3)	$V_P = V_{3-18}$	typ.	12 V
Supply current (pin 3)	$I_P = I_3$	typ.	35 mA
Maximum input signal with d.c. feedback (r.m.s. value)	$V_{i(rms)}$	typ.	2,5 V
Maximum output signal with d.c. feedback (r.m.s. value)	$V_{o(rms)}$	typ.	3 V
Volume control range	$G_V$		-80 to +21,5 dB
Bass control range at 40 Hz	$\Delta G_V$	typ.	$\pm 15$ dB
Treble control range at 16 kHz	$\Delta G_V$	typ.	$\pm 15$ dB
Total harmonic distortion	THD	typ.	0,3 %
Output noise voltage (unweighted; r.m.s. value) at $f = 20$ Hz to 20 kHz; $V_P = 12$ V; for max. voltage gain for voltage gain $G_V = -40$ dB	$V_{no(rms)}$ $V_{no(rms)}$	typ.	310 $\mu$ V 100 $\mu$ V
Channel separation at $G_V = -20$ to +21,5 dB	$\alpha_{cs}$	typ.	60 dB
Tracking between channels at $G_V = -20$ to +26 dB	$\Delta G_V$	max.	2,5 dB
Ripple rejection at 100 Hz	RR	typ.	50 dB
Supply voltage range (pin 3)	$V_P = V_{3-18}$		7,5 to 16,5 V
Operating ambient temperature range	$T_{amb}$		-30 to +80 °C

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102HE).

(1) Series resistor is recommended in the event of the capacitive loads exceeding  $200\text{ pF}$ .

Fig. 1 Block diagram and application circuit with single-pole filter.

Fig. 2 Double-pole low-pass filter for improved bass-boost.

Fig. 3 D.C. feedback with filter network for improved signal handling.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 3)	$V_P = V_{3-18}$	max.	20 V
Total power dissipation	$P_{tot}$	max.	1200 mW
Storage temperature range	$T_{stg}$		-55 to + 150 °C
Operating ambient temperature range	$T_{amb}$		-30 to + 80 °C

## D.C. CHARACTERISTICS

$V_P = V_{3-18} = 12 \text{ V}$ ;  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$ ; measured in Fig. 1;  $R_G \leq 600 \text{ } \Omega$ ;  $R_L \geq 4,7 \text{ k}\Omega$ ;  $C_L \leq 200 \text{ pF}$ ;  
unless otherwise specified

	$V_{no(m)}$	—	420	—	$\mu\text{V}$

**Notes to characteristics**

1. Equation for input resistance (see also Fig. 4)

$$R_i = \frac{160\text{ k}\Omega}{1 + G_v} ; G_v \text{ max} = 12.$$

- Frequencies below 200 Hz and above 5 kHz have reduced voltage swing, the reduction at 40 Hz and at 16 kHz is 30%.
- In the event of bass boosting the output signal handling is reduced. The reduction is 1 dB for maximum bass boost.
- Linear frequency response.
- For peak values add 4,5 dB to r.m.s. values.

Fig. 4 Input resistance ( $R_i$ ) as a function of gain of volume control ( $G_v$ ). Measured in Fig. 1.

# DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

TDA1534

## 14-BIT ANALOGUE TO DIGITAL CONVERTER (ADC)

An integrated 14-bit analogue to digital converter (ADC) which uses the successive approximation conversion technique and includes the comparator, reference source and clock on the same chip. The high linearity makes it very suitable for signal processing while the accurate, temperature-compensated reference source makes it applicable for instrumentation purposes.

The ADC accepts unipolar or bipolar input signals.

Digital output data is in serial form.

All digital outputs are fully TTL compatible.

### QUICK REFERENCE DATA

Positive supply voltage (pin 5)	$V_p$	typ.	5 V
Negative supply voltage 1 (pin 6)	$-V_{N1}$	typ.	5 V
Negative supply voltage 2 (pin 9)	$-V_{N2}$	typ.	17 V
Signal-to-noise ratio	S/N	typ.	84 dB
Linearity error		typ.	$\pm \frac{1}{2}$ LSB
Total power dissipation	$P_{tot}$	typ.	500 mW
Operating ambient temperature range	$T_{amb}$	-20 to +70	°C
Storage temperature range	$T_{stg}$	-55 to +150	°C
Resolution			14 bits
Full scale input current	$I_{FS}$	typ.	4 mA

## FUNCTIONAL DESCRIPTION

The circuit consists of the following parts:

### 14-bit D/A converter

Using "dynamic element matching", which results in high accuracy, linearity and longterm stability, without the need of trimming. The main parts of the DAC are the binary weighted current sources and the bit switches. The DAC also delivers an offset binary current for bipolar operation of the ADC.

### Fast settling comparator/subtractor

Consisting of a high speed, clamped operational amplifier with special frequency compensation system.

### Successive approximation register (SAR)

This register is an array of fourteen addressable latches, with the outputs connected to the bit switches of the D/A converter.

### Logic-level converters

Converting the internally used current-mode-logic (CML) levels to TTL levels, for easy interface of the ADC with standard logic families.

### Clock oscillator and control logic

Delivering the pulses and timing for the SAR and takes care of the communication with the peripheral circuits.

### Reference source

Based on the bandgap voltage of silicon, with extra temperature compensation circuit.

For the timing of the output signals see Fig. 3. At the leading edge of the start conversion (SC) pulse the ADC starts converting the input voltage. During the conversion cycle the following signals appear at the output pins:

### Status (pin 2)

This signal can be used to force the Sample-Hold-Circuit, in front of the ADC, in hold mode.

### Data strobe (pin 4)

This signal is used to clock the data-out signal into the peripheral devices.

### Data out (pin 3)

The 14 bits serial, binary, output code of the A/D converter starting with the most significant bit (MSB). The data must be considered valid at the trailing edge of the data-strobe signal.

## 14-BIT DAC WITH 85 dB S/N RATIO

### GENERAL DESCRIPTION

The TDA1540 is a monolithic integrated 14-bit digital to analogue converter (DAC). It incorporates a 14-bit input shift register with output latches, binary weighted current sources with switches and a reference source.

The IC features an improved switch circuitry which eliminates the need for a deglitcher circuit at the output. This results in a signal-to-noise ratio of typical 85 dB in the audio band.

### QUICK REFERENCE DATA

Supply voltages			
pin 4	$V_{P1}$	typ.	5 V
pin 7	$V_{N1}$	typ.	-5 V

Full scale temperature coefficient at analogue output (pin 22)	$TC_{FS}$	typ.	$\pm 30 \cdot 10^{-6} K^{-1}$
Operating ambient temperature range	$T_{amb}$		-20 to $+70$ °C
Total power dissipation	$P_{tot}$	typ.	350 mW

### PACKAGE OUTLINE

TDA1540P: 28-lead DIL; plastic (SOT-117BE).

**FUNCTIONAL DESCRIPTION**

The binary weighted current sources are obtained by a combination of a passive divider and a time division concept. Figure 1a gives the diagram of one divider stage. The total emitter current  $4I$  of the passive divider is divided into four more or less equal output currents.

The output currents of the passive divider are now interchanged during equal time intervals generated by means of a shift register. The average output currents are exactly equal as a result of this operation. A ripple on the output current, caused by a mismatch of the passive divider, is filtered by an a.c. low-pass filter, requiring an external filter capacitor.

The outputs of the dividers are combined to obtain the output currents  $I(\bar{I}_1)$ ,  $I(\bar{I}_2)$  and  $2I(\bar{I}_3)$  (see Fig. 1b). The current of the most significant bit is generated by an on-chip reference source. A binary weighted current network is formed by cascading the current division stages (see Fig. 2).

The interchanging pulses are generated by an on-chip oscillator and a 4-bit shift register. The binary currents are switched to the current output (pin 22) via diode-transistor switching stages; therefore, the voltage on the output pin must be  $0\text{ V} \pm 10\text{ mV}$ . The output current can be converted into a voltage by means of a summing amplifier.

Figure 3 represents the data input format, and an application circuit is given in Fig. 4.

TDA1541

## DUAL 16-BIT DAC

### GENERAL DESCRIPTION

The TDA1541 is a monolithic integrated dual 16-bit digital-to-analogue converter (DAC) designed for use in hi-fi digital audio equipment such as Compact Disc players, digital tape or cassette recorders.

### Features

- Selectable two-channel input format: offset binary or two's complement
- Internal timing and control circuit
- TTL compatible digital inputs
- High maximum input bit-rate and fast settling time

### QUICK REFERENCE DATA

## FUNCTIONAL DESCRIPTION

The TDA1541 accepts input sample formats in time multiplexed mode or simultaneous mode with any bit length. The most significant bit (MSB) must always be first. This flexible input data format allows easy interfacing with signal processing chips such as interpolation filters, error correction circuits, pulse code modulation adaptors and audio signal processors (ASP).

The high maximum input bit-rate and fast settling time facilitates application in 4 x oversampling systems (44,1 kHz to 176,4 kHz) with the associated simple analogue filtering function (low order, linear phase filter).

### Input data selection (see also Table 1)

With input  $\overline{\text{OB}}/\text{TWC}$  connected to ground, data input (offset binary format) must be in time multiplexed mode. It is accompanied with a word select (WS) and a bit clock input (BCK) signal. A separate system clock input (SCK) is provided for accurate, jitter-free timing of the analogue outputs AOL and AOR.

With  $\overline{\text{OB}}/\text{TWC}$  connected to  $V_{\text{DD}}$  the mode is the same but data format must be in two's complement.

When input  $\overline{\text{OB}}/\text{TWC}$  is connected to ( $V_{\text{DD}1}$ ) the two channels of data (L/R) are input simultaneously via (DATA L) and (DATA R), accompanied with BCK and a latch-enable input (LE). With this mode selected the data must be in offset binary.

The format of data input signals is shown in figures 3, 4 and 5.

True 16-bit performance is achieved by each channel using three 2-bit active dividers, operating on the dynamic element matching principle, in combination with a 10-bit passive current-divider, based on emitter scaling. All digital inputs are TTL compatible.

**Table 1** Input data selection

$\overline{\text{OB}}/\text{TWC}$	mode	pin 1	pin 2	pin 3	pin 4
-5 V	simultaneous	LE	BCK	DATA L	DATA R
0 V	time MUX OB	WS	BCK	DATA OB	SCK

DEVELOPMENT DATA

## MOTOR SPEED REGULATOR

The TDA1559 is a 3 pins speed regulator circuit for d.c. motors. It is especially intended for low-voltage motors in battery operated cassette recorder systems and record players. The IC features a high multiplication coefficient ( $k = 21,5$ ) and a low drop-out voltage (0,5 V). It also contains a current limiter and thermal shut-down.

Pin 1 connected to metal part of mounting surface.

(1) Within this region the cross-section of the leads is uncontrolled.

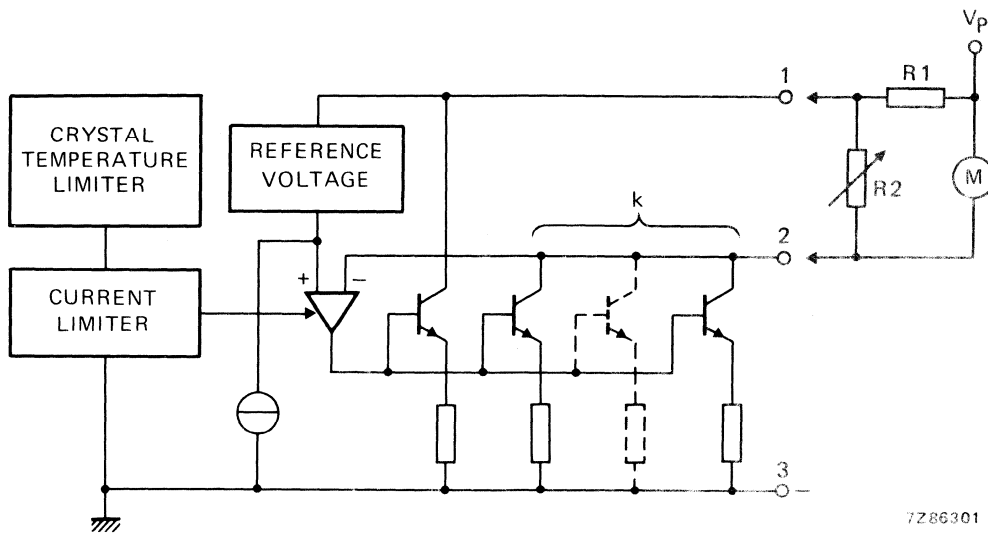

Fig. 2 Functional diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	$V_P = V_{1,3}$ max.	16 V
Output current	$I_2$ max.	1,2 A
Storage temperature	$T_{stg}$	-25 to +125 °C
Junction temperature (limited by thermal limitation)	$T_j$ max.	130 °C
Operating ambient temperature range	$T_{amb}$	-25 to +70 °C

**THERMAL RESISTANCE**

From junction to case	$R_{thj-c}$ =	10 K/W
From junction to ambient	$R_{thj-a}$ =	100 K/W

Fig. 3 Test circuit.

## CHARACTERISTICS

$V_p = 9\text{ V}$ ;  $I_2 = 70\text{ mA}$ ;  $T_{\text{amb}} = 25\text{ }^\circ\text{C}$ ;  $R_1 = 0$ ; heatsink with  $R_{\text{th}} = 100\text{ K/W}$  and after thermal stabilization; unless otherwise specified; see test circuit Fig. 3.

		—	-0,08	—	%/K	

\* There are 4 ranges of k-factors, indicated by either '1', '2', '3', or '4' on the package. Ordering a specific range is not possible.

1 = 19,3 to 20,5

2 = 20,3 to 21,5

3 = 21,3 to 22,7

4 = 22,5 to 24,3

APPLICATION INFORMATION

Fig. 4 Example of using the TDA1559 in a d.c. motor speed regulation circuit.

**Notes to Fig. 4**

$$R_2 = R_2' + R_2''$$

$$E_n = n \times C \times \phi \quad \text{where: } n = \text{speed in revolutions per minute}$$

$$I_m = T \times \frac{2\pi}{60} = \frac{1}{C \cdot \phi}$$

C = motor constant

$\phi$  = magnetic flux

$E_n$  = electromotive force (e.m.f.)

T = motor torque

$R_m$  = motor resistance

$E_n$  can be expressed as:

$$E_n = I_m \left( \frac{R_1}{k} - R_m \right) + V_{\text{ref}} \left\{ 1 + \frac{R_1}{R_2} \left( 1 + \frac{1}{k} \right) \right\} + R_2 \times I_q$$

For optimal regulation ( $dn/dT = 0$ ),  $\left( \frac{R_1}{k} - R_m \right)$  should be zero.

However, if  $R_1 = k \times R_m$ , the regulator will be oscillating, so for stability always  $R_1 < k \times R_m$ .

$R_2$  is determined by:

$$R_2 = \frac{V_{\text{ref}} \times R_1 \times \left( 1 + \frac{1}{k} \right)}{E_n - (R_1 \times I_q) - V_{\text{ref}} - I_m \left( \frac{R_1}{k} - R_m \right)}$$

Example:

$$E_n = E_{2000} = 3,58 \text{ V} \pm 11,6\%$$

$$R_m = 13 \Omega \pm 10\%$$

$$n = 2000 \text{ rev/min}$$

$$T = 1 \text{ mNm}$$

$$R_1 = 220 \Omega$$

$$R_2' = 82 \Omega$$

$$R_2'' = 220 \Omega$$

When a diode (D = BA220) is connected in series with pin 1, then the expressions for  $R_2$  and  $E_n$  are:

$$R_2 = \frac{(V_{\text{ref}} + V_D) \times R_1 \times \left( 1 + \frac{1}{k} \right)}{E_n - (R_1 \times I_q) - (V_{\text{ref}} + V_D) - I_m \left( \frac{R_1}{k} - R_m \right)}$$

$$E_n = I_m \left( \frac{R_1}{k} - R_m \right) + (V_{\text{ref}} + V_D) \left\{ 1 + \frac{R_1}{R_2} \left( 1 + \frac{1}{k} \right) \right\} + R_2 \times I_q$$

Example:

$$E_n = E_{2000} = 3,58 \text{ V} \pm 11,6\%$$

$$R_m = 13 \Omega \pm 10\%$$

$$n = 2000 \text{ rev/min}$$

$$T = 1 \text{ mNm}$$

$$R_1 = 220 \Omega$$

$$R_2' = 160 \Omega$$

$$R_2'' = 470 \Omega$$

$$D = \text{BA220}$$

## INTEGRATED FM TUNER FOR RADIO RECEIVERS

### GENERAL DESCRIPTION

The TDA1574 is a monolithic integrated FM tuner circuit designed for use in the r.f./i.f. section of car radios and home-receivers. The circuit comprises a mixer, oscillator and a linear i.f. amplifier for signal processing, plus the following additional features.

#### Features

- Keyed automatic gain control (a.g.c.)
- Regulated reference voltage
- Buffered oscillator output
- Electronic standby switch
- Internal buffered mixer driving

### QUICK REFERENCE DATA

Supply voltage range (pin 15)	$V_P$		7 to 16 V
Mixer input bias voltage (pins 1 and 2)	$V_{1,2-4}$	typ.	1 V
noise figure	NF	typ.	9 dB
Oscillator output voltage (pin 6)	$V_{6-4}$	typ.	2 V
output admittance at pin 6 for $f = 108,7$ MHz	Y22	typ.	$1,5 + j2$ mS
Oscillator output buffer			
D.C. output voltage (pin 9)	$V_{9-4}$	typ.	6 V
Total harmonic distortion	THD	typ.	-15 dBc
Linear i.f. amplifier output voltage (pin 10)	$V_{10-4}$	typ.	4,5 V
noise figure at $R_S = 300 \Omega$	NF	typ.	6,5 dB
Keyed a.g.c. output voltage range (pin 18)	$V_{18-4}$		+ 0,5 to $V_P - 0,3$ V

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102HE).

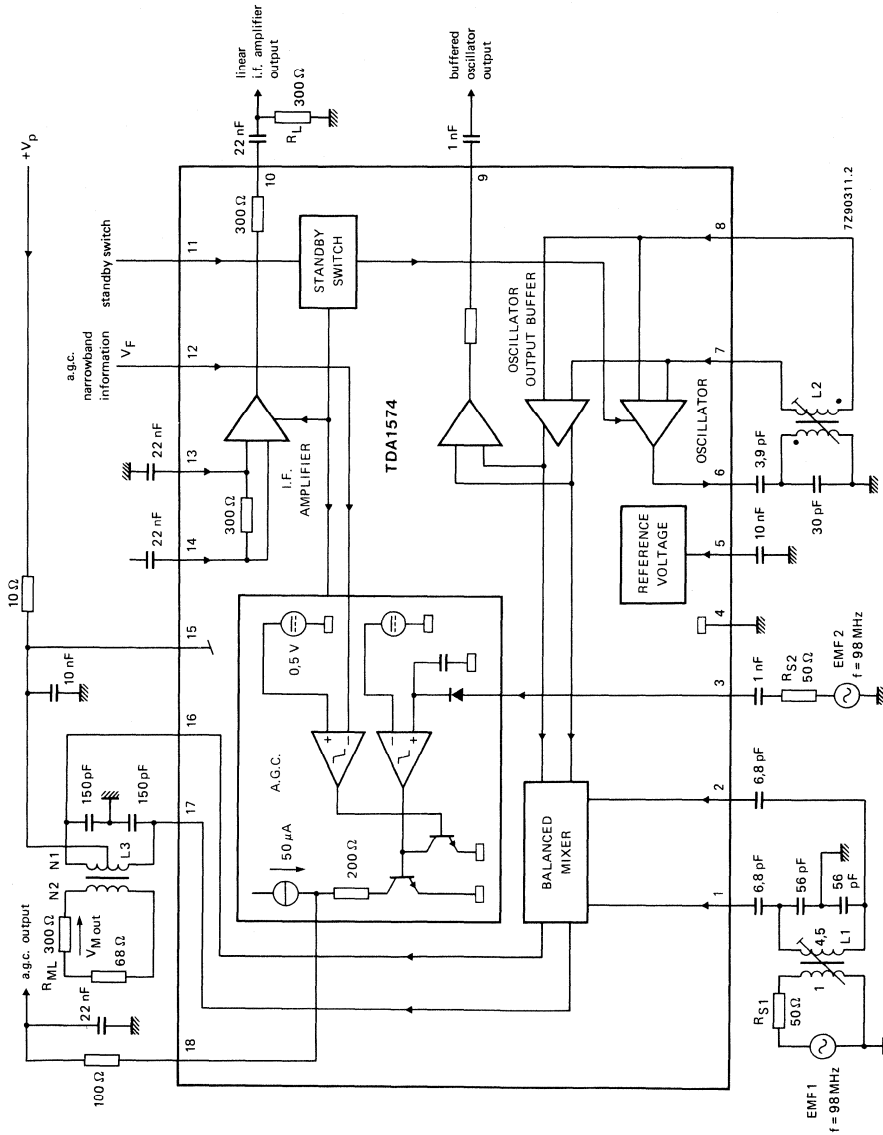

Fig. 1 Block diagram and test circuit.

**Coil data**

- L1: TOKO MC-108, 514HNE-150014S14; L = 0,078  $\mu$ H
- L2: TOKO MC-111, E516HNS-200057; L = 0,08  $\mu$ H
- L3: TOKO coil set 7P, N1 = 5,5 + 5,5 turns, N2 = 4 turns

**FUNCTIONAL DESCRIPTION****Mixer**

The mixer circuit is a double balanced multiplier with a preamplifier (common base input) to obtain a large signal handling range and a low oscillator radiation.

**Oscillator**

The oscillator circuit is an amplifier with a differential input. Voltage regulation is achieved by utilizing the symmetrical tanh-transfer-function to obtain low order 2nd harmonics.

**Linear IF amplifier**

The IF amplifier is a one stage, differential input, wideband amplifier with an output buffer.

**Keyed AGC**

The AGC processor combines narrow- and wideband information via an RF level detector, a comparator and an ANDing stage. The level dependent, current sinking output has an active load, which sets the AGC threshold.

The AGC function can either be controlled by a combination of wideband and narrowband information (keyed AGC), or by a wideband information only, or by narrowband information only. If only narrow-band AGC is wanted pin 3 should be connected to pin 5. If only wideband AGC is wanted pin 12 should be connected to pin 13.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 15)	$V_P = V_{15-4}$	max.	18 V
Mixer output voltage (pins 16 and 17)	$V_{16, 17-4}$	max.	35 V
Standby switch input voltage (pin 11)	$V_{11-4}$	max.	23 V
Reference voltage (pin 5)	$V_{5-4}$	max.	7 V
Field strength input voltage (pin 12)	$V_{12-4}$	max.	7 V
Total power dissipation	$P_{tot}$	max.	800 mW
Storage temperature range	$T_{stg}$		-55 to + 150 °C
Operating ambient temperature range	$T_{amb}$		-40 to + 85 °C

**THERMAL RESISTANCE**

From junction to ambient (in free air)	$R_{th j-amb}$	=	80 K/W
--	----------------	---	--------

**Note**

All pins are short-circuit protected to ground.

**CHARACTERISTICS**

$V_P = V_{15-4} = 8,5 \text{ V}$ ;  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$ ; measured in test circuit Fig. 1; unless otherwise specified

## FM/IF AMPLIFIER CIRCUIT

The TDA 1576 is a monolithic integrated f.m./i.f. amplifier circuit provided with the following functions:

- symmetrical limiting i.f. amplifier
- symmetrical quadrature demodulator
- internal muting circuit
- symmetrical a.f.c. output
- field-strength indication output
- detune-detector
- reference voltage output
- electronic smoothing of the supply voltage
- standby on/off switching circuit.

## QUICK REFERENCE DATA

$f_o = 10,7$  MHz;  $\Delta f = \pm 22,5$  kHz;  $f_m = 400$  Hz;  $Q_L = 20$ ; de-emphasis  $\tau = 50$   $\mu$ s

Fig. 10 Example of the TDA1576 when using a demodulator with two tuned circuits. Adjustment of the demodulator circuit is obtained with an i.f. signal which is higher than the 3 dB limiting level, L2 should be short-circuited or detuned, L1 should be adjusted to min.  $d_2$  distortion, and then L2 to min.  $d_2$  distortion. Coil data:  $L_1 = L_2 = 0,38 \mu\text{H}$ ;  $Q_0 = 70$ ; coil former KAN (C).

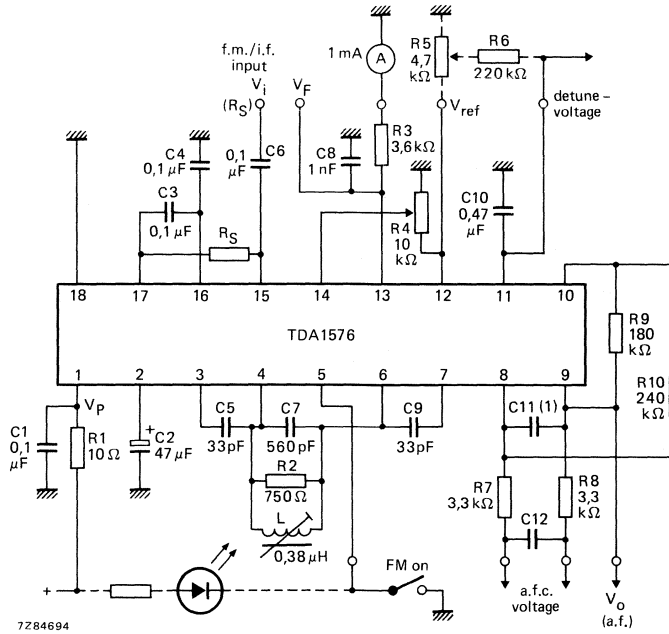

Fig. 11 Total distortion as a function of detuning;  $f_m = 400 \text{ Hz}$ ;  $C_{8,9} = 6,8 \text{ nF}$ ;  $\Delta f = \pm 75 \text{ kHz}$ ;  $V_o = 330 \text{ mV}$  for a frequency deviation  $\Delta f = \pm 75 \text{ kHz}$ .

(1) For mono: C11 = 6,8 nF; for stereo: C11 = 56 pF.

Fig. 12 Application example of using TDA1576.

## TIME MULTIPLEX PLL STEREO DECODER

### GENERAL DESCRIPTION

The TDA1578A is a PLL stereo decoder based on the time-division multiplex principle.

#### Features

- adjustable input and output voltage levels
- automatic mono/stereo switching with hysteresis, controlled by both pilot signal and field strength level
- analogue control of mono/stereo change over
- pilot indicator driver
- analogue muting control
- muting indicator driver
- oscillator with decoupled frequency measurement output
- electronic smoothing of the supply voltage

### QUICK REFERENCE DATA

Measured with a frequency deviation  $\Delta f = \pm 75$  kHz without pilot;  $f_m = 1$  kHz

Supply voltage (pin 8)	$V_P = V_{8-7}$	typ.	8,5	15	V
Supply current (pin 8)	$I_P = I_8$	typ.	21	30	mA
Multiplex input signal (adjustable)	$V_{MUX(p-p)}$	typ.	0,5	1	V
Input resistance (adjustable)	$R_i$	typ.	47		k $\Omega$
A.F. output voltage ( $R = 15$ k $\Omega$ )	$V_o$	typ.	0,75	1,5	V
Output resistance	$R_o$				low-ohmic
Spread in gain	$\Delta G_v$	$\leq$	1		dB
Channel separation	$\alpha$	typ.	50		dB
Total harmonic distortion	THD	$\leq$	0,3	0,1	%
Signal-to-noise ratio	S/N	typ.	90		dB
Carrier and harmonic suppression					
pilot signal; $f = 19$ kHz	$\alpha_{19}$	typ.	32		dB
subcarrier; $f = 38$ kHz	$\alpha_{38}$	typ.	50		dB
$f = 57$ kHz	$\alpha_{57}$	typ.	46		dB
$f = 76$ kHz	$\alpha_{76}$	typ.	60		dB
traffic radio (V.W.F.); $f = 57$ kHz	$\alpha_{57(VWF)}$	typ.	70		dB
SCA (Subsidiary Communications Authorization); $f = 67$ kHz	$\alpha_{67}$	typ.	70		dB
ACI (Adjacent Channel Interference); $f = 114$ kHz	$\alpha_{114}$	typ.	80		dB
intermodulation; $f = 10/13$ kHz	$\alpha_2, \alpha_3$	typ.	70		dB
Supply voltage range (pin 8)	$V_P = V_{8-7}$		7,5 to 18		V
Operating ambient temperature range	$T_{amb}$		-30 to + 80		$^{\circ}C$

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102HE).

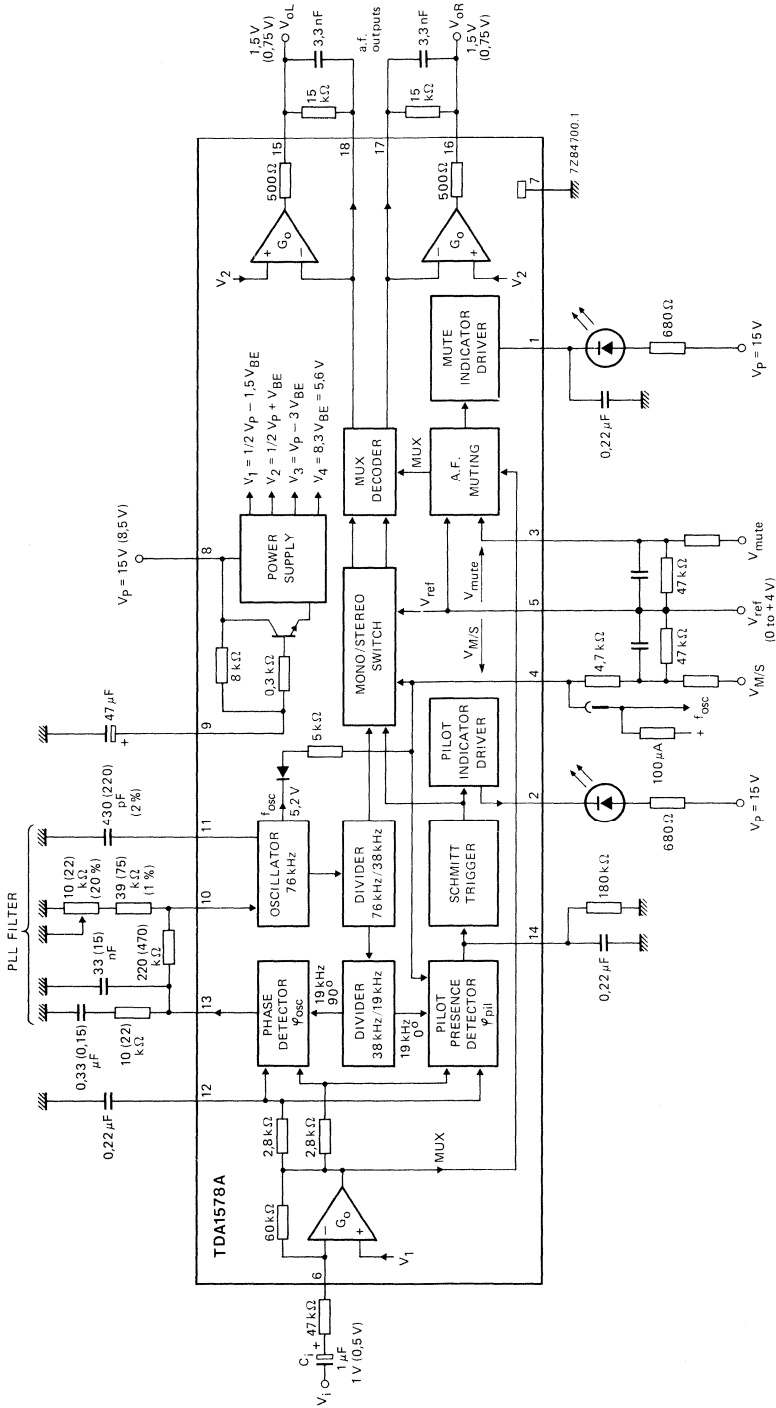

Fig. 1 Block diagram with external components; used as test circuit. Values given in parentheses are for  $V_p = 8.5V$ .

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 8)	$V_P = V_{8-7}$	max.	20 V
Input voltages (pins 3, 4 and 5)	$V_{3;4;5-7}$		0 to 12 V
Indicator driver output voltage	$V_{1;2-7}$	max.	24 V
Indicator driver output current	$I_1; I_2$	max.	30 mA
Total power dissipation at $T_{amb} = 25\text{ }^\circ\text{C}$	$P_{tot}$	max.	1,2 W
Storage temperature range	$T_{stg}$		-55 to + 150 $^\circ\text{C}$
Operating ambient temperature range	$T_{amb}$		-30 to + 80 $^\circ\text{C}$

**THERMAL RESISTANCE**

From crystal to ambient	$R_{th\ c-a}$	=	80 K/W
-------------------------	---------------	---	--------

## CHARACTERISTICS (measured in Fig. 1)

Input signal:  $m = 100\%$  ( $\Delta f = \pm 75$  kHz); pilot signal:  $m = 9\%$  ( $\Delta f = \pm 6,75$  kHz);modulation frequency: 1 kHz;  $V_{3-5} = V_{4-5} = 0$  V;de-emphasizing time:  $T = 50$   $\mu$ s; oscillator adjusted to  $f_{osc}$  at a pilot voltage  $V_i = 0$  V; $T_{amb} = 25$  °C; unless otherwise specified

parameter	V <sub>P</sub> (V)	symbol	min.	typ.	max.	unit

**Notes to the characteristics**

1. Intermodulation suppression (BFC: Beat-Frequency Components)

$$\alpha_2 = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz)}}; f_s = (2 \times 10 \text{ kHz}) - 19 \text{ kHz}$$

$$\alpha_3 = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz)}}; f_s = (3 \times 13 \text{ kHz}) - 38 \text{ kHz}$$

measured with: 91% mono signal;  $f_m = 10$  or  $13$  kHz; 9% pilot signal.

2. Traffic radio (V.W.F.) suppression

$$\alpha_{57(\text{VWF})} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz} \pm 23 \text{ kHz)}}$$

measured with: 91% stereo signal;  $f_m = 1$  kHz; 9% pilot signal;  
5% traffic subcarrier ( $f = 57$  kHz,  $f_m = 23$  Hz AM,  $m = 60\%$ ).

3. ACI (Adjacent Channel Interference)

$$\alpha_{114} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 4 kHz)}}; f_s = 110 \text{ kHz} - (3 \times 38 \text{ kHz})$$

$$\alpha_{190} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 4 kHz)}}; f_s = 186 \text{ kHz} - (5 \times 38 \text{ kHz})$$

measured with: 90% mono signal;  $f_m = 1$  kHz; 9% pilot signal;  
1% spurious signal ( $f_s = 110$  or  $186$  kHz, unmodulated).

4. SCA (Subsidiary Communications Authorization)

$$\alpha_{67} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 9 kHz)}}; f_s = (2 \times 38 \text{ kHz}) - 67 \text{ kHz}$$

measured with: 81% mono signal;  $f_m = 1$  kHz; 9% pilot signal;  
10% SCA-subcarrier ( $f_s = 67$  kHz, unmodulated).

5. Assuming
- $V_T = \frac{k \times T}{q} = 28,6 \text{ mV}$
- at
- $T_j = 330 \text{ K}$
- .

6. The effects of external components are not taken into account.

APPLICATION NOTES

1. When mono/stereo control and muting control are not used, pins 3, 4 and 5 have to be grounded.
2. In a receiver, channel separation adjustment can be obtained by:
  - a. A capacitor at pin 12 ( $C_{12-7}$ ): phasing 19/38 kHz
  - b. RC or LCR filter at the input: frequency response compensation ( $V_G = f(\omega)$ )
  - c. Feeding the output signals of the output amplifier to the inputs of the other channel.
3. PLL-filter for reduced intermodulation ( $\alpha_2$ ); see Fig. 2.
4. External mono 'ON' switch; see Fig. 3.
5. Switching 'OFF' the oscillator; see Fig. 4.

Fig. 2 PLL-filter for  $\alpha_2 = 70$  dB at  $V_p = 15$  V (see also Fig. 1).

Fig. 3 (a) At pin 4;  $-V_{4-5} > 300$  mV; (b) at pin 14.

Fig. 4 The oscillator is switched-off when:  $I_D > 100 \mu A$  ( $> 50 \mu A$  for  $V_p = 8,5$  V) and  $I_D < 1$  mA.

Adjustment recommendations:

at  $V_i(\text{hf}) = 100 \mu\text{V}$  with P1 to  $\alpha = 6 \text{ dB}$  (channel separation),  
 at  $V_i(\text{hf}) = 15 \mu\text{V}$  with P2 to  $V_o(\text{af}) = -3 \text{ dB}$ .

## TRAFFIC WARNING (VWF) DECODER CIRCUIT

The TDA1579 is intended for processing AM-modulated sub-carriers.

It incorporates the following functions:

- controllable selective sub-carrier amplifier (57 kHz)
- SK\* decoder
- active BK/DK\* filters
- BK/DK\* decoder circuits (Schmitt trigger with switched hysteresis)
- BK/DK\* threshold level switch for switch delay
- SK\* indicator driver (LED)
- SK/DK\* control outputs.

\* SK: Senderkennung = Transmitter Identification Code

DK: Durchsagekennung = Announcement Identification Code

BK: Bereichskennung = Area Identification Code.

These terms are used in the West German traffic warning system (Verkehrs Warnfunk).

### QUICK REFERENCE DATA

Measured in Fig. 1 at  $V_{iSK} = 8 \text{ mV}$ ,  $m_{BK} = 60\%$ ,  $f_m = 35 \text{ Hz}$  (AM) (traffic area C);  $m_{DK} = 30\%$ ,  $f_m = 125 \text{ Hz}$  (AM).

Supply voltage (pin 7)	$V_p$	typ.	8,5 V
Supply current (pin 7)	$I_p$	typ.	6 mA
Nominal input voltage at $f = 57 \text{ kHz}$	$V_{iSK}$	typ.	8 mV
Input impedance at $f \leq 57 \text{ kHz}$	$ Z_{ij} $	>	100 k $\Omega$
Control level (-3 dB)	$V_{iSK}$	typ.	2,4 mV
Input voltage range (peak-to-peak value)	$V_{i(p-p)}$	$\geq$	2 V
SK switch-on threshold level	$m_{BKon}$	typ.	42 %
SK switch hysteresis	$\Delta m_{BK}$	typ.	3,5 dB
SK switch-on delay	$t_{dSKon}$	typ.	150 ms
SK switch-off delay	$t_{dSKoff}$	typ.	750 ms
DK switch-on threshold level	$m_{DKon}$	typ.	13 %
DK switch hysteresis	$\Delta m_{DK}$	typ.	3,6 dB
DK switch-on delay	$t_{dDKon}$	typ.	750 ms
DK switch-off delay	$t_{dDKoff}$	typ.	750 ms
Supply voltage range	$V_p$	7,5 to	12 V
Ambient temperature range	$T_{amb}$	-30 to	+80 $^{\circ}\text{C}$

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102HE).

(1) L = 2.36 mH;  $Q_L = 70$ ;  $C = 3.3$  nF;  $f_0 = 57$  Hz; 224 turns 0.1 enameled copper.

## Notes

- Measuring conditions for switch-on delay ( $t_{don}$ ).  
Pin 4 (16) is connected to ground via a switch. The circuit is in a transient state. The switch at pin 4 (16) is opened at the zero-crossing of the positive-going  $V_{oBK}$  ( $V_{oDK}$ ) signal. The time between opening the switches and the positive switching-edge of the output signal at pin 3 (2) is defined as the switch-on delay  $t_{don}$ .
- Measuring conditions for switch-off delay ( $t_{doff}$ ).  
After finishing the measurement of  $t_{don}$ , the SK-input signal is switched off at the zero-crossing of the negative-going  $V_{oBK}$  ( $V_{oDK}$ ) signal (pins 11 and 8 are not short-circuited). The time between the input switching-off and the negative switching-edge of the output signal at pin 3 (2) is defined as the switch-off delay  $t_{doff}$ .

(1)  $L = 2,56 \text{ mH}$ ;  $Q_L = 70$ ;  $C = 3,3 \text{ nF}$ .

## GENERAL FILTER CALCULATIONS

## 1. Gain

Amplifier conditions:  $G_o \gg G_v$  and  $G_o \gg 2 \cdot Q^2$

$$G_v = - \frac{\frac{p}{R_1 \cdot C_1}}{p^2 + p \frac{C_1 + C_2}{R_3 \cdot C_1 \cdot C_2} + \frac{R_1 + R_2}{R_1 \cdot R_2 \cdot R_3 \cdot C_1 \cdot C_2}}, \text{ in which: } p = j\omega; G_v = \frac{V_o}{V_i}.$$

## 2. Resonance frequency

 $\omega_r =$ 

$$\frac{1}{\sqrt{\frac{R_1 \cdot R_2}{R_1 + R_2} \cdot R_3 \cdot C_1 \cdot C_2}}$$

 $C_1 = C_2 = C$ 

$$C \sqrt{\frac{R_1 \cdot R_2}{R_1 + R_2} \cdot R_3}$$

 $C_1 = C_2 = C$   
 $R_2 \ll R_1$ 

$$\frac{1}{C \sqrt{R_2 \cdot R_3}}$$

3. Gain at  $\omega = \omega_r$ 
 $-G_{vr} =$ 

$$\frac{C_2}{C_1 + C_2} \cdot \frac{R_3}{R_1}$$

$$\frac{1}{2} \cdot \frac{R_3}{R_1}$$

$$\frac{1}{2} \cdot \frac{R_3}{R_1}$$

## 4. Quality

$$Q = \frac{\sqrt{C_1 \cdot C_2}}{C_1 + C_2} \cdot \sqrt{\frac{R_3 (R_1 + R_2)}{R_1 \cdot R_2}}$$

$$\frac{1}{2} \sqrt{\frac{R_3 (R_1 + R_2)}{R_1 \cdot R_2}}$$

$$\frac{1}{2} \cdot \frac{R_3}{R_2}$$

## 5. Recommended components

C1 and C2: 5% MKC (metallized polycarbonate film capacitor)

R1, R2 and R3: 2% MR (metal film resistor)

or:

C1 and C2: 5% MKT (metallized polyester film capacitor)

R1, R2 and R3: 2% CR (carbon film resistor)

## TRAFFIC CONTROL MESSAGES AND WARNING TONE CIRCUIT

The TDA1589 is for evaluation of operating signals and logic control signals of a traffic control (TC) message decoder.

### Features

- mute of non-traffic control stations
- restriction to traffic-control message reception
- LED display driver for MUTE indication
- control output for TC messages minimum volume
- delayed start of warning tone signal on failure of TC transmission. Also to be used to control a start of search tuning
- warning tone generator with automatic level control increasing volume in five steps
- interruption of cassette playback with motor stop during TC messages
- warning tone indicating failure of TC transmission also during cassette playback

### QUICK REFERENCE DATA

Supply voltage (pin 10)	$V_P$	7,5 to 16 V typ. 8,5 V
Supply current	$I_P$	typ. 4,5 mA
Warning tone maximum voltage	$V_{O(p-p)}$	typ. 4,3 V
Output LED driver current (pin 3)	$I_3$	typ. 30 mA
motor stop current (pin 5)	$I_5$	typ. 30 mA
motor stop current (pin 6)	$I_6$	typ. 2 mA
MUTE display current (pin 8)	$I_8$	typ. 2 mA
start warning tone current (pin 13)	$I_{13}$	typ. 2 mA
Saturation voltage at output for minimum volume-on (pin 7)	$V_{7\text{ sat}}$	< 0,1 V

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102HE).

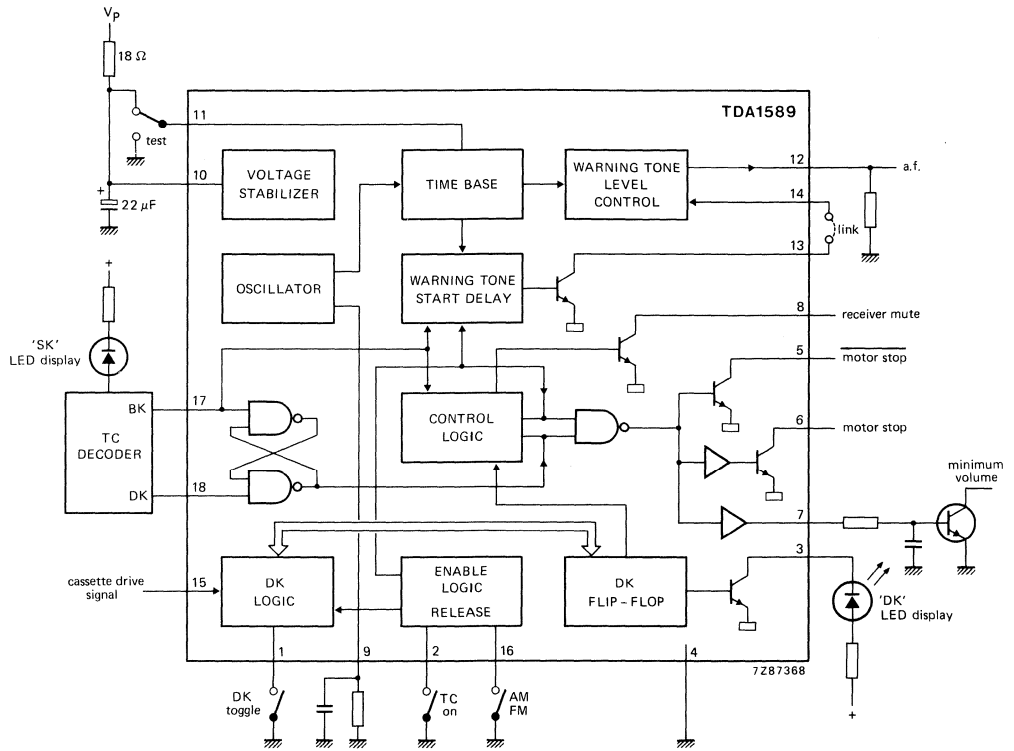

Fig. 1 Block diagram with external components; used as test circuit.

BK = TC area identification code (BereichsKennung)  
 DK = TC message identification code (DurchsageKennung)  
 SK = TC station identification code (SenderKennung)

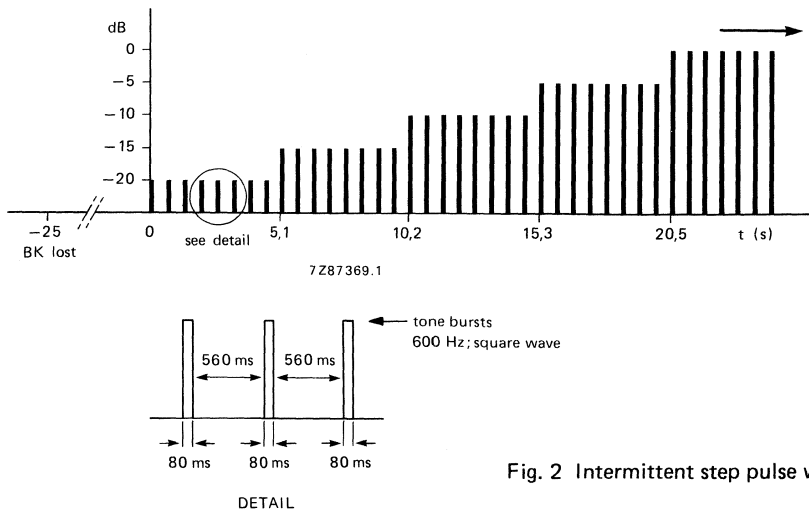

Fig. 2 Intermittent step pulse warning signal.

## FUNCTIONAL DESCRIPTION

The automatic evaluation of traffic control signals is only possible during FM reception. The enable circuit will be active when pin 16 (FM on) is LOW. If traffic control messages are desired, pin 2 (TC on) must be switched to LOW.

### FM radio mode

By operating the DK-toggle switch at pin 1 the DK flip-flop is set. This is displayed by a LED connected to pin 3. In the position "TC off" (pin 2 HIGH) it is not possible to set the DK flip-flop. Non-traffic control stations are muted. If a message is transmitted on the tuned TC station the minimum volume at pin 7 is exposed.

In case of BK-signal failure pin 13 changes to LOW after a delay of about 25 seconds. If pins 13 and 14 are then connected, an intermittent warning signal will be supplied at pin 12. The level increases automatically from -20 dB to 0 dB in 5 steps. (See Fig. 2.)

### Cassette mode

If a TC message is delivered when TC is switched on (pin 16 and pin 2 LOW) and the DK flip-flop is set, the motor of the cassette player is stopped and the receiver automatically cuts in. The minimum volume is also set at the same time.

In case of BK-signal failure, the warning tone will be mixed into the cassette playback.

### Protection

To avoid faulty switching, an internal latch will be set only if both DK (pin 18) and BK (pin 17) are HIGH. The latch will be reset if DK is changed to LOW independent of BK.

Reset of the DK-toggle flip-flop:

- by operating the DK-toggle (pin 1) twice
- by opening the TC-switch (pin 2)
- by switching to AM reception (pin 16)
- by switching off the cassette-player (pin 15)
- by switching power off or on.

### Transmission monitoring

At reception failure of a TC-station BK at pin 17 will become LOW. After about 25 seconds the output (pin 13) will be set LOW to start the warning signal via the jumper between pins 13 and 14. In the meantime the search-tuning can also be started. The warning tone stage gives a graduated signal with a level increasing in five steps from -20 dB to 0 dB in about 20 seconds. The frequency of the warning signal is about 600 Hz; tone period  $\approx$  80 ms; pause  $\approx$  560 ms.

If now another TC-message transmitter has been tuned the input BK (pin 17) becomes HIGH and the warning tone is stopped. Also when switching TC-off (pin 2 HIGH) or switching to AM reception (pin 16 HIGH) the warning tone will stop. The BK-signal has to be stable for more than 1 second to reset the just started 25-second-timer.

TDA1598

## TIME MULTIPLEX PLL STEREO DECODER

### GENERAL DESCRIPTION

The TDA1598 is a PLL stereo decoder based on the time-division multiplex principle.

#### Features

- Selectable input and output voltage levels
- Automatic mono/stereo switching, controlled by both pilot signal and field strength level
- Analogue control of mono/stereo change over
- Pilot indicator driver
- Oscillator with decoupled frequency measurement output
- Internal smoothing of supply voltage

#### QUICK REFERENCE DATA

Supply voltage, pin 8	$V_P = V_{8-7}$	typ.	8,5 V
Supply current, pin 8	$I_P = I_8$	typ.	17 mA
Multiplex input signal (selectable)	$V_{MUX(p-p)}$	typ.	0,5 V
Input resistance (selectable)	$R_i$	typ.	47 k $\Omega$
AF output voltage ( $R = 15$ k $\Omega$ )	$V_{O(rms)}$	typ.	0,75 V
Output resistance	$R_o$	low-ohmic	
Spread in gain	$\Delta$	<	1 dB
Channel separation	$\alpha$	typ.	50 dB
Total harmonic distortion	THD	<	0,5 %
Signal-to-noise ratio	S/N	typ.	90 dB
Carrier and harmonic suppression			
pilot signal; $f = 19$ kHz	$\alpha_{19}$	typ.	32 dB
subcarrier; $f = 38$ kHz	$\alpha_{38}$	typ.	50 dB
$f = 57$ kHz	$\alpha_{57}$	typ.	45 dB
$f = 76$ kHz	$\alpha_{76}$	typ.	60 dB
Traffic radio (VF); $f = 57$ kHz	$\alpha_{57(VF)}$	typ.	70 dB
SCA (Subsidiary Communications Authorization); $f = 67$ kHz	$\alpha_{67}$	typ.	70 dB
ACI (Adjacent Channel Interference); $f = 114$ kHz	$\alpha_{114}$	typ.	80 dB
Operating ambient temperature range	$T_{amb}$		-40 to +80 °C

#### PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102HE).

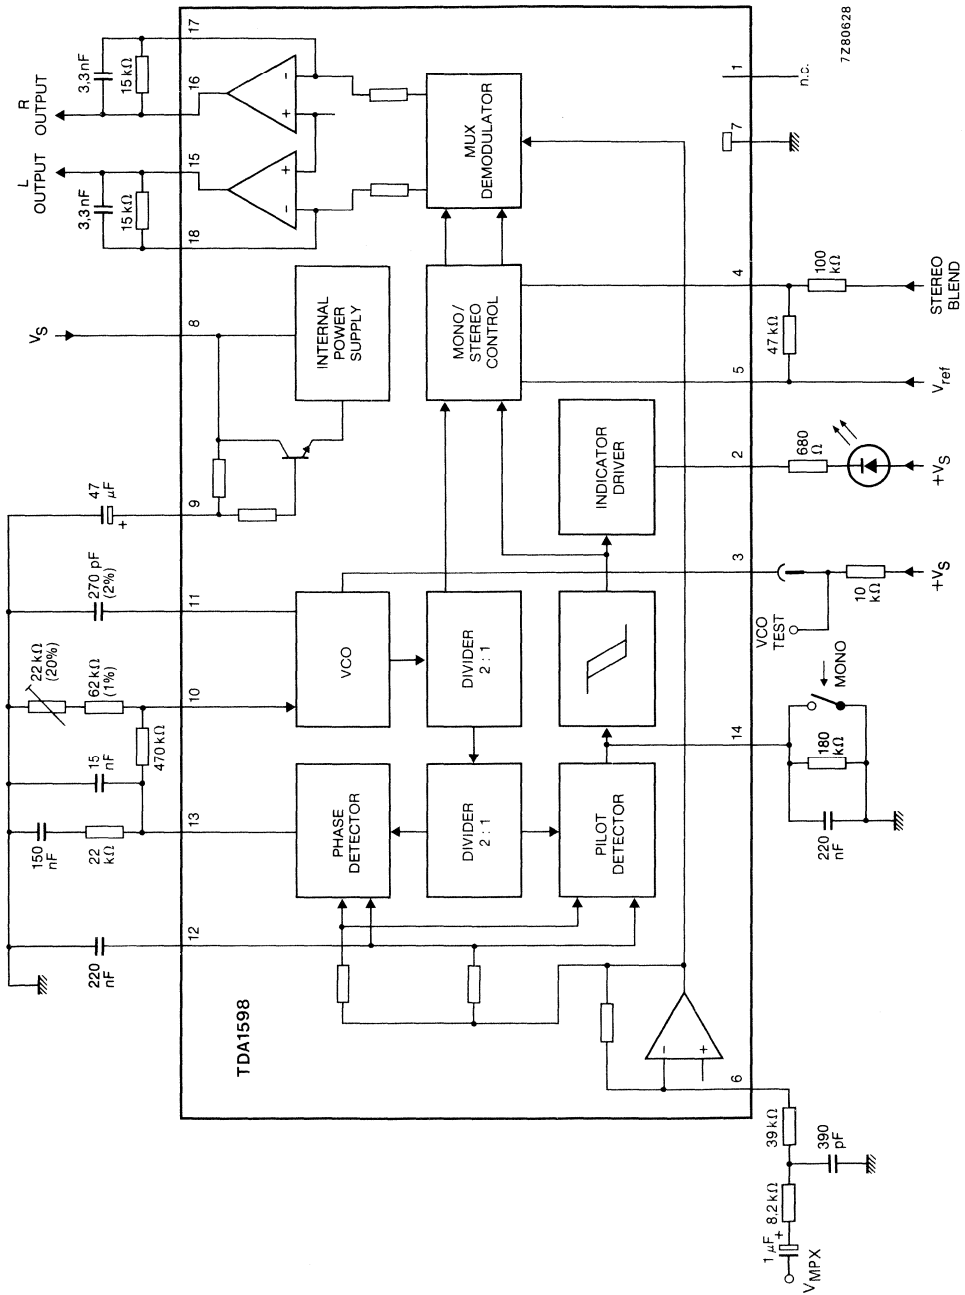

Fig. 1 Block diagram and test circuit.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage, pin 8	$V_P = V_{8-7}$	max.	16 V
Input voltages, pins 4, 5 and 6	$V_{4; 5; 6-7}$	min.	$V_P, 12 V$
Input voltage, pin 3	$V_{3-7}$	max.	$V_P$
Indicator driver voltage	$V_{2-7}$	max.	18 V
Indicator driver current	$I_2$	max.	20 mA
Total power dissipation at $T_{amb} = 25\text{ }^\circ\text{C}$	$P_{tot}$	max.	1,2 W
Storage temperature range	$T_{stg}$		-55 to + 150 $^\circ\text{C}$
Operating ambient temperature range	$T_{amb}$		-40 to + 80 $^\circ\text{C}$

**THERMAL RESISTANCE**

From crystal to ambient	$R_{th\ c-a}$	=	80 K/W
-------------------------	---------------	---	--------

DEVELOPMENT DATA

**CHARACTERISTICS** (measured in Fig. 1)

$V_p = 8,5$  V; input signal:  $m = 100\%$ ; ( $\Delta f = \pm 75$  kHz); pilot signal:  $m = 9\%$  ( $\Delta f = \pm 6,75$  kHz);  
 $f_m$ : 1 kHz;  $V_{4-5} = 0$  V; de-emphasizing time:  $t = 50$   $\mu$ s; oscillator adjusted to  $f_{osc}$  at pilot voltage  
 $V_i = 0$  V;  $T_{amb} = 25$  °C; unless otherwise specified.

**Notes to the characteristics**

1. Intermodulation suppression (BFC: Beat-Frequency Components)

$$\alpha_2 = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz)}} ; f_s = (2 \times 10 \text{ kHz}) - 19 \text{ kHz}$$

$$\alpha_3 = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz)}} ; f_s = (3 \times 13 \text{ kHz}) - 38 \text{ kHz}$$

measured with: 91% mono signal;  $f_m = 10$  or  $13$  kHz; 9% pilot signal.

2. Traffic radio (VF) suppression.

$$\alpha_{57(\text{VF})} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz} \pm 23 \text{ kHz)}}$$

measured with: 91% stereo signal;  $f_m = 1$  kHz; 9% pilot signal; 5% traffic subcarrier ( $f = 57$  Hz,  $f_m = 23$  Hz AM,  $m = 60\%$ ).

3. ACI (Adjacent Channel Interference)

$$\alpha_{114} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 4 kHz)}} ; f_s = 110 \text{ kHz} - (3 \times 38 \text{ kHz})$$

measured with: 90% mono signal;  $f_m = 1$  kHz; 9% pilot signal; 1% spurious signal ( $f_s = 110$  kHz or  $186$  kHz, unmodulated).

4. SCA (Subsidiary Communications Authorization)

$$\alpha_{67} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 9 kHz)}} ; f_s = (2 \times 38 \text{ kHz}) - 67 \text{ kHz}$$

measured with: 81% mono signal;  $f_m = 1$  kHz; 9% pilot signal; 10% SCA-subcarrier ( $f_s = 67$  kHz, unmodulated).

5. The effects of external components are not taken into account.

**APPLICATION NOTES**

1. When mono-stereo control is not used, pins 4 and 5 have to be grounded.
2. In a receiver, channel separation can be adjusted by:
  - a. RC or LC filter at the input: frequency response compensation ( $V_G = f(w)$ ).
  - b. Feeding the output signals of the output amplifier to the inputs of the other channel.
3. PLL-filter for reduced intermodulation ( $a_2$ ); see Fig. 2.
4. External mono 'ON' switch; see Fig. 3.
5. Switching 'OFF' the oscillator; see Fig. 4.

Fig. 2 PLL-filter for  $\alpha_2 = 70$  dB (see also Fig. 1).

Fig. 3 (a) At pin 4;  $-V_{4.5} > 300$  mV; (b) at pin 14.

## 5 W AUDIO POWER AMPLIFIER

The TDA2611A is a monolithic integrated circuit in a 9-lead single in-line (SIL) plastic package with a high supply voltage audio amplifier. Special features are:

- possibility for increasing the input impedance
- single in-line (SIL) construction for easy mounting
- very suitable for application in mains-fed apparatus
- extremely low number of external components
- thermal protection
- well defined open loop gain circuitry with simple quiescent current setting and fixed integrated closed loop gain

## QUICK REFERENCE DATA

Supply voltage range	$V_P$		6 to 35 V
Repetitive peak output current	$I_{ORM}$	<	1,5 A
Output power at $d_{tot} = 10\%$			
$V_P = 18\text{ V}; R_L = 8\ \Omega$	$P_O$	typ.	4,5 W
$V_P = 25\text{ V}; R_L = 15\ \Omega$	$P_O$	typ.	5 W
Total harmonic distortion at $P_O < 2\text{ W}; R_L = 8\ \Omega$	$d_{tot}$	typ.	0,3 %
Input impedance	$ Z_i $	typ.	45 k $\Omega$
Total quiescent current at $V_P = 18\text{ V}$	$I_{tot}$	typ.	25 mA
Sensitivity for $P_O = 2,5\text{ W}; R_L = 8\ \Omega$	$V_i$	typ.	55 mV
Operating ambient temperature	$T_{amb}$		-25 to + 150 °C
Storage temperature	$T_{stg}$		-55 to + 150 °C

## PACKAGE OUTLINE

9-lead SIL; plastic (SOT-110B).

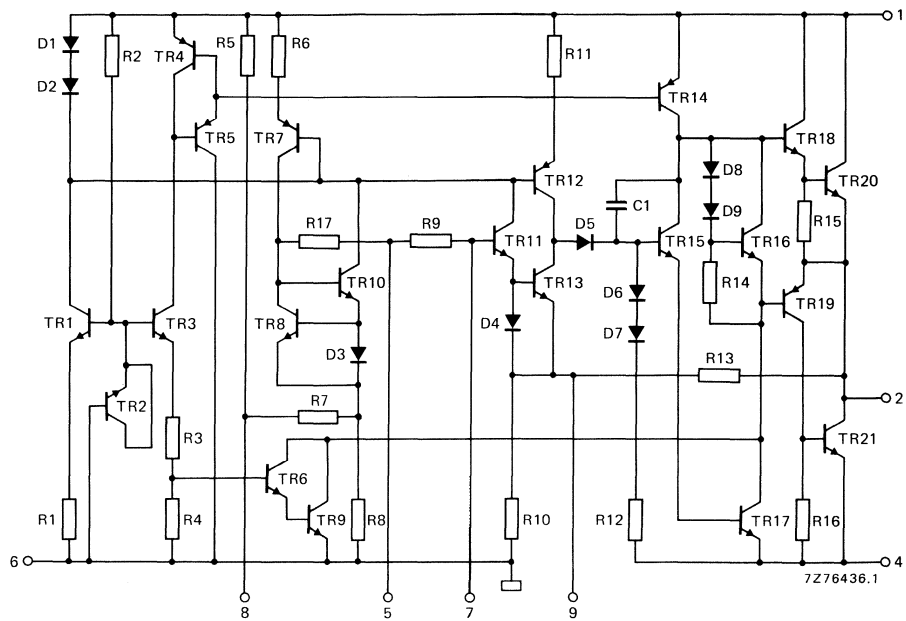

Fig. 1 Circuit diagram; pin 3 not connected.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	$V_p$	max.	35 V
Non-repetitive peak output current	$I_{OSM}$	max.	3 A
Repetitive peak output current	$I_{ORM}$	max.	1,5 A
Total power dissipation			see derating curves Fig. 2
Storage temperature	$T_{stg}$		-55 to + 150 °C
Operating ambient temperature	$T_{amb}$		-25 to + 150 °C

Fig. 2 Power derating curves.

**HEATSINK EXAMPLE**

Assume  $V_p = 18$  V;  $R_L = 8 \Omega$ ;  $T_{amb} = 60$  °C maximum;  $T_j = 150$  °C (max. for a 4 W application into an  $8 \Omega$  load, the maximum dissipation is about 2,2 W).

The thermal resistance from junction to ambient can be expressed as:

$$R_{th\ j-a} = R_{th\ j-tab} + R_{th\ tab-h} + R_{th\ h-a} = \frac{150 - 60}{2,2} = 41 \text{ K/W.}$$

Since  $R_{th\ j-tab} = 11$  K/W and  $R_{th\ tab-h} = 1$  K/W,  $R_{th\ h-a} = 41 - (11 + 1) = 29$  K/W.

**D.C. CHARACTERISTICS**

**INFRARED RECEIVER**

The TDA3047 is for infrared reception with low power consumption.  
 The difference between the TDA3047 and TDA3048 is the polarity of the output signal.

**Features**

- H.F. amplifier with a control range of 66 dB
- Synchronous demodulator and reference amplifier
- A.G.C. detector
- Pulse shaper
- Q-factor killing of the input selectivity, which is controlled by the a.g.c. circuit
- Input voltage limiter

**QUICK REFERENCE DATA**

Supply voltage (pin 8)	$V_P = V_{8-16}$	typ. 5 V
Supply current (pin 8)	$I_P = I_g$	typ. 2,1 mA
Input signal (peak-to-peak value) (100% AM; $f = 36$ kHz)	$V_{2-15(p-p)}$	0,02 to 200 mV
Output signal (peak-to-peak value)	$V_{9-16(p-p)}$	typ. 4,5 V

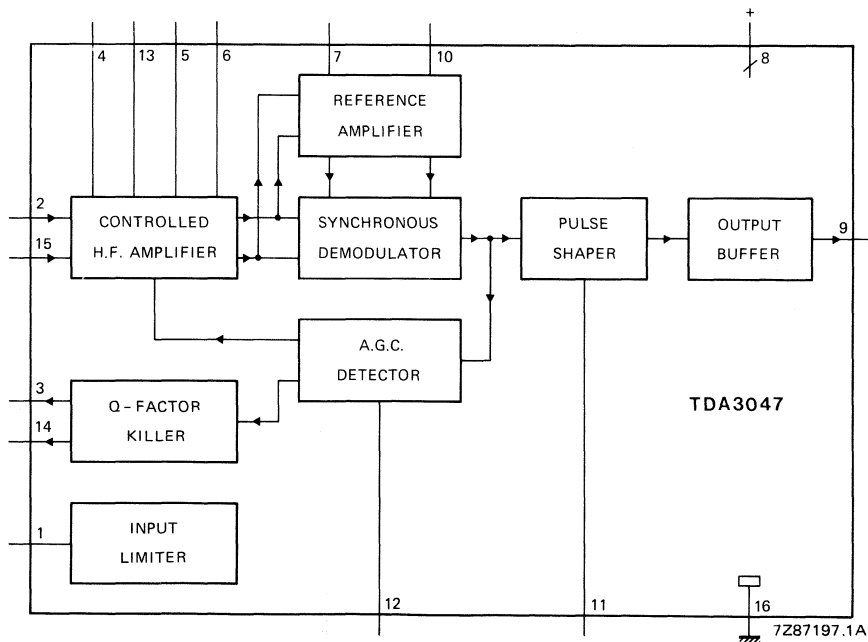

Fig. 1 Block diagram of TDA3047.

**PACKAGE OUTLINES**

TDA3047P: 16-lead DIL; plastic (SOT-38).

TDA3047T: 16-lead mini-pack; plastic (SO-16L; SOT-162A).

## FUNCTIONAL DESCRIPTION

### General

The circuit operates from a 5 V supply and has a current consumption of 2 mA. The output is a current source which can drive or suppress a current of  $> 75 \mu\text{A}$  with a voltage swing of 4,5 V. The Q-killer circuit eliminates distortion of the output pulses due to the decay of the tuned input circuit at high input voltages. The input circuit is protected against signals of  $> 600 \text{ mV}$  by an input limiter. The typical input is an AM signal at a frequency of 36 kHz. Figures 3 and 4 show the circuit diagrams for the application of narrow-band and wide-band receivers respectively. Circuit description of the eight sections shown in Fig. 1 are given below.

### Controlled h.f. amplifier

The input signal is amplified by the gain-controlled amplifier. This circuit comprises three d.c. amplifier stages connected in cascade. The overall gain of the circuit is approximately 83 dB and the gain control range is in the order of 66 dB. Gain control is initially active in the second amplifier stage and is transferred to the first stage as limiting in the second stage occurs, thus maintaining optimum signal-to-noise ratio. Offset voltages in the d.c. coupled amplifier are minimized by two negative feedback loops; these also allow the circuit to have some series resistance of the decoupling capacitor. The output signal of the amplifier is applied to the reference amplifier and to the synchronous demodulator inputs.

### Reference amplifier

The reference amplifier amplifies and limits the input signal. The voltage gain is approximately 0 dB. The output signal of this amplifier is applied to the synchronous demodulator.

### Synchronous demodulator

In the synchronous demodulator the input signal and reference signal are multiplied. The demodulator output current is  $25 \mu\text{A}$  peak-to-peak. The output signal of the demodulator is fed to the input of the a.g.c. detector and to the input of the pulse-shaper circuit.

### A.G.C. detector

The a.g.c. detector comprises two n-p-n transistors operating as a differential pair. The top level of the output signal from the synchronous demodulator is detected by the a.g.c. circuit. Noise pulses are integrated by an internal capacitor. The output signal is amplified and applied to the first and second stages of the amplifier and to the Q-factor killer circuit.

### Pulse shaper

The pulse-shaper comprises two n-p-n transistors operating as a differential pair connected in parallel with the a.g.c. differential pair. The slicing level of the pulse shaper is lower than the slicing level of the a.g.c. detector. The output of the pulse shaper is determined by the voltage of the capacitor connected to pin 11, which is applied directly to the output buffer.

### Output buffer

The voltage of the pulse-shaper capacitor is fed to the base of the first transistor of a differential pair. To obtain a correct RC-5 code, a hysteresis circuit protects the output against spikes. The output at pin 9 is active *high*.

### Q-factor killer

Figure 3 shows the Q-factor killer in the narrow-band application. In this application it is necessary to decrease the Q-factor of the input selectivity particularly when large input signals occur at pins 2 and 15. In the narrow-band application the output of the Q-factor killer can be directly coupled to the input; pin 3 to pin 2 and pin 14 to pin 15.

FOR DETAILED INFORMATION SEE RELEVANT DATA BOOK OR DATA SHEET

## INFRARED RECEIVER

The TDA3048 is for infrared reception with low power consumption.  
The difference between the TDA3048 and TDA3047 is the polarity of the output signal.

### Features

## FUNCTIONAL DESCRIPTION

### General

The circuit operates from a 5 V supply and has a current consumption of 2 mA. The output is a current source which can drive or suppress a current of  $> 75 \mu\text{A}$  with a voltage swing of 4,5 V. The Q-killer circuit eliminates distortion of the output pulses due to the decay of the tuned input circuit at high input voltages. The input circuit is protected against signals of  $> 600 \text{ mV}$  by an input limiter. The typical input is an AM signal at a frequency of 36 kHz. Figures 3 and 4 show the circuit diagrams for the application of narrow-band and wide-band receivers respectively. Circuit description of the eight sections shown in Fig. 1 are given below.

### Controlled h.f. amplifier

The input signal is amplified by the gain-controlled amplifier. This circuit comprises three d.c. amplifier stages connected in cascade. The overall gain of the circuit is approximately 83 dB and the gain control range is in the order of 66 dB. Gain control is initially active in the second amplifier stage and is transferred to the first stage as limiting in the second stage occurs, thus maintaining optimum signal-to-noise ratio. Offset voltages in the d.c. coupled amplifier are minimized by two negative feedback loops; these also allow the circuit to have some series resistance of the decoupling capacitor. The output signal of the amplifier is applied to the reference amplifier and to the synchronous demodulator inputs.

### Reference amplifier

The reference amplifier amplifies and limits the input signal. The voltage gain is approximately 0 dB. The output signal of this amplifier is applied to the synchronous demodulator.

### Synchronous demodulator

In the synchronous demodulator the input signal and reference signal are multiplied. The demodulator output current is  $25 \mu\text{A}$  peak-to-peak. The output signal of the demodulator is fed to the input of the a.g.c. detector and to the input of the pulse-shaper circuit.

### A.G.C. detector

The a.g.c. detector comprises two n-p-n transistors operating as a differential pair. The top level of the output signal from the synchronous demodulator is detected by the a.g.c. circuit. Noise pulses are integrated by an internal capacitor. The output signal is amplified and applied to the first and second stages of the amplifier and to the Q-factor killer circuit.

### Pulse-shaper

The pulse-shaper comprises two n-p-n transistors operating as a differential pair connected in parallel with the a.g.c. differential pair. The slicing level of the pulse shaper is lower than the slicing level of the a.g.c. detector. The output of the pulse shaper is determined by the voltage of the capacitor connected to pin 11, which is applied directly to the output buffer.

### Output buffer

The voltage of the pulse-shaper capacitor is fed to the base of the first transistor of a differential pair. To obtain a correct RC-5 code, a hysteresis circuit protects the output against spikes. The output at pin 9 is active *low*.

### Q-factor killer

Figure 3 shows the Q-factor killer in the narrow-band application. In this application it is necessary to decrease the Q-factor of the input selectivity particularly when large input signals occur at pins 2 and 15. In the narrow-band application the output of the Q-factor killer can be directly coupled to the input; pin 3 to pin 2 and pin 14 to pin 15.

## SPATIAL, STEREO AND PSEUDO-STEREO SOUND CIRCUIT

The TDA3810 integrated circuit provides spatial, stereo and pseudo-stereo sound for radio and television equipment.

### Features

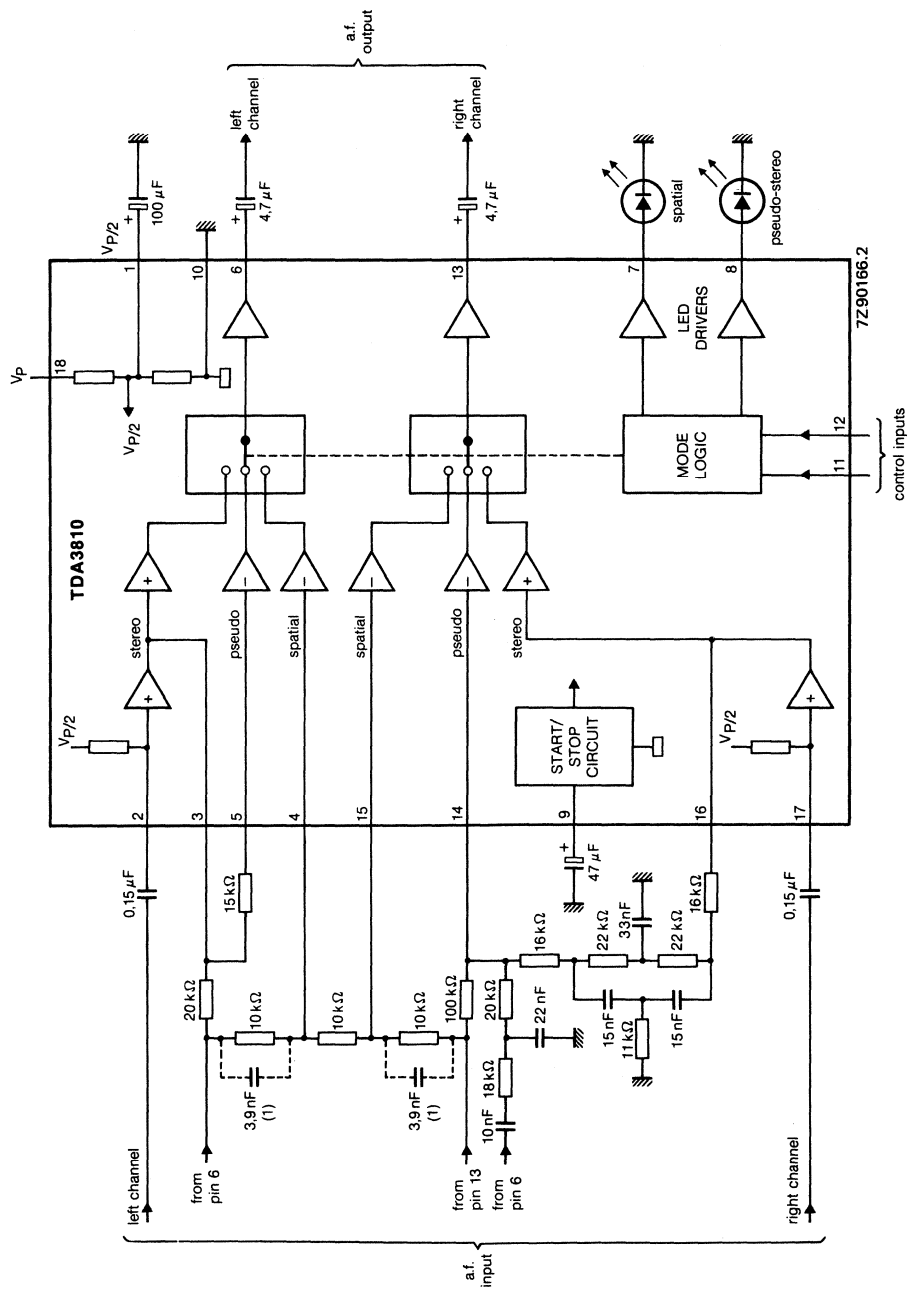

- Three switched functions: spatial (widened stereo image)  
stereo  
pseudo-stereo (artificial stereo from a mono source)
- Offset compensated operational amplifiers to reduce switch noise
- LED driver outputs to facilitate indication of selected operating mode
- Start/stop circuit to reduce switch noise and to prevent LED-flicker
- TTL-compatible control inputs

### QUICK REFERENCE DATA

Supply voltage (pin 18)	$V_P$	typ.	12 V
Supply current (LEDs off)	$I_P$	typ.	6 mA
Operating ambient temperature range	$T_{amb}$	0 to	+ 70 °C
Input signal (r.m.s. value)	$V_{i(rms)}$	<	2 V
Total harmonic distortion (stereo)	THD	typ.	0,1 %
Channel separation (stereo)	$\alpha$	typ.	70 dB
Gain (stereo)	$G_V$	typ.	0 dB

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102HE).

(1) Used in spatial mode for correction of high frequency only (optimal performance).

Fig. 1 Block diagram/test circuit showing external components; for control inputs to pins 11 and 12 see truth table.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 18)	$V_p$	max.	18 V
Storage temperature range	$T_{stg}$		-25 to + 150 °C
Operating ambient temperature range	$T_{amb}$		0 to + 70 °C

**THERMAL RESISTANCE**

From crystal to ambient	$R_{th\ cr-a}$	=	80 K/W
-------------------------	----------------	---	--------

**CHARACTERISTICS**

$V_p = 12\text{ V}$ ;  $T_{amb} = 25\text{ °C}$ ; test circuit Fig. 1 stereo mode (pin 11 to ground) unless otherwise specified. Output load:  $R_{6-10, 13-10} \geq 4,7\text{ k}\Omega$ ;  $C_{6-10, 13-10} \leq 150\text{ pF}$ .

parameter	symbol	min.	typ.	max.	unit
Supply voltage range (pin 18)	$V_p$	4,5	—	16,5	V
Supply current	$I_p$	—	6	12	mA
Reference voltage	$V_S$	5,3	6	6,7	V
Input voltage (pin 2 or 17) THD = 0,2% (stereo mode)	$V_{i(rms)}$	—	—	2	V
Input resistance (pin 2 or 17)	$R_i$	50	75	—	k $\Omega$
Voltage gain $V_o/V_i$	$G_v$	—	0	—	dB
Channel separation (R/L)	$\alpha$	60	70	—	dB
Total harmonic distortion $f = 40\text{ to }16\,000\text{ Hz}$ ; $V_{o(rms)} = 1\text{ V}$	THD	—	0,1	—	%
Power supply ripple rejection	RR	—	50	—	dB
Noise output voltage (unweighted) left and right output	$V_{n(rms)}$	—	10	—	$\mu\text{V}$
<b>SPATIAL MODE</b> (pins 11 and 12 HIGH)					
Antiphase crosstalk	$\alpha$	—	50	—	%
Voltage gain	$G_v$	1,4	2,4	3,4	dB

**PSEUDO-STEREO MODE**

The quality and strength of the pseudo-stereo effect is determined by external filter components.

## DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

TDA5708

# PHOTO DIODE SIGNAL PROCESSOR FOR COMPACT DISC PLAYERS

### GENERAL DESCRIPTION

The TDA5708 is a bipolar integrated circuit designed for use in compact disc players with a single spot read out system. It amplifies the photo-diode signals and processes the error signals for the focus- and radial control network.

### Features

- Data amplifier with equalizer and A.G.C.
- Offset-free pre-amplifier with A.G.C. for the servo signals
- Trackloss and drop-out detection
- Normalizing focus error output signal to minimize radial error interference
- Laser supply amplifier and reference source
- Possibility for car application
- Single and dual supply application
- TTL compatible digital input/outputs

### QUICK REFERENCE DATA

---

Supply voltage range	$V_{DD}$	8 to 12 V
Quiescent supply current	$I_Q$	typ. 11 mA
HF input current (peak-to-peak value) for $V_{HFout(p-p)}$	$I_{HFIn(p-p)}$	typ. 8 $\mu A$
LF input current (for each diode input)	$I_D$	typ. 2 $\mu A$
Laser supply output current	$I_{LO}$	typ. 2 mA
Operating ambient temperature range	$T_{amb}$	-30 to +85 °C

---

### PACKAGE OUTLINE

28-lead DIL; plastic (SOT-117).

# TDA5708

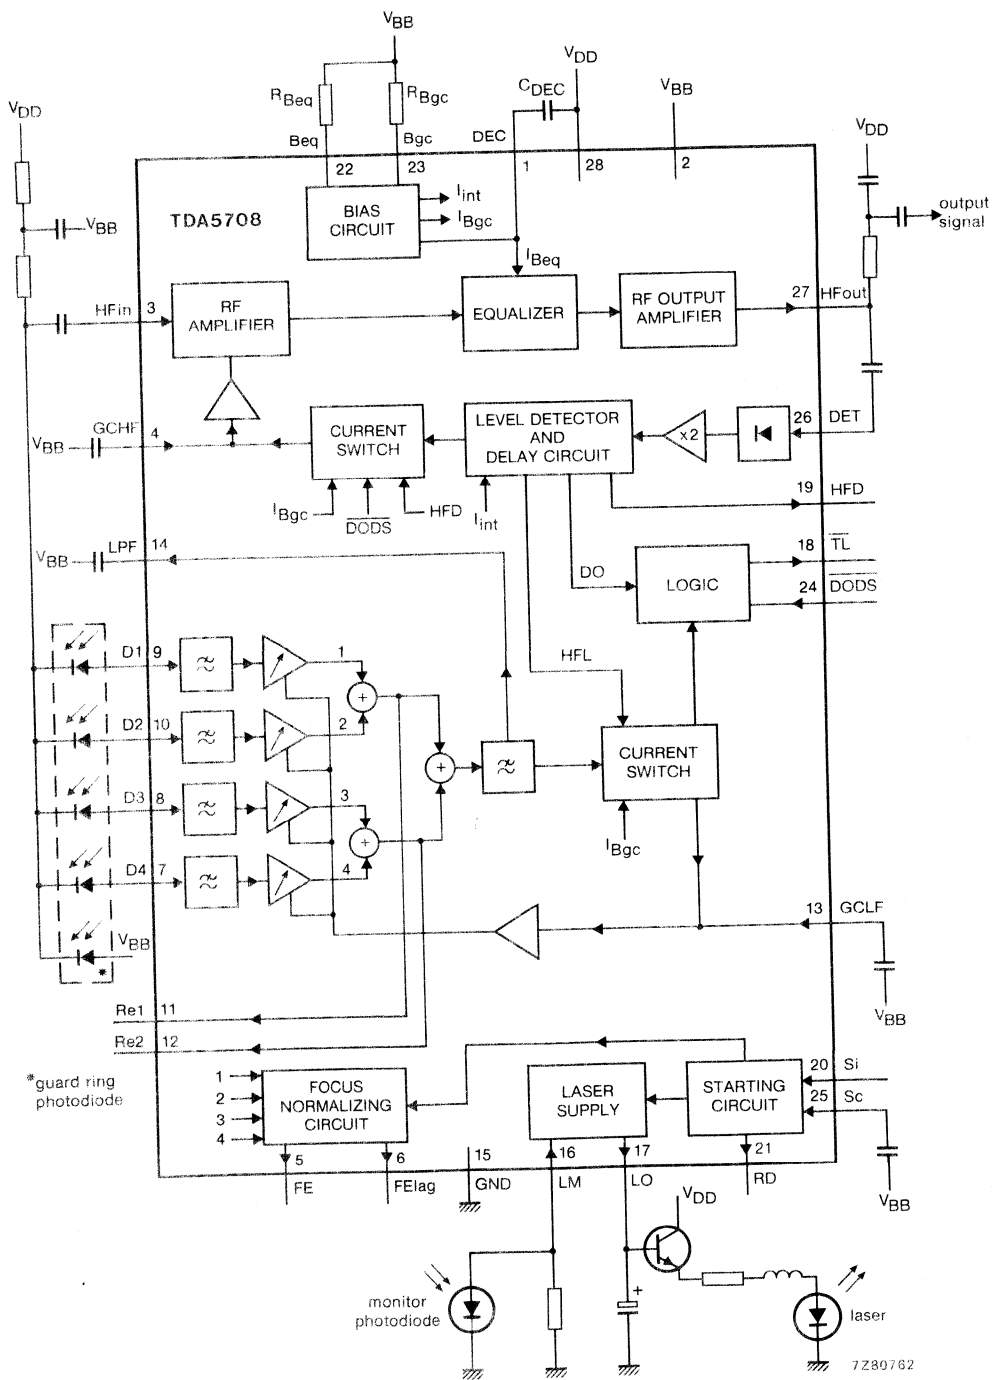

Fig. 1 Block diagram.

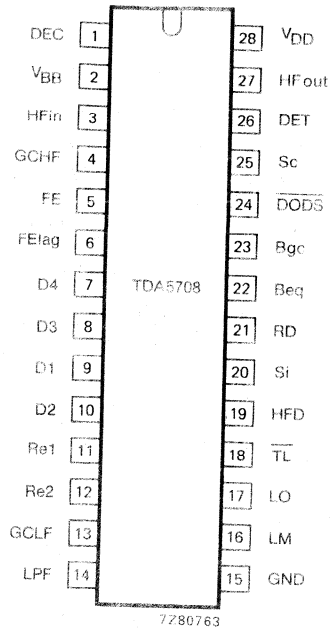

Fig. 2 Pinning diagram; for pin description see next page.

DEVELOPMENT DATA

## PIN DESCRIPTION

Pin No.	Symbol	Description
1.	DEC	Decoupling bias-current HF part.
2	$V_{BB}$	Negative supply connection (also substrate connection).
3	HFin	HF current input.
4	GCHF	Gain control input of HF amplifier. Current output from HF amplitude detector.
5	FE	Current output of normalized, switched focus error signal.
6	FElag	Current output of switched focus error signal, intended for lag network.
7, 8	D4, D3	LF photo diode current input.
9, 10	D1, D2	LF photo diode current input.
11	Re1	Summation of amplified currents D1 and D2.
12	Re2	Summation of amplified currents D3 and D4.
13	GCLF	Gain control input of LF amplifiers. Current output from LF amplitude detector.
14	LPF	Low pass filter for $I_{ret}$ , used in track loss (TL) detector and LF control part ( $I_{ret} = I_{Re1} + I_{Re2}$ ).
15	GND	Laser supply ground. Logic ground.
16	LM	Laser monitor diode input.
17	LO	Laser amplifier current output.
18	$\overline{TL}$	Track loss.
19	HFD	High frequency detector output.
20	Si	On/off control, laser supply and focus circuitry.
21	RD	Ready signal output; starting up procedure finished.
22	Beq	Bias current input for equalizer and HF input parts.
23	Bgc	Bias current input for HF output part and LF gain control, TL and FE circuitry.
24	$\overline{DODS}$	Drop out detector suppression.
25	Sc	Starting up input.
26	DET	HF detector voltage input.
27	HFout	HF amplifier and equalizer voltage output.
28	$V_{DD}$	Positive supply voltage.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage ranges

pin 28 – pin 2

$V_{DD}$  -0,3 to + 13 V

pin 15 – pin 2

$V_{GND}$  -0,3 to + 13 V

pin 16 (open loop)

$V_{LM}$   $V_{BB}$  to  $V_{DD}$  V

Total power dissipation

$P_{tot}$  see Fig. 3

Storage temperature range

$T_{stg}$  -55 to + 150 °C

Operating ambient temperature range

$T_{amb}$  -30 to + 85 °C

Operating junction temperature

$T_j$  max. 150 °C

DEVELOPMENT DATA

## CHARACTERISTICS

$V_{DD} = 10\text{ V}$ ;  $V_{BB} = 0\text{ V}$ ;  $V_{GND} = 0\text{ V}$ ;  $T_{amb} = 25\text{ }^{\circ}\text{C}$ ;  $R_{Beq} = 12\text{ k}\Omega$ ;  $R_{Bgc} = 24\text{ k}\Omega$ ; all voltages with respect to  $V_{BB}$ ; unless otherwise specified.

parameter	symbol	min.	typ.	max.	unit
<b>Supplies</b>					
Supply voltage (pin 28)	$V_{DD}$	8	—	12	V
Laser ground	$V_{GND}$	$V_{BB}$	—	$V_{DD} - 3$	V
Quiescent supply current	$I_Q$	—	11	—	mA
<b>H.F. input (pin 3)</b>					
D.C. voltage level	$V_{HFIn}$	—	1,4	—	V
Input current range (peak-to-peak value) at $f = 100\text{ kHz}$	$I_{HFIn(p-p)}$	3	—	10	$\mu\text{A}$
Input impedance	$ Z_{HFIn} $	0,5	1	2	$\text{k}\Omega$
<b>H.F. output (pin 27)</b>					
Output voltage at $I_{HFIn} = 0\text{ }\mu\text{A}$ ; $V_{GCHF} = 2,8\text{ V}$	$V_{HFout}$	$V_{DD} - 5$	—	$V_{DD} - 3$	V
at $I_{HFIn} = 0\text{ }\mu\text{A}$ ; $V_{GCHF} = 6,3\text{ V}$	$V_{HFout}$	—	$V_{DD} - 4,4$	—	V
Output voltage (note 1; Fig. 6) (peak-to-peak value) at $I_{HFIn(p-p)} = 6\text{ }\mu\text{A}$	$V_{O1(p-p)}$	—	1	—	V
at $I_{HFIn(p-p)} = 3\text{ to }10\text{ }\mu\text{A}$	$V_{O(p-p)}$	—	$M_1$	—	V
Output impedance (note 1; Fig. 6)	$ Z_{HFout} $	—	50	—	$\Omega$
<b>Bias input (pin 22)</b>					
D.C. voltage level at $R_{Beq} = 12\text{ k}\Omega$	$V_{Beq}$	—	590	—	mV
Input current	$I_{Beq}$	—	-50	—	$\mu\text{A}$
<b>Bias input (pin 23)</b>					
D.C. voltage level at $R_{Bgc} = 24\text{ k}\Omega$	$V_{Bgc}$	—	1,28	—	V
Input current	$I_{Bgc}$	—	-50	—	$\mu\text{A}$
<b>Decoupling output (pin 1)</b>					
Output voltage	$V_{DEC}$	—	$V_{DD} - 1,5$	—	V
Output impedance	$ Z_{DEC} $	—	2	—	$\text{k}\Omega$
<b>Level detector input (pin 26)</b>					
D.C. voltage level	$V_{DET}$	—	0,82	—	V
Input current range	$I_{DET}$	-100	—	+ 100	$\mu\text{A}$
Input impedance	$ Z_{DET} $	—	10	—	$\text{k}\Omega$

DEVELOPMENT DATA

parameter	symbol	min.	typ.	max.	unit
<b>Reference current (HF part)</b>					
Positive reference current (Fig. 7)	$I_{refp}$	—	55	—	$\mu A$
Negative reference current (Fig. 8; note 13)	$I_{refn}$	—	15	—	$\mu A$
<b>Gain control (pin 4)</b>					
Input voltage for:					
minimum h.f. gain	$V_{GCHF}$	—	2,8	—	V
maximum h.f. gain	$V_{GCHF}$	—	6,3	—	V
Input impedance at $V_{GCHF} = 2,8$ to $6,3$ V	$ Z_{GCHF} $	—	10	—	$M\Omega$
<b>Output current</b>					
at $I_{DET} = 0$ ; $\overline{DODS} = \text{HIGH}$ or $\text{LOW}$	$I_{GCHF}$	—	-0,4	—	$\mu A$
at $I_{DET} < 0,5 I_{refp}$ ; $\overline{DODS} = \text{HIGH}$ or $\text{LOW}$	$I_{GCHF}$	—	-0,4	—	$\mu A$
at $I_{DET} > 0,5 I_{refp}$ ; $\overline{DODS} = \text{HIGH}$	$I_{GCHF}$	—	-4,6	—	$\mu A$
at $I_{DET} > 0,5 I_{refp}$ ; $\overline{DODS} = \text{LOW}$	$I_{GCHF}$	—	-0,4	—	$\mu A$
at $I_{DET} < I_{refp}$ ; $\overline{DODS} = \text{HIGH}$	$I_{GCHF}$	—	-4,6	—	$\mu A$
at $I_{DET} < I_{refp}$ ; $\overline{DODS} = \text{LOW}$	$I_{GCHF}$	—	-0,4	—	$\mu A$
at $I_{DET} > I_{refp}$ ; $\overline{DODS} = \text{LOW}$	$I_{GCHF}$	—	94	—	$\mu A$
at $I_{DET} > I_{refp}$ ; $\overline{DODS} = \text{HIGH}$	$I_{GCHF}$	—	94	—	$\mu A$
at $I_{DET} > 0,5 I_{refn}$ ; $\overline{DODS} = \text{HIGH}$ or $\text{LOW}$	$I_{GCHF}$	—	-0,4	—	$\mu A$

Notes to the characteristics

1. H.F. part output voltage and output impedance for closed loop conditions:  $f_{HFin} = 0,1$  to  $1$  MHz.  
 $M_1$  is the measured value of  $V_{O1}$ .
2. HFD delay times  $\tau_1$  and  $\tau_2$  measured as shown in Fig. 4.

Fig. 4 Delay time  $\tau$  between  $I_{DET}$  and  $V_{HFD}$ .

DEVELOPMENT DATA

3.  $M_4 = \frac{(I_{D1} + I_{D2} + I_{D3} + I_{D4})}{2}$ .  $M_2$ ; ( $M_2$  see note 7) with  $I_{D1} = I_{D2} = I_{D3} = I_{D4} = 1 \mu A$  and  $Re1$ ,  $Re2$  connected to  $1,5$  V.
4.  $\overline{TL}$  delay times  $\tau_3$ ,  $\tau_4$ ,  $\tau_5$  and  $\tau_6$  measured as shown in Fig. 5.

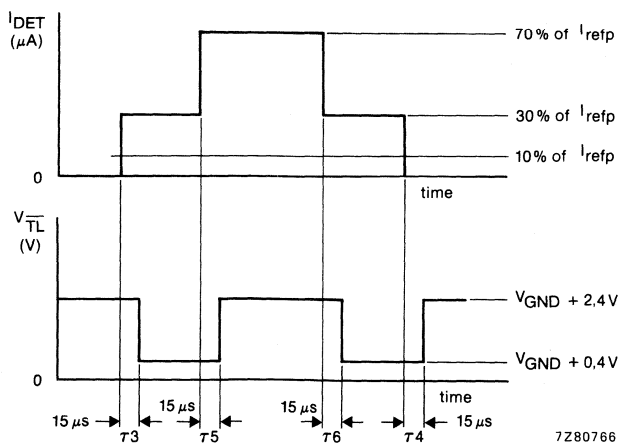

Fig. 5 Delay times between  $I_{DET}$  and  $V_{\overline{TL}}$ .

5. Voltage output signal  $V_{O1}$  measured at  $f_{HFin} = 100$  kHz;  $I_{HFin(p-p)} = 3 \mu A$ ;  $V_{GCHF} = 6,3$  V.  
 Voltage output signal  $V_{O2}$  measured at  $f_{HFin} = 1$  MHz;  $I_{HFin(p-p)} = 3 \mu A$ ;  $V_{GCHF} = 6,3$  V.

**Notes to the characteristics** (continued)

6. Phase of input/output signal, group delay and flatness measured at  $I_{HFIn(p-p)} = 1 \mu A$ ;  
 $V_{GCHF} = 6,3 V$ .

$$\text{Group delay: } \tau = \frac{d\phi}{d\omega}; \Delta f \approx 50 \text{ kHz.}$$

$$\text{Flatness: } \Delta\tau = \tau_{\max} - \tau_{\min}.$$

7.  $M_2$  is the measured value of  $A_1 = \left| \frac{I_{Re2}}{I_{D3} + I_{D4}} \right|$   
 for  $I_{D1} = I_{D2} = I_{D3} = 0$ ;  $I_{D4} = 1 \mu A$  and  $V_{GCLF} = 6,3 V$ .

8.  $M_3$  is the measured value of  $A_3 = \left| \frac{I_{Re2}}{I_{D3} + I_{D4}} \right|$   
 for  $I_{D1} = I_{D2} = I_{D3} = 0$ ;  $I_{D4} = 1 \mu A$  and  $V_{GCLF} = 3,0 V$ .

9. P1 is the measured value of  $\frac{I_{Re1} (1)}{I_{D1} (1) + I_{D2} (1)} \cdot \frac{I_{D1} (2) + I_{D2} (2)}{I_{Re1} (2)}$

Where:

(1) are the current levels at  $f_i = 25 \text{ kHz}$ .

(2) are the current levels at  $f_i = 1 \text{ kHz}$ .

Measured taken at  $V_{GCLF} = 6,3 V$ .

10. P2 is the measured value of  $\frac{I_{Re2} (1)}{I_{D3} (1) + I_{D4} (1)} \cdot \frac{I_{D3} (2) + I_{D4} (2)}{I_{Re2} (2)}$

Where:

(1) are the current levels at  $f_i = 25 \text{ kHz}$ .

(2) are the current levels at  $f_i = 1 \text{ kHz}$ .

Measured taken at  $V_{GCLF} = 6,3 V$ .

11. Laser supply transconductance for d.c.

$$G_{LDC} = \frac{\Delta I_{LO}}{\Delta V_{LM}} \quad (0 < -I_{LO} < 2 \text{ mA}).$$

12. Laser supply transconductance for a.c.

$$G_{LAC} = G_{LDC} \cdot \frac{1}{1 + S \cdot \tau_{11}}$$

Where: S is the laplace operator in the frequency domain.

13.  $M_5$  is the measured value of  $I_{refp}$ .

**Table 1** Test conditions for track loss output ( $\overline{TL}$ )

conditions	$\overline{DODS}$	inputs		output level $\overline{TL}$
		$I_{D(tot)}$	$I_{DET}$	
1	HIGH	$< 4,9 I_{Bgc}$	independent	HIGH
2	HIGH	$> 5,1 I_{Bgc}$	10% of $I_{refp}$	HIGH
3	HIGH	$> 5,1 I_{Bgc}$	30% of $I_{refp}$	LOW
4	HIGH	$> 5,1 I_{Bgc}$	70% of $I_{refp}$	HIGH
5	LOW	$< 4,9 I_{Bgc}$	independent	HIGH
6	LOW	$> 5,1 I_{Bgc}$	10% of $I_{refp}$	LOW
7	LOW	$> 5,1 I_{Bgc}$	30% of $I_{refp}$	LOW
8	LOW	$> 5,1 I_{Bgc}$	70% of $I_{refp}$	HIGH

Where:

$$\overline{DODS} = \text{HIGH} \quad \overline{DODS} \geq V_{GND} + 2,4 \text{ V.}$$

$$\overline{DODS} = \text{LOW} \quad \overline{DODS} \leq V_{GND} + 0,8 \text{ V.}$$

$$I_{D(tot)} = (I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot G3 \cdot G4 \cdot G5.$$

For G3, G4, G5 see transfer functions description of TDA5708.

**Table 2** Test condition for ready output (RD)

conditions	inputs		output level RD
	$V_{Sc}$	$V_{Si}$	
1	$\geq 4V_j + V_{OFF}$	HIGH	LOW
2	$\leq 4V_j - V_{OFF}$	HIGH	LOW
3	$\geq 4V_j + V_{OFF}$	LOW	HIGH
4	$\leq 4V_j - V_{OFF}$	LOW	LOW

Where:

$$V_{OFF} \approx 120 \text{ mV.}$$

$V_j$  is the junction voltage (0,7 V typ.).

DEVELOPMENT DATA

TDA5709

## RADIAL ERROR SIGNAL PROCESSOR FOR COMPACT DISC PLAYERS

### GENERAL DESCRIPTION

The TDA5709 is a bipolar integrated circuit which provides control signals for the radial motor. These control signals are generated from radial error signals received from a photo-diode signal processor (TDA5708), and velocity control signals from the control processor.

### Features

- Tracking error processor with automatic asymmetry control
- A.G.C. circuitry with automatic start-up and wobble generator
- Tracking control for fast forward/reverse scan, search, repeat and pause functions
- TTL compatible digital input/output
- Digitalized tracking error signal
- Possibility for car application

### QUICK REFERENCE DATA

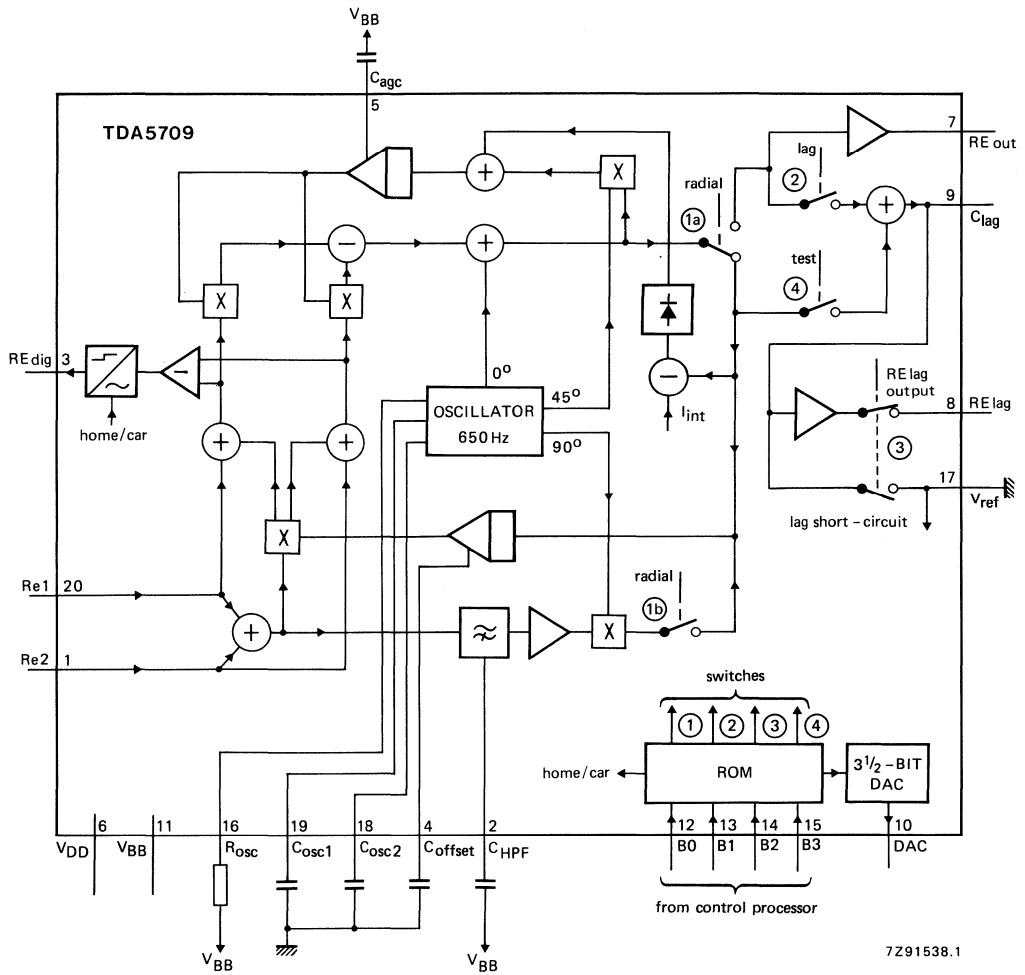

---

Supply voltage range	$V_{DD}-V_{BB}$	8 to 13 V
Quiescent supply current	$I_Q$	typ. 6 mA
Operating ambient temperature range	$T_{amb}$	-30 to +85 °C

---

### PACKAGE OUTLINE

20-lead DIL; plastic (SOT-146).

7291538.1

Fig. 1 Block diagram.

**PIN DESCRIPTION**

Pin No.	Symbol	Description
1	Re2	Input for amplified currents from photo diodes D1 and D2
2	C <sub>HPF</sub>	High-pass filter for Re1 and Re2, used for radial offset control
3	REdig	Digital output of sign (Re2 – Re1)
4	C <sub>offset</sub>	Offset control input for radial offset
5	C <sub>agc</sub>	Gain control input for radial error signal
6	V <sub>DD</sub>	Positive supply voltage
7	REout	Current output of amplified (Re2 – Re1) input currents
8	RElag	Voltage output of integrated (Re2 – Re1) input currents
9	C <sub>lag</sub>	Integrator capacitor for (Re1 – Re2) input currents
10	DAC	Current output for track jumping (3½ bits)
11	V <sub>BB</sub>	Negative supply connection (also substrate connection)
12	B0	Input control bits for off-, catch-, play-status and DAC output current
13	B1	
14	B2	
15	B3	
16	R <sub>osc</sub>	Biassing resistor for oscillator frequency and internal amplitude
17	V <sub>ref</sub>	Intermediate supply voltage
18	C <sub>osc2</sub>	Frequency setting capacitors for oscillator
19	C <sub>osc1</sub>	
20	Re1	Input for amplified currents from photo-diodes D3 and D4

DEVELOPMENT DATA

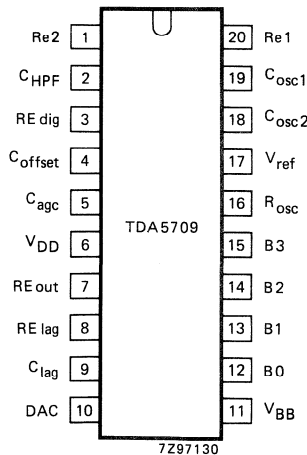

Fig. 2 Pinning diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage range ( $V_{DD} - V_{BB}$ )  
pin 6 – pin 11

$V_{DD}-V_{BB}$  -0,3 to +13 V

Total power dissipation

$P_{tot}$  see Fig. 3

Storage temperature range

$T_{stg}$  -55 to +150 °C

Operating ambient temperature range

$T_{amb}$  -30 to +85 °C

Operating junction temperature

$T_j$  max. 150 °C

**THERMAL RESISTANCE**

From junction to ambient

$R_{th\ j-a}$  = 72 K/W

Fig. 3 Power derating curve.

## CHARACTERISTICS

$V_{DD} = +5\text{ V}$ ;  $V_{BB} = -5\text{ V}$ ;  $T_{amb} = 25\text{ }^{\circ}\text{C}$ ;  $V_{ref} = 0\text{ V}$ ;  $R_{osc} = 24\text{ k}\Omega$ ; all voltages with respect to  $V_{ref}$ ; unless otherwise specified.

DEVELOPMENT DATA

parameter	symbol	min.	typ.	max.	unit
<b>Supplies</b>					
Supply voltage pin 6 – pin 11 ( $V_{DD} - V_{BB}$ )		8	–	13	V

## FM RADIO CIRCUIT

### GENERAL DESCRIPTION

The TDA7000 is a monolithic integrated circuit for mono FM portable radios, where a minimum on peripheral components is important (small dimensions and low costs).

The IC has an FLL (Frequency-Locked-Loop) system with an intermediate frequency of 70 kHz. The i.f. selectivity is obtained by active RC filters. The only function which needs alignment is the resonant circuit for the oscillator, thus selecting the reception frequency. Spurious reception is avoided by means of a mute circuit, which also eliminates too noisy input signals. Special precautions are taken to meet the radiation requirements.

The TDA7000 includes the following functions:

- R.F. input stage
- Mixer
- Local oscillator
- I.F. amplifier/limiter
- Phase demodulator
- Mute detector
- Mute switch

### QUICK REFERENCE DATA

Fig. 3 A.F. output voltage ( $V_o$ ) and total harmonic distortion (THD) as a function of the e.m.f. input voltage (EMF) with a source impedance ( $R_S$ ) of  $75 \Omega$ : (1) muting system enabled; (2) muting system disabled.

Conditions:  $0 \text{ dB} = 75 \text{ mV}$ ;  $f_{rf} = 96 \text{ MHz}$ .

for S + N curve:  $\Delta f = \pm 22,5 \text{ kHz}$ ;  $f_m = 1 \text{ kHz}$ .

for THD curve:  $\Delta f = \pm 75 \text{ kHz}$ ;  $f_m = 1 \text{ kHz}$ .

#### Notes

1. The muting system can be disabled by feeding a current of about  $20 \mu\text{A}$  into pin 1.
2. The interstation noise level can be decreased by choosing a low-value capacitor at pin 3. Silent tuning can be achieved by omitting this capacitor.

TDA7020T

## FM RADIO CIRCUIT

### GENERAL DESCRIPTION

The TDA7020T integrated circuit is for FM portable radios, stereo as well as mono, where a minimum periphery is important in terms of small dimensions and low cost. The IC has a FLL (Frequency Locked Loop) system with an intermediate frequency of 76 kHz. The selectivity is obtained by active RC filters. The only function to be tuned is the resonant circuit of the oscillator. Interstation-noise as well as noise from receiving weak signals is reduced by a correlation mute system.

Special precautions have been taken to meet local oscillator radiation requirements. Because of the low intermediate frequency, low pass filtering of the MUX signal is required to avoid noise when receiving stereo. 50 kHz roll-off compensation, needed because of the low pass characteristic of the FLL, is performed by the integrated LF amplifier. For mono application this amplifier can be used to directly drive an earphone. The field-strength detector enables field-strength dependent channel separation control.

The TDA7020T includes the following functions:

- RF input stage
- Mixer
- Local oscillator
- IF amplifier/limiter
- Frequency detector
- Mute circuit
- Loop amplifier
- Internal reference circuit
- LF amplifier for:
  - mono earphone amplifier or
  - MUX filter
- field-strength dependent channel separation control facility

### QUICK REFERENCE DATA

Supply voltage range (pin 4)	$V_p$		1,8 to 6 V
Supply current at $V_p = 3$ V	$I_p$	typ.	6,3 mA
RF input frequency range	$f_{rf}$		1,5 to 110 MHz
Sensitivity for $-3$ dB limiting (e.m.f. voltage) (source impedance: 75 $\Omega$ ; mute disabled)	EMF	typ.	4 $\mu$ V
Signal handling (e.m.f. voltage) (source impedance: 75 $\Omega$ )	EMF	typ.	200 mV
AF output voltage	$V_o$	typ.	90 mV

TDA7021T

## FM RADIO CIRCUIT FOR MTS

### GENERAL DESCRIPTION

The TDA7021T integrated radio receiver circuit is for portable radios, stereo as well as mono, where a minimum of periphery is important in terms of small dimensions and low cost. It is fully compatible for applications using the low-voltage micro tuning system (MTS). The IC has a frequency locked loop (FLL) system with an intermediate frequency of 76 kHz. The selectivity is obtained by active RC filters. The only function to be tuned is the resonant frequency of the oscillator. Interstation noise as well as noise from receiving weak signals is reduced by a correlation mute system.

Special precautions have been taken to meet local oscillator radiation requirements. Because of the low intermediate frequency, low pass filtering of the MUX signal is required to avoid noise when receiving stereo. 50 kHz roll-off compensation, needed because of the low pass characteristic of the FLL, is performed by the integrated LF amplifier. For mono application this amplifier can be used to directly drive an earphone. The field-strength detector enables field-strength dependent channel separation control.

### Features

- RF input stage
- Mixer
- Local oscillator
- IF amplifier/limiter
- Frequency detector
- Mute circuit
- MTS compatible
- Loop amplifier
- Internal reference circuit
- LF amplifier for
  - mono earphone amplifier or
  - MUX filter
- Field-strength dependent channel separation control facility

### QUICK REFERENCE DATA

## LOW VOLTAGE MONO/STEREO POWER AMPLIFIER

### GENERAL DESCRIPTION

The TDA7050T is a low voltage audio amplifier for small radios with headphones (such as watch, pen and pocket radios) in mono (bridge-tied load) or stereo applications.

### Features

- Limited to battery supply application only (typ. 3 and 4 V)
- Operates with supply voltage down to 1,6 V
- No external components required
- Very low quiescent current
- Fixed integrated gain of 26 dB, floating differential input
- Flexibility in use — mono BTL as well as stereo
- Small dimension of encapsulation (see package design example)

### QUICK REFERENCE DATA

Supply voltage range	$V_P$	1,6 to 6,0 V
Total quiescent current (at $V_P = 3$ V)	$I_{tot}$	typ. 3,2 mA

#### Bridge tied load application (BTL)

Output power at $R_L = 32 \Omega$ $V_P = 3$ V; $d_{tot} = 10\%$	$P_O$	typ. 140 mW
D.C. output offset voltage between the outputs	$ \Delta V $	max. 70 mV
Noise output voltage (r.m.s. value) at $f = 1$ kHz; $R_S = 5$ k $\Omega$	$V_{no(rms)}$	typ. 140 $\mu$ V

#### Stereo application

Output power at $R_L = 32 \Omega$ $d_{tot} = 10\%$ ; $V_P = 3$ V	$P_O$	typ. 35 mW
$d_{tot} = 10\%$ ; $V_P = 4,5$ V	$P_O$	typ. 75 mW
Channel separation at $R_S = 0 \Omega$ ; $f = 1$ kHz	$\alpha$	typ. 40 dB
Noise output voltage (r.m.s. value) at $f = 1$ kHz; $R_S = 5$ k $\Omega$	$V_{no(rms)}$	typ. 100 $\mu$ V

### PACKAGE OUTLINE

8-lead mini-pack; plastic (SO-8; SOT-96A).

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	$V_P$	max.	6 V
Peak output current	$I_{OM}$	max.	150 mA
Total power dissipation			see derating curve Fig. 1
Storage temperature range	$T_{stg}$		-55 to +150 °C
Crystal temperature	$T_c$	max.	100 °C
A.C. and d.c. short-circuit duration at $V_P = 3,0$ V (during mishandling)	$t_{sc}$	max.	5 s

Fig. 1 Power derating curve.

**SO PACKAGE DESIGN EXAMPLE**

To achieve the small dimension of the encapsulation the SO package is preferred with only 8 pins. Because a heatsink is not applicable, the dissipation is limited by the thermal resistance of the 8-pin SO encapsulation until:

$$\frac{T_{j \max} - T_{amb}}{R_{th j-a}} = \frac{100-60}{300} = 0,1 \text{ W.}$$

## CHARACTERISTICS

$V_P = 3\text{ V}$ ;  $f = 1\text{ kHz}$ ;  $R_L = 32\ \Omega$ ;  $T_{\text{amb}} = 25\text{ }^\circ\text{C}$ ; unless otherwise specified

## DIGITAL CONTROLLED I<sup>2</sup>C BUS HI-FI AUDIO PROCESSOR

### GENERAL DESCRIPTION

The TDA8420 is a monolithic bipolar integrated stereo sound circuit with a loudspeaker channel (CH1) and a headphone channel (CH2), digital controlled via I<sup>2</sup>C-bus, for application in television sets.

Functions:

- Input selector
- Mode selector
- Loudspeaker channel (CH1) } with volume control, balance control and mute
- Headphone channel (CH2) }
- Pseudo stereo and spatial function
- Bass and treble control

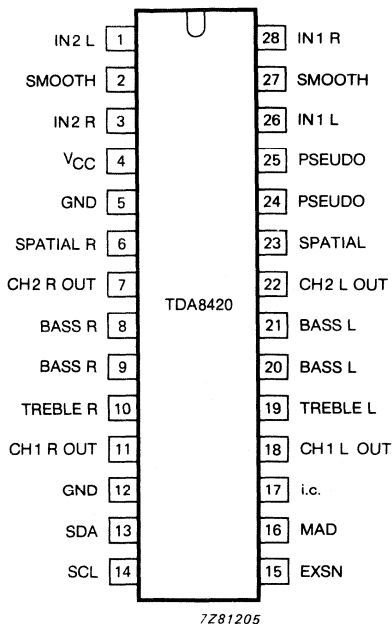

Fig. 2 Pinning diagram.

DEVELOPMENT DATA

## FUNCTIONAL DESCRIPTION

**Input selector**

The input selector selects for both channels, CH1 and CH2, between the two input signals IN1 and IN2. For example is IN1 the internal and IN2 an external AF-signal.

**Mode selector**

For each channel (CH1 and CH2) there is a mode selector which selects between stereo, sound A and sound B in case of bilingual transmission. Both mode selectors can be controlled independently.

**Headphone channel (CH2)**

Volume control and balance.

The stages for volume control for CH2 consist of two parts for left and right. In each part the gain can be adjusted between 0 and -62 dB in steps of 2 dB. There is an additional step with an attenuation of  $\geq 90$  dB. The control range of both parts are controllable independently of each other, so that balance can be varied by controlling the volume of left and right.

**Loudspeaker channel (CH1)**

Volume control and balance.

The loudspeaker channel (CH1) also consists of two parts for volume control (left and right). In each part the gain can be adjusted between +16 dB and -46 dB in steps of 2 dB. An additional step allows an attenuation of  $\geq 90$  dB. Over the whole range both parts can be controlled independently. So that balance can be varied by controlling the volume of left and right.

## Pseudo stereo and spatial

It is possible to switch on either the pseudo stereo- or the spatial-mode. The pseudo stereo-mode has to be used in case of mono transmission and the spatial-mode in case of stereo transmission.

## Bass control

The bass control stage can be switched in between a range of an emphasis of 15 dB and an attenuation of 12 dB for low frequencies in steps of 3 dB.

## Treble control

The treble control stage can be switched in a range between +12 dB and -12 dB in steps of 3 dB.

## Bias and power supply

The TDA8420 includes a bias and power supply stage, which generate a voltage of  $\frac{1}{2} V_{CC}$  with a low output impedance and the injector currents for the logic part.

## Power-on reset

The on-chip power-on reset circuit sets the mute bit to active, so both the loudspeaker channel (CH1) and the headphone channel (CH2) are muted.

The muting can be switched off by transmission of the mute bit.

## I<sup>2</sup>C-bus receiver and data handling

Bus specification.

The TDA8420 is controlled from a microcomputer via the I<sup>2</sup>C-bus.

The I<sup>2</sup>C-bus has two lines. One is called SDA and carries the data, the other is called SCL and carries the clock. Both lines are connected with the positive supply voltage via pull up resistors.

When both lines are "HIGH" the bus is free.

For data transmission SDA is only allowed to change during the time SCL is "LOW". SDA must be stable during SCL is "HIGH". The requirements on set up and hold times are specified in the chapter a.c. electrical characteristics.

A "HIGH" to "LOW" transition of SDA during SCL is "HIGH" is defined as a start condition.

A "LOW" to "HIGH" transition of SDA during SCL is "HIGH" is defined as a stop condition.

The I<sup>2</sup>C-bus receiver will be reset by the reception of a start condition.

After a start condition the I<sup>2</sup>C-bus is considered to be busy.

The I<sup>2</sup>C-bus is considered to be free again after a stop condition.

## Module address

The data transmission to the TDA8420 has to be started with the module address MAD.

The specific module address for TDA8420 is defined as follows:

MBS					LSB			
1	0	0	0	0	0	MAD	R/W	ACK

The module address can be varied externally at pin 16 (connected to ground -> MAD = 0, connected to V<sub>CC</sub> -> MAD = 1). So it is possible to select two IC's TDA8420 within a system.

**Subaddress**

After the module address byte a second byte is used to select the functions for both channels:

CH1: Volume left, volume right, bass, treble and switch functions.

CH2: Volume left, volume right and switch functions.

The subaddress SAD is stored within the TDA8420. The following table defines the coding of the second byte after the module address MAD.

Second byte after module address MAD:

function	128	64	32	16	8	4	2	1
	MSB				LSB			
	7	6	5	4	3	2	1	0
CH1								
volume left	0	0	0	0	0	0	0	0
volume right	0	0	0	0	0	0	0	1
bass	0	0	0	0	0	0	1	0
treble	0	0	0	0	0	0	1	1
switch functions	0	0	0	0	1	0	0	0
CH2								
volume left	0	0	0	0	0	1	0	0
volume right	0	0	0	0	0	1	0	1
switch functions	0	0	0	0	1	1	0	0
subaddress SAD								

**Definition of 3rd byte**

A third byte is used for transmitting data into the TDA8420. The following table defines the coding of the third byte after the module address MAD and the subaddress SAD.

Third byte after module address MAD and subaddress SAD

function		MSB							LSB
		7	6	5	4	3	2	1	0
CH1									
volume left	VL1	1	1	V05	V04	V03	V02	V01	V00
volume right	VR1	1	1	V15	V14	V13	V12	V11	V10
bass	BA	1	1	1	1	BA3	BA2	BA1	BA0

---	---	---	---	---
---	---	---	---	---
-12	0	0	1	0
---	---	---	---	---
---	---	---	---	---
-12	0	0	0	0

Sequence of data transmission.

After a power-on reset all eight functions have to be adjusted with eight data transmissions. It is recommended to transmit the data information for switch functions in CH1 at last because all functions have to be adjusted when the muting is switched off. The sequence of the other data information doesn't matter.

The following figures show the order of data transmission.

1. After a power-on reset

2. Otherwise

The number of data transmissions is unrestricted but before each data byte the module address MAD and the right subaddress SAD is necessary.

## DOLBY\* B & C TYPE NOISE REDUCTION CIRCUITS

### GENERAL DESCRIPTION

The TEA0651/TEA0652 and TEA0654 provide both, Dolby B and Dolby C type audio Noise Reduction (NR). The TEA0651/TEA0652 are NR signal processing ICs in 18-lead DIL packages. They can be used either as a stereo Dolby B NR circuit or as one channel of a switchable Dolby B & C NR circuit. In addition they provide NR ON/OFF switching.

The TEA0654 is a switching IC in a 24-lead DIL package. It contains the switching, the pre-amplifiers for playback and recording functions and a multiplex filter buffer amplifier.

The circuits are pin compatible to Signetics NE651, NE652 and NE654 respectively.

### Features

#### TEA0651/TEA0652

- Dual purpose IC for Dolby B & C NR systems:
  - switchable B/C type NR systems, B-type NR systems (stereo without preamplifiers), automotive entertainment systems (playback only) and portable applications
- Dual version for better matching between HIGH and LOW level stages in C-type NR or better channel matching for stereo B-type NR applications
- Full-wave rectifier
- No capacitive divider for side-chain filter needed
- Electronic switching for NR ON/OFF, B and C-type NR
- Dolby level 0 dB = -6 dBm (387,5 mV) offers line output level option of 0 dBm (775 mV)

#### TEA0654

- Electronic switching for playback/record
- Electronic switching for NR ON/OFF and B/C type NR
- No internal/external matching required for filter networks:
  - only one network for spectral skewing and deskewing necessary; only one network for anti-saturation necessary
- Excellent matching between record and playback
- Line output (monitor) level externally set by resistor ratio independent of internal Dolby level
- Playback and record preamplifier and multiplex filter buffer amplifier included

### PACKAGE OUTLINES

TEA0651/TEA0652: 18-lead DIL; plastic (SOT-102HE).

TEA0654: 24-lead DIL; plastic (SOT-101A).

\* Available only to licensees of Dolby Laboratories Licensing Corporation, San Francisco, CA94111, U.S.A., from whom licensing and application information must be obtained. Dolby is a registered trademark of Dolby Laboratories Licensing Corporation.

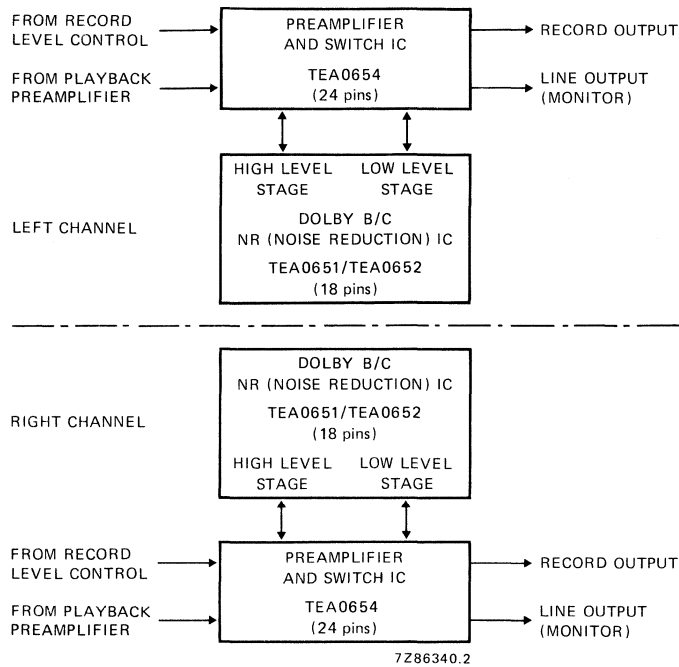

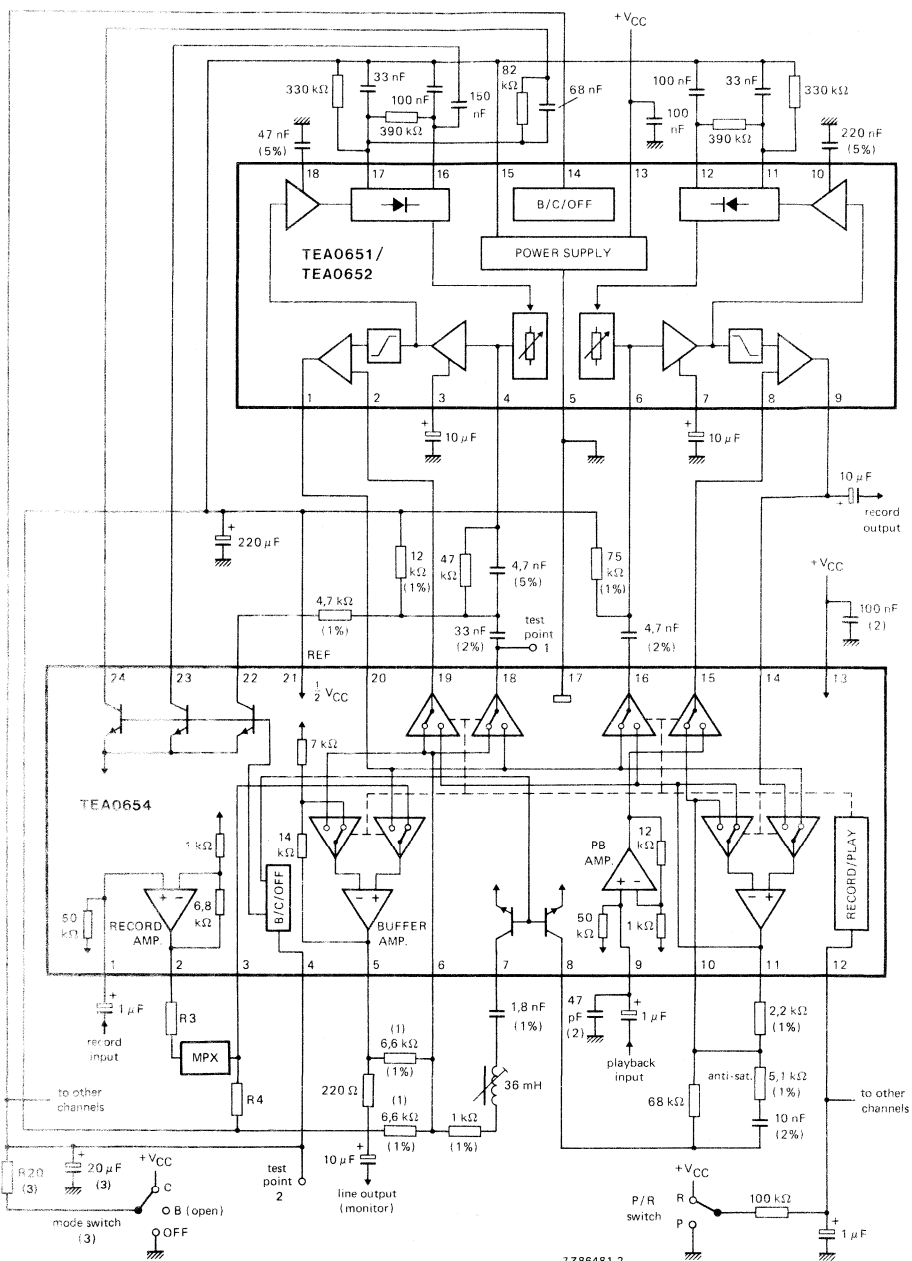

Fig. 1 System block diagram.

Switching levels; see Fig. 2.

pin condition (test point 2)	functions switched for TEA0654 (pin 4)	functions switched for TEA0651/TEA0652 (pin 14)
+ V <sub>CC</sub>	Dolby-C, open collector transistors at pins 7 and 8 switched on, at pins 22, 23, 24 switched off	Dolby-C
½V <sub>CC</sub>	not applicable	stereo Dolby B, both channels active (Figs 15 and 16)
open (internally pulled to ¼V <sub>CC</sub> )	Dolby-B, open collector transistors at pins 7 and 8 switched off, at pins 22, 23, 24 switched on	Dolby-B, low level stage side chain muted
ground	as pin condition 'open'	NR-OFF both side chains muted

- (1) Line output and record input programming resistors.
- (2) Optional capacitors.
- (3) Time constant for mode switch is optional, R20 is equal to 6,8 kΩ divided by number of switched channels.

Fig. 2 Dolby B/C NR system; switches shown in record position.

**SYSTEM RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	$V_{CC}$	max.	23 V
Storage temperature range	$T_{stg}$	-55 to + 150 °C	
Operating ambient temperature range	$T_{amb}$	-30 to + 85 °C	
Total power dissipation	$P_{tot}$	max.	600 mW
TEA0651/TEA0652	$P_{tot}$	max.	800 mW
TEA0654			

**SYSTEM CHARACTERISTICS**

$V_{CC} = 14 V$ ;  $f = 20 Hz$  to 20 kHz;  $T_{amb} = 25 °C$ ; all levels with reference to 387,5 mV = 0 dB = -6 dBm at test point 1 in Fig. 2; record mode; unless otherwise specified; for graphs see Figs 10 to 16.

parameter	conditions			min.	typ.	max.	unit
	mode	f(kHz)					
Supply voltage range	C	-	$V_{CC}$ ; note 1	8	14	20	V
Input sensitivity	C	-	record mode	-	50	-	mV
			playback mode note 2	-	30	-	mV
Signal handling at record output note 3	C	-	$V_{CC} = 8 V$ line output is -6 dBm	12	-	-	dB
	C	1	$V_{CC} = 14 V$ THD - 1% line output is -6 dBm	-	18	-	dB
	-	1	$V_{CC} = 14 V$ line output is 0 dB,	12	-	-	dB
Signal-to-noise ratio (S/N)	C	-	$R_S = 10 k\Omega$ CCIR/ARM weighted	60	66	-	dB
Switching thresholds note 4	OFF	-	voltage at test point 2	-	-	0,065 x $V_{CC}$	V
	B	-	voltage at test point 2; note 5	0,2 x $V_{CC}$	0,25 x $V_{CC}$	0,3 x $V_{CC}$	V
	C	-	voltage at test point 2	0,85 x $V_{CC}$	-	-	V

**Notes to system characteristics**

1. Operation with minimum of 12 dB headroom; system remains functional to 6 V.
2. Attenuation between pins 2 and 3 of TEA0654 is 4 dB;
3. System headroom is determined by programmable monitor output level (pin 5 of TEA0654).
4. For a typical application see Fig. 10. Worst case considerations for the  $V_{CC}$  range from 8 V to 20 V limit the optional external resistor to maximum 6,8 k $\Omega$ , divided by number of switched channels.
5. In the open position (B) of the mode switch pin 14 of TEA0651/TEA0652 is pulled to typical  $0,25 \times V_{CC}$  by pin 4 of TEA0654.

**SYSTEM GRAPHS**

TEA0653T

## DOLBY B TYPE NOISE REDUCTION CIRCUIT

### GENERAL DESCRIPTION

The TEA0653T is a monolithic bipolar IC designed for use in Dolby B type audio Noise Reduction (NR) systems. The device is a dual channel circuit.

### Applications

- Automotive cassette players
- Home cassette decks
- Portable cassette players
- Video cassette recorders
- FM receivers

### Features

- Dual processors provide optimum matching of channels
- No law adjustments required
- Full wave rectifier
- No capacitor required for side chain filter
- Electronic switching for NR ON/OFF
- Reference level 0 dB = 387,5 mV
- Minimum external components
- Easy to apply in 2 or 3 head systems
- Split supply operation is optional

### QUICK REFERENCE DATA

---

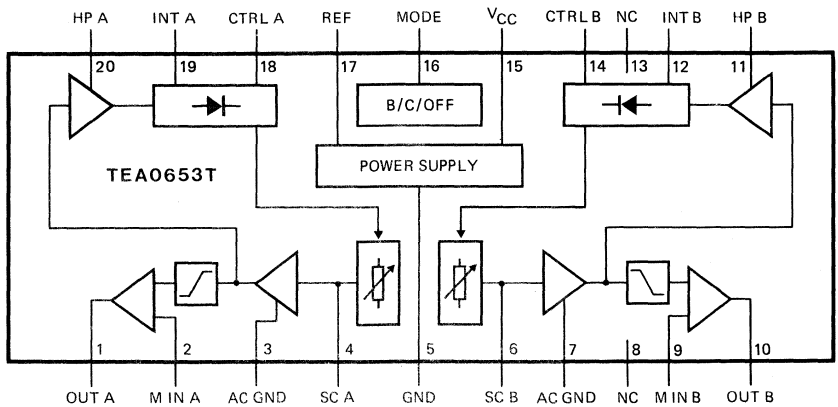

Supply voltage	max.	20 V
Supply current	typ.	17 mA
Signal-to-noise ratio	typ.	90 dB
Storage temperature range		-55 to +150 °C
Operating ambient temperature range		-30 to +85 °C

---

### PACKAGE OUTLINES

TEA0653T: 20-lead mini-pack; plastic (SOT-163A).

\* Available only to licensees of Dolby Laboratories Licensing Corporation, San Francisco, CA94111, U.S.A., from whom licensing and application information must be obtained. Dolby is a registered trademark of Dolby Laboratories Licensing Corporation.

## DOLBY\* B and C TYPE NOISE REDUCTION CIRCUIT

### GENERAL DESCRIPTION

The TEA0665 is designed for use in Dolby B and Dolby C type audio Noise Reduction (NR) systems. The device provides the high and low level stages for one channel of a Dolby C-type NR system, including NR ON/OFF switching and all electronic switching necessary for Dolby C-type systems. In addition the TEA0665 includes a preamplifier for the record and playback functions and a multiplex buffer amplifier. The circuit offers two different line-output levels ( $-6$  and  $0$  dBm) and a low-pass filter, which can be fed into the signal path in playback mode.

### Features

- Few external components required
- Included RECORD/PLAY preamplifiers plus multiplex filter buffer amplifier
- Two different line-output levels
- All electronic switching

### PACKAGE OUTLINES

TEA0665: 28-lead DIL; plastic (SOT-117).

TEA0665T: 28-lead mini-pack; plastic (SO-28; SOT-136A).

\* Available only to licensees of Dolby Laboratories Licensing Corporation, San Francisco, CA94111, U.S.A., from whom licensing and application information must be obtained. Dolby is a registered trademark of Dolby Laboratories Licensing Corporation.

Output resistance			pin 6	R <sub>6-27</sub>	-	160	220	Ω
			pin 21	R <sub>21-27</sub>	-	60	100	Ω

**Notes to the characteristics**

1. Operation with minimum of 12 dB headroom; system remains functional to 7 V.
2. Attenuation between pins 1 and 3 is 3,5 dB (MPX-filter).  
Playback input sensitivity is 45 mV if a switchable MPX-low pass filter is used in playback mode (pins 2 and 3 short-circuited).
3. System headroom is determined by the line output channel in use.  
For low supply voltages line output 2 (pin 6) will saturate at high signal levels. Headroom for line output 1 (pin 5) tracks with record output (pin 21).
4. The equation for REC/PB switch input voltage is:  
REC:  $V_{24-27} > 0,55 V_{CC} - V_{BE} + 1,5 V$ ,  
PB:  $V_{24-27} < 0,45 V_{CC} - V_{BE} - 1,5 V$ .
5. The equation for C/B/OFF mode switch input voltage is:  
OFF:  $V_{25-27} < 0,38 V_{CC} - V_{BE} - 1 V$ ,  
B:  $0,45 V_{CC} < V_{25-27} < 0,55 V_{CC}$  (external voltage),  
C:  $0,5 V_{CC}$  (switch in open position),  
C:  $V_{25-27} > 0,75 V_{CC} - V_{BE} + 1 V$ .

The voltage drop across the external time constant resistor must be taken in to account.

TEA0666

# DOLBY\* B and C TYPE NOISE REDUCTION CIRCUIT

### GENERAL DESCRIPTION

The TEA0666 is designed for use in Dolby B and Dolby C type audio Noise Reduction (NR) systems. The device provides the high and low level stages for one channel of a Dolby C type NR system, including NR ON/OFF switching and all electronic switching necessary for Dolby C-type systems. In addition the TEA0666 includes a preamplifier for the record and playback functions and a multiplex buffer amplifier. The circuit offers two different line-output levels (-6 and 0 dBm) and a low-pass filter, which can be fed into the signal path in playback mode.

### Features

- Few external components required
- Included RECORD/PLAY preamplifiers plus multiplex filter buffer amplifier
- Two different line-output levels
- All electronic switching

### PACKAGE OUTLINES

TEA0666: 28-lead DIL; plastic (SOT-117).

TEA0666T: 28-lead mini-pack; plastic (SO-28; SOT-136A).

\* Available only to licensees of Dolby Laboratories Licensing Corporation, San Francisco, CA94111, U.S.A., from whom licensing and application information must be obtained.  
Dolby is a registered trademark of Dolby Laboratories Licensing Corporation.

TEA0670T

# LOW VOLTAGE DOLBY B/C TYPE IC

### Linear LSI Products

### DESCRIPTION

The TEA0670T is a monolithic IC intended for use in low voltage Dolby\* B & C type noise reduction applications. This IC design features both record and play-back mode with all internal electronic switching.

### Features

- B and C type noise reduction
- Low voltage operation 1.8–8 V
- Playback and record modes
- 0 dB (Dolby level) = 100 mV
- Record input sensitivity 50 mV
- Playback sensitivity 20 mV
- All electronic switching

### APPLICATION

- Portable tape recorders/players

### PACKAGE OUTLINES

28-lead mini-pack; plastic (SO-28; SOT-136A).

\* Available only to licensees of Dolby Laboratories Licensing Corporation, San Francisco, CA94111, U.S.A., from whom licensing and application information must be obtained.  
Dolby is a registered trademark of Dolby Laboratories Licensing Corporation.

## AM CAR RADIO RECEIVER CIRCUIT

The TEA5550 is an a.m. radio circuit, primarily intended for use in car radios.

The IC can reduce the costs in a car radio due to the following features:

- minimum periphery
- no extra r.f.-prestage is necessary
- ceramic i.f. filter is used
- simple on/off switching method allows inexpensive band switching in a.m./f.m. radios

The TEA5550 incorporates the following functions:

- a double balanced mixer with large signal handling range and common mode rejection properties
- a 'one-pin' oscillator, permitting the use of variable capacitance diode tuning
- an i.f. amplifier, designed for ceramic filters
- an a.m. envelope detector
- a.g.c. stages
- a voltage stabilizer, for supplying the internal circuit current and an external current up to 20 mA
- a simple d.c. switch for a.m./f.m. radios

### QUICK REFERENCE DATA

## FM/IF SYSTEM

### GENERAL DESCRIPTION

The TEA5560 is a monolithic integrated FM/IF system circuit, intended for car radios and home-receivers equipped with a ratio detector.

The system incorporates the following functions:

- a three-stage i.f. limiting amplifier
- a 15 dB field-strength dependent muting circuit
- a field-strength dependent d.c. voltage for e.g.:  
mono/stereo switching  
channel separation control of a stereo decoder  
an indicator ( $I_{\max} \leq 1 \text{ mA}$ )
- standby ON/OFF switching circuit
- a voltage stabilizer, for the internal circuit current and an external current up to 15 mA
- adjustable gain ( $\Delta G = 15 \text{ dB}$ )

### QUICK REFERENCE DATA

Supply voltage range (pin 6)	$V_P$	10,2 to 18 V	
Ambient temperature	$T_{\text{amb}}$	typ.	25 °C
Supply voltage (pin 6)	$V_P$	typ.	14,4 V
Frequency	$f_o$	10,7 MHz	
-----			
Sensitivity (3 dB limiting)	$V_i$	typ.	150 $\mu\text{V}$
Signal-to-noise ratio for $V_i = 10 \text{ mV}$	S/N	typ.	80 dB
A.F. output voltage at $\Delta f = \pm 22,5 \text{ kHz}$	$V_o$	typ.	200 mV
Total harmonic distortion; $\Delta f = \pm 22,5 \text{ kHz}$	THD	typ.	0,3 %
A.M. suppression			
AM signal: $m = 0,3$ ; $f_m = 1 \text{ kHz}$			
FM signal: $\Delta f = \pm 22,5 \text{ kHz}$ ; $f_m = 70 \text{ Hz}$ for $V_i = 1 \text{ mV}$	AMS	typ.	50 dB

### PACKAGE OUTLINE

9-lead SIL; plastic (SOT-142). The tab (on top of the package) is connected to pin 9.

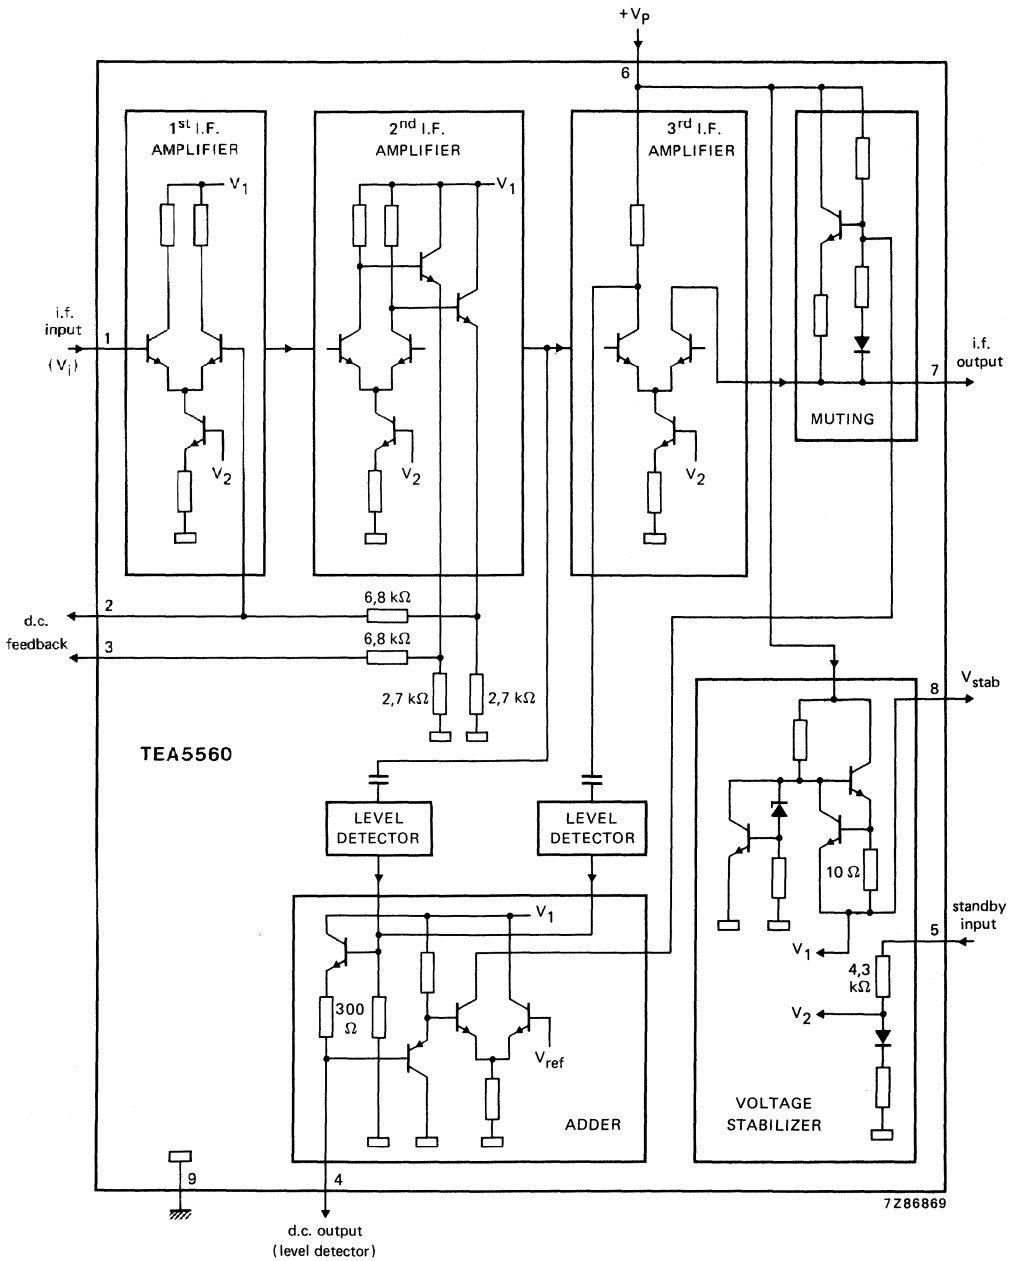

Fig. 1 Block diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltages

pin 6	$V_p = V_{6-9}$	max.	24 V
pin 7	$V_{7-9}$	max.	24 V
Voltage at pin 4	$V_{4-9}$	max.	6 V
Voltage at pin 5	$V_{5-9}$	max.	9 V
Non-repetitive peak output current (pin 8)	$-I_{8SM}$	max.	100 mA
Total power dissipation	$P_{tot}$	max.	1000 mW
Storage temperature range	$T_{stg}$		-55 to +150 °C
Operating ambient temperature range	$T_{amb}$		-30 to +85 °C

**THERMAL RESISTANCE**

From junction to ambient (in free air)	$R_{th\ j-amb}$	=	75 K/W
--	-----------------	---	--------

## D.C. CHARACTERISTICS

$V_P = 14,4 \text{ V}$ ;  $T_{amb} = 25 \text{ }^\circ\text{C}$ ; measured in Fig. 2; unless otherwise specified

## RF/IF CIRCUIT FOR AM/FM RADIO

## GENERAL DESCRIPTION

The TEA5570 is a monolithic integrated radio circuit for use in portable receivers and clock radios. The IC is also applicable to mains-fed AM and AM/FM receivers and car radio-receivers. Apart from the AM/FM switch function the IC incorporates for AM a double balanced mixer, 'one-pin' oscillator, i.f. amplifier with a.g.c. and detector, and a level detector for tuning indication. The FM circuitry comprises i.f. stages with a symmetrical limiter for a ratio detector. A level detector for mono/stereo switch information and/or indication complete the FM part.

## Features

- Simple d.c. switching for AM to FM by only one d.c. contact to ground (no switch contacts in the i.f. channel, a.f. or level detector outputs)
- AM and FM gain control
- Low current consumption ( $I_{tot} = 6 \text{ mA}$ )
- Low voltage operation ( $V_p = 2,7 \text{ to } 9 \text{ V}$ )
- Ability to handle large AM signals; good i.f. suppression
- Applicable for inductive, capacitive and diode tuning
- Double smoothing of a.g.c. line
- Short-wave range up to 30 MHz
- Lumped or distributed i.f. selectivity with coil and/or ceramic filters
- AM and a.g.c. output voltage control
- Distribution of PCB wiring provides good frequency stability
- Economic design for 'AM only' receivers

Indicator current	$I_{12}$	—	250	325	$\mu\text{A}$
D.C. output voltage					
at $V_i = 300\text{ }\mu\text{V}$	$V_{12-16}$	—	0,25	—	V
at $V_i = 2\text{ mV}$	$V_{12-16}$	—	1,0	—	V
<b>AM to FM switch</b>					
Switching current at $V_{3-16} < 1\text{ V}$	$-I_3$	—	—	400	$\mu\text{A}$

**Notes to characteristics**

1. Oscillator operates at  $V_{7-16} > 2,25 \text{ V}$ .
2. I.F. suppression is defined as the ratio  $\alpha = 20 \log \frac{V_{i1}}{V_{i2}}$  where:  $V_{i1}$  is the input voltage at  $f = 455 \text{ kHz}$  and  $V_{i2}$  is the input voltage at  $f = 1 \text{ MHz}$ .
3. Oscillator voltage at pin 8 can be preset by  $R_{\text{osc}}$  (see Fig. 10).
4. Maximum current into pin 5 can be adjusted by  $R_1$  (see Fig. 10);  

$$I_5 = \frac{V_{3-16}}{R_1} - I_3 \text{ when } V_{3-16} = 800 \text{ mV}; I_3 = 400 \mu\text{A}.$$
5. AM suppression is measured with  $f_m = 1 \text{ kHz}$ ,  $m = 0,3$  for AM;  $f_m = 400 \text{ Hz}$ ,  $\Delta f = \pm 22,5 \text{ kHz}$  for FM.

**Facility adaptation**

Facility adaptation is achieved as follows (see Fig. 10):

Facility	Component
FM sensitivity	$R_1$ fixes the current at pin 5 ( $I_5 = \frac{V_{3-16}}{R_1} - 400 \mu\text{A}$ ) (gain adjustable $\pm 10 \text{ dB}$ ; see note 4)
AM sensitivity	$R_{11}$ and coil tapping
AM oscillator biasing	$R_{\text{osc}}$
AM output voltage	$R_7, R_{11}$
AM a.g.c. setting	$R_7$

## PLL STEREO DECODER

### GENERAL DESCRIPTION

The TEA5580 PLL stereo decoder is for car, portable and mains-fed medium-fi radios and radio recorders. It features a 228 kHz voltage-controlled oscillator (VCO) that is locked to the 19 kHz stereo pilot tone by a phase-locked loop (PLL) system. Subcarrier frequencies of 19, 38, 57 and 114 kHz are regenerated via I<sup>2</sup>L logic from the VCO output.

The PLL phase detector suppresses phase distortion due to the 57 kHz pilot tone from the German 'Verkehrs Warnfunk' (VWF) traffic warning system. Typical suppression of the 19 kHz stereo pilot tone is 50 dB, or up to 60 dB with adjustment of the pilot-cancelling resistor (R3, Figs 3 and 4). Adjacent channel interference is prevented by the use of two demodulators, one driven by the 38 kHz decoding signal and the other at 114 kHz to suppress the third harmonic of the multiplexed input signal.

The gain of the input amplifier can be adjusted by an external resistor and the circuit includes compensation for an IF filter typical roll-off frequency of 50 kHz (2 dB down at 38 kHz).

The supply voltage range of the circuit is 3,6 V to 16 V.

### Features

- Wide supply voltage range
- Automatic mono/stereo switching (pilot presence detector)
- Smooth stereo-to-mono change-over at weak signals (signal-dependent stereo channel separation)
- LED driver for stereo/mono indicator
- Suppresses:
  - third harmonics (114 kHz) of multiplexed signal to prevent interference from strong adjacent channels;
  - phase distortion due to the 57 kHz signal from VWF transmitters
- Pilot cancelling circuit to give added suppression of 19 kHz pilot tone
- IF filter roll-off compensation

### PACKAGE OUTLINE

16-lead DIL; plastic (SOT-38).

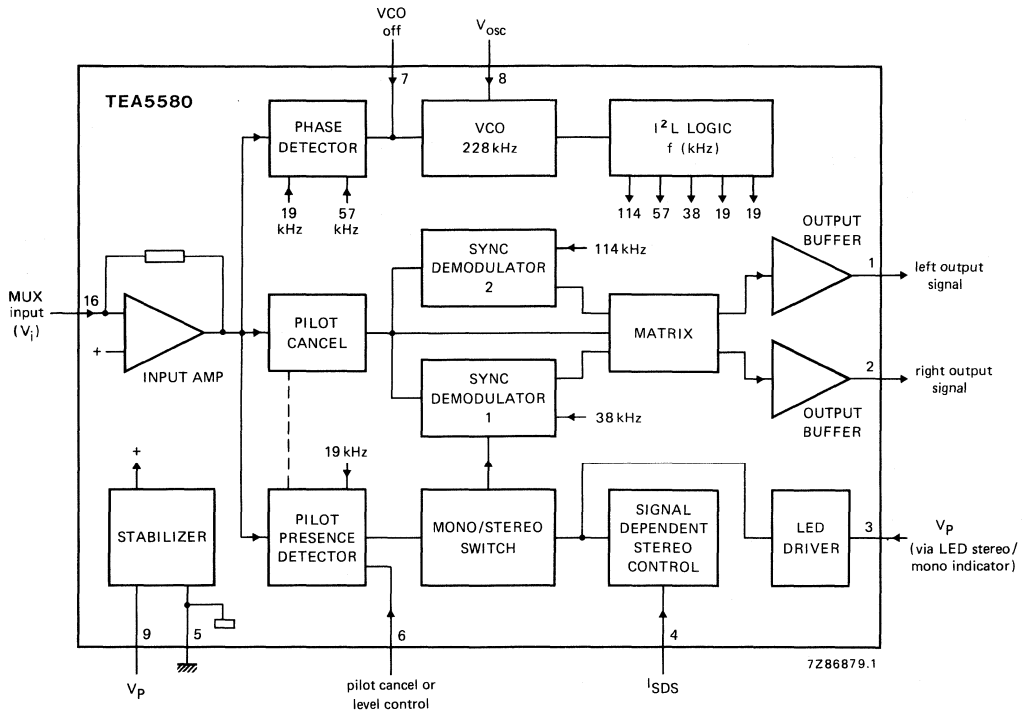

Fig. 1 Block diagram.

**Note**

Do not connect pins 10, 11, 12, 13, 14 or 15.

**RATINGS**

## Notes to the characteristics

1. Minimum supply voltage only applicable in 6 V portable.
2. Without LED-driver current.
3. Guaranteed for mono, mono + pilot, stereo.
4. Also adjustable.
5. Reference output voltage at 1 kHz (measured channel R, pin 2).
6. Intermodulation suppression (BFC: Beat-Frequency Components):

$$\alpha_2 = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz)}}; f_s = (2 \times 10 \text{ kHz}) - 19 \text{ kHz}$$

$$\alpha_3 = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz)}}; f_s = (3 \times 13 \text{ kHz}) - 38 \text{ kHz}$$

measured with 91% mono signal; f<sub>m</sub> = 10 or 13 kHz; 9% pilot signal.

7. Traffic radio (VWF) tone suppression:

$$\alpha_{57} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz} \pm 23 \text{ Hz)}}$$

measured with 91% stereo signal; f<sub>m</sub> = 1 kHz; 9% pilot signal; 5% traffic subcarrier (f = 57 kHz; 60% AM modulated with f<sub>mod</sub> = 23 Hz).

8. SCA (Subsidiary Communication Authorization) tone rejection:

$$\alpha_{67} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 9 kHz)}}; f_s = (2 \times 38 \text{ kHz}) - 67 \text{ kHz}$$

measured with 81% mono signal; f<sub>m</sub> = 1 kHz; 9% pilot signal; 10% SCA-subcarrier (f<sub>s</sub> = 67 kHz, unmodulated).

9. ACI (Adjacent Channel Interference) rejection at:

$$\alpha_{114} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 4 kHz)}}; f_s = (3 \times 38 \text{ kHz}) - 110 \text{ kHz}$$

$$\alpha_{190} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 4 kHz)}}; f_s = (5 \times 38 \text{ kHz}) - 186 \text{ kHz}$$

measured with 90% mono signal;  $f_s = 1 \text{ kHz}$ ; 9% pilot signal; 1% spurious signal ( $f_s = 110$  or  $186 \text{ kHz}$ , unmodulated).

10. The capture range of the PLL may be decreased to 4% by changing the value of C2 to 470 nF (see Fig. 4), if a small ambient temperature range is provided.

## FM/IF SYSTEM AND MICROCOMPUTER-BASED TUNING INTERFACE

### GENERAL DESCRIPTION

The TEA6000 is an FM/IF system circuit intended for microcomputer controlled radio receivers. The circuit includes an AM/FM-IF counter and an analogue-to-digital interface. The i.f. counter generates AM/FM precision tuning and accurate stop information.

### Features

- 3-stage IF limiter for driving a ratio detector
- 2-stage level detector with current output
- operational amplifier for active filtering (e.g. multipath detector)
- high resolution frequency counter for FM and AM IF-signals
- time base reference from crystal oscillator or external source (SAA1057)
- serial two wire bidirectional computer interface (I<sup>2</sup>C-bus)
- multiplexed 3 bit A/D converter for two input signals
- software controlled sensitivity for both ADC inputs

### QUICK REFERENCE DATA

Supply voltages ( $V_{P1}$ and $V_{P2}$ )	$V_P$	typ.	8,4 V
Supply current; ( $I_{P1} + I_{P2}$ )	$I_P$	typ.	36 mA
FM/IF sensitivity at $-3$ dB before limiting	$V_i$	typ.	150 $\mu$ V
Signal to noise ratio for $V_i = 10$ mV	S/N	typ.	80 dB
Audio output voltage $\Delta f = 22,5$ kHz; $V_i = 1$ mV	$V_O$	typ.	170 mV
$\Delta f = 75$ kHz; $V_i = 1$ mV	$V_O$	typ.	520 mV
AM suppression at $V_i = 10$ mV	AMS	typ.	58 dB
Frequency counter sensitivity AM (pin 18)	$V_{i(am)}$	typ.	60 $\mu$ V
FM (pin 16)	$V_{i(fm)}$	typ.	80 $\mu$ V
Resolution frequency counter AM	$f_s(am)$	typ.	250 Hz
FM	$f_s(fm)$	typ.	6,4 kHz
Power dissipation	$P_{tot}$	max.	1300 mW
Storage temperature	$T_{stg}$		$-55$ to $+150$ °C
Operating ambient temperature	$T_{amb}$		$-30$ to $+85$ °C

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT-102HE).

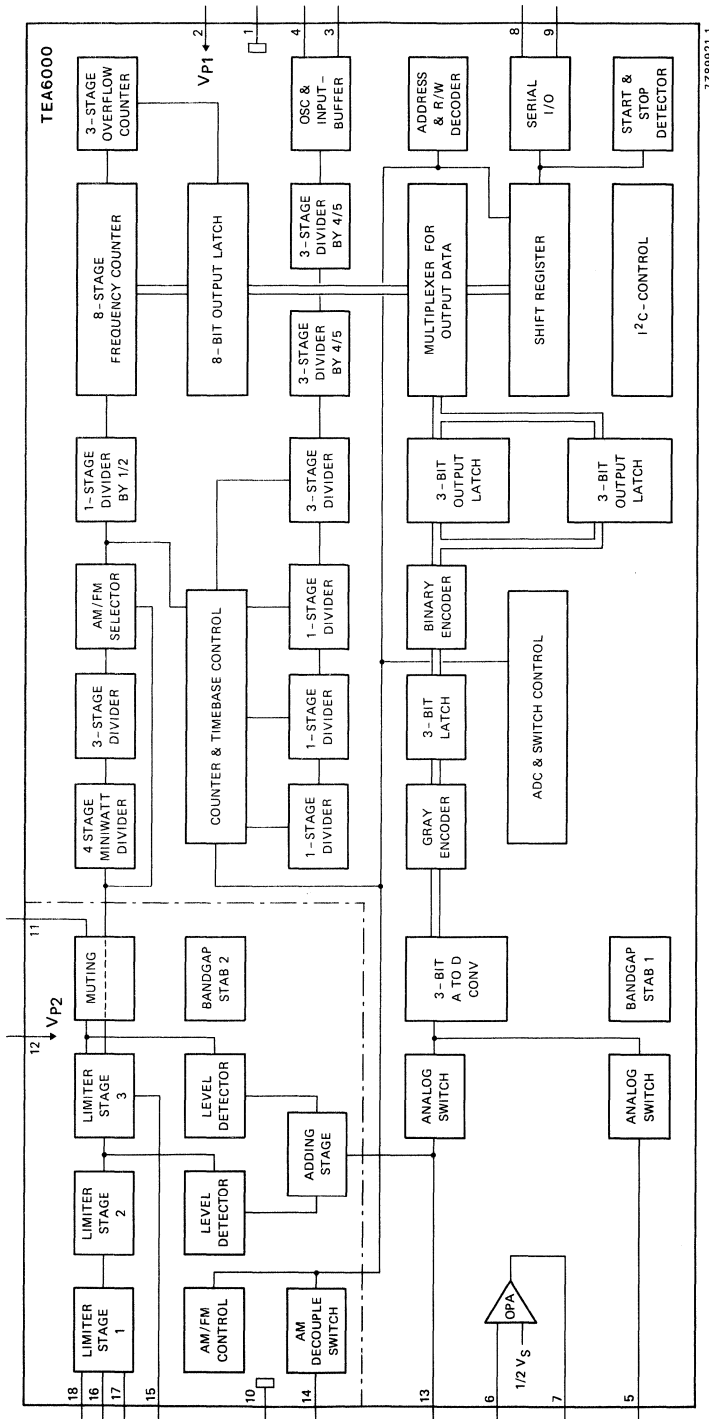

Fig. 1 Block diagram.

## FUNCTIONAL DESCRIPTION

The IF SECTION consists of three balanced differential stages with separated FM and AM inputs, directly coupled by emitter followers. The last stage also has separated outputs, which are intended for driving a ratio detector and the frequency measuring system respectively.

The last two stages are coupled via low-value capacitors to two LEVEL DETECTORS which generate a signal-dependent d.c. current for controlling channel separation and frequency response of a stereo decoder, multipath detector circuitry, AGC and the internal ADC.

The IF MUTING circuit has been incorporated to decrease the interstation noise by about 15 dB.

The 3-bit A/D CONVERTER has two inputs, which are selected via two multiplexed analogue switches. One of these switches is internally connected to the level detector output but can also serve as an external input, as the level detector output can be switched off. The outputs of the ADC are converted to a Gray code, latched and reconverted to a binary code to obtain glitch-free output data. The sensitivity of both inputs can be selected independently via software on two levels.

The reference for the ADC is derived from a BAND-GAP STABILIZER circuit. Multipath distortion on FM will generate an AM modulation on the d.c. voltage from the level detectors. This AM modulation can be filtered and rectified to obtain a multipath-dependent d.c. voltage. This voltage can be applied to the other input of the ADC.

To facilitate filtering an OPERATIONAL AMPLIFIER (OPA) is incorporated on the chip. The typical circuit diagram for a multipath filter is given in Fig. 4.

The FREQUENCY COUNTER is preceded by a 7-stage prescaler for FM, and FM/AM selector stage and a divider by 1 or 2. The actual counter is a presetable and resetable 8-stage counter with a 3-stage data disable overflow counter, which can be switched off. The eight significant output bits are situated symmetrically around 10,7 MHz and 460 kHz, when the external timebase source is used (e.g. SAA1057). See Table 1.

The reference for the TIMEBASE is primarily thought to be the SAA1057. This circuit generates from its 4 MHz crystal oscillator a 32 or 40 kHz signal. This signal is buffered and applied to the timebase circuitry (mode I). The circuit diagram for this mode I is given in Fig. 5a.

In the timebase, the selection is made for reference frequency (32 to 40 kHz), FM or AM mode and the width of the measuring window, all under software control. Accuracy  $\pm \frac{1}{2}$  bit when the window is set to wide (see Fig. 2) and  $\pm 1$  bit when set to narrow. A special feature is the synchronization of the measuring cycle with the input DATA of the I<sup>2</sup>C-bus, meaning the measuring cycle starts immediately after a "WRITE" instruction via the I<sup>2</sup>C-bus.

For those who do not use the SAA1057 as reference, a 2<sup>15</sup> Hz crystal (32 768 Hz) can be connected to the reference inputs directly, obtaining a quartz-oscillator reference. See Fig. 5b for the circuit diagram for this mode II.

When the circuit is used in mode II a correction has to be made to the values of window width and resolution as the cheap watch crystals differ by about 2,4% from the frequency generated by the SAA1057 (32 768 and 32 000 kHz respectively) See Table 2.

Communication between MUST1 and the microcomputer is accomplished via the two-wire bidirectional I<sup>2</sup>C-bus (slave transceiver version); the SDA (serial data) and SCL (serial clock).

To prevent crosstalk between the digital and analogue parts of the circuit the power supply lines are fully isolated.

X1 = 2<sup>15</sup> Hz (32 768 Hz).

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage

pin 2	$V_{P1}$	max.	13,2 V
pin 12	$V_{P2}$	max.	13,2 V
Power dissipation	$P_{tot}$	max.	1300 mW
Storage temperature	$T_{stg}$		-55 to +150 °C
Operating ambient temperature	$T_{amb}$		-30 to +85 °C

**THERMAL RESISTANCE**From crystal to ambient  $R_{th\ c-a} = 50\text{ K/W}$ **D.C. CHARACTERISTICS** $V_{P1} = V_{P2} = 8,4\text{ V}$ ;  $T_{amb} = 25\text{ °C}$ , unless otherwise specified.

parameter	symbol	min.	typ.	max.	unit
Supply voltage					
(pin 2)	$V_{P1}$	7,6	8,4	9,2	V
(pin 12)	$V_{P2}$	7,6	8,4	9,2	V
Supply current AM mode					
pin 2	$I_{P1}$	—	18,5	—	mA
pin 12	$I_{P2}$	—	17,4	—	mA
Supply current FM mode					
pin 2	$I_{P1}$	—	19,2	—	mA
pin 12	$I_{P2}$	—	16,4	—	mA
Power dissipation	$P_{tot}$	—	350	—	mW

**A.C. CHARACTERISTICS** (see Fig. 6) $V_{P1} = V_{P2} = 8,4\text{ V}$ ;  $V_{16-10} = 1\text{ mV}$ ;  $f = 10,7\text{ MHz}$ ;  $\Delta f = 22,5\text{ kHz}$ ;  $f_m = 1\text{ kHz}$ ; unless otherwise specified.

parameter	symbol	min.	typ.	max.	unit
Sensitivity					
at -3 dB before limiting	$V_{I(FM)}$	—	150	—	$\mu\text{V}$
Signal-to-noise ratio, FM input					
$V_i = 20\ \mu\text{V}$	S/N	40	46	—	dB
$V_i = 150\ \mu\text{V}$	S/N	—	64	—	dB
$V_i = 1\text{ mV}$	S/N	—	76	—	dB
$V_i = 10\text{ mV}$	S/N	—	80	—	dB
Noise output voltage					
$V_i = 0\text{ V}$ ; with muting, switch S1 on	$V_{no}$	—	55	—	$\mu\text{V}$
$V_i = 0\text{ V}$ ; without muting, S1 off	$V_{no}$	—	420	—	$\mu\text{V}$
Audio output voltage					
$\Delta f = 22,5\text{ kHz}$	$V_O$	—	170	—	mV
$\Delta f = 75\text{ kHz}$	$V_O$	—	520	—	mV

## A.C. CHARACTERISTICS (continued)

parameter	symbol	min.	typ.	max.	unit
AM suppression					
ratio of the AM output signal referred to the FM signal ( $m = 0,3$ )					
$V_i = 150 \mu\text{V}$	AMS	—	46	—	dB
$V_i = 1 \text{ mV}$	AMS	—	62	—	dB
$V_i = 10 \text{ mV}$	AMS	—	58	—	dB
$V_i = 100 \text{ mV}$	AMS	—	60	—	dB
Level detector output voltage (Fig. 4)					
$R_{13-10} = 4,7 \text{ k}\Omega$ ; $V_i = 10 \text{ mV}$ , FM mode	$V_L$	—	6,2	—	V
Level detector output voltage slope					
$R_{13-10}$ adjusted in FM mode for					
$V_L = 5,5 \text{ V}$ at $V_i = 10 \text{ mV}$ ; $f = 10,7 \text{ MHz}$					
$V_i = 0 \text{ V}$ (pin 16)	$V_L(\text{FM})$	—	130	—	mV
$V_i = 140 \mu\text{V}$	$V_L(\text{FM})$	—	1,3	—	V
$V_i = 1 \text{ mV}$	$V_L(\text{FM})$	—	2,7	—	V
$V_i = 3 \text{ mV}$	$V_L(\text{FM})$	—	4,4	—	V
$R_{13-10}$ adjusted in FM mode (see above)					
$V_i = 0 \text{ V}$ , $f = 460 \text{ kHz}$ (pin 18)	$V_L(\text{AM})$	—	200	—	mV
$V_i = 1 \text{ mV}$ , $f = 460 \text{ kHz}$ (pin 18)	$V_L(\text{AM})$	—	1,4	—	V
$V_i = 10 \text{ mV}$ , $f = 460 \text{ kHz}$ (pin 18)	$V_L(\text{AM})$	—	2,7	—	V
Frequency counter sensitivity					
AM input voltage (pin 18)	$V_I(\text{AM})$	—	60	—	$\mu\text{V}$
FM input voltage (pin 16)	$V_I(\text{FM})$	—	80	—	$\mu\text{V}$
AM input impedance	$R_i$	—	30	—	$\text{k}\Omega$
BUS inputs					
SDA and SCL (pins 9 and 8)					
input voltage HIGH	$V_{IH}$	3,0	—	$V_{P1}$	V
input voltage LOW	$V_{IL}$	-0,3	—	1,5	V
input current HIGH	$I_{IH}$	—	—	10	$\mu\text{A}$
input current LOW	$I_{IL}$	—	—	10	$\mu\text{A}$
acknowledge sink current	$I_{ack}$	—	—	2	mA
maximum input frequency	$f_i \text{ max}$	100	—	—	kHz
Output voltage SDA					
HIGH; $4 \text{ k}\Omega$ to $8,4 \text{ V}$	$V_{OH}$	8,0	—	—	V
LOW; $I = 2 \text{ mA}$	$V_{OL}$	—	—	0,4	V

parameter	symbol	min.	typ.	max.	unit
A/D converter (pin 5 and 13)					
input resistance	$R_i$		t.b.f.		$k\Omega$
input capacitance	$C_i$		t.b.f.		$\mu F$
Trip levels, sensitivity bit HIGH					
level 1	$V_T$	—	0,6	—	V
level 2	$V_T$	—	1,06	—	V
level 3	$V_T$	—	1,38	—	V
level 4	$V_T$	—	1,84	—	V
level 5	$V_T$	—	2,14	—	V
level 6	$V_T$	—	2,55	—	V
level 7	$V_T$	—	2,97	—	V
Trip levels, sensitivity bit LOW					
level 1	$V_T$	—	0,96	—	V
level 2	$V_T$	—	1,78	—	V
level 3	$V_T$	—	2,44	—	V
level 4	$V_T$	—	3,26	—	V
level 5	$V_T$	—	3,92	—	V
level 6	$V_T$	—	4,63	—	V
level 7	$V_T$	—	5,38	—	V
Crystal oscillator (see Fig. 5)					
reference frequency	$f_{ref}$	32	32,768	40	$kHz$
temperature coefficient	TC		t.b.f.		$10^{-6}$
input resistance	$R_i$		t.b.f.		$k\Omega$
input capacitance	$C_i$		t.b.f.		$\mu F$
Operational amplifier (pins 6 and 7)					
voltage gain	$G_V$	—	$10^4$	—	
input bias current	$I_{bias}$	—	30	100	nA
output sink current at $V_O = 1 V$	$I_o$	—	0,2	—	mA
output source current at $V_O = 7,4 V$	$I_o$	5,5	10	—	mA
output voltage swing	$V_{7(p-p)}$	—	5,5	—	V
Frequency measuring system (see pages 8 and 9)					
measuring windows; $f_{ref} = 32$ or $40 kHz$					
AM					
window "0" (LOW)	$t_{gate}$	—	4	—	ms
window "1" (HIGH)	$t_{gate}$	—	8	—	ms
FM					
window "0" (LOW)	$t_{gate}$	—	20	—	ms
window "1" (HIGH)	$t_{gate}$	—	40	—	ms
resolution frequency counter					
AM	$f_s(am)$	—	250	—	Hz
FM	$f_s(fm)$	—	6,4	—	$kHz$

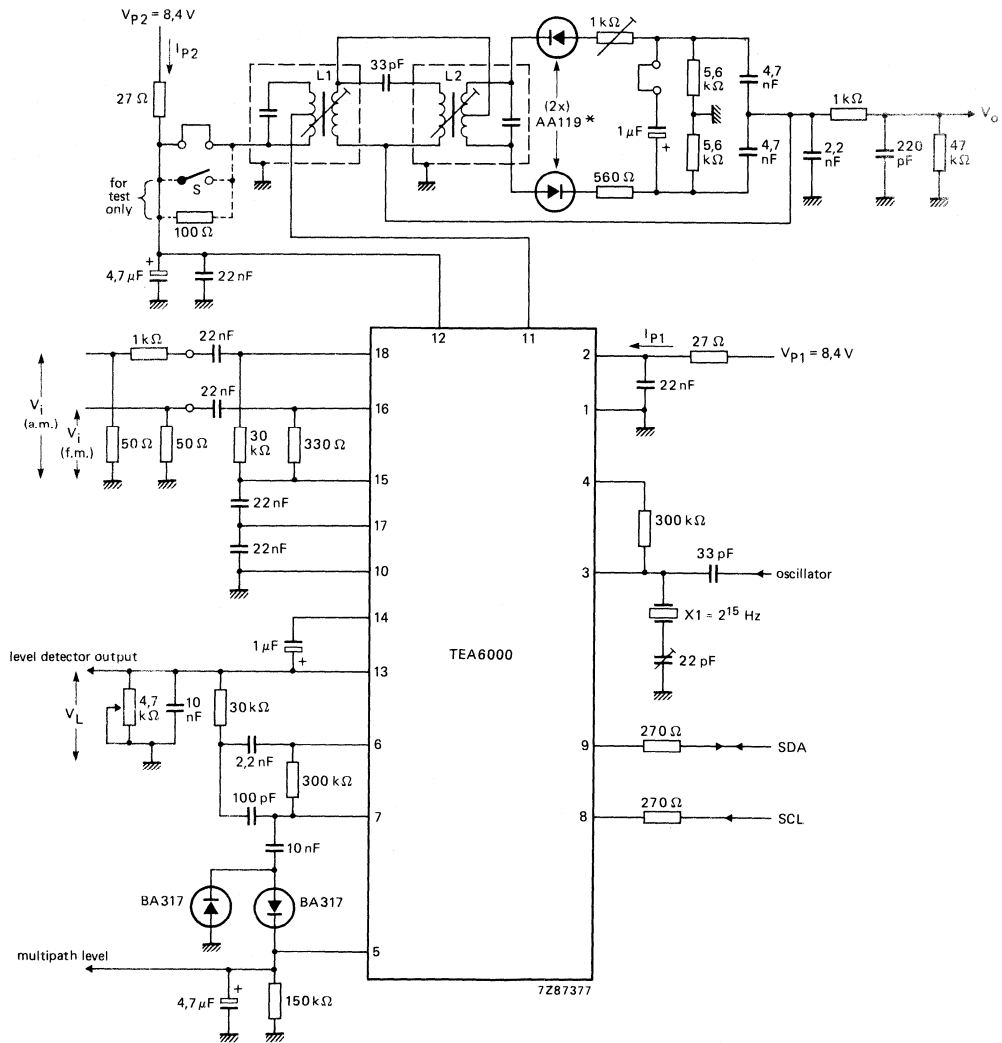

$t_{gate}$  has to be multiplied by  $32\,000/32\,768$  for a  $f_{ref}$  of  $2^{15}$  Hz.  
 $f_s$  has to be multiplied by  $32\,768/32\,000$  for a  $f_{ref}$  of  $2^{15}$  Hz.

TABLE 1 REFERENCE FREQUENCY 32 000 Hz (SAA1057)

TEA6300

## SOUND FADER CONTROL CIRCUIT

### GENERAL DESCRIPTION

The Sound Fader Control circuit (SOFAC) is an I<sup>2</sup>C Bus controlled preamplifier for carradios. It contains the following functions:

- Source selector for three stereo inputs
- In- and outputs for noise reduction circuits
- Volume and balance control  
Control range of 86 dB in 2 dB steps
- Bass and treble control  
from + 15 dB (treble 12 dB) to -12 dB in 3 dB steps
- Fader control from 0 dB to -30 dB in 2 dB steps
- Fast muting
- Low noise suitable for DOLBY (registered trademark) NR
- Signal handling suitable for compact disc
- Pop-free on/off switching
- I<sup>2</sup>C Bus control for all functions

### QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit
Supply voltage	V <sub>CC</sub>	7,0	8,5	13,2	V
Input sensitivity for full power at the output stage	V <sub>i(rms)</sub>	—	50	—	mV
Input signal handling	V <sub>i(rms)</sub>	—	1,65	—	V
Frequency response	f <sub>r</sub>	35	—	20 000	Hz
Channel separation f = 250 Hz to 10 kHz	α <sub>CS</sub>	—	70	—	dB
Total harmonic distortion	THD	—	0,05	—	%
Signal to noise ratio	(S + N)/N	—	80	—	dB
Operating ambient temperature range	T <sub>amb</sub>	-40	—	+ 85	°C

### PACKAGE OUTLINE

28-lead dual in-line; plastic (SOT-117BE).

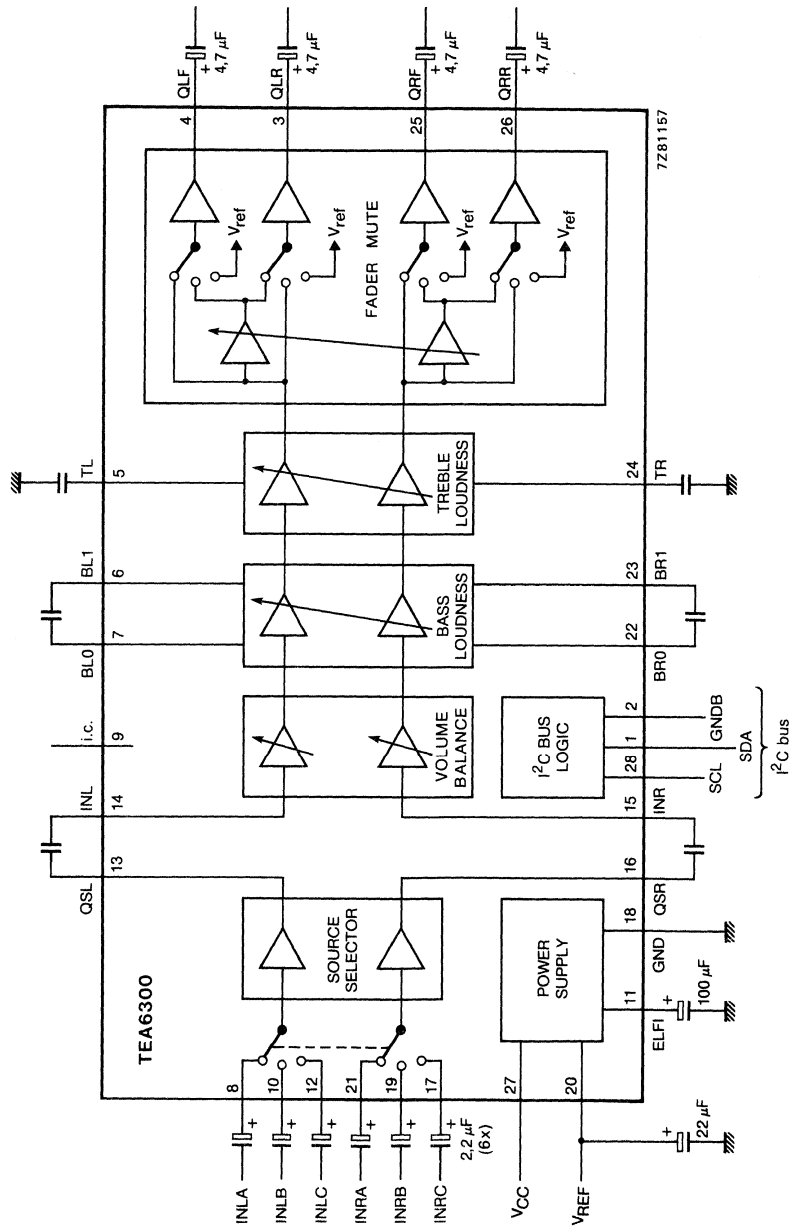

Fig. 1 Block diagram.

**FUNCTIONAL DESCRIPTION**

The input Selector selects three stereo channels e.g. R.F. part (AM/FM), recorder and compact disk. As the outputs of the Source Selector as well as the inputs of the main control part are available, additional circuits like compander- and equalizersystems may be inserted into the signal path.

The a.c. signal setting is performed by resistor chains in combination with multi-input operational amplifiers. The advantage of this principle is the combination of low noise, low distortion and a high dynamic range for the circuit.

The separated Volume Controls of the left and the right channel make the Balance Control possible. By this the range and the characteristic of the Balance is software programmable. By setting an extra Bass (and optional Treble) Control depending on the actual volume position, the loudness function, performed by software in a microcomputer controlling both the switching points and the ranges.

Because the TEA6300 has four outputs a low level Fader is included. The fader Control is independent of the Volume Control and an extra Mute position for the front or the rear or for all channels is built in. The last function may be used for muting during preset selection. For pop-free switching, on and off, an extra pop suppression circuitry is built in. As all switching and control functions are controllable via the two wire I<sup>2</sup>C Bus, no external interface between the microcomputer and the TEA6300 is required. The on-chip power on reset sets the TEA6300 into the general Mute mode.

**DEFINITION OF THE PINS**

DEVELOPMENT DATA

1	SDA	Data input/output
2	GNDB	Ground for BUS terminals
3	QLR	Output left rear
4	QLF	Output left front
5	TL	Termination for treble control capacitor left channel
6	BL1	Termination for bass control capacitor left channel
7	BLO	Termination for bass control capacitor left channel
8	INLA	Input left source A
9	i.c.	internal connected
10	INLB	Input left source B
11	ELFI	Electronic filtering for supply
12	INLC	Input left source C
13	QSL	Output source selector left
14	INL	Input left control part
15	INR	Input right control part
16	QSR	Output source selector right
17	INRC	Input right source C
18	GND	Ground
19	INRB	Input right source B
20	VREF	Reference voltage ( $\frac{1}{2} V_{CC}$ )
21	INRA	Input right source A
22	BRO	Termination for bass control capacitor right channel
23	BR1	Termination for bass control capacitor right channel
24	TR	Termination for treble control capacitor right channel
25	QRF	Output right front
26	QRR	Output right rear
27	VCC	Supply voltage
28	SCL	Clock input

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	symbol	min.	typ.	max.	unit
Supply voltage (pin 27-18)	$V_{CC}$	—	—	16	V
Maximum power dissipation	$P_{tot}$	—	—	2	W
Storage temperature	$T_{stg}$	-55	—	+ 150	°C
Operating ambient temperature	$T_{amb}$	-40	—	+ 85	°C

## CHARACTERISTICS

 $V_{CC} = 8,5 \text{ V}$ ;  $R_S = 600 \Omega$ ;  $R_L = 10 \text{ k}\Omega$ ;  $f = 1 \text{ kHz}$ ;  $T_{amb} = 25 \text{ }^\circ\text{C}$  (Fig. 7) unless otherwise specified.

parameter	symbol	min.	typ.	max.	unit
Supply voltage	$V_{CC}$	7,0	8,5	13,2	V
Supply current	$I_{CC}$	—	26	—	mA
Internal reference voltage (pin 20) $V_{REF} = 0,5 V_{CC}$	$V_{REF}$	—	4,25	—	V
Maximum gain bass and treble linear, fader off	$G_v$	—	20	—	dB
Output level for $P_{max}$ at the output stage	$V_{O(rms)}$	—	500	—	mV
for start of clipping	$V_{O(rms)}$	—	1000	—	mV
Input sensitivity at $V_O = 500 \text{ mV}$	$V_{i(rms)}$	—	50	—	mV
Frequency response bass and treble linear; roll-off frequency -1 dB	$f_r$	35	—	20 000	Hz
Channel separation $G = 0 \text{ dB}$ ; bass and treble linear; frequency range 250 Hz to 10 kHz	$\alpha_{CS}$	45	70	—	dB
Total harmonic distortion frequency range 20 Hz to 12,5 kHz $V_{in} = 50 \text{ mV}$ ; $G = 20 \text{ dB}$	THD	—	0,1	0,3	%
$V_{in} = 500 \text{ mV}$ ; $G = 0 \text{ dB}$	THD	—	0,05	0,2	%
$V_{in} = 1,6 \text{ V}$ ; $G = -10 \text{ dB}$	THD	—	0,2	0,5	%
Ripple rejection $V_{r(rms)} < 200 \text{ mV}$ ; $G = 0 \text{ dB}$ ; bass and treble linear; at $f = 100 \text{ Hz}$	RR <sub>100</sub>	—	70	—	dB
at $f = 40 \text{ Hz to } 12,5 \text{ kHz}$	RR <sub>range</sub>	—	tbf	—	dB

LOW	$V_{IL}$	-0,3	—	1,5	V
Input current					
HIGH	$I_{IH}$	-10	—	10	$\mu A$
LOW	$I_{IL}$	-10	—	10	$\mu A$
Output voltage LOW $I_L = 3 \text{ mA}$					
	$V_{OL}$	—	—	0,4	V
<b>A.C. Characteristics</b> according to the I <sup>2</sup> C Bus specification					
<b>Power-on Reset</b>					
When RESET is active the GMU (general mute) bit is set and the BUS receiver is in RESET position					
Increasing supply voltage					
start of reset	$V_{CC}$	—	—	2,5	V
end of reset	$V_{CC}$	5,2	6,0	6,8	V
Decreasing supply voltage					
start of reset	$V_{CC}$	4,2	5,0	5,8	V

**Notes to the characteristics**

- The indicated values for output power assume a 6 W power amp. with 20 dB gain, connected to the output of the circuit. Signal to noise ratios exclude noise contribution of the power amplifier.
- Signal to noise ratios on a CCIR 468-2 average reading-meter are 4,5 dB better than on CCIR 468-2 quasi peak.

**I<sup>2</sup>C BUS FORMAT**

S	SLAVE ADDRESS	A	SUB-ADDRESS	A	DATA	A	P
---	---------------	---	-------------	---	------	---	---

S = start condition

SLAVE ADDRESS = 1000 0000

A = acknowledge, generated by the slave

SUB-ADDRESS = see table 1

DATA = see table 1

P = STOP condition

If more than 1 byte DATA are transmitted, then auto-increment of the sub-address is performed.

Purchase of Philips' I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C system provided the system conforms to the I<sup>2</sup>C specifications defined by Philips.

## PACKAGE OUTLINES

16-LEAD DUAL IN-LINE; PLASTIC (SOT-38)

- ⊕ Positional accuracy.
- Ⓜ Maximum Material Condition.

- (1) Centre-lines of all leads are within  $\pm 0,127$  mm of the nominal position shown; in the worst case, the spacing between any two leads may deviate from nominal by  $\pm 0,254$  mm.
- (2) Lead spacing tolerances apply from seating plane to the line indicated.

Dimensions in mm

SOLDERING

1. By hand

Apply the soldering iron below the seating plane (or not more than 2 mm above it). If its temperature is below 300 °C it must not be in contact for more than 10 seconds; if between 300 °C and 400 °C, for not more than 5 seconds.

2. By dip or wave

The maximum permissible temperature of the solder is 260 °C; this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified storage maximum. If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

3. Repairing soldered joints

The same precautions and limits apply as in (1) above.

16-LEAD DUAL IN-LINE; PLASTIC WITH INTERNAL HEAT SPREADER  
(SOT-38WE)

- $\oplus$  Positional accuracy.
- $\textcircled{M}$  Maximum Material Condition.

- (1) Centre-lines of all leads are within  $\pm 0,127$  mm of the nominal position shown; in the worst case, the spacing between any two leads may deviate from nominal by  $\pm 0,254$  mm.
- (2) Lead spacing tolerances apply from seating plane to the line indicated.

Dimensions in mm

### SOLDERING

#### 1. By hand

Apply the soldering iron below the seating plane (or not more than 2 mm above it).

If its temperature is below 300 °C it must not be in contact for more than 10 seconds; if between 300 °C and 400 °C, for not more than 5 seconds.

#### 2. By dip or wave

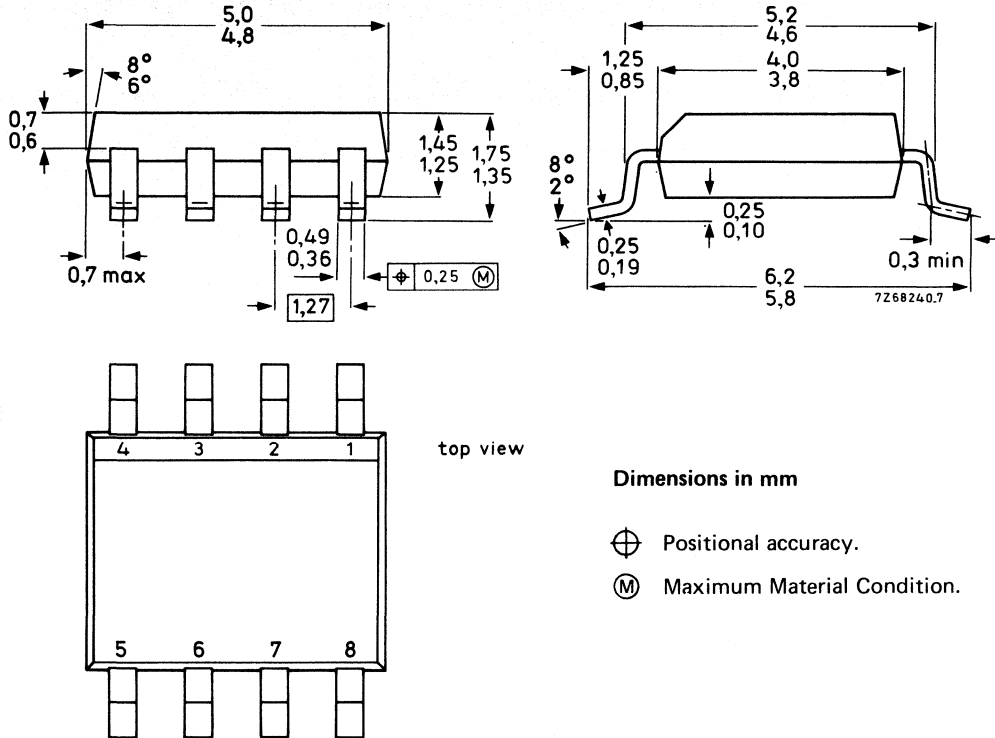

The maximum permissible temperature of the solder is 260 °C; this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified storage maximum. If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

#### 3. Repairing soldered joints

The same precautions and limits apply as in (1) above.

8-LEAD MINI-PACK; PLASTIC (SO-8; SOT-96A)

Dimensions in mm

⊕ Positional accuracy.

Ⓜ Maximum Material Condition.

SOLDERING

The reflow solder technique

The preferred technique for mounting miniature components on hybrid thick or thin-film circuits is reflow soldering. Solder is applied to the required areas on the substrate by dipping in a solder bath or, more usually, by screen printing a solder paste. Components are put in place and the solder is reflowed by heating.

Solder pastes consist of very finely powdered solder and flux suspended in an organic liquid binder. They are available in various forms depending on the specification of the solder and the type of binder used. For hybrid circuit use, a tin-lead solder with 2 to 4% silver is recommended. The working temperature of this paste is about 220 to 230 °C when a mild flux is used.

For printing the paste onto the substrate a stainless steel screen with a mesh of 80 to 105 μm is used for which the emulsion thickness should be about 50 μm. To ensure that sufficient solder paste is applied to the substrate, the screen aperture should be slightly larger than the corresponding contact area.

The contact pins are positioned on the substrate, the slight adhesive force of the solder paste being sufficient to keep them in place. The substrate is heated to the solder working temperature preferably by means of a controlled hot plate. The soldering process should be kept as short as possible: 10 to 15 seconds is sufficient to ensure good solder joints and evaporation of the binder fluid. After soldering, the substrate must be cleaned of any remaining flux.

## 8-LEAD DUAL IN-LINE; PLASTIC (SOT-97A)

- ⊕ Positional accuracy.
- Ⓜ Maximum Material Condition.

- (1) Centre-lines of all leads are within  $\pm 0,127$  mm of the nominal position shown; in the worst case, the spacing between any two leads may deviate from nominal by  $\pm 0,254$  mm.
- (2) Lead spacing tolerances apply from seating plane to the line indicated.
- (3) Only for devices with asymmetrical end-leads.

Dimensions in mm

### SOLDERING

The soldering process should be kept as short as possible: 10 to 15 seconds is sufficient to ensure good solder joints and evaporation of the binder fluid.

After soldering, the substrate must be cleaned of any remaining flux.

9-LEAD SINGLE IN-LINE; PLASTIC (SOT-142)

Dimensions in mm

⊕ Positional accuracy.

Ⓜ Maximum Material Condition.

(1) Centre-lines of all leads are within  $\pm 0,127$  mm of the nominal position shown; in the worst case, the spacing between any two leads may deviate from nominal by  $\pm 0,254$  mm.

(2) Lead spacing tolerances apply from seating plane to the line indicated.

- (2) Lead spacing tolerances apply from seating plane to the line indicated.

40-LEAD MINI-PACK; PLASTIC (VSO-40; SOT-158A)

**SOLDERING**

**The reflow solder technique**

The preferred technique for mounting miniature components on hybrid thick or thin-film circuits is reflow soldering. Solder is applied to the required areas on the substrate by dipping in a solder bath or, more usually, by screen printing a solder paste. Components are put in place and the solder is reflowed by heating.

Solder pastes consist of very finely powdered solder and flux suspended in an organic liquid binder. They are available in various forms depending on the specification of the solder and the type of binder used. For hybrid circuit use, a tin-lead solder with 2 to 4% silver is recommended. The working temperature of this paste is about 220 to 230 °C when a mild flux is used.

For printing the paste onto the substrate a stainless steel screen with a mesh of 80 to 105 μm is used for which the emulsion thickness should be about 50 μm. To ensure that sufficient solder paste is applied to the substrate, the screen aperture should be slightly larger than the corresponding contact area.

The contact pins are positioned on the substrate, the slight adhesive force of the solder paste being sufficient to keep them in place. The substrate is heated to the solder working temperature preferably by means of a controlled hot plate. The soldering process should be kept as short as possible: 10 to 15 seconds is sufficient to ensure good solder joints and evaporation of the binder fluid.

After soldering, the substrate must be cleaned of any remaining flux.

## SOLDERING

### 1. By hand-held soldering iron or pulse-heated solder tool

Apply the heating tool to the flat part of the lead only. Contact time must be limited to 10 seconds at up to 300 °C. When using proper tools, all leads can be soldered in one operation within 2 to 5 seconds at between 270 and 320 °C. (Pulse-heated soldering is not recommended for SO packages).

For pulse-heated solder tool (resistance) soldering of VSO packages, solder is applied to substrate by dipping or by an extra thick tin/lead plating before package placement.

### 2. By wave

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder bath is 10 seconds, if allowed to cool to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A modified wave soldering technique is recommended, using two solder waves (dual-wave); a first turbulent wave with high upward pressure is followed by a smooth, laminar wave. A mildly activated flux will eliminate the need for removal of corrosive residues in most applications.

### 3. By solder paste reflow

Reflow soldering requires the solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the substrate by screen printing or pressure-syringe dispensing before device placement.

Several techniques exist for reflowing, for example, thermal conduction by heated belt, infrared, and vapour-phase reflow. Dwell times vary between 8 and 60 seconds according to method. Typical reflow temperatures range from 215 to 250 °C.

Pre-heating is necessary to dry paste and evaporate binding agent, and to reduce thermal shock on entry to reflow zone.

### 4. Repairing soldered joints

The same precautions and limits apply as in (1) above.
