Data Manual 1986

TTL Products

Preface

Logic Products

Signetics would like to thank you for your interest in our products. This manual contains information and specifications on SSI, MSI, and LSI products in Standard Product families such as 7400, 74S, 74LS, and 8T. Signetics offers a broad range of Logic Products besides those described in this data manual. Newer Random Logic families such as 74HC/HCT and 74F are contained in other data manuals. 10K/100K ECL, 4000 Series CMOS, PROM/RAM, and Application Specific Product specifications are contained in separate data manuals.

This manual also includes:

- updated Technology and Function Cross Reference Guides
- TTL User's Guide
- an expanded chapter on SMD Technology
- updated package information.

All reference to military products has been deleted, specifically, to reflect government restrictions imposed via Revision C of MIL-STD 883, including the general provisions of Paragraph 1-2. Specifications for Signetics military products are available in the Signetics Military Products Data Manual.

Signetics is continually developing new products. As you see new product announcements, you should contact your local Signetics sales office, representative or authorized distributor or write Signetics, c/o Information Services at 811 East Arques Avenue, P.O. Box 3409, Sunnyvale, California 94088-3409, for the latest technical information.

Product Status

DEFINITIONS		
Data Sheet Identification	**Product Status**	**Definition**
Objective Specification	**Formative or In Design**	This data sheet contains the design target or goal specifications for product development. Specifications may change in any manner without notice.
Preliminary Specification	**Preproduction Product**	This data sheet contains preliminary data and supplementary data will be published at a later date. Signetics reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.
Product Specification	**Full Production**	This data sheet contains Final Specifications. Signetics reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.

Logic Products

Preface i

Product Status ii

Section 1 – Introduction
- **Numerical Index** 1-3
- **Technology Selection Guide** 1-8
- **Function Cross Reference Guide** 1-14
- **Ordering Information** 1-24

Section 2 – Quality and Reliability
- **Quality and Reliability Statement** 2-3

Section 3 – Military Information
- **Military Information** 3-3

Section 4 – TTL User's Guide
- **Product Information** 4-3

Section 5 – 74 Series
- **Data Sheets** 5-3

Section 6 – 8T Series
- **Data Sheets** 6-3

Section 7 – LSI Products
- **Data Sheets** 7-3

Section 8 – Surface Mounted ICs
- **Surface Mounted ICs** 8-3

Section 9 – Package Outlines
- **Introduction** 9-3
- **A Plastic Leaded Chip Carrier** 9-5
- **D Plastic Small Outline** 9-6
- **N Plastic Standard Dual-In-Line** 9-9

Section 10 – Sales Offices
- **Office Listing** 10-3

7400	Quad 2-Input NAND Gate	5-3
74LS00	Quad 2-Input NAND Gate	5-3
74S00	Quad 2-Input NAND Gate	5-3
74LS01	Quad 2-Input NAND Gate (Open Collector)	5-6
7402	Quad 2-Input NOR Gate	5-9
74LS02	Quad 2-Input NOR Gate	5-9
74S02	Quad 2-Input NOR Gate	5-9
7403	Quad 2-Input NAND Gate (Open Collector)	5-12
74S03	Quad 2-Input NAND Gate (Open Collector)	5-12
7404	Hex Inverter	5-15
74LS04	Hex Inverter	5-15
74S04	Hex Inverter	5-15
7405	Hex Inverter (Open Collector)	5-18
74LS05	Hex Inverter (Open Collector)	5-18
74S05	Hex Inverter (Open Collector)	5-18
7406	Hex Inverter Buffer/Driver (Open Collector)	5-21
7407	Hex Inverter/Driver, Open Collector	5-21
7408	Quad 2-Input AND Gate	5-24
74LS08	Quad 2-Input AND Gate	5-24
74S08	Quad 2-Input AND Gate	5-24
74LS09	Quad 2-Input AND Gate (Open Collector)	5-27
7410	Triple 3-Input NAND Gate	5-30
74LS10	Triple 3-Input NAND Gate	5-30
74S10	Triple 3-Input NAND Gate	5-30
7411	Triple 3-Input AND Gate	5-30
74LS11	Triple 3-Input AND Gate	5-30
74S11	Triple 3-Input AND Gate	5-30
7413	Dual 4-Input NAND Schmitt Trigger	5-34
74LS13	Dual 4-Input NAND Schmitt Trigger	5-34
7414	Hex Inverter Schmitt Trigger	5-38
74LS14	Hex Inverter Schmitt Trigger	5-38
7416	Hex Inverter Buffer/Driver (Open Collector)	5-42
7417	Hex Buffer/Driver (Open Collector)	5-42
7420	Dual 4-Input NAND Gate	5-45
74LS20	Dual 4-Input NAND Gate	5-45
74S20	Dual 4-Input NAND Gate	5-45
7421	Dual 4-Input AND Gate	5-45
74LS21	Dual 4-Input AND Gate	5-45
7425	Dual 4-Input NOR Gate with Strobe	5-49
7426	Quad 2-Input NAND Gate (Open Collector)	5-52
74LS26	Dual 2-Input NAND Gate (Open Collector)	5-52
7427	Triple 3-Input NOR Gate	5-55
74LS27	Triple 3-Input NOR Gate	5-55
7428	Quad 2-Input NOR Buffer	5-58
7430	8-Input NAND Gate	5-61
74LS30	8-Input NAND Gate	5-61
7432	Quad 2-Input OR Gate	5-64
74LS32	Quad 2-Input OR Gate	5-64
74S32	Quad 2-Input OR Gate	5-64
7433	Quad 2-Input NOR Buffer (Open Collector)	5-67
74LS33	Quad 2-Input NOR Buffer (Open Collector)	5-67
7437	Quad 2-Input NAND Buffer	5-70
74LS37	Quad 2-Input NAND Buffer	5-70
74S37	Quad 2-Input NAND Buffer	5-70
7438	Quad 2-Input NAND Buffer (Open Collector)	5-73
74LS38	Quad 2-Input NAND Buffer (Open Collector)	5-73
74S38	Quad 2-Input NAND Buffer (Open Collector)	5-73

74 SERIES

7439	Quad 2-Input NAND Buffer (Open Collector)	5-76
7440	Quad 4-Input NAND Buffer	5-79
74LS40	Dual 4-Input NAND Buffer	5-79
74S40	Dual 4-Input NAND Buffer	5-79
7442	BCD-to-Decimal Decoder (1-to-10)	5-82
74LS42	BCD-to-Decimal Decoder (1-to-10)	5-82
7445	BCD-to-Decimal Decoder/Driver (Open Collector)	5-86
7451	Dual 2-Wide 2-Input AND-OR-Invert Gate	5-90
74LS51	Dual 2-Wide 2-Input, 2-Wide 3-Input AND-OR-Invert Gate	5-90
74S51	Dual 2-Wide 2-Input AND-OR-Invert Gate	5-90
74LS54	4-Wide 2- and 3-Input AND-OR-Invert Gate	5-93
74S64	4-2-3-2-Input AND-OR-Invert Gate	5-96
7473	Dual J-K Flip-Flop	5-99
74LS73	Dual J-K Flip-Flop	5-99
7474	Dual D-Type Flip-Flop	5-104
74LS74A	Dual D-Type Flip-Flop	5-104
74S74	Dual D-Type Flip-Flop	5-104
7475	Quad Bistable Latch	5-109
74LS75	Quad Bistable Latch	5-109
7476	Dual J-K Flip-Flop	5-114
74LS76	Dual J-K Flip-Flop	5-114
7483	4-Bit Full Adder	5-120
74LS83A	4-Bit Full Adder	5-120
7485	4-Bit Magnitude Comparator	5-125
74LS85	4-Bit Magnitude Comparator	5-125
74S85	4-Bit Magnitude Comparator	5-125
7486	Quad 2-Input Exclusive-OR Gate	5-132
74LS86	Quad 2-Input Exclusive-OR Gate	5-132
74S86	Quad 2-Input Exclusive-OR Gate	5-132
7490	Decade Counter	5-135
74LS90	Decade Counter	5-135
7491A	8-Bit Shift Register	5-140
7492	Divide-by-Twelve Counter	5-144
74LS92	Divide-by-Twelve Counter	5-144
7493	4-Bit Binary Ripple Counter	5-149
74LS93	4-Bit Binary Ripple Counter	5-149
7494	4-Bit Shift Register	5-153
7495	4-Bit Shift Register	5-158
74LS95B	4-Bit Shift Register	5-158
7496	5-Bit Shift Register	5-163
74LS96	5-Bit Shift Register	5-163
74107	Dual J-K Flip-Flop	5-168
74LS107	Dual J-K Flip-Flop	5-168
74109	Dual J-K Positive Edge-Triggered Flip-Flop	5-173
74LS109A	Dual J-K Positive Edge-Triggered Flip-Flop	5-173
74LS112	Dual J-K Edge-Triggered Flip-Flop	5-178
74S112	Dual J-K Edge-Triggered Flip-Flop	5-178
74LS113	Dual J-K Edge-Triggered Flip-Flop	5-183
74S113	Dual J-K Edge-Triggered Flip-Flop	5-183
74116	Dual 4-Bit Transparent Latch	5-188
74121	Monostable Multivibrator	5-193
74123	Dual Retriggerable Monostable Multivibrator	5-198
74125	Quad 3-State Buffer	5-204
74LS125A	Quad 3-State Buffer	5-204
74126	Quad 3-State Buffer	5-204
74LS126A	Quad 3-State Buffer	5-204
74128	Quad 2-Input NOR Buffer	5-209
74132	Quad 2-Input NAND Schmitt Trigger	5-212
74LS132	Quad 2-Input NAND Schmitt Trigger	5-212
74S133	13-Input NAND Gate	5-217
74S134	12-Input NAND Gate (3-State)	5-220
74S135	Quad Exclusive OR/NOR Gate	5-224
74LS136	Quad Two-Input Exclusive OR Gate (Open Collector)	5-227
74LS138	1-of-8 Decoder/Demultiplexer	5-230

Numerical Index

74 SERIES

74S138	1-of-8 Decoder/Demultiplexer	5-230
74LS139	Dual 1-of-4 Decoder/Demultiplexer	5-234
74S139	Dual 1-of-4 Decoder/Demultiplexer	5-234
74S140	Dual 4-Input NAND 50-Ohm Line Driver	5-238
74145	BCD-to-Decimal Decoder/Driver (Open Collector)	5-241
74147	10-Line-to-4-Line Priority Encoder	5-245
74148	8-Input Priority Encoder	5-249
74150	16-Input Multiplexer	5-254
74151	8-Input Multiplexer	5-258
74LS151	8-Input Multiplexer	5-258
74S151	8-Input Multiplexer	5-258
74153	Dual 4-Line to 1-Line Multiplexer	5-263
74LS153	Dual 4-Line to 1-Line Multiplexer	5-263
74S153	Dual 4-Line to 1-Line Multiplexer	5-263
74154	1-of-16 Decoder/Demultiplexer	5-267
74LS154	1-of-16 Decoder/Demultiplexer	5-267
74155	Dual 2-Line to 4-Line Decoder/Demultiplexer	5-271
74LS155	Dual 2-Line to 4-Line Decoder/Demultiplexer	5-271
74156	Dual 2-Line to 4-Line Decoder/Demultiplexer (Open Collector)	5-275
74LS156	Dual 2-Line to 4-Line Decoder/Demultiplexer (Open Collector)	5-275
74157	Quad 2-Input Data Selector/Multiplexer	5-279
74LS157	Quad 2-Input Data Selector/Multiplexer	5-279
74S157	Quad 2-Input Data Selector/Multiplexer	5-279
74158	Quad 2-Input Data Selector/Multiplexer (Inverting)	5-279
74LS158	Quad 2-Input Data Selector/Multiplexer (Inverting)	5-279
74S158	Quad 2-Input Data Selector/Multiplexer (Inverting)	5-279
74160	BCD Decade Counter	5-284
74LS160A	BCD Decade Counter	5-284
74161	4-Bit Binary Counter	5-284
74LS161A	4-Bit Binary Counter	5-284
74LS162A	BCD Decade Counter	5-284
74163	4-Bit Binary Counter	5-284
74LS163A	4-Bit Binary Counter	5-284
74164	8-Bit Serial-In Parallel-Out Shift Register	5-295
74LS164	8-Bit Serial-In Parallel-Out Shift Register	5-295
74165	8-Bit Serial/Parallel-In, Serial-Out Shift Register	5-300
74166	8-Bit Serial/Parallel-In, Serial-Out Shift Register	5-305
74LS168A	Synchronous BCD Decade Up/Down Counter	5-310
74S168A	Synchronous BCD Decade Up/Down Counter	5-310
74LS169A	Synchronous 4-Bit Binary Up/Down Counter	5-310
74S169A	Synchronous 4-Bit Binary Up/Down Counter	5-310
74170	4 x 4 Register File (Open Collector)	5-318
74LS170	4 x 4 Register File (Open Collector)	5-318
74S172	16-Bit Multiple Port Register File (3-State)	5-324
74173	Quad D-Type Flip-Flop with 3-State Outputs	5-330
74LS173	Quad D-Type Flip-Flop with 3-State Outputs	5-330
74174	Hex Flip-Flops	5-336
74LS174	Hex Flip-Flops	5-336
74S174	Hex Flip-Flops	5-336
74175	Quad Flip-Flop	5-341
74LS175	Quad Flip-Flop	5-341
74S175	Quad Flip-Flop	5-341
74180	9-Bit Odd/Even Parity Generator/Checker	5-346
74181	4-Bit Arithmetic Logic Unit	5-350
74LS181	4-Bit Arithmetic Logic Unit	5-350
74S181	4-Bit Arithmetic Logic Unit	5-350
74S182	Lookahead Carry Generator	5-358
74190	Presettable BCD/Decade Up/Down Counter	5-362
74191	Presettable 4-Bit Binary Up/Down Counter	5-362
74LS191	Presettable 4-Bit Binary Up/Down Counter	5-362
74192	Presettable BCD Decade Up/Down Counter	5-371
74LS192	Presettable BCD Decade Up/Down Counter	5-371
74193	Presettable 4-Bit Binary Up/Down Counter	5-371
74LS193	Presettable 4-Bit Binary Up/Down Counter	5-371

74194	4-Bit Bidirectional Universal Shift Register	5-379
74LS194A	4-Bit Bidirectional Universal Shift Register	5-379
74S194	4-Bit Bidirectional Universal Shift Register	5-379
74195	4-Bit Parallel Access Shift Register	5-385
74LS195A	4-Bit Parallel Access Shift Register	5-385
74S195	4-Bit Parallel Access Shift Register	5-385
74LS197	Presettable 4-Bit Binary Ripple Counter	5-390
74199	8-Bit Parallel Access Shift Register	5-395
74221	Dual Monostable Multivibrator	5-400
74S225	16 x 5 Asynchronous First In/First Out Memory (3-State)	5-404
74LS240	Octal Inverter Buffer (3-State)	5-411
74S240	Octal Inverter Buffer (3-State)	5-411
74LS241	Octal Buffer (3-State)	5-411
74S241	Octal Buffer (3-State)	5-411
74LS242	Quad Inverting Transceiver (3-State)	5-415
74S242	Quad Inverting Transceiver	5-415
74LS243	Quad Bus Transceiver (3-State)	5-415
74S243	Quad Transceiver	5-415
74LS244	Octal Buffers (3-State)	5-420
74S244	Octal Buffers (3-State)	5-420
74LS245	Octal Bus Transceiver	5-424
74LS251	8-Input Multiplexer (3-State)	5-428
74S251	8-Input Multiplexer (3-State)	5-428
74LS253	Dual 4-Input Multiplexer (3-State)	5-433
74S253	Dual 4-Input Multiplexer (3-State)	5-433
74LS256	Dual 4-Bit Addressable Latch	5-437
74LS257A	Quad 2-Line to 1-Line Data Selector/Multiplexer (3-State)	5-443
74S257	Quad 2-Line to 1-Line Data Selector/Multiplexer (3-State)	5-443
74LS258A	Quad 2-Line to 1-Line Data Selector/Multiplexer (3-State)	5-448
74S258	Quad 2-Line to 1-Line Data Selector/Multiplexer (3-State)	5-448
74LS259	8-Bit Addressable Latch	5-452
74LS260	Dual 5-Input NOR Gate	5-458
74S260	Dual 5-Input NOR Gate	5-458
74LS266	Quad 2-Input Exclusive-NOR Gate (Open Collector)	5-461
74LS273	Octal Flip-Flop	5-464
74S273	Octal Flip-Flop	5-464
74279	Quad Set-Reset Latch	5-468
74S280	9-Bit Odd/Even Parity Generator/Checker	5-471
74LS283	4-Bit Full Adder with Fast Carry	5-475
74LS290	Decade Counter	5-479
74LS293	4-Bit Binary Ripple Counter	5-484
74LS295B	4-Bit Shift Register with 3-State Outputs	5-489
74298	Quad 2-Port Register	5-494
74LS298	Quad 2-Port Register	5-494
74S350	4-Bit Shifter with 3-State Outputs	5-498
74LS352	Dual 4-Line to 1-Line Multiplexer	5-504
74LS353	Dual 4-Input Multiplexer (3-State)	5-508
74LS363	Octal Transparent Latch with 3-State Outputs	5-512
74LS364	Octal D Flip-Flop with 3-State Outputs	5-517
74365A	Hex Buffer/Driver (3-State)	5-522
74LS365A	Hex Buffer/Driver (3-State)	5-522
74366A	Hex Inverter Buffer (3-State)	5-522
74LS366A	Hex Inverter Buffer (3-State)	5-522
74367A	Hex Buffer/Driver (3-State)	5-522
74LS367A	Hex Buffer/Driver (3-State)	5-522
74368A	Hex Inverter Buffer (3-State)	5-522
74LS368A	Hex Inverter Buffer (3-State)	5-522
74LS373	Octal Transparent Latch with 3-State Outputs	5-527
74S373	Octal Transparent Latch with 3-State Outputs	5-527
74LS374	Octal D Flip-Flop with 3-State Outputs	5-527
74S374	Octal D Flip-Flop with 3-State Outputs	5-527
74LS375	Quad Bistable Latch	5-533
74LS377	Octal D Flip-Flop with Clock Enable	5-537
74LS378	Hex D Flip-Flop with Clock Enable	5-541

74 SERIES

74LS390	Dual Decade Ripple Counter	5-545
74LS393	Dual 4-Bit Binary Ripple Counter	5-550
74LS395A	4-Bit Cascadable Shift-Register with 3-State Outputs	5-554
74LS445	BCD-to-Decimal Decoder/Driver (Open Collector)	5-560
74LS490	Dual BCD Decade Ripple Counter	5-564
74S534	Octal D Flip-Flop with 3-State Outputs	5-568
74LS540	Octal Buffer/Line Driver (3-State)	5-573
74LS541	Octal Buffer/Line Driver	5-573
74LS568A	BCD Decade Up/Down Synchronous Counter (3-State)	5-577
74LS569A	4-Bit Binary Up/Down Synchronous Counter (3-State)	5-577
74LS620	Inverting Octal Bus Transceiver (3-State)	5-588
74LS621	Non-Inverting Octal Bus Transceiver (Open Collector)	5-593
74LS622	Inverting Octal Bus Transceiver (Open Collector)	5-593
74LS623	Non-Inverting Octal Bus Transceiver (3-State)	5-588
74LS640	Inverting Octal Bus Transceiver (3-State)	5-597
74LS640-1	Inverting Octal Bus Transceiver (3-State)	5-597
74LS641	Octal Bus Transceiver (Open Collector)	5-602
74LS641-1	Octal Bus Transceiver (Open Collector)	5-602
74LS642	Octal Bus Transceiver (Open Collector)	5-602
74LS642-1	Octal Bus Transceiver (Open Collector)	5-602
74LS645	Octal Bus Transceiver (3-State)	5-605
74LS645-1	Octal Bus Transceiver (3-State)	5-605
74LS670	4 x 4 Register File (3-State)	5-610

8T SERIES

8T09	3-State Quad Bus Driver	6-3
8T10	3-State Quad D-Type Bus Flip-Flop	6-7
8T13	Dual Line Driver	6-12
8T15	Dual Communications EIA/MIL Line Driver	6-15
8T16	Dual Communications EIA/MIL Line Receiver with Hysteresis	6-19
8T20	Bidirectional One-Shot	6-24
8T22	Retriggerable One Shot	6-30
8T24	Triple Line Receiver with Hysteresis	6-34
8T26A, 28	3-State Quad Bus Transceiver	6-38
8T37	Hex Bus Receiver with Hysteresis-Schmitt Trigger	6-44
8T38	Quad Bus Transceiver (Open Collector)	6-47
8T96, 98	High Speed Hex 3-State Buffers	6-50
8T95, 97	High Speed Hex 3-State Inverters	6-50
8T125	Octal 3-Speed Transceiver	6-54
8T126, 127	Quad, 3-State Transceiver	6-58
8T128, 129	Quad, 3-State Transceiver	6-58
8T380	Quad Bus Receiver with Hysteresis-Schmitt Trigger	6-64
8T3404	High Speed 6-Bit Latch	6-68
8TS805	Octal Transparent Latch with 3-State Outputs	6-72
8TS806	Octal D Flip-Flop with 3-State Outputs	6-72
8TS807	Octal Transparent Latch with 3-State Outputs	6-78
8TS808	Octal D Flip-Flop with 3-State Outputs	6-78

LSI PRODUCTS

74LS764	DRAM Dual-Ported Controller	7-3
74LS765	DRAM Dual-Ported Controller	7-16

Function Cross Reference Guide

Logic Products

The Function Cross Reference Guide is provided for customer reference only. It does not represent all the devices available from Signetics' Logic Division.

The device number given is a base number. Check the Number Cross Reference Guide for the complete part number and availability.

GATES

FUNCTION	DEVICE NO.
Inverters	
Octal Inverter/Driver	30240
Octal Driver, Non-Inverting	30244

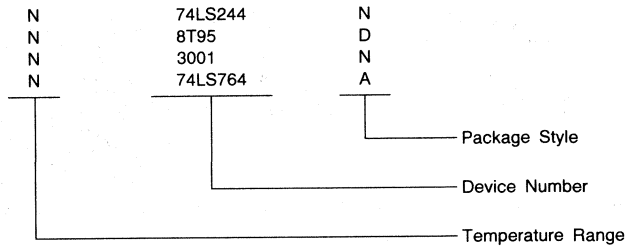
Ordering Information

Signetics commercial TTL products are generally available in both standard dual-in-line and surface mounted options. The ordering code specifies temperature range, device number, and package style as shown below. For commercial product, the standard temperature range is 0-70°C. Available package options are shown on individual data sheets in the "Ordering Code" block. For surface mounted devices the S.O. plastic dual-in-line package is supplied up to and including 28 pins. Above 28 pins, the plastic leaded chip carrier is utilized.

A wide variety of functions and package options is available for military products. Information on military products is available from the nearest Signetics sales office, sales representative, or authorized distributor. The Signetics Military Products Data Manual contains specifications, package, and ordering information for all military-grade products.

ORDERING CODE EXAMPLES



TEMPERATURE RANGE	DEVICE NUMBER	PACKAGE STYLE
N = Commercial Range 0°C to 70°C	74XX 74LSXX 74SXX 8TXX etc.	N = Plastic DIP D = Plastic S.O. DIP (surface mounted) A = Plastic Leaded Chip Carrier
S = Military Range −55°C to 125°C	See Military Products Data Manual	

Signetics

Logic Products

Section 2
Quality and Reliability

SIGNETICS LOGIC PRODUCTS QUALITY

Signetics has put together a winning process for manufacturing Logic Products. Our standard is zero defects, and current customer quality statistics demonstrate our commitment to this goal.

The products produced in the Standard Products Division must meet rigid criteria as defined by our design rules and as evaluated with a thorough product characterization and quality process. The capabilities of our manufacturing process are measured and the results evaluated and reported through our corporate-wide QA05 data base system. The SURE (Systematic Uniform Reliability Evaluation) program monitors the performance of our product in a variety of accelerated environmental stress conditions. All of these programs and systems are intended to prevent product-related problems and to inform our customers and employees of our progress in achieving zero defects.

RELIABILITY BEGINS WITH THE DESIGN

Quality and reliability must begin with design. No amount of extra testing or inspection will produce reliable ICs from a design that is inherently unreliable. Signetics follows very strict design and layout practices with its circuits. To eliminate the possibility of metal migration, current density in any path cannot exceed 2×10^5 A/cm^2. Layout rules are followed to minimize the possibility of shorts, circuit anomalies, and SCR type latch-up effects. Numerous ground-to-substrate connections are required to ensure that the entire chip is at the same ground potential, thereby precluding internal noise problems.

PRODUCT CHARACTERIZATION

Before a new design is released, the characterization phase is completed to ensure that the distribution of parameters resulting from lot-to-lot variations is well within specified limits. Such extensive characterization data also provides a basis for identifying unique application-related problems which are not part of normal data sheet guarantees. Characterization takes place from −55°C to +125°C and at +10% supply voltage.

QUALIFICATION

Formal qualification procedures are required for all new or changed products, processes and facilities. These procedures ensure the high level of product reliability our customers expect. New facilities are qualified by corporate groups as well as by the quality organizations of specific units that will operate in the facility. After qualification, products manufactured by the new facility are subjected to highly accelerated environmental stresses to ensure that they can meet rigorous failure rate requirements. New or changed processes are similarly qualified.

QA05 – QUALITY DATA BASE REPORTING SYSTEM

The QA05 data reporting system collects the results of product assurance testing on all finished lots and feeds this data back to concerned organizations where appropriate action can be taken. The QA05 reports EPQ (Estimated Process Quality) and AOQ (Average Outgoing Quality) results for electrical, visual/mechanical, hermeticity, and documentation audits. Data from this system is available on request.

THE SURE PROGRAM

The SURE (Systematic Uniform Reliability Evaluation) program audits/monitors products from all Signetics' divisions under a variety of accelerated environmental stress conditions. This program, first introduced in 1964, has evolved to suit changing product complexities and performance requirements.

The SURE program has two major functions: Long-term accelerated stress performance audit and a short-term accelerated stress monitor. In the case of Logic products, samples are selected that represent all generic product groups in all wafer fabrication and assembly locations.

THE LONG-TERM AUDIT

One hundred devices from each generic family are subjected to each of the following stresses every eight weeks:

- High Temperature Operating Life: $T_J = 150°C$, 1000 hours, static biased or dynamic operation, as appropriate (worst case bias configuration is chosen)
- High Temperature Storage: $T_J = 150°C$, 1000 hours
- Temperature Humidity Biased Life: 85°C, 85% relative humidity, 1000 hours, static biased
- Temperature Cycling (Air-to-Air): −65°C to +150°C, 1000 cycles

THE SHORT-TERM MONITOR

Every other week a 50-piece sample from each generic family is run to 168 hours of pressure pot (15psig, 121°C, 100% saturated steam) and 300 cycles of thermal shock (−65°C to +150°C)

In addition, each Signetics assembly plant performs SURE product monitor stresses weekly on each generic family and molded package by pin count and frame type. Fifty-piece samples are run on each stress, pressure pot to 96 hours, thermal shock to 300 cycles.

SURE REPORTS

The data from these test matrices provides a basic understanding of product capability, an indication of major failure mechanisms and an estimated failure rate resulting from each stress. This data is compiled periodically and is available to customers upon request.

Many customers use this information in lieu of running their own qualification tests, thereby eliminating time-consuming and costly additional testing.

Quality and Reliability

RELIABILITY ENGINEERING

In addition to the product performance monitors encompassed in the corporate SURE program, Signetics' Corporate and Division Reliability Engineering departments sustain a broad range of evaluation and qualification activities.

Included in the engineering process are:

- Evaluation and qualification of new or changed materials, assembly/wafer-fab processes and equipment, product designs, facilities and subcontractors.
- Device or generic group failure rate studies.
- Advanced environmental stress development.
- Failure mechanism characterization and corrective action/prevention reporting.

The environmental stresses utilized in the engineering programs are similar to those utilized for the SURE monitor; however, more highly-accelerated conditions and extended durations typify the engineering projects. Additional stress systems such as biased pressure pot, power-temperature cycling, and cycle-biased temperature-humidity, are also included in the evaluation programs.

FAILURE ANALYSIS

The SURE Program and the Reliability Engineering Program both include failure analysis activities and are complemented by corporate, divisional and plant failure analysis departments. These engineering units provide a service to our customers who desire detailed failure analysis support, who in turn provide Signetics with the technical understanding of the failure modes and mechanisms actually experienced in service. This information is essential in our ongoing effort to accelerate and improve our understanding of product failure mechanisms and their prevention.

ZERO DEFECTS PROGRAM

In recent years, United States industry has increasingly demanded improved product quality. We at Signetics believe that the customer has every right to expect quality products from a supplier. The benefits which are derived from quality products can be summed up in the words, *lower cost of ownership.*

Those of you who invest in costly test equipment and engineering to assure that incoming products meet your specifications have a special understanding of the cost of ownership. And your cost does not end there; you are also burdened with inflated inventories, lengthened lead times and more rework.

SIGNETICS UNDERSTANDS CUSTOMERS' NEEDS

Signetics has long had an organization of quality professionals, inside all operating units, coordinated by a corporate quality department. This broad decentralized organization provides leadership, feedback, and direction for achieving a high level of quality. Special programs are targeted on specific quality issues. For example, in 1978 a program to reduce electrically defective units for a major automotive manufacturer improved outgoing quality levels by an order of magnitude.

In 1980 we recognized that in order to achieve outgoing levels on the order of 100PPM (parts per million), down from an industry practice of 10,000PPM, we needed to supplement our traditional quality programs with one that encompassed all activities and all levels of the company. Such unprecedented low defect levels could only be achieved by contributions from all employees, from the R and D laboratory to the shipping dock. In short, from a program that would effect a total cultural change within Signetics in our attitude toward quality.

QUALITY PAYS OFF FOR OUR CUSTOMERS

Signetics' dedicated programs in product quality improvement, supplemented by close working relationships with many of our customers, have improved outgoing product quality more than twenty-fold since 1980. Today, many major customers no longer test Signetics circuits. Incoming product moves directly from the receiving dock to the production line, greatly accelerating throughput and reducing inventories. Other customers have pared significantly the amount of sampling done on our products. Others are beginning to adopt these cost-saving practices.

We closely monitor the electrical, visual, and mechanical quality of all our products and review each return to find and correct the cause. Since 1981, over 90% of our customers report a significant improvement in overall quality (see Figure 1).

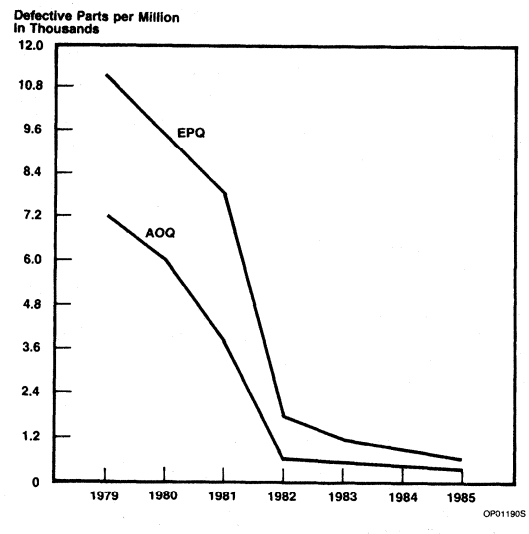


Figure 1. Signetics Quality Progress

Quality and Reliability

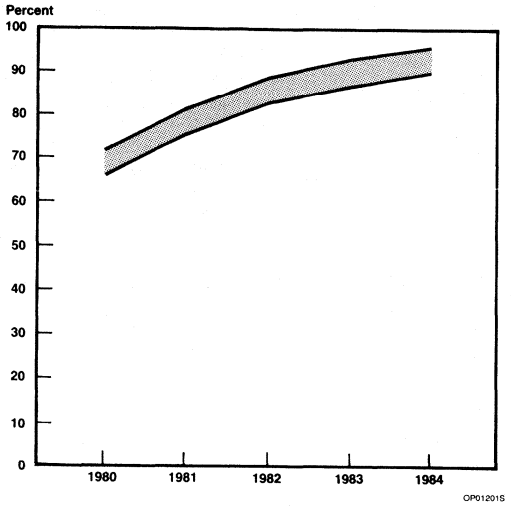

Figure 2. Performance To Schedule On-Time Delivery

At Signetics, quality means more than working circuits. It means on-time delivery of the right product at the agreed upon price (see Figure 2).

ONGOING QUALITY PROGRAM

The quality improvement program at Signetics is based on "Do it Right the First Time". The intent of this innovative program is to change the perception of Signetics' employees that somehow quality is solely a manufacturing issue where some level of defects is inevitable. This attitude has been replaced by one of acceptance of the fact that all errors and defects are preventable, a point of view shared by all technical and administrative functions equally.

This program extends into every area of the company, and more than 40 quality improvement teams throughout the organization drive its ongoing refinement and progress.

Key components of the program are the Quality College, the "Make Certain" Program, Corrective Action Teams, and the Error Cause Removal System.

The core concepts of doing it right the first time are embodied in the four absolutes of quality:

1. The definition of quality is conformance to requirements.
2. The system to achieve quality improvement is prevention.
3. The performance standard is zero defects.
4. The measurement system is the cost of quality.

QUALITY COLLEGE

Almost continuously in session, Quality College is a prerequisite for all employees. The intensive curriculum is built around the four absolutes of quality; colleges are conducted at company facilities throughout the world.

"MAKING CERTAIN" – ADMINISTRATIVE QUALITY IMPROVEMENT

Signetics' experience has shown that the largest source of errors affecting product and service quality is found in paperwork and in other administrative functions. The "Make Certain" program focuses the attention of management and administrative personnel on error prevention, beginning with each employee's own actions.

This program promotes defect prevention in three ways: by educating employees as to the impact and cost of administrative errors, by changing attitudes from accepting occasional errors to one of accepting a personal work standard of zero defects, and by providing a formal mechanism for the prevention of errors.

CORRECTIVE ACTION TEAMS

Employees with the perspective, knowledge, and necessary skills to solve a problem are formed into ad hoc groups called Corrective Action Teams. These teams, a major force within the company for quality improvement, resolve administrative, technical and manufacturing problems.

ECR SYSTEM (ERROR CAUSE REMOVAL)

The ECR System permits employees to report to management any impediments to doing the job right the first time. Once such an impediment is reported, management is obliged to respond promptly with a corrective program. Doing it right the first time in all company activities produces lower cost of ownership through defect prevention.

VENDOR CERTIFICATION PROGRAM

Our vendors are taking ownership of their own product quality by establishing improved process control and inspection systems. They subscribe to the zero defects philosophy. Progress has been excellent.

Quality and Reliability

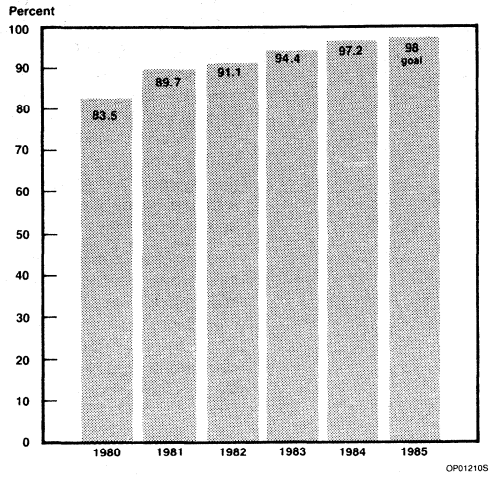

Figure 3. Lot Acceptance Rate From Signetics Vendors

Through intensive work with vendors, we have improved our lot acceptance rate on incoming materials as shown in Figure 3. Simultaneously, waivers of incoming material have been eliminated.

MATERIAL WAIVERS

1985 – 0
1984 – 0
1983 – 0
1982 – 2
1981 – 134

Higher incoming quality material ensures higher outgoing quality products.

QUALITY AND RELIABILITY ORGANIZATION

Quality and reliability professionals at the divisional level are involved with all aspects of the product, from design through every step in the manufacturing process, and provide product assurance testing of outgoing product. A separate corporate-level group provides direction and common facilities.

Quality and Reliability Functions

- Manufacturing quality control
- Product assurance testing
- Laboratory facilities – failure analysis, chemical, metallurgy, thin film, oxides
- Environmental stress testing
- Quality and reliability engineering
- Customer liaison

COMMUNICATING WITH EACH OTHER

For information on Signetics' quality programs or for any question concerning product quality, the field salesperson in your area will provide you with the quickest access to answers. Or, write on your letter-head directly to the corporate director of quality at the corporate address shown at the back of this manual.

We are dedicated to preventing defects. When product problems do occur, we want to know about them so we can eliminate their causes. Here are some ways we can help each other:

- Provide us with one informed contact within your organization. This will establish continuity and build confidence levels.
- Periodic face-to-face exchanges of data and quality improvement ideas between your engineers and ours can help prevent problems before they occur.
- Test correlation data is very useful. Line-pull information and field failure reports also help us improve product performance.
- Provide us with as much specific data on the problem as soon as possible to speed analysis and enable us to take corrective action.
- An advance sample of the devices in question can start us on the problem resolution before physical return of shipment.

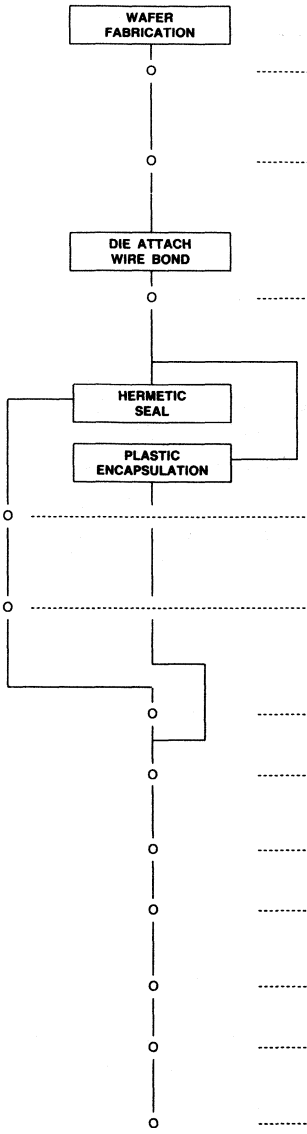
This team work with you will allow us to achieve our mutual goal of improved product quality.

MANUFACTURING: DOING IT RIGHT THE FIRST TIME

In dealing with the standard manufacturing flows, it was recognized that significant improvement would be achieved by "doing every job right the first time", a key concept of the quality improvement program. During the development of the program many profound changes were made. Figure 4, *Logic Products Generic Process Flow*, shows the result. Key changes included such things as implementing 100% temperature testing on all products as well as upgrading test handlers to insure 100% positive binning. Some of the other changes and additions were to tighten the outgoing QA lot acceptance criteria to the tightest in the industry, with zero defect lot acceptance sampling across all three temperatures.

The achievements resulting from the improved process flow have helped Signetics to be recognized as the leading Quality supplier of Logic products. These achievements have also led to our participation in several Ship-to-Stock programs, which our customers use to eliminate incoming inspection. Such programs reduce the user *cost of ownership* by saving both time and money.

Quality and Reliability



SCANNING ELECTRON MICROSCOPE CONTROL

Wafers are sampled daily by the Quality Control Laboratory from each fabrication area and subjected to SEM analysis. This process control reveals manufacturing defects such as contact and oxide step coverage in the metalization process which may result in early failures.

DIE SORT VISUAL ACCEPTANCE

Product is inspected for defects caused during fabrication, wafer testing, or the mechanical scribe and break operation. Defects such as scratches, smears and glassivated bonding pads are included in the lot acceptance criteria.

PRE-SEAL VISUAL ACCEPTANCE

Product is inspected to detect any damage incurred at the die attach and wire bonding stations. Defects such as scratches, contamination and smeared ball bonds are included in the lot acceptance criteria.

STABILIZATION BAKE PRECONDITIONING

Plastic molded devices are baked to stress wire and die bonds and help eliminate marginal devices. It also ensures an optimum plastic seal to enhance moisture resistance. Hermetic devices are baked to ensure the elimination of any remaining cavity moisture.

TEMPERATURE CYCLING

Using MIL-STD-883 Method 1010.1 Condition C devices are cycled from cold to hot temperatures imposing a very severe stress which weakens loose bonds and package seals without degrading good devices. A loosened bond is later detected during 100% electrical tests.

SEAL TESTS

Hermetic package seal integrity is ensured by 100% gross leak testing.

100% ELECTRICAL TEST

Every device is tested for functional and AC/DC parameters at high temperature with guard bands to assure performance to data sheet limits.

BURN IN (SUPR II LEVEL B OPTION)

Devices are burned in for 21 hours at 155°C maximum junction temperature.

SYMBOL

Devices are marked with the Signetics logo, device number and date code or custom symbol per individual specification requirements.

VISUAL

All products are 100% visually inspected per the requirements specified in Signetics or customer documents.

100% PRODUCTION ELECTRICAL TESTING

Every device is tested for functional and AC/DC parameters at 25°C with guard bands to assure performance to data sheet limits.

FINAL QUALITY ASSURANCE GATE

The final QA inspection step guarantees that the specified mechanical and electrical AQL's have been met. Every shipment is sealed and identified by QA personnel.

NOTE: The items on this flowchart do not all happen in the same sequence for all products.

Figure 4. Logic Products Generic Process Flow

Quality and Reliability

As time goes on the drive for a product line that has Zero Defects will grow in intensity. These efforts will provide both Signetics and our customers with the ability to achieve the mutual goal of improved product quality.

The Logic Products Quality Assurance department has monitored PPM progress, which can be seen in Figure 5. We are pleased with the progress that has been made, and expect to achieve even more impressive results as the procedures for accomplishing these tasks are fine tuned.

The real measure of any quality improvement program is the result that our customers see. The meaning of *Quality* is more than just working circuits. It means commitment to *On Time Delivery* at the *Right Place* of the *Right Quantity* of the *Right Product* at the *Agreed Upon Price.*

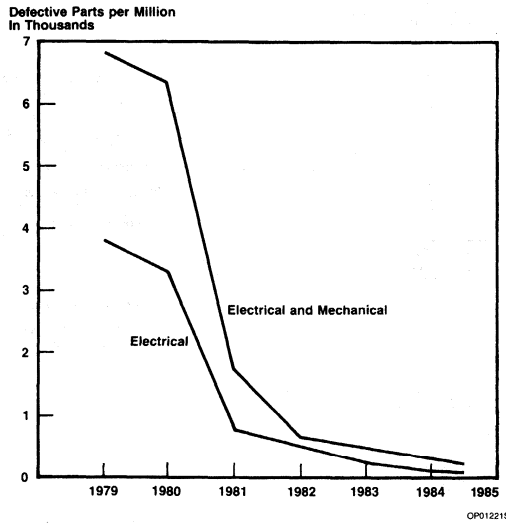


Figure 5. Logic Products AOQ (Average Outgoing Quality)

Signetics

Logic Products

Section 3
Military Information

Logic Products

Effective January 1, 1985, this section has been superseded by the 1985 Military Products Data Manual. Information regarding this manual can be obtained from the Military Division in Sacramento. (916) 925-6700.

MILITARY STANDARD PRODUCTS

The Signetics Military product line offering includes JAN Qualified Class S and B, and Class B vendor standard products. These products are designed to offer our customers the optimum of quality, reliability, delivery and cost. The benefits of these products provide our customers:

- **Industry-wide standardization.**
- **Fewer custom specifications.**
- **Cost savings associated with larger lots.**
- **Better lead times by reducing specification negotiation time and allowing off-the-shelf procurement.**
- **Industry standard marking.**

JAN QUALIFIED PRODUCT

JAN qualified product is offered to give our customers the highest quality and reliability. The JAN processing levels (Class S and B) are a result of the Governments product standardization programs, and our JAN product lines are certified by the qualifying activity, the Defense Electronics Supply Center (DESC). Signetics strongly recommends the use of JAN products which are on the MIL-M-38510 Qualified Products List (QPL).

JAN qualified products are fabricated, assembled, tested and processed in U.S. Government certified facilities in Sunnyvale, California (wafer fab), Orem, Utah (wafer fab, assembly), and Sacramento, California (burn-in, test, quality conformance inspection).

Testing and inspection to MIL-M-38510 is monitored by resident Government Source Inspection (GSI) personnel representing the Defense Contract Administration Services (DCAS).

DESC prohibits any customer imposed additions, deviations, omissions, or waivers on procurement of JAN products. Product must conform completely to Government specifications prior to shipment and is verified by Signetics Quality Control. A Certificate of Conformance and Procurement Traceability is supplied with each lot shipped.

JAN qualified products are listed in QPL-38510, issued periodically by DESC. For current QPL information, customers may contact their local sales representative, Military Marketing in Sacramento, or directly with DESC-EQM at (513) 296-6355. The JAN products listed herein should be considered valid only on its date of publication.

These categories of product conform to Quality Levels A and B of MIL-HDBK-217 (π_Q = 0.5 Class S, 1.0 for Class B).

The example at the bottom of this page illustrates the part numbering system. For JAN product, the part number is per MIL-M-38510.

SIGNETICS CLASS B STANDARD PRODUCT (RB)

Signetics Class B standard product is offered for use when JAN product is qualified on the QPL, DESC JAN product is not available, or when program requirements allow the use of vendor standard product.

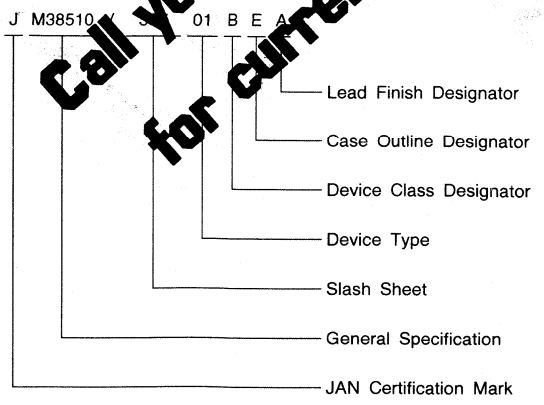
Class B standard product conforms to MIL-STD-883, General provisions Paragraph 1.2.1 (and its sub-paragraphs), except where noted. (See Product Noncompliance Section of Military Data Book and/or Hand Book.) No other claims, expressed or implied, are made of equivalence to JAN product or to MIL-M-38510. Signetics compliant product also conforms with JEDEC Publication 13 except for marking content.

Electrical test requirements are as stated in the most current **Signetics Military Data Manual only.**

- **100% final electrical tests include all Data Manual parameters, test conditions, and temperatures applicable to Subgroups 1, 2, 3, 7, and 9 of MIL-STD-883, Method 5004 for digital products or to Subgroups 1, 2, 3, 4, and 9 for Linear Products.**
- **Group B sample electrical inspection tests consist of all final electrical parameters as well as all other Data Manual parameters with specified minimum or maximum limits.**

End point electrical tests used for QCI inspection sampling (Groups C and D) are those Data Manual parameter limits, test conditions, and temperatures applicable to Group A Subgroups 1, 2, and 3 per MIL-STD-883, Method 5005, or to Subgroup 1 for Linear Products.

Data Manual parameters which have no specified minimum or maximum limits (typical performance only) are not tested. Parameters which have limits specified at 25°C only, are tested only at that temperature. Detailed parameter assignments to subgroups and other test detail are maintained in documented Signetics internal product Electrical specifications, and are available upon request. Actual test programs or symbolics are available for customer review at the factory, but are considered proprietary and will not be copied or otherwise distributed outside of Signetics.



QCI Groups A and B testing are performed on all products and packages per MIL-M-38510 and MIL-STD-883, Method 5005. Signetics utilizes inline Group A and alternate Group B for all lines. QCI Groups C and D are routinely performed on all compliant families and package types.

Waivers, deviations, or exceptions of any kind deemed necessary in the course of the contracts must be issued in accordance with DOD-STD-480. Should Signetics have knowledge of the need for waivers at the time of response to quote (RFQ) or order entry, that information will be transmitted prior to order entry.

Package types which do not have case outlines letters assigned in MIL-M-38510, Appendix C, will be assigned case outline letters per JEDEC Publication 101.

The Signetics standard Product Assurance Plan documentation is available for customer review at the factory, and is considered proprietary.

This category of product conforms to quality level B-2 of MIL-HDBK-217 ($\pi_Q = 6.5$).

For Class B Standard Product, the part number is listed as follows:

54LS161/ B E A

- Lead Finish Designator
- Case Outline Designator
- Device Class Designator
- Generic Device Type

Logic Products

Section 4
TTL User's Guide

INTRODUCTION

The TTL Logic devices described in this data manual differ widely in function, complexity and performance, but their electrical input and output characteristics are very similar and are defined and tested to guarantee compatibility. The data sheets that make up this book cover four major categories of TTL circuits and a series of TTL compatible interface products.

The oldest TTL product category is the gold-doped double-diffused type which is made up of the 7400 family of devices. This family reflects the same performance ranges and differ only in functions and pin configuration.

The remaining two categories of products are fabricated with a non-saturating Schottky clamped transistor technique. The 74S00 family of TTL products are very high performance, high power devices. The most popular TTL category is the 74LS Low Power Schottky family. These products feature the performance of the 74 family at about 1/4 the power.

ABSOLUTE MAXIMUM RATINGS

The Absolute Maximum Ratings constitute limiting values above which serviceability of the device may be impaired. Provisions should be made in system design and testing to limit voltages and currents as shown below.

OPERATING TEMPERATURE AND VOLTAGE RANGES

The nominal supply voltage (V_{CC}) for all TTL circuits is +5.0 volts. Commercial grade parts are guaranteed to perform with a ±5% supply tolerance (±250mV) over an ambient temperature range of 0°C to 70°C.

The actual junction temperature can be calculated by multiplying the power dissipation of the device with the thermal resistance of the package and adding it to the measured ambient temperature T_A or package (case) temperature T_C. The thermal resistance for the various packages in which the TTL products are offered is specified with the Package Information in Section 9 of this manual.

GENERAL TTL CIRCUIT CHARACTERISTICS

All TTL products are derived from a common NAND logic structure. The NAND circuit is actually five subcircuits as shown in Figure 1 and each performs a separate function. The input circuit (1) is an AND gate usually fabricated with a multi-emitter transistor which characterizes TTL technology. Many Schottky processed circuits have been designed with PNP or diode inputs in order to optimize the speed/power performance of the circuits.

The phase splitter (2) provides the inversion and amplification in the circuit. It determines whether the outputs are active level HIGH or active level LOW. The level shifter (3) provides noise immunity between the HIGH and LOW output levels, and minimizes the possibility of having both HIGH level driver (4) and LOW level driver (5) on simultaneously.

The level shifter (3) and HIGH level driver (4) combine to form an emitter follower circuit that tracks the voltage at the collector of the

NAND Gate Example

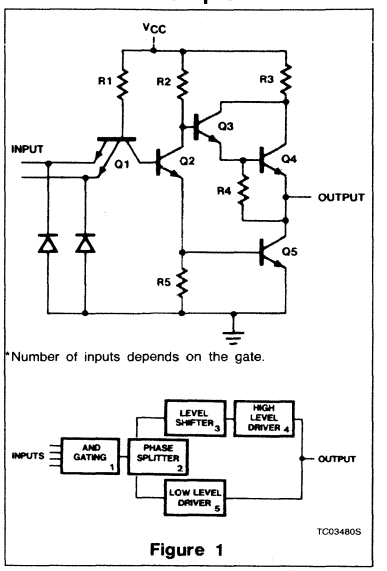

Figure 1

ABSOLUTE MAXIMUM RATINGS

PARAMETER	74	74S	74LS
V_{CC} supply voltage, continuous (Note a)	7.0V	7.0V	7.0V
Input voltage, continuous (Notes a and b)	−0.5V to +5.5V	−0.5V to +5.5V	−0.5V to +7.0V[b]
Input current, continuous	−30mA to +5mA	−30mA to +5mA	−30mA to +1mA
Voltage applied to HIGH outputs (Note a)	−0.5V to V_{CC}	−0.5V to 7.0V	−0.5V to V_{CC}
Voltage applied to "off" Open Collector outputs (Notes a and c)	−0.5V to 7.0V	−0.5V to 7.0V	−0.5V to 7.0V
Current into LOW standard output, continuous	30mA	40mA	15mA
Current into LOW buffer output, continuous	80mA	100mA	50mA
Operating free air temperature range (Com'l)	0°C to +70°C		
Storage temperature range	−65°C to +150°C		

NOTES:

a. Voltages are referenced to device ground terminal.

b. LS devices are generally limited to 7.0V maximum input voltage. Exceptions are called out on individual product data sheets.

c. Some open collector devices are specially processed to handle higher output voltages of from 15V to 30V. The Absolute Maximum voltage for these devices is 10% over the specified V_{OUT} test condition.

TTL INPUT CONFIGURATIONS

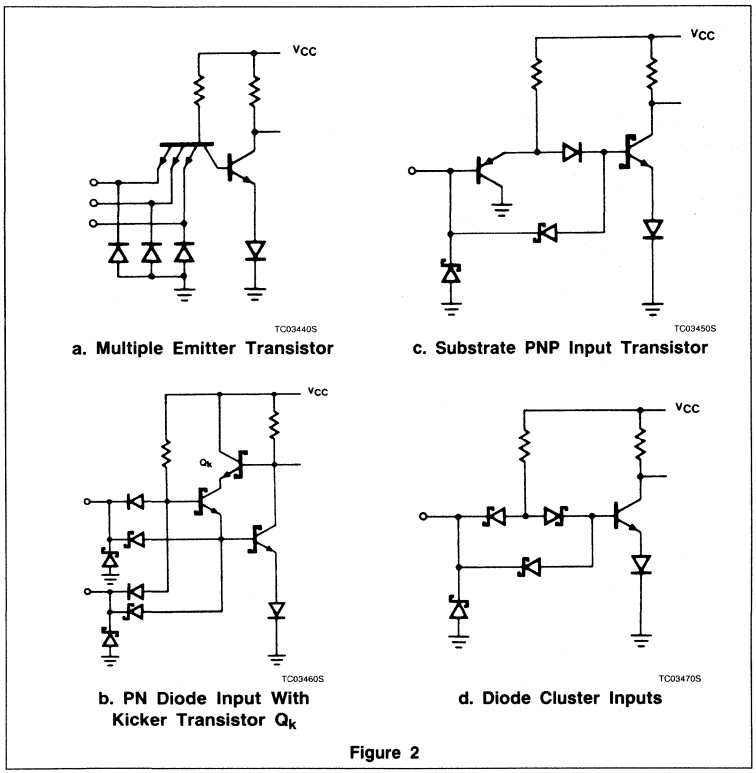

Figure 2

phase splitter. This circuit is usually designed to drive very heavy capacitive loads so that the initial rise time of the output is determined primarily by the rise time at the phase splitter collector. The LOW level driver (5) is usually a saturating transistor for the gold-doped process devices, or a Schottky diode clamped transistor for the Schottky processed devices. These output transistors are designed to sink the rated fan-out current which characterizes the various TTL families.

Input Circuits

The input circuits as described above are basically AND gate configurations designed with multiple-emitter NPN transistors (MET), substrate PNP transistors, or various junction and Schottky diodes as shown in Figure 2. All of the circuit configurations have very high impedance in the HIGH state. When the input voltage is above the circuit threshold voltage, all of the inputs act like reversed biased diodes.

The MET transistors are actually operated in the inverse mode, but the gain is so low there is very little current flowing into the devices. The LOW level input impedance of the MET and diode inputs is determined by the internal pull-up resistor. This resistor is nominally 2kΩ for 54S/74S inputs, and it is 16kΩ to 20kΩ for the 54LS/74LS inputs. Some 54LS/74LS buffer devices have substrate PNP inputs which exhibit very high impedance at both HIGH and LOW input logic levels. This is used to minimize the input load factor and produce better output drive and performance.

The inputs to all Signetics TTL devices have clamp diodes to ground to minimize negative ringing effects. These diodes are designed to operate in the ac mode and cannot handle heavy dc currents for long periods.

Output Circuits

The output circuit configurations used for the TTL products in this manual are shown in Figure 3. The basic advantages and disadvantages of each configuration are given for reference. The different circuits are used to optimize the functional and performance requirements of the various devices, and are not necessarily restricted to individual TTL families. The pull-down circuit (not shown) on the base of the LOW level driver is usually a resistor which provides a means of turning off the output transistor. The majority of the 54S/74S and 54LS/74LS devices use a resistor-transistor network which acts to square-up the $V_{IN} - V_{OUT}$ transfer characteristics of the device.

A resistive pull-up can be added to any TTL output circuit increasing V_{OH} to almost V_{CC}, but only circuits "c," "d," and "e" can be pulled higher than V_{CC}, e.g., to +7.0V for driving MOS circuits. Configurations "a" and "b" have a diode associated with the resistor at the output which clamps the output one diode drop above V_{CC}. This is an important consideration in large systems where sections might be powered down ($V_{CC} = 0$). In this state, the outputs of circuits "a" and "b" represent a very low impedance at a fairly low voltage (< 1.0V), while the outputs of circuits "c," "d," and "e" represent a high impedance and thus a logic HIGH, more appropriate for isolation from the rest of the system.

The output impedance of a typical TTL device in both the LOW and HIGH state is shown in Figure 4. In the LOW state, the output impedance is determined by a saturated transistor (about 8Ω to 10Ω). However, at very high sinking current, especially at low temperature, the output device is not able to stay in saturation and the output impedance rises as shown.

When switching from the LOW to the HIGH state, the totem-pole output structure provides a low output impedance capable of rapidly charging capacitive loads. However, charge and discharge currents must also flow through the V_{CC} and the ground distribution networks. The V_{CC} and ground lines should therefore be short and adequately decoupled.

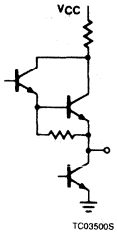
3-State Outputs

Some of the buffers and registers have 3-state outputs designed for "busing." This type of output electrically performs as a totem-pole output with the additional feature that the output may be disabled, neither sinking nor sourcing current. The 3-state outputs are designed to be tied together, but they are not designed to be active simultaneously. In order to minimize noise and protect the outputs from excessive power dissipation, only one 3-state output should be active at any time.

DESIGN CONSIDERATIONS

The properties of high speed TTL logic circuits dictate that some care be used in the design and layout of a system. Some general "design considerations" are included in this section. This is not intended to be a thorough guideline for designing TTL systems, but a reference for some of the constraints and

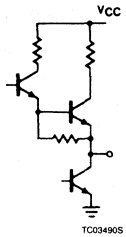
TTL OUTPUT CONFIGURATIONS



a. Darlington

ADVANTAGE:
High ac drive capability
$V_{OH} = V_{CC} - V_{BE}$ at $I_O = 0$
Small size (transistors share one common isolation)

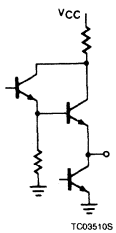
DISADVANTAGE:
Output cannot be pulled higher than one diode drop above V_{CC}



b. 2-stage Emitter Follower ('Darlington Split')

ADVANTAGE:
High ac drive capability
$V_{OH} = V_{CC} - V_{BE}$ at $I_O = 0$

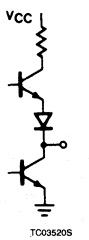
DISADVANTAGE:
Larger than Circuit A
Output cannot be pulled higher than one diode drop above V_{CC}



c. Darlington With Resistor to Ground

ADVANTAGE:
High ac drive capability
Lower $V_{OH} = (V_{CC} - 2\ V_{BE})$ increases speed
Outputs can be pulled higher than V_{CC}

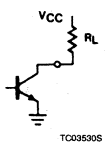
DISADVANTAGE:
Higher dissipation
Lower noise immunity in the HIGH state



d. Transistor – Diode

ADVANTAGE:
Lowest power consumption
Small size
Outputs can be pulled higher than V_{CC}

DISADVANTAGE:
Less ac drive capability



e. Open Collector

ADVANTAGE:
Bussable, allows collector ANDing (Wired-OR)

DISADVANTAGE:
High output impedance in the HIGH state
Slow, especially with capacitive loading
Requires additional resistor

Figure 3

TYPICAL INPUT/OUTPUT CHARACTERISTICS

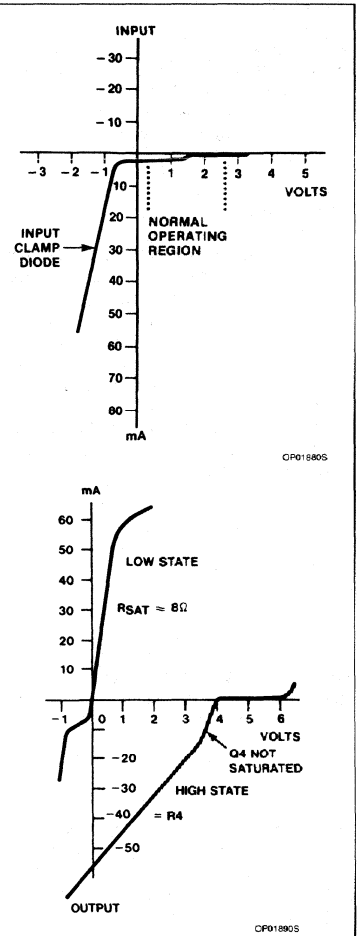


Figure 4

techniques to be considered when designing the system.

Mixing 74 and 74LS is less restrictive, and the overall system design need not be so elaborate. Standard two sided PC boards can be used with good, well decoupled power and ground grid systems. The signal transitions are slower and therefore generate less noise. However, good high speed design techniques are still required, especially when working with counters, registers, or other devices with memory.

Clock Pulse Requirements

Most TTL flip-flop circuits are master-slave devices which makes their clock inputs level

4

sensitive. This is an improvement over ac coupled clock inputs, but it does not make the devices fully insensitive to clock edge rates. The dc level at which the data in the master (input section) is transferred to the slave (output section) is the normal threshold voltage for the devices. For most Signetics TTL devices this level is 1.4V at 25°C, and it changes at a rate of about −4mV/°C.

When the clock input reaches the threshold voltage, the internal gates and the changing outputs start to dump current into the ground lead of the device. If there are enough internal gates or loaded outputs changing at the same time, the chip ground reference level (and therefore the clock input reference level) can rise by as much as 500mV. This ground noise is the algebraic sum of the internal and external ground plane noise. If the clock input of a positive edge triggered device is at or near the threshold of the device during the ground noise transient period, it is quite possible for the internal device to receive multiple clock pulses.

For this reason the rise time on positive edge-triggered devices should be less than the nominal clock to output delay time measured between the 0.8V and 2.0V levels of the clock driver. This edge rate is obtainable from almost any Signetics TTL device of the same family, as long as it is driving no more than rated fan out and no more than 12 to 16 inches of line. When clock pulses are distributed on lines over 16 inches long, all of the clock inputs should be clustered at the receiving end of the line to avoid reflection problems at the driving end.

Special Note

Some of the Signetics Counters and registers have been designed with a special clock buffer that includes a small amount of hysteresis to minimize clock edge rate and noise problems. The LS160A, LS161A, LS162A, LS163A, LS364, and LS374 all have the special clock buffers to increase their tolerance of slow positive clock edges and heavy ground noise.

TTL OUTPUTS TIED TOGETHER

The only TTL outputs that are designed to be tied together are open collector and 3-state outputs. Standard TTL outputs should not be tied together unless their logic levels will always be the same; either all HIGH or all LOW. When connecting open collector or 3-state outputs together some general guidelines must be observed.

Open Collector

These devices must be used whenever two or more OR-tied outputs will be at opposite logic levels at the same time. These devices must have a pull-up resistor (or resistors) added between the OR-tie connector and V_{CC} to establish an active HIGH level. Only special high voltage buffers can be tied to a higher voltage than V_{CC}. The minimum and maximum size of the pull-up resistor is determined as follows:

$$R(Min) = \frac{V_{CC}(Max) - V_{OL}}{I_{OL} - N_2(I_{IL})}$$

$$R(Max) = \frac{V_{CC}(Min) - V_{OH}}{N_1(I_{OH}) + N_2(I_{IH})}$$

where: I_{OL} = Minimum I_{OL} guarantee or OR-tied elements.

$N_2(I_{IL})$ = Cumulative maximum input LOW current for all inputs tied to OR-tie connection.

$N_1(I_{OH})$ = Cumulative maximum output HIGH leakage current for all outputs tied to OR-tie connection.

$N_2(I_{IH})$ = Cumulative maximum input HIGH leakage current for all inputs tied to OR-tie connection.

If a resistor divider network is used to provide the HIGH level, the R(Max) must be decreased enough to provide the required (V_{OH}/R(pull-down)) current.

Minimum propagation delay results when the minimum value of external pull-up resistor is used in Load Circuit 1, Figure 5.

Diodes should be fast recovery 1N4376 or equivalent. External pull-up resistor Load Circuits 2 and 3 give progressively slower propagation delays.

3-STATE OUTPUTS

3-State Outputs are designed to be tied together, but they are not designed to be active simultaneously. In order to minimize noise and protect the outputs from excessive power dissipation, only one 3-state output should be active at any time. This generally requires that the Output Enable signals be non-overlapping. When TTL decoders are used to enable 3-state outputs, the decoder should be disabled while the address is being changed. Since all TTL decoder outputs are subject to decoding spikes, non-overlapping signals cannot normally be guaranteed when the address is changing.

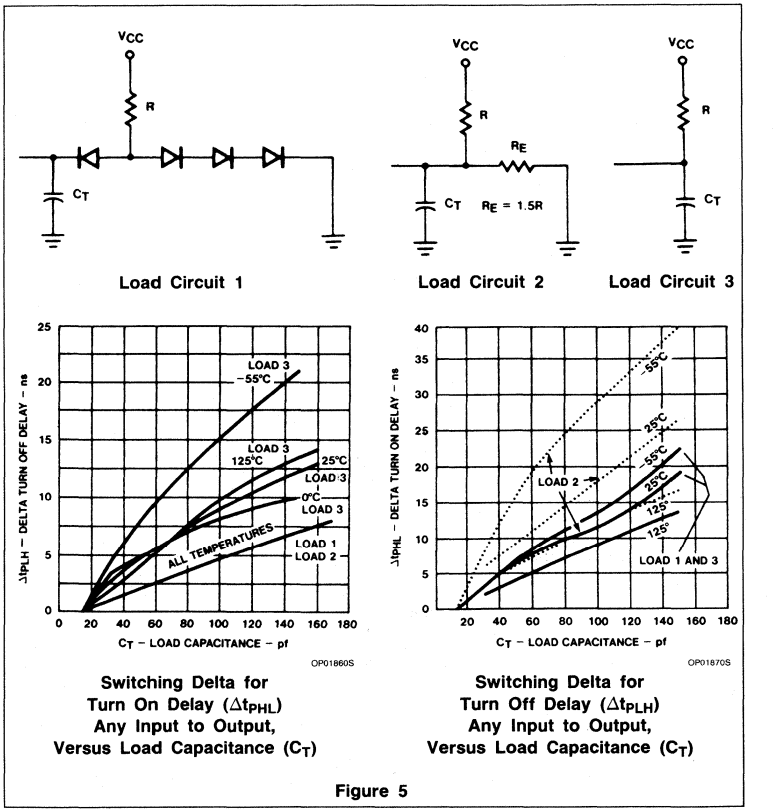

Figure 5

Since most 3-state Output Enable signals are active LOW, shift registers or edge-triggered storage registers provide good Output Enable buffers. Shift registers with one circulating LOW bit, like the "164" or "194" are ideal for sequential enable signals. The "174" or "273" can be used to buffer enable signals from TTL decoders or microcode (ROM) devices. Since the outputs of these registers will change from LOW-to-HIGH faster than from HIGH-to-LOW, the selection of one device at a time is assured.

POWER SUPPLY DECOUPLING

Power supply capacitance decoupling is required for any TTL system. Generally 0.01μF per synchronously driven gate and at least 0.1μF for each 20 gates is required regardless of synchronization. Counters and shift registers are especially susceptible to power and ground line noise. They should be decoupled with a 0.1μF capacitor for each eight internal flip-flops, or one capacitor for each two devices put as close as possible to the devices. Buffers and line drivers should be heavily decoupled at the driver power pins, due to the large current transients needed to charge and discharge the lines.

On-Board Regulation

In most digital systems, there is a large current requirement, and the current supplied usually comes from a main supply. TTL logic tends to generate current spikes during switching due to the overlap in conduction of both upper and lower transistors, thus creating V_{CC} noise. An on-board regulator would not only regulate the power supplied to the circuits on-board, but also would isolate the noise otherwise propagated to the reset of the system. Systems designed using this technique would not need tight regulation on the main power supply.

LINE DRIVING AND RECEIVING

Open wire connections between TTL circuits should not be bundled, tied, or routed together. Instead, point-to-point wiring should be used, preferably above a ground plane which reduces coupling between conductors.

Single line wire interconnections should not exceed two feet; for wires longer than 15 inches, a ground plane is essential to provide adequate system performance. Over 2-foot twisted pairs or coaxial cable should be used. The characteristic impedance of an open wire over a ground plane is about 150Ω, while for twisted pairs of #26 wire the impedance is about 120Ω. For added protection against crosstalk, coaxial cables can be used but coaxial cables having very low characteristic impedances are difficult to drive. For best performance, coaxial cables with a characteristic impedance R_O of 100Ω should be used. Resistive pull-ups at the receiving end can be used to increase noise margins. If reflection effects are unacceptable, the line must be terminated in its characteristic impedance. One method is shown in Figure 6 where the output of the line is tied to V_{CC} through a resistor equivalent to the characteristic impedance of the line. Therefore, R_O is fairly small, and the driving gate must sink the current through it in addition to the current from the inputs being driven. Terminating the line in a voltage divider with two resistors, each twice the line impedance, reduces the extra sink current by 50%. It is preferable to dedicate gates solely for line driving if the line length is in excess of five feet.

Clamp Diode Effect on Negative Input Voltages

All Signetics TTL circuits are provided with clamp diodes on the device inputs to minimize negative ringing effects. These diodes should not be used to clamp negative dc voltages or long duration negative pulses especially for 74LS product. If the input voltage of an LS device is taken more than 0.5 volts negative (referenced to the device ground terminal) for more than 0.5 microseconds, it is possible to activate a parasitic circuit component which can cause the HIGH level output of that gate to degrade sufficiently to cause a logic error.

Disposition of Unused Inputs

Electrically open inputs degrade ac noise immunity as well as the switching speed of a circuit. To optimize performance, each input must be connected to a low impedance source. Unused active HIGH NOR or OR inputs must be returned to ground or a LOW level output. Unused active HIGH NAND or AND inputs should be maintained at a voltage greater than 2.7V, but not exceeding the Absolute Maximum Rating. This eliminates the distributed capacitance associated with the floating input, bond wire, and package lead, and ensures that no degradation will occur in the propagation delay times.

Possible ways of handling unused inputs are:

1. Connect the unused active LOW inputs of the TTL devices to ground. The active HIGH inputs should be tied through a resistor of from 1K to 10kΩ to V_{CC}. The unused active HIGH LS inputs can be tied directly to V_{CC}, as long as the leads are very short and the supply is adequately decoupled.
2. Connect the unused HIGH input to the output of an unused gate that is forced HIGH.
3. Tie unused NAND or AND inputs (multi-emitter inputs) of non-LS devices to a used input of the same gate, provided the HIGH level fan out of the driving circuit is not exceeded. Note that the LOW level fan out is not increased by this connection because the inputs share a common base pull-up resistor.

Unused Gates

It is recommended that the outputs of unused gates be forced HIGH by tying a NAND gate input or all NOR gate inputs to ground. This lowers the power dissipation and supplies a logic HIGH at the gate output which can be used at unused inputs to other gates.

Increasing Fan Out

To increase fan out, inputs and outputs of gates on the same package may be paralleled. It is advisable to limit the gates being paralleled to those in a single package to avoid large transient supply currents due to different switching times of the gates. This is not detrimental to the devices, but could cause logic problems if the gates are being used as clock drivers.

TTL DRIVING TWISTED PAIR

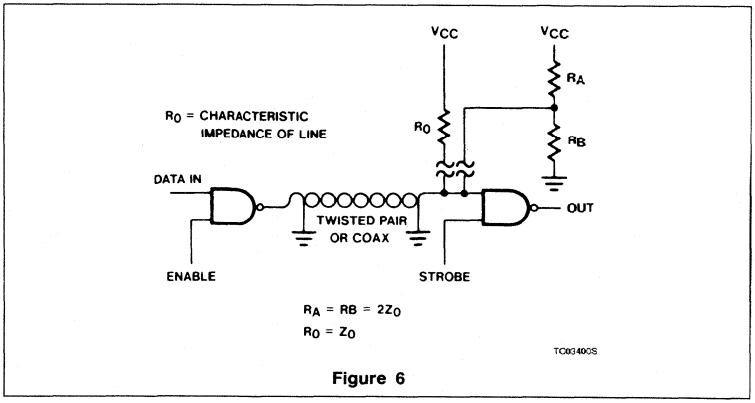

Figure 6

Isolation Diodes

NEVER REVERSE THE V_{CC} AND GROUND POTENTIALS. Catastrophic failure can occur if more than 100mA is conducted through a forward biased substrate (isolation) diode.

Input Loading and Output Drive Characteristics

The logic levels of all the TTL products are fully compatible with each other. However, the inputs loading and output drive characteristics of each of these families is different and must be taken into consideration when mixing the TTL families in a system. Table 1 shows the relative drive capabilities of each family for the Commercial temperature and voltage ranges. For Military ranges the 74LS drive capabilities must be cut in half. You will note that the 74LS Buffers have three times the drive capability of the standard 74LS devices; in fact, they can drive more loads than any other non-buffer TTL device.

Mixing TTL Families

Most TTL families are intended to used together, but this cannot be done indiscriminately. Each family of TTL devices has unique input and output characteristics optimized to get the desired speed or power features. Fast devices like 74S and 74F are designed with relatively low input and output impedances. The speed of these devices is determined primarily by fast rise and fall times internally as well as at the input and output nodes. These fast transitions cause noise of various types in the system. Power and ground line noise is generated by the large currents needed to charge and discharge the circuit and load capacitances during the switching transitions. Signal line noise is generated by the fast output transitions and the relatively low output impedances, which tend to increase reflections.

The noise generated by these 74S and 74F devices can only be tolerated in systems designed with very short signal leads, elaborate ground planes, and good, well decoupled power distribution networks. Mixing the slower TTL families like 74 and 74LS with the higher speed families is also possible but must be done with caution. The slower speed families are more susceptible to induced noise than the higher speed families due to their higher input and output impedances. The low power Schottky 74LS family is especially sensitive to induced noise and must be isolated as much as possible from the 74S and 74F devices. Separate or isolated power and ground systems are recommended, and the LS input signal lines should not run adjacent to lines driven by 74S and 74F devices.

Table 1

DRIVING DEVICE	NUMBER OF LOADS DRIVEN					
	74F	74LS	74	74S	8200 and 9300	82500
74F	33	50	12.5	10	12	50
74F Buffer	106	160	40	32	40	160
74LS	13	20	5	4	5	20
*74LS Buffer	40	60	15	12	15	60
74	26	40	10	8	10	40
74 Buffer	78	120	30	24	30	120
74S	33	50	12.5	10	12	50
74S Buffer	100	150	37.5	30	37	150
8200 & 9300	26	40	10	8	10	40
82500	33	50	12	10	12	50

*The 74LS Buffers include 3-state outputs except LS253 & LS670

NOTE:

For 74LS devices do not connect multiple inputs of a common gate together. This would increase the input coupling capacitance and reduce the ac noise immunity.

DC SYMBOLS AND DEFINITIONS

Voltages — All voltages are referenced to ground. Negative voltage limits are specified as absolute values (i.e., −10V is greater than −1.0V).

Currents — Positive current is defined as conventional current flow into a device. Negative current is defined as conventional current flow out of a device. All current limits are specified as absolute values.

V_{CC}	**Supply voltage:** The range of power supply voltage over which the device is guaranteed to operate within the specified limits.
V_{IK}	**Input clamp voltage:** The most negative voltage at an input when the specified current is forced out of that input terminal. This parameter guarantees the integrity of the input diode intended to clamp negative ringing at the input terminal.
V_{IH}	**Input HIGH voltage:** The range of input voltages recognized by the device as a logic HIGH.
V_{IH}(MIN)	**Minimum Input HIGH voltage:** This value is the guaranteed input HIGH threshold for the device. The minimum allowed input HIGH in a logic system.
V_{IL}	**Input LOW voltage:** The range of input voltages recognized by the device as a logic LOW.
V_{IL}(MAX)	**Maximum Input LOW voltage:** This value is the guaranteed input LOW threshold for the device. The maximum allowed input LOW in a logic system.
V_M	**Measurement voltage:** The reference voltage level on ac waveforms for determining ac performance. Usually specified as 1.5V for most TTL families, but 1.3V for the Low Power Schottky 74LS family.
V_{OH}(MIN)	**Output HIGH voltage:** The minimum guaranteed HIGH voltage at an output terminal for the specified output current I_{OH} and at the minimum V_{CC} value.
V_{OL}(MAX)	**Output LOW voltage:** The maximum guaranteed LOW voltage at an output terminal sinking the specified load current I_{OL}.
V_{T+}	**Positive-going threshold voltage:** The input voltage of a variable threshold device which causes operation according to specification as the input transition rises from below V_{T-}(MIN).
V_{T-}	**Negative-going threshold voltage:** The input voltage of a variable threshold device which causes operation according to specification as the input transition falls from above V_{T+}(MAX).

I_{CC}	**Supply current:** The current flowing into the V_{CC} supply terminal of the circuit with specified input conditions and open outputs. Input conditions are chosen to guarantee worst case operation unless specified.
I_I	**Input leakage current:** The current flowing into an input when the maximum allowed voltage is applied to the input. This parameter guarantees the minimum breakdown voltage for the input.
I_{IH}	**Input HIGH current:** The current flowing into an input when a specified HIGH level voltage is applied to that input.
I_{IL}	**Input LOW current:** The current flowing out of an input when a specified LOW level voltage is applied to that input.
I_{OH}	**Output HIGH current:** The leakage current flowing into a turned off open collector output with a specified HIGH output voltage applied. For devices with a pull-up circuit, the I_{OH} is the current flowing out of an output which is in the HIGH state.
I_{OL}	**Output LOW current:** The current flowing into an output which is in the LOW state.
I_{OS}	**Output short-circuit current:** The current flowing out of an output which is in the HIGH state when that output is short-circuit to ground.
I_{OZH}	**Output off current HIGH:** The current flowing into a disabled 3-state output with a specified HIGH output voltage applied.
I_{OZL}	**Output off current LOW:** The current flowing out of a disabled 3-state output with a specified LOW output voltage applied.

AC SWITCHING PARAMETERS AND DEFINITIONS

f_{MAX}	**The maximum clock frequency:** The maximum input frequency at a clock input for predictable performance. Above this frequency the device may cease to function.
t_{PLH}	**Propagation delay time:** The time between the specified reference points on the input and output waveforms with the output changing from the defined LOW level to the defined HIGH level.
t_{PHL}	**Propagation delay time:** The time between the specified reference points on the input and output waveforms with the output changing from the defined HIGH level to the defined LOW level.
t_{PHZ}	**Output disable time from HIGH level of a 3-state output:** The delay time between the specified reference points on the input and output voltage waveforms with the 3-state output changing from the HIGH level to a high impedance "off" state.
t_{PLZ}	**Output disable time from LOW level of 3-state output:** The delay time between the specified reference points on the input and output voltage waveforms with the 3-state output changing from the LOW level to a high impedance "off" state.
t_{PZH}	**Output enable time to a HIGH level of a 3-state output:** The delay time between the specified reference points on the input and output voltage waveforms with the 3-state output changing from a high impedance "off" state to the HIGH level.
t_{PZL}	**Output enable time to a LOW level of a 3-state output:** The delay time between the specified reference points on the input and output voltage waveforms with the 3-state output changing from a high impedance "off" state to the LOW level.

t_h	**Hold time:** The interval immediately following the active transition of the timing pulse (usually the clock pulse) or following the transition of the control input to its latching level, during which interval the data to be recognized must be maintained at the input to ensure its continued recognition. A negative hold time indicates that the correct logic level may be released prior to the active transition of the timing pulse and still be recognized.
t_s	**Set-up time:** The interval immediately preceding the active transition of the timing pulse (usually the clock pulse) or preceding the transition of the control input to its latching level, during which interval the data to be recognized must be maintained at the input to ensure its recognition. A negative set-up time indicates that the correct logic level may be initiated sometime after the active transition of the timing pulse and still be recognized.
t_w	**Pulse width:** The times between the specified reference points on the leading and trailing edges of a pulse.
t_{rec}	**Recovery time:** The time between the reference point on the trailing edge of an asynchronous input control pulse and the reference point on the activating edge of a synchronous (clock) pulse input such that the device will respond to the synchronous input.
t_{TLH}	**Transition time:** LOW to HIGH, the time between two specified reference points on a waveform, normally 10% and 90% points, that is changing from LOW to HIGH.
t_{THL}	**Transition time:** LOW to HIGH, the time between two specified reference points on a waveform, normally 90% and 10% points, that is changing from LOW to HIGH.
t_r, t_f	**Clock input rise and fall times:** 10% to 90% value.

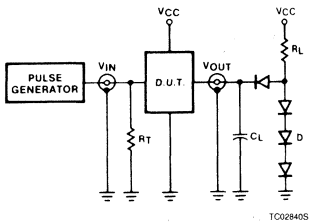
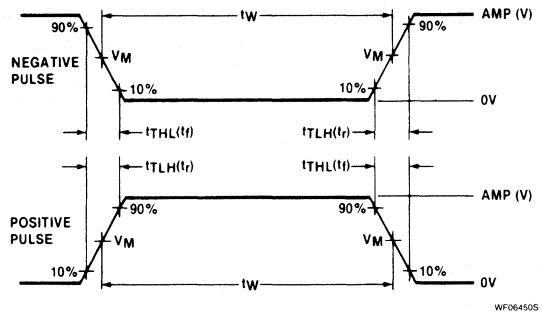
TEST CIRCUITS AND WAVEFORMS





V_M = 1.3V for 74LS; V_M = 1.5V for all other TTL families.

Test Circuit For 74 Totem-Pole Outputs

DEFINITIONS

R_L = Load resistor to V_{CC}; see AC CHARACTERISTICS for value.
C_L = Load capacitance includes jig and probe capacitance; see AC CHARACTERISTICS for value.
R_T = Termination resistance should be equal to Z_{OUT} of Pulse Generators.
D = Diodes are 1N916, 1N3064, or equivalent.
t_{TLH}, t_{THL} Values should be less than or equal to the table entries.

Input Pulse Definitions

FAMILY	INPUT PULSE REQUIREMENTS				
	Amplitude	Rep. Rate	Pulse Width	t_{TLH}	t_{THL}
74	3.0V	1MHz	500ns	7ns	7ns
74LS	3.0V	1MHz	500ns	15ns	6ns
74S	3.0V	1MHz	500ns	2.5ns	2.5ns

DC ELECTRICAL CHARACTERISTICS (Over recommended operating free-air temperature range unless otherwise noted.)

PARAMETER		TEST CONDITIONS[1]		7402			74LS02			74S02			UNIT
				Min	Typ[2]	Max	Min	Typ[2]	Max	Min	Typ[2]	Max

TEST CIRCUITS AND WAVEFORMS

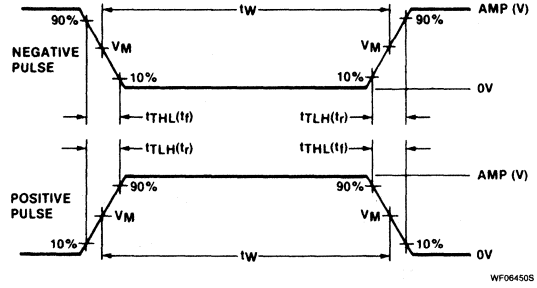
Test Circuit For 74 Open Collectors Outputs



V_M = 1.3V for 74LS; V_M = 1.5V for all other TTL families.

Input Pulse Definition

DEFINITIONS
R_L = Load resistor to V_{CC}; see AC CHARACTERISTICS for value.
C_L = Load capacitance includes jig and probe capacitance; see AC CHARACTERISTICS for value.
R_T = Termination resistance should be equal to Z_{OUT} of Pulse Generators.
D = Diodes are 1N916, 1N3064, or equivalent.
t_{TLH}, t_{THL} Values should be less than or equal to the table entries.

FAMILY	INPUT PULSE REQUIREMENTS				
	Amplitude	Rep. Rate	Pulse Width	t_{TLH}	t_{THL}
74	3.0V	1MHz	500ns	7ns	7ns
74LS	3.0V	1MHz	500ns	15ns	6ns
74S	3.0V	1MHz	500ns	2.5ns	2.5ns

DC ELECTRICAL CHARACTERISTICS (Over recommended operating free-air temperature range unless otherwise noted.)

PARAMETER		TEST CONDITIONS[1]			7406, 7407 Min	7406, 7407 Typ[2]	7406, 7407 Max	UNIT
I_{OH}	HIGH-level output current	V_{CC} = MIN, V_{IH} = MIN, V_{IL} = MAX, V_{OH} = 30V					250	μA
V_{OL}	LOW-level output voltage	V_{CC} = MIN, V_{IH} = MIN, V_{IL} = MAX	I_{OL} = 16mA				0.4	V
			I_{OL} = 30mA				0.7	V
			I_{OL} = 40mA				0.7	V
V_{IK}	Input clamp voltage	V_{CC} = MIN, I_I = I_{IK}					−1.5	V
I_I	Input current at maximum input voltage	V_{CC} = MAX, V_I = 5.5V					1.0	mA
I_{IH}	HIGH-level input current	V_{CC} = MAX, V_I = 2.4V					40	μA
I_{IL}	LOW-level input current	V_{CC} = MAX, V_I = 0.4V					−1.6	mA
I_{CC}	Supply current (total)	V_{CC} = MAX	I_{CCH} Outputs HIGH	'06		30	48	mA
			I_{CCL} Outputs LOW			32	51	mA
			I_{CCH} Outputs HIGH	'07		29	41	mA
			I_{CCL} Outputs LOW			21	30	mA

NOTES:
1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.

AC WAVEFORMS

Dual 4-Input NAND Schmitt Trigger
Product Specification

Logic Products

DESCRIPTION

The '13 contains two 4-input NAND gates which accept standard TTL input signals and provide standard TTL output levels. They are capable of transforming slowly changing input signals into sharply defined, jitter-free output signals. In addition, they have greater noise margin than conventional NAND gates.

Each circuit contains a 4-input Schmitt trigger followed by a Darlington level shifter and a phase splitter driving a TTL totem-pole output. The Schmitt trigger uses positive feedback to effectively speed-up slow input transitions, and provide different input threshold voltages for positive and negative-going transitions. This hysteresis between the positive-going and negative-going input threshold (typically 800mV) is determined by resistor ratios and is essentially insensitive to temperature and supply voltage variations. As long as three inputs remain at a more positive voltage than $V_{t+\,MAX}$, the gate will respond in the transitions of the other input as shown in Waveform 1.

V_M = 1.3V for 74LS; V_M = 1.5V for all other TTL families.

Test Circuit For 74 Totem-Pole Outputs

DEFINITIONS
R_L = Load resistor to V_{CC}; see AC CHARACTERISTICS for value.
C_L = Load capacitance includes jig and probe capacitance; see AC CHARACTERISTICS for value.
R_T = Termination resistance should be equal to Z_{OUT} of Pulse Generators.
D = Diodes are 1N916, 1N3064, or equivalent.
t_{TLH}, t_{THL} Values should be less than or equal to the table entries.

Input Pulse Definitions

FAMILY	INPUT PULSE REQUIREMENTS				
	Amplitude	Rep. Rate	Pulse Width	t_{TLH}	t_{THL}
74	3.0V	1MHz	500ns	7ns	7ns
74LS	3.0V	1MHz	500ns	15ns	6ns
74S	3.0V	1MHz	500ns	2.5ns	2.5ns

Signetics

7414, LS14
Schmitt Triggers

Hex Inverter Schmitt Trigger
Product Specification

Logic Products

DESCRIPTION

The '14 contains six logic inverters which accept standard TTL input signals and provide standard TTL output levels. They are capable of transforming slowly changing input signals into sharply defined, jitter-free output signals. In addition, they have greater noise margin than conventional inverters.

Each circuit contains a Schmitt trigger followed by a Darlington level shifter and a phase splitter driving a TTL totem-pole output. The Schmitt trigger uses positive feedback to effectively speed-up slow input transition, and provide different input threshold voltages for positive and negative-going transitions. This hysteresis between the positive-going and negative-going input thresholds (typically 800mV) is determined internally by resistor ratios and is essentially insensitive to temperature and supply voltage variations.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
7414	15ns	31mA
74LS14	15ns	10mA

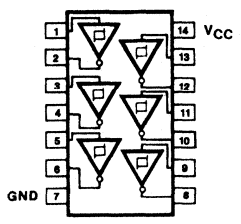
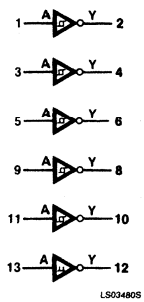
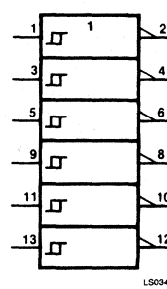
PIN CONFIGURATION



LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



ABSOLUTE MAXIMUM RATINGS (Over operating free-air temperature range unless otherwise noted.)

PARAMETER		74	UNIT
V_{CC}	Supply voltage	7.0	V
V_{IN}	Input voltage	−0.5 to +5.5	V
I_{IN}	Input current	−30 to +5	mA
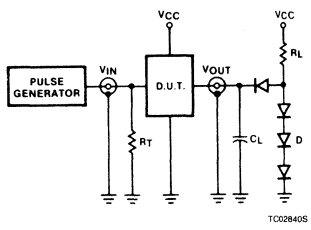
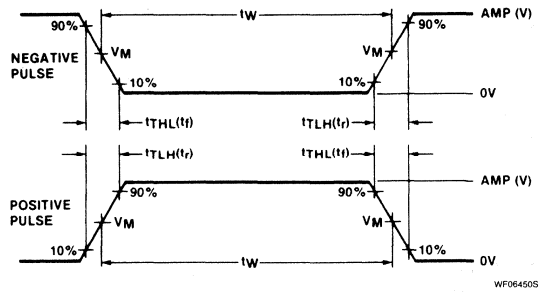
V_{OUT}	Voltage applied to output in HIGH output state	−0.5 to +V_{CC}	V
T_A	Operating free-air temperature range	0 to 70	°C

RECOMMENDED OPERATING CONDITIONS

PARAMETER		74			UNIT
		Min	Nom	Max	
V_{CC}	Supply voltage	4.75	5.0	5.25	V
V_{IH}	HIGH-level input voltage	2.0			V
V_{IL}	LOW-level input voltage			+0.8	V
I_{IK}	Input clamp current			−12	mA
I_{OH}	HIGH-level output current			−800	μA
I_{OL}	LOW-level output current			16	mA
T_A	Operating free-air temperature	0		70	°C

TEST CIRCUITS AND WAVEFORMS





V_M = 1.3V for 74LS; V_M = 1.5V for all other TTL families.

Test Circuit For 74 Totem-Pole Outputs

Input Pulse Definition

DEFINITIONS
R_L = Load resistor to V_{CC}; see AC CHARACTERISTICS for value.
C_L = Load capacitance includes jig and probe capacitance; see AC CHARACTERISTICS for value.
R_T = Termination resistance should be equal to Z_{OUT} of Pulse Generators.
D = Diodes are 1N916, 1N3064, or equivalent.
t_{TLH}, t_{THL} Values should be less than or equal to the table entries.

FAMILY	INPUT PULSE REQUIREMENTS				
	Amplitude	Rep. Rate	Pulse Width	t_{TLH}	t_{THL}
74	3.0V	1MHz	500ns	7ns	7ns
74LS	3.0V	1MHz	500ns	15ns	6ns
74S	3.0V	1MHz	500ns	2.5ns	2.5ns

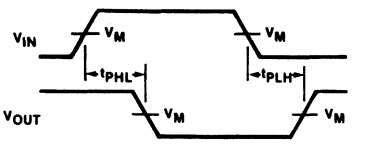
DC ELECTRICAL CHARACTERISTICS (Over recommended operating free-air temperature range unless otherwise noted.)

PARAMETER		TEST CONDITIONS[1]		7425			UNIT
				Min	Typ[2]	Max	
V_{OH}	HIGH-level output voltage	V_{CC} = MIN, V_{IL} = MAX, I_{OH} = MAX		2.4	3.4		V
V_{OL}	LOW-level output voltage	V_{CC} = MIN, V_{IH} = MIN, I_{OL} = MAX			0.2	0.4	V
V_{IK}	Input clamp voltage	V_{CC} = MIN, I_I = I_{IK}				−1.5	V
I_I	Input current at maximum input voltage	V_{CC} = MAX, V_I = 5.5V				1.0	mA
I_{IH}	HIGH-level input current	V_{CC} = MAX, V_I = 2.4V	G input			160	μA
			Other inputs			40	μA
I_{IL}	LOW-level input current	V_{CC} = MAX, V_I = 0.4V	G input			−6.4	mA
			Other inputs			−1.6	mA
I_{OS}	Short-circuit output current[3]	V_{CC} = MAX		−18		−55	mA
I_{CC}	Supply current (total)	V_{CC} = MAX	I_{CCH} Outputs HIGH		8	16	mA
			I_{CCL} Outputs LOW		10	19	mA

NOTES:
1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. I_{OS} is tested with V_{OUT} = +0.5V and V_{CC} = V_{CC} MAX+0.5V. Not more than one output should be shorted at a time and duration of the short circuit should not exceed one second.

5

AC WAVEFORM



V_M = 1.3V for 74LS; V_M = 1.5V for all other TTL families.

Waveform 1. Waveform For Inverting Outputs

Signetics

7442, LS42
Decoders

BCD-To-Decimal Decoder (1-of-10)
Product Specification

Logic Products

FEATURES

- **Mutually exclusive outputs**
- **1-of-8 demultiplexing ability**
- **Outputs disabled for input codes above nine**

DESCRIPTION

The '42 decoder accepts four active HIGH BCD inputs and provides 10 mutually exclusive active LOW outputs, as shown by logic symbol or diagram. The active LOW outputs facilitate addressing other MSI units with active LOW input enables.

The logic design of the '42 ensures that all outputs are HIGH when binary codes greater than nine are applied to the inputs.

The most significant input, A_3, produces a useful inhibit function when the '42 is used as a 1-of-8 decoder. The A_3 input can also be used as the Data input in an 8-output demultiplexer application.

Signetics

7445
Decoder/Driver

BCD-To-Decimal Decoder/Driver (Open Collector)
Product Specification

Logic Products

FEATURES

- **80mA output sink capability**
- **30V output breakdown voltage**
- **Ideally suited as lamp or solenoid driver**
- **See '42 for standard TTL output version**
- **See '145 for "LS" version**

DESCRIPTION

The '45 decoder accepts BCD inputs on the A_0 to A_3 address lines and generates 10 mutually exclusive active LOW outputs. When an input code greater than "9" is applied, all outputs are off. This device can therefore be used as a 1-of-8 decoder with A_3 used as an active LOW enable.

The '45 can sink 20mA while maintaining the standardized guaranteed output LOW voltage (V_{OL}) of 0.4V, but it can sink up to 80mA with a guaranteed V_{OL} of less than 0.9V.

The '45 features an output breakdown voltage of 30V and is ideally suited as a lamp or solenoid driver.

7473, LS73
Flip-Flops

Dual J-K Flip-Flop
Product Specification

Logic Products

DESCRIPTION

The '73 is a dual flip-flop with individual J, K, Clock and direct Reset inputs. The 7473 is positive pulse-triggered. JK information is loaded into the master while the Clock is HIGH and transferred to the slave on the HIGH-to-LOW transition. For the 7473, the J and K inputs should be stable while the Clock is HIGH for conventional operation.

The 74LS73 is a negative edge-triggered flip-flop. The J and K inputs must be stable one set-up time prior to the HIGH-to-LOW Clock transition for predictable operation.

The Reset ($\overline{R}_D$) is an asynchronous active LOW input. When LOW, it overrides the Clock and Data inputs, forcing the Q output LOW and the $\overline{Q}$ output HIGH.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)
7473	20MHz	10mA
74LS73	45MHz	4mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N7473N, N74LS73N

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

I_{CC}	Supply current[4] (total)	V_{CC} = MAX				10	40		4	8	mA

NOTES:

1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. I_{OS} is tested with V_{OUT} = +0.5V and V_{CC} = V_{CC} MAX + 0.5V. Not more than one output should be shorted at a time and duration of the short circuit should not exceed one second.
4. With the Clock input grounded and all outputs open, I_{CC} is measured with the Q and $\overline{Q}$ outputs HIGH in turn.

AC ELECTRICAL CHARACTERISTICS T_A = 25°C, V_{CC} = 5.0V

PARAMETER		TEST CONDITIONS	74		74LS		UNIT
			C_L = 15pF, R_L = 400Ω		C_L = 15pF, R_L = 2kΩ		
			Min	Max	Min	Max	
f_{MAX}	Maximum clock frequency	Waveform 3	15		30		MHz
t_{PLH} t_{PHL}	Propagation delay Clock to output	Waveform 1, 'LS73 Waveform 3, '73		25 40		20 30	ns
t_{PLH} t_{PHL}	Propagation delay $\overline{R}_D$ to output	Waveform 2		25 40		20 30	ns

NOTE:

Per industry convention, f_{MAX} is the worst case value of the maximum device operating frequency with no constraints on t_r, t_f, pulse width or duty cycle.

AC SET-UP REQUIREMENTS $T_A = 25°C$, $V_{CC} = 5.0V$

PARAMETER		TEST CONDITIONS	74		74LS		UNIT
			Min	Max	Min	Max

Signetics

7474, LS74A, S74
Flip-Flops

Dual D-Type Flip-Flop
Product Specification

Logic Products

DESCRIPTION

The '74 is a dual positive edge-triggered D-type flip-flop featuring individual Data, Clock, Set and Reset inputs; also complementary Q and $\overline{Q}$ outputs.

Set ($\overline{S}_D$) and Reset ($\overline{R}_D$) are asynchronous active-LOW inputs and operate independently of the Clock input. Information on the Data (D) input is transferred to the Q output on the LOW-to-HIGH transition of the clock pulse. The D inputs must be stable one set-up time prior to the LOW-to-HIGH clock transition for predictable operation. Although the Clock input is level-sensitive, the positive transition of the clock pulse between the 0.8V and 2.0V levels should be equal to or less than the clock-to-output delay time for reliable operation.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)
7474	25MHz	17mA
74LS74A	33MHz	4mA
74S74	100MHz	30mA

NOTE:

7475, LS75
Latches

Quad Bistable Latch
Product Specification

Logic Products

FEATURES
- **4-bit bistable latch**
- **Refer to 74LS375 for V_{CC} and GND on corner pins**

DESCRIPTION
The '75 has four bistable latches. Each 2-bit latch is controlled by an active HIGH Enable input (E). When E is HIGH, the data enters the latch and appears at the Q output. The Q outputs follow the Data inputs as long as E is HIGH. The data on the D inputs one set-up time before the HIGH-to-LOW transition of the enable will be stored in the latch. The latched outputs remain stable as long as the enable is LOW.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)

Signetics

7476, LS76
Flip-Flops

Dual J-K Flip-Flop
Product Specification

Logic Products

DESCRIPTION

The '76 is a dual J-K flip-flop with individual J, K, Clock, Set and Reset inputs. The 7476 is positive pulse-triggered. JK information is loaded into the master while the Clock is HIGH and transferred to the slave on the HIGH-to-LOW Clock transition. The J and K inputs must be stable while the Clock is HIGH for conventional operation.

The 74LS76 is a negative edge-triggered flip-flop. The J and K inputs must be stable only one set-up time prior to the HIGH-to-LOW Clock transition.

The Set ($\overline{S}_D$) and Reset ($\overline{R}_D$) are asynchronous active LOW inputs. When LOW, they override the Clock and Data inputs, forcing the outputs to the steady state levels as shown in the Function Table.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)
7476	20MHz	10mA
74LS76	45MHz	4mA

ORDERING CODE

X = Don't care.
⎍ = Positive Clock pulse.

NOTES:
1. Both outputs will be HIGH while both $\bar{S}_D$ and $\bar{R}_D$ are LOW, but the output states are unpredictable if $\bar{S}_D$ and $\bar{R}_D$ go HIGH simultaneously.
2. The 74LS76 is edge triggered. Data must be stable one set-up time prior to the negative edge of the Clock for predictable operation.
3. The J and K inputs of the 7476 must be stable while the Clock is HIGH for conventional operation.

ABSOLUTE MAXIMUM RATINGS (Over operating free-air temperature range unless otherwise noted.)

7483, LS83A
Adders

4-Bit Full Adder
Product Specification

FEATURES

- **High speed 4-bit binary addition**
- **Cascadeable in 4-bit increments**
- **LS83A has fast internal carry lookahead**
- **See '283 for corner power pin version**

DESCRIPTION

The '83 adds two 4-bit binary words (A_n plus B_n) plus the incoming carry. The binary sum appears on the Sum outputs ($\Sigma_1 - \Sigma_4$) and the outgoing carry (C_{OUT}) according to the equation:

$C_{IN} + (A_1 + B_1) + 2(A_2 + B_2) + 4(A_3 + B_3) + 8(A_4 + B_4) = \Sigma_1 + 2\Sigma_2 + 4\Sigma_3 + 8\Sigma_4 + 16C_{OUT}$

Where (+) = plus.

Due to the symmetry of the binary add function, the '83 can be used with either all active-HIGH operands (positive logic) or with all active-LOW operands (negative logic). See Function Table. With active-HIGH inputs, C_{IN} cannot be left open; it must be held LOW when no "carry in" is intended. Interchanging inputs of equal weight does not affect the operation, thus C_{IN}, A_1, B_1, can arbitrarily be assigned to pins 10, 11, 13, etc.

TYPE	TYPICAL ADD TIMES (TWO 8-BIT WORDS)	TYPICAL SUPPLY CURRENT (TOTAL)
7483	23ns	66mA
74LS83A	25ns	19mA

Comparators

4-Bit Magnitude Comparator
Product Specification

Logic Products

FEATURES
- **Magnitude comparison of any binary words**
- **Serial or parallel expansion without extra gating**
- **Use 74S85 for very high speed comparisons**

DESCRIPTION
The '85 is a 4-bit magnitude comparator that can be expanded to almost any length. It compares two 4-bit binary, BCD, or other monotonic codes and presents the three possible magnitude results at the outputs. The 4-bit inputs are weighted ($A_0 - A_3$) and ($B_0 - B_3$), where A_3 and B_3 are the most significant bits.

The operation of the '85 is described in the Function Table, showing all possible logic conditions. The upper part of the table describes the normal operation under all conditions that will occur in a single device or in a series expansion scheme.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)

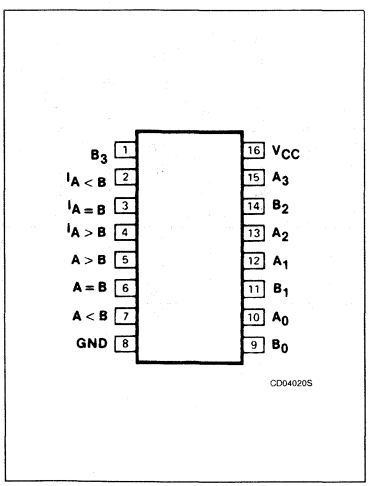
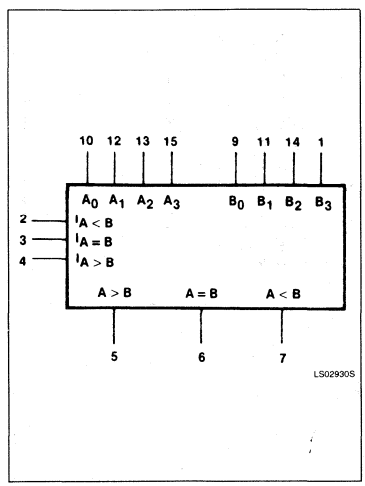
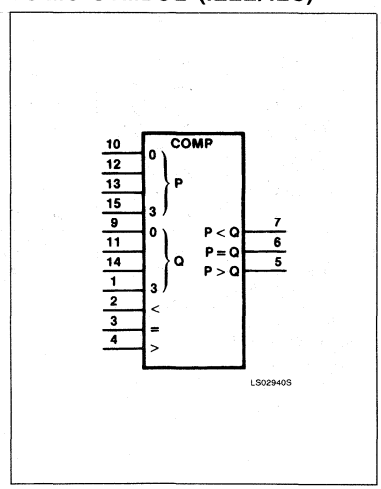
PIN CONFIGURATION



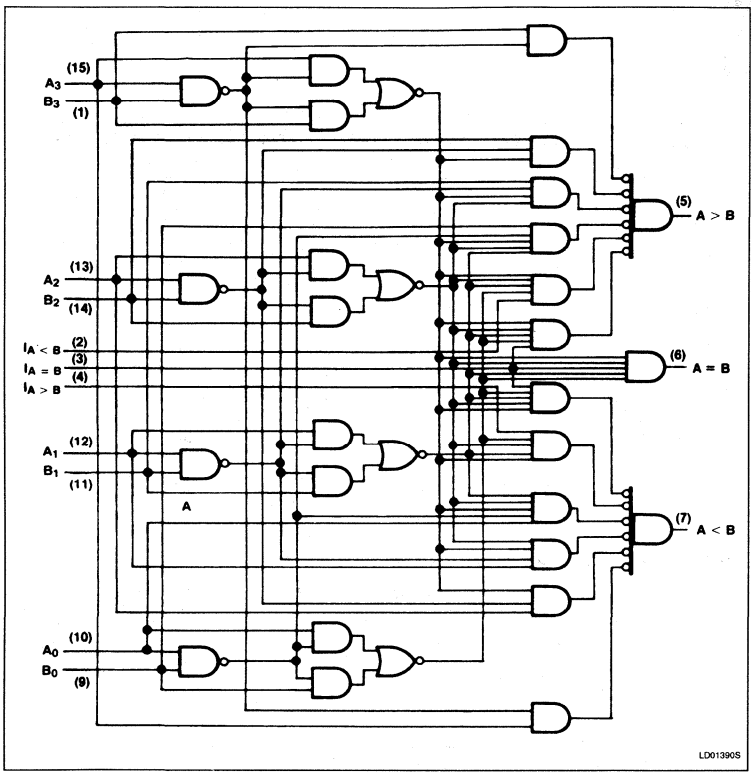
LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



LOGIC DIAGRAM



In the upper part of the table the three outputs are mutually exclusive. In the lower part of the table, the outputs reflect the feed-forward conditions that exist in the parallel expansion scheme.

The expansion inputs $I_{A>B}$, $I_{A=B}$, and $I_{A<B}$ are the least significant bit positions. When used for series expansion, the A > B, A = B and A < B outputs of the least significant word are connected to the corresponding $I_{A>B}$, $I_{A=B}$, and $I_{A<B}$ inputs of the next higher stage. Stages can be added in this manner to any length, but a propagation delay penalty of about 15ns is added with each additional stage. For proper operation the expansion inputs of the least significant word should be tied as follows: $I_{A>B}$ = LOW, $I_{A=B}$ = HIGH, and $I_{A<B}$ = LOW.

The parallel expansion scheme shown in Figure 1 demonstrates the most efficient general use of these comparators. In the parallel expansion scheme, the expansion inputs can be used as a fifth input bit position except on the least significant device which must be connected as in the serial scheme. The expansion inputs are used by labeling $I_{A>B}$ as an "A" input, $I_{A<B}$ as a "B" input and setting $I_{A=B}$ LOW. The '85 can be used as a 5-bit comparator only when the outputs are used to drive the ($A_0 - A_3$) and ($B_0 - B_3$) inputs of another '85 device. The parallel technique can be expanded to any number of bits as shown in Table 1.

7490, LS90
Counters

Decade Counter
Product Specification

Logic Products

DESCRIPTION

The '90 is a 4-bit, ripple-type Decade Counter. The device consists of four master-slave flip-flops internally connected to provide a divide-by-two section and a divide-by-five section. Each section has a separate Clock input to initiate state changes of the counter on the HIGH-to-LOW clock transition. State changes of the Q outputs do not occur simultaneously because of internal ripple delays. Therefore, decoded output signals are subject to decoding spikes and should not be used for clocks or strobes.

A gated AND asynchronous Master Reset ($MR_1 \cdot MR_2$) is provided which overrides both clocks and resets (clears) all the flip-flops. Also provided is a gated AND asynchronous Master Set ($MS_1 \cdot MS_2$) which overrides the clocks and the MR inputs, setting the outputs to nine (HLLH).

Since the output from the divide-by-two section is not internally connected to the succeeding stages, the device may be operated in various counting modes. In a BCD (8421) counter the $\overline{CP}_1$ input must be externally connected to the Q_0 output. The $\overline{CP}_0$ input receives the incoming count producing a BCD count sequence. In a symmetrical Bi-quinary divide-by-ten counter the Q_3 output must be connected externally to the $\overline{CP}_0$ input. The input count is then applied to the CP_1 input and a divide-by-ten square wave is obtained at output Q_0. To operate as a divide-by-two and a divide-by-five counter no external interconnections are required. The first flip-flop is used as a binary element for the divide-by-two function ($\overline{CP}_0$ as the input and Q_0 as the output). The $\overline{CP}_1$ input is used to obtain a divide-by-five operation at the Q_3 output.

Signetics

7491A
Register

8-Bit Shift Register
Product Specification

Logic Products

FEATURES

- **8-bit serial-in-serial-out shift register**
- **Common buffered clock**
- **2-input gate for serial data entry**
- **True and Complement outputs**

DESCRIPTION

The '91A is an 8-bit serial-in-serial-out shift register. The serial data is entered through a 2-input AND gate (D_{Sa} and D_{Sb}). HIGH data is entered when both D_{Sa} and D_{Sb} are HIGH. LOW data is entered when either Serial Data input is LOW. The Data inputs are edge-triggered and must be stable just one set-up time prior to the LOW-to-HIGH transition of the Clock input (CP) for predictable operation. The data is shifted one bit to the right ($Q_0 \rightarrow Q_2 \cdots \rightarrow Q_7$) synchronous with each LOW-to-HIGH clock transition. The '91A has no reset capacity, so initialization requires the shifting in of at least 8 bits of known data.

Once the register is fully loaded, the Q output follows the Serial inputs delayed by eight clock pulses. The Complement ($\overline{Q}$) output from the last stage is also available for simpler decoding applications.

Signetics

7492, LS92
Counters

Divide-By-Twelve Counter
Product Specification

Logic Products

DESCRIPTION

The '92 is a 4-bit, ripple-type Divide-by-12 Counter. The device consists of four master-slave flip-flops internally connected to provide a divide-by-two section and a divide-by-six section. Each section has a separate Clock input to initiate state changes of the counter on the HIGH-to-LOW clock transition. State changes of the Q outputs do not occur simultaneously because of internal ripple delays. Therefore, decoded output signals are subject to decoding spikes and should not be used for clocks or strobes.

A gated AND asynchronous Master Reset ($MR_1 \cdot MR_2$) is provided which overrides both clocks and resets (clears) all the flip-flops.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT
7492	28MHz	28mA
74LS92	42MHz	9mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N7492N, N74LS92N

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

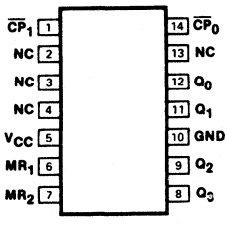
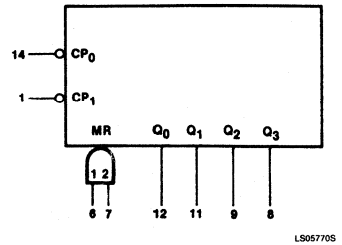
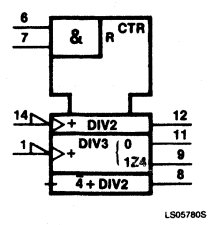
PIN CONFIGURATION



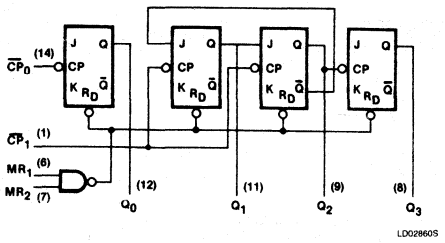
LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



LOGIC DIAGRAM



( ) = Pin numbers
V_{CC} = Pin 5
GND = Pin 10

Since the output from the divide-by-two section is not internally connected to the succeeding stages, the device may be operated in various counting modes. In a Modulo-12, Divide-by-12 Counter the $\overline{CP}_1$ input must be externally connected to the Q_0 output. The $\overline{CP}_0$ input receives the incoming count and Q_3 produces a symmetrical divide-by-12 square wave output. In a divide-by-six counter no external connections are required. The first flip-flop is used as a binary element for the divide-by-two function. The $\overline{CP}_1$ input is used to obtain divide-by-three operation at the Q_1 and Q_2 outputs and divide-by-six operation at the Q_3 output.

The input count pulses are applied to input $\overline{CP}_0$. Simultaneous divisions of 2, 4, 8 and 16 are performed at the Q_0, Q_1, Q_2 and Q_3 outputs as shown in the Function Table.

As a 3-bit ripple counter the input count pulses are applied to input $\overline{CP}_1$. Simultaneous frequency divisions of 2, 4 and 8 are available at the Q_1, Q_2 and Q_3 outputs. Independent use of the first flip-flop is available if the reset function coincides with reset of the 3-bit ripple-through counter.

- **Buffered positive edge-triggered clock**

DESCRIPTION

The '94 is a 4-bit shift register with serial and parallel (ones transfer) data entry. To facilitate parallel ones transfer from two sources, two Parallel Load inputs (PL_0 and PL_1) with associated Parallel Data inputs ($D_{0a} - D_{0d}$ and $D_{1a} - D_{1d}$) are provided. To accommodate these extra inputs only the output of the last stage is available. The asynchronous Master Reset (MR) is active HIGH. When MR is HIGH, it overrides the clock and clears the register, forcing Q_d LOW.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT
7494	25ns	35mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N7494N

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

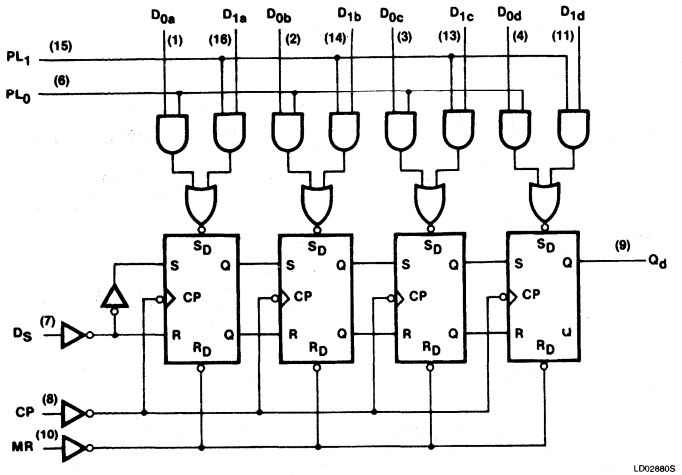
LOGIC DIAGRAM



( ) = Pin number
V_{CC} = Pin 5
GND = Pin 12

Four flip-flops are connected so that shifting is synchronous; they change state when the clock goes from LOW-to-HIGH. Data is accepted at the serial D_S input prior to this clock transition. Two Parallel Load inputs and Parallel Data inputs allow an asynchronous ones transfer from two sources. The flip-flops can be set independently to the HIGH state when the appropriate Parallel input is activated. Parallel inputs D_{0a} through D_{0d} are activated during the time the PL_0 is HIGH and Parallel inputs D_{1a} through D_{1d} are activated when PL_1 is HIGH. If both sets of inputs are activated, a HIGH on either input will set the flip-flops to a HIGH. The register should not be clocked while the Parallel Load inputs are activated. The Parallel Load and Parallel Data inputs will override the MR if both are activated simultaneously. However, for predictable operation, both signals should not be deactivated simultaneously.

FUNCTION TABLE

OPERATING MODE	INPUTS							OUTPUTS			
	PL_0	PL_1	D_{0n}	D_{1n}	MR	CP	D_S	Q_a	Q_b	Q_c	Q_d
Parallel load	H	L	L	X	X	X	X	Q_a	Q_b	Q_c	Q_d
	H	L	H	X	X	X	X	H	H	H	H
	L	H	X	L	X	X	X	Q_a	Q_b	Q_c	Q_d
	L	H	X	H	X	X	X	H	H	H	H
Reset (clear)	L	L	X	X	H	X	X	L	L	L	L
Shift right	L	L	X	X	L	↑	l	L	q_a	q_b	q_c
	L	L	X	X	L	↑	h	H	q_a	q_b	q_c

H = HIGH voltage level.
h = HIGH voltage level one set-up time prior to the LOW-to-HIGH clock transition.
L = LOW voltage level.
l = LOW voltage level one set-up time prior to the LOW-to-HIGH clock transition.
q_n = Lower case letters indicate the state of the referenced output one set-up time prior to the LOW-to-HIGH clock transition.
X = Don't care.
↑ = LOW-to-HIGH clock transition.

ABSOLUTE MAXIMUM RATINGS (Over operating free-air temperature range unless otherwise noted.)

Shift Registers

4-Bit Shift Register
Product Specification

Logic Products

FEATURES
- **Separate negative-edge-triggered shift and parallel load clocks**
- **Common mode control input**
- **Shift right serial input**
- **Synchronous shift or load capabilities**

DESCRIPTION
The '95 is a 4-Bit Shift Register with serial and parallel synchronous operating modes. It has serial Data (D_S) and four parallel Data ($D_0 - D_3$) inputs and four Parallel outputs ($Q_0 - Q_3$). The serial or parallel mode of operation is controlled by a Mode Select input (S) and two Clock inputs ($\overline{CP}_1$ and $\overline{CP}_2$). The serial (shift right) or parallel data transfers occur synchronously with the HIGH-to-LOW transition of the selected Clock input.

When the Mode Select input (S) is HIGH, $\overline{CP}_2$ is enabled. A HIGH-to-LOW transition on enabled $\overline{CP}_2$ loads parallel data from the $D_0 - D_3$ inputs into the register. When S is LOW, CP_1 is enabled. A HIGH-to-LOW transition on enabled $\overline{CP}_1$ shifts the data from Serial input D_S to Q_0 and transfers the data in Q_0 to Q_1, Q_1 to Q_2, and Q_2 to Q_3 respectively (shift right). Shift left is accomplished by externally connecting Q_3 to D_2, Q_2 to D_1, Q_1 to D_0, and operating the '95 in the parallel mode (S = HIGH).

In normal operations the Mode Select (S) should change states only when both Clock inputs are LOW. However, changing S from HIGH-to-LOW while $\overline{CP}_2$ is LOW, or changing S from LOW-to-HIGH while $\overline{CP}_1$ is LOW will not cause any changes on the register outputs.

Shift Registers

5-Bit Shift Register
Product Specification

Logic Products

FEATURES
- **5-bit parallel-to-serial or serial-to-parallel converter**
- **Asynchronous ones transfer preset entry**
- **Buffered positive-triggered clock**
- **Buffered active LOW Clear (Master Reset)**

DESCRIPTION
The '96 is a 5-bit shift register with both serial and parallel (ones transfer) data entry. Since the '96 has the output of each stage available as well as a D-type serial input and ones transfer inputs on each stage, it can be used in 5-bit serial-to-parallel, serial-to-serial and some parallel-to-serial data operations.

The '96 is five master/slave flip-flops connected to perform right shift. The flip-flops change state on the LOW-to-HIGH transition of the clock. The Serial (S) input is edge-triggered and must be stable only one set-up time before the LOW-to-HIGH clock transition.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)

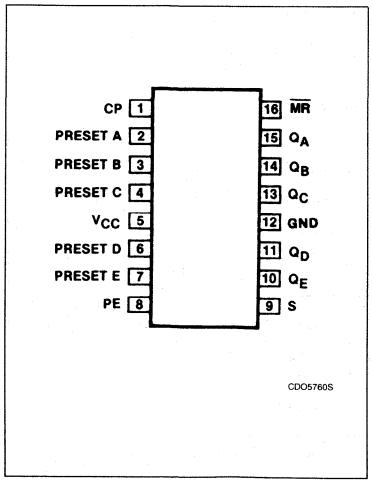
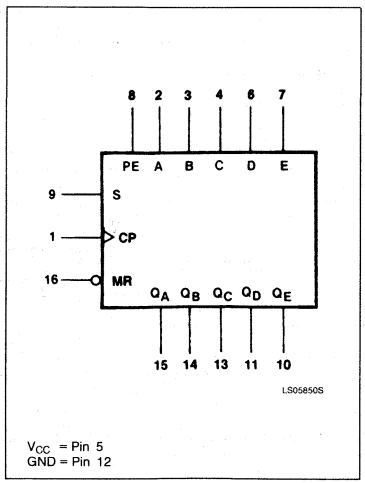
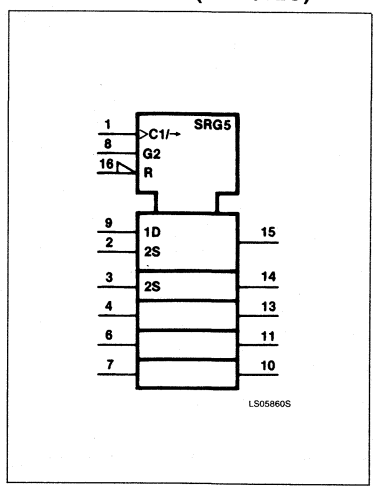
PIN CONFIGURATION



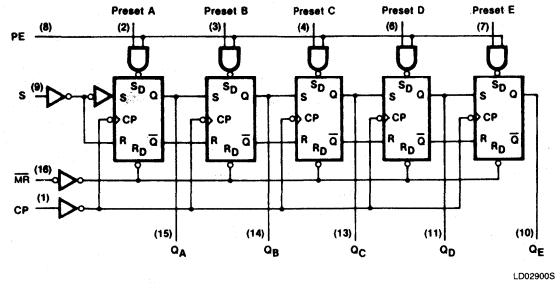
LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



LOGIC DIAGRAM



( ) = Pin number
V_{CC} = Pin 5
GND = Pin 12

Each flip-flop has asynchronous set inputs, allowing them to be independently set HIGH. The set inputs are controlled by a common active HIGH Preset Enable (PE) input. The PE input is not buffered, and care must be taken not to overload the driving element. When the PE is HIGH, a HIGH on the Preset (A – E) inputs will set the associated flip-flops HIGH. A LOW on the A – E inputs will cause "no change" in the appropriate flip-flops.

The asynchronous active LOW Clear ($\overline{MR}$) is buffered. When LOW, the $\overline{MR}$ overrides the clock and clears the register if the PE is not active. The Preset inputs override the $\overline{MR}$, forcing the flip-flops HIGH if both are activated simultaneously. However, for predictable operation, both signals should not be deactivated simultaneously.

FUNCTION TABLE

INPUTS								OUTPUTS				
Master Reset	Preset Enable	Preset					Clock	Serial	Q_A	Q_B	Q_C	Q_D	Q_E
		A	B	C	D	E

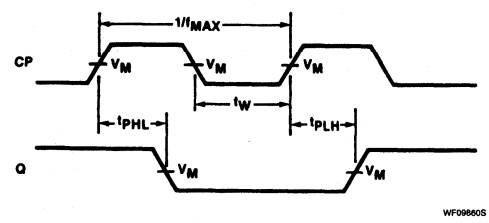
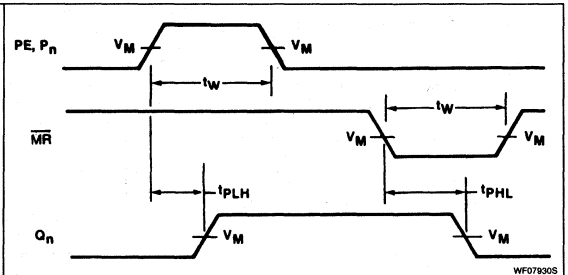
t_h	Hold time, S to CP	Waveform 3	0		0		ns

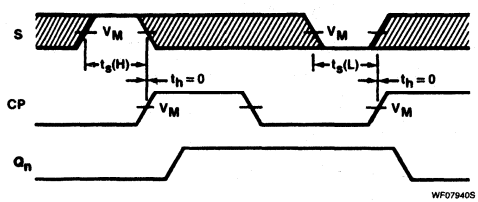
AC WAVEFORMS



Waveform 1. Clock To Output Delays And Clock Pulse Width



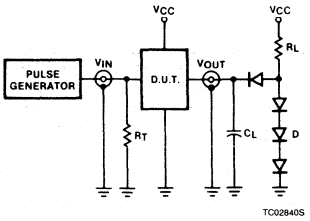
Waveform 2. Parallel Load And Parallel Data To Output Delays And Master Reset To Output Delay

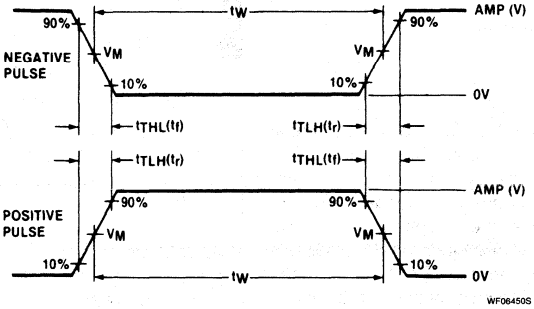


For all waveforms, $V_M = 1.5V$ for 74 and 74S; $V_M = 1.3V$ for 74LS.
The shaded areas indicate when the input is permitted to change for predictable output performance.
The number of Clock Pulses required between the t_{PLH} and t_{PHL} measurements can be determined from the appropriate Truth Table.

Waveform 3. Data Set-up And Hold Time

TEST CIRCUITS AND WAVEFORMS





V_M = 1.3V for 74LS; V_M = 1.5V for all other TTL families.

Signetics

74107, LS107
Flip-Flops

Dual J-K Flip-Flop
Product Specification

Logic Products

DESCRIPTION

The '107 is a dual flip-flop with individual J, K, Clock and direct Reset inputs. The 74107 is a positive pulse-triggered flip-flop. JK information is loaded into the master while the Clock is HIGH and transferred to the slave on the HIGH-to-LOW Clock transition. For these devices the J and K inputs should be stable while the Clock is HIGH for conventional operation.

The 74LS107 is a negative edge-triggered flip-flop. The J and K inputs must be stable one set-up time prior to the HIGH-to-LOW Clock transition for predictable operation.

The Reset ($\overline{R}_D$) is an asynchronous active LOW input. When LOW, it overrides the Clock and Data inputs, forcing the Q output LOW and the $\overline{Q}$ output HIGH.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)
74107	20MHz	20mA
74LS107	45MHz	4mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N74107N, N74LS107N
Plastic SO	N74LS107D

NOTE:

74109, LS109A
Flip-Flops

Dual J-$\overline{K}$ Positive Edge-Triggered Flip-Flop
Product Specification

Logic Products

DESCRIPTION

The '109 is dual positive edge-triggered J$\overline{K}$-type flip-flop featuring individual J, $\overline{K}$, Clock, Set and Reset inputs; also complementary Q and $\overline{Q}$ outputs.

Set ($\overline{S}_D$) and Reset ($\overline{R}_D$) are asynchronous active LOW inputs and operate independently of the Clock input.

The J and $\overline{K}$ are edge-triggered inputs which control the state changes of the flip-flops as described in the Mode Select-Truth Table.

The J and $\overline{K}$ inputs must be stable just one set-up time prior to the LOW-to-HIGH transition of the Clock for predictable operation. The J$\overline{K}$ design allows operation as a D flip-flop by tying the J and $\overline{K}$ inputs together.

Although the Clock input is level sensitive, the positive transition of the Clock pulse between the 0.8V and 2.0V levels should be equal to or less than the Clock to output delay time for reliable operation.

74LS112, S112
Flip-Flops

Dual J-K Edge-Triggered Flip-Flop
Product Specification

Logic Products

DESCRIPTION

The '112 is a dual J-K negative edge-triggered flip-flop featuring individual J, K, Clock, Set and Reset inputs. The Set ($\overline{S}_D$) and Reset ($\overline{R}_D$) inputs, when LOW, set or reset the outputs as shown in the Function Table regardless of the levels at the other inputs.

A HIGH level on the Clock ($\overline{CP}$) input enables the J and K inputs and data will be accepted. The logic levels at the J and K inputs may be allowed to change while the $\overline{CP}$ is HIGH and the flip-flop will perform according to the Function Table as long as minimum setup and hold times are observed. Output state changes are initiated by the HIGH-to-LOW transition of $\overline{CP}$.

74LS113, S113
Flip-Flops

Dual J-K Edge-Triggered Flip-Flop
Product Specification

Logic Products

DESCRIPTION

The '113 is a dual J-K negative edge-triggered flip-flop featuring individual J, K, Set and Clock inputs. The asynchronous Set ($\overline{S}_D$) input, when LOW, forces the outputs to the steady state levels as shown in the Function Table regardless of the levels at the other inputs.

A HIGH level on the Clock ($\overline{CP}$) input enables the J and K inputs and data will be accepted. The logic levels at the J and K inputs may be allowed to change while the $\overline{CP}$ is HIGH and the flip-flop will perform according to the Function Table as long as minimum set-up and hold times are observed. Output state changes are initiated by the HIGH-to-LOW transition of $\overline{CP}$.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)

Signetics

74116
Latch

Dual 4-Bit Transparent Latch
Product Specification

Logic Products

DESCRIPTION

The '116 has two independent 4-bit transparent latches. Each 4-bit latch is controlled by a two-input active LOW Enable gate ($\overline{E}_0$ and $\overline{E}_1$). When both $\overline{E}_0$ and $\overline{E}_1$ are LOW, the data enters the latch and appears at the output. The outputs follow the Data inputs as long as $\overline{E}_0$ and $\overline{E}_1$ are LOW. The data on the D inputs one set-up time before the LOW-to-HIGH transition of $\overline{E}_0$ or $\overline{E}_1$ will be stored in the latch. The Latched outputs remain stable as long as either $\overline{E}_0$ or $\overline{E}_1$ is HIGH.

Each 4-bit latch has an active LOW asynchronous Master Reset ($\overline{MR}$) input. When LOW, the $\overline{MR}$ input overrides the Data and Enable inputs and sets the four Latch outputs LOW.

74121
Multivibrator

Monostable Multivibrator
Product Specification

Logic Products

FEATURES

- **Very good pulse width stability**
- **Virtually immune to temperature and voltage variations**
- **Schmitt trigger input for slow input transitions**
- **Internal timing resistor provided**

DESCRIPTION

These multivibrators feature dual active LOW going edge inputs and a single active HIGH going edge input which can be used as an active HIGH enable input. Complementary output pulses are provided.

Pulse triggering occurs at a particular voltage level and is not directly related to the transition time of the input pulse. Schmitt-trigger input circuitry (TTL hysteresis) for the B input allows jitter-free triggering from inputs with transition rates as slow as 1 volt/second, providing the circuit with an excellent noise immunity of typically 1.2 volts. A high immunity to V_{CC} noise of typically 1.5 volts is also provided by internal latching circuitry. Once fired, the outputs are independent of further transitions of the inputs and are a function only of the timing components. Input pulses may be of any duration relative to the output pulse. Output pulse length may be varied from 20 nanoseconds to 28 seconds by choosing appropriate timing components. With no external timing components (i.e., R_{int} connected to V_{CC}, C_{ext} and R_{ext}/C_{ext} open), an output pulse of typically 30 or 35 nanoseconds is achieved which may be used as a dc triggered reset signal. Output rise and fall times are TTL compatible and independent of pulse length.

Pulse width stability is achieved through internal compensation and is virtually independent of V_{CC} and temperature. In most applications, pulse stability will only be limited by the accuracy of external timing components.

Jitter-free operation is maintained over the full temperature and V_{CC} ranges for more than six decades of timing capacitance (10pF to 10μF) and more than one decade of timing resistance (2kΩ to 30kΩ for the 54121 and 2KΩ to 40kΩ for the 74121). Throughout these ranges, pulse width is defined by the relationship: (see Figure 1)

$$t_{W(out)} = C_{ext}\ R_{ext}\ \ln 2$$

$$t_{W(out)} \cong 0.7\ C_{ext}\ R_{ext}$$

Signetics

74123
Multivibrator

Dual Retriggerable Monostable Multivibrator
Product Specification

Logic Products

FEATURES

- **DC triggered from active HIGH or active LOW inputs**
- **Retriggerable for very long pulses — up to 100% duty cycle**
- **Direct reset terminates output pulse**
- **Compensated for V_{CC} and temperature variations**

DESCRIPTION

The '123 is a dual retriggerable monostable multivibrator with output pulse width control by three methods. The basic pulse time is programmed by selection of external resistance (R_{ext}) and capacitance (C_{ext}) values. Once triggered, the basic pulse width may be extended by retriggering the gated active LOW going edge input ($\overline{A}$) or the active HIGH going edge input (B), or be reduced by use of the overriding active LOW reset.

The basic output pulse width is essentially determined by the values of external capacitance and timing resistance.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74123	24ns	46mA

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N74123N
Plastic SO	N74123D

For pulse widths when $C_{ext} \leqslant 1000pF$, see Figure A.

When $C_{ext} > 1000pF$, the output pulse width is defined as:

$$t_W = 0.28\ R_{ext} \cdot C_{ext}\ (1 + \frac{0.7}{R_{ext}})$$

The external resistance and capacitance are normally connected as shown in Figure B. If an electrolytic capacitor is to be used with an inverse voltage rating of less than 1V then Figure C should be used. (Inverse voltage rating of an electrolytic is normally specified at 5% of the forward voltage rating.) If the inverse voltage rating is 1V or more (this includes a 100% safety margin) then Figure B can be used. Note that if Figure C is used the timing equations change as follows:

$$t_W \cong 0.25\ R_{ext} \cdot C_{ext}\ (1 + \frac{0.7}{R_{ext}})$$

Signetics

74132, LS132
Schmitt Triggers

Quad 2-Input NAND Schmitt Trigger
Product Specification

Logic Products

The '132 contains four 2-input NAND gates which accept standard TTL input signals and provide standard TTL output levels. They are capable of transforming slowly changing input signals into sharply defined, jitter-free output signals. In addition, they have greater noise margin than conventional NAND gates.

Each circuit contains a 2-input Schmitt trigger followed by a Darlington level shifter and a phase splitter driving a TTL totem-pole output. The Schmitt trigger uses positive feedback to effectively speed-up slow input transition, and provide different input threshold voltages for positive and negative-going transitions. This hysteresis between the positive-going and negative-going input threshold (typically 800mW) is determined internally by resistor ratios and is essentially insensitive to temperature and supply voltage variations. As long as one input remains at a more positive voltage than V_{T+MAX}, the gate will respond to the transitions of the other input as shown in Waveform 1.

Signetics

74LS138, S138
Decoders/Demultiplexers

1-Of-8 Decoder/Demultiplexer
Product Specification

Logic Products

FEATURES

- **Demultiplexing capability**
- **Multiple input enable for easy expansion**
- **Ideal for memory chip select decoding**
- **Direct replacement for Intel 3205**

DESCRIPTION

The '138 decoder accepts three binary weighted inputs (A_0, A_1, A_2) and when enabled, provides eight mutually exclusive, active LOW outputs ($\overline{0} - \overline{7}$). The device features three Enable Inputs: two active LOW ($\overline{E}_1$, $\overline{E}_2$) and one active HIGH (E_3). Every output will be HIGH unless $\overline{E}_1$ and $\overline{E}_2$ are LOW and E_3 is HIGH. This multiple enable function allows easy parallel expansion of the device to a 1-of-32 (5 lines to 32 lines) decoder with just four '138s and one inverter.

The device can be used as an eight output demultiplexer by using one of the active LOW Enable inputs as the Data input and the remaining Enable inputs as strobes. Enable inputs not used must be permanently tied to their appropriate active HIGH or active LOW state.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)

74LS139, S139
Decoders/Demultiplexers

Dual 1-of-4 Decoder/Demultiplexer
Product Specification

Logic Products

FEATURES

- **Demultiplexing capability**
- **Two independent 1-of-4 decoders**
- **Multifunction capability**
- **Replaces 9321 and 93L21 for higher performance**

DESCRIPTION

The '139 is a high-speed, dual 1-of-4 decoder/demultiplexer. This device has two independent decoders, each accepting two binary weighted inputs (A_0, A_1) and providing four mutually exclusive active LOW outputs ($\overline{0} - \overline{3}$). Each decoder has an active LOW Enable ($\overline{E}$). When $\overline{E}$ is HIGH, every output is forced HIGH. The Enable can be used as the Data input for a 1-of-4 demultiplexer application.

Decoder/Driver

BCD-To-Decimal Decoder/Driver (Open Collector)
Product Specification

Logic Products

FEATURES

- **80mA output drive capability**
- **15V output breakdown voltage**
- **See '45 for 30V output voltage**
- **See '42 for standard TTL outputs**

DESCRIPTION

The '145 is a 1-of-10 decoder with Open Collector outputs. This decoder accepts BCD inputs on the A_0 to A_3 address lines and generates 10 mutually exclusive active LOW outputs. When an input code greater than "9" is applied, all outputs are HIGH. This device can therefore be used as a 1-of-8 decoder with A_3 used as an active LOW enable.

The '145 features an output breakdown voltage of 15V. This device is ideal as a lamp or solenoid driver.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)

74147
Encoder

10-Line-To-4-Line Priority Encoder
Product Specification

Logic Products

FEATURES

- **Encodes 10-line decimal to 4-line BCD**
- **Useful for 10-position switch encoding**
- **Used in code converters and generators**

DESCRIPTION

The '147 9-input priority encoder accepts data from nine active-LOW inputs ($\bar{I}_1 - \bar{I}_9$) and provides a binary representation on the four active-LOW outputs ($A_0 - A_3$). A priority is assigned to each input so that when two or more inputs are simultaneously active, the input with the highest priority is represented on the output, with input line $\bar{I}_9$ having the highest priority.

The device provides the 10-line-to-4-line priority encoding function by use of the implied decimal "zero." The "zero" is encoded when all nine data inputs are HIGH, forcing all four outputs HIGH.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74147	10ns	46mA

ORDERING CODE

Signetics

74148
Encoder

8-Input Priority Encoder
Product Specification

Logic Products

FEATURES

- **Code conversions**
- **Multi-channel D/A converter**
- **Decimal-to-BCD converter**
- **Cascading for priority encoding of "N" bits**
- **Input Enable capability**
- **Priority encoding — automatic selection of highest priority input line**
- **Output Enable — active LOW when all inputs HIGH**
- **Group Signal output — active when any input is LOW**

DESCRIPTION

The '148 8-input priority encoder accepts data from eight active-LOW inputs and provides a binary representation on the three active-LOW outputs. A priority is assigned to each input so that when two or more inputs are simultaneously active, the input with the highest priority is represented on the output, with input line $\bar{I}_7$ having the highest priority.

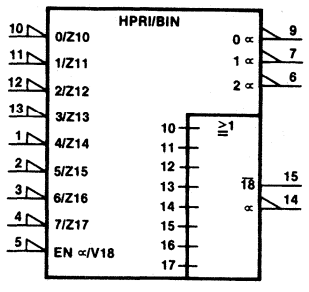
LOGIC SYMBOL (IEEE/IEC)



LS03850S

Encoder 74148

A HIGH on the Enable Input ($\overline{EI}$) will force all outputs to the inactive (HIGH) state and allow new data to settle without producing erroneous information at the outputs.

A Group Signal ($\overline{GS}$) output and an Enable Output ($\overline{EO}$) are provided with the three data outputs. The $\overline{GS}$ is active-LOW when any input is LOW; this indicates when any input is active. The $\overline{EO}$ is active-LOW when all inputs are HIGH. Using the Enable Output along with the Enable Input allows priority encoding of N input signals. Both $\overline{EO}$ and $\overline{GS}$ are active-HIGH when the Enable input is HIGH.

Multiplexer

16-Input Multiplexer
Product Specification

Logic Products

FEATURES

- **Select data from 16 sources**
- **Demultiplexing capability**
- **Active-LOW enable or strobe**
- **Inverting data output**

DESCRIPTION

The '150 is a logical implementation of a single-pole, 16-position switch with the switch position controlled by the state of four Select inputs. S_0, S_1, S_2, S_3. The Multiplexer output ($\overline{Y}$) inverts the selected data. The Enable input ($\overline{E}$) is active-LOW. When $\overline{E}$ is HIGH the $\overline{Y}$ output is HIGH regardless of all other inputs. In one package the '150 provides the ability to select from 16 sources of data or control information.

8-Input Multiplexer
Product Specification

Logic Products

FEATURES
- **Multifunction capability**
- **Complementary outputs**
- **See '251 for 3-state version**

DESCRIPTION
The '151 is a logical implementation of a single-pole, 8-position switch with the switch position controlled by the state of three Select inputs, S_0, S_1, S_2. True (Y) and Complement ($\overline{Y}$) outputs are both provided. The Enable input ($\overline{E}$) is active LOW. When $\overline{E}$ is HIGH, the $\overline{Y}$ output is HIGH and the Y output is LOW, regardless of all other inputs. The logic function provided at the output is:

$$Y = \overline{E} \bullet (I_0 \bullet \overline{S}_0 \bullet \overline{S}_1 \bullet \overline{S}_2 + I_1 \bullet S_0 \bullet \overline{S}_1 \bullet \overline{S}_2 + I_2 \bullet \overline{S}_0 \bullet S_1 \bullet \overline{S}_2 + I_3 \bullet S_0 \bullet S_1 \bullet \overline{S}_2 + I_4 \bullet \overline{S}_0 \bullet \overline{S}_1 \bullet S_2 + I_5 \bullet S_0 \bullet \overline{S}_1 \bullet S_2 + I_6 \bullet \overline{S}_0 \bullet S_1 \bullet S_2 + I_7 \bullet S_0 \bullet S_1 \bullet S_2$$

In one package the '151 provides the ability to select from eight sources of data or control information. The device can provide any logic function of four variables and its negation with correct manipulation.

TYPE	TYPICAL PROPAGATION DELAY (ENABLE TO $\overline{Y}$)	TYPICAL SUPPLY CURRENT (TOTAL)
74151	18ns	29mA
74LS151	12ns	6mA
74S151	9ns	45mA

74153, LS153, S153
Multiplexers

Dual 4-Line To 1-Line Multiplexer
Product Specification

Logic Products

FEATURES
- **Non-inverting outputs**
- **Separate enable for each section**
- **Common select inputs**
- **See '253 for 3-state version**

DESCRIPTION
The '153 is a dual 4-input multiplexer that can select 2 bits of data from up to eight (8) sources under control of the common Select inputs (S_0, S_1). The two 4-input multiplexer circuits have individual active LOW Enables ($\overline{E}_a$, $\overline{E}_b$) which can be used to strobe the outputs independently. Outputs (Y_a, Y_b) are forced LOW when the corresponding Enables ($\overline{E}_a$, $\overline{E}_b$) are HIGH.

$Y_a = \overline{E}_a \bullet (I_{0a} \bullet \overline{S}_1 \bullet \overline{S}_0 + I_{1a} \bullet \overline{S}_1 \bullet S_0 + I_{2a} \bullet S_1 \bullet \overline{S}_0 + I_{3a} \bullet S_1 \bullet S_2)$

$Y_b = \overline{E}_b \bullet (I_{0b} \bullet \overline{S}_1 \bullet \overline{S}_0 + I_{1b} \bullet \overline{S}_1 \bullet S_0 + I_{2b} \bullet S_1 \bullet \overline{S}_0 + I_{3b} \bullet S_1 \bullet S_2)$

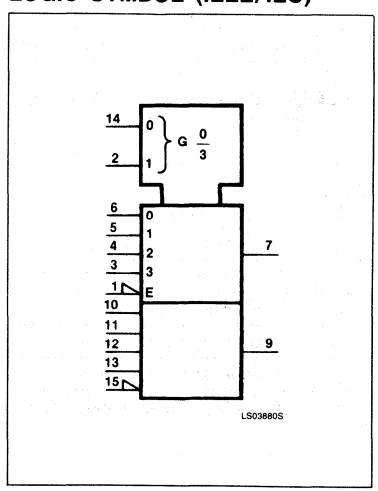
LOGIC SYMBOL (IEEE/IEC)



Multiplexers

74153, LS153, S153

The '153 can be used to move data to a common output bus from a group of registers. The state of the Select inputs would determine the particular register from which the data came. An alternative application is as a function generator. The device can generate two functions or three variables. This is useful for implementing highly irregular random logic.

74154, LS154
Decoder/Demultiplexers

1-of-16 Decoder/Demultiplexer
Product Specification

Logic Products

FEATURES
- **16-line demultiplexing capability**
- **Mutually exclusive outputs**
- **2-input enable gate for strobing or expansion**

DESCRIPTION
The '154 decoder accepts four active HIGH binary address inputs and provides 16 mutually exclusive active LOW outputs. The 2-input enable gate can be used to strobe the decoder to eliminate the normal decoding "glitches" on the outputs, or it can be used for expansion of the decoder. The enable gate has two AND'ed inputs which must be LOW to enable the outputs.

The '154 can be used as a 1-of-16 demultiplexer by using one of the enable inputs as the multiplexed data input. When the other enable is LOW, the addressed output will follow the state of the applied data.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74154	21ns	34mA
74LS154	15ns	9mA

Decoders/Demultiplexers

Dual 2-Line To 4-Line Decoder/Demultiplexer
Product Specification

Logic Products

FEATURES
- **Common Address Inputs**
- **True or complement data demultiplexing**
- **Dual 1-of-4 or 1-of-8 decoding**
- **Function generator applications**

DESCRIPTION
The '155 is a Dual 1-of-4 Decoder/Demultiplexer with common Address inputs and separate gated Enable inputs. Each decoder section, when enabled, will accept the binary weighted Address input (A_0, A_1) and provide four mutually exclusive active-LOW outputs ($\overline{0} - \overline{3}$). When the enable requirements of each decoder are not met, all outputs of that decoder are HIGH.

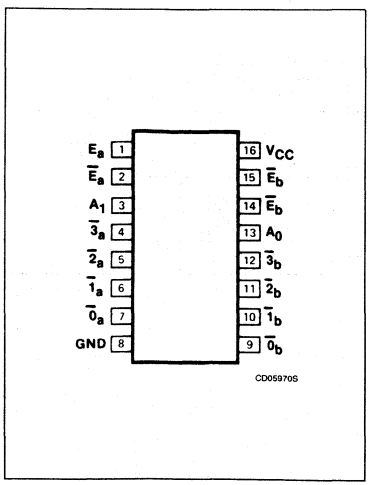
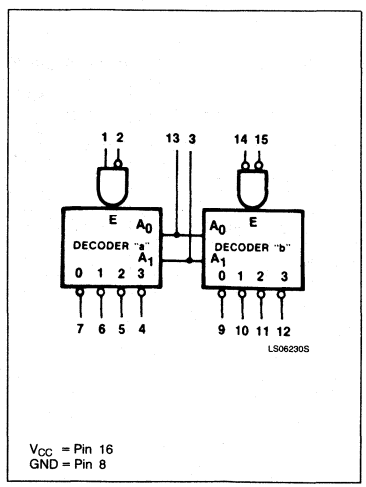
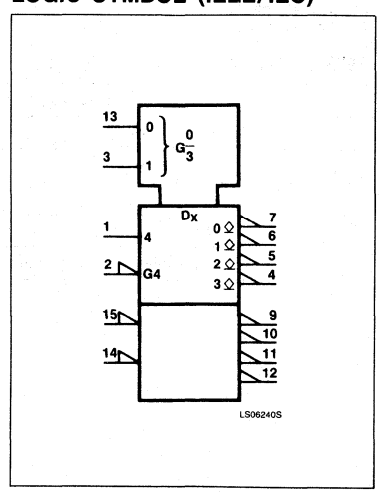
PIN CONFIGURATION



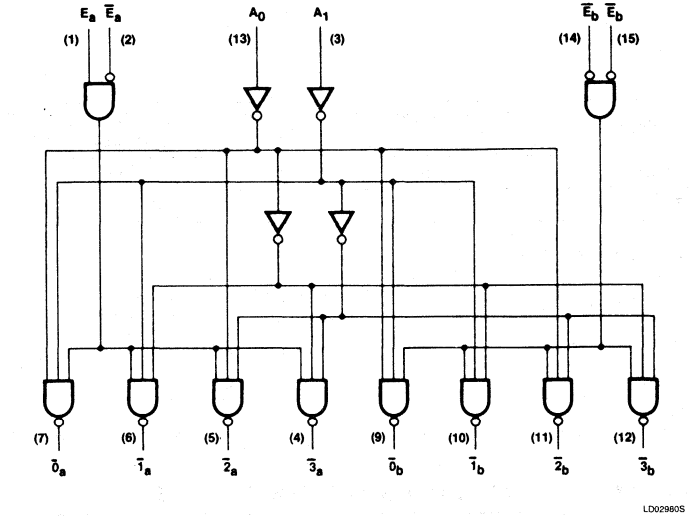
LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



LOGIC DIAGRAM



V_{CC} = Pin 16
GND = Pin 8

Both decoder sections have a 2-input enable gate. For decoder "a" the enable gate requires one active-HIGH input and one active-LOW input ($E_a \cdot \bar{E}_a$). Decoder "a" can accept either true or complemented data in demultiplexing applications, by using the $\bar{E}_a$ or E_a inputs respectively. The decoder "b" enable gate requires two active-LOW inputs ($\bar{E}_b \cdot \bar{E}_b$). The device can be used as a 1-of-8 decoder/demultiplexer by tying E_a to $\bar{E}_b$ and relabeling the common connection address as (A_2); forming the common enable by connecting the remaining $\bar{E}_b$ and $\bar{E}_a$.

The '156 can be used to generate all four minterms of two variables. The four minterms are useful to replace multiple gate functions in some applications. A further advantage of the '156 is being able to AND the minterm functions by tying outputs together. Any number of terms can be wired-AND as shown in the formula below:

$$f = (E + A_0 + A_1) \cdot (E + \bar{A}_0 + A_1) \cdot (E + A_0 + \bar{A}_1) \cdot (E + A_0 + A_1)$$

where $E = E_a + E_a$; $E = E_b + E_b$.

Product Specification

Logic Products

DESCRIPTION

The '157 is a quad 2-input multiplexer which selects four bits of data from two sources under the control of a common Select input (S). The Enable input ($\overline{E}$) is active LOW. When $\overline{E}$ is HIGH, all of the outputs (Y) are forced LOW regardless of all other input conditions.

Moving data from two groups of registers to four common output busses is a common use of the '157. The state of the Select input determines the particular register from which the data comes. It can also be used as a function generator. The device is useful for implementing highly irregular logic by generating any four of the 16 different functions of two variables with one variable common.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74157	13ns	30mA

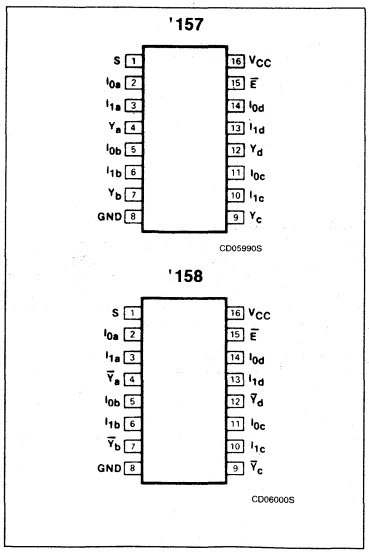
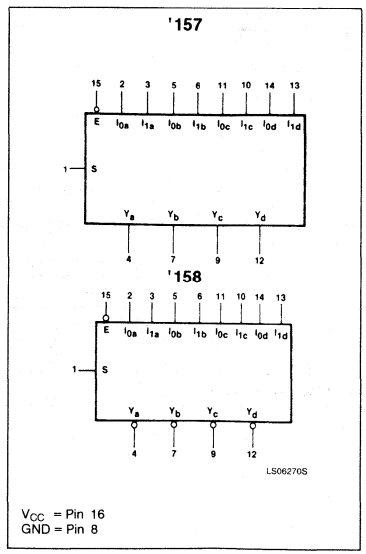
PIN CONFIGURATION

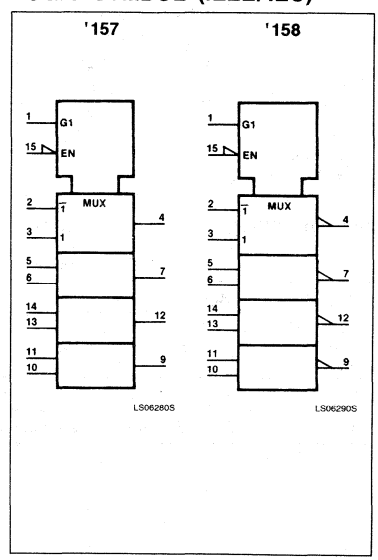


LOGIC SYMBOL

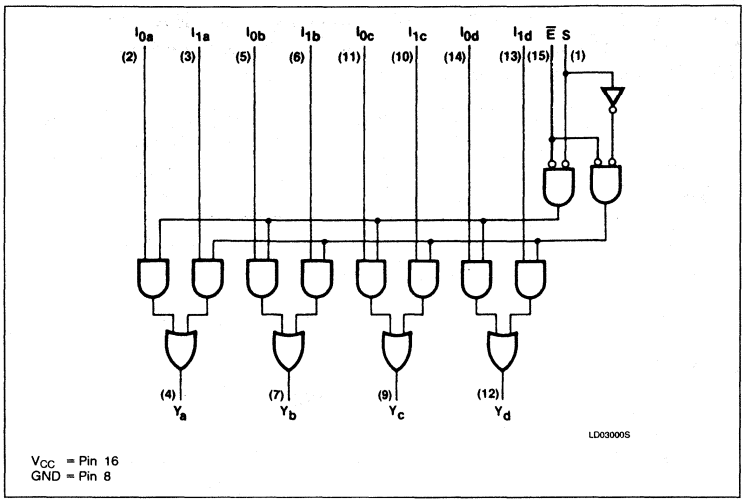


V_{CC} = Pin 16
GND = Pin 8

LOGIC SYMBOL (IEEE/IEC)

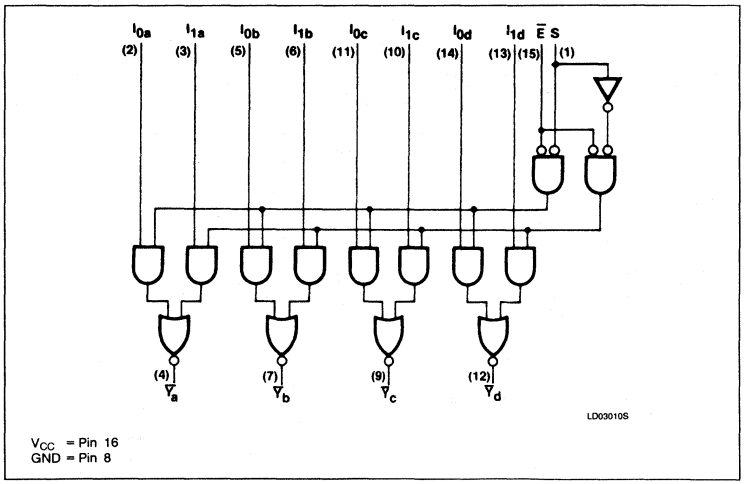


LOGIC DIAGRAM, '157



V_{CC} = Pin 16
GND = Pin 8

LOGIC DIAGRAM, '158



V_{CC} = Pin 16
GND = Pin 8

The device is the logic implementation of a 4-pole, 2-position switch where the position of the switch is determined by the logic levels supplied to the Select input. Logic equations for the outputs are shown below:

$Y_a = \overline{E} \cdot (I_{1a} \cdot S + I_{0a} \cdot \overline{S})$
$Y_b = \overline{E} \cdot (I_{1b} \cdot S + I_{0b} \cdot \overline{S})$
$Y_c = \overline{E} \cdot (I_{1c} \cdot S + I_{0c} \cdot \overline{S})$
$Y_d = \overline{E} \cdot (I_{1d} \cdot S + I_{0d} \cdot \overline{S})$

The '158 is similar but has inverting outputs:

$\overline{Y}_a = \overline{E} \cdot (I_{1a} \cdot S + I_{0a} \cdot \overline{S})$
$\overline{Y}_b = \overline{E} \cdot (I_{1b} \cdot S + I_{0b} \cdot \overline{S})$
$\overline{Y}_c = \overline{E} \cdot (I_{1c} \cdot S + I_{0c} \cdot \overline{S})$
$\overline{Y}_d = \overline{E} \cdot (I_{1d} \cdot S + I_{0d} \cdot \overline{S})$

DESCRIPTION

Synchronous presettable decade (74160, 74LS160A, 74LS162A) and 4-bit (74161, 74LS161A, 74163, 74LS163A) counters feature an internal carry look-ahead and can be used for high-speed counting. Synchronous operation is provided by having all flip-flops clocked simultaneously on the positive-going edge of the clock. The Clock input is buffered.

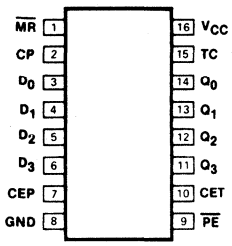
The outputs of the counters may be preset to HIGH or LOW level. A LOW level at the Parallel Enable ($\overline{PE}$) input disables the counting action and causes the data at the $D_0 - D_3$ inputs to be loaded into the counter on the positive-going edge of the clock (providing that the set-up and hold requirements for $\overline{PE}$ are met). Preset takes place regardless of the levels at Count Enable (CEP, CET) inputs.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

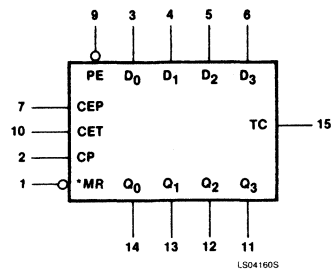
PINS	DESCRIPTION	74	74LS
CP, CET	Inputs	2ul	2LSul
D, CEP	Inputs	1ul	1LSul
$\overline{PE}$	Input	1ul	2LSul
All	Outputs	10ul	10LSul
$\overline{MR}$	Input ('160, '161)	1ul	1LSul
$\overline{MR}$	Input ('162, '163)	1ul	2LSul

NOTE:
Where a 74 unit load (ul) is understood to be 40μA I_{IH} and −1.6mA I_{IL}, and a 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

PIN CONFIGURATION



LOGIC SYMBOL



V_{CC} = Pin 16
GND = Pin 8

A LOW level at the Master Reset ($\overline{MR}$) input sets all four outputs of the flip-flops ($Q_0 - Q_3$) in '160, 'LS160A, '161, and 'LS161A to LOW levels regardless of the levels at CP, $\overline{PE}$, CET and CEP inputs (thus providing an asynchronous clear function).

For the 'LS162A, '163, and LS163A, the clear function is synchronous. A LOW level at the Master Reset ($\overline{MR}$) input sets all four outputs of the flip-flops ($Q_0 - Q_3$) to LOW levels after the next positive-going transition on the Clock (CP) input (providing that the set-up and hold requirements for $\overline{MR}$ are met). This action occurs regardless of the levels at $\overline{PE}$, CET, and CEP inputs. This synchronous reset feature enables the designer to modify the maximum count with only one external NAND gate (see Figure A).

The carry look-ahead simplifies serial cascading of the counters. Both Count Enable inputs (CEP and CET) must be HIGH to count. The CET input is fed forward to enable the TC output. The TC output thus enabled will produce a HIGH output pulse of a duration approximately equal to the HIGH level output of Q_0. This pulse can be used to enable the next cascaded stage (see Figure B).

For conventional operation of 74160, 74161 and 74163, the following transitions should be avoided.

1. HIGH-to-LOW transition on the CEP or CET input if clock is LOW.
2. LOW-to-HIGH transitions on the Parallel Enable input when CP is LOW, if the count enables and $\overline{MR}$ are HIGH at or before the transition.

For 74163 there is an additional transition to be avoided.

3. LOW-to-HIGH transition on the $\overline{MR}$ input when clock is LOW, if the Enable and $\overline{PE}$ inputs are HIGH at or before the transition.

These restrictions are not applicable to 74LS160A, 74LS161A, 74LS162A and 74LS163A.

			I_{CCL} All outputs LOW			63	101		19	32	mA

NOTES:

1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. I_{OS} is tested with V_{OUT} = +0.5V and V_{CC} = V_{CC} MAX+0.5V. Not more than one output should be shorted at a time and duration of the short circuit should not exceed one second.
4. I_{CCH} is measured with $\overline{PE}$ input HIGH, again with $\overline{PE}$ input LOW, all other inputs HIGH and outputs open. I_{CCL} is measured with Clock input HIGH, again with Clock input LOW, all other inputs low and outputs open.

AC ELECTRICAL CHARACTERISTICS $T_A = 25°C$, $V_{CC} = 5.0V$

Shift Registers

8-Bit Serial-In Parallel-Out Shift Register
Product Specification

Logic Products

FEATURES
- **Gated serial Data inputs**
- **Typical shift frequency of 36MHz**
- **Asynchronous Master Reset**
- **Fully buffered Clock and Data inputs**

DESCRIPTION
The '164 is an 8-bit edge-triggered shift register with serial data entry and an output from each of the eight stages. Data is entered serially through one of two inputs (D_{sa} or D_{sb}); either input can be used as an active HIGH enable for data entry through the other input. Both inputs must be connected together or an unused input must be tied HIGH.

Data shifts one place to the right on each LOW-to-HIGH transition of the Clock (CP) input, and enters into Q_0 the logical AND of the two Data inputs ($D_{sa} \cdot D_{sb}$) that existed one set-up time before the rising clock edge. A LOW level on the Master Reset ($\overline{MR}$) input overrides all other inputs and clears the register asynchronously, forcing all outputs LOW.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74
$\overline{PL}$	Input	2ul
Other	Inputs	1ul
All	Outputs	10ul

NOTE:
A 74 unit load (ul) is understood to be 40μA I_{IH} and −1.6mA I_{IL}.

DESCRIPTION

The '165 is an 8-bit parallel load or serial-in shift register with complementary Serial outputs (Q_7 and $\overline{Q}_7$) available from the last stage. When the Parallel Load ($\overline{PL}$) input is LOW, parallel data from the $D_0 - D_7$ inputs are loaded into the register asynchronously. When the $\overline{PL}$ input is HIGH, data enters the register serially at the D_S input and shifts one place to the right ($Q_0 \rightarrow Q_1 \rightarrow Q_2$, etc.) with each positive-going clock transition. This feature allows parallel-to-serial converter expansion by tying the Q_7 output to the D_S input of the succeeding stage.

The Clock input is a gated-OR structure which allows one input to be used as an active LOW Clock Enable ($\overline{CE}$) input. The pin assignment for the CP and $\overline{CE}$ inputs is arbitrary and can be reversed for layout convenience. The LOW-to-HIGH transition of $\overline{CE}$ input should only take place while the CP is HIGH for predictable operation. Also, the CP and $\overline{CE}$ inputs should be LOW before the LOW-to-HIGH transition of $\overline{PL}$ to prevent shifting the data when $\overline{PL}$ is released.

74166
Shift Register

8-Bit Serial/Parallel-In, Serial-Out Shift Register
Product Specification

Logic Products

FEATURES

- **Synchronous parallel to serial applications**
- **Synchronous serial data input for easy expansion**
- **Clock enable for "do nothing" mode**
- **Asynchronous Master Reset**
- **See '165 for asynchronous parallel data load**

DESCRIPTION

The '166 is an 8-bit shift register that has fully synchronous serial or parallel data entry selected by an active LOW Parallel Enable ($\overline{PE}$) input. When the $\overline{PE}$ is LOW one set-up time before the LOW-to-HIGH clock transition, parallel data is entered into the register. When $\overline{PE}$ is HIGH, data is entered into internal bit position Q_0 from Serial Data Input (D_S), and the remaining bits are shifted one place to the right ($Q_0 \rightarrow Q_1 \rightarrow Q_2$, etc.) with each positive-going clock transition. For expansion of the register in parallel to serial converters, the Q_7 output is connected to the D_S input of the succeeding stage.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74
All	Inputs	1ul
Q_7	Output	10ul

NOTE:
Where a 74 unit load (ul) is understood to be 40μA I_{IH} and −1.6mA I_{IL}.

The clock input is a gated OR structure which allows one input to be used as an active LOW Clock Enable ($\overline{CE}$) input. The pin assignment for the CP and $\overline{CE}$ inputs is arbitrary and can be reversed for layout convenience. The LOW-to-HIGH transition of $\overline{CE}$ input should only take place while the CP is HIGH for predictable operation. A LOW on the Master Reset ($\overline{MR}$) input overrides all other inputs and clears the register asynchronously, forcing all bit positions to a LOW state.

4-Bit Bidirectional Counters

4-Bit Up/Down Synchronous Counter
Product Specification

FEATURES
- **Synchronous counting and loading**
- **Up/down counting**
- **Modulo 16 binary counter — '169A**
- **BCD decade counter — '168A**
- **Two Count Enable inputs for n-bit cascading**
- **Positive edge-triggered clock**

DESCRIPTION
The '168A is a synchronous, presettable BCD decade up/down counter featuring an internal carry look-ahead for applications in high-speed counting designs. Synchronous operation is provided by having all flip-flops clocked simultaneously so that the outputs change coincident with each other when so instructed by the Count Enable inputs and internal gating. This mode of operation eliminates the output spikes which are normally associated with asynchronous (ripple clock) counters. A buffered Clock input triggers the flip-flops on the LOW-to-HIGH transition of the clock.

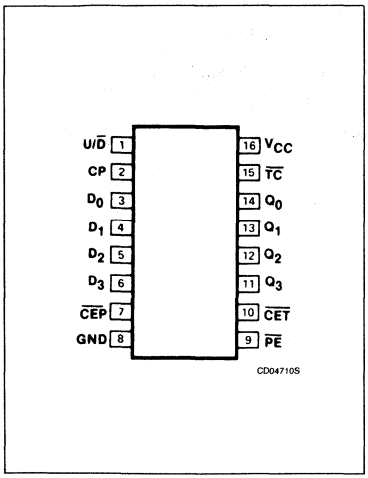
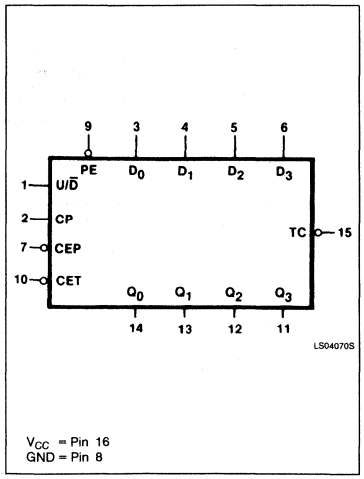
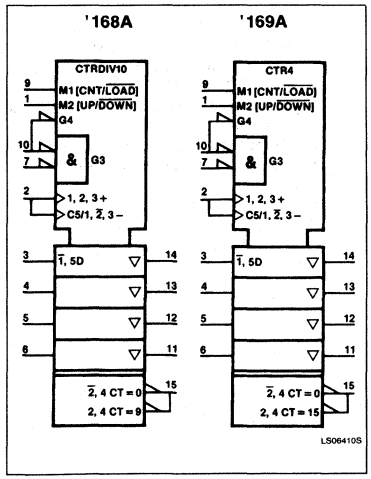
PIN CONFIGURATION



LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



The counter is fully programmable; that is, the outputs may be preset to either level. Presetting is synchronous with the clock and takes place regardless of the levels of the Count Enable inputs. A LOW level on the Parallel Enable ($\overline{PE}$) input disables the counter and causes the data at the D_n input to be loaded into the counter on the next LOW-to-HIGH transition of the clock.

The direction of counting is controlled by the Up/Down (U/$\overline{D}$) input; a HIGH will cause the count to increase, a LOW will cause the count to decrease.

The carry look-ahead circuitry provides for cascading counters for n-bit synchronous applications without additional gating. Instrumental in accomplishing this function are two Count Enable inputs ($\overline{CET} \cdot \overline{CEP}$) and a Terminal Count ($\overline{TC}$) output. Both Count Enable inputs must be LOW to count. The $\overline{CET}$ input is fed forward to enable the $\overline{TC}$ output. The $\overline{TC}$ output thus enabled will produce a LOW output pulse with a duration approximately equal to the HIGH level portion of the Q_0 output. This LOW level $\overline{TC}$ pulse is used to enable successive cascaded stages. See Figure A for the fast synchronous multistage counting connections.

The '169A is identical except that it is a Modulo 16 counter.

Signetics

74170, LS170
Register Files

4 x 4 Register File (Open Collector)
Product Specification

Logic Products

FEATURES

- **Simultaneous and independent Read and Write operations**
- **Expandable to 1024 words by n-bits**
- **Open Collector outputs for wired-AND expansion**
- **See '670 for 3-State output version**

DESCRIPTION

The '170 is a 16-bit register file organized as 4 words of 4 bits each, permitting simultaneous writing into one word location and reading from another location. The 4-bit word to be stored is presented to four Data inputs. The Write Address inputs (W_A and W_B) determine the location of the stored word. When the Write Enable ($\overline{WE}$) input is LOW, the data is entered into the addressed location. The addressed location remains transparent to the data while the $\overline{WE}$ is LOW. Data supplied at the inputs will be read out in true (non-inverting) form. Data and Write Address inputs are inhibited when $\overline{WE}$ is HIGH.

Direct acquisition of data stored in any of the four registers is made possible by individual Read Address inputs (R_A and R_B). The addressed word appears at the four outputs when the Read Enable ($\overline{RE}$) is LOW. Data outputs are inhibited and remain HIGH when the Read Enable input is HIGH. This permits simultaneous reading and writing, eliminates recovery times, and is limited in speed only by the read time and the write time.

Up to 256 devices can be stacked to increase the word size to 1024 locations by tying the Open Collector outputs together. Parallel expansion to generate n-bit words is accomplished by driving the Enable and Address inputs of each device in parallel.

TYPE	TYPICAL PROPAGATION DELAY (RE to Q)	TYPICAL SUPPLY CURRENT (TOTAL)
74170	10ns (t_{PLH}) 20ns (t_{PHL})	127mA
74LS170	20ns (t_{PLH}) 20ns (t_{PHL})	25mA

AC SET-UP REQUIREMENTS $T_A = 25°C$, $V_{CC} = 5.0V$

PARAMETER		TEST CONDITIONS	74		74LS		UNIT
			Min	Max	Min	Max	
t_W	Write enable pulse width	Waveform 3	25		25		ns
t_s	Set-up time, data to positive-going $\overline{WE}$[c]	Waveform 3	10		10		ns
t_h	Hold time, data to positive-going $\overline{WE}$[c]	Waveform 3	15		15		ns
t_s	Set-up time, read address to negative-going $\overline{WE}$[c]	Waveform 3	15		15		ns
t_h	Hold time, read address to positive-going $\overline{WE}$[c]	Waveform 3	5.0		5.0		ns
t_W	Read enable pulse width	Waveform 4	25		25		ns
t_{latch}	Latch time for new data[d]	Waveform 5	25		25		ns

NOTES:

c. Write Address set-up time will protect the data written into the previous address. If protection of data in the previous address is not required, t_s (Write Address to $\overline{WE}$) can be ignored, as any address selection sustained for the final 30ns of the $\overline{WE}$ pulse and during t_h (Write Address to $\overline{WE}$) will result in data being written into that location. Depending on the duration of the input conditions, one or a number of previous addresses may have been written into.

d. Latch time is the time allowed for the internal output of the latch to assume the state of new data. This is important only when attempting to read from a location immediately after that location has received new data. This parameter is measured from the falling edge of $\overline{WE}$ to the rising edge of R_A or R_B. $\overline{RE}$ must be LOW.

Signetics

74S172
Register File

16-Bit Multiple Port Register File (3-State)
Product Specification

Logic Products

FEATURES

- **Simultaneous and independent Read and Write operations**
- **Expandable to 1024 words on n-bits**
- **3-State outputs**

DESCRIPTION

The '172 is a high-performance, 16-bit multiport register file with 3-State outputs organized as eight words of two bits each. Multiple address decoding circuitry is used so that the read and write operation can be performed independently on up to three word locations. Data can be written into two word locations through input Port "A" or input Port "C" while data is simultaneously read from both output Port "B" and output Port "C".

Port "A" is an input port which can be used to write two bits of data (D_{A0}, D_{A1}) into one of eight register locations selected by the Address inputs (A_{A0}, A_{A1}, A_{A2}). When the Write Enable ($\overline{WE}_A$) input is LOW one set-up time prior to the LOW-to-HIGH transition of the Clock (CP) input, the data is written into the selected location.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)
74S172	40MHz	160mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N74S172N

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

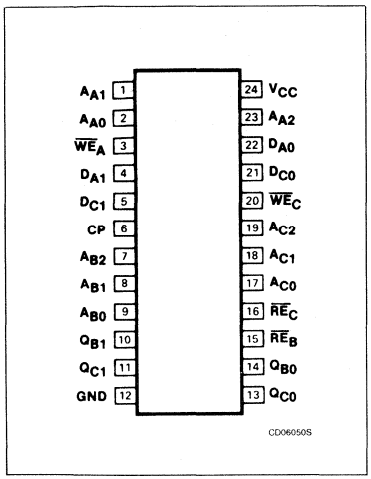
PINS	DESCRIPTION	74S
All	Inputs	1Sul
All	Outputs	8Sul

NOTE:
A 74S unit load (Sul) is 50μA and I_{IH} −2.0mA I_{IL}.

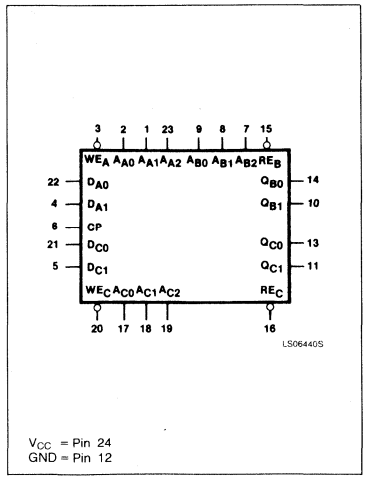
Port "B" is an output port which can be used to read two bits of data from one of eight register locations selected by the Address inputs (A_{B0}, A_{B1}, A_{B2}). When the Read Enable ($\overline{RE}_B$) is LOW, the selected 2-bit word appears on outputs Q_{B0} and Q_{B1}. When $\overline{RE}_B$ is HIGH, the Q_{B0} and Q_{B1} outputs are in the HIGH impedance "off" state. The read operation is independent of the clock.

Port "C" is a read/write port that has separate Data input and Data output sections, but common Address inputs (A_{C0}, A_{C1}, A_{C2}). Data can be simultaneously written into and read from the same register location. Port "C" can be used to write data into one location while Port "A" is writing into a different location, but data cannot be written reliably into the same location simultaneously.

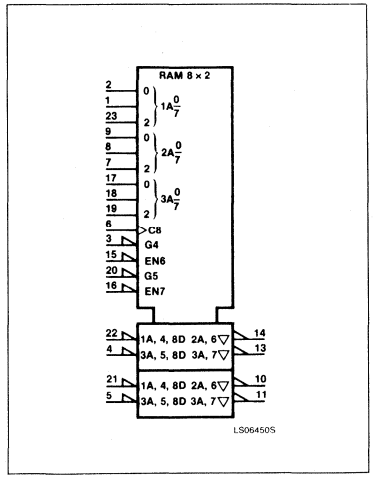
PIN CONFIGURATION



LOGIC SYMBOL



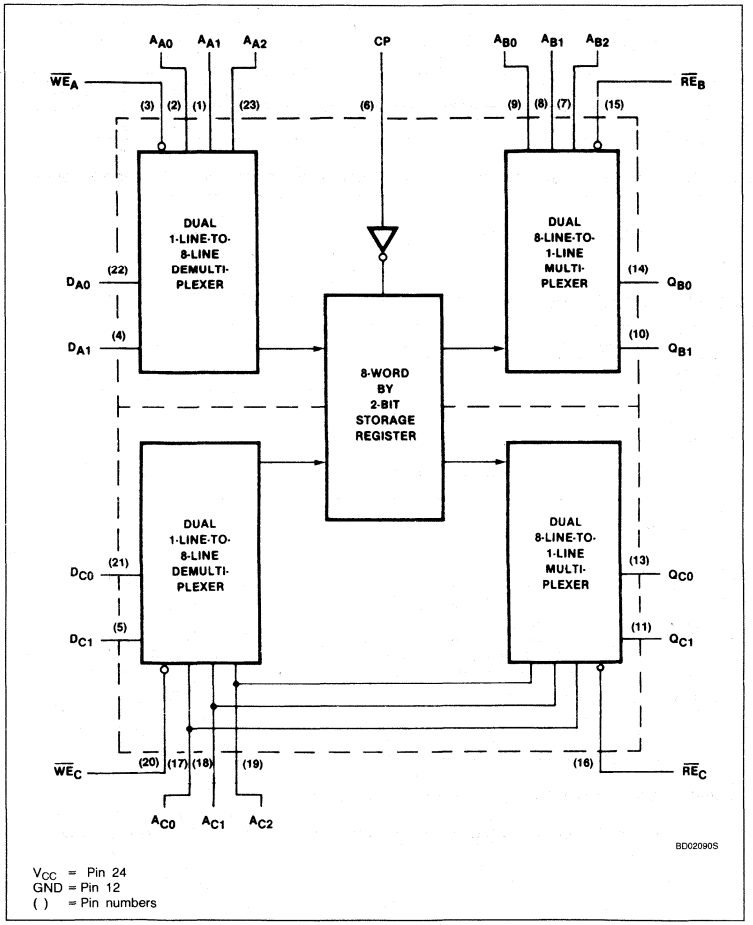
LOGIC SYMBOL (IEEE/IEC)



If both Ports "A" and "C" are enabled for writing into the same location during the same clock cycle, the LOW data will predominate if there is a conflict.

The register operation is essentially a master-slave flip-flop. Each master acts as a transparent D latch when selected by the "A" or "C" address and the clock and applicable write enable are LOW. The data in the master is transferred to the slave (or output section) following the LOW-to-HIGH transition of the Clock (CP). The Address inputs must be stable while the Clock and Write Enable inputs are LOW to ensure retention of data previously written into the other locations. Any number of masters can be altered while the clock and write enable are LOW, but the new data will not be loaded into the slaves, or be available at the outputs, until the clock goes HIGH.

BLOCK DIAGRAM



V_{CC} = Pin 24
GND = Pin 12
( ) = Pin numbers

WRITE MODE SELECT TABLE

OPERATING MODE	INPUTS			ADDRESSED REGISTER
	$\overline{CP}$	$\overline{WE}$	D_n	
Write data[a]	↑	l	l	L
	↑	l	h	H
Hold[b]	↓	h	X	no change

READ MODE SELECT TABLE

OPERATING MODE	INPUTS		OUTPUTS
	$\overline{RE}$	Addressed Register	Q_n
Read	L	L	L
	L	H	H
Disabled	H	X	(Z)

H = HIGH voltage level steady state.
h = HIGH voltage level one set-up time prior to the LOW-to-HIGH or HIGH-to-LOW clock transition.
L = LOW voltage level steady state.
l = LOW voltage level one set-up time prior to the LOW-to-HIGH clock transition.
X = Don't care.
(Z) = HIGH impedance (off) state.
↑ = LOW-to-HIGH clock transition.
↓ = HIGH-to-LOW clock transition.

NOTES:
a. The Write Address (A_A and A_C) to the "internal register" must be stable while $\overline{WE}$ and CP are LOW for conventional operation.
b. The Write Enable must be HIGH before the HIGH-to-LOW clock transition to ensure that the data in the register is not changed.

ABSOLUTE MAXIMUM RATINGS (Over operating free-air temperature range unless otherwise noted.)

PARAMETER		74S	UNIT

Signetics

74173, LS173
Flip-Flops

Quad D-Type Flip-Flop With 3-State Outputs
Product Specification

Logic Products

FEATURES

- **Edge-triggered D-type register**
- **Gated Input enable for hold "do nothing" mode**
- **3-State output buffers**
- **Gated output enable control**
- **Pin compatible with the 8T10 and DM8551**

DESCRIPTION

The '173 is a 4-bit parallel load register with clock enable control, 3-State buffered outputs and master reset. When the two Clock Enable ($\overline{E}_1$ and $\overline{E}_2$) inputs are LOW, the data on the D inputs is loaded into the register synchronously with the LOW-to-HIGH Clock (CP) transition. When one or both $\overline{E}$ inputs are HIGH one set-up time before the LOW-to-HIGH clock transition, the register will retain the previous data. Data inputs and Clock Enable inputs are fully edge triggered and must be stable only one set-up time before the LOW-to-HIGH clock transition.

The Master Reset (MR) is an active HIGH asynchronous input. When the MR is HIGH, all four flip-flops are reset (cleared) independently of any other input condition.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)
74173	35MHz	50mA
74LS173	50MHz	20mA

Plastic DIP	N74173N, N74LS173N
Plastic SO-16	N74LS173D
Plastic SOL-16	CD7186D

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74	74LS
All	Inputs	1ul	1LSul
All	Outputs	10ul	30LSul

NOTE:
Where a 74 unit load (ul) is understood to be 40μA I_{IH} and −1.6mA I_{IL} and a 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

The 3-State output buffers are controlled by a 2-input NOR gate. When both Output Enable ($\overline{OE}_1$ and $\overline{OE}_2$) inputs are LOW, the data in the register is presented at the Q outputs. When one or both $\overline{OE}$ inputs is HIGH, the outputs are forced to a HIGH impedance "off" state. The 3-State output buffers are completely independent of the register operation; the $\overline{OE}$ transition does not affect the clock and reset operations.

Flip-Flops

Hex D Flip-Flops
Product Specification

Logic Products

FEATURES

- **Six edge-triggered D-type flip-flops**
- **Three speed-power ranges available**
- **Buffered common clock**
- **Buffered, asynchronous Master Reset**

DESCRIPTION

The '174 has six edge-triggered D-type flip-flops with individual D inputs and Q outputs. The common buffered Clock (CP) and Master Reset ($\overline{MR}$) inputs load and reset (clear) all flip-flops simultaneously.

The register is fully edge triggered. The state of each D input, one set-up time before the LOW-to-HIGH clock transition, is transferred to the corresponding flip-flop's Q output.

All outputs will be forced LOW independently of Clock or Data inputs by a LOW voltage level on the $\overline{MR}$ input. The device is useful for applications where the true output only is required and the Clock and Master Reset are common to all storage elements.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74
$I_0 - I_7$	Data inputs	1ul
P_E, P_O	Parity inputs	2ul
Σ_E, Σ_O	Parity outputs	10ul

NOTE:
A 74 unit load (ul) is understood to be 40μA I_{IH} and −1.6mA I_{IL}.

DESCRIPTION

The '180 is a 9-bit parity generator or checker commonly used to detect errors in high speed data transmission or data retrieval systems. Both Even and Odd parity enable inputs and parity outputs are available for generating or checking parity on 8-bits.

True active-HIGH or true active-LOW parity can be generated at both the Even and Odd outputs. True active-HIGH parity is established with Even Parity enable input (P_E) set HIGH and the Odd Parity enable input (P_O) set LOW. True active-LOW parity is established when P_E is LOW and P_O is HIGH. When both enable inputs are at the same logic level, both outputs will be forced to the opposite logic level.

Parity checking of a 9-bit word (8 bits plus parity) is possible by using the two enable inputs plus an inverter as the ninth data input. To check for true active-HIGH parity, the ninth data input is tied to the P_O input and an inverter is connected between the P_O and P_E inputs. To check for true active-LOW parity, the ninth data input is tied to the P_E input and an inverter is connected between the P_E and P_O inputs.

Expansion to larger word sizes is accomplished by serially cascading the '180 in 8-bit increments. The Even and Odd parity outputs of the first stage are connected to the corresponding P_E and P_O inputs, respectively, of the succeeding stage.

I_{CC}	Supply current[4] (total)	V_{CC} = MAX			34	56	mA

NOTES:
1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. I_{OS} is tested with V_{OUT} = +0.5V and V_{CC} = V_{CC} MAX + 0.5V. Not more than one output should be shorted at a time and duration of the short circuit should not exceed one second.
4. Measure I_{CC} with P_E and P_O inputs at 4.5V, all other inputs and outputs open.

AC ELECTRICAL CHARACTERISTICS T_A = 25°C, V_{CC} = 5.0V

Signetics

74181, LS181, S181
Arithmetic Logic Units

4-Bit Arithmetic Logic Unit
Product Specification

Logic Products

FEATURES
- **Provides 16 arithmetic operations: ADD, SUBTRACT, COMPARE, DOUBLE, plus 12 other arithmetic operations**
- **Provides all 16 logic operations of two variables: Exclusive-OR, Compare, AND, NAND, NOR, OR, plus 10 other logic operations**
- **Full lookahead carry for high-speed arithmetic operation on long words**

DESCRIPTION
The '181 is a 4-bit high-speed parallel Arithmetic Logic Unit (ALU). Controlled by the four Function Select inputs ($S_0 - S_3$) and the Mode Control Input (M), it can perform all the 16 possible logic operations or 16 different arithmetic operations on active HIGH or active LOW operands. The Function Table lists these operations.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74181	22ns	91mA
74LS181	22ns	21mA
74S181	11ns	120mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N74181N, N74LS181N, N74S181N

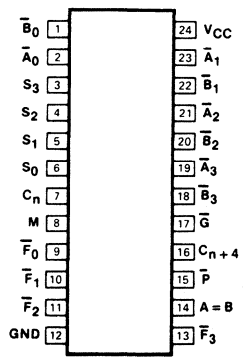
NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

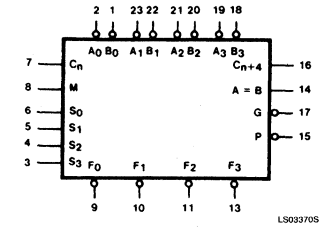
PINS	DESCRIPTION	74	74S	74LS
Mode	Input	1ul	1Sul	1LSul
$\overline{A}$ or $\overline{B}$	Inputs	3ul	3Sul	3LSul
S	Inputs	4ul	4Sul	4LSul
Carry	Input	5ul	5Sul	5LSul
$F_0 - F_3$, = B, C_{n+4}	Outputs	10ul	10Sul	10LSul
$\overline{G}$	Output	10ul	10Sul	40LSul
$\overline{P}$	Output	10ul	10Sul	20LSul

NOTE:
Where a 74 unit load (ul) is understood to be 40μA I_{IH} and −1.6mA I_{IL}, a 74S unit load (Sul) is 50μA I_{IH} and −2.0mA I_{IL}, and 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

PIN CONFIGURATION

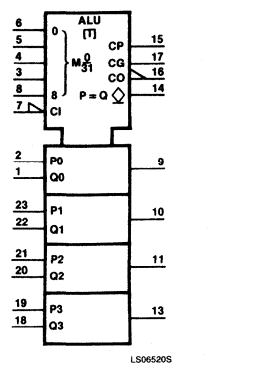


LOGIC SYMBOL



V_{CC} = Pin 24
GND = Pin 12

LOGIC SYMBOL (IEEE/IEC)



When the Mode Control input (M) is HIGH, all internal carries are inhibited and the device performs logic operations on the individual bits as listed. When the Mode Control Input is LOW, the carries are enabled and the device performs arithmetic operations on the two 4-bit words. The device incorporates full internal carry lookahead and provides for either ripple carry between devices using the C_{n+4} output, or for carry lookahead between packages using the signals $\overline{P}$ (Carry Propagate) and $\overline{G}$ (Carry Generate). $\overline{P}$ and $\overline{G}$ are not affected by carry in. When speed requirements are not stringent, it can be used in a simple ripple carry mode by connecting the Carry output (C_{n+4}) signal to the Carry input (C_n) of the next unit. For high-speed operation the device is used in conjunction with the '182 carry lookahead circuit. One carry lookahead package is required for each group of four '181 devices. Carry lookahead can be provided at various levels and offers high-speed capability over extremely long word lengths.

The A = B output from the device goes HIGH when all four $\overline{F}$ outputs are HIGH and can be used to indicate logic equivalence over 4 bits when the unit is in the subtract mode. The A = B output is open collector and can be wired-AND with other A = B outputs to give a comparison for more than 4 bits. The A = B signal can also be used with the C_{n+4} signal to indicate A > B and A < B.

The Function Table lists the arithmetic operations that are performed without a carry in. An incoming carry adds a one to each operation. Thus, select code LHHL generates A minus B minus 1 (2s complement notation) without a carry in and generates A minus B when a carry is applied.

Because subtraction is actually performed by complementary addition (1s complement), a carry out means borrow; thus, a carry is generated when there is no underflow and no carry is generated when there is underflow.

As indicated, this device can be used with either active LOW inputs producing active LOW outputs or with active HIGH inputs producing active HIGH outputs. For either case the table lists the operations that are performed to the operands labeled inside the logic symbol.

Lookahead Carry Generator
Product Specification

Logic Products

FEATURES

- **Provides carry lookahead across a group of four ALU's**
- **Multi-level lookahead for high-speed arithmetic operation over long word lengths**

DESCRIPTION

The '182 carry lookahead generator accepts up to four pairs of active LOW Carry Propagate ($\overline{P}_0$, $\overline{P}_1$, $\overline{P}_2$, $\overline{P}_3$) and Carry Generate ($\overline{G}_0$, $\overline{G}_1$, $\overline{G}_2$, $\overline{G}_3$) signals and an active HIGH Carry input (C_n) and provides anticipated active HIGH carries (C_{n+x}, C_{n+y}, C_{n+z}) across four groups of binary adders. The '182 also has active LOW Carry Propagate ($\overline{P}$) and Carry Generate ($\overline{G}$) outputs which may be used for further levels of lookahead.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)

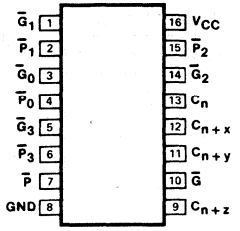
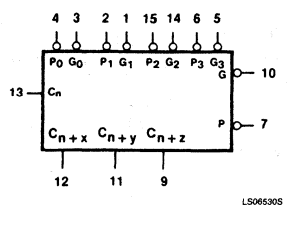
PIN CONFIGURATION

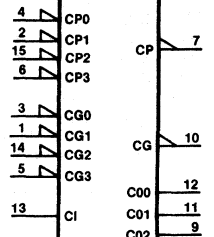


LOGIC SYMBOL



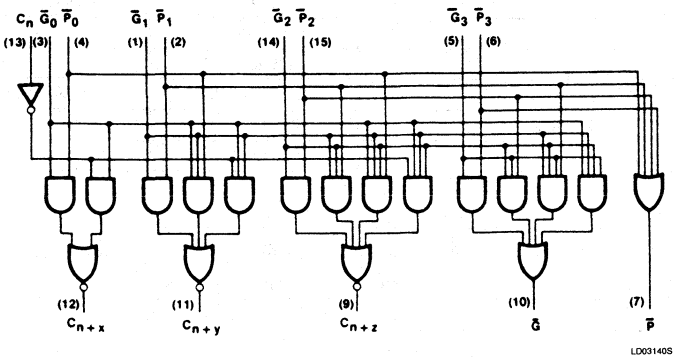
V_{CC} = Pin 16
GND = Pin 8

LOGIC SYMBOL (IEEE/IEC)



Carry Generator | 74S182

LOGIC DIAGRAM



V_{CC} = Pin 16
GND = Pin 8
( ) = Pin Numbers

The logic equations provided at the outputs are:

$$C_{n+x} = G_0 + P_0C_n$$

$$C_{n+y} = G_1 + P_1G_0 = P_1P_0C_n$$

$$C_{n+z} = G_2 + P_2G_1 + P_2P_1G_0$$

$$\overline{G} = \overline{G_3 + P_3G_2 + P_3P_2G_1 + P_3P_2P_1G_0}$$

$$\overline{P} = \overline{P_3P_2P_1P_0}$$

The '182 can also be used with binary ALU's in an active LOW or active HIGH input operand mode. The connections to and from the ALU to the carry lookahead generator are identical in both cases.

Logic Products

74190, 191, LS191
Counters

'190 Presettable BCD/Decade Up/Down Counter
'191 Presettable 4-Bit Binary Up/Down Counter
Product Specification

FEATURES
- **Synchronous, reversible counting**
- **BCD/decade—'190**
  4-bit binary—'191
- **Synchronous, reversible counting**
- **Asynchronous parallel load capability**
- **Count enable control for synchronous expansion**
- **Single Up/Down control input**

DESCRIPTION
The '190 is an asynchronously presettable up/down BCD decade counter. It contains four master/slave flip-flops with internal gating and steering logic to provide asynchronous preset and synchronous count-up and count-down operation. The '191 is similar, but is a 4-bit binary counter.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)
74190	25MHz	65mA
74191	25MHz	65mA
74LS191	25MHz	20mA

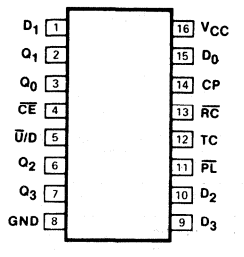
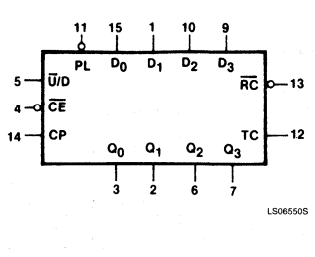
Other	Inputs	1ul	1LSul
All	Outputs	10ul	10LSul

NOTE:
Where a 74 unit load (ul) is understood to be 40μA I_{IH} and −1.6mA I_{IL}, and a 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

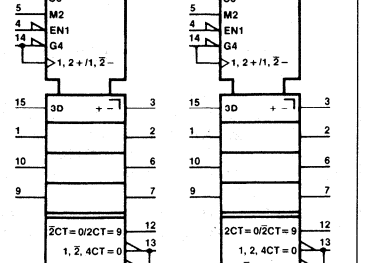
PIN CONFIGURATION



LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



Asynchronous parallel load capability permits the counter to be preset to any desired number. Information present on the parallel Data inputs ($D_0 - D_3$) is loaded into the counter and appears on the outputs when the Parallel Load ($\overline{PL}$) input is LOW. As indicated in the Mode Select Table, this operation overrides the counting function.

Counting is inhibited by a HIGH level on the Count Enable ($\overline{CE}$) input. When $\overline{CE}$ is LOW, internal state changes are initiated synchronously by the LOW-to-HIGH transition of the Clock input. The Up/Down ($\overline{U}/D$) input signal determines the direction of counting as indicated in the Mode Select Table. The $\overline{CE}$ input may go LOW when the clock is in either state, however, the LOW-to-HIGH $\overline{CE}$ transition must occur only when the clock is HIGH. Also, the $\overline{U}/D$ input should be changed only when either $\overline{CE}$ or CP is HIGH.

Overflow/underflow indications are provided by two types of outputs, the Terminal Count (TC) and Ripple Clock ($\overline{RC}$). The TC output is normally LOW and goes HIGH when a circuit reaches zero in the count-down mode or reaches "9" in the count-up mode for 74190, and reaches "15" in the count-up mode for 74191/74LS191. The TC output will remain HIGH until a state change occurs, either by counting or presetting, or until $\overline{U}/D$ is changed. Do not use the TC output as a clock signal because it is subject to decoding spikes.

The TC signal is used internally to enable the $\overline{RC}$ output. When TC is HIGH and $\overline{CE}$ is LOW, the RC follows the Clock Pulse (CP) delayed by two gate delays. The $\overline{RC}$ output essentially duplicates the LOW clock pulse width, although delayed in time by two gate delays. This feature simplifies the design of multistage counters, as indicated in Figures A and B. In Figure A, each $\overline{RC}$ output is used as the Clock input for the next higher stage. When the clock source has a limited drive capability this configuration is particularly advantageous, since the clock source drives only the first stage. It is only necessary to inhibit the first stage to prevent counting in all stages, since a HIGH signal on $\overline{CE}$ inhibits the $\overline{RC}$ output pulse as indicated in the Mode Select Table. The timing skew between state changes in the first and last stages is represented by the cumulative delay of the clock as it ripples through the preceding stages. This is a disadvantage of the configuration in some applications.

Figure B shows a method of causing state changes to occur simultaneously in all stages. The $\overline{RC}$ outputs propagate the carry/borrow signals in ripple fashion and all Clock inputs are driven in parallel. The LOW state duration of the clock in this configuration must be long enough to allow the negative-going edge of the carry/borrow signal to ripple through to the last stage before the clock goes HIGH. Since the $\overline{RC}$ output of any package goes HIGH shortly after its CP input goes HIGH, there is no such restriction on the HIGH state duration of the clock.

In Figure C, the configuration shown avoids ripple delays and their associated restrictions. Combining the TC signals from all the preceding stages forms the $\overline{CE}$ input signal for a given stage. An enable signal must be included in each carry gate in order to inhibit counting. The TC output of a given stage is not affected by its own $\overline{CE}$, therefore, the simple inhibit scheme of Figure A and B does not apply.

74192, 74193, LS192, LS193 Counters

'192 Presettable BCD Decade Up/Down Counter
'193 Presettable 4-Bit Binary Up/Down Counter
Product Specification

FEATURES

- **Synchronous reversible 4-bit binary counting**
- **Asynchronous parallel load**
- **Asynchronous reset (clear)**
- **Expandable without external logic**

DESCRIPTION

The '192 and '193 are 4-bit synchronous up/down counters — the '192 counts in BCD mode and the '193 counts in the binary mode. Separate up/down clocks, CP_U and CP_D respectively, simplify operation. The outputs change state synchronously with the LOW-to-HIGH transition of either Clock input. If the CP_U clock is pulsed while CP_D is held HIGH, the device will count up . . . if CP_D is pulsed while the CP_U is held HIGH, the device will count down. Only one Clock input can be held HIGH at any time, or erroneous operation will result. The device can be cleared at any time by the asynchronous reset pin — it may also be loaded in parallel by activating the asynchronous parallel load pin.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT

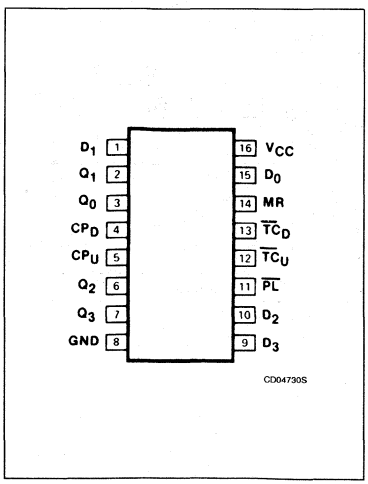
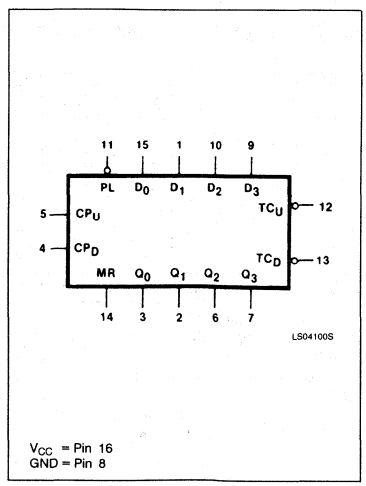
All	Outputs	10ul	10LSul

NOTE:
Where a 74 unit load (ul) is understood to be 40μA I_{IH} and −1.6mA I_{IL}, and a 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

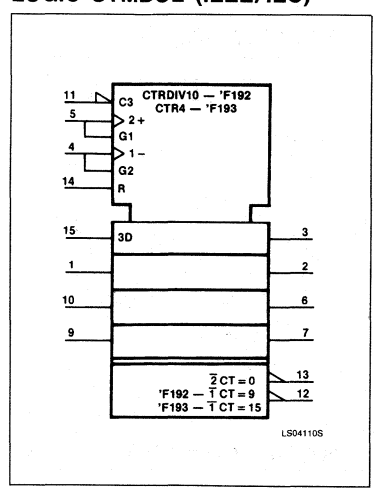
PIN CONFIGURATION



LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



Inside the device are four master-slave JK flip-flops with the necessary steering logic to provide the asynchronous reset, load, and synchronous count up and count down functions.

Each flip-flop contains JK feedback from slave to master, such that a LOW-to-HIGH transition on the CP_D input will decrease the count by one, while a similar transition on the CPU_U input will advance the count by one.

One clock should be held HIGH while counting with the other, because the circuit will either count by two's or not at all, depending on the state of the first flip-flop, which cannot toggle as long as either Clock input is LOW. Applications requiring reversible operation must make the reversing decision while the activating clock is HIGH to avoid erroneous counts.

The Terminal Count Up ($\overline{TC}_U$) and Terminal Count down ($\overline{TC}_D$) outputs are normally HIGH. When the circuit has reached the maximum count state of 9 (for the '192 and 15 for the '193), the next HIGH-to-LOW transition of CP_U will cause $\overline{TC}_U$ to go LOW. $\overline{TC}_U$ will stay LOW until CP_U goes HIGH again, duplicating the count up clock, although delayed by two gate delays. Likewise, the $\overline{TC}_D$ output will go LOW when the circuit is in the zero state and the CP_D goes LOW. The $\overline{TC}$ outputs can be used as the Clock input signals to the next higher order circuit in a multistage counter, since they duplicate the clock waveforms. Multistage counters will not be fully synchronous, since there is a two-gate delay time difference added for each stage that is added.

The counter may be preset by the asynchronous parallel load capability of the circuit. Information present on the parallel Data inputs ($D_0 - D_3$) is loaded into the counter and appears on the outputs regardless of the conditions of the Clock inputs when the Parallel Load ($\overline{PL}$) input is LOW. A HIGH level on the Master Reset (MR) input will disable the parallel load gates, override both Clock inputs, and set all Q outputs LOW. If one of the Clock input is LOW during and after a reset or load operation, the next LOW-to-HIGH transition of that clock will be interpreted as a legitimate signal and will be counted.

Product Specification

Logic Products

- **Buffered clock and control inputs**
- **Shift left and shift right capability**
- **Synchronous parallel and serial data transfers**
- **Easily expanded for both serial and parallel operation**
- **Asynchronous Master Reset**
- **Hold (do nothing) mode**

DESCRIPTION

The functional characteristics of the '194 4-Bit Bidirectional Shift Register are indicated in the Logic Diagram and Function Table. The register is fully synchronous, with all operations taking place in less than 20ns (typical) for the 54/74 and 54LS/74LS, and 12ns (typical) for 54S/74S, making the device especially useful for implementing very high speed CPUs, or for memory buffer registers.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)
74194	36MHz	39mA

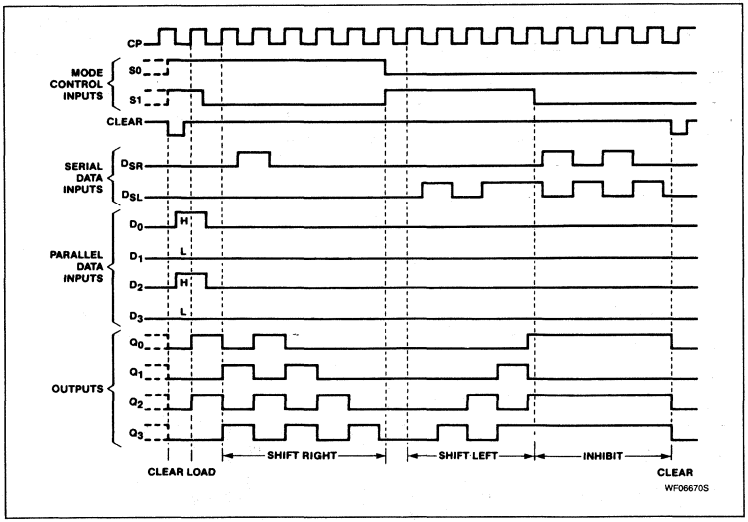
	↑	H	l[a]	h	h	X	X	H	q_0	q_1	q_2
Parallel load	↑	H	h	h	X	X	d_n	d_0	d_1	d_2	d_3

H = HIGH voltage level.
h = HIGH voltage level one set-up time prior to the LOW-to-HIGH clock transition.
L = LOW voltage level.
l = LOW voltage level one set-up time prior to the LOW-to-HIGH clock transition.
$d_n(q_n)$ = Lower case letters indicate the state of the referenced input (or output) one set-up time prior to the LOW-to-HIGH clock transition.
X = Don't care.
↑ = LOW-to-HIGH clock transition.

NOTE:
a. The HIGH-to-LOW transition of the S_0 and S_1 inputs on the 74194 should only take place while CP is HIGH for conventional operation.

TYPICAL CLEAR, LOAD, RIGHT-SHIFT, LEFT-SHIFT, INHIBIT AND CLEAR SEQUENCES



The '194 design has special logic features which increase the range of application. The synchronous operation of the device is determined by two Mode Select inputs, S_0 and S_1. As shown in the Mode Select Table, data can be entered and shifted from left to right (shift right, $Q_0 \rightarrow Q_1$, etc.) or, right to left (shift left, $Q_3 \rightarrow Q_2$, etc.) or, parallel data can be entered, loading all 4 bits of the register simultaneously. When both S_0 and S_1 are LOW, existing data is retained in a hold (do nothing) mode. The first and last stages provide D-type Serial Data inputs (D_{SR}, D_{SL}) to allow multistage shift right or shift left data transfers without interfering with parallel load operation.

Mode Select and Data inputs on the 74S194 and 74LS194A are edge-triggered, responding only to the LOW-to-HIGH transition of the Clock (CP). Therefore, the only timing restriction is that the Mode Control and selected Data inputs must be stable one set-up time prior to the positive transition of the clock pulse. The Mode Select inputs of the 74194 are gated with the clock and should be changed from HIGH-to-LOW only while the Clock input is HIGH.

The four parallel data inputs ($D_0 - D_3$) are D-type inputs. Data appearing on $D_0 - D_3$ inputs when S_0 and S_1 are HIGH is transferred to the $Q_0 - Q_3$ outputs respectively, following the next LOW-to-HIGH transition of the clock. When LOW, the asynchronous Master Reset ($\overline{MR}$) overrides all other input conditions and forces the Q outputs LOW.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74	74S	74LS
All	Inputs	1ul	1Sul	1LSul
All	Outputs	10ul	10Sul	10LSul

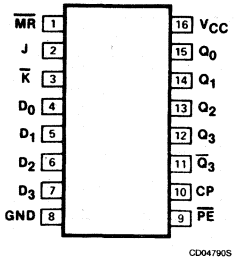
NOTE:
Where a 74 unit load (ul) is understood to be 40μA I_{IH} and −1.6mA I_{IL}, a 74S unit load (Sul) is 50μA I_{IH} and −2.0mA I_{IL}, and 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

DESCRIPTION
The functional characteristics of the '195 4-Bit Parallel Access Shift register are indicated in the Logic Diagram and Function Table. The device is useful in a wide variety of shifting, counting and storage applications. It performs serial, parallel, serial-to-parallel, or parallel-to-serial data transfers at very high speeds.

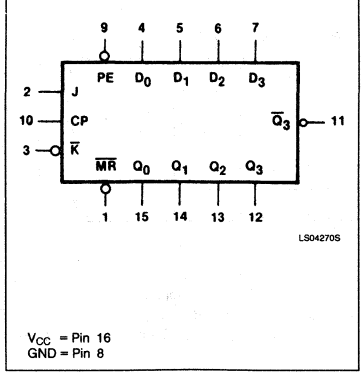
The '195 operates on two primary modes: shift right ($Q_0 \rightarrow Q_1$) and parallel load, which are controlled by the state of the Parallel Enable ($\overline{PE}$) input. Serial data enters the first flip-flop (Q_0) via the J and $\overline{K}$ inputs when the $\overline{PE}$ input is HIGH, and is shifted 1 bit in the direction $Q_0 \rightarrow Q_1 \rightarrow Q_2 \rightarrow Q_3$ following each LOW-to-HIGH clock transition.

The J and $\overline{K}$ inputs provide the flexibility of the JK type input for special applications and, by tying the two pins together, the simple D type input for general applications. The device appears as four common clocked D flip-flops when the $\overline{PE}$ input is LOW. After the LOW-to-HIGH clock transition, data on the parallel inputs ($D_0 - D_3$) is transferred to the respective $Q_0 - Q_3$ outputs.

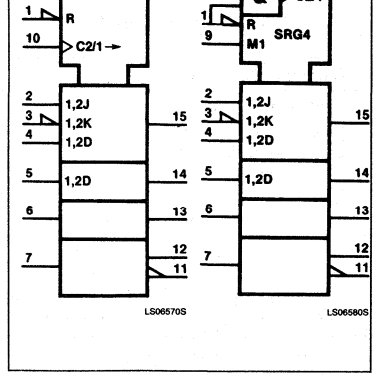
PIN CONFIGURATION



LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



Shift left operation ($Q_3 \rightarrow Q_2$) can be achieved by tying the Q_n outputs to the D_{n-1}) inputs and holding the $\overline{PE}$ input low.

All parallel and serial data transfers are synchronous, occuring after each LOW-to-HIGH clock transition. The '195 utilizes edge-triggering, therefore, there is no restriction on the activity of the J, $\overline{K}$, D_n, and $\overline{PE}$ inputs for logic operation, other than the set-up and release time requirements.

A LOW on the asynchronous Master Reset ($\overline{MR}$) input sets all Q outputs LOW, independent of any other input condition. The $\overline{MR}$ on the 54/74195 is gated with the clock. Therefore, the LOW-to-HIGH $\overline{MR}$ transition should only occur while the clock is LOW to avoid false clocking on the 54/74195.

			V_I = 2.7V						20			50	μA
I_{IL}	LOW-level input current	V_{CC} = MAX	V_I = 0.4V			−1.6			−0.4				mA
			V_I = 0.5V									−2	mA
I_{OS}	Short-circuit output current[3]	V_{CC} = MAX		−18		−57	−20		−100	−40		−100	mA
I_{CC}	Supply current[4] (total)	V_{CC} = MAX			39	63		14	21		70	109	mA

NOTES:

1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. I_{OS} is tested with V_{OUT} = +0.5V and V_{CC} = V_{CC} MAX + 0.5V. Not more than one output should be shorted at a time and duration of the short circuit should not exceed one second.
4. With all outputs open, $\overline{PE}$ grounded, and 4.5V applied to the J, $\overline{K}$, and Data inputs, I_{CC} is measured by applying a momentary ground, followed by 4.5V to $\overline{MR}$, and then a momentary ground, followed by 4.5V to clock.

Signetics

74LS197
Counter

Presettable 4-Bit Binary Ripple Counter
Product Specification

Logic Products

FEATURES

- **High speed 4-bit binary counting**
- **Asynchronous parallel load for presetting counter**
- **Overriding Master Reset**
- **Buffered Q_0 output drives $\overline{CP}_1$ input plus standard fan-out**

DESCRIPTION

The '197 is an asynchronously presettable binary ripple counter partitioned into divide-by-2 and divide-by-8 sections with each section having a separate Clock input. Stage changes are initiated in the counting modes by the HIGH-to-LOW transition of the Clock inputs, however, state changes of the Q outputs do not occur simultaneously because of the internal ripple delays. Designers should keep in mind when using external logic to decode the Q outputs, that the unequal delays can lead to decoding spikes, and thus a decoded signal should not be used as a strobe or clock. The Q_0 flip-flop is triggered by the $\overline{CP}_0$ input while the $\overline{CP}_1$ input triggers the divide-by-8 section.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT
74LS197	40MHz	16mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N74LS197N
Plastic SO-14	N74LS197D

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74LS
$\overline{CP}_0$	Clock input	6LSul
$\overline{CP}_1$	Clock input	3.5LSul
All	Other inputs	1LSul
$Q_0 - Q_3$	Outputs	10LSul

NOTE:
Where a 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

The device has an asynchronous active-LOW Master Reset ($\overline{MR}$) input which overrides all other inputs and forces all outputs LOW. The counter is also asynchronously presettable. A LOW on the Parallel Load ($\overline{PL}$) input overrides the Clock inputs and loads the data from parallel Data ($D_0 - D_3$) inputs into the flip-flops. The counter acts as a transparent latch while the $\overline{PL}$ is LOW and any change in the D_n inputs will be reflected in the outputs.

Shift Register

8-Bit Parallel-Access Shift Register
Product Specification

Logic Products

FEATURES
- **Buffered clock and control inputs**
- **Shift right and parallel load capability**
- **Fully synchronous data transfers**
- **J-$\overline{K}$ (D) inputs to first stage**
- **Clock enable for hold (do nothing) mode**
- **Asynchronous Master Reset**

DESCRIPTION

The functional characteristics of the '199 8-Bit Parallel-Access Shift Register are indicated in the Logic Diagram and Function Table. The device is useful in a wide variety of shifting, counting and storage applications. It performs serial, parallel, serial to parallel, or parallel to serial data transfers at very high speeds.

H = HIGH voltage level steady state.
h = HIGH voltage level one set-up time prior to the LOW-to-HIGH clock transition.
L = LOW voltage level steady state.
l = LOW voltage level one set-up time prior to the LOW-to-HIGH clock transition.
X = Don't care
$d_n(q_n)$ = Lower case letters indicate the state of the referenced input (or output) one set-up time prior to the LOW-to-HIGH clock transition.
↑ = LOW-to-HIGH clock transition.

NOTE:
a. The LOW-to-HIGH transition of $\overline{CE}$ should only occur while CP is HIGH for conventional operation.

The '199 operates in two primary modes: shift right ($Q_0 \rightarrow Q_1$) and parallel load, which are controlled by the state of the Parallel Enable ($\overline{PE}$) input. Serial data enters the first flip-flop (Q_0) via the J and $\overline{K}$ inputs when the $\overline{PE}$ input is HIGH, and is shifted one bit in the direction $Q_0 \rightarrow Q_1 \rightarrow Q_3$ following each LOW-to-HIGH clock transition. The J and $\overline{K}$ inputs provide the flexibility of the J-K type input for special applications and, by tying the two pins together, the simple D-type input for general applications. The device appears as eight common clocked D flip-flops when the $\overline{PE}$ input is LOW. After the LOW-to-HIGH clock transition, data on the parallel inputs ($D_0 - D_7$) is transferred to the respective $Q_0 - Q_7$ outputs.

All parallel and serial data transfers are synchronous, occuring after each LOW-to-HIGH clock transition. The '199 utilizes edge-triggering, therefore, there is no restriction on the activity of the J, $\overline{K}$, D_n, and $\overline{PE}$ inputs for logic operation, other than the set-up and release time requirements.

The clock input is a gated OR structure which allows one input to be used as an active-LOW Clock Enable ($\overline{CE}$) input. The pin assignment for the CP and $\overline{CE}$ inputs is arbitrary and can be reversed for layout convenience. The LOW-to-HIGH transition of $\overline{CE}$ input should only take place while the CP is HIGH for conventional operation.

A LOW on the Master Reset ($\overline{MR}$) input overrides all other inputs and clears the register asynchronously, forcing all bit positions to a LOW state.

74221
Multivibrator

Dual Monostable Multivibrator
Product Specification

Logic Products

FEATURES

- **Pulse width variance is typically less than ±0.5% for 98% of the units**
- **The '221 demonstrates electrical and switching characteristics that are virtually identical to the '121 one-shots**
- **Pin-out is identical to the '123**
- **Overriding Reset terminates output pulse**
- **B input has hysteresis for improved noise immunity**
- **Maximum pulse width:**
  54221: 21 seconds
  74221: 28 seconds

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

DESCRIPTION

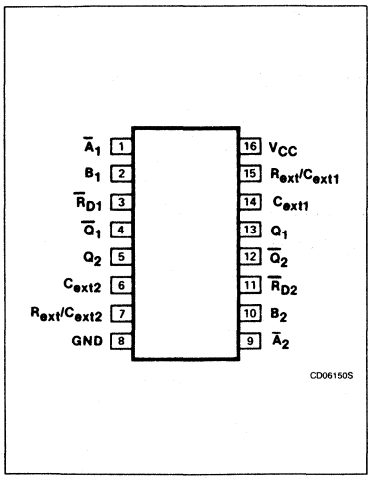
The '221 is a dual monostable multivibrator with performance characteristics virtually identical to those of the '121. Each multivibrator features an active LOW going edge input ($\overline{A}$) and an active HIGH going edge input (B), either of which can be used as an Enable input.

Pulse triggering occurs at a particular voltage level and is not directly related to the transition time of the input pulse. Schmitt-trigger input circuitry (TTL hysteresis) for the B input allows jitter-free triggering from inputs with transition rates as slow as 1 volt/second, providing the circuit with excellent noise immunity of typically 1.2 volts. A high immunity to V_{CC} noise of typically 1.5 volts is also provided by internal latching circuitry.

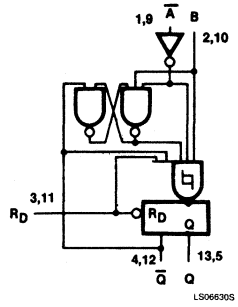
Once fired, the outputs are independent of further transitions of the $\overline{A}$ and B inputs and are a function of the timing components. The output pulses can be terminated by the overriding active LOW Reset ($\overline{R}_D$). Input pulses may be of any duration relative to the output pulse. Output pulse length may be varied from 35 nanoseconds to the maximums shown in the FEATURES by choosing appropriate timing components. With R_{ext} = 2kΩ and C_{ext} = 0, an output pulse of typically 30 nanoseconds is achieved which may be used as a dc triggered reset signal. Output rise and fall times are TTL compatible and independent of pulse length.

Pulse width stability is achieved through internal compensation and is virtually independent of V_{CC} and temperature. In most applications, pulse stability will only be limited by the accuracy of external timing components.

PIN CONFIGURATION

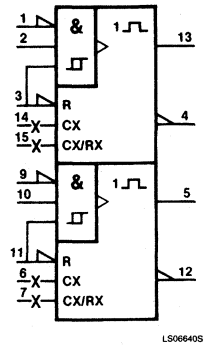


LOGIC SYMBOL



V_{CC} = Pin 16 C_{ext} = Pins 14, 6
GND = Pin 8 C_{ext}/R_{ext} = Pins 15, 7

LOGIC SYMBOL (IEEE/IEC)



Jitter-free operation is maintained over the full temperature and V_{CC} ranges for more than six decades of timing capacitance (10pF to 10μF) and more than one decade of timing resistance (2kΩ to 30kΩ for the 54221 and 2kΩ to 40kΩ for the 74221). Throughout these ranges, pulse width is defined by the following relationship: (see Figure A)

$$t_{W(out)} = C_{ext}R_{ext}\ln 2$$
$$t_{W(out)} \cong 0.7C_{ext}R_{ext}$$

In circuits where pulse cutoff is not critical, timing capacitance up to 1000μF and timing resistance as low as 1.4kΩ may be used.

Pin assignments for these devices are identical to those of the '123 so that the '221 can be substituted for those products in systems not using the retrigger by merely changing the value of R_{ext} and/or C_{ext}.

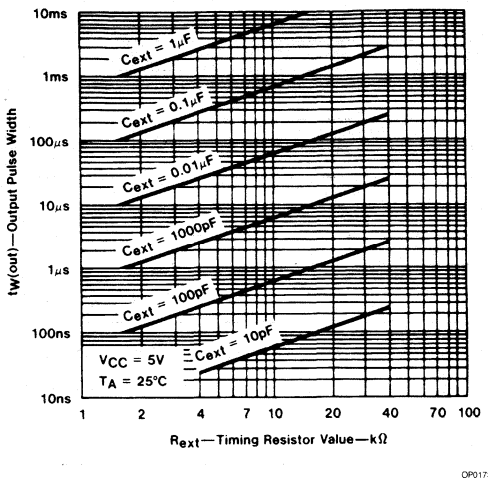


Figure 1. Output Pulse Width vs Timing Resistor Value

FUNCTION TABLE

Signetics

74S225
16 x 5 FIFO

16 x 5 Asynchronous First-In/First-Out Memory (3-State)
Product Specification

Logic Products

FEATURES

- **Independent synchronous inputs and outputs**
- **Organized as 16-words of 5 bits**
- **DC to 10-MHz data rate**
- **3-state outputs**

DESCRIPTION

This 80-bit active element memory is a monolithic Schottky-clamped transistor-transistor logic (STTL) array organized as 16 words of five-bits each. A memory system using the 'S225 can easily be expanded in multiples of 16 words or of 5 bits as shown in Figure 2. The three-state outputs controlled by a single enable, $\overline{OE}$, make bus connection and multiplexing easy.

A FIFO is a memory storage device which allows data to be written into and/or read from its array at independent data rates. The 'S225 is a FIFO which will process data at any desired clock rate from DC to 10MHz. The data is processed in a parallel format, word by word.

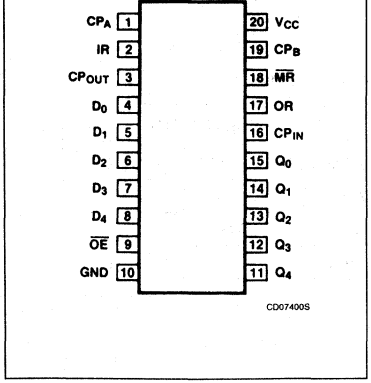
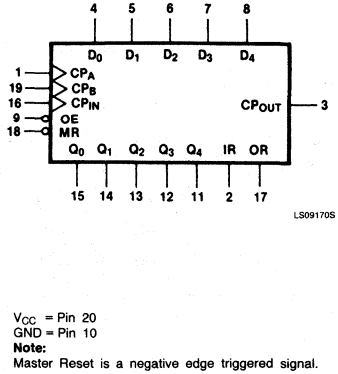
PIN CONFIGURATION

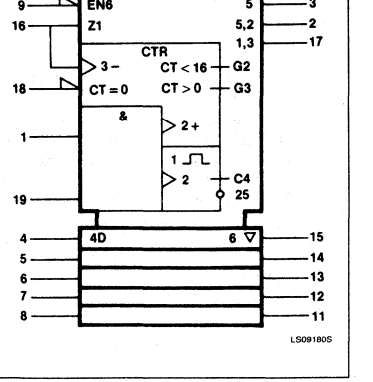


LOGIC SYMBOL



V_{CC} = Pin 20
GND = Pin 10
Note:
Master Reset is a negative edge triggered signal.

LOGIC SYMBOL (IEEE/IEC)



Reading or writing is done independently utilizing separate synchronous data clocks. Data may be written into the array on the low-to-high transition of either load clock input. Data may be read out of the array on the low-to-high transition of the unload clock input (normally high). When writing data into the FIFO one of the load clock inputs must be held high while the other strobes in the data. This arrangement allows either load clock to function as an inhibit for the other.

Status of the 'S225 is provided by three outputs. Input ready monitors the status of the last word location and signifies when the memory is full. This output is high whenever the memory is available to accept any data.

The unload clock output also monitors the last word location. This output generates a low-logic-level pulse (synchronized to the internal clock pulse) when the location is vacant. The third status output, output ready, is high when the first word location contains valid data and unload clock input is high. When unload clock input goes low, output ready will go low and remain low until new valid data is in the first word location. The first word location is defined as the location from which data is provided to the outputs.

The data outputs are noninverted with respect to the data inputs and are three-state with a common control input, output enable. When output enable is low, the data outputs are enabled to function as totem-pole outputs. A high-logic-level forces each data output to a high-impedance state while all other inputs and outputs remain active.

The master reset input invalidates all data stored in the memory array by clearing the control logic and setting output ready to a low-logic-level on the high-to-low transition of a low-active pulse. The data outputs do not change as a result of the master reset input; however, the output ready at a low-logic-level signifies invalid data.

			Other inputs			−250	μA
I_{OS}	Short-circuit output current[3]	V_{CC} = MAX		−30		−100	mA
I_{CC}	Supply current[4] (total)	V_{CC} = MAX			80	120	mA

NOTES:

1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. Not more than one output should be shorted at a time. For testing I_{OS}, the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a HIGH output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.
4. Measure I_{CC} with all outputs open and all possible inputs grounded.

AC ELECTRICAL CHARACTERISTICS $T_A = 25°C$, $V_{CC} = 5.0V$

Signetics

74LS245
Transceiver

Octal Transceiver (3-State)
Product Specification

Logic Products

FEATURES

- **Octal bidirectional bus interface**
- **3-State buffer outputs**
- **PNP inputs for reduced loading**
- **Hysteresis on all Data inputs**

DESCRIPTION

The 'LS245 is an octal transceiver featuring non-inverting 3-State bus compatible outputs in both send and receive directions. The outputs are all capable of sinking 24mA and sourcing up to 15mA, producing very good capacitive drive characteristics. The device features a Chip Enable (CE) input for easy cascading and a Send/Receive (S/R) input for direction control. All data inputs have hysteresis built in to minimize AC noise effects.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74LS245	8ns	58mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C

Signetics

74LS251, S251
Multiplexers

8-Input Multiplexer (3-State)
Product Specification

Logic Products

FEATURES

- **High speed 8-to-1 multiplexing**
- **True and complement outputs**
- **Both outputs are 3-State for further multiplexer expansion**
- **3-State outputs are buffer type with 12mA/24mA outputs for Military/Commercial applications**

TYPE	TYPICAL PROPAGATION DELAY (DATA TO Y)	TYPICAL SUPPLY CURRENT (TOTAL)
74LS251	18ns	9mA
74S251	8ns	55mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N74S251N, N74LS251AN

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

DESCRIPTION

The '251 is a logical implementation of a single-pole, 8-position switch with the state of three Select inputs (S_0, S_1, S_2) controlling the switch position. Assertion (Y) and Negation ($\overline{Y}$) outputs are both provided. The Output Enable input ($\overline{OE}$) is active LOW. The logic function provided at the output, when activated, is:

$$Y = \overline{OE} \cdot (I_0 \cdot \overline{S}_0 \cdot \overline{S}_1 \cdot \overline{S}_2 + I_1 \cdot S_0 \cdot \overline{S}_1 \cdot \overline{S}_2 + I_2 \cdot \overline{S}_0 \cdot S_1 \cdot \overline{S}_2 + I_3 \cdot S_0 \cdot S_1 \cdot \overline{S}_2 + I_4 \cdot \overline{S}_0 \cdot \overline{S}_1 \cdot S_2 + I_5 \cdot S_0 \cdot \overline{S}_1 \cdot S_2 + I_6 \cdot \overline{S}_0 \cdot S_1 \cdot S_2 + I_7 \cdot S_0 \cdot S_1 \cdot S_2).$$

Both outputs are in the HIGH impedance (HIGH Z) state when the output enable is HIGH, allowing multiplexer expansion by tying the outputs of up to 128 devices together. All but one device must be in the HIGH impedance state to avoid high currents that would exceed the maximum ratings, when the outputs of the 3-State devices are tied together. Design of the output enable signals must ensure there is no overlap in the active LOW portion of the enable voltages.

Multiplexers

Dual 4-Input Multiplexer (3-State)
Product Specification

Logic Products

FEATURES
- **3-State outputs for bus interface and multiplex expansion**
- **Common Select inputs**
- **Separate Output Enable inputs**

DESCRIPTION
The '253 has two identical 4-input multiplexers with 3-State outputs which select two bits from four sources selected by common Select inputs (S_0, S_1). When the individual Output Enable ($\overline{E}_{0a}$, $\overline{E}_{0b}$) inputs of the 4-input multiplexers are HIGH, the outputs are forced to a HIGH impedance (HIGH Z) state.

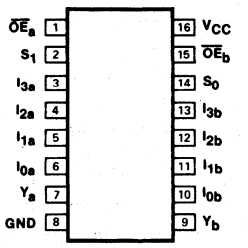
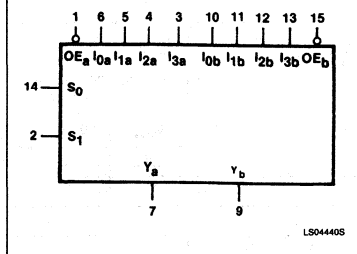
5

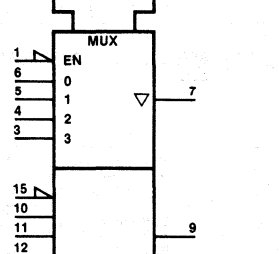
PIN CONFIGURATION



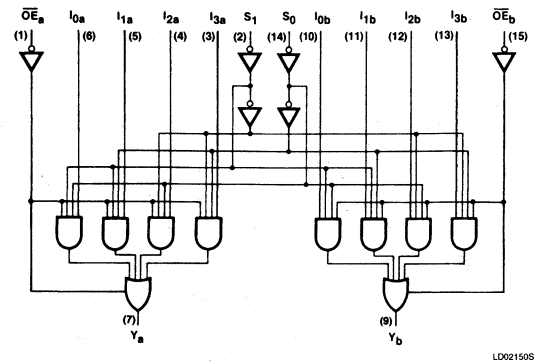
LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



LOGIC DIAGRAM



V_{CC} = Pin 16
GND = Pin 8

The '253 is the logic implementation of a 2-pole, 4-position switch; the position of the switch being determined by the logic levels supplied to the two Select inputs. Logic equations for the outputs are shown below:

$$Y_a = \overline{OE}_a \cdot (I_{0a} \cdot \overline{S}_1 \cdot \overline{S}_0 + I_{1a} \cdot \overline{S}_1 \cdot S_0 + I_{2a} \cdot S_1 \cdot \overline{S}_0 + I_{3a} \cdot S_1 \cdot S_0)$$

$$Y_b = \overline{OE}_b \cdot (I_{0b} \cdot \overline{S}_1 \cdot \overline{S}_0 + I_{1b} \cdot \overline{S}_1 \cdot S_0 + I_{2b} \cdot S_1 \cdot \overline{S}_0 + I_{3b} \cdot S_1 \cdot S_0)$$

All but one device must be in the HIGH impedance state to avoid high currents exceeding the maximum ratings, if the outputs of the 3-State devices are tied together. Design of the Output Enable signals must ensure that there is no overlap.

Signetics

74LS256
Latch

Dual 4-Bit Addressable Latch
Product Specification

Logic Products

FEATURES

- **Combines dual demultiplexer and 8-bit latch**
- **Serial-to-parallel capability**
- **Output from each storage bit available**
- **Random (addressable) data entry**
- **Easily expandable**
- **Common Clear input**
- **Useful as dual 1-of-4 active HIGH decoder**

DESCRIPTION

The '256 dual addressable latch has four distinct modes of operation and are selectable by controlling the Clear and Enable inputs (see Function Table). In the addressable latch mode, data at the Data (D) inputs is written into the addressed latches. The addressed latches will follow the Data input with all unaddressed latches remaining in their previous states.

In the memory mode, all latches remain in their previous states and are unaffected by the Data or Address inputs. To eliminate the possibility of entering erroneous data in the latches, the enable should be held HIGH (inactive) while the address lines are changing. In the dual 1-of-4 decoding or demultiplexing mode ($\overline{CLR}$ = $\overline{E}$ = LOW), addressed outputs will follow the level of the D inputs, with all other outputs LOW. In the clear mode, all outputs are LOW and unaffected by the Address and Data inputs.

Data Selectors/Multiplexers

Quad 2-Line To 1-Line Data Selector/Multiplexer (3-State)
Product Specification

Logic Products

FEATURES
- **Multifunction capability**
- **Non-inverting data path**
- **3-State outputs**

DESCRIPTION
The '257 has four identical 2-input multiplexers with 3-State outputs which select 4 bits of data from two sources under control of a common Data Select input (S). The I_0 inputs are selected when the Select input is LOW and the I_1 inputs are selected when the Select input is HIGH. Data appears at the outputs in true (non-inverted) form from the selected outputs.

The '257 is the logic implementation of a 4-pole, 2-position switch where the position of the switch is determined by the logic levels supplied to the Select input.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74LS257A	13ns	9mA

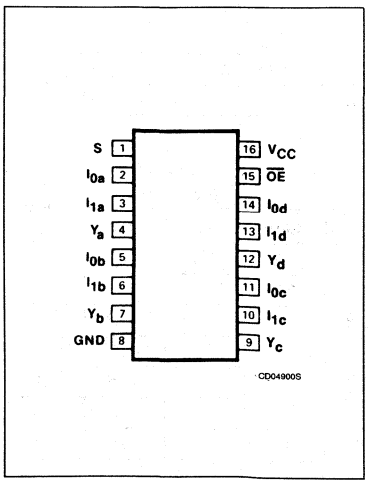
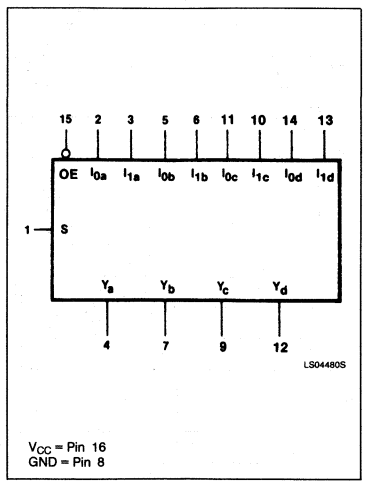
Other	Inputs	1Sul	1LSul
All	Outputs	10Sul	30LSul

NOTE:
A 74S unit load (Sul) is understood to be 50μA I_{IH} and −2.0mA I_{IL}, and a 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

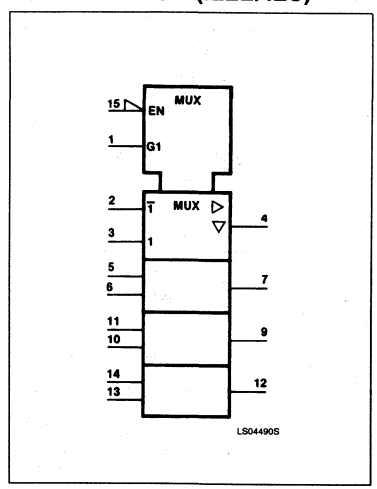
PIN CONFIGURATION



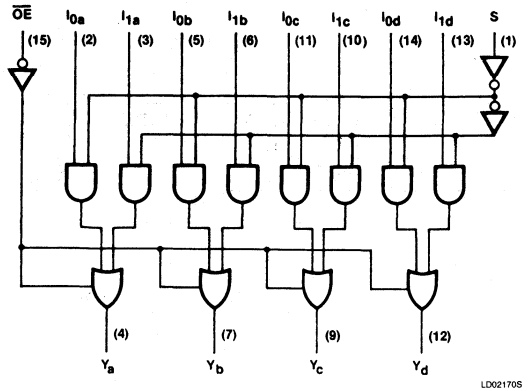
LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



LOGIC DIAGRAM



V_{CC} = Pin 16
GND = Pin 8

Outputs are forced to a HIGH impedance "off" state when the Output Enable input ($\overline{OE}$) is HIGH. All but one device must be in the HIGH impedance state to avoid currents exceeding the maximum ratings if outputs are tied together. Design of the output enable signals must ensure that there is no overlap when outputs of 3-state devices are tied together.

FUNCTION TABLE

Quad 2-Line To 1-Line Data Selector/Multiplexer (3-State)
Product Specification

Logic Products

FEATURES
- **Multifunction capability**
- **Inverting data path**
- **3-State outputs**
- **See '257 for non-inverting version**

DESCRIPTION
The '258 has four identical 2-input multiplexers with 3-State outputs which select 4 bits of data from two sources under control of a common Data Select input (S). The I_0 inputs are selected when the Select input is LOW and the I_1 inputs are selected when the Select input is HIGH. Data appears at the outputs in inverted (complementary) form.

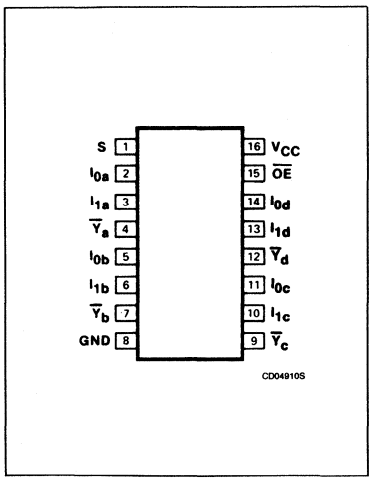
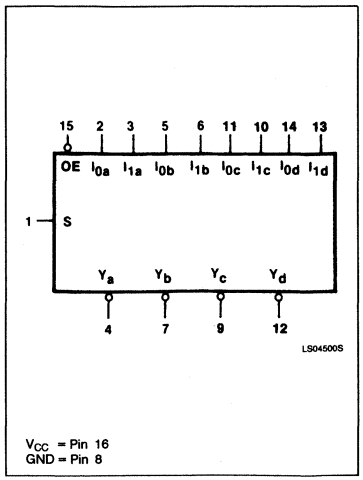
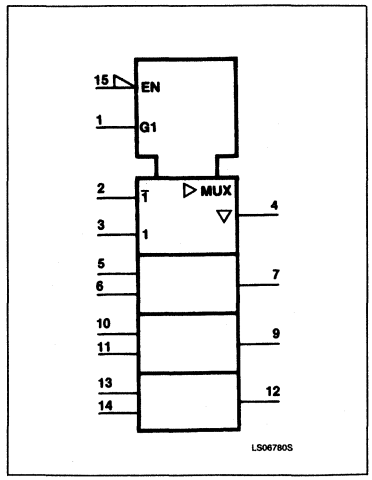
PIN CONFIGURATION



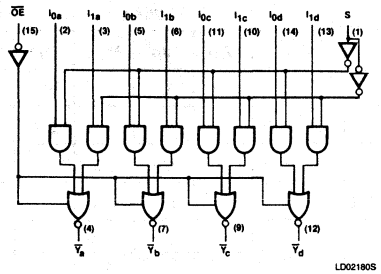
LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



LOGIC DIAGRAM



V_{CC} = Pin 16
GND = Pin 8

The '258 is the logic implementation of a 4-pole, 2-position switch where the position of the switch is determined by the logic levels supplied to the Select input.

Outputs are forced to a HIGH impedance "off" state when the Output Enable input ($\overline{OE}$) is HIGH. All but one device must be in the HIGH impedance state to avoid currents exceeding the maximum ratings if outputs of the 3-state devices are tied together. Design of the Output Enable signals must ensure that there is no overlap when outputs of 3-state devices are tied together.

FUNCTION TABLE

OUTPUT ENABLE	SELECT INPUT	DATA INPUTS		OUTPUTS
$\overline{OE}$	S	I_0	I_1	$\overline{Y}$
H	X	X	X	(Z)
L	H	X	L	H
L	H	X	H	L
L	L	L	X	H
L	L	H	X	L

H = HIGH voltage level
L = LOW voltage level
X = Don't care
(Z) = HIGH impedance (off) state

Signetics

74LS259
Latch

8-Bit Addressable Latch
Product Specification

Logic Products

FEATURES

- **Combines demultiplexer and 8-bit latch**
- **Serial-to-parallel capability**
- **Output from each storage bit available**
- **Random (addressable) data entry**
- **Easily expandable**
- **Common Clear input**
- **Useful as a 1-of-8 active HIGH decoder**

DESCRIPTION

The '259 addressable latch has four distinct modes of operation that are selectable by controlling the Clear and Enable inputs (see Function Table). In the addressable latch mode, data at the Data (D) inputs is written into the addressed latches. The addressed latches will follow the Data input with all unaddressed latches remaining in their previous states. In the memory mode, all latches remain in their previous states and are unaffected by the Data or Address inputs. To eliminate the possibility of entering erroneous data in the latches, the enable should be held HIGH (inactive) while the address lines are changing. In the 1-of-8 decoding or demultiplexing mode ($\overline{CLR}$ = $\overline{E}$ = LOW), addressed outputs will follow the level of the D inputs, with all other outputs LOW. In the clear mode, all outputs are LOW and unaffected by the Address and Data inputs.

Signetics

74LS273, S273
Flip-Flops

Octal D Flip-Flops
Product Specification

Logic Products

FEATURES

- **Ideal buffer for MOS microprocessor or memory**
- **Eight edge-triggered D flip-flops**
- **High speed Schottky version available**
- **Buffered common clock**
- **Buffered, asynchronous Master Reset**
- **Slim 20-pin plastic and ceramic DIP packages**
- **See '377 for Clock Enable version**
- **See '373 for transparent latch version**
- **See '374 for 3-state version**

DESCRIPTION

The '273 has eight edge-triggered D-type flip-flops with individual D inputs and Q outputs. The common buffered Clock (CP) and Master Reset ($\overline{MR}$) inputs load and reset (clear) all flip-flops simultaneously.

The register is fully edge triggered. The state of each D input, one set-up time before the LOW-to-HIGH clock transition, is transferred to the corresponding flip-flop's Q output.

All outputs will be forced LOW independently of Clock or Data inputs by a LOW voltage level on the $\overline{MR}$ input. The device is useful for applications where the true output only is required and the Clock and Master Reset are common to all storage elements.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)

74S280
Parity Generator/Checker

9-Bit Odd/Even Parity Generator/Checker
Product Specification

Logic Products

FEATURES

- **Buffered inputs — one normalized load**
- **Word-length easily expanded by cascading**
- **Similar pin configuration to '180 for easy system up-grading**

DESCRIPTION

The '280 is a 9-bit parity generator or checker commonly used to detect errors in high-speed data transmission or data retrieval systems. Both Even and Odd parity outputs are available for generating or checking even or odd parity on up to 9 bits.

The Even parity output (Σ_E) is HIGH when an even number of Data inputs ($I_0 - I_8$) are HIGH. The Odd parity output (Σ_O) is HIGH when an odd number of data inputs are HIGH.

Expansion to larger word sizes is accomplished by tying the Even outputs (Σ_E) of up to nine parallel devices to the Data inputs of the final stage. This expansion scheme allows an 81-bit data word to be checked in less than 40ns with the 'S280.

Signetics

74LS283
Adder

4-Bit Full Adder With Fast Carry
Product Specification

Logic Products

FEATURES
- **High-speed 4-bit binary addition**
- **Cascadable in 4-bit increments**
- **Fast internal carry lookahead**

DESCRIPTION
The '283 adds two 4-bit binary words (A_n plus B_n) plus the incoming carry. The binary sum appears on the Sum outputs ($\Sigma_1 - \Sigma_4$) and the outgoing carry (C_{OUT}) according to the equation:

$$C_{IN} + (A_1 + B_1) + 2(A_2 + B_2) + 4(A_3 + B_3) + 8(A_4 + B_4) = \Sigma_1 + 2\Sigma_2 + 4\Sigma_3 + 8\Sigma_4 + 16C_{OUT}$$

Where (+) = plus.

Due to the symmetry of the binary add function, the '283 can be used with either all active HIGH operands (positive logic) or all active LOW operands (negative logic) – see Function Table. In case of all active LOW operands the results $\Sigma_1 - \Sigma_4$ and C_{OUT} should be interpreted also as active LOW. With active HIGH inputs, C_{IN} cannot be left open; it must be held LOW when no "carry in" is intended. Interchanging inputs of equal weight does not affect the operation, thus C_{IN}, A_1, B_1 can arbitrarily be assigned to pins 5, 6, 7, etc.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74LS283	13ns	20mA

Signetics

74LS290
Counter

Decade Counter
Product Specification

Logic Products

DESCRIPTION

The '290 is a 4-bit, ripple type decade counter. The device consists of four master-slave flip-flops internally connected to provide a divide-by-two section and a divide-by-five section. Each section has a separate Clock input to initiate state changes of the counter on the HIGH-to-LOW clock transition. State changes of the Q outputs do not occur simultaneously because of internal ripple delays. Therefore, decoded output signals are subject to decoding spikes and should not be used for clocks or strobes.

A gated AND asynchronous Master Reset ($MR_1 \cdot MR_2$) is provided which overrides both clocks and resets (clears) all the flip-flops. Also provided is a gated AND asynchronous Master Set ($MS_1 \cdot MS_2$) which overrides the Clock and MR inputs, setting the outputs to nine (HLLH).

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)

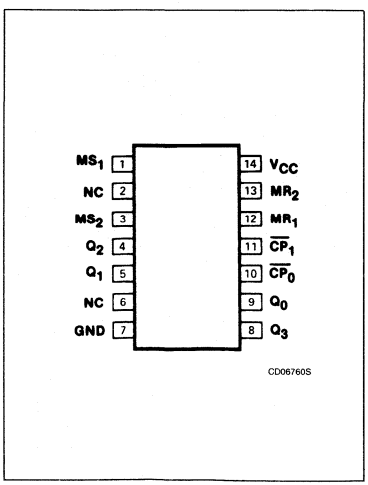
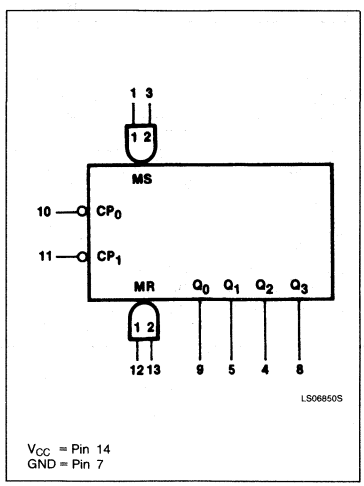
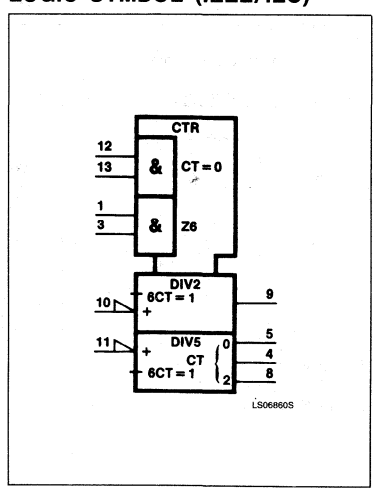
PIN CONFIGURATION



LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



Since the output from the divide-by-two section is not internally connected to the succeeding stages, the device may be operated in various counting modes. In a BCD (8421) counter the $\overline{CP}_1$ input must be externally connected to the Q_0 output. The $\overline{CP}_0$ input receives the incoming count, producing a BCD count sequence. In a symmetrical bi-quinary divide-by-ten counter the Q_3 output must be connected externally to the $\overline{CP}_0$ input. The input count is then applied to the $\overline{CP}_1$ input and a divide-by-ten square wave is obtained at output Q_0. To operate as a divide-by-two and a divide-by-five counter, no external interconnections are required. The first flip-flop is used as a binary element for the divide-by-two function ($\overline{CP}_0$ as the input and Q_0 as the output). The $\overline{CP}_1$ input is used to obtain divide-by-five operation at the Q_3 output.

Since the output from the divide-by-two section is not internally connected to the succeeding stages, the device may be operated in various counting modes. In a 4-bit ripple counter the output Q_0 must be connected externally to input $\overline{CP}_1$. The input count pulses are applied to input $\overline{CP}_0$. Simultaneous divisions of 2, 4, 8 and 16 are preformed at the Q_0, Q_1, Q_2 and Q_3 outputs as shown in the function table. As a 3-bit ripple counter the input count pulses are applied to input $\overline{CP}_1$. Simultaneous frequency divisions of 2, 4 and 8 are available at the Q_1, Q_2 and Q_3 outputs. Independent use of the first flip-flop is available if the reset function coincides with reset of the 3-bit ripple-through counter.

Shift Register

4-Bit Shift Register With 3-State Outputs
Product Specification

Logic Products

FEATURES
- **4-bit parallel load shift register**
- **Independent 3-State buffer outputs**
- **See '395 for serial expansion and Master Reset version**

DESCRIPTION
The '295B is a 4-Bit Shift Register with serial and parallel synchronous operating modes and four 3-State buffer outputs. The shifting and loading operations are controlled by the state of the Parallel Enable (PE) input. When PE is HIGH, data is loaded from the Parallel Data outputs ($D_0 - D_3$) into the register synchronous with the HIGH-to-LOW transition of the Clock input ($\overline{CP}$). When PE is LOW, the data at the Serial Data input (D_S) is loaded into the Q_0 flip-flop, and the data in the register is shifted one bit to the right in the direction ($Q_0 \rightarrow Q_1 \rightarrow Q_2 \rightarrow Q_3$) synchronous with the negative transition of the Clock. The PE and Data inputs are fully edge triggered and must be stable only one set-up time prior to the HIGH-to-LOW transition of the Clock.

The 3-State output buffers are designed to drive heavily loaded 3-state buses or large capacitive loads. The active HIGH Output Enable (OE) controls all four 3-state buffers independent of the register operation. When OE is HIGH the data in the register appears at the outputs. When OE is LOW the outputs are in the HIGH impedance "off" state, which means they will neither drive nor load the bus.

I_{CC}	Supply current[4] (total)	V_{CC} = MAX	Condition 1		16	29	mA
			Condition 2		17	33	mA

NOTES:

1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. I_{OS} is tested with V_{OUT} = +0.5V and V_{CC} = V_{CC} MAX + 0.5V. Not more than one output should be shorted at a time and duration of the short circuit should not exceed one second.
4. Measure I_{CC} with the outputs open, D_S and PE at 4.5V, and the Data inputs grounded under the following conditions: *Condition 1 :* OE at 4.5V and a momentary 3V, then ground, applied to the Clock input.
   Condition 2 : OE and Clock input grounded.

AC ELECTRICAL CHARACTERISTICS $T_A = 25°C$, $V_{CC} = 5.0V$

Registers

Quad 2-Port Register
Product Specification

Logic Products

FEATURES
- **Fully synchronous operation**
- **Select from two data sources**
- **Buffered, negative edge triggered clock**

DESCRIPTION
This device is a high-speed Quad 2-Port Register. It selects 4 bits of data from two sources (Ports) under the control of a common Select input (S). The selected data is transferred to the 4-bit output register synchronous with the HIGH-to-LOW transition of the Clock input ($\overline{CP}$). The 4-bit register is fully edge triggered. The Data inputs (I_0 and I_1) and Select input (S) must be stable only one set-up time prior to the HIGH-to-LOW transition of the clock for predictable operation.

Plastic DIP	N74S350N

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

DESCRIPTION

The '350 is a combination logic circuit that shifts a 4-bit word from 0 to 3 places. No clocking is required as with shift registers.

The '350 can be used to shift any number of bits any number of places up or down by suitable interconnection. Shifting can be:

1. Logical – with logic zeros filled in at either end of the shifting field.
2. Arithmetic – where the sign bit is extended during a shift down.
3. End around – where the data word forms a continuous loop.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74S
All	Inputs	1Sul
All	Outputs	10Sul

NOTE:
A 74S unit load (Sul) is 50μA I_{IH} and −2.0mA I_{IL}.

The 3-State outputs are useful for bus interface applications or expansion to a larger number of shift positions in end around shifting. The active LOW Output Enable ($\overline{OE}$) input controls the state of the outputs. The outputs are in the HIGH impedance "off" state when $\overline{OE}$ is HIGH, and they are active when $\overline{OE}$ is LOW.

Signetics

74LS352
Multiplexer

Dual 4-Line to 1-Line Multiplexer
Product Specification

Logic Products

FEATURES
- **Inverting version of 'LS153**
- **Separate Enable for each section**
- **Common Select inputs**
- **See 'LS353 for 3-State version**

DESCRIPTION
The 'LS352 is a dual 4-input multiplexer that can select 2 bits of data from up to eight sources under control of the common Select inputs (S_0, S_1). The two 4-input multiplexer circuits have individual active LOW Enables ($\overline{E}_a$, $\overline{E}_b$) which can be used to strobe the outputs independently. Outputs (Y_a, Y_b) are forced HIGH when the corresponding Enables ($\overline{E}_a$, $\overline{E}_b$) are HIGH.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74LS352	15ns	6.2mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N74LS352N

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

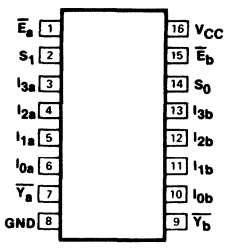
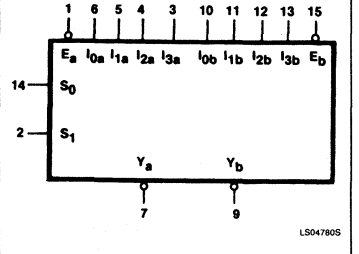
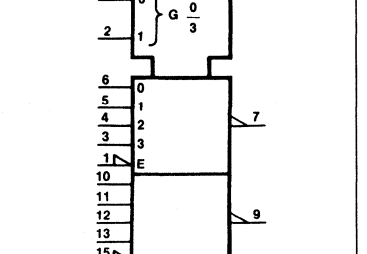
PIN CONFIGURATION



LOGIC SYMBOL

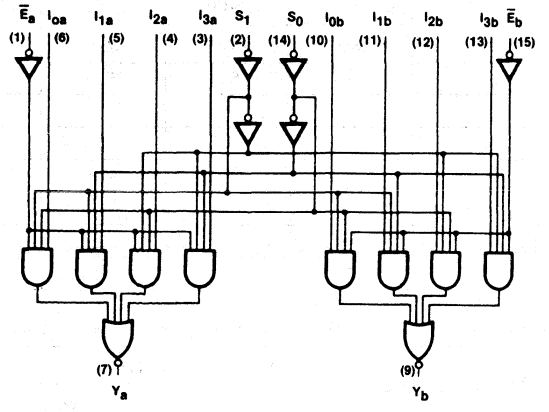


LOGIC SYMBOL (IEEE/IEC)



Multiplexer | 74LS352

LOGIC DIAGRAM



V_{CC} = Pin 16
GND = Pin 8

The device is the logical implementation of a 2-pole, 4-position switch, where the position of the switch is determined by the logic levels supplied to the two Select inputs. The logic equations for the outputs are shown below.

$$\overline{Y_a} = \overline{E}_a \cdot (I_{0a} \cdot \overline{S}_1 \cdot \overline{S}_0 + I_{1a} \cdot \overline{S}_1 \cdot S_0 + I_{2a} \cdot S_1 \cdot \overline{S}_0 + I_{3a} \cdot S_1 \cdot S_0)$$

$$\overline{Y_b} = \overline{E}_b \cdot (I_{0b} \cdot \overline{S}_1 \cdot \overline{S}_0 + I_{1b} \cdot \overline{S}_1 \cdot S_0 + I_{2b} \cdot S_1 \cdot \overline{S}_0 + I_{3b} \cdot S_1 \cdot S_0)$$

The 'LS352 can be used to move data to a common output bus from a group of registers. The state of the Select inputs would determine the particular register from which the data came. An alternative application is as a function generator. The device can generate two functions or three variables. This is useful for implementing highly irregular random logic.

Signetics

74LS353
Multiplexer

Dual 4-Input Multiplexer (3-State)
Product Specification

Logic Products

FEATURES

- **Inverting version of 'LS253**
- **3-State outputs for bus interface and multiplex expansion**
- **Common Select inputs**
- **Separate Output Enable inputs**

DESCRIPTION

The 'LS353 has two identical 4-input multiplexers with 3-State outputs which select two bits from eight sources selected by common Select inputs (S_0, S_1). When the individual Output Enable ($\overline{E}_{0a}$, $\overline{E}_{0b}$) inputs of the 4-input multiplexers are HIGH, the outputs are forced to a HIGH impedance (HIGH Z) state.

TYPE	TYPICAL PROPAGATION DELAY (FROM DATA)	TYPICAL SUPPLY CURRENT (TOTAL)
74LS353	12ns	8mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C

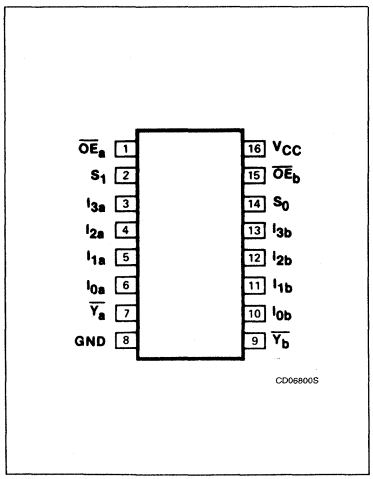
INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

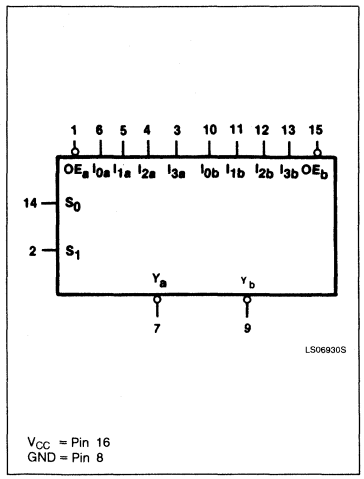
PINS	DESCRIPTION	74LS
All	Inputs	1LSul
All	Outputs	10LSul

NOTE:
74LS unit load (LSul) is 20μA, I_{IH} and −0.4mA I_{IL}.

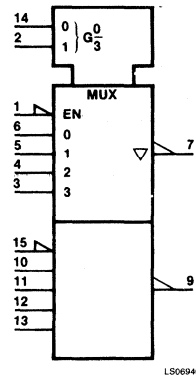
PIN CONFIGURATION



LOGIC SYMBOL

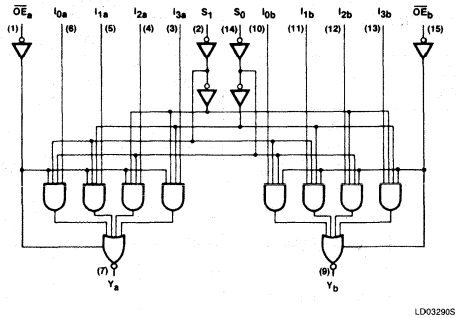


LOGIC SYMBOL (IEEE/IEC)



Multiplexer | 74LS353

LOGIC DIAGRAM



V_{CC} = Pin 16
GND = Pin 8

The 'LS353 is the logic implementation of a 2-pole, 4-position switch; the position of the switch being determined by the logic levels supplied to the two Select inputs. Logic equations for the outputs are shown below:

$$\overline{Y}_a = \overline{OE}_a \cdot (I_{0a} \cdot \overline{S}_1 \cdot \overline{S}_0 + I_{1a} \cdot \overline{S}_1 \cdot S_0 + I_{2a} \cdot S_1 \cdot \overline{S}_0 + I_{3a} \cdot S_1 \cdot S_0)$$

$$\overline{Y}_b = \overline{OE}_b \cdot (I_{0b} \cdot \overline{S}_1 \cdot \overline{S}_0 + I_{1b} \cdot \overline{S}_1 \cdot S_0 + I_{2b} \cdot S_1 \cdot \overline{S}_0 + I_{3b} \cdot S_1 \cdot S_0)$$

All but one device must be in the HiGH impedance state to avoid high currents exceeding the maximum ratings, if the outputs of the 3-State devices are tied together. Design of the Output Enable signals must ensure that there is no overlap.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74LS
All	Inputs	1LSul
All	Outputs	30LSul

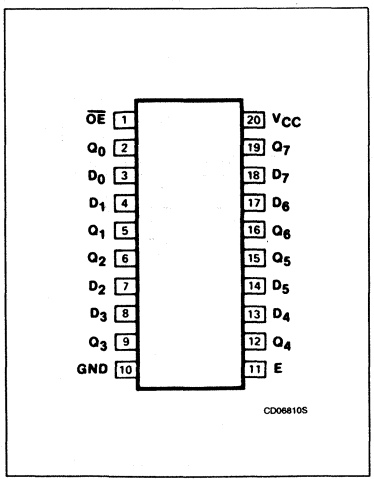
NOTE:
A 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

DESCRIPTION

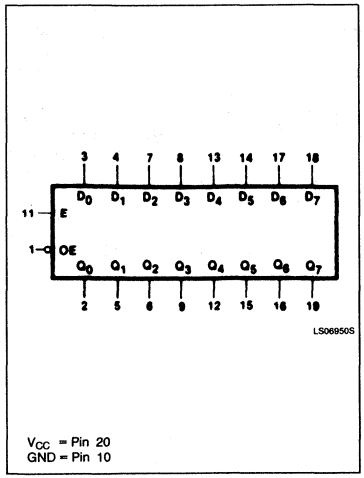
The '363 is an octal transparent latch coupled to eight 3-state output buffers. The two sections of the device are controlled independently by Latch Enable (E) and Output Enable ($\overline{OE}$) control gates.

The data on the D inputs is transferred to the Latch outputs when the Latch Enable (E) input is HIGH. The latch remains transparent to the Data inputs while E is HIGH, and stores the data present one set-up time before the HIGH-to-LOW enable transition. The enable gate has about 400mV of hysteresis built in to help minimize problems that signal and ground noise can cause on the latching operation.

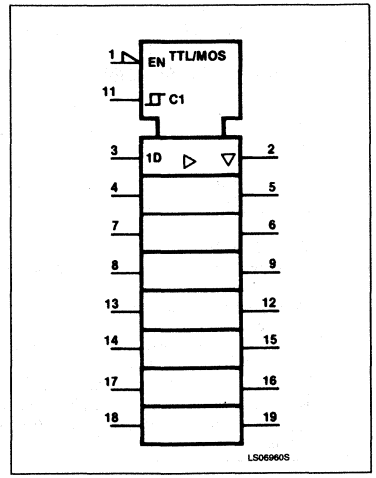
PIN CONFIGURATION



LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



Latch | 74LS363

The 3-state output buffers are designed to drive heavily loaded 3-state buses, MOS memories, or MOS microprocessors. The output HIGH level differs from the normal 3-state buffer by driving the output about 1V closer to V_{CC}, or to over 3.5V at minimum V_{CC}. This feature makes these devices ideal for driving MOS memories or microprocessors with thresholds of 2.4V to 3.5V.

The active LOW Output Enable ($\overline{OE}$) controls all eight 3-state buffers independent of the latch operation. When $\overline{OE}$ is LOW, the latched or transparent data appears at the outputs. When $\overline{OE}$ is HIGH, the outputs are in the HIGH impedance "off" state, which means they will neither drive nor load the bus.

LOGIC DIAGRAM

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74LS
All	Inputs	1LSul
All	Outputs	30LSul

NOTE:
A 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

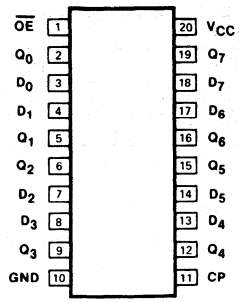
DESCRIPTION

The '364 is an 8-bit edge-triggered register coupled to eight 3-State output buffers. The two sections of the device are controlled independently by the Clock (CP) and Output Enable ($\overline{OE}$) control gates.

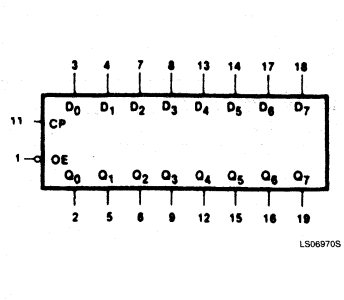
The register is fully edge triggered. The state of each D input, one set-up time before the LOW-to-HIGH clock transition, is transferred to the corresponding flip-flop's Q output. The clock buffer has about 400mV of hysteresis built in to help minimize problems that signal and ground noise can cause on the clocking operation.

5

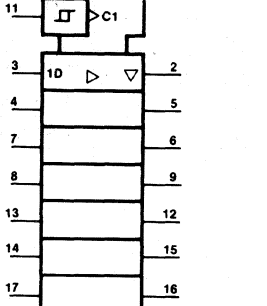
PIN CONFIGURATION



LOGIC SYMBOL

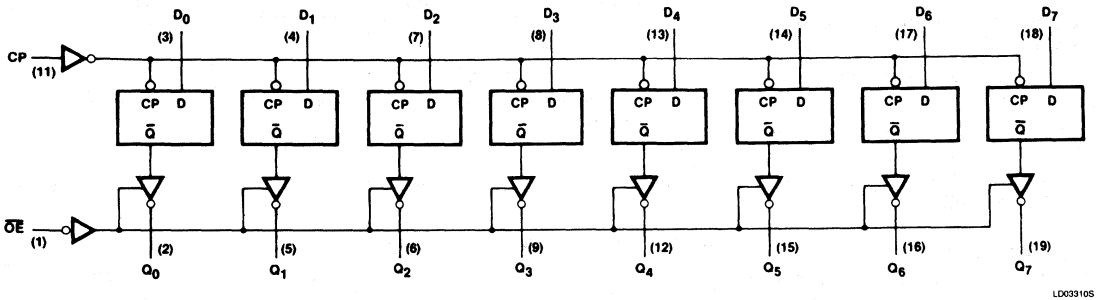


LOGIC SYMBOL (IEEE/IEC)



The 3-State output buffers are designed to drive heavily loaded 3-State buses, MOS memories, or MOS microprocessors. The output HIGH level differs from the normal 3-State buffer by driving the output about 1V closer to V_{CC}, or to over 3.5V at minimum V_{CC}. This feature makes these devices ideal for driving MOS memories or microprocessors with thresholds of 2.4V to 3.5V. The active LOW Output Enable ($\overline{OE}$) controls all eight 3-State buffers independent of the register operation. When $\overline{OE}$ is LOW, the data in the register appears at the outputs. When $\overline{OE}$ is HIGH, the outputs are in the HIGH impedance "off" state, which means they will neither drive nor load the bus.

LOGIC DIAGRAM



V_{CC} = Pin 20
GND = Pin 10

MODE SELECT—FUNCTION TABLE

OPERATING MODES	INPUTS			INTERNAL REGISTER	OUTPUTS
	$\overline{OE}$	CP	D_n		$Q_0 - Q_7$
Load and read register	L	↑	l	L	L
	L	↑	h	H	H
Latch register and disable outputs	H	↑	l	L	(Z)
	H	↑	h	H	(Z)

H = HIGH voltage level
h = HIGH voltage level one set-up time prior to the LOW-to-HIGH clock transtition
L = LOW voltage level
l = LOW voltage level one set-up time prior to the LOW-to-HIGH clock transition
(Z) = HIGH impedance "off" state
↑ = LOW-to-HIGH clock transition

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

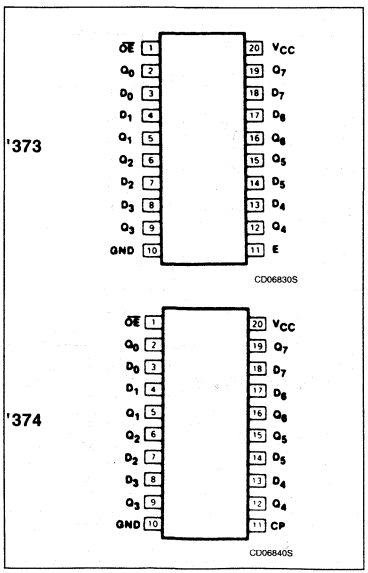
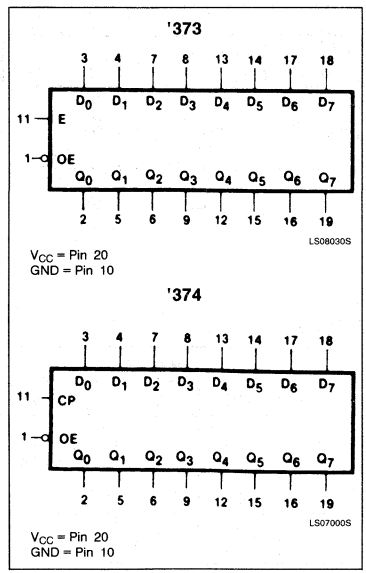
PINS	DESCRIPTION	74S	74LS
All	Inputs	1Sul	1LSul
All	Outputs	10Sul	30LSul

NOTE:
Where a 74S unit load (Sul) is 50μA I_{IH} and −2.0mA I_{IL}, and a 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

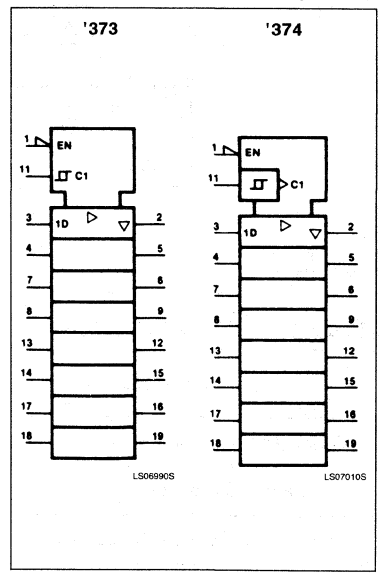
PIN CONFIGURATION



LOGIC SYMBOL



LOGIC SYMBOL (IEEE/EC)



The data on the D inputs are transferred to the latch outputs when the Latch Enable (E) input is HIGH. The latch remains transparent to the data inputs while E is HIGH, and stores the data present one set-up time before the HIGH-to-LOW enable transition. The enable gate has hysteresis built in to help minimize problems that signal and ground noise can cause on the latching operation.

The 3-State output buffers are designed to drive heavily loaded 3-State buses, MOS memories, or MOS microprocessors. The active LOW Output Enable ($\overline{OE}$) controls all eight 3-State buffers independent of the latch operation. When $\overline{OE}$ is LOW, the latched or transparent data appears at the outputs. When $\overline{OE}$ is HIGH, the outputs are in the HIGH impedance "off" state, which means they will neither drive nor load the bus.

The '374 is an 8-bit, edge-triggered register coupled to eight 3-State output buffers. The two sections of the device are controlled independently by the Clock (CP) and Output Enable ($\overline{OE}$) control gates.

The register is fully edge triggered. The state of each D input, one set-up time before the LOW-to-HIGH clock transition, is transferred to the corresponding flip-flop's Q output. The clock buffer has hysteresis built in to help minimize problems that signal and ground noise can cause on the clocking operation.

The 3-State output buffers are designed to drive heavily loaded 3-State buses, MOS memories, or MOS microprocessors. The active LOW Output Enable ($\overline{OE}$) controls all eight 3-State buffers independent of the register operation. When $\overline{OE}$ is LOW, the data in the register appears at the outputs. When $\overline{OE}$ is HIGH, the outputs are in the HIGH impedance "off" state, which means they will neither drive nor load the bus.

D = Diodes are 1N916, 1N3064, or equivalent.

$R_X = 1k\Omega$ for 74, 74S, $R_X = 5k\Omega$ for 74LS.

t_{TLH}, t_{THL} Values should be less than or equal to the table entries.

Signetics

74LS375
Latch

Quad Bistable Latch
Product Specification

Logic Products

FEATURES
- **Quad transparent latch**
- **Complementary outputs**

DESCRIPTION
The '375 has two independent 2-bit transparent latches. Each 2-bit latch is controlled by an active HIGH Enable input (E). When E is HIGH, the data enters the latch and appears at the Q output. The Q outputs follow the Data inputs as long as E is HIGH. The data on the D inputs one set-up time before the HIGH-to-LOW transition of the enable will be stored in the latch. The latched output remains stable as long as the enable is LOW.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74LS
All	Inputs	1LSul
All	Outputs	10LSul

NOTE:
Where a 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

DESCRIPTION

The '377 has eight edge-triggered, D-type flip-flops with individual D inputs and Q outputs. The common buffered Clock (CP) input loads all flip-flops simultaneously, when the Clock Enable ($\overline{CE}$) is LOW.

The register is fully edge triggered. The state of each D input, one set-up time before the LOW-to-HIGH clock transition, is transferred to the corresponding flip-flop's Q output. The $\overline{CE}$ input must be stable only one set-up time prior to the LOW-to-HIGH clock transition for predictable operation.

74LS390
Counter

Dual Decade Ripple Counter
Product Specification

Logic Products

FEATURES

- **Two BCD decade or bi-quinary counters**
- **One package can be configured to divide-by-2, 4, 5, 10, 20, 25, 50 or 100**
- **Two Master Resets to clear each decade counter individually**

DESCRIPTION

The '390 is a dual 4-bit decade ripple counter divided into four separately clocked sections. The counter has two divide-by-two sections and two divide-by-five sections. These sections are normally used in a BCD decade or a bi-quinary configuration, since they share a common Master Reset input. If the two Master Resets can be used to simultaneously clear all 8 bits of the counter, a number of counting configurations are possible within one package. The separate clocks of each section allow ripple counter or frequency division applications of divide-by-2, 4, 5, 10, 20, 25, 50 or 100.

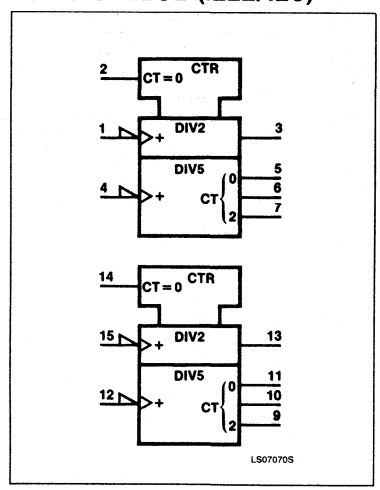
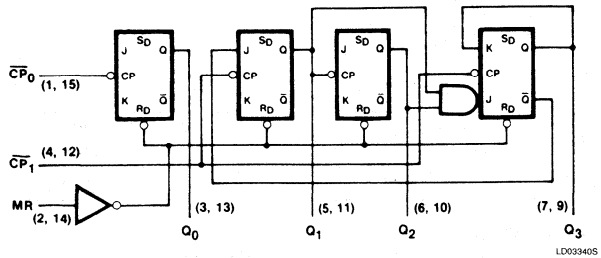
LOGIC SYMBOL (IEEE/IEC)



Counter | 74LS390

LOGIC DIAGRAM



V_{CC} = Pin 16
GND = Pin 8
( ) = Pin numbers

Each section is triggered by the HIGH-to-LOW transition of the Clock ($\overline{CP}$) inputs. For BCD decade operation, the Q_0 output is connected to the $\overline{CP}_1$ input of the divide-by-five section. For bi-quinary decade operation (50% duty cycle output), the Q_3 output is connected to the CP_0 input, and Q_0 becomes the decade output.

The Master Resets (MR_a and MR_b) are active HIGH synchronous inputs to each decade counter which operate on the portion of the counter identified by the "a" and "b" suffixes in the Pin Configuration. A HIGH level on the MR input overrides the clocks and sets the four outputs LOW.

BCD COUNT SEQUENCE FOR ½ THE '390

COUNT	OUTPUTS			
	Q_0	Q_1	Q_2	Q_3
0	L	L	L	L

74LS393
Counter

Dual 4-Bit Binary Ripple Counter
Product Specification

Logic Products

FEATURES

- **Two 4-bit binary counters**
- **Divide-by any binary module up to 28 in one package**
- **Two Master Resets to clear each 4-bit counter individually**

DESCRIPTION

The '393 is a Dual 4-bit Binary Ripple Counter with separate Clock and Master Reset inputs to each counter. The operation of each half of the '393 is the same as the '93 except no external clock connections are required. The counters are triggered by a HIGH-to-LOW transition of the Clock ($\overline{CP}_a$ and $\overline{CP}_b$) inputs. The counter outputs are internally connected to provide Clock inputs to succeeding stages. The outputs of the ripple counter do not change synchronously and should not be used for high speed address decoding.

Signetics

74LS395A
Shift Register

4-Bit Cascadable Shift Register With 3-State Outputs
Product Specification

Logic Products

FEATURES
- **4-bit parallel load shift register**
- **Independent 3-state buffer outputs**
- **Separate Q_3 output for serial expansion**
- **Asynchronous Master Reset**

DESCRIPTION
The '395 is a 4-Bit Shift Register with serial and parallel synchronous operating modes and four 3-state buffer outputs. The shifting and loading operations are controlled by the state of the Parallel Enable (PE) input. When PE is HIGH, data is loaded from the Parallel Data inputs ($D_0 - D_3$) into the register synchronous with the HIGH-to-LOW transition of the Clock input ($\overline{CP}$). When PE is LOW, the data at the Serial Data input (D_S) is loaded into the Q_0 flip-flop, and the data in the register is shifted one bit to the right in the direction ($Q_0 \rightarrow Q_1 \rightarrow Q_2 \rightarrow Q_3$) synchronous with the negative clock transition. The PE and Data inputs are fully edge-triggered and must be stable only one set-up prior to the HIGH-to-LOW transition of the clock.

The Master Reset ($\overline{MR}$) is an asynchronous active-LOW input. When LOW, the $\overline{MR}$ overrides the clock and all other inputs and clears the register.

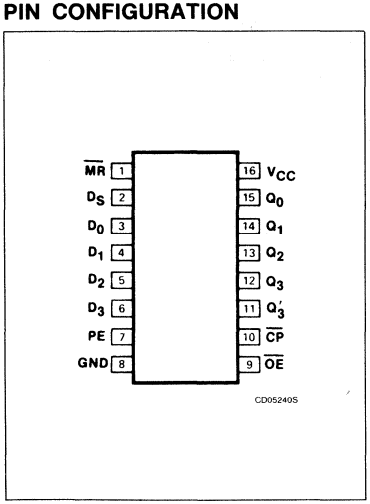
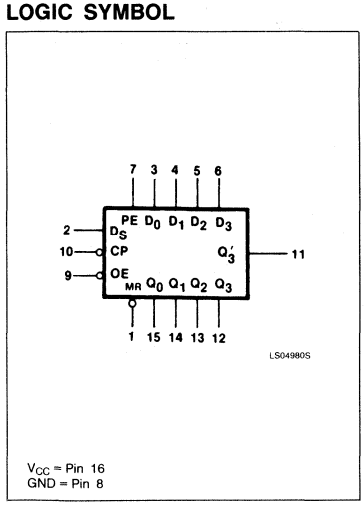
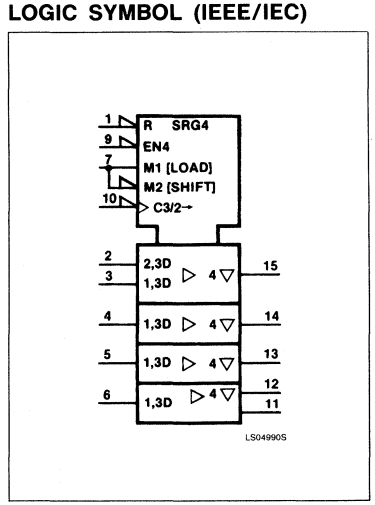
PIN CONFIGURATION



LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



Shift Register | 74LS395A

The 3-state output buffers are designed to drive heavily loaded 3-state buses, or large capacitive loads. The active-LOW Output Enable ($\overline{OE}$) controls all four 3-state buffers independent of the register operation. The data in the register appears at the outputs when $\overline{OE}$ is LOW. The outputs are in the HIGH impedance "off" state, which means they will neither drive nor load the bus when $\overline{OE}$ is HIGH. The output from the last stage is brought out separately. This output (Q_3') is tied to the Serial Data input (D_S) of the next register for serial expansion applications. The Q_3 output is not affected by the 3-state buffer operation.

NOTES:
1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. I_{OS} is tested with V_{OUT} = +0.5V and V_{CC} = V_{CC} MAX + 0.5V. Not more than one output should be shorted at a time and duration of the short circuit should not exceed one second.
4. Measure I_{CC} with D_S and Master Reset at 4.5V. The Data inputs grounded and outputs open under the following conditions: *Condition 1:* $\overline{OE}$ at 4.5V. A momentary 3V, then ground, applied to $\overline{CP}$. *Condition 2:* Ground $\overline{OE}$ and $\overline{CP}$ inputs.

AC ELECTRICAL CHARACTERISTICS T_A = 25°C, V_{CC} = 5.0V

Signetics

74LS445
Decoder/Driver

BCD-To-Decimal Decoder/Driver (Open Collector)
Product Specification

Logic Products

FEATURES

- **80mA output drive capability**
- **7V output breakdown voltage**
- **See '45 for 30V output voltage**
- **See '42 for standard TTL outputs**

DESCRIPTION

The '445 is a 1-of-10 decoder with open collector outputs. This decoder accepts BCD inputs on the A_0 to A_3 address lines and generates 10 mutually exclusive active LOW outputs. When an input code greater than "9" is applied, all outputs are HIGH. This device can therefore be used as a 1-of-8 decoder with A_3 used as an active LOW enable.

The '445 features an output breakdown voltage of 7V. This device is ideal as a lamp or solenoid driver.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74LS445	39ns	7mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N74LS445N

NOTE:

Signetics

74LS490
Counter

Dual BCD Decade Ripple Counter
Product Specification

Logic Products

FEATURES

- **Two BCD decade counters**
- **Asynchronous Master Set (set-to-9)**
- **Asynchronous Master Reset (clear)**

DESCRIPTION

The '490 is a Dual BCD Decade Ripple Counter with separate Clock, Master Set, and Master Reset inputs to each counter. The operation of each half of the '490 is the same as the '90 used in the BCD decade mode.

The counters are triggered by the HIGH-to-LOW transition of the Clock ($\overline{CP}$) inputs. No external connections are required to get the full BCD (8421) decade counting scheme from the counters. The counter outputs are internally connected as clocks or decoded inputs to succeeding stages. Since this is a ripple type counter, the outputs do not change synchronously and should not be used for high speed address decoding.

TYPE	TYPICAL f_{MAX}	TYPICAL SUPPLY CURRENT (TOTAL)
74LS490	55MHz	15mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N74LS490N

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74LS
$\overline{CP}$	Input	4LSul
MR, MS	Inputs	1LSul
$Q_0 - Q_3$	Outputs	10LSul

NOTE:
Where a 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

The Master Set (MS) and Master Reset (MR) are asynchronous active-HIGH inputs. The HIGH MR input overrides the clock and clears the associated 4 bits of the counter. The HIGH MS input overrides the clock and MR inputs and sets the associated 4 bits to nine (HLLH).

Signetics

74S534
Flip-Flop

Octal D Flip-Flop With 3-State Outputs
Product Specification

Logic Products

FEATURES

- **8-bit positive, edge-triggered register**
- **Inverting outputs**
- **3-State output buffers**
- **Common 3-State Output Enable**
- **Independent register and 3-State buffer operation**

DESCRIPTION

The '534 is an 8-bit, edge-triggered register coupled to eight 3-State inverting output buffers. The two sections of the device are controlled independently by the Clock (CP) and Output Enable ($\overline{OE}$) control gates.

The register is fully edge triggered. The state of each D input, one set-up time before the LOW-to-HIGH clock transition, is transferred to the corresponding flip-flop's $\overline{Q}$ output. The clock buffer has about 400mV of hysteresis built in to help minimize problems that signal and ground noise can cause on the clocking operation.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74S534	8ns	116mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N74S534N

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74S
All	Inputs	1Sul
All	Outputs	10Sul

NOTE:
Where a 74S unit load (Sul) is 50μA I_{IH} and −2.0mA I_{IL}.

The 3-State inverting output buffers are designed to drive heavily loaded 3-State buses, MOS memories, or MOS microprocessors. The active LOW Output Enable ($\overline{OE}$) controls all eight 3-State buffers independent of the register operation. When $\overline{OE}$ is LOW, the data in the register appears at the outputs. When $\overline{OE}$ is HIGH, the outputs are in the HIGH impedance "off" state, which means they will neither drive nor load the bus.

3-State Bidirectional Counters

'568A BCD Decade Up/Down Synchronous Counter (3-State)
'569A 4-Bit Binary Up/Down Synchronous Counter (3-State)
Product Specification

Logic Products

FEATURES
- **Speed improved over LS568/ LS569**
- **Synchronous counting and loading**
- **UP/DOWN counting**
- **BCD decade counter – '568A**
- **Modulo 16 binary counter – '569A**
- **Two Count Enable inputs for n-bit cascading**
- **Positive edge-triggered clock**
- **Asynchronous Master Reset**
- **3-State Counter outputs**
- **Gated Carry output**

DESCRIPTION
The '568A and '569A are synchronous presettable UP/DOWN counters featuring an internal carry look-ahead for applications in high speed counting designs.

Synchronous operation is provided by having all flip-flops clocked simultaneously so that the outputs change coincident with each other when so instructed by the Count-Enable inputs and internal gating. This mode of operation eliminates the output spikes which are normally associated with asynchronous (ripple clock) counters. A buffered Clock input triggers the flip-flops on the LOW-to-HIGH transition of the Clock.

TYPE	TYPICAL f_{Max}	TYPICAL SUPPLY CURRENT (TOTAL)

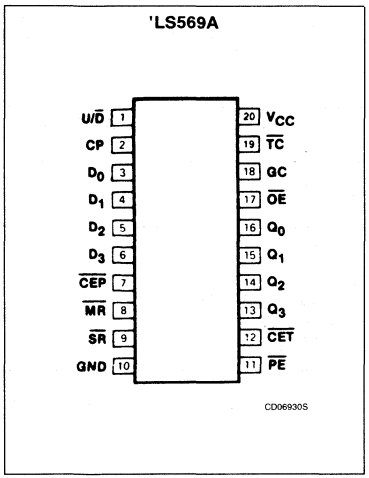
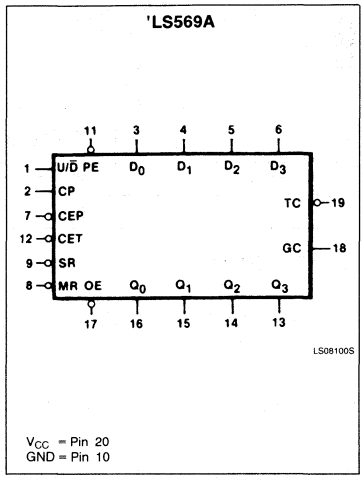
3-State Bidirectional Counters | 74LS568A, 569A

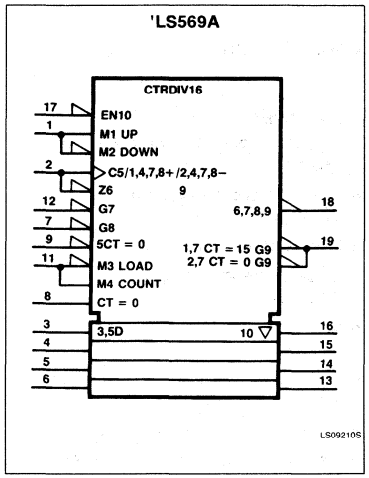
PIN CONFIGURATION



LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



The counter is fully programmable; that is, the outputs may be preset to either level. Presetting is synchronous with the Clock, and takes place regardless of the levels of the Count Enable inputs. A LOW level on the Parallel Enable ($\overline{PE}$) input disables the counter and causes the data at the D_n inputs to be loaded into the counter on the next LOW-to-HIGH transition of the Clock. The Synchronous Reset ($\overline{SR}$), when LOW one set-up time before the LOW-to-HIGH transition of the Clock, overrides the $\overline{CEP}$, $\overline{CET}$ and $\overline{PE}$ inputs, and causes the flip-flops to go LOW coincident with the positive Clock transition.

The Master Reset ($\overline{MR}$) is an asynchronous overriding clear function which forces all stages to a LOW state while the $\overline{MR}$ input is LOW without regard to the Clock.

The carry look-ahead circuitry provides for cascading counters for n-bit synchronous applications without additional gating. Instrumental in accomplishing this function are two Count Enable inputs ($\overline{CET}$·$\overline{CEP}$) and a Terminal Count ($\overline{TC}$) output. Both Count Enable inputs must be LOW to count. The $\overline{CET}$ input is fed forward to enable the $\overline{TC}$ output. The $\overline{TC}$ output thus enabled will produce a LOW output pulse with a duration approximately equal to the HIGH level portion of the Q_0 output. This LOW level $\overline{TC}$ pulse is used to enable successive cascaded stages. See Figure A in '168/'169 data sheet for the fast synchronous multistage counting connections.

The Gated Clock output (GC) is a Terminal Count output which provides a HIGH-LOW-HIGH pulse for a duration equal to the LOW time of the Clock pulse when $\overline{TC}$ is LOW. The GC output can be used as a Clock input for the next stage in a simple ripple expansion scheme.

The direction of counting is controlled by the UP/DOWN (U/$\overline{D}$) input; a HIGH will cause the count to increase, a LOW will cause the count to decrease.

The active LOW Output Enable ($\overline{OE}$) input controls the 3-State buffer outputs independent of the counter operation. When $\overline{OE}$ is LOW, the count appears at the buffer outputs. When $\overline{OE}$ is HIGH, the outputs are in the HIGH impedance "off" state, which means they will neither drive nor load the bus.

- **PNP inputs for reduced loading**

DESCRIPTION
The 'LS623 is an octal transceiver featuring non-inverting 3-state bus compatible outputs in both send and receive directions. The outputs are capable of sinking 24mA and sourcing up to 15mA, providing very good capacitive drive characteristics. The LS620 is an inverting version of the 'LS623. Both have built-in hysteresis to minimize ac noise effects.

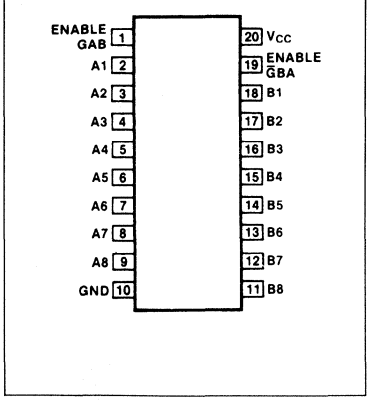
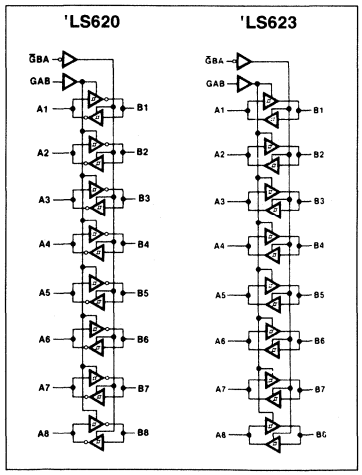
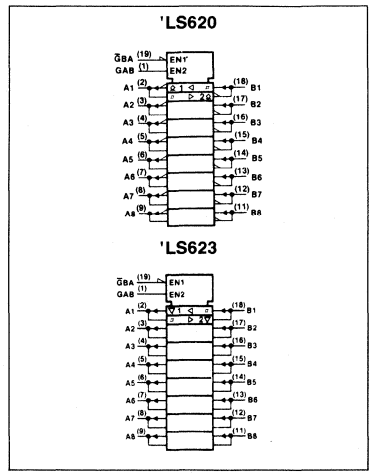
PIN CONFIGURATION



LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



FUNCTION TABLE

ENABLE	INPUTS	OPERATION	
$\overline{G}BA$	GAB	'LS620	'LS623
L	L	$\overline{B}$ data to A bus	B data to A bus
H	H	$\overline{A}$ data to B bus	A data to B bus
H	L	(Z)	(Z)
L	H	$\overline{B}$ data to A bus, $\overline{A}$ data to B bus	B data to A bus, A data to B bus

H = HIGH voltage level
L = LOW voltage level
(Z) = HIGH impedance (off) state.

These octal bus transceivers are designed for asynchronous two-way communication between data buses. The control function implementation allows for maximum flexibility in timing.

These devices allow data transmission from the A bus to the B bus or from the B bus to the A bus depending upon the logic levels at the enable inputs ($\overline{G}$BA and GAB). The enable inputs can be used to disable the device so that the buses are effectively isolated.

The dual-enable configuration gives the 'LS620 and 'LS623 the capability to store data by simultaneous enabling of $\overline{G}$BA and GAB. Each output reinforces its input in this transceiver configuration. Thus, when both control inputs are enabled and all other data sources to the two sets of bus lines are at high impedance, both sets of bus lines (16 in all) will remain at their last states.

ABSOLUTE MAXIMUM RATINGS (Over operating free-air temperature range unless otherwise noted.)

PARAMETER		74LS	UNIT
V_{CC}	Supply voltage	7.0	V
V_{IN}	Input voltage	−0.5 to +7.0	V

Transceiver

Inverting Octal Bus Transceiver (3-State)
Product Specification

Logic Products

FEATURES
- **Octal bidirectional bus interface**
- **Inverting 3-State buffer outputs**
- **PNP inputs for reduced loading**
- **Hysteresis on all Data inputs**
- **48mA sink capability ('LS640-1)**

DESCRIPTION
The 'LS640 is an octal transceiver featuring inverting 3-State bus compatible outputs in both send and receive directions. The outputs are all capable of sinking 24mA and sourcing up to 15mA, producing very good capacitive drive characteristics. In addition, the 74LS640-1 features a 48mA sink current capability. The device features a Chip Enable ($\overline{CE}$) input for easy cascading and a Send/Receive (S/$\overline{R}$) input for direction control. All Data inputs have hysteresis built in to minimize ac noise effects.

74LS645, 74LS645-1
Transceiver

Octal Bus Transceiver (3-State)
Product Specification

Logic Products

FEATURES

- **Octal bidirectional bus interface**
- **3-State buffer outputs**
- **PNP inputs for reduced loading**
- **Hysteresis on all Data inputs**
- **48mA sink capability ('LS645-1)**

DESCRIPTION

The 'LS645 is an octal transceiver featuring non-inverting 3-State bus compatible outputs in both send and receive directions. The outputs are all capable of sinking 24mA and sourcing up to 15mA, producing very good capacitive drive characteristics. In addition, the 74LS645-1 features a 48mA sink current capability. The device features a Chip Enable ($\overline{CE}$) input for easy cascading and a Send/Receive (S/R) input for direction control. All Data inputs have hysteresis built in to minimize ac noise effects.

Signetics

74LS670
Register File

4 x 4 Register File (3-State)
Product Specification

Logic Products

FEATURES

- **Simultaneous and independent Read and Write operations**
- **Expandable to almost any word size and bit length**
- **3-State outputs**
- **See '170 for open collector version**

DESCRIPTION

The '670 is a 16-bit 3-State Register File organized as 4 words of 4 bits each. Separate Read and Write Address and Enable inputs are available, permitting simultaneous writing into one word location and reading from another location. The 4-bit word to be stored is presented to four Data inputs. The Write Address inputs (W_A and W_B) determine the location of the stored word. When the Write Enable ($\overline{WE}$) input is LOW, the data is entered into the addressed location. The addressed location remains transparent to the data while the $\overline{WE}$ is LOW. Data supplied at the inputs will be read out in true (non-inverting) form from the 3-State outputs. Data and Write Address inputs are inhibited when $\overline{WE}$ is HIGH.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74LS670	25ns	30mA

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C
Plastic DIP	N74LS670N
Plastic SOL-16	N74LS670D

NOTE:
For information regarding devices processed to Military Specifications, see the Signetics Military Products Data Manual.

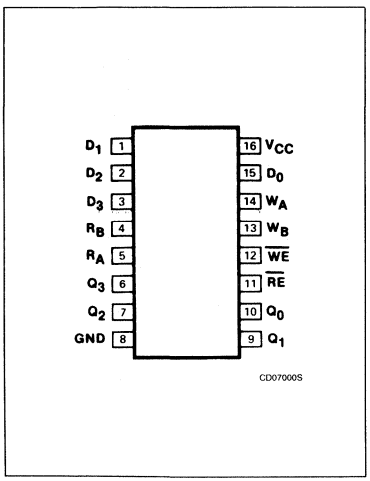
INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	74LS
$D_0 - D_3$, W_A, W_B, R_A, R_B	Inputs	1LSul
$\overline{WE}$	Input	2LSul
$\overline{RE}$	Input	3LSul
$Q_0 - Q_3$	Outputs	10LSul

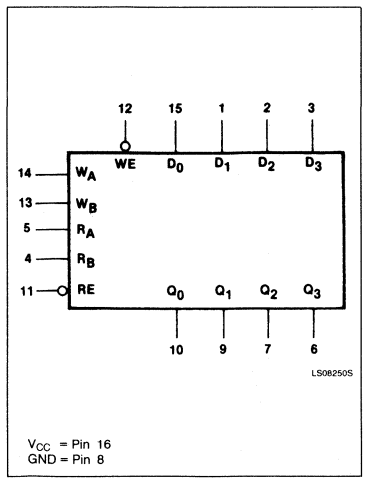
NOTE:
A 74LS unit load (LSul) is 20μA I_{IH} and −0.4mA I_{IL}.

Direct acquisition of data stored in any of the four registers is made possible by individual Read Address inputs (R_A and R_B). The addressed word appears at the four outputs when the Read Enable ($\overline{RE}$) is LOW. Data outputs are in the HIGH impedance "off" state when the Read Enable input is HIGH. This permits outputs to be tied together to increase the word capacity to very large numbers.

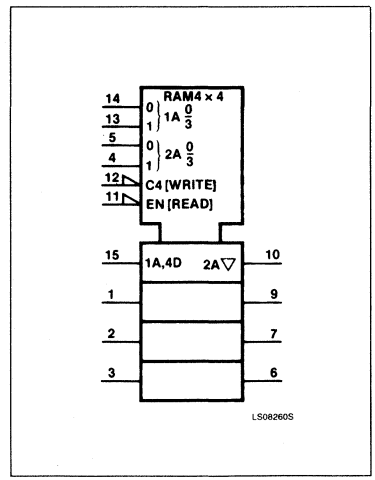
PIN CONFIGURATION



LOGIC SYMBOL

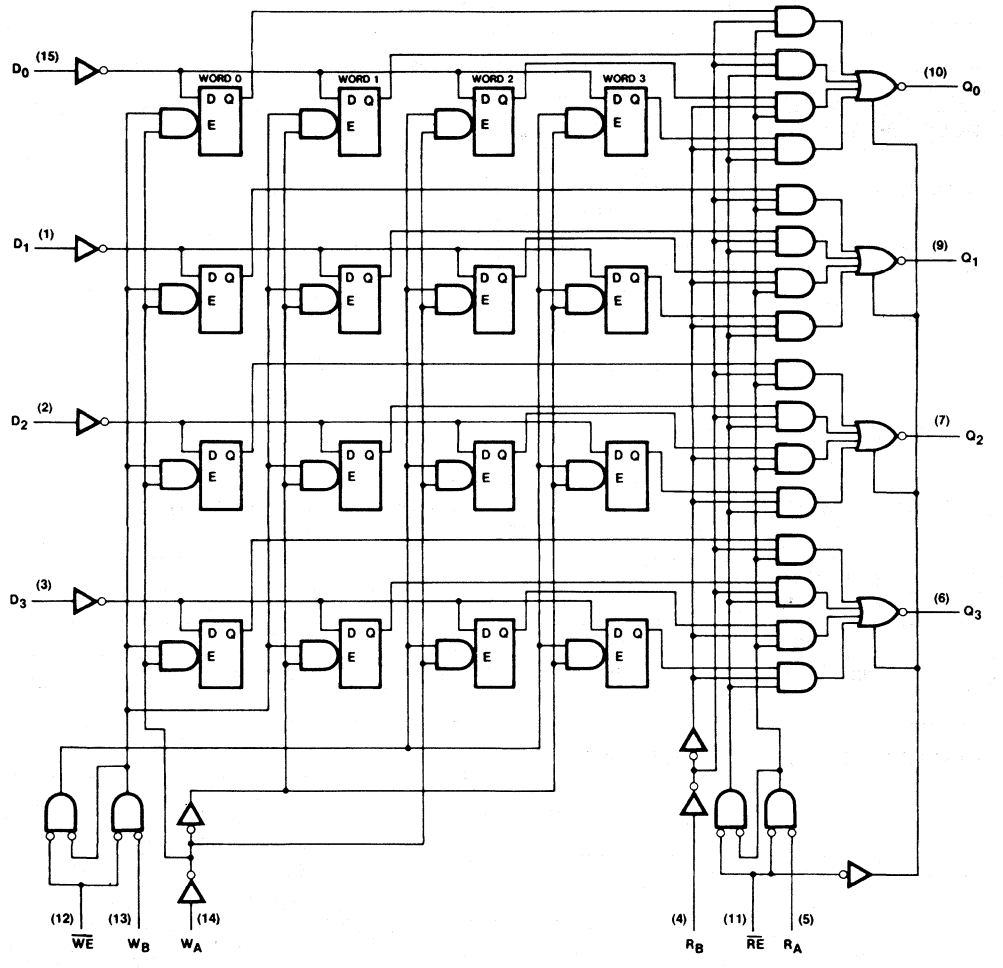


LOGIC SYMBOL (IEEE/IEC)



Up to 128 devices can be stacked to increase the word size to 512 locations by tying the 3-State outputs together. Since the limiting factor for expansion is the output HIGH current, further stacking is possible by tying pull-up resistors to the outputs to increase the I_{OH} current available. Design of the Read Enable signals for the stacked devices must ensure that there is no overlap in the LOW levels which would cause more than one output to be active at the same time. Parallel expansion to generate n-bit words is accomplished by driving the Enable and Address inputs of each device in parallel.

LOGIC DIAGRAM



( ) = Pin numbers

WRITE MODE SELECT TABLE

OPERATING MODE	INPUTS		INTERNAL LATCHES[a]
	$\overline{WE}$	D_n	
Write data	L L	L H	L H
Data latched	H	X	no change

NOTE:

a. The Write Address (W_A and W_B) to the "internal latches" must be stable while $\overline{WE}$ is LOW for conventional operation.

READ MODE SELECT TABLE

OPERATING MODE	INPUTS		OUTPUT Q_n
	$\overline{RE}$	Internal Latches[b]	
Read	L L	L H	L H
Disabled	H	X	(Z)

NOTE:

b. The selection of the "internal latches" by Read Address (R_A and R_B) are not constrained by $\overline{WE}$ or $\overline{RE}$ operation.

H = HIGH voltage level
L = LOW voltage level
X = Don't care
(Z) = HIGH impedance "off" state.

ABSOLUTE MAXIMUM RATINGS (Over operating free-air temperature range unless otherwise noted.)

PARAMETER		74LS	UNIT

t_{PZH}	Enable time to HIGH level	Waveform 3		35	ns
t_{PZL}	Enable time to LOW level	Waveform 3		40	ns
t_{PHZ}	Disable time from HIGH level	Waveform 3, C_L = 5pF		50	ns
t_{PLZ}	Disable time from LOW level	Waveform 3, C_L = 5pF		35	ns

AC SET-UP REQUIREMENTS $T_A = 25°C$, $V_{CC} = 5.0V$

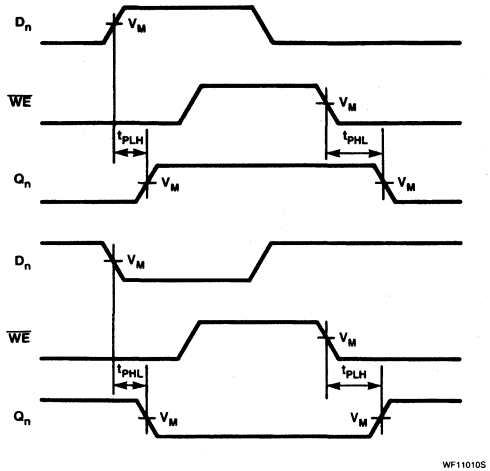
PARAMETER		TEST CONDITIONS	74LS670		UNIT
			Min	Max	
t_W	Read enable pulse width	Waveform 3	25		ns
t_W	Write enable pulse width	Waveform 2, $\overline{RE} = \leqslant 0.8V$	25		ns
t_S	Set-up time, data to positive-going $\overline{WE}$	Waveform 2	10		ns
t_h	Hold time, data to positive-going $\overline{WE}$	Waveform 2	15		ns
t_S	Set-up time, write address to negative-going $\overline{WE}$[(c)]	Waveform 2	15		ns
t_h	Hold time, write address to positive-going $\overline{WE}$[(c)]	Waveform 2	5.0		ns
t_{latch}	Latch time for new data[(d)]	Waveform 2	25		ns

NOTES:

c. Write address set-up time will protect the data written into the previous address. If protection of data in the previous address is not required, t_S (write address to $\overline{WE}$) can be ignored, as any address selection sustained for the final 30ns of the $\overline{WE}$ pulse and during t_h (write address to $\overline{WE}$) will result in data being written into that location. Depending on the duration of the input conditions, one or a number of previous addresses may have been written into.

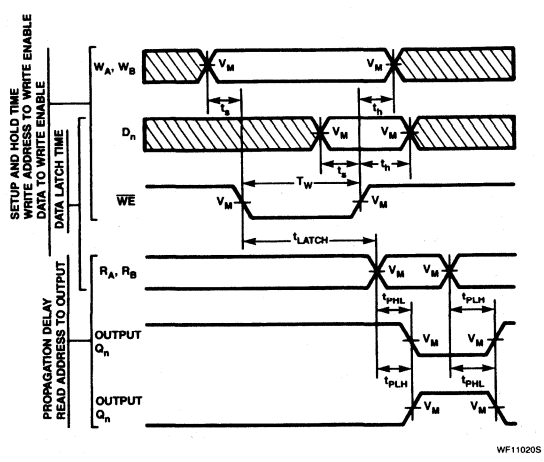
d. Latch time is the time allowed for the internal output of the latch to assume the state of new data. This is important only when attempting to read from a location immediately after that location has received new data. This parameter is measured from the falling edge of $\overline{WE}$ to the rising or falling edge of R_A or R_B. $\overline{RE}$ must be LOW.

AC WAVEFORMS



$V_M = 1.3V$

Waveform 1. Propagation Delay, Write Enable And Data To Outputs



$V_M = 1.3V$

DEFINITIONS

R_L = Load resistor to V_{CC}; see AC CHARACTERISTICS for value.

C_L = Load capacitance includes jig and probe capacitance; see AC CHARACTERISTICS for value.

R_T = Termination resistance should be equal to Z_{OUT} of Pulse Generators.

D = Diodes are 1N916, 1N3064, or equivalent.

R_X = 1kΩ for 74, 74S, R_X = 5kΩ for 74LS.

t_{TLH}, t_{THL} Values should be less than or equal to the table entries.

FAMILY	INPUT PULSE REQUIREMENTS				
	Amplitude	Rep. Rate	Pulse Width	t_{TLH}	t_{THL}
74	3.0V	1MHz	500ns	7ns	7ns
74LS	3.0V	1MHz	500ns	15ns	6ns
74S	3.0V	1MHz	500ns	2.5ns	2.5ns

Quad Bus Driver

3-State Quad Bus Driver
Product Specification

Logic Products

FEATURES
- **High speed**
- **Quad bus driver**
- **40mA Low-state drive**
- **300pF load driving capability**

DESCRIPTION
The 8T09 is a high speed quad bus driver device for applications requiring up to 25 loads interconnected on a single bus.

The tri-state outputs present high impedance to the bus when disabled (control input "1"), and active drive when enabled (control input "0"). This eliminates the resistor pullup requirement while providing performance superior to open collector schemes. Each output can sink 40mA and drive 300pF loading with guaranteed propagation delay less than 20 nanoseconds.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
N8T09	7ns	

ORDERING CODE

PACKAGES	COMMERCIAL RANGE V_{CC} = 5V ±5%; T_A = 0°C to +70°C

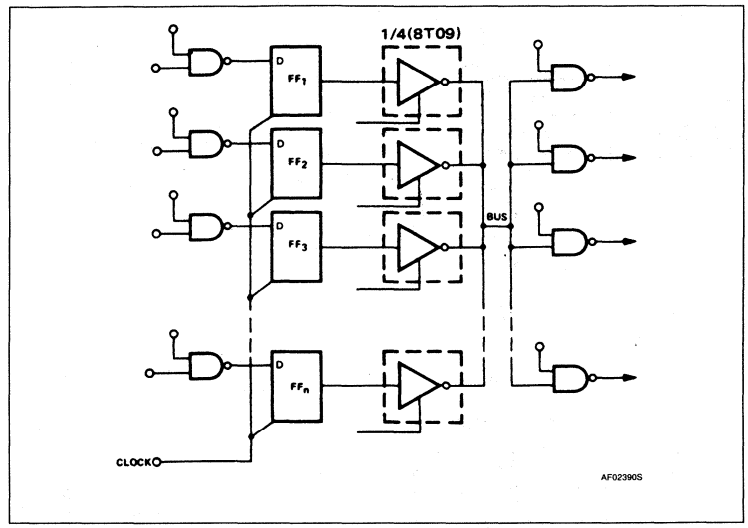
Quad Bus Driver 8T09

The figure to right illustrates usage of the 8T09 in data processing logic. For example, FF_1 thru FF_n may represent bit X in each of several functions in a minicomputer (accumulators, MQ register, index registers, indirect address registers, etc.). Transfer from any source to any load, including transfers from one register to another, can take place along the single path labeled "BUS".

TYPICAL APPLICATIONS



Signetics

8T10
Bus Flip-Flop

3-State Quad D-Type Bus Flip-Flop
Product Specification

Logic Products

DESCRIPTION

The 8T10 is a high speed Quad D flip-flop with tri-state outputs for use in bus-organized systems. The high current sink capability permits up to 20 standard loads to be interconnected on a single bus. The outputs present a high impedance to the bus when disabled (Control Input "1") and active drive when enabled (Control Inputs "0").

All four D-type flip-flops operate from a common clock with data being transferred on the low-to-high transition of the pulse.

A master reset input resets all flip-flops upon application of a logic "1" level.

Data will be stored if either one or both inputs to the Input Disable NOR gate is a logic "1".

8T13
Line Driver

Dual Line Driver
Product Specification

Logic Products

KEY DESIGN BENEFITS

- High-Power Drive Capability: Specified at −75mA source current rating at 2.4 volts.
- Party-Line Operation: Emitter-follower outputs enable two or more drivers to drive the same line. This permits multiple time-shared terminal connections since these drivers have no effect upon the transmission line unless activated.
- Input gating structure allows employment of the "OR" as well as the "AND" function.
- High Speed: Propagation Delay = 20ns (max).
- Input Clamp Diodes: Protects inputs from line ringing.
- Single 5 Volt power supply.
- Short Circuit Protection: Incorporates a latch-back short circuit protection feature which protects the device by limiting the current it may source under conditions of zero load resistance.

NOTE:
A unit load (ul) is 40μA I_{IH} and −1.6mA I_{IL}.

DESCRIPTION

The 8T13 is a monolithic Dual Line Driver designed to drive 50Ω or 75Ω coaxial transmission lines. TTL multiple emitter inputs allow this line driver to interface with stand- and TTL or DTL systems. The outputs are designed to drive long lengths of coaxial cable, strip line, or twisted pair transmission lines with impedances of 50Ω to 500Ω.

8T15
Line Driver

Dual Communications EIA/MIL Line Driver
Product Specification

Logic Products

DESCRIPTION

The 8T15 Dual Communications Line Driver provides line driving capability for data transmission between Data Communication and Terminal Equipment. The device meets or exceeds the requirements of EIA Standard RS-232B and C, Mil STD-188B and CCITT V24.

This dual 4-input NAND driver will accept standard TTL logic level inputs and will drive interface lines with nominal data levels of = 6V and −6V. Output slew rate may be adjusted by attaching an external capacitor from the output terminal to ground. The outputs are protected against damage caused by accidental shorting to as high as ±25V.

8T16
Line Receiver

Dual Communications EIA/MIL Line Receiver with Hysteresis
Product Specification

Logic Products

DESCRIPTION

The 8T16 Dual Communications line Receiver provides receiving capability for data lines between Data Communication and Terminal Equipment. The device meets or exceeds the requirements of EIA Standard RS-232B and C, MIL-STD-188B and CCITT V24 and operates from a single 5 volt power supply.

The receivers accept single (EIA) or double ended (MIL) inputs and are provided with an output strobing control. Both EIA and MIL input standards are accommodated.

When using the EIA input terminal (with the Hysteresis terminal open), input voltage threshold levels are typically +2V and −2V with a guaranteed minimum Hysteresis of 2.4V. By grounding the "Hysteresis" terminal, the EIA input voltage threshold levels may be shifted to typically +1.0V and +2.1V with a minimum guaranteed Hysteresis of 0.75V. (Note that when using the EIA inputs, the MIL inputs—both positive and negative—must be grounded.)

The MIL input voltage threshold levels are typically +0.6V and −0.6V with a minimum guaranteed Hysteresis of 0.7V. A MIL negative terminal is provided on each receiver per specification MIL-STD-188B to provide for common mode noise rejection.

Each receiver includes a strobe input so that:

a. A "1" on the strobe input allows data transfer.
b. A "0" on the strobe input holds the output high.

1. All voltage measurements are referenced to the ground terminal. Terminals not specifically referenced are left electrically open.
2. All measurements are taken with ground pin tied to zero volts.
3. Positive current is defined as into the terminal referenced.
4. Positive logic definition: "UP" Level = H, "DOWN" Level = L.
5. Precautionary measures should be taken to ensure current limiting in accordance with Absolute Maximum Ratings.
6. Manufacturer reserves the right to make design and process changes and improvements.
7. This test guarantees operation free of latch-up over the specified input voltage range.
8. Output source current is supplied through a resistor to ground.
10. Previous EIA input: +3V (See hysteresis curve).
11. Previous MIL input: +0.9V (See hysteresis curve).
12. Previous EIA input: −3.0V (See hysteresis curve).
13. Previous MIL input: −0.9V (See hysteresis curve).
14. Reference AC Test Figures.
15. This test guarantees transfer of signals of up to 20kHz. Connect 1000pF between the output terminal and ground.
16. Each receiver to be tested separately.
17. V_{CC} = 5.25V.

AC ELECTRICAL CHARACTERISTICS $T_A = 25°C$, $V_{CC} = 5.0V$

Product Specification

Logic Products

FEATURES
- **Differential Input Threshold = ±4mV**
- **Pulse Position Error = Typically < 3ns**
- **Max. Input Frequency = 8MHz**
- **Triggers on Positive and/or Transitions**

APPLICATIONS
- **Disc, Tape and Drum Readers**
- **Digital Communications Receivers**
- **Signal Conditioners**
- **Transition Detectors**

DESCRIPTION
The Bidirectional One Shot is intended for applications where high speed low level signal processing is required.

The 8T20 is a Monolithic Building Block, consisting of a high speed analog comparator, digital control circuitry, and a precision monostable multivibrator. The differential input threshold voltage is between ±4mV with respect to the input reference level which may range from −3.2V to +4.2V. For input frequencies up to 8MHz, the device may be conditioned to act as a frequency doubler since it can trigger on both positive and negative input transitions.

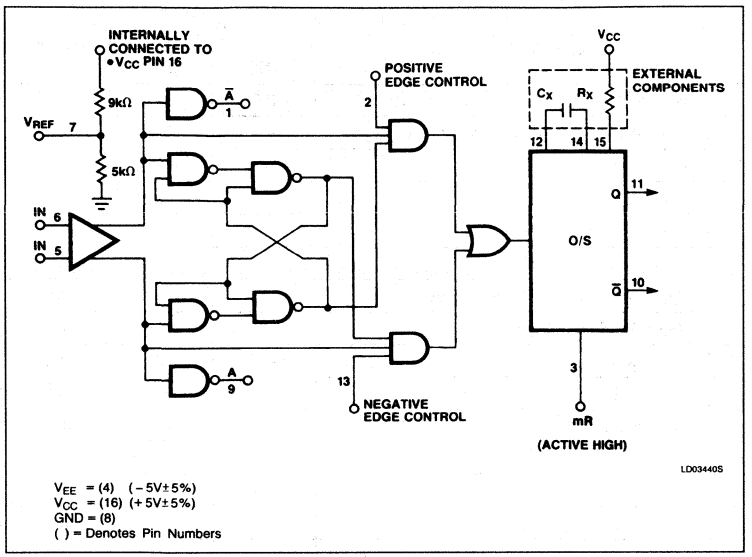
LOGIC DIAGRAM



Timing pins permit using this device in a variety of applications where external control over pulse width is desirable. Pulse width (t^W) is defined by the relationship $t^W = C_X R_X$ Loge 2. Pulse width stability is internally compensated and virtually independent of temperature and V^{CC} variations, thus only limited by the accuracy of external timing components.

An internal resistive divider is available on the chip to provide a voltage of 1.4V (typ.). This output can be connected directly to either of the comparator inputs as a reference voltage when interfacing with TTL outputs.

ABSOLUTE MAXIMUM RATINGS (Over operating free-air temperature range unless otherwise noted.)

PARAMETER		8T	UNIT
V_{CC}	Supply voltage, positive	7.0	V
V_{EE}	Supply voltage, negative	−7.0	V

I_{OH}	HIGH-level output current			−800	μA
I_{OL}	LOW-level output current			16	mA
T_A	Operating free-air temperature	0		70	°C

DC ELECTRICAL CHARACTERISTICS (Over recommended operating free-air temperature range unless otherwise noted.)

PARAMETER		TEST CONDITIONS[1]	8T20		UNIT
			Min	Max	
V_{IH}	Input HIGH voltage	Guaranteed input HIGH threshold voltage	2.0		V
V_{IL}	Input LOW voltage	Guaranteed input LOW threshold voltage		0.8	V
V_{IK}	Input clamp diode voltage	V_{CC} = MIN, I_{IK} = −12mA		−1.5	V
V_{OH}	HIGH-level output voltage	V_{CC} = MIN, I_{OH} = −800μA	2.4		V
V_{OL}	LOW-level output voltage	V_{CC} = MIN, I_{OL} = 16mA		0.4	V
I_{IH}	HIGH-level input current	V_{CC} = MAX, V_I = 4.5V		40	μA
I_{IL}	LOW-level input current	V_{CC} = MAX, V_I = 0.4V PEC, NEC		−2.4	mA
I_{IL}	Low level input current	V_{CC} = MAX, V_I = 0.4V mR		−1.6	mA
I_{OS}	Short-circuit output current[3]	V_{CC} = MAX	−20	−70	mA
I_{CC}	Supply current (total)	V_{CC} = 5.25V		55	mA
I_{EE}	Supply current (total)	V_{CC} = 5.25V		−20	mA
DIFFERENTIAL INPUTS					
V_T	Input threshold voltage[4]		±4		mV
I_B	Input bias current[5]	V_{CC} = +5V, V_{EE} = −5V		125	μA
I_{OS}	Input offset current		2		μA
V_{CM}	Common mode input volt, range[6]		−3.2	+4.2	V

NOTES:
1. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
2. All typical values are at V_{CC} = 5V, T_A = 25°C.
3. I_{OS} is tested with V_{OUT} = +0.5V and V_{CC} = V_{CC} MAX + 0.5V. Not more than one output should be shorted at a time and duration of the short circuit should not exceed one second.
4. The differential input threshold voltage (V_T) is defined as the maximum DC voltage from the reference level necessary to trigger the one-shot.
5. Refer to Figure 5.
6. Common mode voltages that are confined within the dynamic range as specified will not cause false triggering of the one-shot.

Signetics

8T22
Multivibrator

Retriggerable One Shot
Product Specification

Logic Products

DESCRIPTION

The 8T22 is a direct pin-for pin replacement for the 9601 retriggerable one-shot. Triggering can be performed on either the leading or falling edge of the input signal through selection of the proper input terminal.

The inputs are level-sensitive making triggering independent of signal transition times. Output pulse width is determined by external timing components (R_X and C_X) with each trigger pulse initiating a complete new-timing cycle.

For those applications where a dual retriggerable one-shot is required the Signetics 9602 should be considered.

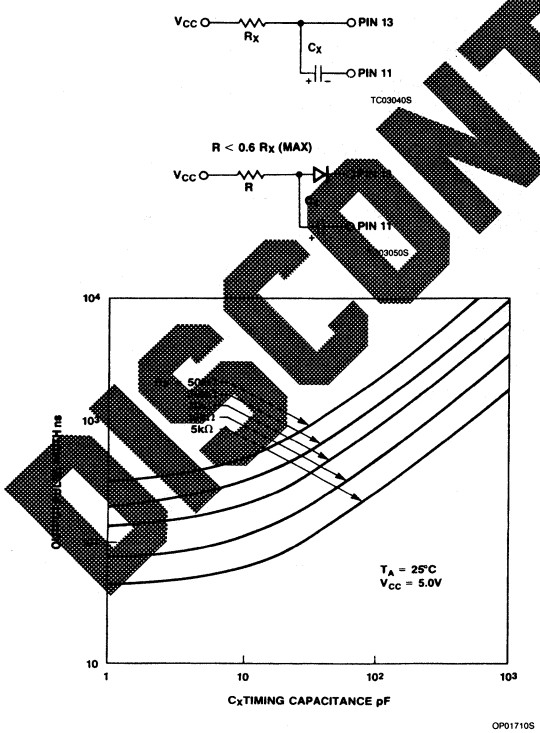
Multivibrator — 8T22

AC ELECTRICAL CHARACTERISTICS $T_A = 25°C$, $V_{CC} = 5.0V$

PARAMETER	TEST CONDITIONS	8T22			UNIT
		Min	Typ	Max	
Propagation delay Negative trigger input to true output (t_{PLH})	$R_x = 5.0k\Omega$, $C_x = 0$ $C_L = 15pF$		25	40	ns
Negative trigger input to false output (t_{PHL})	$R_x = 5.0k\Omega$, $C_x = 0$ $C_L = 15pF$		25	40	ns
Min. true output pulse width	$R_x = 5.0k\Omega$, $C_x = 0$ $C_L = 15pF$			55	ns
Pulse width variation	$R_x = 10k\Omega$, $C_x = 1000pF$	3.08	42	3.[illegible]	µs
Timing resistor		5		[illegible]	kΩ
C_{Stray} – maximum allowable wiring capacitance	P13 to ground			[illegible]	pF

NOTES:
1. Positive current is defined as into the pin referenced.
2. Unless otherwise note, 10kΩ resistor placed between Pin 13 and $V_{CC}(R_x)$.

OPERATION RULES



1. An external resistor (R_x) and external capacitor (C_x) are required as shown in the Logic Diagram.
2. The value of R_x may vary from 5.0 to 50 kΩ (0 to 75°C).
3. C_x may vary from 0 to any necessary value available. If, however, the capacitor has leakages approaching 3.0µA or if stray capacitance from either terminal to ground is more than 50pF, the timing equations may not represent the pulse width obtained.
4. If electrolytic capacitors are to be used, the following configurations are recommended:

   A. For use with low leakage electrolytic capacitors. The normal RC configuration can be used predictably only if the forward capacitor leakage at 5.0 volts is less than 3µA, and the inverse capacitor leakage at 1.0 volt is less than 5µA over the operational temperature range, and Rule 3 above is satisfied.

   B. Use with high inverse leakage current electrolytic capacitors. The diode in this configuration prevents high inverse leakage currents through the capacitor by preventing an inverse voltage across the capacitor.

$t \approx 0.3\ RC_x$

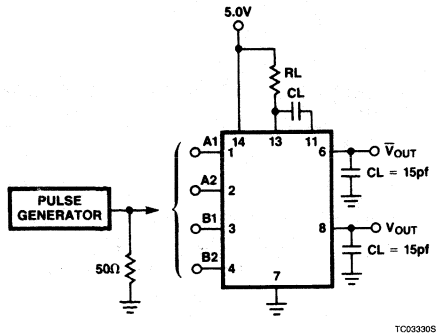
The output pulse with (t) is defined as follows:

$$t = 0.32\ R_xC_x\left[1 + \frac{0.7}{R_x}\right]$$

Where R_x is in kΩ, C_x is in pF, t is in ns; for $C_x < 10^3$pF.

Typical Output Pulse Width Versus Timing Resistance And Capacitance For $C_x < 10^3$pF Is Shown In The Above Graph.

AC TEST CIRCUITS AND WAVEFORMS



NOTES:
1. Pulse Generator has the following characteristics: $t_r = t_f = 10ns$ (10% to 90%) AMP. = 3V.
2. C_L includes probe and jig capacitance.
3. For t_{PLH}, t_{PHL} and tw (min.) RX = 5kΩ ±1%, CX = OPEN, PRR = 1MHz.
4. For Δtpw: RX = 10kΩ ±1%, CX = 1000pf ±1%, PRR = 200KHz.

Signetics

8T24
Line Receiver

Triple Line Receiver with Hysteresis
Product Specification

Logic Products

FEATURES

- **Built-in input threshold hysteresis***
- **High speed: $t_{PHL} = t_{PLH} = 20ns$ (typical)**
- **Each channel can be strobed independently**
- **Fanout of ten (10) with standard TTL integrated circuits**
- **Input gating is included with each line receiver for increased application flexibility**
- **Operation from a single +5V Power Supply**

*Hysteresis is defined as the difference between the input thresholds for the "1" and "0" output states. Hysteresis is specified at 0.4V typically and 0.2V minimum over the operating temperature range.

DESCRIPTION

The 8T24 is a Triple Line Receiver designed specifically to meet the IBM System (360, System/370 I/O Interface Specification [IBM Specification GA 22-6974-0]): Each receiver incorporates hysteresis to provide high noise immunity and high input impedance to minimize loading on the driver circuit.

An input voltage of 1.7 volts or more is interpreted as a logical one; an input of 0.70 volts or less is interpreted as a logical zero as is an open circuited input.

The receiver input (R) of the 8T24 will not be damaged by a DC input of +7.0 volts with power on or by a DC input of +6.0 volts with power off in the receiver. The 8T24 will also withstand an input of −0.15V with power on or off.

The 8T24 is fully compatible with TTL and DTL systems and operates from a single 5 volt power supply.

DESCRIPTION

The 8T26A/28 consists of four pairs of 3-state logic elements configured as quad bus drivers/receivers, along with separate buffered receiver enable and driver enable lines. This single IC quad transceiver design distinguishes the 8T26A/28 from conventional multi-IC implementations. In addition, the 8T26/28's ultra high speed while driving heavy bus capacitance (300pF) makes these devices particularly suitable for memory systems and bidirectional data buses.

Both the driver and receiver gates have 3-State outputs and low-current PNP inputs. 3-State outputs provide the high switching speeds of totem-pole TTL circuits while offering the bus capability of open collector gates. PNP inputs reduce input loading to 200μA maximum.

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	N8T	S8T
I_N	Input	0.5SuI	0.5SuI

Signetics

8T37
Bus Receiver

Hex Bus Receiver with Hysteresis — Schmitt Trigger
Product Specification

Logic Products

DESCRIPTION

The 8T37 is a hex bus receiver with hysteresis organized as two triple receivers with separate disable lines for each group. Typically the devices may be used in bus organized data transmission systems interconnected by terminated lines. The low input current requirement allows several drivers and receivers to communicate over a common bus in "party line" fashion. A power-up or power-down sequence of the receiver will not affect the bus. Built in hysteresis provides maximum noise immunity and makes the 8T37 also an ideal Schmitt trigger in those applications where the non-linear input characteristics of standard TTL are undesirable.

Low input current requirements make the nex-inverter inputs compatible with MOS/CMOS in addition to DTL/TTL. All inputs have clamping diodes to simplify systems design. The receiver outputs as well as the disable inputs are TTL/DTL compatible.

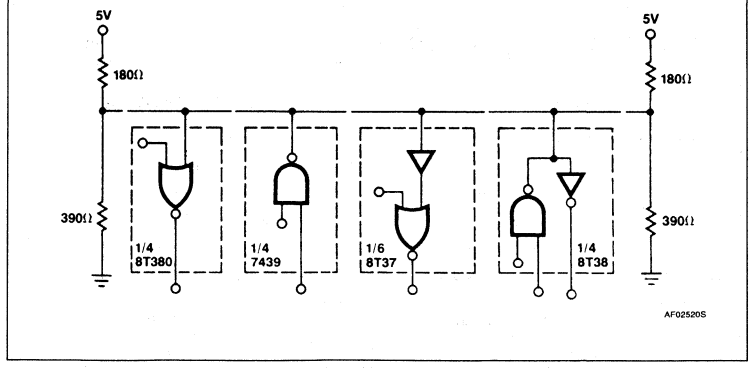
TYPICAL APPLICATION



Signetics

8T38
Bus Transceiver

Quad Bus Transceiver (Open Collector)
Product Specification

Logic Products

DESCRIPTION

The 8T38 is a quad bus transceiver with a common two input disable control for the drivers. Open collector driver outputs together with low input requirements for the receivers offer extreme versatility in low cost bus organized systems.

Busses may be terminated at both ends such that up to 100 driver/receiver pairs can utilize a common data bus. The receiver incorporates hysteresis to provide maximum noise immunity. In addition the receiver does not load the bus when $V_{CC} = 0$.

In those applications where only bus receiver are required the 8T380 quad bus receiver should be considered.

High Speed Hex 3-State Inverters
Product Specification

DESCRIPTION

Each of the 3-state bus interface elements described herein has low current PNP inputs and is designed with Schottky TTL technology for ultra high speed. The devices are used to convert TTL/DTL or MOS/CMOS to 3-state TTL bus levels. For maximum systems flexibility, the 8T95 and 8T97 do so without logic inversion, whereas the 8T96 and 8T98 provide the logical complement of the input. The 8T95 and 8T96 feature a common control line for all six devices, whereas the 8T97 and 8T98 have control lines for four devices from one input and two from another input.

Transceiver

Octal 3-State Transceiver
Product Specification

Logic Products

FEATURES

- **Octal bidirectional bus interface**
- **3-State buffer outputs**
- **PNP inputs for reduced loading**
- **Hysteresis on all Data inputs**
- **Pin compatible with 74LS245**

DESCRIPTION

The 8T125 is an octal transceiver featuring inverting 3-State bus-compatible outputs in both send and receive directions. The outputs are all capable of sinking 24mA and sourcing up to 15mA, producing very good capacitive drive characteristics. The device features a Chip Enable input for easy cascading and a Send/Receive input for direction control. All Data inputs have hysteresis built in to minimize ac noise effects.

8T126, 127, 128, 129 Transceivers

Quad, 3-State Transceivers
Product Specification

DESCRIPTION

The 8T126 through 8T129 are quad transceivers designed to handle many bus interface applications. The devices feature 3-State outputs on both send and receive buffers, and pnp transistors on all inputs to reduce input LOW loading requirements.

The 8T126 and 8T128 feature a 3.4V minimum V_{OH} level on the receiver for MOS interface applications. The send and receive buffers have separate Enable inputs for independent control.

The 8T127 and 8T129 feature full 24mA drive in both send and receive buffers. These devices have a common Chip Enable input for easy cascading and a Send/Receive input for direction control.

Signetics

8T380
Bus Receiver

Quad Bus Receiver with Hysteresis-Schmitt Trigger
Product Specification

Logic Products

DESCRIPTION

The 8T380 is a quad 2-input bus receiver with hysteresis for use in I/O, data, and memory busses. Built-in hysteresis provides maximum noise immunity and a power-up or power-down sequence on the receiver will not affect the bus. LOW input current allows several drivers and receivers to communicate over a common bus in "Party line" fashion. The 8T380 is ideal as a Schmitt Trigger in analog interfaces that cannot tolerate the non-linear input impedance characteristics of standard TTL. Further, the LOW input requirements allow the 8T380 to be used as a CMOS to TTL interface. All inputs have clamping diodes to simplify systems design.

TYPICAL APPLICATIONS

A generalized "Party Line" bus interface is shown in Figure 1. Each driver/receiver combination can communicate with any other pair of all. Open collector NAND Gates such as the Signetics 7439 have adequate driver capability for the bus terminations as well as 20 driver/receiver pairs. In addition the bussing scheme is non-inverting as shown and bus drivers are activated by a logic "1" whereas bus receivers are activated by a Logic "0."

Each termination consisting of a 180Ω resistor to V_{CC} and 390Ω to ground is a 120Ω Thevenin's equivalent circuit. The maximum length of cable that can be driven is a complex relationship involving the type of cable used as well as the distribution of drivers and receivers on the bus. Using flat ribbon cable, a maximum reasonable length is 50 ft. minus the combined length of all taps or stubs.

SCHMITT TRIGGER

The receiver transfer curve shown in Figure 2a makes the 8T380 ideal in a variety of Schmitt Trigger and waveshaping applications such as Figure 2b.

MOS/CMOS INTERFACE

The input current which is only 50μA MAX in the logical "1" state and no current in the logical "0" state marks the 8T380 an ideal MOS/CMOS interface element.

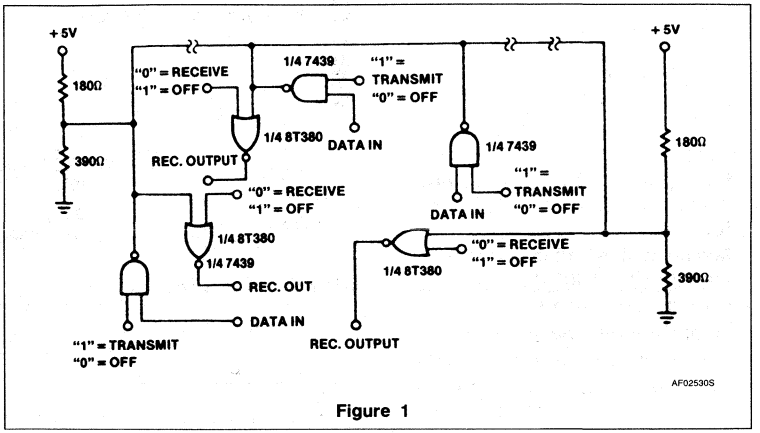

Figure 1

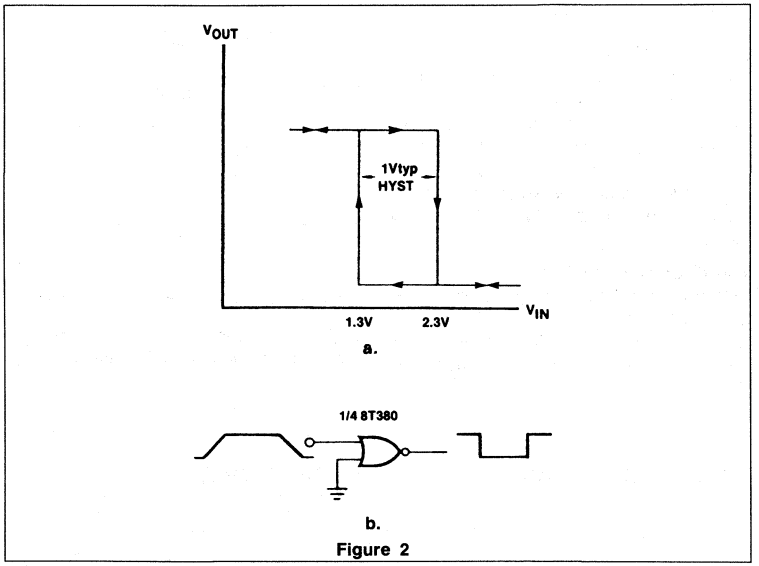

Figure 2

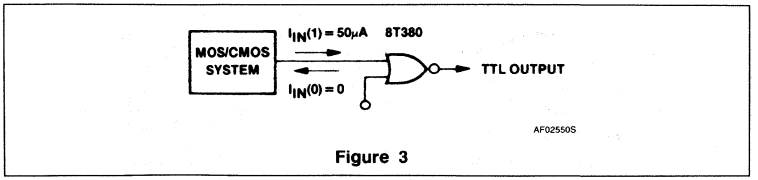

Figure 3

Signetics

8T3404
Latch

High Speed 6-Bit Latch
Product Specification

Logic Products

FEATURES

- **Low input load current: .25mA max., 1/6 standard TTL input load**
- **Minimum line reflection: low voltage diode input clamp**
- **Outputs sink 10mA min.**
- **16-pin dual in-line package**
- **Simple expansion: enable inputs**
- **12ns max. data to output delay over 0°C to 75°C temperature**
- **Directly compatible with DTL and TTL logic circuits**

DESCRIPTION

The Signetics 8T3404 contains six high speed latches organized as independent 2-bit and 4-bit latches. They are designed for use as memory address registers, data registers, or other storage elements. The latches act as high speed inverters when the "Write" input is "low."

The 8T3404 is packaged in a standard 16-pin dual in-line package; and its performance is specified over the temperature range of 0°C to +75°C, ambient. To obtain fast switching speeds resulting in higher performance than equivalent devices made with a gold diffusion process, Schottky barrier diode clamped transistors are used.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)

8TS805 Octal Transparent Latch With 3-State Outputs
8TS806 Octal D Flip-Flop With 3-State Outputs
Product Specification

Logic Products

FEATURES
- **8-bit transparent latch – 8TS805**
- **8-bit positive, edge-triggered register – 8TS806**
- **3-State output buffers**
- **Common 3-State Output Enable**
- **Independent register and 3-State buffer operation**

DESCRIPTION
The 8TS805 is an octal, transparent latch coupled to eight 3-State output buffers. The two sections of the device are controlled independently by Latch Enable (E) and Output Enable ($\overline{OE}$) control gates.

The data on the D inputs are transferred to the latch outputs when the Latch Enable (E) input is HIGH. The latch remains transparent to the data inputs while E is HIGH, and stores the data present one set-up time before the High-to-Low enable transition. The enable gate has about 400mV of hysteresis built in. This prevents noise problems that signal and ground noise can cause on the latch's operation.

NOTE:
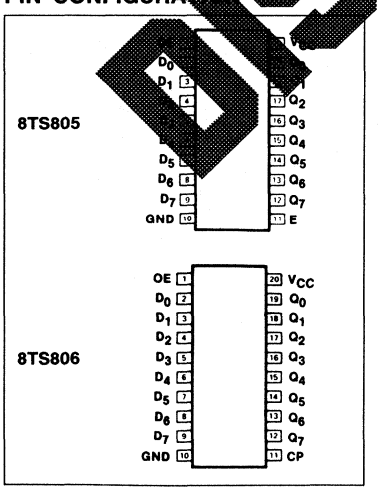
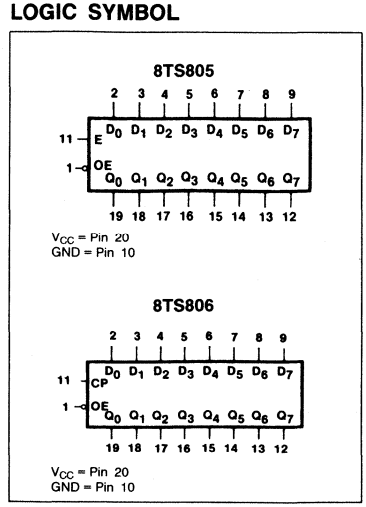
An 8TS unit load is 50µA I_{IH} and −2.0mA I_{IL}.

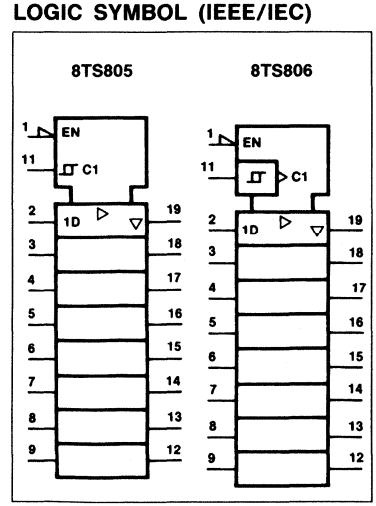
PIN CONFIGURATION



LOGIC SYMBOL



LOGIC SYMBOL (IEEE/IEC)



The 3-State output buffers are designed to drive heavily loaded 3-State buses, MOS memories, or MOS microprocessors. The active LOW Output Enable ($\overline{OE}$) controls all eight 3-State buffers independent of the latch operation. When $\overline{OE}$ is LOW, the latched or transparent data appears at the outputs. When $\overline{OE}$ is HIGH, the outputs are in the HIGH impedance "off" state, which means they will neither drive nor load the bus.

The 8TS806 is an 8-bit, edge-triggered register coupled to eight 3-State output buffers. The two sections of the device are controlled independently by the Clock (CP) and Output Enable ($\overline{OE}$) control gates.

The register is fully edge triggered. The state of each D input, one set-up time before the LOW-to-HIGH clock transition, is transferred to the corresponding flip-flop's Q output. The clock buffer has about 400mV of hysteresis built in to help minimize problems that signal and ground noise can cause on the clocking operation.

FEATURES
- **8-bit transparent latch – 8TS807**
- **8-bit positive, edge-triggered register – 8TS808**
- **3-State inverting output buffers**
- **Common 3-State Output Enable**
- **Independent register and 3-State buffer operation**

DESCRIPTION
The 8TS807 is an octal transparent latch coupled to eight 3-State output buffers. The two sections of the device are controlled independently by Latch Enable (E) and Output Enable ($\overline{OE}$) control gates.

The data on the D inputs are transferred to the latch outputs when the Latch Enable (E) input is HIGH. The latch remains transparent to the data inputs while E is HIGH, and stores the data present one set-up time before the HIGH-to-LOW enable transition. The enable gate has about 400mV of hysteresis built in to help minimize problems that signal and ground noise can cause on the latching operation.

Logic Products

FEATURES

- **Allows two microprocessors to access the same bank of DRAM**
- **Replaces 25 TTL devices to perform arbitration, signal timing, multiplexing, and refresh generation**
- **9 address output pins allow control of up to 256K DRAMS**
- **Separate refresh clock allows adjustable refresh timing**
- **On-board 18-bit address input latch**
- **30MHz Maximum Clock rate**

DESCRIPTION

The 74LS764 DRAM Dual-Ported Controller is a high speed, clocked dual port arbiter and timing generator that allows two microprocessors, microcontrollers, or any other memory accessing devices to share the same block of memory. The device performs arbitration, signal timing, address multiplexing and refresh, replacing up to 25 discrete TTL devices.

The 'LS764 contains an on-board 18-bit address input latch which latches the address inputs at the start of an access cycle.

The device is available in a 40-pin plastic DIP or 44 pin PLCC with pinouts designed to allow convenient placement of microprocessors, DRAMs, and other support chips.

A9	17	18	I	
A10	2	2	I	Address inputs used to generate memory column address.
A11	4	4	I	
A12	6	6	I	
A13	8	8	I	
A14	10	10	I	
A15	12	13	I	
A16	14	15	I	
A17	16	17	I	
A18	18	19	I	
$\overline{REQ}_1$	21	23	I	Memory access request from microprocessor one.
$\overline{REQ}_2$	22	24	I	Memory access request from microprocessor two.
CP	24	26	I	Clock input which determines the master timing and arbitration rates.
RCP	40	44	I	Refresh Clock determines the period of refresh for each row after it is internally divided by 64.
$\overline{SEL}_1$	20	22	O	Select signal is activated in response to the active $\overline{REQ}_1$ input, indicating that access will be granted to microprocessor one.
V_{CC}	11	11		Power supply +5V ±5%
GND	31	34 35		Ground
$\overline{SEL}_2$	20	25	O	Select signal is activated in response to the active $\overline{REQ}_2$ input, indicating that access will be granted to microprocessor two.
MA0	34	38	O	Memory address output pins, designed to drive the address lines of a DRAM.
MA1	33	37	O	
MA2	32	36	O	
MA3	30	33	O	
MA4	29	32	O	
MA5	28	31	O	
MA6	27	30	O	
MA7	26	29	O	
MA8	25	28	O	
GNT	38	42	O	Grant output internally activated upon start of memory access cycle.
$\overline{RAS}$	35	39	O	Row address strobe is used to latch the row address into the bank of DRAM(to be connected directly to the $\overline{RAS}$ inputs of the DRAMs).
WG	39	43	O	When activated, the "Write Gate" signal from the device could be gated with the microprocessor's write strobe to perform an "Early Write".
$\overline{CASEN}$	37	41	O	Column Address Strobe Enable is used to latch the column address into the bank of DRAMs.
DTACK	36	40	O	Data Transfer Acknowledge indicates that data on the DRAM output lines is valid or the proper access time has occurred.

DRAM Controller | 74LS764

ARCHITECTURE

The 'LS764 arbitration logic is divided into two stages. The first stage controls which one of the two $\overline{REQ}$ inputs will be serviced by activating the corresponding $\overline{SEL}$ output. The $\overline{SEL}$ output signals have been provided for use as look-ahead enables for 3-state address lines from each of the microprocessors connected to the address inputs of the 'LS764.

The second arbitration stage controls arbitration between the $\overline{SEL}$ signals and refresh requests. Refresh always has priority and is serviced immediately after the current cycle is completed (if needed). This arbitration stage also indicates the start of an access cycle via the GNT output signal. GNT is provided to indicate to the requesting microprocessor that its access cycle has begun. The GNT and $\overline{SEL}$ outputs can be used to generate wait states.

The 'LS764 has an 18-bit internal latch which latches the address inputs, A1 – A18, at the start of the access cycle. The latched address inputs are propagated to the MA0 – MA8 address outputs via an internal 18-bit MUX, which multiplexes the 18 address inputs to 9 row address and 9 column address signals, giving the 'LS764 the capability to interface 256K DRAMs to the masters.

The internal refresh row counter has 9 outputs, allowing the 'LS764 to refresh up to 512 row DRAMs.

The generation of $\overline{RAS}$, $\overline{CASEN}$, Write Gate (WG), and Data Transfer Acknowledge (DTACK) outputs is controlled by on chip timing logic.

FUNCTIONAL DESCRIPTION

The speed at which the 'LS764 operates is determined by the CP input, with a maximum limit of 30MHz. All internal signal timing and control is based on this input.

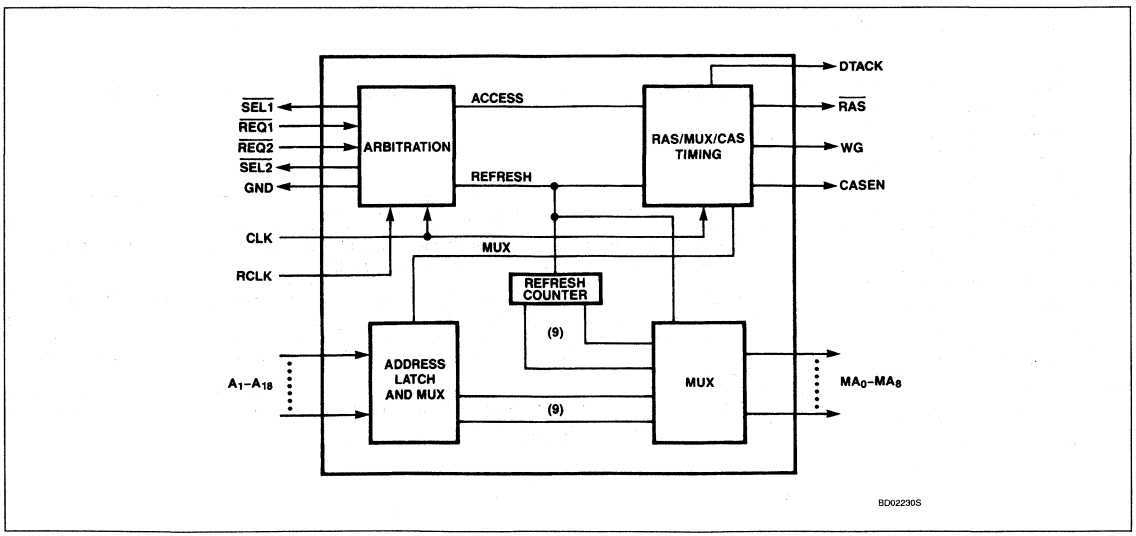
A microprocessor requests access to the DRAM by activating the appropriate $\overline{REQ}$ input. If a refresh cycle is not in process and the other request input is not active, the $\overline{SEL}$ output corresponding to the active $\overline{REQ}$ input will go LOW to indicate that access will be granted. The GNT output then goes HIGH (by the LOW-to-HIGH transition) indicating that a memory access cycle is now commencing. If an access or refresh cycle is in process, and the other microprocessor has not requested access, the $\overline{SEL}$ output corresponding to the active $\overline{REQ}$ input will go LOW to indicate that access will be granted, but GNT will not go HIGH until the current cycle is completed. After completion of current cycle, and followed by a synchronization period, GNT will automatically become active.

If access to the DRAM is requested by both microprocessors, the initial arbitration stage will determine which processor will be serviced by activating the corresponding $\overline{SEL}$ output. This arbitration takes place irrespective of whether or not a refresh cycle is in progress at the time access is requested. $\overline{REQ}$ contention is arbitrated by internal circuitry sampling the $\overline{REQ_1}$ and $\overline{REQ_2}$ inputs on different edges of the CP input: $\overline{REQ_1}$ is sampled on the rising edge of the clock and $\overline{REQ_2}$ is sampled on the falling edge of the same clock. Specially designed CTL flip-flops have been used in this circuitry to eliminate meta-stable states. Again, if a refresh cycle is in progress, the GNT output will not become active until the refresh cycle is completed.

When GNT becomes true on the 'LS764, the A1 – A18 address input signals are latched internally and the A1 – A9 signals are propagated to the MA0 – MA8 output pins. One-half clock cycle is allowed for the address signals to propagate through to the outputs, after which the $\overline{RAS}$ output is brought valid.

At the next half clock cycle, the A10 – A18 latch outputs on the 'LS764 are selected and propagated to the MA0 – MA9 outputs. The write gate (WG) output becomes valid at this time to indicate the proper time to gate the WRITE signal from the selected processor to the DRAM to perform an EARLY WRITE cycle. One-half clock cycle is again allowed for the A10 – A18 signals to propagate and stabilize. $\overline{CASEN}$ then becomes valid. $\overline{CASEN}$ can be used as a CAS output or decoded with higher-order address signals to produce multiple CAS signals. Once $\overline{CASEN}$ is valid, the controller will wait three clock cycles before negating $\overline{RAS}$, making a total $\overline{RAS}$ pulse width of 4 clock cycles. At the time $\overline{RAS}$ becomes inactive, the DTACK output becomes true to indicate that data on the DRAM data lines is valid, or that the proper access time has been met. DTACK can be used to indicate a valid data transfer acknowledge for processors requiring this signal. All controller output signals will be held in this

BLOCK DIAGRAM

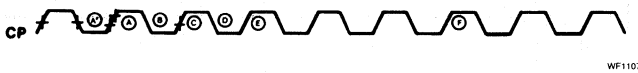


final state until the selected processor withdraws its request by driving its $\overline{REQ}$ input HIGH. When the request is withdrawn, internal synchronization takes place, the controller output signals become inactive, and any pending access or refresh cycles are serviced.

The refresh cycle commences from internally generated refresh requests. RCP is divided by 64 to produce a refresh request internally. Refresh requests are arbitrated with $\overline{SEL}$ outputs in the second stage of arbitration. Refresh always has priority and will be serviced immediately or upon completion of the current access cycle. At the start of a refresh grant, the 9 refresh counter address signals are allowed to propagate to the MA0 – MA8 outputs for one-half clock, at which time the $\overline{RAS}$ signal becomes active for 4 clock cycles, then inactive for 3 clock cycles to meet the $\overline{RAS}$ precharge requirement of the DRAMs, at which time the refresh cycle is terminated.

All signal outputs on the 'LS764 have 48mA drivers and proprietary positive edge rate controlling circuitry to reduce reflections when driving DRAMs on a PC board. The outputs are specified to handle up to 256pF without degradation of control and minimal degradation of access time, allowing any one pin to drive 32 devices (8pF load per input).

AC WAVEFORM FOR IMMEDIATE ACCESS (Sequence of events for $\overline{REQ_1}$ access when no refresh or $\overline{REQ_2}$ access)



WF11070S

A' $\overline{REQ_2}$ sampled

A $\overline{REQ_1}$ sampled
$\overline{SEL_1}$ triggered ($\overline{SEL_1}$ triggered by $\overline{REQ_1}$ sample circuitry)

B GNT triggered ($\overline{SEL_1}$ and GNT propagation paths are the same)
A1 – A18 latched (Input address latch triggered by GNT circuitry)
A1 – A9 propagate to MA outputs

C $\overline{RAS}$ triggered

D WG triggered
A10 – A18 selected and progagated to MA outputs

E $\overline{CASEN}$ triggered

F $\overline{RAS}$ negated
DTACK triggered

7

SYSTEM CYCLES

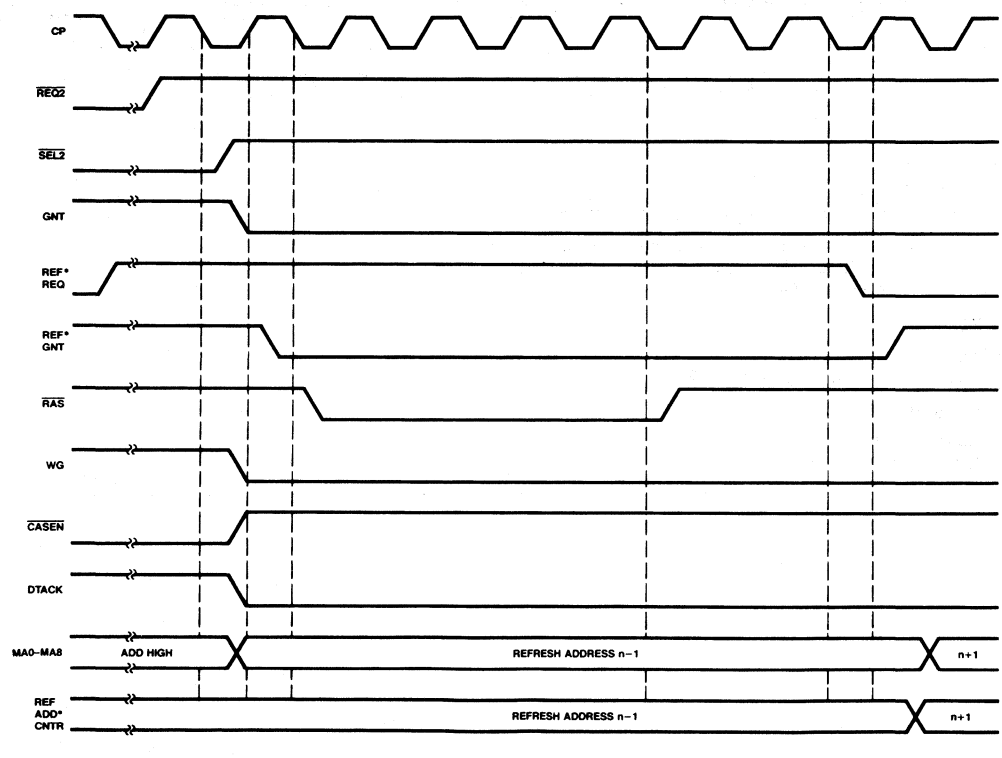
The 74LS764 is always in one of the following cycles.

A. IDLE — There is no request pending and the refresh clock has not completed 64 clock cycles since the last refresh request.

B. REFRESH — A refresh request is initiated every 64 refresh clock cycles, unless there is a refresh cycle already in progress. It is a $\overline{RAS}$ only refresh cycle, derived from the clock (CP).

C. $REQUEST_1$ — This is a memory access cycle for processor 1. It can only be initiated when there is no refresh or request 2 cycle in progress.

D. $REQUEST_2$ — This is a memory access cycle for processor 2. It can only be initiated when there is no refresh or request 1 cycle in progress.



NOTE:
* These are internal signals only.

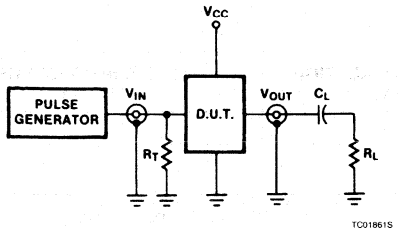
NOTE:
These delays are with respect to clock edge "G" of the $\overline{REQ_1}$ or $\overline{REQ_2}$ access cycle shown on the AC Waveforms.

AC SET-UP AND HOLD REQUIREMENTS

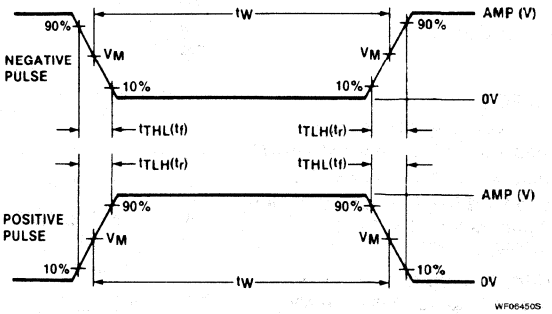
PARAMETER		TEST CONDITIONS	74LS764 $C_L = 300pF$, $R_L = 70\Omega$		UNIT
			Min	Max	
$t_s(H)$ $t_s(L)$	Set-up time, HIGH or LOW $\overline{REQ_1}$, $\overline{REQ_2}$ to CP		3 3		ns
$t_h(H)$ $t_h(L)$	Hold time, HIGH or LOW CP to $\overline{REQ_1}$, $\overline{REQ_2}$		5 5		ns
$t_s(H)$ $t_s(L)$	Set-up time, HIGH or LOW $A_1 - A_{18}$ to CP(falling edge)	AC Waveforms	−8** −8**		ns
$t_h(H)$ $t_h(L)$	Hold time, HIGH or LOW CP(falling edge) to $A_1 - A_{18}$		14 14		ns
$t_w(H)$ $t_w(L)$	CP pulse width, HIGH or LOW		19 18		ns
$t_w(H)$ $t_w(L)$	RCP pulse width, HIGH or LOW		10 12		ns

NOTES:
** These numbers indicate that the address inputs have a negative set-up time and could be valid 8ns after the falling edge of the CP clock. It is suggested that $\overline{SEL_2}$ be used to enable Address Bus 2 and the opposite polarity of the same be used, instead of SEL1 to enable Address Bus 1. This will insure that set-up time for Address Bus 1 is not violated.

TEST CIRCUITS AND WAVEFORMS



Test Circuit Simulating RAM Boards



V_M = 1.3V for 74LS; V_M = 1.5V for all other TTL families.

Input Pulse Definition

FAMILY	INPUT PULSE REQUIREMENTS				
	Amplitude	Rep. Rate	Pulse Width	t_{TLH}	t_{THL}
74LS	3.0V	1MHz	500ns	15ns	6ns

DEFINITIONS

R_L = Load resistor to GND; see AC CHARACTERISTICS for value.

C_L = Load capacitance includes jig and probe capacitance; see AC CHARACTERISTICS for value.

R_T = Termination resistance should be equal to Z_{OUT} of pulse generators.

D = DIODES are IN916, IN3064, or equivalent.

t_{TLH}, t_{THL} values should be less than or equal to the table entries.

Signetics

74LS765
DRAM Controller

DRAM Dual-Ported Controller
Preliminary Specification

Logic Products

FEATURES

- **Allows two microprocessors to access the same bank of DRAM**
- **Replaces 25 TTL devices to perform arbitration, signal timing, multiplexing, and refresh generation**
- **9 address output pins allow control of up to 256K DRAMS**
- **Separate refresh clock allows adjustable refresh timing**
- **Same as LS764 but without input latch**
- **30MHz Maximum Clock rate**

DESCRIPTION

The 74LS765 DRAM Dual-Ported Controller is a high speed, clocked dual port arbiter and timing generator that allows two microprocessors, microcontrollers, or any other memory accessing devices to share the same block of memory. The device performs arbitration, signal timing, address multiplexing and refresh, replacing up to 25 discrete TTL devices.

The 'LS765 unlatched option eliminates the address input latch to facilitate use with latched address outputs.

The device is available in a 40-pin plastic DIP or 44-pin PLCC with pinouts designed to allow convenient placement of microprocessors, DRAMs, and other support chips.

TYPE	TYPICAL PROPAGATION DELAY	TYPICAL SUPPLY CURRENT (TOTAL)
74LS765	45ns	215mA

Signetics

74LS1801
Bit Stream Manager

Encoder/Decoder
Product Specification

Logic Products

DESCRIPTION

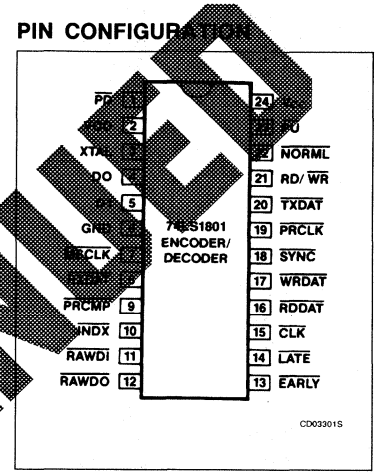
The 74LS1801 Encoder/Decoder (Figure 1) supports disk drive and data communications devices that require fast and reliable data separation capabilities. Although ideally suited for use with the 74LS1802 Serializer/Deserializer, the 74LS1801 is a flexible device which can be implemented in a variety of design applications.

Encoding is possible in FM, MFM, or Differential Manchester formats, making the 74LS1801 invaluable in designs requiring single density disk recording, double density disk recording, or in data communications applications. Included on-chip is a phase-comparator which can be bypassed; this feature is particularly useful in applications that use a complete external phase lock loop.

FEATURES

- **Data rates up to 10MHz**
- **FM, MFM, and Differential Manchester encoding/decoding**
- **Precompensation in MFM write mode**
- **Built-in phase comparator**
- **Single 5-volt power supply**
- **Selectable encoding violation generation/detection formats**

PIN CONFIGURATION



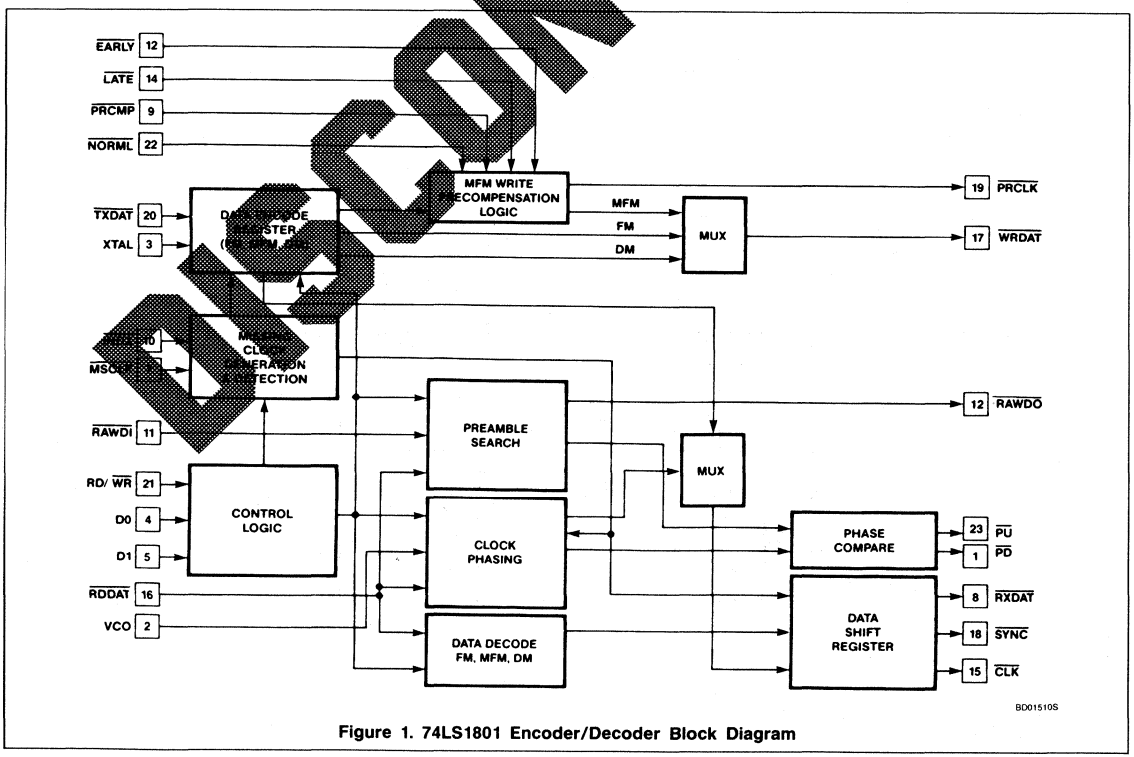


Figure 1. 74LS1801 Encoder/Decoder Block Diagram

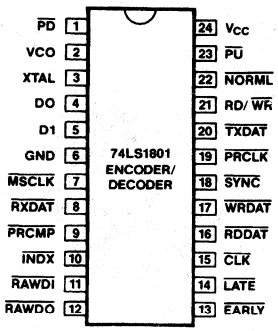
PIN DESCRIPTION



PIN NO.	IDENTIFIER	DESCRIPTION
1	$\overline{PD}$	Pump Down – an output from the phase comparator that indicates the frequency of an external VCO is too high as compared to $\overline{RDDAT}$.
2	VCO	Voltage Controlled Oscillator – an input used as a phase reference for the encoded read data ($\overline{RDDAT}$).
3	XTAL	An input used to synchronize the 74LS1801 during write mode; the crystal frequency is twice the serial data rate.
4	D0	Mode Select inputs designating the format
5	D1	(MFM, FM, or Differential Manchester) of serial data that is to be encoded or decoded.
6	GND	Ground.
7	MSCLK	Missing CLocK – missing clock bits are generated/detected in the data stream, depending upon the state of this input (Table 2, 3).
8	$\overline{RXDAT}$	Receive DATa – an output consisting of NRZ data decoded from MFM, FM, or Differential Manchester data.
9	$\overline{PRCMP}$	PReCoMP – an input that allows precompensation of MFM encoded data.

PIN NO.	IDENTIFIER	DESCRIPTION
10	$\overline{INDX}$	INDeX – an input that designates the missing clock pattern to be generated during the write mode; in the read mode, determines which data/clock pattern must be recognized as an address mark (Table 2, 3).
11	$\overline{RAWDI}$	RAW Data In – a shaped data pulse derived from $\overline{RAWDO}$. $\overline{RAWDI}$ is normally tied directly to $\overline{RAWDO}$.
12	$\overline{RAWDO}$	RAW Data Out – a shaped data pulse derived from $\overline{RDDAT}$ that can be processed through an external phase lock loop. $\overline{RAWDO}$ is normally tied directly to $\overline{RAWDI}$.
13	$\overline{EARLY}$	Modifies clock rate with respect to crystal reference when early precompensation is desired.
14	$\overline{LATE}$	Modifies clock rate with respect to crystal reference when late pre-compensation is desired.
15	CLK	CLocK – Clock input equal to the frequency of NRZ data.
16	$\overline{RDDAT}$	ReaD DATa – an input of encoded serial data (MFM, FM, or Differential Manchester) that is to be converted to NRZ data.
17	$\overline{WRDAT}$	WRite DATa – an output of encoded serial data (FM, MFM, or Differential Manchester) derived from NRZ data.
18	$\overline{SYNC}$	SYNChronization output – when active low, indicates recognition of valid encoding violation in the $\overline{RDDAT}$.
19	$\overline{PRCLK}$	PRecompensation CLocK – an output used to excite an external delay line.
20	$\overline{TXDAT}$	Transmit Data – an input of NRZ data that is to be encoded to FM, MFM, or Differential Manchester data.
21	RD/$\overline{WR}$	ReaD/WRite – an input designating mode of operation: when high, a read is indicated; when low, a write is indicated.
22	$\overline{NORML}$	NORMaL – a clock input that is used when no precompensation is desired.
23	$\overline{PU}$	Pump Up – an output from the phase comparator that indicates the frequency of an external VCO is too low as compared to $\overline{RDDAT}$.
24	V_{CC}	Supply voltage.

FUNCTIONAL OPERATION

The 74LS1801 Encoder/Decoder serves to translate data between disk drive or data communications devices and the 74LS1802 Serializer/Deserializer (or comparable device). Information entering or leaving the Serializer/Deserializer interface is in the form of standard NRZ data and can be encoded to (or decoded from) one of three popular formats:

- Frequency Modulation (FM) — single density disk recordings.
- Modified Frequency Modulation (MFM) — double density disk recordings.
- Differential Manchester — data communications applications.

Read/Write and Format Control

The operational mode of the 74LS1801 is dictated by the RD/$\overline{WR}$ input: when low, a write (encode) is indicated; when high, a read (decode) is designated. In either mode, the format of data being decoded or encoded is controlled by the states of D0 and D1 inputs as shown below:

Table 1. Format Control

D0	D1	RESULTING FORMAT
L	L	MFM
H	L	FM
L	H	Differential Manchester

Following are discussions of the encoding and decoding functions of the 74LS1801 and the timing requirements necessary for accurate data transmittal.

Encoding Logic

When in the encode mode, NRZ data is input via the $\overline{TXDAT}$ input and, after a short bit delay, is output on $\overline{TXDAT}$ as described. Output format is dependent on the states of D0 and D1. Address marks are distinguished from data by missing clock pulses within the character.

These "missing clocks" are generated within the byte following a preamble of either all 0's (MFM and FM formats) or all 1's (Differential Manchester format). As described in Table 2, clocks are eliminated according to inputs $\overline{INDX}$, $\overline{MSCLK}$, and the specified encoding format.

When encoding data in the MFM format, $\overline{MSCLK}$ may be enabled during preamble generation and up to the beginning of an address mark. $\overline{MSCLK}$ can then be disabled during the byte following an address mark, or before the final bit of a four bit series in which the first two bits are 0's (e.g., before the final 0 in 0010). In applications utilizing consecutive A1 characters (such as in the case of floppy disk soft-sectored formats), $\overline{MSCLK}$ would remain active until the beginning of the byte following the A1 series.

Table 2. Missing Clocks

$\overline{MSCLK}$	$\overline{INDX}$	FORMAT	RESULTING CLOCK PATTERN Bit Cell Numbers: 0	1	2	3	4	5	6	7
L	H	FM			V	V	V			
L	L	FM			V		V			
L	H	Differential Manchester	V	V		V				
L	L	Differential Manchester	V	V						
L	X	MFM	2nd of 3 clocks missing							

NOTES:
X = Don't care
V = Missing Clock

Table 3. Address Mark Identification Requirements in Decode Mode

$\overline{MSCLK}$	$\overline{INDX}$	CONDITIONS FOR ACTIVE $\overline{SYNC}$ OUTPUT
H	X	First "1" bit after preamble
L	H	$A1_{16}$ with missing clocks
L	L	Any byte with missing clocks

The 74LS1801 also provides precompensation capabilities when encoding data in the MFM format. Activating the $\overline{PRCMP}$ signal (low) synchronously encodes data according to a clock signal provided on one of three inputs: $\overline{EARLY}$ – a clock shifted early in time, $\overline{LATE}$ – a clock shifted late in time, or $\overline{NORMAL}$ – a clock provided when no precompensation is needed. These inputs are supplied by an external delay line which, in turn, is excited by the $\overline{PRCLK}$ output (see Typical System Configuration, Figure 2.)

When encoding in FM or Differential Manchester formats, missing clocks are only generated in the first byte following a preamble of zeroes. The most significant bit of this byte must be a "1"; for example, address marks F8, FB, FC, or FE. $\overline{MSCLK}$ may be enabled up to the beginning of an address mark; once an address mark has been transmitted, it is not necessary to disable $\overline{MSCLK}$.

Decoding Logic

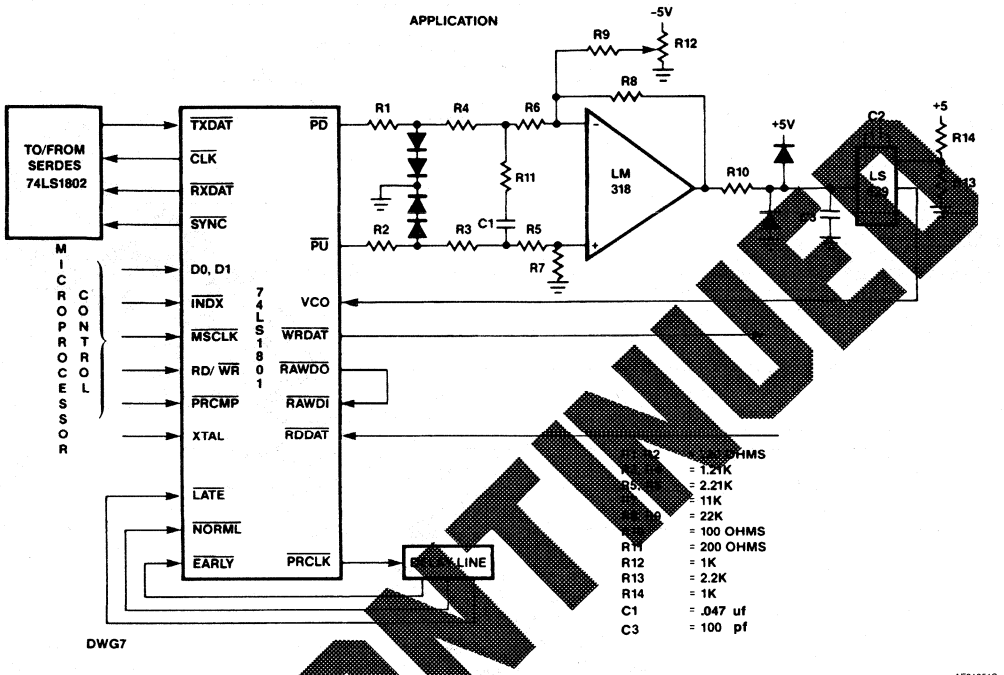
In the decode mode, data (MFM, FM, or Differential Manchester) is input via the $\overline{RDDAT}$ input and, after an eleven bit delay, is output as NRZ data on $\overline{RXDAT}$. As described above, input format is defined by the states of D0 and D1. In the MFM format, a minimum preamble length of 34 bits is required to allow for phase synchronization and location of an address mark; when in FM or Differential Manchester mode, a minimum length of 18 bits is required. After a preamble has been recognized, the 74LS1801 searches for an address mark. When an address mark is identified, the $\overline{SYNC}$ output becomes active low, and alerts the 74LS1802 of incoming data. Rules for positive address mark identification are described below and summarized in Table 3.

When $\overline{MSCLK}$ is inactive, $\overline{SYNC}$ is activated on the first "1" data bit following a preamble of zeroes (MFM and FM) or 1's (Differential Manchester). Data is contained in the byte following this bit.

If $\overline{MSCLK}$ is active, the byte following a preamble of all zeroes is checked for the required missing clocks (Table 3) and if detected, $\overline{SYNC}$ is activated.

PHASE LOCK LOOP AND DATA SEPARATION LOGIC

Data/clock separation logic requires a clock pulse that is synchronous with read data ($\overline{RDDAT}$); to create this signal, the 74LS1801 employs a Phase Lock Loop. In its simplest form, the PLL consists of an internal phase comparator, an external low pass filter and an external voltage controlled oscillator (VCO). Output from the VCO is continuously fed back to the phase compare circuit and contrasted with data read from the disk or communications device ($\overline{RDDAT}$). A difference in phase is represented as one of two quantized output pulses: Pump Up indicates VCO frequency is too low, whereas Pump Down indicates that the VCO frequency is too high. The resulting output ($\overline{PU}$ or $\overline{PD}$) is then processed by a low-pass filter which outputs a DC voltage proportional to the phase deviation. Accordingly, the VCO frequency is precisely serviced to the rate at which data was recorded. The 74LS1801 provides the capability to bypass internal phase compare logic; a typical application of this feature would be in designs implementing a complete external PLL.



NOTE:
The Phase Lock Loop shown here is designed for 5MHz operation. For applications at higher speeds, different values are required for the PLL.

Figure 2. Typical System Configuration

Figure 3 illustrates this application and is discussed below.

RAW Data Out is a shaped data pulse derived directly from RDDAT. In Manchester and FM modes, output is generated from the falling edge of RDDAT; in Differential Manchester mode, output is generated from both rising and falling edges. RAW Data In is a shaped data pulse derived from RAWDO and is used in internal data separation logic. The falling edge of RAWDI is in phase with the falling edge of the signal. RAWDI is normally tied directly to RAWDO.

74LS1802
Bit Stream Manager

Serializer/Deserializer
Product Specification

Logic Products

DESCRIPTION

The 74LS1802 Serializer/Deserializer (Figure 1) incorporates speed, flexibility, and proven ISL technology into a general-purpose device that performs many of the functions necessary for the implementation of a disk or communications controller. On-chip serializing/deserializing, programmable ECC and CRC operation, and bit comparison logic (useful for address-mark or header comparisons) make for a truly versatile device. A selectable 8- or 16-bit data bus and associated control lines allow for a DMA interface which requires little external hardware — a minimum system may be easily built with a microcontroller, a DMA controller, a RAM buffer, disk control lines and interface logic.

FEATURES

- **Data rates up to 10MHz**
- **Selectable CRC-16 or CRC-CCITT polynomials**
- **Full Duplex operation with CRC/ECC on receive data**
- **Programmable ECC polynomial register**
- **Programmable control register**
- **On-chip bit comparator**
- **8- or 16-bit selectable data bus**
- **48-pin DIP**

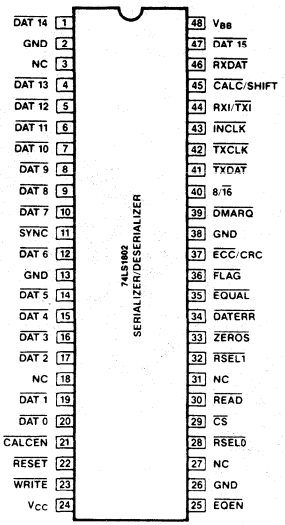
PIN DESCRIPTION



CD00630S

PIN NO.	IDENTIFIER	DESCRIPTION
1, 4–10, 12, 14–17, 19–20, 47	$\overline{DAT0}$ – $\overline{DAT15}$	DATa Bus — bidirectional tri-state lines that communicate serial data, deserialized data, control and ECC polynomial information.
2	GND	Ground.
3	NC	Not connected.
11	$\overline{SYNC}$	SYNChronization Input – active low; generated by the 74LS1802 in the receive mode, and generated externally for transmit mode.
13	GND	Ground.
18	NC	Not connected.
21	$\overline{CALCEN}$	CALculate ENable – when active low, this input enables the error detection circuit to calculate/compare CRC check bits for data and ID fields.
22	$\overline{RESET}$	When active low, this input clears the Data Shift Register and the $\overline{DMARQ}$ output.
23	$\overline{WRITE}$	When active low, this input latches data on the Data Bus into the Transmit Hold Register, the Control Register, or the ECC Polynomial Register.
24	V_{CC}	Supply voltage.
25	$\overline{EQEN}$	EQual ENable – when active low, this input enables the $\overline{EQUAL}$ output.
26	GND	Ground.
27	NC	Not connected.
28, 32	$\overline{RSEL0}$, $\overline{RSEL1}$	Register SELect — inputs that designate which input register (Control Register, Transmit Hold Register, ECC Polynomial Register) is to be written into.
29	$\overline{CS}$	Chip Select – when active low, this input enables $\overline{READ}$ and $\overline{WRITE}$ inputs for data transaction.
30	$\overline{READ}$	When active low, this input enables data transfer from the Receive Hold Register onto the Data Bus.
31	NC	Not connected.
33	$\overline{ZEROS}$	When active low, this output indicates that both bits under comparison are in 0 state and equivalent.
34	$\overline{DATERR}$	DATa ERror – when active low, this output indicates that an $\overline{ECC}$/CRC error has been detected.
35	$\overline{EQUAL}$	When active low, this output indicates that both bits in the bit comparator are in the same state.
36	$\overline{FLAG}$	An active low output pulse generated every 8- or 16-bits; $\overline{FLAG}$ indicates that data is available in receive mode or is requested in transmit mode.
37	$\overline{ECC}$/CRC	When this input is low, the 32-bit ECC circuit is selected; when high, the 16-bit CRC circuit is selected.
38	GND	Ground.
39	$\overline{DMARQ}$	DMA ReQuest – when active low, this output indicates that data is available either in receive mode or is requested in transmit mode. (See control register description.)
40	8/$\overline{16}$	When low, this input designates 16-bit operation; when high, 8-bit operation is selected.
41	$\overline{TXDAT}$	Transmit Data – NRZ transmit data.
42	$\overline{TXCLK}$	Output clock with frequency equal to receive and transmit data.
43	$\overline{INCLK}$	Input clock with frequency equal to receive and transmit data.
44	RXI/$\overline{TXI}$	When low, this input designates transmit mode; when high, receive mode is selected.
45	$\overline{CALC}$/SHIFT	When low, this input causes the error detection circuit to generate the syndrome bytes. At the end of a data or ID field, $\overline{CALC}$/SHIFT is forced high to shift out check bits (transmit mode), or compare these bits with received check bits (receive mode).
46	$\overline{RXDAT}$	Receive data – NRZ receive data.
48	V_{BB}	Supply voltage for internal circuits.

7

Bit Stream Manager | 74LS1802

FUNCTIONAL OPERATION

As shown in Figure 1, data I/O is facilitated by either an 8- or 16-bit bus. A high at 8/$\overline{16}$ input puts the 74LS1802 into an 8-bit mode; when low, a 16-bit mode is indicated. Incoming data on the bus takes one of three forms: transmit data to be serialized, ECC polynomial specification data, or control register information. The 74LS1802 is informed of the type of input data through the $\overline{RSEL0}$ and $\overline{RSEL1}$ inputs, and as shown in Table 1, data is placed in one of three registers:

Table 1. Input Data Register Designations

$\overline{RSEL0}$	$\overline{RSEL1}$	REGISTER NAME
L	H	Cont Reg
H	L	Xmit Hold Reg
H	H	ECC Polyn Reg

Control Register

The Control Register shown in the accompanying diagram is a 5-bit register which can be programmed to implement the following modes/functions.

MSB				LSB
Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

Where,

Bit 0 = $\overline{LEDGE}$/TEDGE
Bit 1 = ECC PRESET
Bit 2 = CRC PRESET
Bit 3 = $\overline{EQUAL}$/LATCH
Bit 4 = $\overline{CRC16}$/CRC-CCITT

Bit 0 ($\overline{LEDGE}$/TEDGE)

The falling edge of $\overline{DMARQ}$ indicates to an external DMA device to perform a read or a Write. If the $\overline{LEDGE}$/TEDGE bit is set to 0, $\overline{DMARQ}$ is terminated by the rising edge of $\overline{READ}$ or $\overline{WRITE}$ when the byte is received, $\overline{DMARQ}$ is terminated by the falling edge of $\overline{READ}$ or $\overline{WRITE}$.

Bit 1 (ECC PRESET)

The ECC shift register can be preset to either all 0's or all 1's to be compatible with existing systems. When the ECC PRESET bit is set to 0, the ECC shift register is preset to 1's. When set to 1, the shift register is set to 0's.

Bit 2 (CRC PRESET)

To be compatible with existing systems, the CRC shift register must be preset to either all 0's or all 1's. For example, IBM 3740 and SYSTEM 34 compatible floppy disks require that the CRC shift register be preset to 1's, while Intel ISIS compatible disks require that this register be set to 0's. When the CRC PRESET bit is set to 0, the CRC shift register is preset to 1's; when set to 1, this register is set to 0's.

Bit 3 ($\overline{EQUAL}$/LATCH)

The $\overline{EQUAL}$ output indicates the status of an internal bit-comparator. When the $\overline{EQUAL}$/LATCH bit is set to 0, $\overline{EQUAL}$ reflects the status of the bit comparator on a per-bit basis. When set to 1, $\overline{EQUAL}$ is latched on the first miscompare between receive and transmit data – this condition is cleared (i.e., $\overline{EQUAL}$ is returned to a high state) when $\overline{SYNC}$ goes high.

Bit 4 ($\overline{CRC16}$/CCITT)

When set to 0, the CRC circuit selects the standard CRC-16 polynomial ($X^{16} + X^{15} + X^2 + 1$); when set to 1, the standard CRC-CCITT polynomial ($X^{16} + X^{12} + X^5 + 1$) is selected.

Transmit Hold Register

The main function of the Transmit Hold Register is to hold a byte/word in reserve ready for transmission.

Before data is transmitted, it is loaded into the Transmit Hold Register. $\overline{SYNC}$ is then activated to start the transmit process. This in turn activates $\overline{FLAG}$ and $\overline{DMARQ}$. Generation of $\overline{FLAG}$ and $\overline{DMARQ}$ indicates that the contents of the Transmit Hold Register have been loaded into the Data Shift Register. Hence, the next byte/word of data should be loaded into the Transmit Hold Register.

ECC POLYNOMIAL REGISTER

The register is composed of 32 bits, each bit representing an X-term. It is selected by writing a one to the appropriate bit. An ECC polynomial is loaded by writing four consecutive bytes (most significant byte first) into the register. Thus the polynomial $X^{32} + X^{23} + X^{21} + X^{11} + X^8 + X^2 + 1$ would be programmed as follows:

BYTE NO.	DATA							
	MSB							LSB
	D7							D0
1	0	0	0	0	0	1	0	X
2	0	0	0	0	1	0	0	1
3	1	0	1	0	0	0	0	0
4	0	0	0	0	0	0	0	0

X = Don't care

The following would appear in the register as:

X^{32} X^{23} X^{21}
1 00000000 10100000

X^{11} X^8 X^2 X^0
00001001 00000101

with X^0 and X^{32} set to 1 by default.

ADDRESS MARK OR HEADER COMPARISONS

A bit comparator in the 74LS1802 compares one bit of received data with one bit of transmitted data; two status lines, $\overline{EQUAL}$ and $\overline{ZEROS}$, reflect the result of the comparison. When active low, $\overline{EQUAL}$ indicates both bits are in the same state, while $\overline{ZEROS}$ indicates the status of the bits under comparison. In this mode the chip is operating in a full duplex mode with CRC/ECC being performed on the receive data.

$\overline{EQUAL}$ can be used to detect a specific address mark or data header. The expected header to be identified is loaded into the Transmit Hold Register and RXI/$\overline{TXI}$ is set low for transmit mode. The output originates from the 74LS1801 Encoder/Decoder, and when set low, indicates that data follows. The preceding bytes may be an address mark (see the 74LS1801 Decoding Logic). The $\overline{EQUAL}$ and $\overline{ZEROS}$ reflect the actual status of the bit comparator when $\overline{SYNC}$ is active. However, when $\overline{SYNC}$ is inactive high, $\overline{EQUAL}$ and $\overline{ZEROS}$ are held active. Note that $\overline{SYNC}$ must be reset at the end of a transmission in preparation for a following read or write.

As specified by the $\overline{EQUAL}$/LATCH Bit in the Control Register, the bit comparator operates in one of two modes. When the control bit is 0, $\overline{EQUAL}$ reflects the status of the bit comparator on a per-bit basis. When the control bit is 1, $\overline{EQUAL}$ is latched on the first miscompare between received and transmitted data and stays in this mode until $\overline{SYNC}$ becomes inactive high.

TRANSMITTING DATA

To transmit data, several initializations must take place: RXI/$\overline{TXI}$ must be held low to indicate a transmit operation, $\overline{ECC}$/CRC is set to the appropriate state, and $\overline{CALC}$/SHIFT must be held low to put the $\overline{ECC}$/CRC circuit into "calculate mode." After the first byte/word of data has been loaded into the Transmit Hold Register, $\overline{SYNC}$ must be externally activated (low) to begin the transmit process. Activating $\overline{SYNC}$ forces the $\overline{FLAG}$ and $\overline{DMARQ}$ lines to go active, after which the next byte/word of data may be loaded into the device. Thereafter, $\overline{FLAG}$ and $\overline{DMARQ}$ will go active every 8 or 16 bits to request more data.

$\overline{CALCEN}$ may be activated to enable the $\overline{ECC}$/CRC circuit before the start of the byte that is to be included in the $\overline{ECC}$/CRC calculations. While the last byte of the data or header field is being shifted-out, $\overline{CALC}$/SHIFT must be forced high, causing the $\overline{ECC}$/CRC check bits to be shifted out after the data. As a result, $\overline{SYNC}$ must be held active low for at least 32 bits (ECC) or 16 bits (CRC) following the last bit of the data field. Typical timing for a transmit operation is shown in Figure 2.

RECEIVING DATA

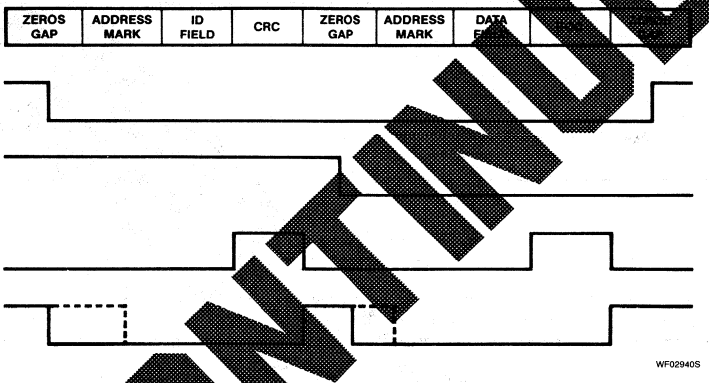
Several conditions must be fulfilled before a receive operation takes place. RXI/$\overline{TXI}$ is held high to indicate a receive operation, $\overline{ECC}$/CRC is set to the appropriate state, and $\overline{CALC}$/SHIFT is held low to put the $\overline{ECC}$/CRC circuit into "calculate mode." If the address mark is to be included in $\overline{ECC}$/CRC calculations, $\overline{CALCEN}$ may be activated low at this time. Once these conditions have been fulfilled, receive data can be enabled.

When $\overline{SYNC}$ is activated, a counter circuit sets up either 8- or 16-bits of data and generates active $\overline{FLAG}$ and $\overline{DMARQ}$ outputs to indicate data available in the Receive Hold Register. This continues until $\overline{SYNC}$ becomes high.

While the last byte of data is being received $\overline{CALC}$/SHIFT must be forced high to put the $\overline{ECC}$/CRC circuit into "checkmode" at the beginning of the next byte. At this time, check bits on receive data are compared to check bits appended to the end of the data field; if the two groups of bits do not match, $\overline{DATERR}$ is activated. $\overline{DATERR}$ is latched internally and is cleared when $\overline{SYNC}$ goes inactive.

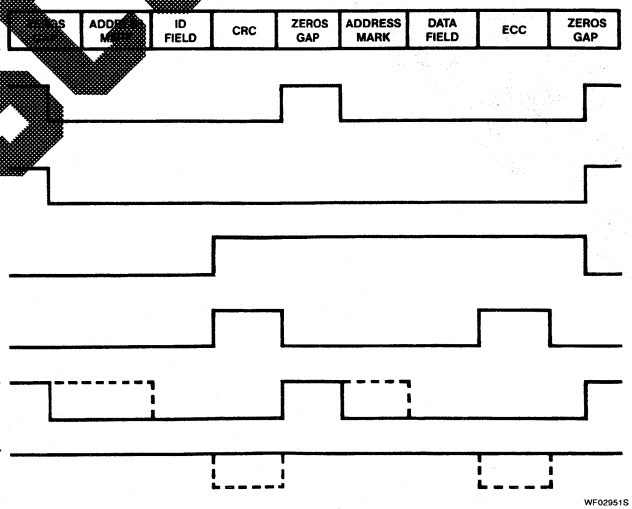
Note that $\overline{SYNC}$ must be held active until all check bits (32 for ECC, 16 for CRC) have been compared. The result of the bit comparison is held in the Receive Hold Register. If no error occurred, the Receive Hold Register will be set to 0's, otherwise the bytes are used in the correction process.

Typical timing for a header comparison (with CRC) is shown in Figure 3.



NOTE:
*$\overline{CALCEN}$ should be activated before or after the address mark, depending on whether or not the address mark is to be included in $\overline{ECC}$/CRC calculations.

Figure 2. Timing Example of a Transmit Operation



NOTE:
*$\overline{CALCEN}$ should be activated before or after the address mark, depending on whether or not the address mark is to be included in $\overline{ECC}$/CRC calculations.

Signetics

74LS1811
Bit Stream Manager

Encoder/Decoder
Preliminary Specification

Logic Products

DESCRIPTION

The 74LS1811 Encoder/Decoder (Figure 1) supports disk drive and data communications devices that require fast and reliable data separation capabilities. Although ideally suited for use with the 74LS1812 Serializer/Deserializer, the 74LS1811 is a flexible device which can be implemented in a variety of design applications.

Encoding is possible in FM, MFM, or Differential Manchester formats, making the 74LS1811 invaluable in designs requiring single density disk recording, double density disk recording, or in data communications applications. Included on-chip is a phase-comparator which can be bypassed; this feature is particularly useful in applications that use a complete external phase lock loop.

FEATURES

- **FM, MFM, and Differential Manchester encoding/decoding**
- **Precompensation in MFM write mode**
- **Built-in phase comparator**
- **Single 5-volt power supply**
- **Selectable encoding violation generation/detection formats**
- **Data Rates:**
  - **FM 16MHz**
  - **MFM 20MHz**
  - **DM 20MHz**

PIN CONFIGURATION

Signetics

74LS1812
Bit Stream Manager

Serializer/Deserializer
Preliminary Specification

Logic Products

DESCRIPTION

The 74LS1812 Serializer/Deserializer (Figure 1) incorporates speed, flexibility, and proven ISL technology into a general-purpose device that performs many of the functions necessary for the implementation of a disk or communications controller. On-chip serializing/deserializing, programmable ECC and CRC operation, and bit comparison logic (useful for address-mark or header comparisons) make for a truly versatile device. A selectable 8- or 16-bit data bus and associated control lines allow for a DMA interface which requires little external hardware — a minimum system may be easily built with a microcontroller, a DMA controller, a RAM buffer, disk control lines and interface logic.

FEATURES

- **Data rates up to 30MHz**
- **Selectable CRC-16 or CRC-CCITT polynomials**
- **Full Duplex operation with CRC/ECC on receive data**
- **Programmable ECC polynomial register**
- **Programmable control register**
- **On-chip bit comparator**
- **8- or 16-bit selectable data bus**
- **48-pin DIP or 68-pin PLCC**

Signetics

2960
Error Detection and Correction (EDC) Unit

Product Specification

Logic Products

FEATURES

- **Boosts Memory Reliability — Corrects all single-bit errors. Detects all double and some triple-bit errors. Reliability of dynamic RAM systems is increased more than 60-fold.**
- **Very High Speed — Perfect for MOS microprocessor, minicomputer and mainframe systems.**
  - **Data in to error detect: 32ns worst case.**
  - **Data in to corrected data out: 65ns worst case.**
- **High performance systems can use the Signetics EDC in the check-only mode to avoid memory system slowdown.**
- **Replaces 25 to 50 MSI chips — All necessary features are built-in to the Signetics 2960, including diagnostics, data in, data out and check bit latches.**
- **Handles Data Words From 8 to 64 Bits — The Signetics 2960 is cascadable: 1 EDC for 8 or 16 bits, 2 for 32 bits, 4 for 64 bits.**
- **Easy Byte Operations — Separate byte enables on the data out latch simplify the steps and cuts the time required by byte writes.**
- **Built-In Diagnostics — The processor may completely exercise the EDC under software control to check for proper operation.**

DESCRIPTION

The Signetics 2960 Error Detection and Correction Unit (EDC) (Figure 1) contains the logic necessary to generate check bits on a 16-bit data field according to a modified Hamming Code, and to correct the data word when check bits are supplied. Operating on data read from memory, the EDC will correct any single bit error and will detect all double and some triple bit errors. For 16-bit words, 6 check bits are used. The 2960 can be expanded to operate on 32-bit words (7 check bits) and 64-bit words (8 check bits). In all configurations, the device makes the error syndrome available on separate outputs for data logging.

The Signetics 2960 also features two diagnostic modes, in which diagnostic data can be forced into portions of the chip to simplify device testing and to execute system diagnostic functions.

The product is supplied in a 48 lead hermetic DIP package and a 48-pin plastic package.

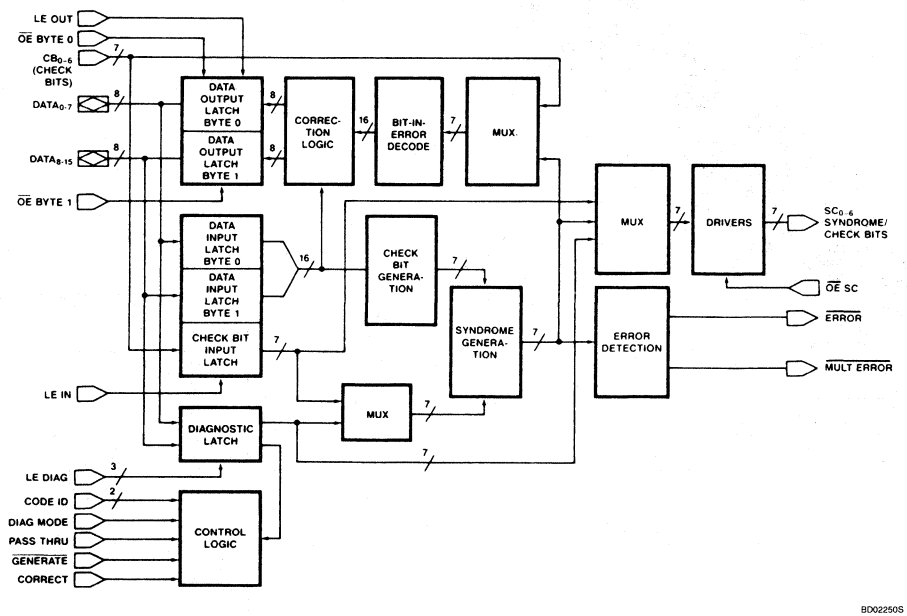

Figure 1. Block Diagram Of 2960

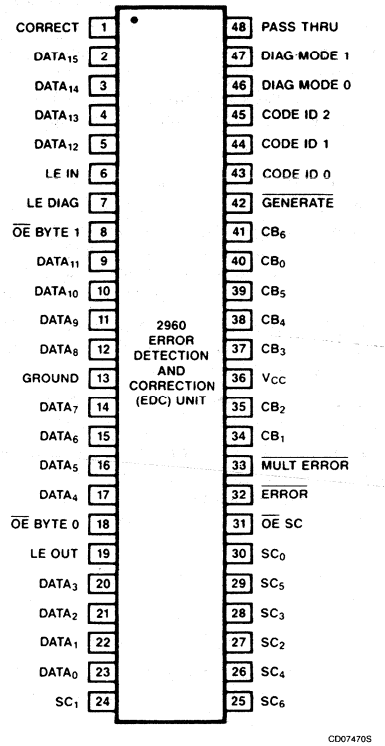
2960 PACKAGE AND PIN DESIGNATIONS



PIN DESCRIPTION

PIN NO.	IDENTIFIER	FUNCTION
1	Correct	**Correct input:** When HIGH this signal allows the correction network to correct any single-bit error in the Data input Latch (by complementing the bit-in-error) before putting it onto the Data Output Latch. When LOW the EDC will drive data directly from the Data input latch to the Data Output Latch without correction.
2 – 5 9 – 12 14 – 17 20 – 23	$DATA_{15-12}$ $DATA_{11-8}$ $DATA_{7-4}$ $DATA_{3-0}$	**16 Bidirectional Data Lines:** They provide input to the Data Input Latch and Diagnostic Latch, and receive output from the Data Output Latch. $DATA_0$ is the least significant bit; $DATA_{15}$ is the most significant.
6	LE IN	**Latch Enable:** Data Input Latch. Controls latching of the input data. When HIGH the Data input Latch and Check Bit Input Latch follow the input data and input check bits. When LOW, the Data Input Latch and Check Bit Input Latch are latched to their previous state.
7	LE DIAG	**Latch Enable:** Diagnostic Latch. When HIGH the Diagnostic Latch follows the 16-bit data on the input lines. When LOW the outputs of the Diagnostic Latch are latched to their previous states. The Diagnostic Latch holds diagnostic check bits, and internal control signals for CODE ID_{0-2}, DIAG $MODE_{0-1}$, CORRECT and PASS THRU.

PIN DESCRIPTION (Continued)

PIN NO.	IDENTIFIER	FUNCTION
18, 8	OE BYTE 0, OE BYTE 1	**Output Enable:** Bytes 0 and 1, Data Output Latch. These lines control the 3-state outputs for each of the two bytes of the Data Output Latch. When LOW these lines enable the Data Output Latch and when HIGH these lines force the Data Output Latch into the high impedance state. The two enable lines can be separately activated to enable only one byte of the Data Output Latch at a time.
13	GND	**Ground.**
19	LE OUT	**Latch Enable:** Data Output Latch. Controls the latching of the Data Output Latch. When LOW the Data Output Latch is latched to its previous state. When HIGH the Data Output Latch follows the output of the Data Input Latch as modified by the correction logic network. In Correct Mode, single-bit errors are corrected by the network before loading into the Data Output Latch. In Detect Mode, the contents of the Data Input Latch are passed through the correction network unchanged into the Data Output Latch. The inputs to the Data Output Latch are unspecified if the EDC is in Generate Mode.
24, 25 – 30	$SC_1S_6 - S_0$	**Syndrome/Check Bit Outputs:** These seven lines hold the check/partial-check bits when the EDC is in Generate Mode, and will hold the syndrome/partial syndrome bits when the device is in Detect or Correct Modes. These are 3-state outputs.
31	OE SC	**Output Enable:** Syndrome/Check Bits. When LOW, the 3-state output lines SC_{0-6} are enabled. When HIGH, the SC outputs are in the high impedance state.
32	ERROR	**Error Detected Output:** When the EDC is in Detect or Correct Mode, this output will go LOW if one or more syndrome bits are asserted, meaning there are one or more bit errors in the data or check bits. If no syndrome bits are asserted, there are no errors detected and the output will be HIGH. In Generate Mode, ERROR is forced HIGH. (In a 64-bit configuration, ERROR must be externally implemented.)
33	MULT ERROR	**Multiple Errors Detected Output:** When the EDC is in Detect or Correct Mode, this output if LOW indicates that there are two or more bit errors that have been detected. If HIGH this indicates that either one or no errors have been detected. In Generate mode, MULT ERROR is forced HIGH (in a 64-bit configuration, MULT ERROR must be externally implemented.)
40, 34 – 35 37 – 39, 41	CB_{0-6}	**Seven Check Bit Input Lines:** The check bit lines are used to input check bits for error detection. Also used to input syndrome bits for error correction in 32 and 64-bit configurations.
36	V_{CC}	+5V Power Supply.
42	GENERATE	**Generate Check Bits Input:** When this input is LOW the EDC is in the Check Bit Generate Mode. When HIGH the EDC is in the Detect Mode or Correct Mode. In the Generate Mode the circuit generates the check bits or partial check bits specific to the data in the Data Input Latch. The generated check bits are placed on the SC outputs. In the Detect or Correct Modes the EDC detects single and multiple errors, and generates syndrome bits based upon the contents of the Data Input Latch and Check Bit input Latch. In Correct Mode, single-bit errors are also automatically corrected - corrected data is placed at the inputs of the Data Output Latch. The syndrome result is placed on the SC outputs and indicates in a coded form the number of errors and the bit-in-error.
43 – 45	Code ID_{0-2}	**Code Identification Inputs:** These three bits identify the size of the total data word to be processed and which 16-bit slice of larger data words a particular EDC is processing. The three allowable data word sizes are 16, 32 and 64 bits and their respective modified Hamming codes are designated 16/22, 32/39 and 64/72. Special CODE ID input 001 (ID_2, ID_1, ID_0) is also used to instruct the EDC that the signals, CODE ID_{0-2}, DIAG $MODE_{0-1}$, CORRECT and PASS THRU are to be taken from the Diagnostic Latch, rather than from the input control lines.
46, 47	DIAG $MODE_{0-1}$	**Diagnostic Mode Select:** These two lines control the initialization and diagnostic operation of the EDC.
48	PASS THRU	**Pass Thru Input:** This line when HIGH forces the contents of the Check Bit Latch onto the Syndrome/Check Bit outputs (SC_{0-6}) and the unmodified contents of the Data Input Latch onto the inputs of the Data Output Latch.

ARCHITECTURAL SUMMARY

The EDC Unit is a powerful 16-bit cascadable slice used for check bit generation, error detection, error correction and diagnostics.

As shown in Figure 1, the device consists of the following:

- Data Input Latch
- Check Bit Input Latch
- Check Bit Generation Logic
- Syndrome Generation Logic
- Error Detection Logic

Table 1. Hamming Code and Slice Identification

**In Code ID_{2-0} 001 (ID_2, ID_1, ID_0) DM_1 and DM_0 are taken from the Diagnostic Latch.

- Error Correction Logic
- Data Output Latch
- Diagnostic Latch
- Control Logic

Data Input Latch

16 bits of data are loaded from the bidirectional DATA lines under control of the Latch Enable input, LE IN. Depending on the control mode the input data is either used for check bit generation or error detection/correction.

Check Bit Input Latch

Seven check bits are loaded under control of LE IN. Check bits are used in the Error Detection and Error Correction modes.

Check Bit Generation Logic

This block generates the appropriate check bit for the 16 bits of data in the Data Input Latch. The check bits are generated according to a modified Hamming code.

Syndrome Generation Logic

In both Error Detection and Error Correction modes, this logic block compares the check bits read from memory against a newly generated set of check bits produced for the data read in from memory. If both sets of check bits match, then there are no errors. If there is a mismatch, then one or more of the data or check bits is in error.

The syndrome bits are produced by an exclusive-OR of the two sets of check bits. If the two sets of check bits are identical (meaning there are no errors) the syndrome bits will be all zeroes. If there are errors, the syndrome bits can be decoded to determine the number of errors and the bit-in-error.

Error Detection Logic

This section decodes the syndrome bits generated by the Syndrome Generation Logic. If there are no errors in either the input datas or check bits, the ERROR and MULT ERROR outputs remain HIGH. If one or more errors are detected, ERROR goes LOW. If two or more errors are detected, both ERROR and MULT ERROR go LOW.

Error Correction Logic

For single errors, the Error Correction Logic complements (corrects) the single data bit in error. This corrected data is loadable into the Data Output Latch, which can then be read onto the bidirectional data lines. If the single error is one of the check bits, the correction logic does not place corrected check bits on the syndrome/check bit outputs. If the corrected check bits are needed the EDC must be switched to Generate Mode.

Data Output Latch

The Data Output Latch is used for storing the result of an error correction operation. The latch is loaded from the correction logic under control of the Data Output Latch Enable, LE OUT. The Data Output Latch may also be loaded directly from the Data Input Latch under control of the PASS THRU control input.

The Data Output Latch is split into two 8-bit (byte) latches which may be enabled independently for reading onto the bidirectional data lines.

Diagnostic Latch

This is a 16-bit latch loadable from the bidirectional data lines under control of the Diagnostic Latch Enable, LE DIAG. The Diagnostic Latch contains check bit information in one byte and control information in the other byte. The Diagnostic Latch is used for driving the device when in Internal Control Mode, or for supplying check bits when in one of the Diagnostic Modes.

Control Logic

The control logic determines the specific operating mode of the device. Normally the control logic is driven by external control inputs. However, in Internal Control Mode, the control signals are read from the Diagnostic Latch.

FUNCTIONAL OPERATION

The EDC contains the logic necessary to generate check bits on a 16-bit data field according to a modified Hamming code (Table 1). Operating on data read from memory, the EDC will correct any single-bit error and will detect all double and some triple-bit errors. The EDC can be configured to operate on 16-bit data words (with 6 check bits), 32-bit data words (with 7 check bits) and 64-bit data words (with 8 check bits). In fact, the EDC can be configured to work on data words from 8 to 64 bits. In all configurations, the device makes the error syndrome bits available on separate outputs for error data logging.

Code and Byte Specification

The EDC may be configured in several different ways and operates differently in each configuration. It is necessary to indicate to the device what size data word is involved and which bytes of the data word it is processing. This is done with input lines CODE ID_{0-2}, as shown in Table 1; the three modified Hamming codes are defined below:

- 16/22 — 16 data bits, 6 check bits, 22 bits in total.
- 32/39 — 32 data bits, 7 check bits, 39 bits in total.
- 64/72 — 64 data bits, 8 check bits, 72 bits in total.

CODE ID input 001 (ID_2, ID_1, ID_0) is a special code, described later, used to operate the device in Internal Control Mode.

7

Table 3. Diagnostic Mode Control

DIAG $MODE_1$	DIAG $MODE_0$	DIAGNOSTIC MODE SELECTED
0	0	**Non-diagnostic mode:** The EDC functions normally in all modes.
0	1	**Diagnostic Generate:** The contents of the Diagnostic Latch are substituted for the normally generated check bits when in the Generate Mode. The EDC functions normally in the Detect or Correct modes.
1	0	**Diagnostic Detect/Correct:** In the Detect or Correct Mode, the contents of the Diagnostic Latch are substituted for the check bits normally read from the Check Bit Input Latch. The EDC functions normally in the Generate Mode.
1	1	**Initialize:** The outputs of the Data Input Latch are forced to zeroes (and latched upon removal of the Initialize Mode) and the check bits generated correspond to the all-zero data.

Table 4. 16-Bit Modified Hamming Code

GENERATED CHECK BITS	PARITY	PARTICIPATING DATA BITS															
		0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
CX	Even (XOR)		X	X	X		X			X	X		X			X	
C0	Even (XOR)	X	X	X		X		X		X		X		X			
C1	Odd (XNOR)	X			X	X			X		X	X			X		X
C2	Odd (XNOR)	X	X				X	X	X				X	X	X		
C4	Even (XOR)			X	X	X	X	X	X							X	X
C8	Even (XOR)									X	X	X	X	X	X	X	X

NOTE:
The check bit is generated as either an XOR or XNOR of the eight data bits noted by an "X" in the table.

Control Mode Selection

The device control lines are GENERATE, CORRECT, PASS THRU, DIAG $MODE_{0-1}$ and CODE ID_{0-2}. Table 2 indicates the operating modes selected by various combinations of the control line inputs.

Diagnostics

Table 3 shows specifically how DIAG $MODE_{0-1}$ select between normal operation, initialization and one of two diagnostic modes. The Diagnostic Modes allow the user to operate the EDC under software control in order to verify proper functioning of the device.

Check and Syndrome Bit Labelling

The check bits generated in the EDC are designed as follows:

- 16-bit configuration - CX, C0, C1, C2, C4, C8;
- 32-bit configuration - CX, C0, C1, C2, C4, C8, C16;
- 64-bit configuration - CX, C0, C1, C2, C4, C8, C16, C32.

Syndrome bits are similarly labeled SX through S32. There are only 6 syndrome bits in the 16-bit configuration, 7 for 32 bits and 8 syndrome bits in the 64-bit configuration.

The error correction code can be selected independent of the processor with the exception of diagnostic software.

Diagnostic software run by a processor to checkout the EDC system must know specifically which code is being used. This is only a problem when the EDC replaces an existing MSI implementation on an existing computer. In this case, the computer's software must first determine which of two codes (the old one used by the MSI implementation or the new one used by the EDC) is used by the computer's memory system.

This is easily determined by writing a test data word into memory and then examining whether the generated check bits are typical of the old or the new code. From then on the software runs only the diagnostic appropriate for the code used on that particular computer's memory system.

Initialize Mode

The inputs of the Data Output Latch are forced to zeroes. The check bit outputs (SC) are generated to correspond to the all-zero data. ERROR and MULT ERROR are forced HIGH in the Initialize Mode.

Initialize Mode is useful after power up when RAM contents are random. The EDC may be placed in initialize mode and its outputs written in to all memory locations by the processor.

Code Selections

The Signetics 2960 EDC uses a modified Hamming Code which provides the following functions:

- Cascading of EDC Units
- Detection of all double-bit errors
- Detection of gross error conditions (all "0s" or all "1s").

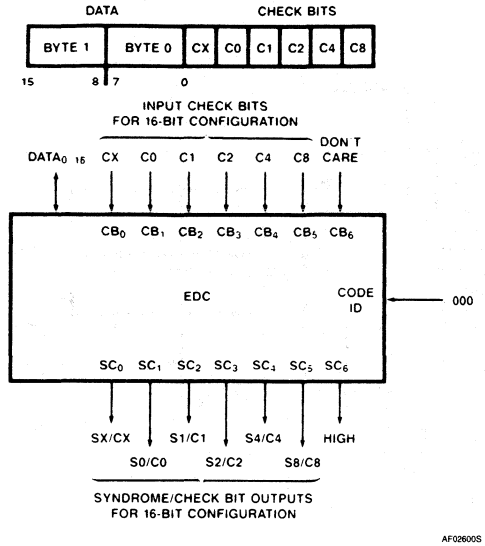

Figure 2. 16-Bit Data Format And I/O

16-Bit Data Word Configuration

The 16-bit format consists of 16 data bits, six check bits and, as previously indicated, is designated as the 16/22 code. The data format and I/O configuration for a 16-bit word is shown in Figure 2.

Generate Mode

In this mode check bits will be generated that correspond to the contents of the Data Input Latch. The check bits generated are placed on the outputs SC_{0-5} (SC_6 is a logical one, or high).

Check bits are generated according to a modified Hamming code. Details of the code for check bit generation are contained in Table 4.

Each check bit is generated as either an XOR or XNOR of eight of the 16 data bits as indicated in the table. The XOR function results in an even parity check bit; the XNOR is an odd parity check bit. Data flow for the Generate Mode is shown in Figure 3.

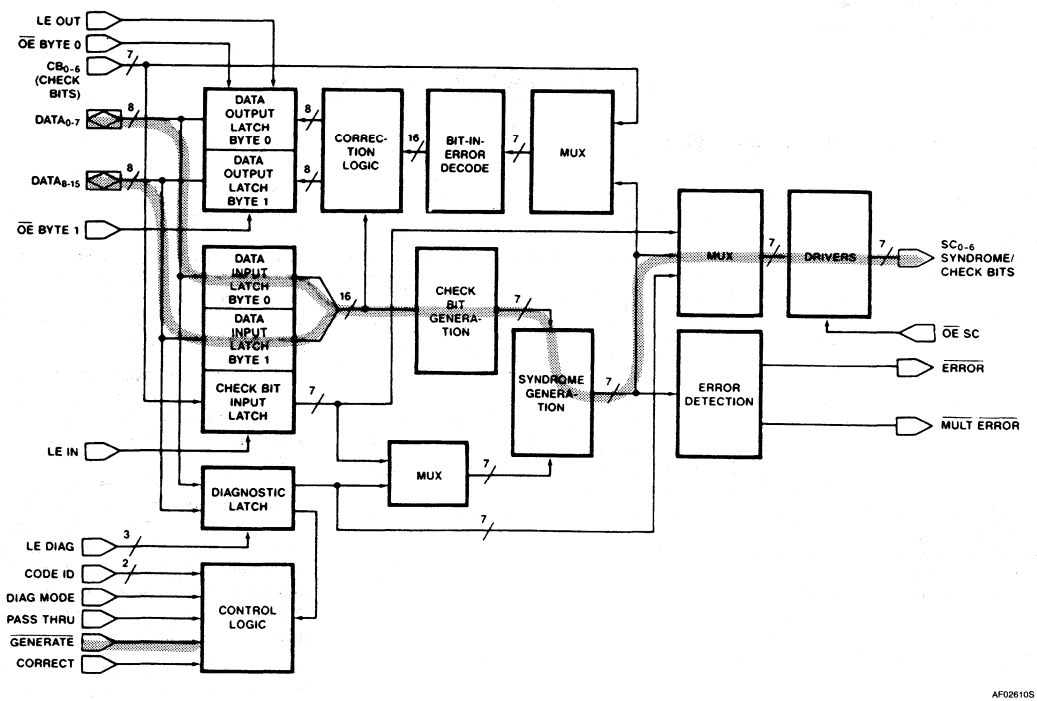

Figure 3. Check Bit Generation

Error Detection and Correction (EDC) Unit

2960

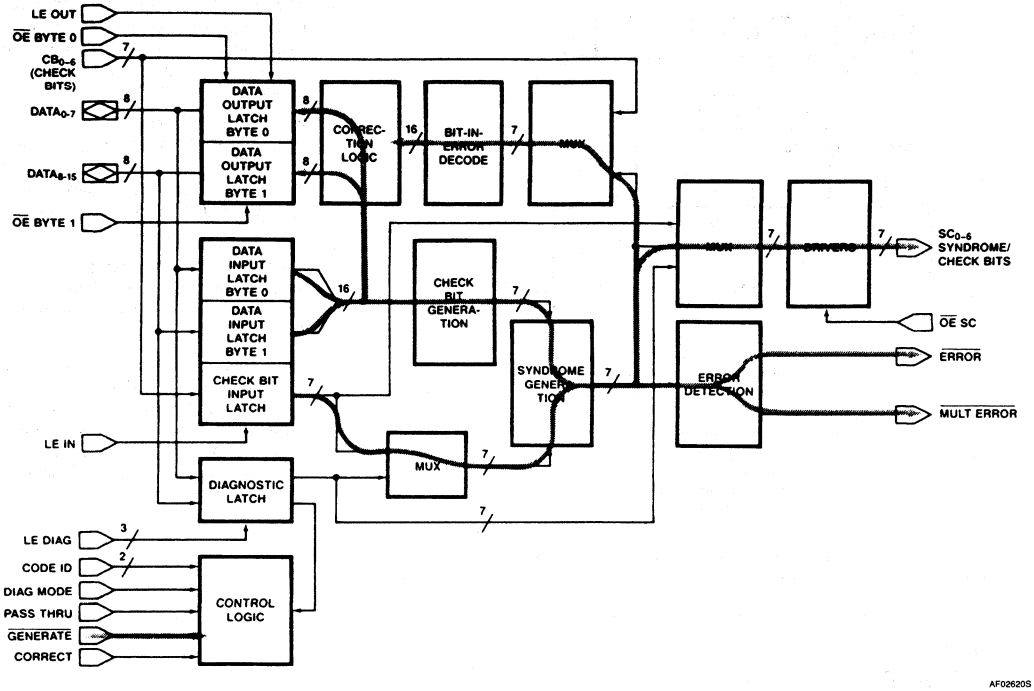

Figure 4. Error Detection And Correction

Table 5. Syndrome Decode to Bit-In-Error

SYNDROME BITS SX	S0	S1	S8	S4	S2	0	1	0	1	0	1	0	1
						0	0	1	1	0	0	1	1
						0	0	0	0	1	1	1	1
0	0	0				*	C8	C4	T	C2	T	T	M
0	0	1				C1	T	T	15	T	13	7	T
0	1	0				C0	T	T	M	T	12	6	T
0	1	1				T	10	4	T	0	T	T	M
1	0	0				CX	T	T	14	T	11	5	T
1	0	1				T	9	3	T	M	T	T	M
1	1	0				T	8	2	T	1	T	T	M
1	1	1				M	T	T	M	T	M	M	T

* — no errors detected
Number — the location of the single bit-in-error
T — two errors detected
M — three or more errors detected

Detect Mode

In this mode the device examines the contents of the Data Input Latch against the Check Bit Input Latch, and will detect all single-bit errors, all double-bit errors and some triple-bit errors. If one or more errors are detected, ERROR goes LOW. If two or more errors are detected, MULT ERROR goes LOW. Both error indicators are HIGH if there are no errors.

Also available on device outputs SC_{0-5} are the syndrome bits generated by the error detection step. The syndrome bits may be decoded to determine if a bit error was detected and, for single-bit errors, which of the data or check bits is in error. Table 5 provides decoding data for the syndrome bits generated by the 16-bit configuration (as an example, if the syndrome bits SX/S0/S1/S2/S4/S8 were 101001 this would be decoded to indicate that there is a single-bit error at data bit 9). If no error is detected the syndrome bits will all be zeroes.

In Detect Mode, the contents of the Data Input Latch are driven directly to the inputs of the Data Output Latch without correction.

Table 6. Diagnostic Latch Loading

DATA BIT	INTERNAL FUNCTION
0	Diagnostic Check Bit X
1	Diagnostic Check Bit 0
2	Diagnostic Check Bit 1
3	Diagnostic Check Bit 2
4	Diagnostic Check Bit 4
5	Diagnostic Check Bit 8
6, 7	Don't Care
8	CODE ID 0
9	CODE ID 1
10	CODE ID 2
11	DIAG MODE 0
12	DIAG MODE 1
13	CORRECT
14	PASS THRU
15	Don't Care

Correct Mode

In this mode, the EDC functions the same as in Detect Mode except that the correction network is allowed to correct (complement) any single-bit error of the Data Input Latch before putting it onto the inputs of the Data Output Latch — see Figure 4. If multiple errors are detected, the output of the correction network is unspecified. If the single-bit error is a check bit there is no automatic correction. If check bit correction is desired, this can be done by placing the device in Generate Mode to produce a correct check bit sequence for the data in the Data Input Latch.

Pass Thru Mode

In this mode, the unmodified contents of the Data Input Latch are placed on the inputs of the Data Output Latch and the contents of the Check Bit Input Latch are placed on outputs SC_{0-5}. ERROR and MULT ERROR are forced HIGH in this mode.

Diagnostic Latch

The diagnostic Latch serves both for diagnostic uses and internal control uses. It is loaded from the DATA lines under the control of LE DIAG. Table 6 shows the loading definitions for the DATA lines.

Diagnostic Generate/Detect/Correct

These are special diagnostic modes selected by DIAG $MODE_{0-1}$ where either normal check bit inputs or outputs are substituted for by check bits loaded into the Diagnostic Latch — See Table 2 for details. Figures 5 and 6 illustrate the flow of data during the two diagnostic modes.

Internal Control Mode

This mode is selected by CODE ID_{0-2} input 001 (ID_2, ID_1, ID_0).

When in Internal Control Mode, the EDC takes the CODE ID_{0-2}, DIAG $MODE_{0-1}$, CORRECT, and PASS THRU control signals from the internal Diagnostic Latch rather than from the external input lines.

Table 6 gives the format for loading the Diagnostic Latch.

32-Bit Data Word Configuration

The 32-bit format consists of 32 data bits, seven check bits and, as previously indicated, is designated as the 32/39 code. The data format and I/O configuration for a 32-bit word is shown in Figure 7.

The upper EDC (Slice 0/1) handles the least significant bytes 0 and 1 — the external DATA lines 0 to 15 are connected to the same numbered inputs of the upper device. The lower EDC (Slice 2/3) handles the most significant bytes 2 and 3 — the external DATA lines for bits 16 to 31 are connected to inputs $DATA_0$ through $DATA_{15}$ respectively.

The valid syndrome and check bit outputs are those of Slice 2/3 as shown in the diagram. In Correct Mode these must be read into Slice 0/1 via the CB inputs and are selected by the MUX as inputs to the bit-in-error decoded (see block diagram), thus requiring external buffering and output enabling of the check bit lines as shown. The OE SC signal can be used to control enabling of check bit inputs - when syndrome outputs are enabled, the external check bit inputs will be disabled.

The valid ERROR and MULT ERROR outputs are those of the Slice 2/3. The ERROR and MULT ERROR outputs of Slice 0/1 are unspecified. All of the latch enables and control signals must be input to both of the devices.

Generate Mode

In this mode check bits will be generated that correspond to the contents of the Data Input Latch. The check bits generated are placed on the outputs SC_{0-6} of Slice 2/3.

Check bits are generated according to a modified Hamming code. Details of the code for check bit generation are contained in Table 7. Check bits are generated as either an XOR or XNOR or 16 of the 32 data bits as indicated in the table. The XOR function results in an even parity check bit, the XNOR in an odd parity check bit.

Detect Code

In this mode the device examines the contents of the Data Input Latch against the Check Bit Input Latch, and will detect all single-bit errors, all double-bit errors and some triple-bit errors. If one or more errors are detected, ERROR goes LOW. If two or more errors are detected MULT ERROR goes LOW. Both error indicators are HIGH if there are no errors. The valid ERROR and MULT ERROR signals are those of Slice 2/3 — those of Slice 0/1 are undefined.

Also available on Slice 2/3 outputs $SC_{0/6}$ are the syndrome bits generated by the error detection step. The syndrome bits may be decoded to determine if a bit error was detected and, for single-bit errors, which of the data or check bits is in error. Table 8 gives the chart for decoding the syndrome bits generated for the 32-bit configuration (as an example, if the syndrome bits SX/S0/S1/S2/S4/S8/S16 were 0010011 this would be decoded to indicate that there is a single-bit error at data bit 25). If no error is detected the syndrome bits will be all zeroes.

In Detect Mode, the contents of the Data Input Latch are driven directly to the inputs of the Data Output Latch without corrections.

Correct Mode

In this mode, the EDC functions the same as in Detect Mode except that the correction network is allowed to correct (complement) any single-bit error of the Data Input Latch before putting it onto the inputs of the Data Output Latch. If multiple errors are detected, the output of the correction network is unspecified. If the single-bit error is a check bit there is no automatic correction — if desired this would be done by placing the device in Generate Mode to produce a correct check bit sequence for the data in the Data Input Latch.

For data correction, both Slices 0/1 and 2/3 require access to the syndrome bits on Slice 2/3's outputs SC_{0-6}. Slice 2/3 has access to these syndrome bits through internal data paths, but for Slice 0/1 they must be read through the inputs CB_{0-6}. The device connections for this are shown in Figure 7. When in Correct Mode the SC outputs must be enabled so that they are available for reading in through the CB inputs.

Pass Thru Mode

In this mode, the unmodified contents of the Data Input Latch are placed on the inputs of the Data Output Latch and the contents of the Check Bit Input Latch are placed on outputs SC_{0-6} of Slice 2/3. ERROR and MULT ERROR are forced HIGH in this mode.

Diagnostic Latches/AC Calculations

Table 9 shows how the latches (Slice 1 and Slice 2) are loaded for code 32/39 (32-bit format). Table 10 shows key AC parameters for the 32-bit configuration.

64-Bit Data Word Configuration

The 64-bit format consists of 64 data bits, eight check bits and, as previously indicated, is designated as the 64/72 code. The data format and I/O configuration for a 64-bit word is shown in Figure 8.

The configuration to process the 64-bit format is similar to that shown in Figure 2. In this configuration a portion of the syndrome generation and error detection is implemented externally of the EDCs in MSI. For error correction the syndrome bits generated must be read back into all four EDCs through the CB inputs. This necessitates the check bit buffering shown in Figure 8. The OE SC signal can control the check bit enabling — when syndrome bit outputs are enabled the external check bit lines will be disabled so that the syndrome bits may be read onto the CB inputs.

The error detection signals for the 64-bit configuration differ from the 16 and 32-bit configurations. The ERROR signal functions the same: it is LOW if one or more errors are detected, and HIGH if no errors are detected.

The DOUBLE ERROR signal is HIGH if and only if a double-bit error is detected — it is LOW otherwise. All of the MULT ERROR outputs of the four devices are valid. MULT ERROR is LOW for all three ERROR cases and some DOUBLE ERROR combinations — See Table 15. It is HIGH if either zero or one errors are detected.

This is a different meaning for MULT ERROR than in other configurations.

Generate Mode

In this mode check bits will be generated that correspond to the contents of the Data Input Latch. The check bits generated appear at the outputs of the XOR gates as indicated in Figure 8.

Check bits are generated according to a modified Hamming code. Details of the code for check bit generation are contained in Table 11. Check bits are generated as either an XOR or XNOR of 32 of the 64 bits as indicated in the table. The XOR function results in an even parity check bit, the XNOR in an odd parity check bit.

Table 10. Key AC Calculations for the 32-Bit Configuration

* — no errors detected
Number — the location of the single bit-in-error
T — two errors detected
M — three or more errors detected

Detect Mode

In this mode the device compares the contents of the Data Input Latch against the contents of the Check Bit Input Latch and will detect all single-bit errors, all double-bit errors and some triple-bit errors. If one or more errors are detected, ERROR goes LOW. If exactly two errors are detected, DOUBLE ERROR goes HIGH. If three or more errors are detected, MULT ERROR goes LOW - the MULT ERROR output of any of the four EDCs may be used.

Available as XOR gate outputs are the generated syndrome bits — see Figure 8. The syndrome bits may be decoded to determine if a bit error was detected and for single-bit errors, which of the data or check bits is in error. Table 12 gives the chart for encoding the syndrome bits generated for the 64-bit configuration (as an example, if the syndrome bits SX/S1/S2/S4/S8/S16/S32 were 00100101 this would be decoded to indicate that there is a single-bit error at data bit 41). If no error is detected the syndrome bits will all be zeroes. In Detect Mode the contents of the Data Input Latch are driven directly to the Inputs of the Data Output Latch without corrections.

Correct Mode

In this mode, the EDC functions the same as in Detect Mode except that the correction network is allowed to correct (complement) any single-bit error of the Data Input Latch before putting it onto the inputs of the Data Output Latch. If multiple errors are detected, the output of the correction network is unspecified, if the single bit error is a check bit there is no automatic correction. Check bit correction can be done by placing the device in generate mode to produce a correct check bit sequence for the data in the Data Input Latch.

To perform the correction step, all four slices require access to the syndrome bits which are generated externally of the devices. This access is provided by reading the syndrome bits in through the CB inputs where they are selected as inputs to the bit-in-error decoded by the multiplexer (see block diagram). The device connections for this operation are shown in Figure 8. When in Correct Mode the SC outputs must be enabled so that the syndrome bits are available at the CB inputs.

Pass Thru Mode

In this mode, the unmodified contents of the Data Input Latch are placed on the inputs of the Data Output Latch, and the contents of the Check Bit Input Latch are passed through the external XOR network and appear inverted at the XOR gate outputs labeled CX to C32 — see Figure 8.

Diagnostic Latch

The Diagnostic Latch is used for both diagnostic and internal control of the EDC. Table 13 provides bit definitions and shows the 64-bit loading format.

Diagnostic Generate/Detect/Correct

These are special diagnostic modes selected by DIAG $MODE_{0-1}$ where either normal check bit inputs or outputs are substituted for by check bits from the Diagnostic Latch — see Table 2 for details.

Table 13. Diagnostic Latch Loading

60	Slice 6/7 — DIAG MODE 1
61	Slice 6/7 — CORRECT
62	Slice 6/7 — PASS THRU
63	Don't Care

Internal Control Mode

This mode is selected by CODE ID_{0-2}, input 001 (ID_2, ID_2, ID_0).

When in Internal Control Mode the EDC takes the CODE ID_{0-2}, DIAG $MODE_{0-1}$, CORRECT and PASS THRU signals from the internal Diagnostic Latch rather than from the external control lines — see Table 13 for latch loading.

AC Calculations

Table 14 shows key AC parameters for the 64-bit configuration.

Functional Equations

The following equations and tables describe in detail how the output values of the Signetics 2960 are determined as a function of input values and internal states of the chip. Before examining the tables, the following symbol definitions should be carefully studied.

Table 14. Key AC Calculations for the 64-Bit Configuration

64-BIT PROPAGATION DELAY		COMPONENT DELAYS FROM 2960 AC SPECIFICATIONS, TABLE C (PLUS MSI)

*S6, S5, ... S0 are internal syndromes except in Modes 010, 100, 101, 110, 111, (CODE ID_2, ID_1, ID_0). In these modes the syndromes are input over the Check-Bit lines S6 – C6, S5 – C5, S1 – C1, S0 – C0.

**The S6 internal syndrome is always forced to 0 in CODE ID 000.

SC Outputs

Tables 16 through 20 show how outputs SC_{0-6} are generated in each control mode for various CODE IDs (internal control mode not applicable).

DEFINITIONS

D_i ← ($DATA_i$ if LE IN is HIGH or the output of bit i of the Data input Latch if LE IN is LOW)
C_i ← (CB_i if LE IN is HIGH or the output of bit i of the Check Bit Latch if LE IN is LOW)
DL_i ← Output of the bit i of the Diagnostic Latch
S_i ← Internally generated syndromes (same as outputs of SC_i if outputs enabled)
PA ← D0 ⊕ D1 ⊕ D2 ⊕ D4 ⊕ D6 ⊕ D8 ⊕ D10 ⊕ D12
PB ← D0 ⊕ D1 ⊕ D2 ⊕ D3 ⊕ D4 ⊕ D5 ⊕ D6 ⊕ D7
PC ← D8 ⊕ D9 ⊕ D10 ⊕ D11 ⊕ D12 ⊕ D13 ⊕ D14 ⊕ D15

Data Correction

Tables 21 through 27 show which data output bits are corrected (inverted) depending upon the syndromes and the CODE ID position. Note that the syndromes that determine data correction are in some cases syndromes input externally via the CB inputs and in some cases syndromes generated internally by that EDC (S_i are the internal syndromes and are the same as the value of the SC_i output of that EDC if enabled).

The tables show the number of data bit inverted (corrected) if any for the CODE ID and syndrome combination.

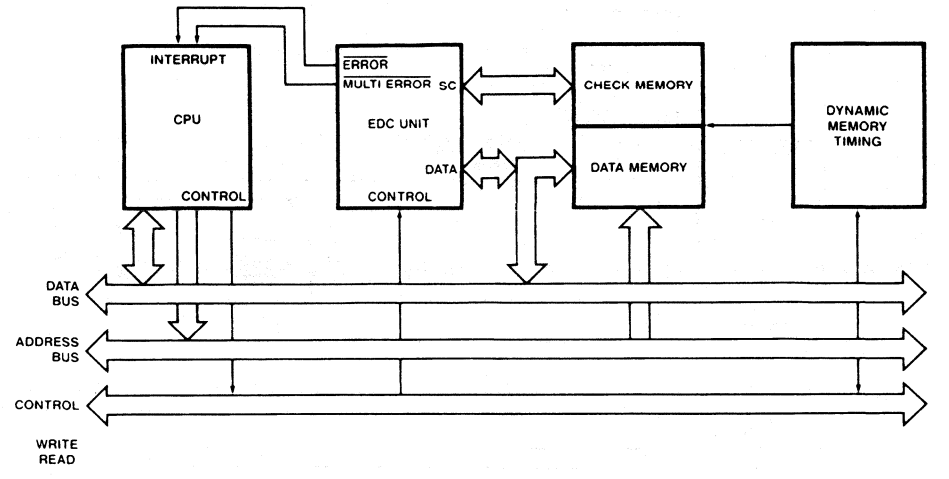

Figure 9. Check-Only Configuration

SYSTEM DESIGN CONSIDERATIONS

High Performance Parallel Operation

For maximum memory system performance the EDC should be used in the Check-Only configuration shown in Figure 9. With this configuration the memory system operates as fast with EDC as it would without.

On reads from memory, data is read out from the RAMs directly to the data bus (same as in a non-EDC system). At the same time, the data is read into the EDC to check for errors.

If an error exists the EDC's error flags are used to interrupt the CPU and/or to stretch the memory cycle. If no error is detected, no slowdown is required.

If an error is detected, the EDC generates corrected data for the processor. At the designer's option the correct data may be written back into memory; error logging and diagnostic routines may also be run under processor control.

The Check-Only configuration allows data reads to proceed as fast with EDC as without. Only if an error is detected is there any slowdown. But even if the memory system had an error every hour this would mean only one error every 3 – 4 billion memory cycles. So even with a very high error rate, EDC in a Check-Only configuration has essentially zero impact on memory system speed.

On writes to memory, check bits must be generated before the full memory word can be written into memory. The data word is frequently buffered while the check bits are generated. This makes the check bit generate time transparent to the processor.

EDC in the Data Path

The simplest configuration for EDC is to have the EDC directly in the data path as shown in Figure 10. Correct-Always Configuration). In the configuration data read from memory is always corrected prior to putting the data on the data bus. The advantages are simpler operation and no need for mid-cycle interrupts. The disadvantages is that memory system speed is slowed by the amount of time it takes for error correction on every cycle.

Usually the Correct-Always Configuration will be used with MOS microprocessors which have ample memory timing budgets. Most high performance processors will use the high performance parallel configuration shown in Figure 9.

Scrubbing Avoids Double Errors

Single-bit errors are by far the most common in a memory system and are always correctable by the EDC.

Double bit memory errors are far less frequent than single bit errors (50 to 1, or 100 to 1) and are always detected by the EDC but not corrected.

In a memory system, soft errors occur only one at a time. A double bit error in a data word occurs when a single soft error is left uncorrected and is followed by another error in the data word hours, days, or weeks after the first.

"Scrubbing" memory periodically avoids almost all double-bit errors. In the scrubbing operation, every data word in a memory is periodically checked by the EDC for single-bit errors. If one is found, it is corrected and the data word written back into memory. Errors are not allowed to pile up and so most double-bit errors are avoided.

The scrubbing operation is generally done as a background routine when the memory is not being used by the processor.

If memory is scrubbed frequently, errors are detected and corrected during processor accesses need not be immediately written back into memory. Instead the error will be corrected in memory during scrubbing. This reduces the time delay involved in a processor access of an incorrect memory word.

Correction of Double-Bit Errors

In some cases, double-bit memory errors can be corrected. This is possible when one of the two bit errors is a hard error.

When a double bit error is detected the data word should be checked to determine if one of the errors is a hard error. If so the hard error bit may be corrected by inverting it leaving only a single, correctable error. The time for this operation is negligible since it will occur infrequently.

Error Detection and Correction (EDC) Unit 2960

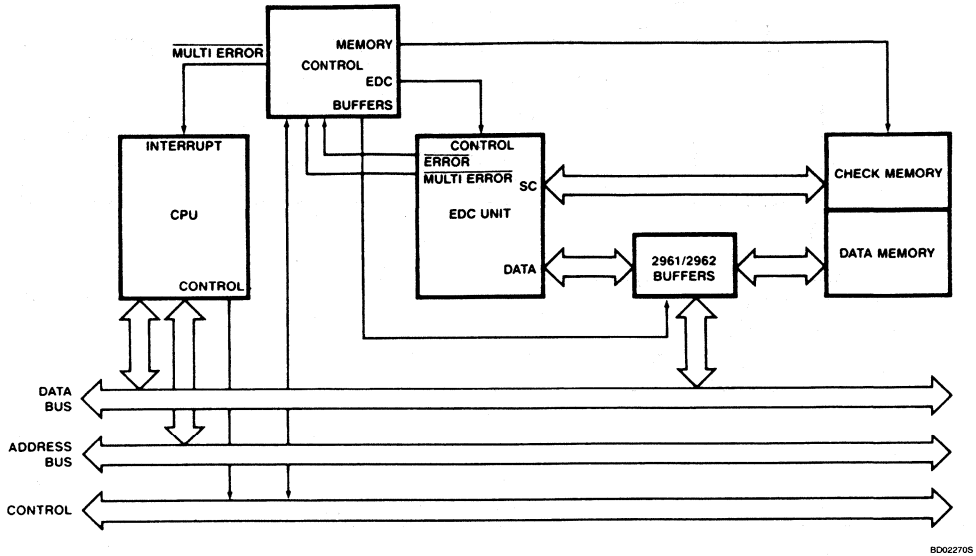

Figure 10. Correct-Always Configuration

The procedure after detection of a double error is as follows:

- Invert the data bits read from memory.
- Write the inverted data back into the same memory word.
- Re-read the memory location and XOR the newly read out value with the old. If there is no hard error then the XOR result will be 1's. If there is a hard error, it will have the same bit value regardless of what was written in. So it will show as a 0 after the XOR operation.
- Invert the hard error bit (this will "correct" it) leaving only one error in the data.
- The EDC can then correct the single bit error.
- Rewrite the correct data word into memory. This does not change the hard error but does eliminate the soft error. So the next memory access will find only a single-bit, correctable error.

An example helps to illustrate the procedure:

Example of Double Bit Error Correction When One is a Hard Error

		16 DATA BITS	6 CHECK BITS
1)	Data read from memory ($D_2$2)	1111111100000011	011010
2)	EDC detects a multiple error Syndromes:		011000
3)	Syndrome decode indicates a double bit error.		
4)	Invert the bits read from memory ($D_1$1)	0000000011111100	100101
5)	Write D_1 back to the same memory location.		
6)	Read back the memory location (D_2)	0000000011111101	100101
7)	XOR D_1 and D_2	1111111100000010	111111
8)	So the last data bit is the hard error. Use this to modify D_1	1111111100000010	011010
9)	Pass the modified D_1 through the EDC. The EDC detects a single bit correctable error and outputs corrected data.	1111111100000000	011010
10)	Write the corrected data back to memory to fix the soft error		

Error Logging and Preventative Maintenance

The effectiveness of preventative maintenance can be increased by logging information on errors detected by the EDC. This is called error logging.

The EDC provides syndromes when errors are detected. The syndromes indicate which bit is in error. In most memory systems, each individual RAM supplies only one bit of the memory word. So the syndrome and data word address specify which RAM was in error.

Typically a permanent/hard RAM failure is preceded by a period of time where the RAM displays an increasing frequency of intermittent, soft errors. Error logging statistics can be used to detect an increasing intermittent error frequency so that the RAM can be replaced before a permanent failure occurs.

Error logging also records the location of already hard failed RAMs. With EDC a hard failure will not halt system operation. EDC always can correct single bit errors even if it is a hard error. EDC can also correct double bit errors where one is hard and one soft. The ability to continue operation despite hard errors can greatly reduce the need for emergency field maintenance. The hard-failed RAMs can be instead replaced at low cost during a regularly scheduled preventative maintenance session.

Reducing Check Bit Overhead

Memory word widths need not be same as the data word width of the processor. There is a substantial reduction in check bit overhead if wider memory words are used. (See Table 28.)

This reduction in check-bit overhead lowers cost and increases the amount of data that can be packed on to each board.

The tradeoff is that when writing data pieces into memory that are narrower than the memory word width, more steps are required. These steps are exactly the same as those described in Byte Write in the Applications section. No penalty exists for reads from memory.

Table 28. Reducing Check Bit Overhead

MEMORY WORD		CHECK BIT OVERHEAD
#Data Bits	#Check Bits	
8	5	38%
16	6	27%
32	7	14%
64	8	11%

EDC per Board vs EDC Per System

The choice of an EDC per system or per board depends on the economics and the architecture of the system.

Certainly the cheaper approach is to have only one EDC per system and this is a viable solution if only one memory location is accessed at a time.

This solution does require that the system have both data and check bit lines - see Figure 11. This makes retrofitting a system difficult and creates complications if static or ROM memory, which do not require check bits, are mixed in with dynamic RAM.

If the system has an advanced architecture it is quite likely that it is necessary to simultaneously access memory locations on different memory boards — see Figure 12. Architectural features that require this are interleaved memory, cache memory, and DMA that is done simultaneously with processor memory accesses. EDC per board is a simpler system from a design standpoint.

The EDC is designed to work efficiently in either the per system or per board configurations.

Test Information

Incoming test procedures on this device should be carefully planned, taking into account the complexity and power levels of the part. The following notes may be useful.

1. Insure the part is adequately decoupled at the test head. Large changes in V_{CC} current as the device switches may cause erroneous function failures due to V_{CC} changes.
2. Do not leave inputs floating during any tests, as they may start to oscillate at high frequency.
3. Do not attempt to perform threshold tests at high speed. Following an input transition, ground current may change by as much as 400mA in 5 – 8ns. Inductance in the ground cable may allow the ground pin at the device to rise by 100's of millivolts momentarily.
4. Use extreme care in defining input levels for AC tests. Many inputs may be changed at once, so there will be significant noise at the device pins and they may not actually reach V_{IL} or V_{IH} until the noise has settled. Signetics recommends using V_{IL} 0.4V and V_{IH} −2.4V for AC tests.
5. To simplify failure analysis, programs should be designed to perform DC, Function, and AC tests as three distinct groups of tests.
6. To assist in testing, Signetics offers documentation on our test procedures and, in most cases, can provide Fairchild Sentry programs, under license.

7

I_{CC}	Power supply current[5]	V_{CC} = MAX	T_A = 25°C			300	360	mA
			T_A = 0 to +70°C					
			T_A = +70°C					

NOTES:
1. For conditions shown as MIN or MAX, use the appropriate value specified under Electrical Characteristics for the applicable device type.
2. Typical limits are at V_{CC} = 5.0V, 25°C ambient and maximum loading.
3. Not more than one output should be shorted at a time. Duration of the short circuit test should not exceed one second.
4. These are three-state outputs internally connected to TTL inputs. Input Characteristics are measured with output enables HIGH.
5. Worst case I_{CC} is at minimum temperature.
6. These input levels provide zero noise immunity and should only be tested in a static, noise-free environment.

GUARANTEED PERFORMANCE OVER COMMERCIAL TEMPERATURE RANGE OF 0 TO +70°C

The tables that follow specify the guaranteed performance of the 2960 over the commercial operating range of 0 to +70°C, with V_{CC} from 4.75V to 5.25V. All data are in ns with inputs switching between 0V and 3V at 1V/ns and measurements made at 1.5V. All outputs have maximum DC load.

This data applies to the following part numbers: N2960N and N2960I.

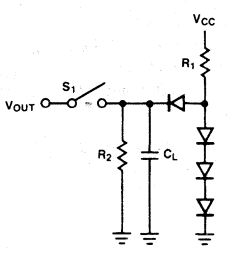
Normal Outputs:



TC03550S

NOTES:
1. C_L = 50pF includes scope probe, wiring and stray capacitances without devices in test fixture.
2. S_1, S_2, S_3 are closed during function test and all AC tests, except output enable tests.
3. S_1 and S_3 are closed while S_2 is open for t_{PZH} test.
   S_1 and S_2 are closed while S_3 is open for t_{PZL} test.
4. R_2 = 1K for three-state output.
   R_2 is determined by the I_{OH} at V_{OH} = 2.4V for non-three-state output.
5. R_1 is determined by I_{OL} (MIL) at V_{CC} = 5.0V minus the current to ground through R_2.
6. C_L = 5.0pF for output disable tests.

Error Detection and Correction (EDC) Unit 2960

APPLICATIONS

Byte Write

Byte operations are increasingly common for 16 and 32-bit processors. These complicate memory operations because check bits are generated for a complete 16 or 32 or 64-bit memory word, not for a single byte.

To write a byte into memory with EDC requires the following steps — See Figures 13 and 14.

- Latch the byte into the bus buffers
- Read the complete word from memory
- Correct the complete data word if necessary
- Insert the byte to be written into the data word
- Generate new check bits for the entire data word
- Store the data word back into memory.

(In fact these steps must be taken for any piece of data being written into memory that is not as wide as a full memory word).

The EDC is designed with the intent of keeping byte operations simple in error detection/correction systems. The EDC has separate output enables for each byte in the Data Output Latch. As shown in Figures 13 and 14, this allows the data word to be read from memory, the new byte to be inserted among the old, and new check bits to be generated using less time and less hardware than if separate byte enables were not available.

Diagnostics

EDC is used to boost the reliability of the overall system. It is necessary to also be able to check the operation of the EDC itself. For this reason the EDC has an internal control mode, a diagnostic latch, and two diagnostic modes.

To check that the EDC is functioning properly, the processor can put the EDC under software control by setting CODE ID_{2-0} to 001. This puts the EDC into Internal Control Mode. In Internal Control Mode the EDC is controlled by the contents of the Diagnostic Latch, which is loaded from the DATA inputs under processor control.

DATA BITS	CHECK BITS REQUIRED	
	Single Error Corrections Only	Single Error Correct & Double Error Detect
8	4	5
16	5	6
32	6	7
64	7	8

The EDC is set into CORRECT Mode. The processor loads in a known set of check bits into the Diagnostic Latch, a known set of data bits into the Data in Latch, and forces data errors. The output of the EDC (syndromes, error flags, corrected data) is then compared against the expected responses. By exercising the EDC with a string of data/check combinations and comparing the output against the expected responses, the EDC can be fully checked out.

Eight Bit Data Word

Eight bit MOS microprocessors can use EDC too. Only five check bits are required. The EDC configuration for eight bits is shown in Figure 15. It operates as does the normal 16-bit configuration with the upper byte fixed at 0.

Other Word Widths

EDC on data words other than 8, 16, 32, of 64 bits can be accomplished with the 2960. In most cases the extra data bits can be forced to a constant and EDC will proceed as normal. For example a 24-bit data word is shown in Figure 16.

Single Error Correction Only

The EDC normally corrects all single bit errors and detects all double bit and some triple bit errors. To save one check bit per word the ability to detect double bit errors can be sacrificed — single errors are still detected and corrected.

Figure 17 shows single error correction only configurations for 8, 16, 32, and 64-bit data words respectively.

Check Bit Correction

The EDC detects single bit errors whether the error is a data bit or a check bit. Data bit errors are automatically corrected by the EDC. To generate corrected check bits once a single check bit error is detected, the EDC need only be switched to GENERATE mode (data in the DATA INPUT LATCH is valid).

The syndromes generated by the EDC may be decoded to determine whether the single bit error is a check bit.

In many memory systems, a check bit error will be ignored on the memory read and corrected during a periodic "scrubbing" of memory — see System Design Considerations).

Multiple Errors

The bit-in-error decode logic uses syndrome bits SO through S32 to correct errors, SX is only used in developing the multiple error signal. This means that some multiple errors will cause a data bit to be inverted.

For example, in the 16-bit mode if data bits 8 and 13 are in error the syndrome 111100 (SX, S0, S1, S2, S4 S8) is produced. This is flagged a double error by the error detection logic, but the decoded bit-in-error only receives syndrome 11100 (S0, S1, S2, S4, S8) which it decodes as a single error in data bit 0 and inverts that bit. If it is desired to inhibit this inversion, the multiple error output may be connected to the correct input as in Figure 18. This will inhibit correction when a multiple error occurs. Extra time delay may be introduced in the data to correct data path when this is done.

2964B
Dynamic Memory Controller

Product Specification

Logic Products

FEATURES

- **Operating Options — controls 16K or 64K DRAMs**
- **8-Bit Refresh Counter — refresh address generation, clear input, and selectable terminal count (128 or 256) output**
- **Row Address Decoder — four Active *R*ow *A*ddress *S*elect (RAS) outputs during refresh**
- **On-Chip Latches — dual 8-bit address latches and RAS decoder latches**
- **User-Selectable Refresh Modes — burst, distributed or transparent**
- **3-port, 8-bit address multiplexer with Schottky speed**
- **Non-inverting address for RAS and CAS signal paths**

PRODUCT DESCRIPTION

The Signetics 2964B **D**ynamic **M**emory **C**ontroller (DMC) provides address multiplexing, refresh address generation, and RAS/CAS control for dynamic RAMs of any data width. The eight-bit address path is designed for 64K DRAMs but can be used equally well with 16K DRAMs. Sixteen address input latches and two row address select latches (for higher order addresses) allow the DMC to control up to 256K words of memory (with 64K DRAMs) by using the internal RAS decoder to select from one-of-four banks of DRAMs.

FUNCTIONAL OPERATION

The Signetics 2964B Dynamic Memory Controller (Figure 1) replaces a dozen MSI devices by grouping several unique functions. Two 8-bit latches capture and hold the memory address. These latches and a clearable, 8-bit refresh counter feed into an 8-bit, 3-input, Schottky speed MUX, for output to the DRAM address lines.

The 2964B also includes a special RAS decoder and CAS buffer. Placing these functions on the same chip minimizes the time skew between output functions which would otherwise be separate MSI chips, and therefore, allows a faster memory cycle time by the amount of skew eliminated.

The RAS Decoder allows upper addresses to select one-of-four banks of DRAM by determining which bank receives an RAS input. During refresh (RFSH = LOW), the decoder mode is changed to four-of-four and all banks of

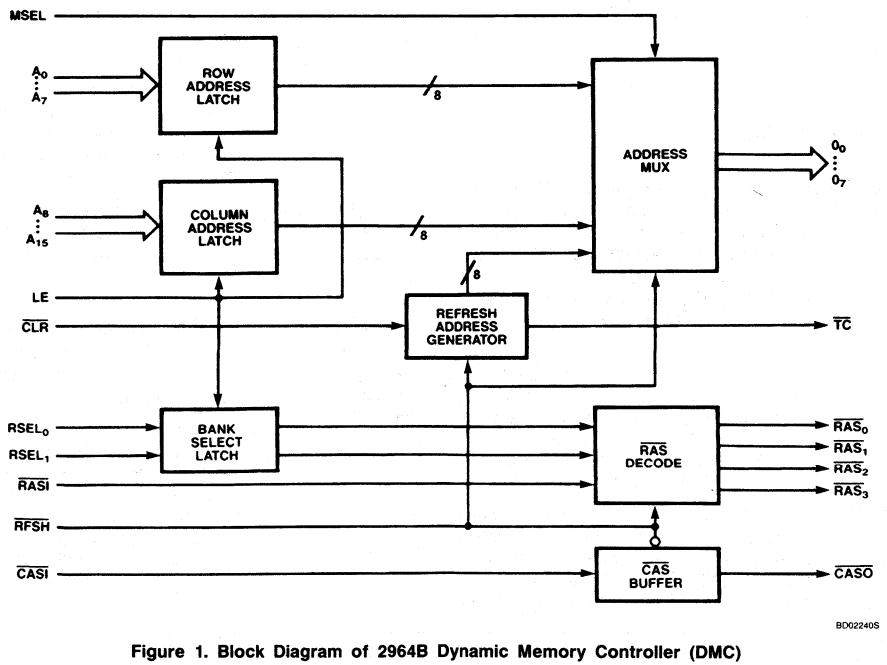

Figure 1. Block Diagram of 2964B Dynamic Memory Controller (DMC)

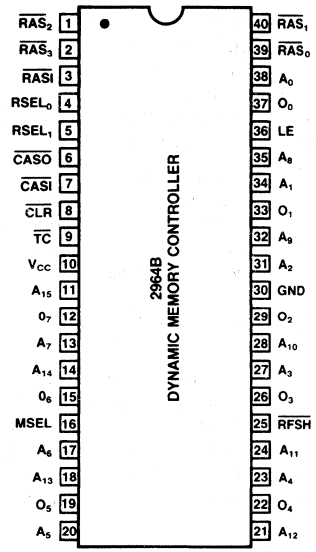
2964B PACKAGE/PIN DESIGNATIONS



PIN NO.	IDENTIFIER	FUNCTION
1, 2, 39 and 40	$\overline{RAS_2}$, $\overline{RAS_3}$ $\overline{RAS_0}$, $\overline{RAS_1}$	Row Address Strobe outputs ($\overline{RAS_i}$). Each provides a Row Address Strobe for one of the four banks of memory. Each will go active LOW only when selected by $RSEL_0$ and $RSEL_1$ and only when $\overline{RASI}$ goes active LOW. All $\overline{RAS_{0\text{-}3}}$ outputs go active low in response to $\overline{RASI}$ when $\overline{RFSH}$ goes LOW.
3	$\overline{RASI}$	The Row Address Strobe input. During normal memory cycles, the selected $\overline{RAS}$ Decoder output, $\overline{RAS_0}$, $\overline{RAS_1}$, $\overline{RAS_2}$ or $\overline{RAS_3}$, will go active LOW in response to an active LOW input at $\overline{RASI}$. During refresh (RFSH = LOW), all $\overline{RAS}$ outputs go LOW in response to $\overline{RASI}$ = LOW.
4 and 5	$RSEL_0$ and $RSEL_1$	The $\overline{RAS}$ decoder Select inputs. Data (latched) at these inputs (normally higher-order addresses) is decoded by the $\overline{RAS}$ Decoder to "$\overline{RAS}$ Select" one of four banks of memory with $\overline{RAS_0}$, $\overline{RAS_1}$, $\overline{RAS_2}$ or $\overline{RAS_3}$.
6	$\overline{CASO}$	The Column Address Strobe output. The active LOW $\overline{CASO}$ output strobes the Column Address into the dynamic RAM. $\overline{CASO}$ is inhibited during refresh ($\overline{RFSH}$ = LOW).
7	$\overline{CASI}$	The Column Address Strobe. An active LOW input at $\overline{CASI}$ will result in an active LOW output at $\overline{CASO}$, unless a refresh cycle is in progress ($\overline{RFSH}$ = LOW).
8	$\overline{CLR}$	The refresh counter Clear input. An active LOW input at $\overline{CLR}$ resets the refresh counter to all LOW (refresh address output to all HIGH).
9	$\overline{TC}$	The Terminal Count output. A LOW output at $\overline{TC}$ indicates that the refresh counter has been sequenced through either 128 or 256 refresh addresses depending on A_{15}. The $\overline{TC}$ output remains active LOW until the refresh counter is advanced by the rising edge of $\overline{RASI}$ or $\overline{RFSH}$.
10	V_{CC}	+5V power supply
11, 14, 18, 21, 24, 28, 32 and 35	$A_{15} - A_8$	The high-order Address inputs are used to latch eight Column Address inputs for the DRAM. These inputs drive the outputs $O_0 - O_7$ when MSEL is LOW — see next paragraph. A_{15} is a dual input. With normal TTL level inputs. A_{15} acts as an address input for 64K DRAMs. If A_{15} is pulled up to +12V through a 1K resistor, the terminal count output $\overline{TC}$ will go LOW every 128 counts (for 16K DRAMs) instead of every 256 counts.
12, 15, 19, 22, 26, 29, 33 and 37	$O_7 - O_0$	The DRAM address outputs. The eight-bit width is designed for DRAMs up to 64K.
13, 17, 20, 23, 27, 31, 34 and 38	$A_7 - A_0$	The low-order Address inputs are used to latch eight Row Address inputs for the DRAM. These inputs drive the outputs $O_0 - O_7$ when MSEL is HIGH.
16	MSEL	The Multiplexer-SELect input determines whether low-order or high-order address inputs appear at the multiplexer outputs $O_0 - O_7$. When MSEL is HIGH, the low-order address latches ($A_0 - A_7$) are connected to the outputs. When MSEL is LOW, the high-order address latches are connected to the outputs.

2964B PACKAGE/PIN DESIGNATIONS (Continued)

PIN NO.	IDENTIFIER	FUNCTION
25	$\overline{RFSH}$	The Refresh control input. When active LOW, the $\overline{RFSH}$ input switches the address output multiplexer to output the inverted contents of the 8-bit refresh counter. $\overline{RFSH}$ LOW also inhibits the $\overline{CAS}$ buffer and changes the mode of the $\overline{RAS}$ decoder from one-of-four to four-of-four so that all four $\overline{RAS}$ decoder outputs, $\overline{RAS_0}$, $\overline{RAS_1}$, $\overline{RAS_2}$ and $\overline{RAS_3}$, go LOW in response to a LOW input at $\overline{RASI}$. This action refreshes one row address in each of the four $\overline{RAS}$ decoded memory banks. The refresh counter is advanced at the end of each cycle by the LOW-to-HIGH transition of $\overline{RFSH}$ or $\overline{RASI}$ (whichever occurs first). In burst mode refresh. $\overline{RFSH}$ may be held LOW and refresh accompanied by toggling $\overline{RASI}$.
30	GND	Ground.
36	LE	The address latch enable input. An active HIGH input at LE causes the two 8-bit address latches and the 2-bit $\overline{RAS}$ Select input latch to go transparent, accepting new input data. A LOW input on LE latches the input data which meets set-up and hold time requirements.

memory receive an RAS input for refresh in response to an RASI active LOW input. CAS is inhibited during refresh.

Burst mode refresh is accomplished by holding RFSH low and toggling RASI.

A_{15} is a dual function input which controls the refresh counter's range. For 64K DRAMs, it is an address input. For 16K DRAMs, it can be pulled to +12V through 1K to terminate the refresh count at 128 instead of 256.

		70°C				165	mA
I_T	A_{15} Enable current	A_{15} connected to +12V through $1K\Omega \pm 10\%$				5	mA

NOTES:
1. For conditions shown as MIN or MAX, use the appropriate value specified under DC Electrical Characteristics for the applicable device type.
2. Typical limits are at $V_{CC} = 5.0V$, 25°C ambient and maximum loading.
3. Not more than one output should be shorted at a time. Duration of the short circuit test should not exceed one second.
4. I_{CC} is worst case when the Address inputs are latched HIGH, the refresh counter is at terminal count (255), $\overline{RASI}$ and $\overline{CASI}$ are HIGH and all other inputs are LOW.

AC ELECTRICAL CHARACTERISTICS

Tables 1 and 2 specify performance characteristics of the Signetics 2964B over the operating range for capacitive loads of 50 and 150 picofarads, respectively. Note that the minimum specified limits for t_{PW}, t_S, and t_H are for minimum system operating requirements and that limits for t_{SKEW} and t_{PD} are guaranteed test limits for the device. All AC parameters are specified at 1.5 volts.

NOTES:
1. $\overline{RFSH}$ inhibits $\overline{CASO}$ during refresh. Specification is for $\overline{CASO}$ inhibit time.
2. O_i to $\overline{RAS}_i$, ($\overline{RFSH}$ = HIGH) skew is guaranteed maximum difference between fastest $\overline{RASI}$ to $\overline{RAS}_i$ delay and slowest A_i to O_i delay within a single device. O_i to $\overline{CASO}$ skew is maximum difference between fastest $\overline{CASI}$ to $\overline{CASO}$ delay and slowest MSEL to O_i delay within a single device. See application section entitled Memory Cycle Timing for correlation to System Timing requirements.
3. O_i to $\overline{RAS}_i$, ($\overline{RFSH}$ = LOW) skew is guaranteed maximum difference between fastest $\overline{RASI}$ to $\overline{RAS}_i$ delay and slowest $\overline{RFSH}$ to O_i delay within a single device. See application section on Refresh Timing for correlation to system refresh timing requirements.
4. O_i to $\overline{RAS}_i$ (MSEL ⌝⌞) skew is guaranteed maximum difference between fastest MSEL ⌝⌞ to O_i delay and slowest $\overline{RASI}$ to $\overline{RAS}_i$ delay within a single device.

TIMING DIAGRAM

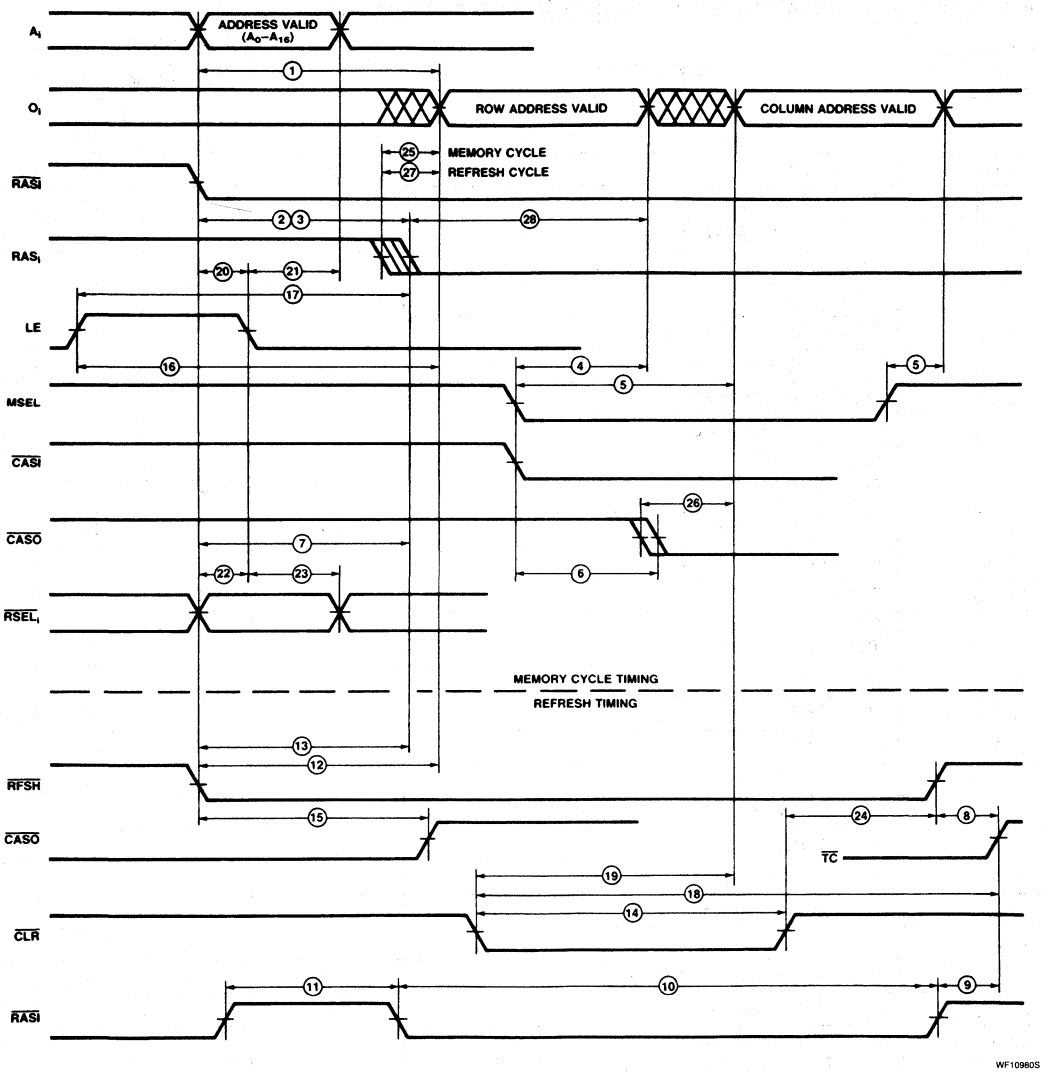

Figure 2. Dynamic Memory Controller Timing

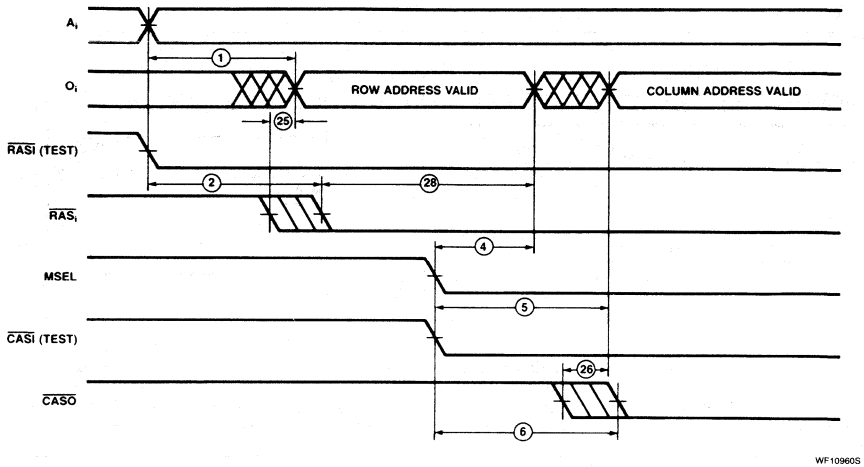
MEMORY CYCLE TIMING

The relationship between DMC specifications and system timing requirements are shown in Figure 3. T_1, T_2, and T_3 represent the minimum timing requirements at the DMC inputs to guarantee that DRAM timing requirements are met and that maximum system performance is achieved.

The minimum requirements for T_1, T_2, and T_3 are as follows:

$T_1MIN = t_{RAH} + t_{28}$
$T_2MIN = t_1 + t_{26} + t_{ASC}$
$T_3MIN = t_{ASR} + t_{25}$ where,
t_{RAH} = Row Address Hold Time
t_{ASC} = Column Address Set-up Time
t_{ASR} = Row Address Set-up Time



Legend
㉕ = Guaranteed maximum difference between fastest $\overline{RASI}_1$ to $\overline{RAS}$ delay and the slowest A_1 to O_1 delay on any single device.
㉖ = Guaranteed maximum difference between fastest $\overline{CASI}$ to $\overline{CASO}$ delay and the slowest MSEL to 0_1 delay on any single device.
㉘ = Guaranteed maximum difference between fastest MSEL to O_i delay and the slowest RASI to RAS_i delay on any single device.

b. Desired System Timing

Figure 3. Memory Cycle Timing

REFRESH CYCLE TIMING

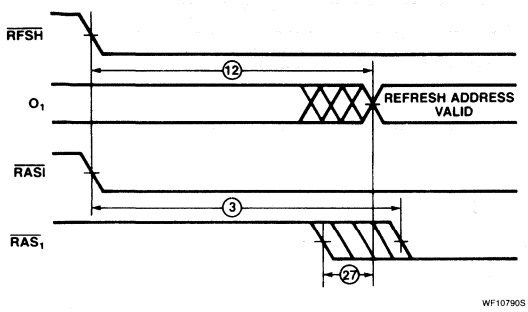
The timing relationships for refresh are shown in Figure 4.

T_4 minimum is calculated as follows:

$$T_4 = t_{ASR} + t_{27}$$

Burst refresh timing is shown in Figure 5.

AC WAVEFORMS



㉗ = Guaranteed maximum difference between fastest $\overline{RASi}_1$ to $\overline{RAS}$ delay and the slowest $\overline{RFSH}$ to O_1 delay on any single device.

PACKAGE DATA

Type: Plastic or Ceramic
Configuration: DIP
Width: 0.6 in.
Length: 2.0 in.
Pin Centers: 0.1 in.

APPLICATIONS

Speed with Minimum Skew

The DMC provides Schottky speed in all of the critical paths. In addition, time skew between the Address, RAS and CAS paths is minimized (and specified) by placing these functions on the same chip. The inclusion of the CAS buffer allows matching of its propagation delay, and also provides the CAS inhibit function during RAS — only refresh.

Input Latches

The eighteen input latches are transparent when LE is HIGH and latch the input data, meeting the set-up and hold time requirements when LE goes LOW. In systems with separate address and data buses, LE may be permanently enabled HIGH.

Refresh Counter

The 8-bit refresh counter provides both 128 and 256 line refresh capability. Refresh control is external to allow maximum user flexibility. Transparent (hidden), burst, synchronous or asynchronous refresh modes are all possible.

The refresh counter is advanced at the LOW-to-HIGH transition of RFSH (or RASI). This assures a stable counter output for the next refresh cycle. The counter will continue to cycle through 256 addresses unless reset to zero by CLR. This actually causes all output to go HIGH since the output MUX is inverting. (Address inputs to outputs are non-inverting since both the input latches and output MUX are inverting.)

Refresh Terminal Count

The refresh counter also provides a Terminal Count output for burst mode refresh applications. TC normally occurs at count 255 (00_7 to 0_7 all LOW when RFSH is LOW). TC can be made to occur at count 127 for 128 line burst mode refresh by pulling A_{15} up to +12V through a 1KΩ ±10% resistor. The counter actually cycles through 256 with TC determined by A_{15}. Otherwise A_{15} functions as an address input when driven at normal TTL levels.

Three-Input 8-Bit Address Multiplexer

The address MUX is 8-bits wide (for 64K DRAMs) and has three data sources, the lower address input latch (A_0 to A_7), the upper address input latch (A_8 to A_{15}), and the internal refresh counter. The lower address latch is selected when MSEL is HIGH. This is normally the Row address. The upper address latch is selected when MSEL is LOW. This is normally the Column address. The third source — the refresh counter is selected when RFSH is LOW and overrides MSEL.

When RFSH goes LOW, the MUX selects the refresh counter address and CASO is inhibited. Also, the RAS Decoder function is changed from one-of-four to four-of-four so all RAS outputs $RAS_0 - RAS_3$ go low to refresh all banks of memory when RASI goes LOW. When RFSH is HIGH, only one RAS output goes low, determined by the RAS Select inputs, $RSEL_0$ and $RSEL_1$. In either case the RAS Decoder output timing is controlled by RASI to make sure the refresh count appears at $00_0 - 0_7$ before $RAS_0 - RAS_3$ goes LOW. This assures meeting Row address Set-up time requirement of the DRAM (t_{ASR}).

Maximum Performance System

The typical organization of a maximum performance 16-bit system including Error Detection and Correction is shown in Figure 6. Delay lines provide the most accurate timing and are recommended for RAS, MSEL, and CAS timing in this type of system.

Controlling 16K RAMS or Smaller Systems

16K DRAMs require seven address inputs and 128 line refresh. Also A_0 is often used to designate upper or lower byte transactions in 16-bit systems. These modifications are shown in Figure 7.

Product Specification

Logic Products

FEATURES

- **Schottky TTL process**
- **45ns cycle time (typ.)**
- **Direct addressing of standard bipolar PROM or ROM**
- **512 microinstruction addressability**
- **Advanced organization:**
  - **9-bit microprogram address register and bus organized to address memory by row and column**
  - **4-bit program latch**
  - **2-flag registers**
- **11 address control functions:**
  - **3 jump and test latch functions**
  - **16 way jump and test instructions**
- **8 flag control functions:**
  - **4 flag input functions**
  - **4 flag output functions**

DESCRIPTION

The N3001 MCU is 1 element of a bipolar microcomputer set. When used with the N3002, 74S182, ROM or PROM memory, a powerful microprogrammed computer can be implemented.

The N3001 MCU controls the fetch sequence of microinstructions from the microprogram memory. Functions performed by the N3001 include:

- Maintenance of microprogram address register
- Selection of next microinstruction address
- Decoding and testing of data supplied via several input buses
- Saving and testing of carry output data from the central processing (CP) array
- Control of carry/shift input data to the CP array
- Control of microprogram interrupts

PIN DESIGNATION

PIN	SYMBOL	NAME AND FUNCTION	TYPE
1 – 4	$\overline{PX_4} - \overline{PX_7}$	**Primary Instruction Bus Inputs:** Data on the primary instruction bus is tested by the JPX function to determine the next microprogram address.	Active low
5, 6, 8, 10	$\overline{SX_0} - \overline{SX_3}$	**Secondary Instruction Bus Inputs:** Data on the secondary instruction bus is synchronously loaded into the PR-latch while the data on the PX-bus is being tested (JPX). During a subsequent cycle, the contents of the PR-latch may be tested by the JPR, JLL, or JRL functions to determine the next microprogram address.	Active low
7, 9, 11	$PR_0 - PR_2$	**PR-Latch Outputs:** The PR-latch outputs ($SX_0 - SX_2$) are synchronously enabled by the JCE function. They can be used to modify microinstructions at the outputs of the microprogram memory or to provide additional control lines.	Open Collector
12, 13 15, 16	$FC_0 - FC_3$	**Flag Logic Control Inputs:** The flag logic control inputs are used to cross-switch the flags (C and Z) with the flag logic input (FI) and the flag logic output (FO).	Active high
14	$\overline{FO}$	**Flag Logic Output:** The outputs of the flags (C and Z) are multiplexed internally to form the common flag logic output. The output may also be forced to a logical 0 or logical 1.	Active low Three-state
17	$\overline{FI}$	**Flag Logic Input:** The flag logic input is demultiplexed internally and applied to the inputs of the flags (C and Z). Note: The flag input data is saved in the F-latch when the clock input (CLK) is low.	Active low
18	ISE	**Interrupt Strobe Enable Output:** The interrupt strobe enable output goes to logical 1 when one of the JZR functions are selected (see Functional Description). It can be used to provide the strobe signal required by interrupt circuits.	Active high
19	CLK	**Clock Input**	
20	GND	**Ground**	
21 – 24 37 – 39	$AC_0 - AC_6$	**Next Address Control Function Inputs:** All jump functions are selected by these control lines.	Active high
25	EN	**Enable Input:** When in the high state, the enable input enables the microprogram address, PR-latch and flag outputs.	
26 – 29	$MA_0 - MA_3$	**Microprogram Column Address Outputs**	Three-state
30 – 34	$MA_4 - MA_8$	**Microprogram Row Address Outputs**	Three-state
35	ERA	**Enable Row Address Input:** When in the low state, the enable row address input independently disables the microprogram row address outputs. It can be used to facilitate the implementation of priority interrupt systems.	Active high
36	LD	**Microprogram Address Load Input:** When the active high state, the microprogram address load input inhibits all jump functions and synchronously loads the data on the instruction buses into the microprogram address register. However, it does not inhibit the operation of the PR-latch or the generation of the interrupt strobe enable.	Active high
40	V_{CC}	**+5 Volt supply**	

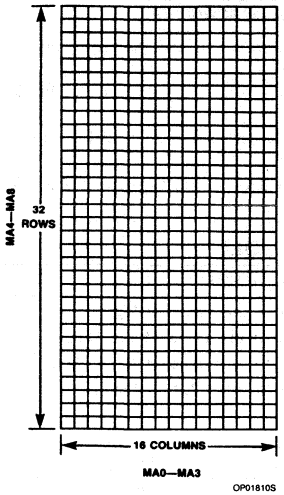
THEORY OF OPERATION

The MCU controls the sequence of microinstructions in the microprogram memory. The MCU simultaneously controls 2 flip-flops (C, Z) which are interactive with the carry-in and carry-out logic of an array of CPEs.

The functional control of the MCU provides both unconditional jumps to new memory locations and jumps which are dependent on the state of MCU flags or the state of the "PR" latch. Each intruction has a "jump set" associated with it. This "jump set" is the total group of memory locations which can be addressed by that instruction.

The MCU utilizes a two-dimensional addressing scheme in the microprogram memory. Microprogram memory is organized as 32 rows and 16 columns for a total of 512 words. Word length is variable according to application. Address is accomplished by a 9-bit address organized as a 5-bit row and 4-bit column address.

ADDRESSING ORGANIZATION



MA0 – MA3

FUNCTIONAL DESCRIPTION

The following is a description of each of the eleven address control functions. The symbols shown below are used to specify row and column addresses.

MNEMONIC	FUNCTION
row_n	5-bit next row address where n is the decimal row address.
col_n	4-bit next column address where n is the decimal column address.

Unconditional Address Control (Jump) Functions

The jump functions use the current microprogram address (i.e., the contents of the microprogram address register prior to the rising edge of the clock) and several bits from the address control inputs (AC0 – AC6) to generate the next microprogram address.

JUMP FUNCTION TABLE

MNEMONIC	NAME AND FUNCTION
JCC	Jump in current column. $AC_0 - AC_4$ are used to select 1 of 32 row addresses in the current column, specified by $MA_0 - MA_3$, as the next address.
JZR	Jump to zero row. $AC_0 - AC_3$ are used to select 1 of 16 column addresses in row_0, as the next address.
JCR	Jump in current row. $AC_0 - AC_3$ are used to select 1 of 16 addresses in the current row, specified by $MA_4 - MA_8$, as the next address.
JCE	Jump in current column/row group and enable PR-latch outputs. $AC_0 - AC_2$ are used to select 1 of 8 row addresses in the current row group, specified by $MA_7 - MA_8$, as the next row address. The current column is specified by $MA_0 - MA_3$. The PR-latch outputs are asynchronously enabled.

JUMP/TEST FUNCTION TABLE

MNEMONIC	NAME AND FUNCTION
JFL	Jump/test F-latch. $AC_0 - AC_3$ are used to select 1 of 16 row addresses in the current row group, specified by MA_8, as the next row address. If the current column group, specified by MA_3, is $col_0 - col_7$, the F-latch is used to select col_2 or col_3 as the next column address. If MA_3 specifies column group $col_8 - col_{15}$, the F-latch is used to select col_{10} or col_{11} as the next column address.
JCF	Jump/test C-flag, $AC_0 - AC_2$ are used to select 1 of 8 row addresses in the current row group, specified by MA_7 and MA_8, as the next row address. If the current column group specified by MA_3 is $col_0 - col_7$, the C-flag is used to select col_2 or col_3 as the next column address. If MA_3 specifies column group $col_8 - col_{15}$, the C-flag is used to select col_{10} or col_{11} as the next column address. JZF
JZF	Jump/test Z-flag. Identical to the JCF function described above, except that the Z-flag, rather than the C-flag, is used to select the next column address.
JPR	Jump/test PR-latch. $AC_0 - AC_2$ are used to select 1 of 8 row addresses in the current row group, specified by MA_7 and MA_8, as the next row address. The 4 PR-latch bits are used to select 1 of 16 possible column addresses as the next column address.
JLL	Jump/test rightmost PR-latch bits. $AC_0 - AC_2$ are used to select 1 of 8 row addresses in the current row group, specified by MA_7 and MA_8, as the next row address. PR_2 and PR_3 are used to select 1 of 4 column addresses in col_4 through col_7 as the next column address.
JRL	Jump/test rightmost PR-latch bits. AC_0 and AC_1 are used to select 1 of 4 high – order row addresses in the current row group, specified by MA_7 and MA_8, as the next row address. PR_0 and PR_1 are used to select 1 of 4 possible column addresses in col_{12} through col_{16} as the next column address.
JPX	Jump/test PX-bus and load PR-latch. AC_0 and AC_1 are used to select 1 of 4 row addresses in the current row group, specified by $MA_6 - MA_8$, as the next row address. $PX_4 - PX_7$ are used to select 1 of 16 possible column addresses as the next column address. $SX_0 - SX_3$ data is locked in the PR-latch at the rising edge of the clock.

7

Flag Conditional Address Control (Jump Test) Functions

The jump/test flag functions use the current microprogram address, the contents of the selected flag or latch, and several bits from the address control function to generate the next microprogram address.

PX-Bus and PR-Latch Conditional Address Control (Jump/Test) Functions

The PX-bus jump/test function uses the data on the primary instruction bus ($PX_4 - PX_7$), the current microprogram address control function to generate the next microprogram address. The PR-latch jump/test functions use the data in the PR-latch, the current microprogram address, and several selection bits from the address control function to generate the next microprogram address.

Flag Control Functions

The flag control functions of the MCU are selected by the 4 input lines designated $FC_0 - FC_3$. Function code formats are given in "Flag Control Function summary".

The following is a detailed description of each of the 8 flag control functions.

Flag Input Control Functions

The flag input control functions select which flag or flags will be set to the current value of the flag input (FI) line.

Data on FI is stored in the F-latch when the clock is low. The content of the F-latch is loaded into the C and/or Z flag on the rising edge of the clock.

Flag Output Control Functions

The flag output control functions select the value to which the flag output (FO) line will be forced.

FLAG CONTROL FUNCTION

MNEMONIC	FUNCTION DESCRIPTION
SCZ	Set C-flag and Z-flag to FI. The C-flag and the Z-flag are both set to the value of FI.
STZ	Set Z-flag to FI. The Z-flag is set to the value of FI. The C-flag is unaffected.
STC	Set C-flag to FI. The C-flag is set to the value of FI. The Z-flag is unaffected.
HCZ	Hold C-flag and Z-flag. The values in the C-flag and Z-flag are unaffected.

FLAG OUTPUT CONTROL FUNCTION TABLE

MNEMONIC	FUNCTION DESCRIPTION
FF0	Force FO to 0. FO is forced to the value of logical 0.
FFC	Force FO to C. FO is forced to the value of the C-flag.
FFZ	Force FO to Z. FO is forced to the value of the Z-flag.
FF1	Force FO to 1. FO is forced to the value of logical 1.

FLAG CONTROL FUNCTION SUMMARY

TYPE	MNEMONIC	DESCRIPTION	FC_1	0
Flag Input	SCZ	Set C-flag and Z-flag to f	0	0
	STZ	Set Z-flag to f	0	0
	STC	Set C-flag to f	1	1
	HCZ	Hold C-flag and Z-flag	1	1

TYPE	MNEMONIC	DESCRIPTION	FC_3	2
Flag Output	FF0	Force FO to 0	0	0
	FFC	Force FO to C-flag	1	0
	FFZ	Force FO to Z-flag	0	1
	FF1	Force FO to 1	1	1

LOAD FUNCTION	NEXT ROW					NEXT COL

NOTES:
dn = Data on address control line n
mn = Data in microprogram address register bit n
Pn = Data in PR-latch bit n
xn = Data on PX – bus line n (active low)
f, c, z = Contents of F-latch, C-flag, or Z-flag respectively

STROBE FUNCTIONS

The load function of the MCU is controlled by the input line designated LD. If the LD line is active high at the rising edge of the clock, the data on the primary and secondary instruction buses, $PX_4 - PX_7$ and $SX_0 - SX_3$, is loaded into the microprogram address register. $PX_4 - PX_7$ are loaded into $MA_4 - MA_7$. The high-order bit of the microprogram address register MA_8 is set to a logical 0. The bits from primary instruction bus select 1 of 16 possible column addresses. Likewise, the bits from the secondary instruction bus select 1 of the first 16 row addresses.

The MCU generates an interrupt strobe enable on the output line designated ISE. The line is placed in active high state whenever a JZR is col_{15} is selected as the address control function. Generally, the start of a macroinstruction fetch sequence is situated at row_0 and col_{15} so the interrupt control may be enabled at the beginning of the fetch/execute cycle. The interrupt control responds to the interrupt by pulling the enable row address (ERA) input line low to override the selected next row address from the MCU. Then by gating an alternative next row address on to the row address lines of the microprogram memory, the microprogram may be forced to enter an interrupt handling routine. The alternative row address placed on the microprogram memory address lines does not alter the contents of the microprogram address register. Therefore, subsequent jump functions will utilize the row address in the register, and not the alternative row address, to determine the next microprogram address.

Note, the load function always overrides the address control function on $AC_0 - AC_6$. It does not, however, override the latch enable or load sub-functions of the JCE or JPX instruction, respectively. In addition, it does not inhibit the interrupt strobe enable or any of the flag control functions.

JUMP SET DIAGRAMS

The following 10 diagrams illustrate the jump set for each of the 11 jump and jump/test functions of the MCU. Location 341 indicated by the circled square, represents 1 current row (row_{21}) and current column (col_5) address. The dark boxes indicate the microprogram locations that may be selected by the particular function as the next address.

Product Specification

Logic Products

FEATURES
- **45ns cycle time (typ)**
- **Easy expansion to multiple of 2 bits**
- **11 general purpose registers**
- **Full function accumulator**
- **Useful functions include:**
- **2's complement arithmetic**
  - **Logical AND, OR, NOT, exclusive-NOR**
  - **Increment, decrement**
  - **Shift left/shift right**
  - **Bit testing and zero detection**
  - **Carry look-ahead generation**
  - **Masking via K-bus conditioned locking allowing non-destructive testing of data in accumulator and scratchpad**
- **3 input buses**
- **2 output buses**
- **Control bus**

DESCRIPTION
The N3002 Central Processing Element (CPE) is one part of a bipolar microcomputer set. The N3002 is organized as a 2-bit slice and performs the logical and arithmetic functions required by microinstructions. A system with any number of bits in a data word can be implemented by using multiple N3002s, the N3001 microcomputer control unit, the N74S182 carry look-ahead unit and ROM or PROM memory.

PIN DESCRIPTION

PIN	SYMBOL	NAME AND FUNCTION	TYPE
1, 2	$I_0 - I_1$	**External Bus Input:** The external bus inputs provide a separate input port for external input devices.	Active low
3, 4	$K_0 - K_1$	**Mask Bus Inputs:** The mask bus inputs provide a separate input port from the microprogram memory, to allow mask or constant entry	Active low
5, 6	X, Y	**Standard Carry Look-Ahead Cascade Outputs:** The cascade outputs allow high speed arithmetic operations to be performed when they are used in conjunction with the 74S182 Look-Ahead Carry Generator	Active high
7	CO	**Ripple Carry Out:** The ripple carry output is only disabled during shift right operations.	Active low Three-state
8	RO	**Shift Right Output:** The shift right output is only enabled during shift right operations.	Active low Three-state
9	LI	**Shift Right Input**	Active low
10	CI	**Carry Input**	Active low
11	EA	**Memory Address Enable Input:** When in the low state, the memory address enable input enables the memory address outputs ($A_0 - A_1$).	Active low
12 — 13	$A_0 - A_1$	**Memory Address Bus Outputs:** The memory address bus outputs are the buffered outputs of the memory address register (MAR).	Active low Three-state
14	GND	**Ground**	
14 — 17 24 — 27	$F_0 - F_6$	**Micro-Function Bus Inputs:** The micro-function bus inputs control ALU function and register selection.	Active high
18	CLK	**Clock Input**	
19 — 20	$D_0 - D_1$	**Memory Data Bus Outputs:** The memory data bus outputs are the buffered outputs of the full function accumulator register (AC).	Active low Three-state
21 — 22	$M_0 - M_1$	**Memory Data Bus Inputs:** The memory data bus inputs provide a separate input port for memory data.	Active low
23	ED	**Memory Data Enable Input:** When in the low state, the memory data enable input enables the memory data outputs ($D_0 - D_1$).	Active low
28	V_{CC}	**+5 Volt Supply**	

SYSTEM DESCRIPTION

Microfunction Decoder and K-Bus

Basic microfunctions are controlled by a 7-bit bus ($F_0 - F_6$) which is organized into 2 groups. The higher 3 bits ($F_4 - F_6$) are designated as F-Group and the lower 4 bits ($F_0 - F_3$) are designated as the R-Group. The F-Group specifies the type of operation to be performed and the R-Group specifies the registers involved.

The F-Bus instructs the microfunction decoder to:

- Select ALU functions to be performed
- Generate scratchpad register address
- Control A and B multiplexer

The resulting microfunction action can be:

- Data transfer
- Shift operations
- Increment and decrement
- Initialize stack
- Test for zero conditions
- 2's complement addition and subtraction
- Bit masking
- Maintain program counter

A and B Multiplexers

A and B multiplexers select the proper 2 operands to the ALU.

A multiplexer selects inputs from one of the following:

- M-bus (data from main memory)
- Scratchpad registers
- Accumulator

B multiplexer selects inputs from one of the following:

- I-bus (data from external I/O devices)
- Accumulator
- K-bus (literal or masking information from micro-program memory)

Scratchpad Registers

- Contains 11 registers ($R_0 - R_9$, T)
- Scratchpad register outputs are multiplexed to the ALU via the A multiplexer
- Used to store intermediate results from arithmetic/logic operations
- Can be used as program counter

Arithmetic/Logic Unit (ALU)

The ALU performs the arithmetic and logic operations of the CPE.

Arithmetic operations are:

- 2's complement addition
- Incrementing
- Decrementing
- Shift left
- Shift right

Logical operations are:

- Transfer
- AND
- Inclusive-OR
- Exclusive-NOR
- Logic complement

ALU operation results are then stored in the accumulator and/or scratchpad registers. For easy expansion to larger arrays carry look-ahead outputs (X and Y) and cascading shift inputs (LI, RO) are provided.

Accumulator

- Stores results from ALU operations
- The output of accumulator is multiplexed into ALU via the A and B multiplexer as one of the operands

Input Buses

M-bus: Data bus from main memory

- Accepts 2 bits of data from main memory into CPE
- Is multiplexed into the ALU via the A multiplexer

I-bus: Data bus from input/output devices Accepts 2 bits of data from external input/output devices into CPE

- Is multiplexed into the ALU via the B multiplexer

K-bus: A special feature of the N3002 CPE

- During arithmetic operations, the K-bus can be used to **mask** portions of the field being operated on
- Select or remove accumulator from operation by placing K-bus in all "1" or all "0" state respectively
- During non-arithmetic operation, the carry circuit can be used in conjunction with the K-bus for word-wise-OR operation for bit testing
- Supply literal or constant data to CPE

Output Buses

A-bus and Memory Address Register

- Main memory address is stored in the memory address register (MAR)
- Main memory is addressed via the A-bus
- MAR and A-bus may also be used to generate device address when executing I/O instructions
- A-bus has Tri-State outputs

D-bus: Data bus from CPE to main memory or to I/O devices

- Sends buffered accumulator outputs to main memory or the external I/O devices
- D-bus has Tri-State outputs

FUNCTION DESCRIPTION

F GROUP	R GROUP	K BUS	NAME	EQUATION	DESCRIPTION
0	I	XX	—	$R_n + (AC\ K) + CI \rightarrow R_n, AC$	**Logically AND AC with K-bus.** Add the result to R_n and carry input (CI). Deposit the sum in AC and R_n.
		OO	ILR	$R_n + CI \rightarrow R, AC$	Conditionally increment R_n and load the result in AC. Used to load AC from R_n or to increment R_n and load a copy of the results in AC.
		11	ALR	$AC + R_n + CI \rightarrow R_n, AC$	Add AC and CI to R_n and load the result in AC. Used to add AC to a register. If R_n is AC, then AC is shifted left one bit position.
0	II	XX	—	$M + (AC\ K) + CI \rightarrow AT$	**Logically AND AC with the K-bus.** Add the result to CI and the M-bus. Deposit the sum in AC or T.
		OO	ACM	$M + CI \rightarrow AT$	Add CI to M-bus. Load the result in AC or T, as specified. Used to load memory data in the specified register, or to load incremented memory data in the specified register.
		11	AMA	$M + AM + CI \rightarrow AT$	Add the M-bus to AC and CI, and load the result in AC or T, as specified. Used to add memory data or incremented memory data to AC and store the sum in the specified register.
0	III	XX	—	$AT_L \vee (\overline{I_L \wedge K_L}) \rightarrow RO$ $LI \vee [(I_H \wedge K_H) \wedge AT_H] \rightarrow AT_H$ $[AT_L \wedge (I_L \wedge K_L)]$ $[AT_H \vee (I_H \wedge K_H)] \rightarrow AT_L$	None
		OO	SRA	$AT_L \rightarrow RO$ $AT_H \rightarrow AT_L$ $L_I \rightarrow AT_H$	Shift AC or T, as specified, right one bit position. Place the previous low order bit value on RO and fill the high order bit from the data on LI. Used to shift or rotate AC or T right one bit.
1	I	XX	—	$K \vee R_n \rightarrow MAR$ $R_n + K + CI \rightarrow R_n$	**Logically OR R_n with the K-bus.** Deposit the result in MAR. Add the K-bus to R_n and CI. Deposit the result in R_n.
		OO	LMI	$R_n \rightarrow MAR, R_n + CI \rightarrow R_n$	Load MAR to R_n. Conditionally increment R_n. Used to maintain a macro-instruction program counter.
		11	DSM	$11 \rightarrow MAR, R_n - 1 + CI \rightarrow R_n$	Set MAR to all ones. Conditionally decrement R_n by one. Used to force MAR to its highest address and to decrement R_n.
1	II	XX	—	$K \vee M \rightarrow MAR$ $M + K + CI \rightarrow AT$	**Logically OR the M-bus with the K-bus.** Deposit the result in MAR. Add the K-bus to the M-bus and CI. Deposit the sum in AC or T.
		OO	LMM	$M \rightarrow MAR, M + CI \rightarrow AT$	Load MAR from the M-bus. Add CI to the M-bus. Deposit the result in AC or T. Used to load the address register with memory data for macro-instructions using indirect addressing.
		11	LDM	$11 \rightarrow MAR$ $M - 1 + CI \rightarrow AT$	Set MAR to all ones. Subtract one from the M-bus. Add CI to the difference and deposit the result in AC or T, as specified. Used to load decremented memory data in AC or T.

7

FUNCTION DESCRIPTION (Continued)

F GROUP	R GROUP	K BUS	NAME	EQUATION	DESCRIPTION
1	III	XX	—	$(\overline{AT} \vee K) + (AT \wedge K) + CI \rightarrow AT$	**Logically OR the K-bus with the complement of AC or T, as specified.** Add the result to the logical AND of specified register with the K-bus. Add the sum to CI. Deposit the result in the specified register.
		OO	CIA	$\overline{AT} + CI \rightarrow AT$	Add CI to the complement of AC or T, as specified. Deposit the result in the specified register. Used to form the 1's or 2's complement of AC or T.
		11	DCA	$\overline{AT} - 1 + CI \rightarrow AT$	Subtract one from AC or T, as specified. Add CI to the difference and deposit the sum in the specified register. Used to decrement AC or T.
2	I	XX	—	$(AC \wedge K) - 1 + CI \rightarrow R_n$	**Logically AND the K-bus with AC.** Subtract one from the result and add the difference to CI. Deposit the sum in R_n.
		OO	CSR	$CI - 1 \rightarrow R_n$ (See Note 1)	Subtract one from CI and deposit the difference in R_n. Used to conditionally clear or set R_n to all 0's or 1's, respectively.
		11	SDR	$AC - 1 + CI \rightarrow R_n$ (See Note 1)	Subtract one from AC and add the difference to CI. Deposit the sum in R_n. Used to store AC in R_n, or to store the decremented value of AC in R_n.
2	II	XX	—	$(AC \wedge K) - 1 + CI \rightarrow AT$ (See Note 1)	**Logically AND the K-bus with AC.** Subtract one from the result and add the difference to CI. Deposit the sum in AC or T, as specified.
		OO	CSA	$CI - 1 \rightarrow AT$ (See Note 1)	Subtract one from CI and deposit the difference in AC or T. Used to conditionally clear or set AC or T.
		11	SDA	$AC - 1 + CI \rightarrow AT$ (See Note 1)	Subtract one from AC and add the difference to CI. Deposit the sum in AC or T. Used to store AC in T, or decrement AC, or store the decremented value of AC in T.
2	III	XX	—	$(I \wedge K) - 1 + CI \rightarrow AT$ (See Note 1)	**Logically AND the data of the K-bus with the data on the I-bus.** Subtract one from the result and add the difference to CI. Deposit the sum in AC or T, as specified.
		OO	CSA	$CI - 1 \rightarrow AT$	Subtract one from CI and deposit the difference in AC or T. Used to conditionally clear or set AC or T.
		11	LDI	$I - 1 + CI \rightarrow AT$	Subtract one from the data on the I-bus and add the difference to CI. Deposit the sum in AC or T, as specified. Used to load input bus data or decremented input bus data in the specified register.
3	I	XX	—	$R_n + (AC \wedge K) + CI \rightarrow R_n$	**Logically AND AC with the K-bus.** Add R_n and CI to the result. Deposit the sum in R_n.
		OO	INR	$R_n + CI \rightarrow R_n$	Add CI to R_n and deposit the sum in R_n. Used to increment R_n.
		11	ADR	$AC + R_n + CI \rightarrow R_n$	Add AC to R_n. Add the result to CI and deposit the sum in R_n. Used to add the accumulator to a register or to add the incremented value of the accumulator to a register.
3	II	XX	—	$M + (AC \wedge K) + CI \rightarrow AT$	**Logically AND AC with the K-bus.** Add the result to CI and the M-bus. Deposit the sum in AC or T.
		OO	ACM	$M + CI \rightarrow AT$	Add CI to M-bus. Load the result in AC or T, as specified. Used to load memory data in the specified register, or to load incremented memory data in the specified register.
		11	AMA	$M + AC + CI \rightarrow AT$	Add the M-bus to AC and CI, and load the result in AC or T, as specified. Used to add memory data or incremented memory data to AC and store the sum in the specified register.

FUNCTION DESCRIPTION (Continued)

F GROUP	R GROUP	K BUS	NAME	EQUATION	DESCRIPTION
3	III	XX	—	AT + (I∧K) + CI → AT	**Logically AND the K-bus with the I-bus.** Add CI and the contents of AC or T, as specified, to the result. Deposit the sum in the specified register.
		OO	INA	AT + CI → AT	Conditionally increment AC or T. Used to increment AC or T.
		11	AIA	I + AT + CI → AT	Add the I-bus to AC or T. Add CI to the result and deposit the sum in the specified register. Used to add input data or incremented input data to the specified register.
4	I	XX	—	CI ∨ (R_n∧AC∧K) → CO R_n∧(AC∧K) → R_n	**Logically AND the K-bus with AC.** Logically AND the result with the contents of R_n. Deposit the final result in R_n. Logically OR the value of CI with the word-wise OR of the bits of the final result. Place the value of the carry OR on the carry output (CO) line.
		OO	CLR	CI → CO, O → R_n	Clear R_n to all O's. Force CO to CI. Used to clear a register and force CO to CI.
		11	ANM	CI ∨ (R_n∧AC) → CO R_n∧AC → R_n	Logically AND AC with R_n. Deposit the result in R_n. Force CO to one if the result is non-zero. Used to AND the accumulator with a register and test for a zero result.
4	II	XX	—	CI ∨ (M∧AC∧K) → CO M∧(AC∧K) → AT	**Logically AND the K-bus with AC.** Logically AND the result with the M-bus. Deposit the final result in AC or T. Logically OR the value of CI with the word-wise OR of the bits of the final result. Place the value of the carry OR on CO.
		OO	CLA	CI → CO, O → AT	Clear AC or T, as specified, to all O's. Force CO to CI. Used to clear the specified register and force CO to CI.
		11	ANM	CI ∨ (M∧AC) → CO M∧AC → AT	Logically AND the M-bus with AC. Deposit the result in AC or T. Force CO to one if the result is non-zero. Used to AND the M-bus data to the accumulator and test for a zero result.
4	III	XX	—	CI ∨ (AT∧1∧K) → CO AT∧(I∧K) → AT	**Logically AND the I-bus with the K-bus.** Logically AND the result with AC or T. Deposit the final result in the specified register. Logically OR CI with the word-wise OR of the final result. Place the value of the carry OR on CO.
		OO	CLA	CI → CO, O → AT	Clear AC or T, as specified, to all O's. Force CO to CI. Used to clear the specified register and force CO to CI.
		11	ANI	CI ∨ (AT∧I) → CO AT∧1 → AT	Logically AND the I-bus with AC or T, as specified. Deposit the result in the specified register. Force CO to one if the result is non-zero. Used to AND the I-bus to the accumulator and test for a zero result.
5	I	XX	—	CI ∨ (R_n∧K) → CO K∧R_n → R_n	**Logically AND the K-bus with R_n.** Deposit the result in R_n. Logically OR CI with the word-wise OR of the result. Place the value of the carry OR on CO.
		OO	CLR	CI → CO, O → R_n	Clear R_n to all O's. Force CO to CI. Used to clear a register and force CO to CI.
		11	TZR	CI ∨ R_n → CO R_n → R_n	Force CO to one if R_n is non-zero. Used to test a register for zero. Also used to AND K-bus data with a register for masking and, optionally, testing for a zero result.
5	II	XX	—	CI ∨ (M∧K) → CO K∧M → AT	**Logically AND the K-bus with the M-bus.** Deposit the result in AC or T, as specified. Logically OR CI with the word-wise OR of the result. Place the value of the carry OR on CO.
		OO	CLA	CI → CO, O → AT	Clear AC or T, as specified, to all O's. Force CO to CI. Used to clear the specified register and force CO to CI.
		11	LTM	CI ∨ M → CO M → AT	Load AC or T, as specified, from the M-bus. Force CO to one if the result is non-zero. Used to load the specified register from memory and test for zero result. Also used to AND the K-bus with the M-bus for masking and, optionally, testing for a zero result.

FUNCTION DESCRIPTION (Continued)

F GROUP	R GROUP	K BUS	NAME	EQUATION	DESCRIPTION
5	III	XX	—	$CI \vee (AT \wedge K) \rightarrow CO$ $K \wedge AT \rightarrow AT$	**Logically AND the K-bus with AC or T, as specified.** Deposit the result in the specified register. Logically OR CI with the word-wise OR of the result. Place the value of the carry OR on CO.
		OO	CLA	$CI \rightarrow CO$, $O \rightarrow AT$	Clear AC or T, as specified, to all O's. Force CO to CI. Used to clear the specified register and force CO to CI.
		11	TZA	$CI \vee AT \rightarrow CO$ $AT \rightarrow AT$	Force CO to one if AC or T, as specified, is non-zero. Used to test the specified register for zero. Also used to AND the K-bus to the specified register for masking and, optionally, testing for a zero result.
6	I	XX	—	$CI \vee (AC \wedge K) \rightarrow CO$ $R_n \vee (AC \wedge K) \rightarrow R_n$	**Logically OR CI with the word-wise OR of the logical AND of AC and the K-bus.** Place the result of the carry OR on CO. Logically OR R_n with the logical AND of AC and the K-bus. Deposit the result in R_n.
		OO	NOP	$CI \rightarrow CO$, $R_n \rightarrow R_n$	Force CO to CI. Used as a null operation or to force CO to CI.
		11	ORR	$CI \vee AC \rightarrow CO$ $R_n \vee AC \rightarrow R_n$	Force CO to one if AC is non-zero. Logically OR AC with R_n. Deposit the result in R_n. Used to OR the accumulator to a register and, optionally, test the previous accumulator value for zero.
6	II	XX	—	$CI \vee (AC \wedge K) \rightarrow CO$ $M \vee (AC \wedge K) \rightarrow AT$	**Logically OR CI with the word-wise OR of the logical AND of AC and the K-bus.** Place the carry OR on CO. Logically OR the M-bus, with the logical AND of AC and the K-bus. Deposit the final result in AC or T.
		OO	LMF	$CI \rightarrow CO$, $M \rightarrow AT$	Load AC or T, as specified, from the M-bus. Force CO to CI. Used to load the specified register with memory data and force CO to CI.
		11	ORM	$CI \vee AC \rightarrow CO$ $M \vee AC \rightarrow AT$	Force CO to one if AC is non-zero. Logically OR the M-bus with AC. Deposit the result in AC or T, as specified. Used to OR M-bus with the AC and, optionally, test the previous value of AC for zero.
6	III	XX	—	$CI \vee (I \wedge K) \rightarrow CO$ $AT \vee (I \wedge I) \rightarrow AT$	**Logical OR CI with the word-wise OR of the logical AND of the I-bus and the K-bus.** Place the carry OR on CO. Logically AND the K-bus with the I-bus. Logically OR the result with AC or T, as specified. Deposit the final result in the specified register.
		OO	NOP	$CI \rightarrow CO$, $AT \rightarrow AT$	Force CO to CI. Used as a null operation or to force CO to CI.
		11	ORI	$CI \vee I \rightarrow CO$ $I \vee AT \rightarrow$	Force CO to one if the data on the I-bus is non-zero. Logically OR the I-bus to AC to T, as specified. Deposit the result in the specified register. Used to OR I-bus data with the specified register and, optionally, test the I-bus data for zero.
7	I	XX	—	$CI \vee (R_n \wedge AC \wedge K) \rightarrow CO$ $R_n \overline{\oplus} (AC \vee K) \rightarrow R_n$	**Logically OR CI with the word-wise OR of the logical AND of R_n and AC and the K-bus.** Place the carry OR on CO. Logically AND the K-bus with AC. Exclusive-NOR the result with R_n. Deposit the final result in R_n.
		OO	CMR	$CI \rightarrow CO$, $R_n \rightarrow R_n$	Complement the contents of R_n. Force CO to CI.
		11	XNR	$CI (R_n \vee AC) \rightarrow CO$ $R_n \overline{\oplus} AC \rightarrow R_n$	Force CO to one if the logical AND of AC and R_n is non-zero. Exclusive-NOR AC with R_n. Deposit the result in R_n. Used to exclusive-NOR the accumulator with a register.

Logically AND the K-bus with the I-bus. Exclusive-NOR the result with AC or T, as specified. Deposit the final result in the specified register.
		OO	CMA	$CI \rightarrow CO\ \overline{AT} \rightarrow AT$	**Complement AC or T, as specified.** Force CO. to CI.
		11	XNI	$CI \vee (AT \wedge I) \rightarrow CO$ $I \overline{\oplus} AT \rightarrow AT$	**Force CO to one if the logical AND of the specified register and the I-bus is non-zero.** Exclusive-NOR AC with the I-bus. Deposit the result in AC or T, as specified. Used to exclusive-NOR input data with the accumulator.

NOTE:
2's complement arithmetic adds 111 ... 11 to perform subtraction of 000 ... 01.

FUNCTION DESCRIPTION KEY

SYMBOL	MEANING
I, K, M	Data on the I, K, and M buses, respectively
CI, LI	Data on the carry input and left input, respectively
CO, RO	Data on the carry output and right output, respectively
R_n	Contents of register n including T and AC (R-Group I)
AC	Contents of the accumulator
AT	Contents of AC or T, as specified
MAR	Contents of the memory address register
L, H	As subscripts, designate low and high order bit, respectively
+	2's complement addition
–	2's complement subtraction
$\wedge$	Logical AND
$\vee$	Logical OR
$\oplus$	Exclusive-NOR
$\rightarrow$	Deposit into

9403
64-Bit FIFO Buffer Memory

Product Specification

Logic Products

FEATURES

- **10MHz Serial or Parallel Data Rate**
- **Serial or Parallel Input and Output**
- **Expandable Without External Logic**
- **Three-State Outputs**
- **Fully TTL-Compatible**
- **Slim (0.4 In.) 24-Pin DIP**

PRODUCT DESCRIPTION

The 9403 is an expandable fall-through type First-In First-Out (FIFO) Buffer Memory that is optimized for high-speed disc/tape controllers and communication-buffer applications. In multiples of four, the device can be expanded to any number of bits and subsequently, to any number of words. Serial or parallel data can be asynchronously entered or retrieved which makes the 9403 *the* cost-effective solution for implementing buffer memories.

FUNCTIONAL DESCRIPTION

As shown in Figure 1, the 9403 consists of three parts which operate asynchronously and are virtually independent. These parts are:

- **Input Register —** with serial and parallel data inputs and control signals that permit easy expansion and a handshake interface.
- **FIFO Stack —** 4-bit wide, 14-word deep fall-through type with self-contained control logic.
- **Output Register —** with serial and parallel data outputs and control signals that permit easy expansion and a handshake interface.

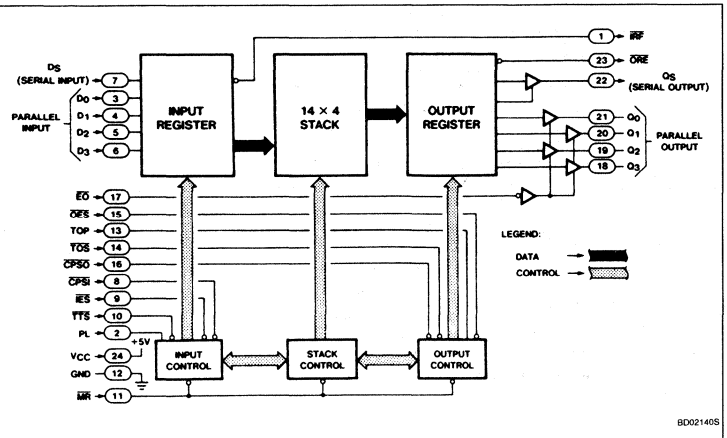

Figure 1. Simplified Block Diagram of 9403 Buffer Memory

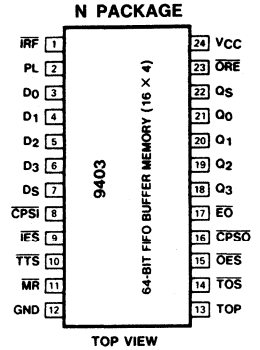
PIN DESIGNATIONS & DESCRIPTIONS



ORDER NUMBER

N9403N

MNEMONIC	AND FUNCTION	DESCRIPTION
$\overline{IRF}$	Input register full output	Low when input register is full
PL	Parallel load input	High on PL enables $D_0 - D_3$; not edge-triggered, 1's catching
$D_0 - D_3$	Parallel data input	—
D_S	Serial data input	—
$\overline{CPSI}$	Serial input clock	Edge-triggered and activates on falling edge
$\overline{IES}$	Serial input enable	When low, serial input is enabled
$\overline{TTS}$	Transfer to stack input	When low, initiates fall-through
$\overline{MR}$	Master Reset	Active low
TOP	Transfer out parallel input	When high and $\overline{TOS}$ is low, enables word transfer from stack to output register — not edge-triggered
$\overline{TOS}$	Transfer out serial input	When low and TOP is high, enables word transfer from stack to output register — not edge-triggered
$\overline{OES}$	Serial output enable input	When low, enables serial output
$\overline{CPSO}$	Serial output clock input	Edge-triggered and activates on falling edge
$\overline{EQ}$	Output enable	Active low
$Q_0 - Q_3$	Parallel data ouput	
Q_S	Serial data output	
$\overline{ORE}$	Output register empty output	When high, output register contains valid data
GND	Ground	—
V_{CC}	Supply voltage	+5 volts

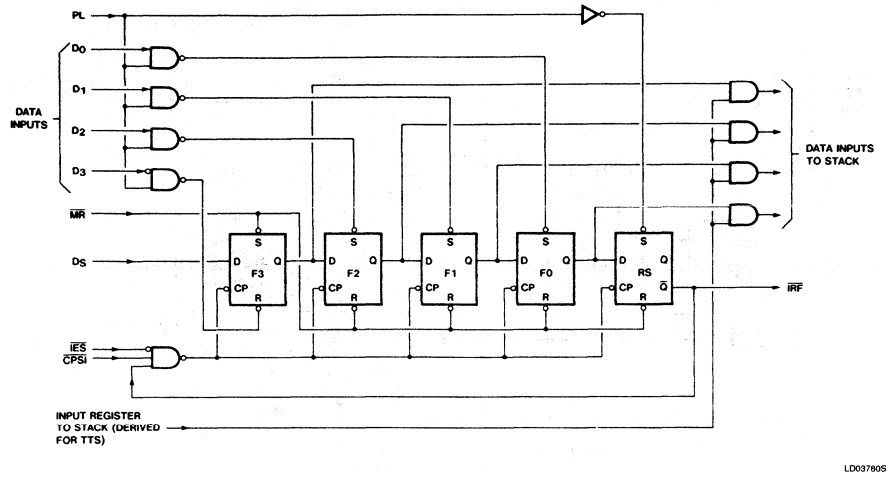


Figure 2. Functional Equivalent of Input Register

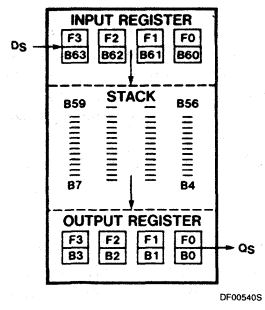

Figure 3. Final Bit Positions Resulting from a Serial Train of 64-Bits

INPUT REGISTER

Data can be entered serially or, using the parallel mode of operation, data is entered in 4-bit increments. In either case, the data is subsequently transferred to the fall-through stack; the functional equivalent of this register is shown in Figure 2. The **I**nput **R**egister **F**ull ($\overline{IRF}$) status signal is internally generated by the **R**egister **S**tatus (RS) flip-flop; when initialized, the $\overline{Q}$ ($\overline{IRF}$) output of this flip-flop is high.

Serial Entry (Input Register)

Serial data is entered via the D_S input and is handled by a 5-bit shift register consisting of flip-flops F3, F2, F1, F0, and RS. With $\overline{IES}$ and PL both low, each high-to-low transition of the serial input clock ($\overline{CPSI}$) shifts the input data in domino order from F3 to F2 to F1 to F0. After the fourth clock transition, the four bits of serial data are aligned in F3 through F0 and RS is set, forcing $\overline{IRF}$ low and inhibiting $\overline{CPSI}$ until contents of the input register are transferred to the stack. Figure 3 shows how a serial train of 64-bits would appear in the 9403 — four bits (B60 – B63) in the input register, 56 bits (B4 – B59) in the stack, and four bits (B0 – B3) in the output register.

Parallel Entry (Input Register)

When PL is high and $\overline{CPSI}$ is low (Figure 2), flip-flops F0 – F3 are loaded with data and $\overline{IRF}$ is forced low. This condition remains until current data is transferred to the stack. Once the data is transferred, $\overline{IRF}$ is driven high and new data can again be clocked into the input flip-flops. If parallel expansion is not being implemented, $\overline{IES}$ must be low to establish row mastership — refer to discussion of parallel expansion.

STACK OPERATION

As shown in Figure 2, the outputs of F0 – F3 are applied to the stack under control of a signal derived from $\overline{TTS}$. When $\overline{TTS}$ is low, an attempt to inititate a fall-through action is made. If the top location of stack is empty, data is loaded and the input register is re-initialized provided PL is low. Note that initialization is postponed until PL is again low. Thus, automatic FIFO action is achieved by connecting the $\overline{TTS}$ input to the $\overline{IRF}$ output.

The RS flip-flop (Figure 2) records the fact that data has been transferred to the stack; this flip-flop is not cleared until PL goes low. Therefore, if a particular data word is transferred to the stack and falls to the second location before PL goes low, the same word will not be re-transferred even though $\overline{IRF}$ and $\overline{TTS}$ are still low. Once data enters the stack, "fall-through" is automatic; a delay is necessary only when waiting for the next stack location to empty. In the 9403, as in most modern FIFO designs, the $\overline{MR}$ input initializes the stack control section and does not clear the data.

OUTPUT REGISTER

This register receives and stores 4-bits of data from the bottom stack location and, on demand, outputs data onto a three-state 4-bit parallel data bus or a three-state serial data bus. The **O**utput **R**egister **F**ull ($\overline{ORE}$) status signal is internally-generated by the FX flip-flop; when data is transferred from the stack to the output register, $\overline{ORE}$ goes high. The functional equivalent of the output register is shown in Figure 4.

Retrieval of Serial Data

When the FIFO stack is empty and $\overline{MR}$ is driven low, the $\overline{ORE}$ output goes low to indicate that the output register is ready to accept new data from the stack. After new data is entered and falls through to the bottom stack location, it is transferred to the output register provided $\overline{TOS}$ is low and TOP is high. As a result of the data transfer, $\overline{ORE}$ goes high indicating valid data in the output register. Subsequently, the $\overline{Q}_S$ output is automatically enabled and the first data bit is transmitted to the three-state serial data bus. Henceforth, a serial shift of data occurs on each high-to-low transition of $\overline{CSPO}$. On the fourth transition, the register is emptied, $\overline{ORE}$ is forced low, and serial output $\overline{Q}_S$ is diabled. To request a new word from the stack, the $\overline{TOS}$ input can be connected to the $\overline{ORE}$ output.

9403

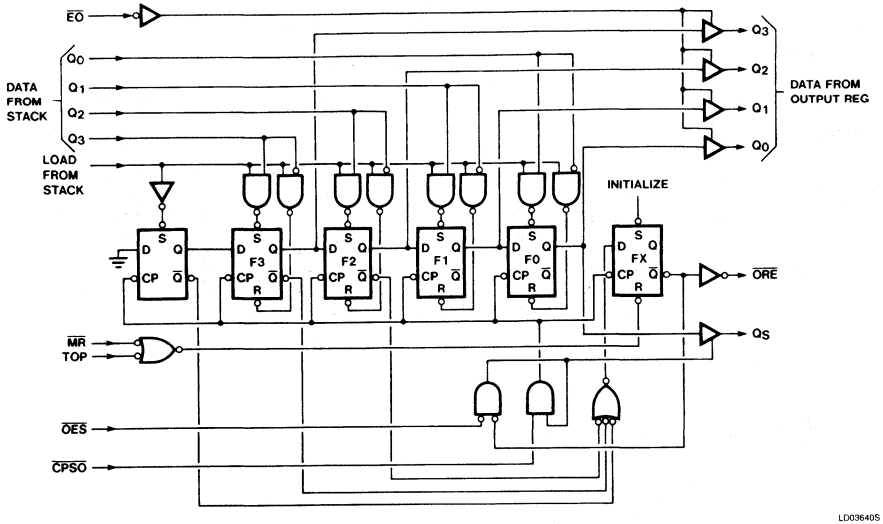

Figure 4. Functional Equivalent of Output Register

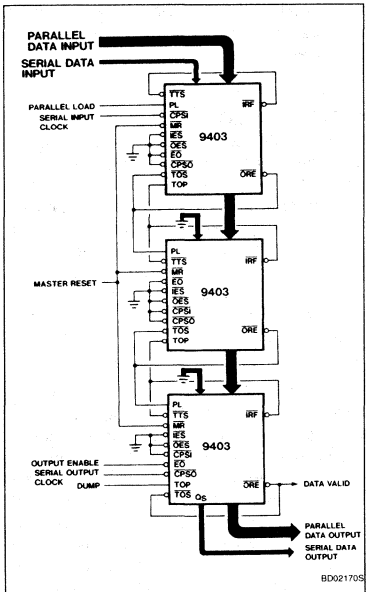

Figure 5. Word Expansion

Retrieval of Parallel Data

With the stack empty and $\overline{MR}$ in the active-low state, the $\overline{ORE}$ output goes low, signifying that the output register is also empty. When new data is entered and has fallen through to bottom location of the stack, it is automatically transferred to the output register, provided the Transfer Out Parallel (TOP) input is high. When the data is transferred from stack-to-register, $\overline{ORE}$ goes high and valid data appears at $Q_0 - Q_3$ (Figure 4), provided the three-state buffers are enabled, that is, $\overline{EO}$ is active-low. When TOP goes low, $\overline{ORE}$ is driven low which indicates that the data output cycle is complete; however, the original data remains latched in the flip-flops until the next word (if available) is transferred from the stack to the output register.

For parallel operation, $\overline{CPSO}$ must be low, whereas, $\overline{TOS}$ should be grounded for single-slice operation or connected to the appropriate $\overline{ORE}$ for expanded operation. The TOP input is not edge-triggered; therefore, if it goes high before data is available from stack but data becomes available before it goes low, the data will be transferred to the output register. However, internal control circuits prevent the same data from being transferred twice. If TOP goes high and returns to low before data is available from the stack, $\overline{ORE}$ will remain low, indicating the absence of valid output data.

VERTICAL EXPANSION

In a vertical structure, the 9403 can be expanded to achieve greater word capacity without any external parts; a 46-word by 4-bit FIFO is shown in Figure 5. Using the same technique and similar connections, any FIFO of 15n + 1 words (where *n* is the number of devices) can be constructed. Observe that word expansion does not sacrifice flexibility of the 9403 FIFO as regards serial/parallel input and output.

HORIZONTAL EXPANSION

The 9403 can be horizontally expanded to store long words in multiples of 4-bits, again without external logic. Connections required to form a 16-word by 12-bit FIFO are shown in Figure 6, using similar techniques, any 16-word by 4n-bit FIFO (where *n* is the number of devices) can be constructed.

For horizontal or bit expansion, it is good practice to connect, respectively, the $\overline{IRF}$ and $\overline{ORE}$ ouputs of the right-most device (most significant device) to the $\overline{TTS}$ and $\overline{TOS}$ inputs of all devices to the left (least significant devices) to guarantee that no operation is initiated before each and every device is ready. Word expansion does not affect the ability of the 9403 to handle serial/parallel inputs and outputs; however, the ripple form of expansion shown in Figure 6 does extract a penalty in speed of operation. Whereas a single 9403 is guaranteed to operate at 10MHz, an array of four FIFOs connected as shown is guaranteed to operate at 4.3MHz.

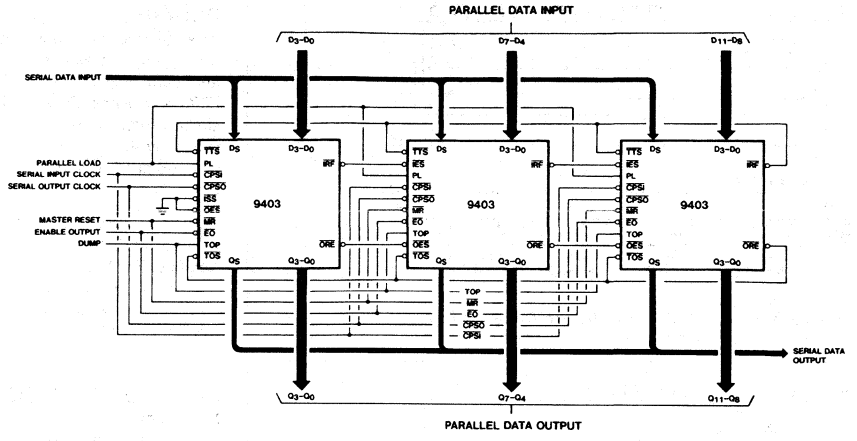

Figure 6. Bit Expansion

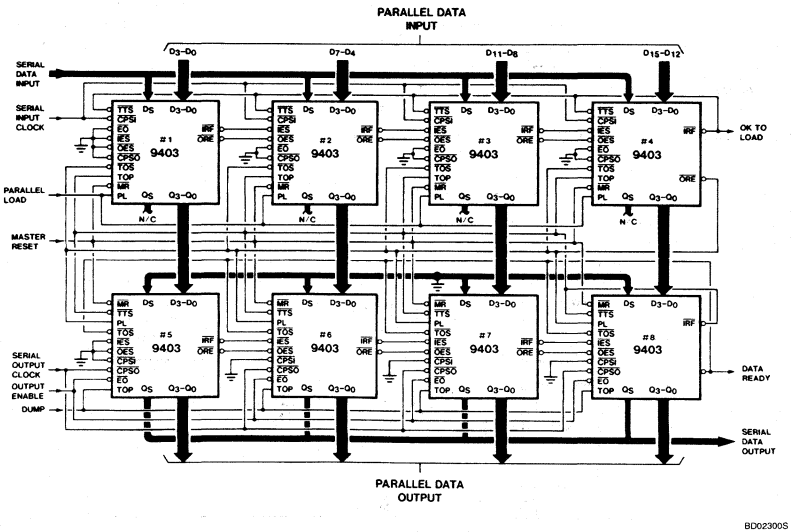

INPUT REGISTER	UNIT NUMBER & ORDER OF SERIAL BITS				OUTPUT REGISTER	UNIT NUMBER & ORDER OF SERIAL BITS			
	#1	#2	#3	#4		#5	#6	#7	#8

Figure 7. Horizontal and Vertical Expansion — 31 x 16 FIFO

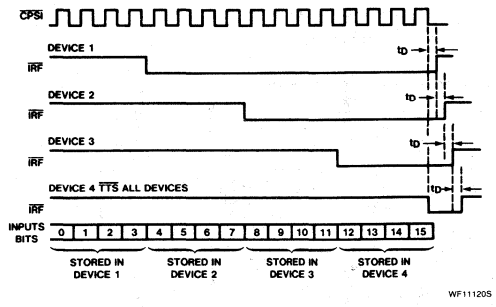

Figure 8. Entry of Serial Data for Array of Figure 7

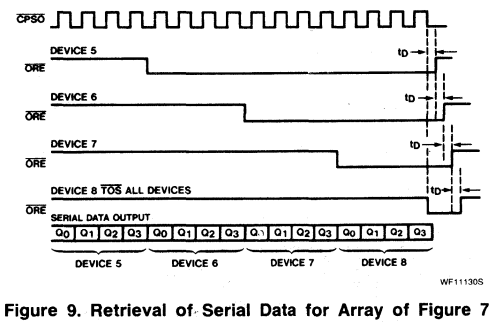

Figure 9. Retrieval of Serial Data for Array of Figure 7

HORIZONTAL AND VERTICAL EXPANSION

In addition to bit-or-word expansion, the 9403 can be used to expand in both the horizontal and vertical directions; a 31-word by 16-bit FIFO is shown in Figure 7. Using the same or similar techniques, any FIFO of 15m + 1 words by 4n-bits can be constructed, where *m* is the number of devices in a column and *n* is the number of devices in a row.

The chart appended to Figure 7 shows the final positions for a contiguous serial entry of 496 bits. Figures 8 and 9, respectively, show the timing relationships involved for data-entry and data-retrieval pertaining to the 31-word by 16-bit array.

INTERLOCKING CIRCUITS

Most conventional FIFO designs provide the status-signal counterparts of $\overline{IRF}$ and $\overline{ORE}$. However, when these devices are used in arrays, variations in unit-to-unit operating speeds require the use of external gating to ensure that all devices have, in fact, completed the last operation. The 9403 incorporates simple but effective master/slave interlocking circuits to eliminate these gating requirements.

CRC Generator/Checker

Product Specification

Logic Products

FEATURES
- **TTL inputs/outputs**
- **12MHz (Max) data rate**
- **Separate preset/reset controls**
- **SDLC specified pattern match (8X01A only)**
- **Automatic right justification**
- **Pin-for-pin compatibility and functionally identical with 8X01 (8X01A only)**
- **V_{CC} = 5V**
- **14-Pin DIP**

APPLICATIONS
- **Floppy and other disk systems**
- **Digital cassette and cartridge systems**
- **Data communication systems**

DESCRIPTION
The CRC Generator/Checker (8X01A or 9401) provides error-correction capabilities for digital systems that handle serial data. The two parts differ in that the 8X01A provides Synchronous Data Link Control (SDLC).

The serial data stream is divided by a selected polynomial; the remainder resulting from this algebraic process is transmitted at the end of the data stream as a Cyclic Redundancy Check Character (CRCC). At the receiving end, the same calculation is performed on the data. If the received message is error-free, the calculated remainder should satisfy a predetermined pattern. In most cases, the remainder is zero; however, where SDLC protocols (8X01A only) are used, the correct remainder is 1111000010111000 ($X^0 - X^{15}$).

Eight polynomials are provided and any of these can be selected via a 3-bit control bus. Popular polynomials, such as CRC-16 and CCITT are implemented and the one selected can be programmed to start with all zeroes or all ones. Right justification for polynomials of degree less than 16 is automatic.

NOTE:
Refer to Truth Table on next page for selection of polynomials.

FUNCTIONAL OPERATION
8X01A and 9401
The CRC Generator/Checker circuit provides a means of detecting errors in a serial data communications environment. A binary message can be interpreted as a binary polynomial H(x). This polynomial can be divided by a generator polynomial P(x) such that H(x) = P(x) Q(x) + R(x) whereby Q(x) is the quotient and R(x) is the remainder. During transmission, the remainder is appended to the end of the message as check bits. For a given message, a unique remainder is generated. Hardware implementation of division is simply a feedback shift register with Exclusive-OR gating. Subtraction and addition in modulo 2 is implemented by the Exclusive-OR function. The number of shift register stages is equal to the degree of the divisor polynomial.

The accompanying truth table defines the polynomials implemented in the CRC circuit. Each polynomial can be selected via control inputs S_0, S_1 and S_2. To generate the check bits, the data stream is entered via the Data (D) input, using the high to low transition of the Clock ($\overline{CP}$) input. This data is gated with the most significant output (Q) of the shift register which, in turn, controls the exclusive OR gates. The Check Word Enable (CWE) must be held high while the data is being entered. After the last data bit is entered, the CWE is brought low and the check bits are shifted out of the register and appended to the data bits using external gating — see Check Word Generation diagram.

To check an incoming message for errors, both the data and check bits are entered through the "D" input with the CWE input held high. The 8X01A while not in the data path, monitors the message. After the last check bit is entered, in the 8X01A, the ERror output is made valid by a high-to-low transition of $\overline{CP}$. If no error is detected during the data transmission, all bits of the internal register are low and the ERror output is also low; if an error is detected, it is reflected by the bit pattern and the ERror output is high. The ERror output status remains valid until the next high-to-low transition of $\overline{CP}$ or until initialized by the preset ($\overline{P}$) or reset (MR) functions. The $\overline{PME}$ line must be high if the ERror output is used to indicate an all-zero result.

A high level applied to the Master Reset (MR) input asynchronously clears the shift register. A low level applied to the Preset (P) input asynchronously sets all bits to the appropriate state if the control-code inputs (S_0, S_1, and S_2) specify a 16-bit polynomial. In the case of check polynomials that are 8-or-12 bits in length, only the most significant 8-or-12 bits of the shift register are set; all remaining bits are cleared.

8X01A ONLY

For data communications using the Synchronous Data Link Control (SDLC) protocol, the 8X01A is preset to an all-ones configuration before any accumulation is done; this applies to both transmitting and receiving modes of operation. Using SDLC, the check sum shifted out of the 8X01A must be inverted.

During the receiving mode, a special pattern of 1111000010111000 ($X^0 - X^{15}$) is used in place of all-zeroes to check for a valid message. The Pattern Match Enable pin allows the user to select this option. If $\overline{PME}$ is low during the last bit time of the message, the ERror output is low providing the result matches the special pattern; if an error occurs, ER is high.

FEATURES

- **10-Bit Address Generator (1024 Microinstruction Addressability)**
- **Operating Frequency Exceeding 12 MHz**
- **Direct Branching Over Full Address Range**
- **Conditional Branching**
- **Subroutine Branching Capability**
- **4-Level Stack Register File**
- **Loop Control Facility Using Stack**
- **Three-State Address Outputs**

PRODUCT DESCRIPTION

The Signetics 8X02A Control Store Sequencer generates addresses to access instructions from a microprogram memory (control store). This high-speed device provides an efficient means of controlling the flow through a microprogram with a powerful set of sequencing functions. The 8X02A can directly address up to 1024 microinstructions; however, the total address space can be expanded by adding conventional paging techniques. Combined with memory, the 8X02A forms a powerful control section for CPU's, controllers, test equipment, and other microprogram-controlled systems.

Control Store Sequencer 8X02A

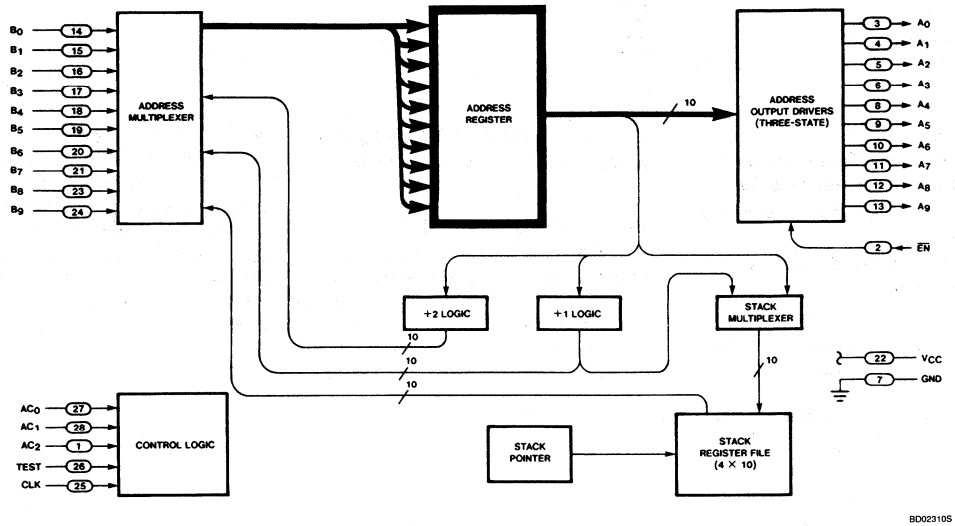

Figure 1. 8X02A Control Store Sequencer — Functional Block Diagram

FUNCTIONAL OPERATION

As shown in Figure 1, the data appearing on the address output pins ($A_0 - A_9$) is the contents of the 10-bit Address Register. On the rising edge of the clock input pulse (CLK), a new address is latched into the Address Register. This new address is supplied via the Address Multiplexer which selects one of five sources:

- Branch Address Input ($B_0 - B_9$)
- Current Address + 1
- Current Address + 2 (for the SKIP function)
- Stack Register File (most recent entry)
- All Zeroes (RESET)

The selection of the next address is determined by the "Address Control Function" specified by inputs $AC_0 - AC_2$ and the TEST input. Table 1 defines the eight Address Control Functions.

The "Reset" (RST) Address Control Function unconditionally forces all Address Register bits to zero on the rising edge of CLK. Sequential microprogram flow is provided by the "Increment" (INC) function which unconditionally increments the Address Register by one for each clock cycle. The Address Register automatically wraps around from the highest address (all "1s") to the lowest address (all "0s").

As shown in Table 1, the TEST input is used to conditionally execute four of the eight Address Control Functions. If the TEST input is **low** (false), the Address Register is simply incremented by one — (for the BLT function, the Stack Pointer is also decremented). If the TEST input is **high** (true), the sequencer executes one of the following:

- Skip (TSK) — the Address Register is incremented by two.
- Branch (BRT) — the Address Register is loaded from the Branch Address Inputs.
- Branch-to-Subroutine (BSR).
- Branch-to-Loop (BLT).

The Stack Register File holds up to four 10-bit addresses and operates in the Last-In/First-Out (LIFO) mode. A Stack Pointer keeps track of the next register of the Stack File to be written into; the pointer is incremented after each "push" and decremented after each "pop" — see Table 1. When branching to a subroutine (BSR), the return address (current address + 1) is "pushed" onto the stack and the branch address input is loaded into the Address Register. To return from a subroutine, the "POP" function pops the return address off the stack and loads it into the Address Register.

The "Push-for-Looping" (PLP) function may be specified in the first instruction of a loop to "push" the current address onto the stack: the Address Register is incremented. A "Branch-to-Loop" (BLT) function placed at the end of the loop "pops" the stack and conditionally branches to the top-of-loop address, depending on the TEST input. If the test for repeating the loop is satisfied (TEST input **high**), the sequencer causes a branch back to the first instruction of the loop in which the top-of-loop address is "pushed" back onto the stack. If the test fails (TEST input **low**), the top-of-loop address is discarded, the stack pointer is decremented and the Address Register is incremented. A combination of subroutines and loops may be nested up to four levels deep.

In abnormal circumstances, the Stack Pointer will wraparound from the fourth to the first register of the Stack File and vice-versa. If the stack is full (four addresses currently stored), an additional "push" causes the first (oldest) entry to be overwritten — (the four most recent entries are always maintained). If the stack is empty, a "pop" will access the fourth register of the Stack File; however, the contents of this register may be unpredictable.

The three-state address outputs ($A_0 - A_9$) are controlled by a common enable input ($\overline{EN}$). When the enable input is **high**, the output drivers are placed in the high-impedance state allowing alternative access to the microprogram memory. Other circuit functions are unaffected by $\overline{EN}$.

NOTE

To implement a RESET externally it is necessary to force all Address Control Inputs ($AC_0 - AC_2$) to the **high** state until at least one rising edge of CLK has occurred. If the AC inputs are supplied directly from the microprogram memory, a RESET may be accomplished by disabling the memory outputs. Pullup resistors should be provided to achieve the required high voltage level.

Control Store Sequencer 8X02A

APPLICATION

FUNCTIONAL DESCRIPTION

Figure 3 shows a typical configuration of an 8X02A-based control section in a CPU application. Microinstructions read from the memory are used to produce control signals for the CPU and to determine the next microinstruction via the 8X02A Address Control inputs ($AC_0 - AC_2$). In the case of a conditional branch or skip, the status condition applied to the 8X02A TEST input is selected according to the microinstruction. In a branch-type microinstruction, a branch field typically supplies the 8X02A Branch Address inputs ($B_0 - B_9$). (In non-branching instructions, this field may contain other CPU control information.) When a macroinstruction is presented to the CPU, the starting address of the microprogram routine which executes the macroinstruction is presented to the Branch Address inputs. Similar configurations may be used for other applications in which the Branch Address inputs are typically supplied directly from the microprogram memory.

Signetics

8X41
Autodirectional Bus Transceiver

Product Specification

Logic Products

DESIGN FEATURE

- **Intelligent bidirectional bus repeater with self-generating or external control**
- **Eight independent channels**
- **Open-collector outputs (meets DEC UNIBUS* specifications)**
- **TTL compatible**
- **High speed (30-nanoseconds max)**
- **Expandable to any number of bits**
- **High input impedance for every operating value of V_{cc}**
- **Low input current (less than 100-microamperes); high output current (up to 70-milliamperes)**
- **0.6 in. 24-pin DIP**
- **+5V supply**

USE AND APPLICATION

- **Minicomputers**
- **Microcomputers MOS/Bipolar**
- **Communications**
- **Signal buffer**
- **Bus fan-out extensions**
- **Distributed processing**
- **Bidirectional bus connector/ isolator**

PRODUCT DESCRIPTION

The Signetics 8X41 Autodirectional Bus Transceiver is a general purpose asynchronous device ideal for system bus expansion applications. The 8X41 consists of eight data channels, each with one pair of terminals (A_i and B_i); each data channel can be operated independently.

The device requires no external controls since all intelligence is internally generated; thus, operation of the device is completely autonomous. The first logic low signal that occurs on one channel terminal (A_i and B_i) will be repeated on the corresponding terminal (B_i or A_i) of the same channel.

The 8X41 is designed for use in open-collector bus systems where high speed and low-current inputs/high-current outputs are required. In system configurations, the discrete capabilities of the bus transceiver can be expanded by parallel connection to service any number of bits. To provide reliable operation and integrity of data transfers, all channels are disabled by an on-chip power monitor whenever V_{CC} falls below approximately 4V.

FUNCTIONAL OPERATION

The 8X41 (Figure 1) consists of eight functionally independent yet logically identical channels. Each channel consists of two bus terminals (A_i and B_i); each terminal is internally connected to an open-collector driver and a high-impedance receiver. The monitoring state of each channel is defined when both terminals (A_i and B_i) are "high"; in this state, the internal logic of the 8X41 continually examines the A and B bus signals to determine signal direction — A_i to B_i or B_i to A_i. A low signal occurring at either of the two terminals causes the open-collector driver on the opposite terminal to follow suit; hence, the signal is repeated by the 8X41. For each channel, latches L1 and L2 determine signal direction. As shown in the truth table for these latches, there is no transmission of data when both signals are low; however, this condition should never occur during normal system operation.

The internal automatic direction control can be overridden by either or both of the common disable inputs — $\overline{DBA}$ and $\overline{DAB}$. When $\overline{DBA}$ is driven low ($\overline{DAB}$ = high), the B_i to A_i path is interrupted and the device becomes a unidirectional repeater in the A_i to B_i direction only. With these conditions reversed ($\overline{DAB}$ = low and $\overline{DBA}$ = high), the A_i to B_i path is interrupted and the chip functions as a unidirectional repeater in the B_i to A_i direction. When both control signals are low, data passage is inhibited in both directions. Refer to the I/O truth table for all possible input/output conditions.

- **CRT Terminals**

PRODUCT DESCRIPTION
The Signetics 8 x 60 FIFO RAM Controller (FRC) is an address and status generator designed to implement a high-speed/high-capacity First-In/First-Out (FIFO) stack utilizing standard off-the-shelf RAMs — see **Applications** on the last page of this data sheet. The FRC can control up to 4096 words of buffer memory; intermediate buffer sizes can be selected — refer to the memory length table on the next page. Built-in arbitration logic handles read/write operations on a first-come/first-served basis.

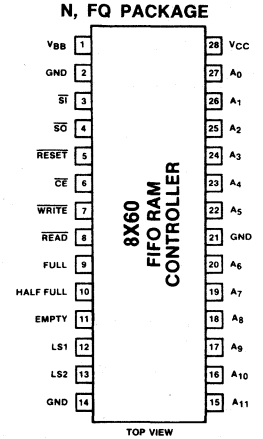
As shown in Figure 1, the FRC consists of:
- A 12-Bit Write Address Generation Counter (Counter #1) and a 12-Bit Read Address Generation Counter (Counter #2).
- A 12-Bit Up/Down Status Counter (Counter #3).
- Twelve Three-State Address Drivers.
- Control Logic.

The two address counters, #1 and #2, respectively, are used to generate write and read addresses; the outputs of these counters are multiplexed to the three-state address drivers. Counter #3 generates **full, empty,** and **half full** status.

FUNCTIONAL OPERATION
The FRC operates in either of two basic modes — **write** into the FIFO buffer memory or **read** from the FIFO buffer memory. These two operations are described in subsequent paragraphs and the complete sequence is summarized in Table 1. Typical Write/Read timing relationships, arbitration logic, and chip-enable control are shown in the Timing Diagrams.

PACKAGE AND PIN DESIGNATOR

N, FQ PACKAGE



TOP VIEW

ORDER NUMBERS

N8X60N, RB8X60F

PIN NO.	IDENTIFIER	FUNCTION
1	V_{BB}	Supply voltage for internal circuits.
2, 14, 21	GND	Circuit ground.
3	$\overline{SI}$	Shift-In request for write cycle; active-low input.
4	$\overline{SO}$	Shift-Out request for read cycle; active-low input.
5	$\overline{RESET}$	Active-low master reset input.
6	$\overline{CE}$	Active-low chip enable input.
7	$\overline{WRITE}$	Write cycle address valid; active-low output.
8	$\overline{READ}$	Read cycle address valid; active-low output.
9	FULL	Memory full status output; also, override input capability. Active when **high.**
10	HALF FULL	Memory half-full status output; active-high.
11	EMPTY	Memory empty status output; also, override input capability. Active when **high.**
12	LS1	Least significant bit (LSB) of the memory length select input.
13	LS2	Most significant bit (MSB) of the memory length select input.
15 – 20 22 – 27	$A_{11} - A_0$	Three-state address outputs: A_0 = LSB.
28	V_{CC}	Supply voltage.

7

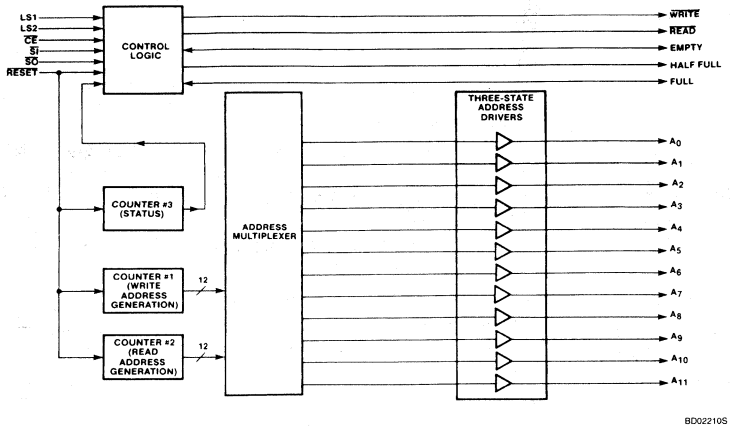


Figure 1. Functional Block Diagram of FIFO RAM Controller

FIFO BUFFER MEMORY — WRITE CYCLE

To perform a write operation, $\overline{SO}$ must be **high** and SI must be **low.** When these conditions exist and other control parameters (Table 1) are satisfied, the write address in Counter #1 (Figure 1) is output to the address bus via the multiplexer and $\overline{WRITE}$ output goes **low.** (**Note.** Normally, the $\overline{WRITE}$ output goes **low** after the address output becomes state — refer to **$\overline{WRITE}$ Cycle Timing Diagram.** The $\overline{WRITE}$ output may then act as a **write** or **chip** enable for the RAMs that are used to implement the memory.

When the **write** cycle is ended ($\overline{SI}$ is forced high), the $\overline{WRITE}$ output goes **high**, the address output buffers return to a high-impedance state. Counter #1 (Write Address Generation) and Counter #3 (Status) are both incremented, and Counter #2 (Read Address Generation) remains unchanged.

FIFO BUFFER MEMORY — READ CYCLE

To perform a read operation, $\overline{SI}$ must be **high** and $\overline{SO}$ must be **low.** When these conditions exist and other control parameters (Table 1) are satisfied, the read address contained in Counter #2 (Figure 1) is output to the address bus and the $\overline{READ}$ output goes **low.**

When the **read** cycle is ended ($\overline{SO}$ is forced **high**) the $\overline{READ}$ output goes **high**, the output buffers return to a high-impedance state. Counter #2 (Read Address Generation) is incremented. Counter #3 (Status) is decremented, and Counter #1 (Write Address Generation) remains unchanged.

MEMORY LENGTH

LS1	LS2	HALF LENGTH	FULL LENGTH
L	L	2048	4096
H	L	32	64
L	H	512	1024
H	H	128	256

CONTROL LOGIC

To prevent the possibility of operational conflicts, $\overline{SI}$ and $\overline{SO}$ are treated on a first-come/first-served basis; these two input signals are controlled by internal arbitration logic — refer to the applicable **Timing Diagrams** and **AC Characteristics** for functional and timing relationships. If one cycle is requested while the other cycle is in progress, the requested cycle will commence as soon as the current-cycle is complete (provided other control parameters are satisfied).

As shown in the accompanying diagram, the buffer length of the FIFO memory can be hardware-selected via the Length Select (LS1, LS2) Inputs. When less than the maximum length is selected, the unused high-order bits of the address outputs are held in the high-impedance state.

Generation of the status output signals (HALF FULL, FULL and EMPTY) is a function of the Length Select (LS1, LS2) inputs and the current state of Status Counter #3. In general, the status outputs reflect the conditions that follow:

- **HALF FULL** — this status output signals goes **high** on the positive-going edge of $\overline{SI}$ if the MSB of the selected length of Counter #3 becomes a "1". The HALF FULL signal will go from **high-to-low** on the positive-going edge of $\overline{SO}$ when, after the **read** cycle, the selected length of Counter #3 changes from "100 ... 00" to "011 ... 11". For example, if the selected memory length is 256 words (FULL = 256), then HALF FULL = 128 words; hence, on the positive-going edge of $\overline{SO}$ when Counter #3 reaches a count of 127, the HALF FULL output will go from **high**-to-**low**.
- **FULL** — this signal serves both as a status output and as an override input. The FULL signal goes **high** on the negative-going edge of $\overline{SI}$ if all bits of Counter #3 for selected length are equal to "1". The FULL output goes from **high**-to-**low** on the negative-going edge of $\overline{SO}$.
- **EMPTY** — this signal also serves as a status output and as an override input. On the negative-going edge of $\overline{SO}$, the EMPTY output is driven **high** if Status Counter #3 contains a value of "1"; on the positive-going edge of $\overline{SO}$, the counter is decremented to "0". The EMPTY output goes from **high**-to-**low** on the negative-going edge of $\overline{SI}$.

Once the FULL signal is **high**, further Write Cycle Requests ($\overline{SI}$ = low) are ignored; similarly, once the EMPTY signal is **high**, further Read Cycle requests ($\overline{SO}$ = low) are ignored. However, to accommodate diversified applications, the FULL and EMPTY outputs are

open-collector with on-chip 4.7K passive pull-up resistors. If either the FULL or EMPTY pins are forced **low** via external control, the corresponding **write** or **read** cycle may resume (provided the external FULL or EMPTY input is held **low** until the corresponding $\overline{WRITE}$ or $\overline{READ}$ output goes **low**) and the address/status counters will continue normal operation* — refer to Table 1.

The user must force the $\overline{RESET}$ input **low** to initialize the chip. (**Note.** If the $\overline{RESET}$ signal is driven **low** during a **write** or **read** cycle, the address output may have a short period of uncertainty before assuming a high-impedance state.) The following actions occur when $\overline{RESET}$ is active:

- All internal counters are set to "0".
- All address output lines are forced to the high-impedance state.
- HALF FULL and FULL outputs are forced **low**.
- $\overline{WRITE}$, $\overline{READ}$, and EMPTY outputs are forced high.

When $\overline{CE}$ is **high**, the address output lines are forced to the high-impedance state, further **write** or **read** cycle requests are ignored, and all counters remain unchanged. If $\overline{CE}$ switches from **low**-to-**high** during a **write** or **read** cycle, the cycle in progress is always completed before the disabled state is entered. For details of these operations, refer to the timing information shown later in this data sheet.

*Refer to **Note** on inside back cover

Table 1. Summary of Operation

INPUTS				INITIAL CONDITIONS	RESULTING OUTPUTS			COMMENTS
$\overline{RESET}$	$\overline{CE}$	$\overline{SI}$	$\overline{SO}$		$\overline{WRITE}$	$\overline{READ}$	Address Bus	
L	X	X	X		H	H	Hi-Z	Reset all counters to 0.
H	X	H	H		H	H	Hi-Z	No action
H	L	L	H	FULL = L	L	H	Write address from Ctr #1	Shift into FIFO stack (Write Cycle)
H	L	L	H	FULL = H	H	H	Hi-Z	Stack full (write inhibited)
H	L	H	L	EMPTY = L	H	L	Read address from Ctr #2	Shift out of FIFO stack (Read Cycle)
H	L	H	L	EMPTY = H	H	H	Hi-Z	Stack empty (read inhibited)
H	L	L	↓	Write cycle in progress	L	H	Write address from Ctr#1	Continue write cycle (until $\overline{SI}$ goes high)
H	L	↓	L	Read cycle in progress	H	L	Read Address from Ctr #2	Continue read cycle (until $\overline{SO}$ goes high)
H	L	L	L	EMPTY = H	L	H	Write address from Ctr #1	Shift in (read inhibited)
H	L	L	L	FULL = H	H	L	Read address from Ctr #2	Shift out (write inhibited)
H	L	↑	H	Write cycle in progress	↑	H	Goes to Hi-Z	Increment write address counter #1 and status counter #3
H	L	H	↑	Read cycle in progress	H	↑	Goes to Hi-Z	Increment read address counter #2; decrement status counter #3
H	L	↑	L	Write cycle in progress (note 1)	↑	↓	Changes to read address from Ctr #2	Increment write address counter #1 and status counter #3
H	L	L	↑	Read cycle in progress (note 2)	↓	↑	Changes to write address from Ctr #1	Increment read address counter #2; decrement status counter #3
H	H	↓	H		H	H	Hi-Z	Chip disabled
H	H	H	↓		H	H	Hi-Z	Chip disabled
H	↑	L	X	FULL = L; write cycle begun (note 1)	L	H	Write address from Ctr #1	Continue write cycle (until $\overline{SI}$ goes high)
H	↑	X	L	EMPTY = L: read cycle begun (note 2)	H	L	Read address from Ctr #2	Continue read cycle (until $\overline{SO}$ goes high)
H	↓	L	L	FULL = L; EMPTY = L	–	–	–	This set of conditions should be avoided

NOTES:
1. Write cycle will occur if either $\overline{SI}$ goes **low** before $\overline{SO}$ goes **low** or EMPTY = H when $\overline{SO}$ goes **low.**
2. Read cycle will occur if either $\overline{SO}$ goes **low** before $\overline{SI}$ goes **low** or FULL = H when $\overline{SI}$ goes **low.**

	HALF FULL, FULL, and EMPTY	V_{CC} = MIN; I_{OL} = 8mA		0.35	0.5	V
V_{CD}	Diode clamp voltage: All inputs except FULL and EMPTY	V_{CC} = MIN; I_{CD} = −18mA	−1.5	−0.8		V
I_{IH}	High level input current: All inputs except FULL and EMPTY	V_{CC} = MAX; V_{IH} = 2.7V		0.1	20	μA
	FULL and EMPTY	V_{CC} = MAX; V_{IH} = 2.7V; stack FULL or stack EMPTY (Note 3)		−470	−750	μA
I_{IL}	Low level input current: All inputs except FULL and EMPTY	V_{CC} = MAX; V_{IL} = 0.4V		−0.17	−0.4	mA
	FULL and EMPTY	V_{CC} = MAX; V_{IL} = 0.4V; Stack FULL or Stack EMPTY		−1.12	−1.8	mA
I_{OH}	High level output current: FULL, EMPTY	V_{CC} = MIN; V_{OH} = V_{CC} (min)		15	100	μA
I_{OZH}	High-Z output current (HIGH); address bus (Three-state)	V_{CC} = MAX; V_{OUT} = 2.4V		0.9	20	μA
I_{OZL}	High-Z output current (LOW); address bus (Three-state)	V_{CC} = MAX; V_{OUT} = 0.5V		−0.6	−20	μA
I_I	Input leakage current: All inputs except FULL and EMPTY	V_{CC} = MAX; V_{IN} = 5.5V		0.03	0.1	mA
I_{OS}	Short-circuit output current: address bus and HALF FULL	V_{CC} = MAX; V_{OH} = 0V	−15	−68	−100	mA
	$\overline{WRITE}$, $\overline{READ}$	V_{CC} = MAX; V_{OH} = 0V	−40	−73	−100	mA
I_{CC}	Supply current from V_{CC}	V_{CC} = MAX; Address Bus = High-Z; 0°C →		81	140	mA
		70°C →		81	110	
I_{BB}	Supply current from V_{BB}	V_{BB} = Max; 0°C →		63	95	mA
		70°C →		63	85	

NOTES:

1. V_{BB} can be obtained from a regulated 1.5V supply; alternately, proper supply current (I_{BB}) can be obtained by connecting a 56-ohm (± 5%, 0.5W) resistor in series with V_{CC} as shown later in the APPLICATIONS diagram.
2. Typical limits are: V_{CC} = 5.0V; T_A = 25°C.
3. Because of the internal pull-up resistor on the FULL and EMPTY pins, a negative current is required to force the required voltage.

Surface Mounted ICs

Surface Mounted ICs

INTRODUCTION

Economic survival is driving the electronics industry to use cheaper, faster, more reliable and more dense systems and components. Assembly technologies, such as SMD (Surface Mounted Device) technology, developed and used in hybrids and for military electronics for over two decades, is being adapted to commercial electronics as part of this evolution. With SMD technology, components are soldered directly to a metalized footprint on the surface of the board or substrate rather than being inserted through holes drilled in the board and then soldered. Because of this evolution, package styles specially designed to facilitate surface mounting are now in high demand.

The reasons for the change to SMD technology vary from one customer to another; but the primary motivator is higher profits through lower manufacturing and material costs, or an improved product, or both.

Improved Electrical Performance

Because SMD packages are much smaller than their DIP counterparts, they have much less capacitance and inductance, and provide improved AC performance, especially in high-speed environments. They help to minimize problems associated with ground bounce and multiple output switching found with standard DIP packages. The SO package is especially suitable for high-speed families such as FAST and High-Speed CMOS where package inductance can induce or compound problems not normally found in slower technologies.

Ease Of Automation

SMD pick-and-place machines offer higher yields, faster cycle rates (3 – 10x faster), and much higher throughput volumes than automatic insertion machines for DIP packages.

Greatly Increased Densities

Greatly increased densities can be achieved through surface mounting. The packages themselves are much smaller (as much as 70%) and can be placed much closer together. Furthermore, both sides of the board can be used with SMDs.

Reduced Board Costs

The number of layers, total size of the board and the number of plated through holes can be reduced, thus lowering the total cost of the board (many companies claim savings of 30 to 50%).

Easier Board Rework

In those instances where rework is necessary, it is much faster and cheaper with SMDs.

Improved Reliability

Not only are the components proving to be at least as reliable as their DIP counterparts, but surface mounted assemblies show fewer failures in stress tests than equivalent through hole assemblies.

Lower Shipping, Storage And Handling Costs

SMD components are up to 70% smaller and weigh up to 90% less than DIPs (up to 95% savings in storage area for Tape & Reel SMD components vs DIPs and up to 90% savings in component weight). Surface mount assemblies offer additional savings in both weight and space, both of which can be linked to increased profits.

SMD packages for integrated circuits fall into two categories: Swiss Outline also known as Small Outline (SO) and the Plastic Leaded Chip Carrier (PLCC).

SO PACKAGE

The SO package was developed by N.V. Philips Corp, originally for the Swiss watch industry. In the mid 1970s Signetics introduced linear ICs in SO packages to the US market (hybrid and telecommunications). As demand grew, other technologies such as FAST, Low Power Schottky, Schottky, TTL, CMOS, High-Speed CMOS (HC and HCT), ECL, ROMs, RAMs, PROMs, were made available in SO packages.

The SO is a dual-in-line plastic package with leads spaced 0.050″ apart and bent down and out in a Gull-Wing format. It comes in two widths: 0.150″ SO, and 0.300″ SOL (SO-Large) depending on the pin count.

As ICs became more complex and the number of pins grew, the standard dual-in-line packages grew longer and wider, presenting new electrical and mechanical problems. Some of these were resolved with the introduction of the ceramic leadless chip carrier (LCC). These were square, ceramic packages without leads which can be socketed or soldered directly to a substrate if the thermal coefficient of expansion of the chip carrier and the substrate are matched.

In 1980, the Plastic Leaded Chip Carrier (PLCC) was introduced as a cheaper alternative to the LCC. However, this was at the same time that SMD was winning acceptance in commercial electronics and the PLCC was seen as an ideal SMD package for the higher pin count devices (those with more than 28 leads). The PLCC is a square, plastic package with leads on four sides, spaced down and under in a J-Bend configuration. It is available in the higher pin counts: 20, 28, 44, 52, 68, 84 with even higher pin counts under development.

The smallest square PLCC is the 20 pin package. There are many reasons for this; the primary one is that below 20 pins, the package would be as thick as it is square,

Table 1

PIN COUNT	SO	SOL	PLCC
8	x		
14	x		
16	x	x	
18		x	x (rectangular)
20		x	x
24		x	
28		x	x
44			x
52			x
68			x
84			x

Surface Mounted ICs

Table 2. Maximum Thermal Resistance (θ_{JA}) Values for SMD Packages (°C/W)

PINS	SO	SOL	PLCC
8	160		
14	115		
16	110	90	
20		85	70
24		75	
28		70	60
44			42
52			39
68			42
84			32

NOTE:
For more detailed information see Application Note SMD100 entitled "Thermal Considerations For Surface Mounted Devices" contained in the Application Note section of this data manual.

resulting in a cube-like package which would be very difficult to handle in an automated environment.

Logic and linear devices are available in SO while the more complex parts such as Microprocessors, Microcontrollers, Complex Peripherals, large memory devices, and other higher pin count integrated circuits will be found in the PLCC.

ASSEMBLY

The assembly of these SMD packages is virtually the same as for the older DIP packages using the same materials and most of the same equipment and assembly technologies.

The only differences in the process are the smaller lead frames, different lead bends (gull-wing for SO and J-Bend for the PLCC), and closer spacing resulting in a much smaller package for the same basic die.

RELIABILITY

Reliability studies of SMD components, conducted not only by Signetics and Philips, but many of our competitors and our customers have revealed that these packages are at least as reliable as the standard plastic DIP packages that have been used over the past 20 years. In several cases, test results of the SMD packages have been better than their DIP counterparts.

THERMAL CHARACTERISTICS

Thermal characteristics of ICs have always been a major consideration to producers and users of electronics products because an increase in junction temperature (T_J) can have an adverse effect on the long term operating life of an IC. The advantages realized by miniaturization have trade-offs in terms of increased junction temperatures. Some of the variables affecting T_J are controlled by the producer of the IC, while others are controlled by the user and the environment in which the device is used.

With the increased use of SMD, thermal management remains a valid concern because not only are the packages much smaller, but the thermal energy is concentrated much more densely on the PCB. For these reasons users of SMD must be more aware of all the variables affecting T_J.

Power Dissipation

Power dissipation (P_D) varies from one device to another depending on technology and complexity. It can be obtained by multiplying V_{CCmax} by the I_{CC} characterized at the maximum ambient temperature expected (in the case of TTL, 70°C).

- Junction temperature (T_J) is the temperature of a powered IC measured at the substrate diode. When the device is powered, the heat generated causes the T_J to rise above the ambient temperature (T_A).
- All standard TTL, Schottky, Low Power Schottky, and FAST being built by Signetics use copper leadframes.
- The ability of the package to conduct heat from the chip to the environment is expressed in terms of thermal resistance, normally called Theta JA (θ_{JA}). θ_{JA} is the total resistance from the junction to ambient and is often separated into two components: θ_{JC} (junction to case) and θ_{CA} (case to ambient). $\theta_{JA} = \theta_{JC} + \theta_{CA}$. θ_{JA} values for SMD packages are listed in Table 2.
- All measurements are in still air.
- $T_{A\ max}$ is +70°C.
- I_{CC} characterized at nominal V_{CC} and +70°C ambient.
- Calculate power (P) by multiplying V_{CC} nominal x I_{CC} at +70°C.
  $P = I_E$
- Calculate rise in (T_J) by multiplying Power by θ_{JA}.
  $T_J = P \times \theta_{JA}$
- Add $T_J + T_{A\ max}$. If result is greater than 120°C, then thermal mounting or some other way to reduce the T_J must be used.

Factors Affecting Thermal Resistance

In addition to possible loading and duty cycle factors in some technologies, there are several factors which affect θ_{JA} of any IC package. Effective thermal management demands a sound understanding of all these variables.

Package variables include the leadframe design, leadframe material, the plastic used to encapsulate the device, and to a lesser extent, other variables such as the die size and die attach methods. While the thermal conductivity of the wire can be calculated, it is too insignificant to be considered as a factor.

Other factors that have a significant impact on the θ_{JA} include the substrate upon which the package is mounted, the density of the layout, the gap between the package and substrate, the number and length of traces on the surfaces of the board, the use of thermally conductive epoxies, and any external cooling methods.

STANDARDIZATION

The SO package is an industry standard format. In June 1985, the JEDEC (Joint Electronics Engineering Council) of the EIA (Electronics Industries Association) issued a Solid State Product Outlines Standard for each of the SO formats: MS-012 AA-AC for the 0.150″ body width SO and MS-013 AA-AE for the 0.300″ body width SOL. In addition to the JEDEC Standard, de facto standardization has been achieved in the industry in that most of the major US and European IC manufacturers (more than 15 companies currently) use this standard.

The PLCC is also a standardized format, with a JEDEC Registered Outline #MO-047 AA-AH. It also is multiple sourced with over 10 US IC manufacturers using this standard.

Points worth noting: ALL SO AND SOL PACKAGES HAVE 0.050″ LEAD SPACING AND A GULL-WING LEAD BEND, WHILE ALL PLCC PACKAGES HAVE THE SAME LEAD SPACING AND A J-BEND LEAD BEND.

TAPE AND REEL

One revolutionary trend in SMD is the development of Tape and Reel for the IC packages. Philips and several other companies making automatic placement equipment recognized the need for a feed system which allows for positive indexing large volumes of components at high-speed in order to get maximum efficiency out of the new pick-and-place machines. Tubes are limited to a relatively small number of parts (dictated by tube length) and depend on gravity to feed components to the placement head. After several

Surface Mounted ICs

proposed tape formats, Philips, Signetics, many of the component and placement equipment manufacturers, and board manufacturers convened under the auspices of EIA (Electronic Industries Association) and agreed on an industry standard specification for Tape and Reel for both SO and PLCC packages. The proposed EIA specification RS 481A is being used by Signetics and Philips, both of whom have shipped components on Tape and Reel since late 1984.

SUCCESS IN SURFACE MOUNTING BEGINS WITH THE DESIGNER

In addition to the different package configurations, surface mounting is done on a much smaller scale. Instead of the plated through holes, metallized footprints must be etched onto the substrate surface.

The designer will be using a more refined set of rules for layout of the surface mount PC board. Because the components can be spaced closer together with small contact spacing, a narrower conductor trace width is necessary. A common signal conductor can be 0.010″ to 0.012″ wide and 0.015″ through 0.030″ is adequate for power and ground bussing. The suggested footprint contact area has a generous tolerance. For the SO I.C., a rectangular pattern is used on 0.050″ spacing. The length of the pad is 0.050″ to 0.060″ and the width can vary from 0.020″ to 0.035″. The 0.025″ x 0.050″ footprint pattern will work well using the grid placement system favored by most designers. The 0.012″ conductor width spaced at 0.025″ provides a reasonable 0.013″ air gap between traces. However, if conductor traces are routed between contact pads, it will be necessary to neck down the trace width to 0.008″ and still retain an equal airgap at each side. Because neck down traces require additional time in both hand taping or CAD/photo plot generation of artmasters, some compromises may be justified. By reducing the contact pad size to 0.020″ x 0.050″, it is possible to route a consistent 0.010″ conductor trace width and still maintain the desired clearances. However, some PC board shops may not maintain the consistent quality necessary when using this fine line approach over the entire board. It is important to discuss limitation and premium cost penalties with your supplier before full commitment to the 0.010″, and smaller, trace widths.

Another very important consideration to be taken into account is the thermal concentration caused by miniaturization. The same die is being used in the SMD as in the DIP, thus the power dissipated is the same; however, the smaller packages are being placed much closer together, concentrating the thermal energy. The trade-offs between the increase in density and the concentration of thermal energy must be evaluated by the board manufacturer.

These factors may influence the choice of PCB material, the number of layers, and the thickness of the PCB board. New methods to transfer heat from the package to the board and then away from the board should be considered by the designer.

Other factors to be considered are the placement system, soldering method, post-assembly cleaning, inspection, test, and the availability of parts in SMD packages.

One of the first steps is to list all the devices needed and to determine which ones are available in SMD format. With the growth of popularity of SMD, the number of different functions offered by Signetics continues to grow rapidly. In addition to the SIGNETICS SMD POCKET GUIDE, there are several cross-reference lists available from design and assembly services. However, with the explosive growth of this market NONE OF THESE LISTS ARE NECESSARILY CURRENT. Please check with your local sales office because the parts availability lists are growing almost daily.

When choosing the type of footprints to use, it is very important that the designer considers the soldering method being used.

Basically there are two types of soldering in use today: flow soldering (wave, drag, or hot solder dip) and reflow soldering (vapor phase, infrared, thermal conduction through the PCB, and hot air).

The SO package can be soldered using a flow soldering method. The devices must be attached to the PCB by means of an adhesive because the device side of the board will be facing down as it goes through the solder wave. The orientation of the part as it goes through the solder wave can play an important role in the elimination of bridges. Experiments should be conducted by the user to determine the best footprints for use in a particular soldering system. Some users feel that the narrower footprints help to reduce solder bridges. Others have been experimenting with rounded footprints to reduce bridging during wave soldering and claim to have had very good results.

Reflow soldering has been done for many years in the hybrid industry. A solder paste or solder cream is applied to the footprint prior to placement of the component. These pastes and creams contain tiny spheres of solder suspended in a carrier which contains the flux. As the substrate temperature is raised, the flux, solvents, and carriers are driven off and the solder liquifies. Various melting point pastes and creams are available. As the liquid solder migrates to the metallized footprints, the surface tension is enough to move the leaded components. For SO packages, this can be an advantage because it acts as a self-positioning mechanism. However, it can be a problem for the smaller passive components if the solder paste isn't printed on evenly. If there is an uneven amount of solder paste on one end of one of these smaller devices, the surface tension can pull stronger on one side causing

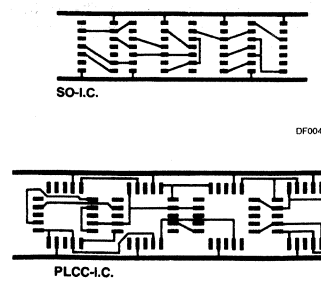

Figure 3. Planning – Layout And Component Placement

Surface Mounted ICs

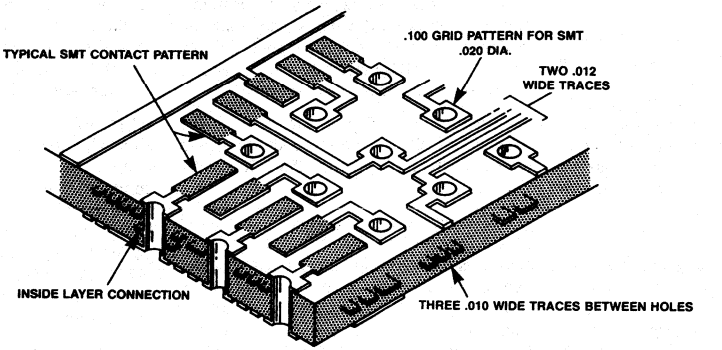

Figure 4

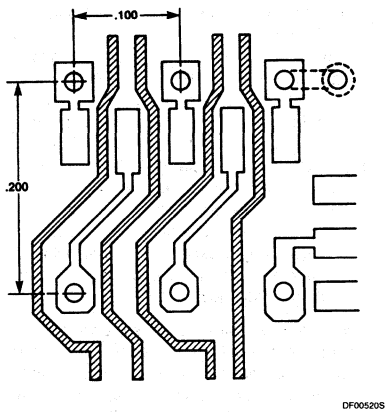

Figure 5

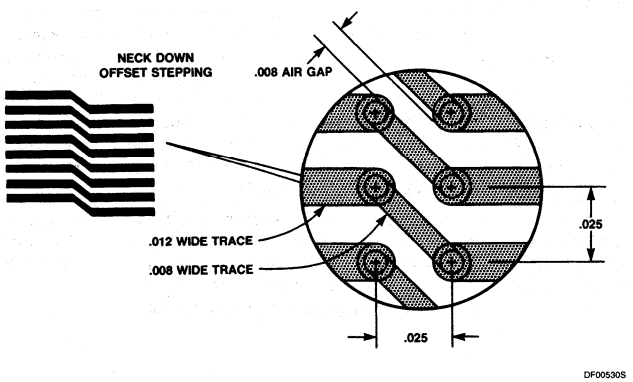

Figure 6

Surface Mounted ICs

a "tombstoning" effect, i.e., one end of the device is lifted straight up.

Many variations of footprint patterns are possible. The formula shown in Figure 1 is applicable for both reflow and wave solder processes. Many configurations are possible and should be tried on an experimental basis before commitment to a large production run. Both time and development costs can be conserved by utilizing design and process consultants specializing in surface mount technology.

Figures 1 and 2 show some typical footprints used in reflow soldering. Note that the width of the footprint for the SO package varies from 0.025″ to 0.035″. Most users tend towards the narrow footprint. Further, the length of these prints should be kept as short as possible to prevent the part from swimming or sliding back and forth on the footprint while still allowing a good meniscus.

Another factor worth noting is that the footprint for PLCC should not extend too far under the package as this could promote solder bridges under the package where they can not be seen during inspection. The footprint for the PLCC should extend out further from the package than the lead itself to allow a good meniscus that will result in a strong, inspectable bond.

Careful placement of related components will allow a more effective use of a much smaller surface area. The interconnections that can be made on the substrate surface result in the elimination of feedthrough holes. Reduction of these holes and their associated pad areas further increase the density of the layout, and reduce total board cost as well. As indicated, the SO package has the same pinout on two parallel rows as found on the older DIP packages being replaced. Arranging related ICs in blocks or functional clusters with their associated discreet components can also help to maximize the use of the available surface area.

For several reasons, many users have expressed their preference for SO format through 28 pins. The SO is much smaller and lighter than the PLCC. The SOL, although a bit longer than the PLCC, still occupies about the same board space as you can see below.

Further, when using several packages and connecting them together, a given number of SO and SOL packages would take much less space than the same number of PLCCs, simply because of the interconnect geography. (See Figure 3).

Besides being smaller, the SO format is dual-in-line and has the same pinouts as those of a standard DIP (PLCC pinouts vary between devices as well as between manufacturers). The SO format is easier to handle and is much easier to visually inspect.

For devices over 28 pins, the PLCC is the package of choice, largely because it can hold a much larger die than the 0.300″ wide SO packages.

In the early days of PCB technology when plated through holes were not possible, designers were forced to carefully plan component arrangements and connections. Using experience and ingenuity, they were able to eliminate crossovers while reducing the need for unwanted jumpers. With the advent of plated through holes and mutilayer boards, the restriction to single sided boards was eliminated. Using the single sided concept the techniques used to interconnect the SMDs are as important as the footprint patterns. As noted before, the contact pads on 0.050″ centers, range between 0.025″ and 0.035″ in width. Prior to choosing to add a feedthrough hole on the pad itself, two factors should be considered: 1) The hole diameter selected must allow for a reasonable location tolerance. A 0.010″ to 0.015″ diameter plated through hole in 0.062″ thick FR4 material may increase the cost of your PCB. 2) Unless the feedthrough hole on the footprint area is either plugged or masked, in a reflow soldering situation, the solder will tend to migrate away from the IC contact resulting in a poor solder joint.

It is more desirable to add a separate pad for via or feedthrough requirements. To further provide for routing conductor traces while insuring an acceptable air gap, you may choose to use a 0.035″ to 0.037″ square pad for these feedthrough holes. The square configuration will furnish more than enough metal in the diagonal corners to compensate for the reduced annular cross section at the sides of the square. The 0.035″ – 0.037″ square feedthrough pad can be spaced at 0.050″ when necessary or on the more traditional 0.100″ pad. With this spacing it is possible to route two 0.012″ wide conductor traces between pads, something only possible before with costly mutilayer designs using leaded through hole technology.

The feedthrough pad is then connected to the component contact area with a narrow trace. This narrow trace reduces migration of the solder paste during the reflow process. To further reduce migration of the liquid solder, application of solder mask coating over surface areas not requiring solder is recommended. This coating is applied with a wet screen process or photographically as a dry film and will act as a dam to contain solder to the contract area. (See Figures 4 and 5).

When using reflow soldering, the trace width should be about half the width of the footprint pattern. As noted before the signal carrying conductors are generally 0.012″ to 0.015″ wide. Supply voltages are carried on wider traces. When running traces between the device leads, it will be necessary to reduce the width to about 0.008″ which provides an 0.008″ gap between the trace and the edge of the pads when using 0.025″ pads.

Because the SMDs are so much smaller than their leaded counterparts, the scale of the layout should be considered. On larger boards with a mix of SMDs and leaded devices, a 2:1 scale may be adequate. More complex layouts can be designed at 4:1 scale with excellent results. The larger scale will make it possible to increase density while assuring accuracy. If designing with a CAD system, accuracy and density can both be increased by increasing the grid resolution. Routing conductors traces will require careful planning, it is customary to use a 90° or 45° angle (Figure 6) when traces must divert from a continuous line.

Offset stepping several 0.012″ wide conductor traces on 0.025″ spacing will require necking down at the point of direction change to maintain the desired air gap. The start and stop points of photoplotter aperture runs must be carefully executed to reduce the chance of overlay and shorting. If outside services are used for digitizing or photoplotting, discuss your requirements for accuracy before proceeding. Some compromises may have to be made to ensure quality and control costs. Preparing artmasters on mylar using precision tape products and pre-printed footprint patterns may afford more flexibility during your entry into SMD technology. Changes can be made easily, and economical photo reduction processes will provide high quality working film. The technique used to prepare working film is a choice generally influenced by in-house capability or services available in a region.

Dramatic changes are taking place throughout this industry. Surface mount technology is key to an efficient transition into miniaturization and automation of electronic production.

INTRODUCTION

The following information applies to all packages unless otherwise specified on individual package outline drawings.

1. Dimensions are shown in Metric units (Millimeters) and English units (Inches).
2. Lead material: Copper Alloy, solder (63%Sn/37%Pb) dipped.
3. Body material: Plastic (Epoxy)
4. Thermal resistance values are determined by temperature sensitive parameter (TSP) method. This method uses the forward voltage drop of a calibrated diode to measure the change in junction temperature due to a known power application. The substrate diode of a Bipolar technology device is generally the diode used in these tests. Die size and test environment have significant effects on thermal resistance values.
