GENERAL

Pro electron type designation code for semiconductor devices

Basic type number

This type designation code applies to discrete semiconductor devices - as opposed to integrated circuits -, multiples of such devices, semiconductor chips and darlington transistors.

A basic type number consists of two letters followed by a serial number.

FIRST LETTER

The first letter gives information about the material for the active part of the device.

- **A** germanium or other material with band gap of 0.6 to 1.0 eV
- **B** silicon or other material with band gap 1.0 to 1.3 eV
- **C** gallium-arsenide or other material with band gap 1.3 eV or more
- **R** compound materials (e.g. cadmium-sulphide)

SECOND LETTER

The second letter indicates the function for which the device is primarily designed (see note 1). The same letter could be used for multi-chip devices with similar elements.

A	diode	:	signal, low power (see note 2)
B	diode	:	variable capacitance
C	transistor	:	low power, audio frequency
D	transistor	:	power, audio frequency
E	diode	:	tunnel
F	transistor	:	low power, high frequency
G	multiple of dissimilar devices; miscellaneous devices	:	(see note 3)
H	diode	:	magnetic sensitive
L	transistor	:	power, high frequency
N	photo coupler	:	
P	radiation detector	:	high sensitive phototransistor, solar-cell (see note 3)
Q	radiation generator	:	light-emitting diode LED; laser (see note 3)
R	control or switching device	:	low power (see note 3); e.g. thyristors, diacs, triacs, unijunction transistors UJT, programmable unijunction transistors PUT, silicon bidirectional switch SBS, opto-triacs, etc.
S	transistor	:	low power switching
T	control or switching device	:	power (see note 3); e.g. thyristors, triacs
U	transistor	:	power switching
W	surface acoustic wave device	:	
X	diode	:	multiplier; e.g. varactor, step recovery
Y	diode	:	rectifying, booster
Z	diode	:	voltage reference or regulator, transient voltage suppressor diode (see note 3)

SERIAL NUMBER

Three figures, running from 100 to 999, for devices primarily intended for consumer equipment (see note 4). One letter (Z, Y, X etc.) and two figures, running from 10 to 99, for devices primarily intended for industrial/ professional equipment (see note 4). This letter has no fixed meaning, with the following exceptions:

- **A** : for triacs after second letter 'R' or 'T'
- **F** : for emitters and receivers in fibre-optic communication after second letter 'G', 'P' or 'Q' (see note 5)
- **L** : for lasers in non-fibre-optic applications, after second letter 'G' or 'Q' (see note 5)
- **O** : for opto-triacs after second letter 'R'
- **T** : for 3-state bicolour LEDs after second letter 'Q'
- **W** : for transient voltage suppressor diodes after second letter 'Z'

EXAMPLES OF BASIC TYPE NUMBERS

AA112 : germanium, low-power signal diode (consumer type)
ACY32 : germanium,, low-power AF transistor (industrial type)
BD232 : silicon, power AF transistor (consumer type)
CQY17 : GaAs, light-emitting diode (industrial type)
RPY84 : CdS, photo-conductive cell (industrial type)

Version letter(s)

One or two letters may be added to the basic type number to indicate a minor variant of the basic type either electrically or mechanically. The letters never have a fixed meaning, except:

letter 'R' indicating reverse polarity
letter 'W' for surface mounted devices (SMD).

Suffix

Sub-classification can be used for devices supplied in a wide range of variants called associated types.

The following sub-coding suffixes are in use:

VOLTAGE REFERENCE AND VOLTAGE REGULATOR DIODES

One letter and one number, preceded by a hyphen (-). The letter, if required, indicates the nominal tolerance of the zener voltage

A : 1% (according to IEC 63: series E96)
B : 2% (according to IEC 63: series E48)
C : 5% (according to IEC 63: series E24)
D : 10% (according to IEC 63: series E12)
E : 20% (according to IEC 63: series E6)

In the event of a 3% nominal tolerance the letter 'F' will be used.

The number denotes the typical operating (zener) voltage related to the nominal current rating for the whole range. The letter 'V' is used instead of the decimal point.

Example : BZY74-C6V3 or -C10.

TRANSIENT VOLTAGE SUPPRESSOR DIODES

One number, precede by a hyphen (-). The number indicates the maximum recommended continuous reversed (stand-off) voltage V_R. The letter 'V' is used instead of a decimal point.

Example : BZW70-9V1 or -39.

The letter 'B' may be used immediately after the last number to indicate bidirectional suppressor diodes.

Example : BZW10-15B.

CONVENTIONAL AND CONTROLLED AVALANCHE RECTIFIER DIODES AND THYRISTORS

One number, preceded by a hyphen (-). The number indicates the rated maximum repetitive peak reverse voltage (V_{RRM}) or the rated repetitive peak off-state voltage (V_{DRM}), whichever is the lower./ Reversed polarity with respect to the case is indicated by letter 'R', immediately after the number.

Example : BYT-100 or -100R.

RADIATION DETECTORS

One number, preceded by a hyphen (-). The number indicates the depletion layer in µm. The resolution is indicated by a version letter.

Example : BPX10-2A.

ARRAY OF RADIATION DETECTORS AND GENERATORS

One number preceded by a hyphen. The number indicates how many basic devices are assembled into the array.

Example : BPW50-6, BPW50-9, BPW50-12.

RADIATION GENERATORS

One number, preceded by a hyphen (-). The number indicates the luminance intensity range in milli-candela (mcd).

Example : CQY54-1.

Pro electron type designation code for semiconductor devices

HIGH FREQUENCY POWER TRANSISTORS

One number, preceded by a hyphen (-). The number indicates the supply voltage.

Example : BLU80-24.

	S - orange	BAS - orange	6 - blue	F - blue
			7 - violet	G - violet
			8 - grey	H - grey
			9 - white	I - white

The cathode side is indicated by the broad band(s).

Notes

1. Low-power type = $R_{th\ j\text{-}c}$ > 15 K/W.
   Power type = $R_{th\ j\text{-}c}$ < 15 K/W.
2. See Pro Electron colour for small signal diodes.
3. With special third letter (see 'serial number' section).
4. When the supply of these serial numbers is exhausted, the serial number may be expanded to three figures (industrial types) and four figures (consumer types).
5. In the case of second letter 'G', the first letter should be defined in accordance with the material of the main optical device.

RATING SYSTEMS

The rating systems described are those recommended by the International Electrotechnical Commission (IEC) in its Publication 134.

DEFINITIONS OF TERMS USED

Electronic device. An electronic tube or valve, transistor or other semiconductor device.

Note
This definition excludes inductors, capacitors, resistors and similar components.

Characteristic. A characteristic is an inherent and measurable property of a device. Such a property may be electrical, mechanical, thermal, hydraulic, electro-magnetic, or nuclear, and can be expressed as a value for stated or recognized conditions. A characteristic may also be a set of related values, usually shown in graphical form.

Bogey electronic device. An electronic device whose characteristics have the published nominal values for the type. A bogey electronic device for any particular application can be obtained by considering only those characteristics which are directly related to the application.

Rating. A value which establishes either a limiting capability or a limiting condition for an electronic device. It is determined for specified values of environment and operation, and may be stated in any suitable terms.

Note
Limiting conditions may be either maxima or minima.

Rating system. The set of principles upon which ratings are established and which determine their interpretation.

Note
The rating system indicates the division of responsibility between the device manufacturer and the circuit designer, with the object of ensuring that the working conditions do not exceed the ratings.

ABSOLUTE MAXIMUM RATING SYSTEM

Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, which should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.

The equipment manufacturer should design so that, initially and throughout life, no absolute maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply voltage variation, equipment component variation, equipment control adjustment, load variations, signal variation, environmental conditions, and variations in characteristics of the device under consideration and of all other electronic devices in the equipment.

DESIGN MAXIMUM RATING SYSTEM

Design maximum ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking responsibility for the effects of changes in operating conditions due to variations in the characteristics of the electronic device under consideration.

The equipment manufacturer should design so that, initially and throughout life, no design maximum value for the intended service is exceeded with a bogey device under the worst probable operating conditions with respect to supply voltage variation, equipment component variation, variation in characteristics of all other devices in the equipment, equipment control adjustment, load variation, signal variation and environmental conditions.

DESIGN CENTRE RATING SYSTEM

Design centre ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device of a specified type as defined by its published data, and should not be exceeded under normal conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device in average applications, taking responsibility for normal changes in operating conditions due to rated supply voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations in the characteristics of all electronic devices.

The equipment manufacturer should design so that, initially, no design centre value for the intended service is exceeded with a bogey electronic device in equipment operating at the stated normal supply voltage.

LETTER SYMBOLS FOR RECTIFIER DIODES, THYRISTORS, TRIACS AND BREAKOVER DIODES

LETTER SYMBOLS FOR CURRENTS, VOLTAGES AND POWERS

Basic letters: – The basic letters to be used are:

I, i = current V, v = voltage P, p = power

Lower-case basic letters shall be used for the representation of instantaneous values which vary with time. In all other instances upper-case letters shall be used.

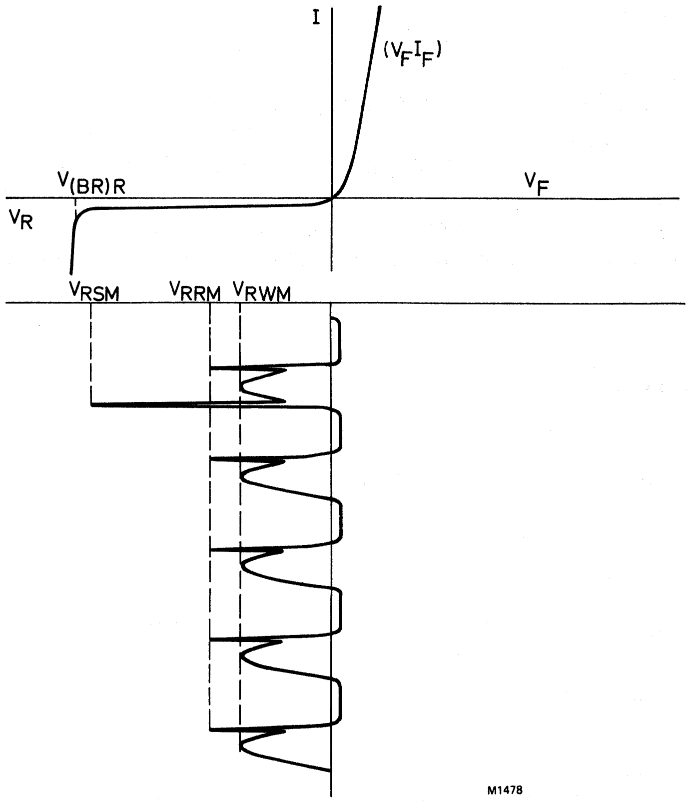
Subscripts

amb	Ambient
(AV), (av)	Average value
(BO)	Breakover
(BR)	Breakdown
case	Case
C	Controllable
D,d	Forward off-state [1]), non-triggered (gate voltage or current)
F,f	Forward [1]), fall
G,g	Gate terminal
H	Holding
I,i	Input
J,j	Junction
L	Latching
M,m	Peak or crest value
min	Minimum
O,o	Output, open circuit
(OV)	Overload
P,p	Pulse
Q,q	Turn-off
R,r	As first subscript: reverse, rise As second subscript: repetitive, recovery
(RMS), (rms)	R.M.S. value
S,s	As first subscript: storage, stray, series, source, switching As second subscript: non-repetitive
stg	Storage
T,t	Forward on-state [1]), triggered (gate voltage or current)
th	Thermal
(TO)	Threshold
tot	Total
W	Working
Z	Reference or regulator (i.e. zener)

For power rectifier diodes, thyristors and triacs, the terminals are **not** indicated in the subscript, except for the gate-terminal of thyristors and triacs.

1) For the anode-cathode voltage of thyristors and triacs, F is replaced either by D or T, to distinguish between 'off-state' (non-triggered) and 'on-state' (triggered).

Example of the use of letter symbols



Simplified rectifier characteristic together with an anode-cathode voltage as a function of time.

Upper-case subscripts shall be used for the indication of:

a) continuous (d.c.) values (without signal)

Example I_B

b) instantaneous total values

Example i_B

c) average total values

Example $I_{B(AV)}$

d) peak total values

Example I_{BM}

e) root-mean-square total values

Example $I_{B(RMS)}$

Lower-case subscripts shall be used for the indication of values applying to the varying component alone:

a) instantaneous values

Example i_b

b) root-mean-square values

Example $I_{b(rms)}$

c) peak values

Example I_{bm}

d) average values

Example $I_{b(av)}$

Note:

If more than one subscript is used, subscript for which both styles exist shall either be all upper-case or all lower-case.

Additional rules for subscripts

Subscripts for currents

Transistors: If it is necessary to indicate the terminal carrying the current, this should be done by the first subscript (conventional current flow from the external circuit into the terminal is positive).

Examples: I_B, i_B, i_b, I_{bm}

Diodes: To indicate a forward current (conventional current flow into the anode terminal) the subscript F or f should be used; for a reverse current (conventional current flow out of the anode terminal) the subscript R or r should be used.

Examples: I_F, I_R, i_F, $I_{f(rms)}$

Subscripts for voltages

Transistors: If it is necessary to indicate the points between which a voltage is measured, this should be done by the first two subscripts. The first subscript indicates the terminal at which the voltage is measured and the second the reference terminal or the circuit node. Where there is no possibility of confusion, the second subscript may be omitted.

Examples: V_{BE}, v_{BE}, v_{be}, V_{bem}

Diodes: To indicate a forward voltage (anode positive with respect to cathode), the subscript F or f should be used; for a reverse voltage (anode negative with respect to cathode) the subscript R or r should be used.

Examples: V_F, V_R, v_F, V_{rm}

Subscripts for four-pole matrix parameters

The first letter subscript (or double numeric subscript) indicates input, output, forward transfer or reverse transfer

Examples: h_i (or h_{11})
h_o (or h_{22})
h_f (or h_{21})
h_r (or h_{12})

A further subscript is used for the identification of the circuit configuration. When no confusion is possible, this further subscript may be omitted.

Examples: h_{fe} (or h_{21e}), h_{FE} (or h_{21E})

Distinction between real and imaginary parts

If it is necessary to distinguish between real and imaginary parts of electrical parameters, no additional subscripts should be used. If basic symbols for the real and imaginary parts exist, these may be used.

Examples: $Z_i = R_i + jX_i$
$y_{fe} = g_{fe} + jb_{fe}$

If such symbols do not exist or if they are not suitable, the following notation shall be used:

Examples: Re (h_{ib}) etc. for the real part of h_{ib}
Im (h_{ib}) etc. for the imaginary part of h_{ib}

QUALITY CONFORMANCE AND RELIABILITY

In addition to 100% testing of all major device parameters in the production department, independently controlled statistical sampling for conformance and reliability takes place using BS6001 'Sampling Procedures and Tables'. BS6001 is consistent with MIL–STD–105D. DEF131A, IS02859, CA–C–115.

The market demand for a continuously improving product quality is being met by the annual updating of formal quality improvement plans.

The 'Defect free' and 'Right first time' concepts are applied regularly as part of an overall quality programme covering all aspects of device quality from initital design to final production. These concepts, together with the quality assurance requirements, embrace all the principles outlined in DEF STAN 05–21, AQAP–1, and BS5750 Pt1.

CONFORMANCE

The Company actively promote a policy of customer cooperation to determine their quality problems and future requirements. This cooperation is often in the form of a 'ppm' activity. The 'ppm' is a measure of conformance of the outgoing product, and is expressed as the number of reject devices found per million of products delivered (e.g. a process average of 0,01% = 100 ppm). Mutually agreed ppm targets are set, and a programme of quality improvement work initiated.

In addition to the above, special inspection and/or test procedures are available, following consultation with the customer and the agreement of a special specification.

RELIABILITY

'Screening', or 'Burn-in' procedures are also available, based on the requirements of CECC 50 000.

CECC 50 000 offers a choice of four screening sequences: 'A', 'B', 'C', 'D'. The Company's standard 'Hi-rel' procedure offers a combination of 'C' and 'D' sequences.

Sequence 'C'

1. High temperature storage – 24 hours minimum.
2. Rapid change of temperature – as detailed in agreed specification.
3. Sealing – fine leak test.
   – gross leak test.
4. Functional electrical characteristics – within group 'A' limits.

Sequence 'D'

1. 'Burn-in' – high-voltage reverse bias, 48 hours duration. Conditions as specified in CECC 50 000.
2. Post 'Burn-in' measurements – functional electrical characteristics, within group 'A' limits.

Other 'Hi-rel', 'Burn-in', or Screening' procedures may be available on request.

RECTIFIER DIODES

REVERSE RECOVERY

When a semiconductor rectifier diode has been conducting in the forward direction sufficiently long to establish the steady state, there will be a charge due to minority carriers present. Before the device can block in the reverse direction this charge must be extracted. This extraction takes the form of a transient reverse current and this, together with the reverse bias voltage results in additional power dissipation which reduces the rectification efficiency. At sine-wave frequencies up to about 400 Hz these effects can often be ignored, but at higher frequencies and for square waves the switching losses must be considered.

Stored charge

The area under the I_R- time curve is known as the stored charge (Q_s) and is normally quoted in micro- or nanocoulombs. Low stored charge devices are preferred for fast switching applications.

Reverse recovery time

Another parameter which can be used to determine the speed of the rectifier is the reverse recovery time (t_{rr}). This is measured from the instant the current passes through zero (from forward to reverse) to the instant the current recovers to 10% of its peak reverse value. Low reverse recovery times are associated with low stored charge devices.

The conditions which need to be specified are:

a. Steady-state forward current (I_F); high currents increase recovery time.
b. Reverse bias voltage (V_R); low reverse voltage increases recovery time.
c. Rate of fall of anode current (dI_F/dt); high rates of fall reduce recovery time, but increase stored charge.
d. Junction temperature (T_j); high temperatures increase both recovery time and stored charge.

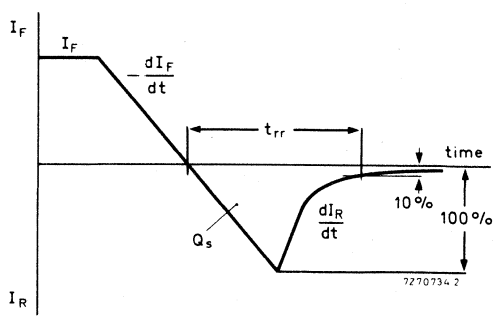


Fig. 1 Waveform showing the reverse recovery aspects.

REVERSE RECOVERY

Softness of recovery

In many switching circuits it is not just the magnitude but the shape of the reverse recovery characteristic that is important. If the positive-going edge of the characteristic has a fast rise time (as in a so-called 'snap-off' device) this edge may cause conducted or radiated r.f.i., or it may generate high voltages across inductors which may be in series with the rectifier. The maximum slope of the reverse recovery current (dI_R/dt) is quoted as a measure of the 'softness' of the characteristic. Low values are less liable to give r.f.i. problems. The measurement conditions which need to be specified are as above. When stored charges are very low, e.g. for epitaxial and Schottky-barrier rectifier diodes,this softness characteristic can be ignored.

DOUBLE-DIFFUSED RECTIFIER DIODES

A single-diffused diode with a two layer p-n structure cannot combine a high forward current density with a high reverse blocking voltage.

A way out of this dilemma is provided by the three layer double-diffused structure. A lightly doped silicon layer, called the base, is sandwiched between highly doped diffused p^+ and n^+ outer layers giving a $p^+ -pn^+$ or $p^+ -nn^+$ layer. Generally, the base gives the diode its high reverse voltage, and the two diffused regions give the high forward current rating.

Although double-diffused diodes are highly efficient, a slight compromise is still necessary. Generally, for a given silicon chip area, the thicker the base layer the higher the V_R and the lower the I_F. Reverse switching characteristics also determine the base design. Fast recovery diodes usually have n-type base regions to give 'soft' recovery. Other diodes have the base type, n or p, chosen to meet their specific requirements.

ULTRA FAST RECTIFIER DIODES

Ultra fast rectifier diodes, made by epitaxial technology, are intended for use in applications where low conduction and switching losses are of paramount importance and relatively low reverse voltage (V_{RRM} = 400 V) is required: e.g., switched-mode power supplies operating at frequencies of about 50 kHz.

The use of epitaxial technology means that there is very close control over the almost ideal diffusion profile and base width giving very high carrier injection efficiencies leading to lower conduction losses than conventional technology permits. The well defined diffusion profile also allows a tight control of stored minority carriers in the base region, so that very fast turn-off times can be achieved. The range of devices also has a soft reverse recovery and a low forward recovery voltage.

SWITCHING LOSSES (see also Fig.3)

The product of transient reverse current and reverse bias voltage is a power dissipation, most of which occurs during the fall time. In repetitive operation an average power can be calculated. This is then added to the forward dissipation to give the total power. The peak value of transient reverse current is known as I_{RRM}.

The conditions which need to be specified are:

a. Forward current (I_F); high currents increase switching losses.
b. Rate of fall of anode current (dI_F/dt); high rates of fall increase switching losses. This is particularly important in square-wave operation. Power losses in sine-wave operation for a given frequency are considerably less due to the much lower dI_F/dt.
c. Frequency (f); high frequency means high losses.
d. Reverse bias voltage (V_R); high reverse bias means high losses.
e. Junction temperature (T_j); high temperature means high losses.

JEDEC assigned type numbers

(EIA-standard RS-236-B; June, 1963)

1. Prefix identification

The prefix identification consisting of a first number symbol and the letter "N" shall not be indicated in the coding.

2. Banding systems

The sequence number consisting of a two, three, or four digit number after the letter "N" may be coded as follows:

2.1 Two-digit sequence numbers shall consist of a first black band and the sequence number in second and third bands of the colours indicated in Table 1. If a suffix letter is required, it shall be indicated with a fourth band as indicated in Table 1.

2.2 Three-digit sequence numbers shall consist of the sequence number in first, second, and third bands of the colours indicated in Table 1. If a suffix letter is required, it shall be indicated with a fourth band as indicated in Table 1.

2.3 Four-digit sequence numbers shall consist of the sequence number in four bands of the colours indicated in Table 1.

If a suffix letter is required it shall be indicated as the fifth band.

3. Cathode identification and reading sequence

3.1 A double-width band shall be used as the first band reading from cathode to anode ends.

3.2 An alternative method is provided where equal width bands may be used. The bands shall be clearly grouped toward the cathode end, and shall be read from cathode to anode ends.

3.3 Either of the above colour banding methods may be used in stead of the cathode designating symbol or other marking.

4. Colour bands

The sequence numbers of the type numbers and suffix letters shall be indicated by the colours in Table 1.

TAPE AND REEL SPECIFICATION

Semiconductors in SOT-23, SOT-143 and SOT-89 encapsulations can be delivered in reel packing for aotomatic placement on hybrid circuits and printed circuit boards. The devices are placed with the mounting side downwards in compartments.

A separate cross-section for SOD-80 encapsulation is given in Fig. 3.

A separate reel packing for SOT-89 encapsulation is given in Fig. 4.

Amount of devices per reel

The bandolier of a 180 mm reel contains at least 3000 devices with no more than 15 empty compartments (0,5%). Three consecutive empty places might be found provided this gap is followed by 6 consecutive devices.

The carrier tape (leader) starts with at least 75 empty positions (equivalent to 300 mm); the covering foil is at least 300 mm. In order to fix the carrier tape a self-adhesive tape of 20 to 50 mm is applied.

At the end of the bandolier (trailer) at least 75 empty positions (equivalent to a length of 300 mm) and 300 mm foil. For fixing onto the reel a self-adhesive tape of 20 to 50 mm is applied.

BANDOLIER AND REEL SPECIFICATION FOR AXIAL-LEADED DIODES

This specification concerns all axial-leaded diodes in this handbook.

The taped and reeled products fulfil the requirements of IEC 286-1: Tape packaging of components with axial leads on continuous tapes.

Dimensions in mm

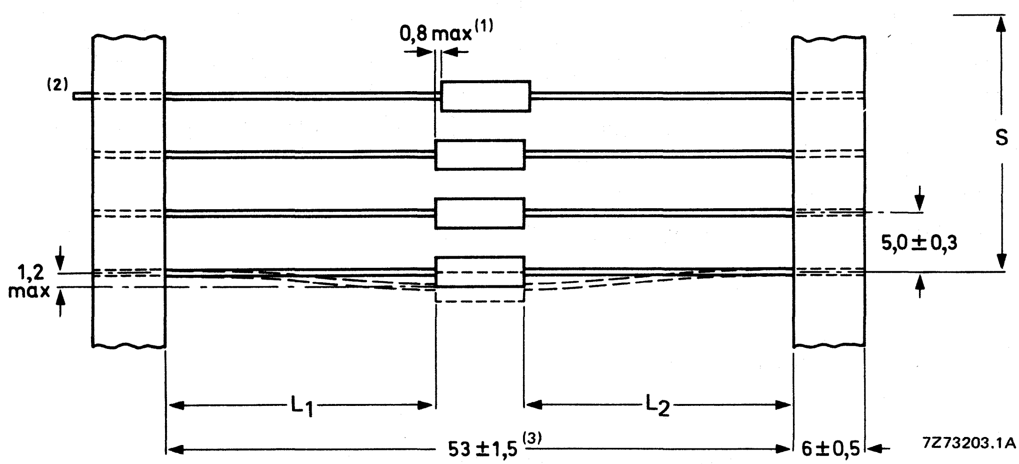

Fig. 1 Configuration of bandolier.

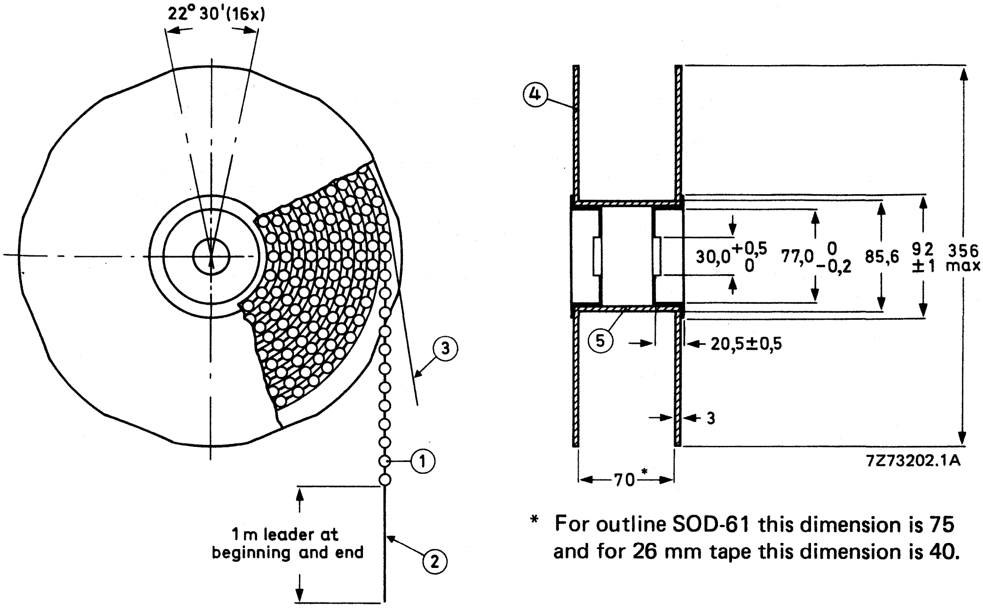
The red tape indicates the diode cathode side.
1. Displacement between any two diodes; for DO-34 maximum 0,4.
2. No protruding ends of lead except for BZX75 series maximum 1,2.
3. For outline SOD-61 this dimension is 58 ± 2 and for 26 mm tape this dimension is $26^{+1,5}_{-0}$.

The cumulative space (S) measured over ten spacings = 50 ± 2; for 26 mm: 20 spacings (= 100 ± 2).

The diodes are centred so that $| L_1 - L_2 | \leqslant 1,2$ mm.

A black marker is printed on the white tape of the bandolier every 50 diodes.

The axial taping specification described above is compatible with automatic insertion equipment as manufactured by Universal, U.S.M. (Dynapert) and M.E.I. (Panasert).



* For outline SOD-61 this dimension is 75 and for 26 mm tape this dimension is 40.

RULES FOR MOUNTING AND SOLDERING OF AXIAL-LEADED DEVICES*

Introduction

Excessive forces or temperatures applied to a diode may cause serious damage to the diode. To avoid damage when soldering and mounting the following rules should be followed.

General

Perpendicular forces on the body of the diode must be avoided.

Avoid sudden forces on the leads or body. These forces often are much higher than allowed.

High acceleration forces as a result of any shock (dropping on a hard surface for instance) must be prevented.

Bending

During bending the leads must be supported between body or stud and bending point.

Axial forces on the body during the bending process must not exceed 20 N.

Bending the leads through 90^{o} is allowed at any distance from the body when it is possible to support the leads during bending without contacting the envelope or weldings.

Bending close to the body or stud without supporting the leads only is allowed if the bend radius is greater than 0,5 mm.

Twisting

Twisting the leads is allowed at any distance from the body or stud if the lead is properly clamped between body or stud and twisting point.

Without clamping, twisting the leads is only allowed at a distance of greater than 3 mm from the body; the torque angle must not exceed 30^{o}.

Straightening

Straightening the leads is allowed if the applied pulling force in the axial direction does not exceed 20 N and the total duration is not longer than 5 seconds.

Soldering

Avoid any force on the body or leads during or just after soldering.

Do not correct the position of an already soldered device by pushing, pulling or twisting the body.

Prevent fast cooling after soldering.

MOUNTING

If the rules for mounting and soldering are observed properly, the following mounting or process methods are allowed:

- Preheating of the printed-circuit board before soldering, up to a maximum of 100 °C.
- Flat mounting with the diode body in direct contact with the printed-circuit board with or without metal tracks on both sides and/or plated-through holes.
- Flat mounting with the diode body in direct contact with hot spots or hot tracks during soldering.
- Upright mounting with the diode body in direct contact with the printed-circuit board if the body is not in contact with metal tracks or plated-through holes.

General

Parts of the general mounting and soldering rules can be overruled by individual type mounting and soldering rules, mentioned with the type description.

SOD-64 ENVELOPES WITH PREFORMED LEADS

Some types of automatic insertion machines have problems bending the (relatively thick) leads of SOD-64 glass bead diodes. Therefore we have available the most popular SOD-64 types with preformed leads. They are supplied in bulk, in quantities of 1000 pieces.

The following types are available; (/20 indicates preformed leads):

SOLDERING RECOMMENDATIONS
SOT-23, SOT-143 AND SOT-89 ENVELOPES

SOT-23, SOT-143 and SOT-89 devices are ideally suited for placement onto thick and thin film substrates and printed circuit boards.

To assure reliable and consistent connections particular attention should be paid to:

1. **Flux**

   A non-active flux is recommended. Where active fluxes are employed, great care in subsequent substrate cleaning must be exercised.

2. **Metal-alloy solder or solder paste**

   Correct choice of solder alloy or solder paste to be employed e.g. 62% Sn, 36% Pb, 2% Ag or 60% Sn/40% Pb. Any paste used should contain at least 85% metal dry weight.

3. **Soldering temperature**

   This will vary according to the actual method employed.

REFLOW SOLDERING

The preferred technique for mounting microminiature components on hybrid thick and thin-film is the method of reflow soldering.

The tags of SOT-23, SOT-143 and SOT-89 envelopes are pre-tinned and the best results are obtained if a similar solder is applied to the corresponding soldering areas on the substrate. This can be done by either dipping the substrate in a solder bath or by screen printing a solder paste.
The maximum temperature of the leads or tab during the soldering cycle should not exceed 285 ^{o}C.
The most economic method of soldering is a process in which all different components are soldered simultaneously for example SOT-23, SOT-143 or SOT-89 devices, capacitors and resistors.

Having first been fluxed, all components are positioned on the substrate. The slight adhesive force of the flux is sufficient to keep the components in place. Solder paste contains a flux and has therefore good inherent adhesive properties which eases positioning of the components.

With the components in position the substrate is heated to a point where the solder begins to flow. This can be done on a heating plate or on a conveyor belt running through an infrared tunnel. The maximum allowed temperature of the plastic body of a device must be kept below 280 ^{o}C during the soldering cycle. For further temperature behaviour during the soldering process see Figs 2 and 3.

The surface tension of the liquid solder tends to draw the tags of the device towards the centre of the soldering area and has thus a correcting effect on slight mispositionings. However, if the layout leaves something to be desired the same effect can result in undesirable shifts; particularly if the soldering areas on the substrate and the components are not concentrally arranged. This problem can be solved using a standard contact pattern, which leaves sufficient scope for the self-positioning effect (see Figs 4 and 5).

After cooling the connections may be visually inspected and, where necessary, repaired with a light soldering iron. Finally any remaining flux must be removed carefully.

WAVE SOLDERING

The normal (dual) wave soldering process can also be aplied to SOT-23 and SOT-143 envelopes
We do not recommend SOT-89 for wave soldering.

IMMERSION SOLDERING

Where a complete substrate or printed circuit board is immersed in solder:
a. The temperature of the soldering bath should not exceed 280 °C.
b. The duration of the soldering cycle should not exceed 10 seconds.
c. Forced cooling may be applied (see Fig. 1).

HAND SOLDERING

It is possible to solder microminiature devices with a light hand-held soldering iron, but this method has obvious drawbacks and should therefore be restricted to laboratory use and/or incidental repairs on production circuits.

1. It is time-consuming and expensive.
2. The device cannot be positioned accurately and therefore the connecting tags may come into contact with the substrate and damage it.
3. There is a great risk of breaking either substrate or even internal connections inside the encapsulation.
4. The envelope may be damaged by the iron.

Maximum time of immersion in soldering bath is 10 seconds at an ambient temperature of 25 °C.

SOLDERING RECOMMENDATIONS
SOD-80 ENVELOPE

The layout shown below is intended for use with mounting of diodes having a SOD-80 envelope onto a printed circuit board in those cases where the diode is glued to the p.c. board first and soldered afterwards.

The dimensions given may be smaller if the diode in question is not fixed to the substrate prior to soldering. The position of the SOD-80 device is then self-adjusted during the soldering process.

THERMAL CHARACTERISTICS
FOR SOT-23 AND SOT-143 ENVELOPES

The heat generated in a semiconductor chip normally flows by various paths to the surroundings (ambient).

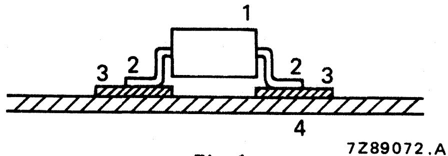

Fig. 1.

1. Heat radiation from the envelope to ambient (1).
   This heat transfer can be neglected when the envelope is mounted on a substrate or printed circuit board.
2. Heat transmission via leads (2) soldering points (3) and substrate (4).

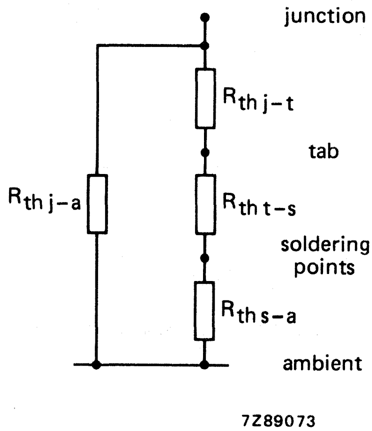

Fig. 2 Thermal behaviour of heat flow when the device is mounted on a substrate or printed circuit board.

$R_{th\ j\text{-}t}$ = Thermal resistance from junction to tab.

$R_{th\ t\text{-}s}$ = Thermal resistance from tab to soldering points.

$R_{th\ s\text{-}a}$ = Thermal resistance from soldering points to ambient.

$R_{th\ j\text{-}a}$ = Thermal resistance from junction to ambient.

Heat transfer directly from envelope to ambient

This depends on the difference between the temperatures of envelope and the surroundings. When the device is mounted on a substrate or printed circuit board direct heat flow can usually be neglected in relation to the heat flow via leads and substrate.
Thus the thermal model can be as in Fig. 3.

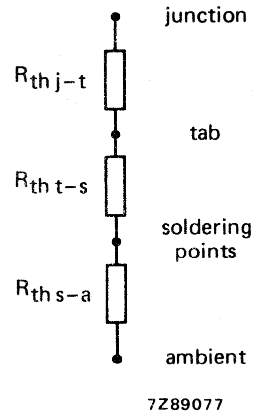

Fig. 3 Basic thermal model.

Heat transfer from junction to tab

This is an internal heat transfer and has been measured. In general it is:

for high-frequency transistors, low-power diodes and (MOS) FETs	60 K/W
for low-frequency and switching transistors	50 K/W
for low-frequency medium-power transistors	30 K/W

Heat transfer from tab to soldering points

This value has also been measured for SOT-23 with $P_{tot} < 350$ mW	280 K/W
for types of semiconductors in this envelope with $P_{tot} < 425$ mW	260 K/W
for types of semiconductors in a SOT-143 envelope this value is	310 K/W

Heat transfer from soldering points to ambient

This depends on the shape and material of tracks and substrate. In figures 4 and 5 standard mounting conditions are given to set up the maximum power ratings for SOT-23 and SOT-143 encapsulations.

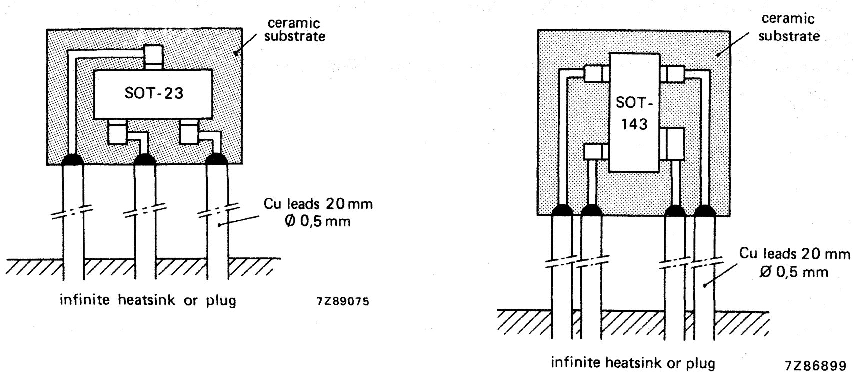

Fig. 4 Test circuits SOT-23 and SOT-143 mounting conditions on a ceramic substrate.

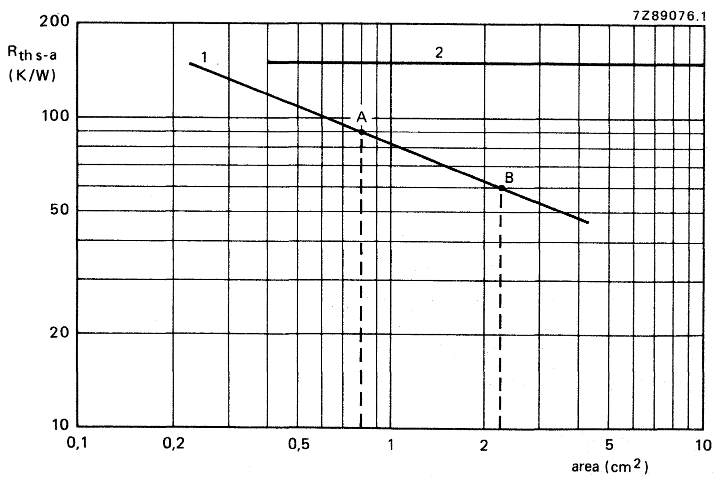

Fig. 5 Heat transfer from soldering points to ambient.

1. Ceramic substrate

Point A on the curve in Fig. 5 is for an area of the ceramic substrate of 8 mm x 10 mm x 0,7 mm for the maximum rating of all high-frequency, low-frequency and switching transistors and also for all diodes.
Point B on the curve in Fig. 5 is for an area of the ceramic substrate of 15 mm x 15 mm x 0,7 mm for the maximum rating of low-frequency medium-power semiconductors.

2. Printed circuit board

$R_{th\ s\text{-}a}$ = 150 K/W for SOT-23 and SOT-143 envelopes mounted on a printed circuit board.

The values for the thermal resistance from junction to tab, and tab to soldering points, are given earlier and in Fig. 5.
The formula for devices in SOT-23 with one crystal can be generalized:

$$T_j = P\,(R_{th\ j\text{-}t} + R_{th\ t\text{-}s} + R_{th\ s\text{-}a}) + T_{amb}$$

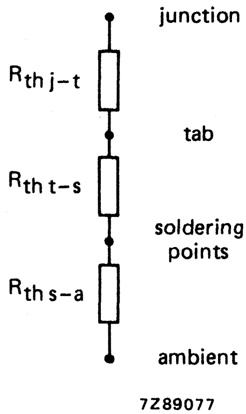

Fig. 6 Thermal model of SOT-23 envelopes with one crystal.

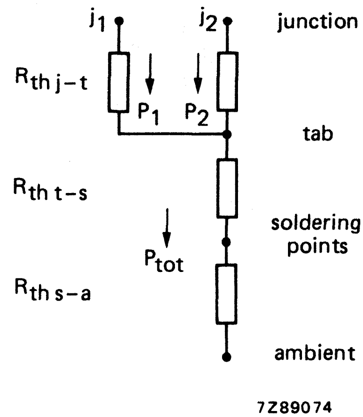

Fig. 7 Thermal model of SOT-23 envelopes with two crystals (double diode).

The formulae for devices with two crystals (double diodes) are:

$$T_{tab} = P_{tot} \cdot (R_{th\ t\text{-}s} + R_{th\ s\text{-}a}) + T_{amb} = P_{tot}\,(280 + 90) + T_{amb}$$

$$T_{j1} = (P_1 \times R_{th\ j\text{-}t}) + T_{tab} = P_1 \cdot 60 + T_{tab}$$

$$T_{j2} = (P_2 \times R_{th\ j\text{-}t}) + T_{tab} = P_2 \cdot 60 + T_{tab}$$

As mentioned with Fig. 3:

$R_{th\ j\text{-}t}$ for diodes is 60 K/W.

$R_{th\ s\text{-}a}$ (area 8 mm x 10 mm x 0,7 mm) = 90 K/W.

$R_{th\ t\text{-}s}$ for all semiconductors in SOT-23 = 280 K/W.

Thus:

$$T_{j1} = 60\,P_1 + 370\,P_{tot} + T_{amb}.$$

$$T_{j2} = 60\,P_2 + 370\,P_{tot} + T_{amb}.$$

THERMAL MODEL

Figure 1 illustrates the various components of thermal resistance for a diode mounted with symmetrical lead length.

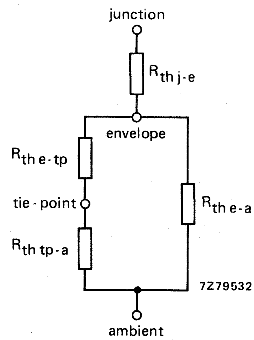

Fig. 1 Thermal resistance model.

The values for these various parameters depend on the outline of the diode, the leadlength and the method used to mount the device on the printed circuit board. Some useful values are shown in Table 1.

Using this model, values for the thermal resistance from junction to ambient can be calculated using the formula:

$$R_{th\,j\text{-}a} = R_{th\,j\text{-}e} + \frac{R_{th\,e\text{-}a}\,(R_{th\,e\text{-}tp} + R_{th\,tp\text{-}a})}{R_{th\,e\text{-}a} + R_{th\,e\text{-}tp} + R_{th\,tp\text{-}a}}$$

$R_{th\,j\text{-}tp}$	60 K/W	50 K/W	46 K/W	25 K/W	Lead length = 10 mm.

Note:

The junction temperature can then be calculated by using dissipation graphs and the above thermal model.

CUSTOM MADE EHT STACKS

Based on our experience gained with high voltage stacks in the professional market we are offering a wide range of custom-made EHT stacks for industrial, military and aerospace applications; e.g.

- X-ray equipment
- E-beam microscopes
- Automobile ignition systems
- Conventional (50 Hz) microwave ovens
- SMPS-microwave ovens
- Ion implanters
- Radar equipment
- Bar-code readers

All stacks are in a glass-bead envelope offering the following features;

- Hermetic sealing
- Glass passivation for excellent stability
- High-temperature metallurgical bonds
- Low leakage currents enabling junction temperatures up to 175 °C
- Well-matched coefficients of expansion of component materials
- Possibility of guaranteed controlled avalanche properties

Encapsulation of the glass-bead stack in plastic, to increase the isolation distance, is also possible.

Some examples of custom made stacks:

SILICON AM BAND SWITCHING DIODE FOR SURFACE MOUNTING

The BA423L is a switching diode intended for band switching in AM radio receivers.

This SM diode is a leadless diode in a hermetically sealed SOD-80 envelope with lead/tin plated metal discs at each end. It is suitable for "automatic placement" and as such it can withstand immersion soldering.

The diodes are delivered in "super 8" tape.

BAND-SWITCHING DIODES FOR SURFACE MOUNTING

Switching diodes in a SOD-80 envelope, intended for band switching in v.h.f. television tuners. A special feature of these diodes is their low capacitance.

These SM diodes are leadless diodes in an hermetically sealed micro-miniature glass envelope with tin-plated metal discs at each end. They are suitable for Automatic Placement and as such they can withstand immersion soldering.

The diodes are delivered in "super 8" tape.

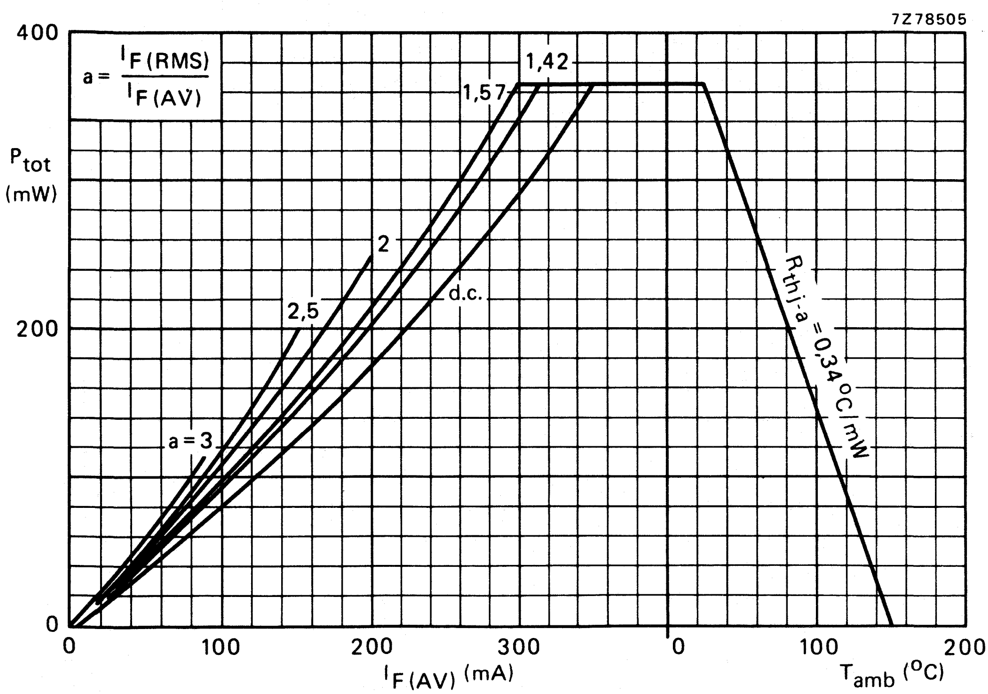

Fig. 3.

From the left-hand graph the total power dissipation can be found as a function of the average output current.

The parameter $a = \frac{I_{F(RMS)}}{I_{F(AV)}}$ depends on $n\omega R_L C_L$ and $\frac{R_t + r_{diff}}{nR_L}$ and can be found from existing graphs.

Once the power dissipation is known, the maximum permissible ambient temperature follows from the right-hand graph.

BAS81/82/83
Schottky barrier diodes

DESCRIPTION

General purpose and switching Schottky barrier diodes, with an integrated protection ring against static discharges. They feature a low forward voltage drop, low leakage current and a low capacitance and as such can be used in very fast switching applications.

This surface mounted diode is a packaged in a hermetically sealed SOD80C glass envelope with tin-plated metal discs at each end. It is suitable for "automatic placement" and as such it can withstand immersion soldering.

The diodes are delivered in "super 8" tape.

GENERAL PURPOSE DIODES FOR SURFACE MOUNTING

Silicon planar epitaxial diodes; intended for switching and general purposes in industrial equipment e.g. oscilloscopes, digital voltmeters and video output stages in colour television.

The SM DIODE is a leadless diode in an hermetically sealed glass envelope with tin plated metal discs at each end. It is suitable for Automatic Placement and as such it can withstand immersion soldering.

The diodes are delivered in "super 8" tape.

From the left-hand graph the total power dissipation can be found as a function of the average output current

The parameter $a = \frac{I_{F(RMS)} \text{ per diode}}{I_{F(AV)} \text{ per diode}}$ depends on $n\omega R_L C_L$ and $\frac{R_t + r_{diff}}{nR_L}$ and can be found from existing graphs.

For detailed explanation see Application Book: RECTIFIER DIODES.

Once the power dissipation is known, the maximum permissible ambient temperature follows from the right-hand graph.
For the series resistance, added to limit the initial peak rectifier current, the required minimum value can be found from Fig. 5.

MATCHING PROPERTIES

The capacitance of the two diodes in their common envelope may differ within certain limits. The total, relative capacitance difference between the two diodes in one envelope may be found in Fig. 2. The anode a1 or a2 with the higher capacitance at V_R = 3 V, is identified by a white dot.

BASIC TOLERANCE

The relative deviation of the capacitance value at V_R = 0,5 V is maximum 3,5%.

$$k = \left| \frac{C_1\ (0{,}5\ V) - C_2\ (0{,}5\ V)}{C_2\ (0{,}5\ V)} \right| = < 3{,}5\%.$$

ADDITIONAL TOLERANCE

In the range of V_R = 0,5 to 8 V the following additional tolerances are valid.

$$S = \left| \left(\frac{C_1}{C_2}\right)_{V_R} - \left(\frac{C_1}{C_2}\right)_{0{,}5\ V} \right|$$

S < 2% for V_R = 0,5 to 3 V
S < 4% for V_R = 3 to 5,5 V
S < 6% for V_R = 5,5 to 8 V

} see Fig. 2

C_1 is the capacitance of a_1 when $a_1 > a_2$
C_1 is the capacitance of a_2 when $a_2 > a_1$

APPLICATION INFORMATION

In designing horizontal deflection circuits, allowance has to be made for component and operating spreads, in order not to exceed any Absolute Maximum Rating.
Extensive analysis have shown that for the working peak forward current and reverse voltage the total allowance need not to be higher than 25%. For that reason the dissipation graph (Fig. 6) is based on the **nominal** I_{FWM}; 25% safety margin for tolerance and spreads is taken into account.

MOUNTING AND SOLDERING NOTES

Introduction

Excessive forces or temperatures applied to a diode may cause serious damage to the diode. To avoid damage when soldering and mounting, the following rules have to be followed.

Bending

During bending, the leads must be supported between body and bending point. Axial forces on the body during the bending process must not exceed 50 N. Perpendicular force on the body must be avoided as much as possible, however, if present, it shall not exceed 10 N. Bending the leads through 90° is allowed at any distance from the studs when it is possible to support the leads during the bending without contacting envelope or solder joints.

Twisting

Twisting the leads is allowed at any distance from the body if the lead is properly clamped between stud and twisting point. Without clamping, twisting is allowed only at a distance > 5 mm from the studs, the torque-angle must not exceed 30°.

Soldering

The minimum distance of soldering point to stud is 2 mm, the maximum allowed solder temperature is 300 °C, and the soldering time must not be longer than 10 seconds.

Prevent fast cooling after soldering.

When the device has to be mounted with straight or short-cropped leads, the leads should be soldered individually; bent leads may be soldered simultaneously. Do not correct the position of an already soldered device by pushing, pulling or twisting the body.

APPLICATION INFORMATION

In designing horizontal deflection circuits, allowance has to be made for component and operating spreads, in order not to exceed any Absolute Maximum Rating.
Extensive analysis have shown that for the working peak forward current and reverse voltage the total allowance need not to be higher than 25%. For that reason the dissipation graph (Fig. 6) is based on the **nominal** I_{FWM}; 25% safety margin for tolerance and spreads is taken into account.

OPERATING NOTES

The various components of junction temperature rise above ambient, for mounting with symmetrical lead length, are illustrated below.

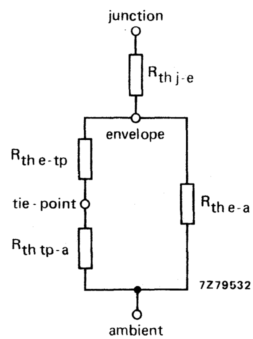

Fig. 11 Thermal model. $R_{th\ j\text{-}e} = 35$ K/W.

The thermal resistances between envelope and tie-point, and between envelope and ambient depend on lead length.

lead length	5	10	15	20	25	mm
$R_{th\ e\text{-}tp}$	38	76	114	152	190	K/W
$R_{th\ e\text{-}a}$	750	560	410	330	280	K/W

The thermal resistance between tie-point and ambient depends on the mounting method; for mounting on a 1,5 mm thick epoxy-glass printed-circuit board with a copper-thickness ⩾ 40 μm, the following values apply:

1. Mounted as given in Fig. 2 the thermal resistance $R_{th\ tp\text{-}a}$ is 70 K/W.
2. Mounted with copper laminate of 1 cm^2 per lead $R_{th\ tp\text{-}a}$ is 55 K/W.
3. Mounted with copper laminate of 2,25 cm^2 per lead $R_{th\ tp\text{-}a}$ is 45 K/W.

Note
Any temperature can be calculated by using the dissipation graph (Fig. 6) and the above thermal model.

SILICON VERY FAST EHT SOFT-RECOVERY RECTIFIER DIODES*

EHT rectifier diodes in glass envelopes intended for use in high-voltage applications e.g. the high-voltage supply of television receivers and monitors, at frequencies in excess of 30 kHz. The devices feature non-snap-off characteristics. Because of the small envelope, the diodes should be used in a suitable insulating medium (resin, oil or special arrangements in test cases).

AVALANCHE FAST SOFT-RECOVERY RECTIFIER DIODES

Rectifier diodes in hermetically sealed axial-leaded ID* envelopes. They are intended for television and industrial applications, such as switched-mode power supplies, scan rectifiers in TV receivers and also for use in inverter and converter applications. The devices feature non-snap-off (soft-recovery) switching characteristics and are capable of absorbing reverse transient energy (e.g. during flashover in a picture tube).

EPITAXIAL AVALANCHE DIODES

Rectifier diodes in hermetically sealed leadless SMID*-envelopes. They feature low forward voltage drop, very fast recovery, very low stored charge, non-snap-off switching characteristics and are capable of absorbing reverse transient energy (e.g. during flashover in a picture tube). These properties make the diodes very suitable for use in switched-mode power supplies and in general high-frequency circuits, where low conduction and switching losses are essential.

Notes

1. I_Z tolerance and stability of I_Z.

   The quoted values of ΔV_{ref} are based on a constant current I_Z. Two factors can cause V_{ref} to change, namely the differential resistance r_{diff} and the temperature coefficient S_Z.

   a. As the max. r_{diff} of the device can be 50 Ω, a change of 0,01 mA in the current through the reference diode will result in a ΔV_{ref} of 0,01 mA x 50 Ω = 0,5 mV. This level of ΔV_{ref} is not significant on a BZV10 ($\Delta V_{ref} < 46$ mV), it is however very significant on a BZV14 ($\Delta V_{ref} < 2{,}3$ mV).

   b. The temperature coefficient of the reference voltage S_Z is a function of I_Z. Reference diodes are classified at the specified test current and the S_Z of the reference diode will be different at the different levels of I_Z. The absolute value of I_Z is important, however, the stability of I_Z, once the level has been set, is far more significant. This applies particularly to the BZV13 and BZV14. The effect of I_Z stability on S_Z is shown in Fig. 3.

2. Voltage excursion (ΔV_{ref} and temperature coefficient).

   All reference diodes are characterized by the 'box method'. This guarantees a maximum voltage excursion (ΔV_{ref}) over the specified temperature range, at the specified test current (I_Z), verified by tests at indicated temperature points within the range. V_Z is measured and recorded at each temperature specified. The ΔV_{ref} between the highest and lowest values must not exceed the maximum ΔV_{ref} given. The temperature coefficient, therefore is given only as a reference; but may be derived from:

$$S_Z = \frac{(V_{ref\,1} - V_{ref\,2}) \times 100}{(T_{amb2} - T_{amb1}) \times V_{ref\,nom}} \ \%/K.$$

Model for calculating the static working voltage ($V_{Z\ stat}$).

This model can be derived from $V_{Z\ stat} = V_{Z\ dyn} + \Delta V_Z$ of which $V_{Z\ dyn}$ is given in the preceding tables and can be derived from the typical dynamic characteristic curves (Figs 2, 3, 4 and 5)
$\Delta V_Z = \Delta T \times S_Z$. For S_Z see tables and graphs S_Z versus T_j.
$\Delta T = P_{tot} \times R_{th\ j\text{-}a} = I_Z \times V_{Z\ dyn} \times R_{th\ j\text{-}a}$.
Following $\Delta V_Z = I_Z \times V_{Z\ dyn} \times R_{th\ j\text{-}a} \times S_Z$ and the model will be:

$$V_{Z\ stat} = V_{Z\ dyn} + I_Z \times V_{Z\ dyn} \times R_{th\ j\text{-}a} \times S_Z$$

Calculating example

BZV49-C24 mounted on a ceramic substrate of 7 x 5 x 0,6 mm; at I_Z = 7 mA.

$$V_{Z\ stat} = 24 + \left(\frac{7}{1000} \times 24 \times \frac{125}{1000} \times 20{,}3\right)$$
$$= 24 + 0{,}4 = 24{,}4\ \text{V}.$$

VOLTAGE REGULATOR DIODES FOR SURFACE MOUNTING

Silicon planar diodes designed for use as low-voltage stabilizers or voltage references. They are available in the international standardized E24 (± 5%) range, and also in tolerance ranges of 2% and 3%. The series consists of 37 types with nominal working voltages ranging from 2,4 V to 75 V.

The SM diode is a leadless diode in a hermetically sealed glass SOD-80 envelope with tin plated metal discs at each end. It is suitable for "automatic placement" and as such it can withstand immersion soldering.

The diodes are delivered in "super 8" tape.

VOLTAGE REGULATOR DIODES

Silicon planar diodes in DO-34 envelopes intended for use as low voltage stabilizers or voltage references. They are available in international standardized E24 (± 5%) range and ± 2% tolerance range. The series consists of 37 types with nominal working voltages ranging from 2,4 V to 75 V.

QUICK REFERENCE DATA

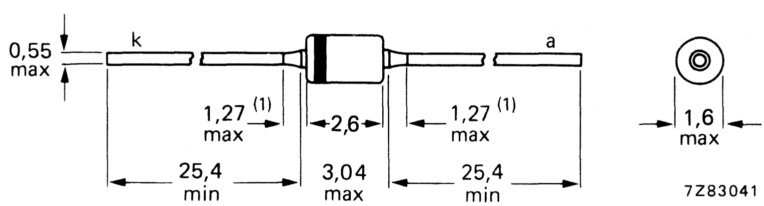
Working voltage range	V_Z	nom.	2,4 to 75	V
Total power dissipation	P_{tot}	max.	500	mW*
Non-repetitive peak reverse power dissipation	P_{ZSM}	max.	30	W
Junction temperature	T_j	max.	200	°C
Thermal resistance from junction to tie-point	$R_{th\ j\text{-}tp}$	=	0,30	K/mW

* If leads are kept at T_{tp} = 50 °C at 8 mm from body.

MECHANICAL DATA

Dimensions in mm

Fig. 1 SOD-68 (DO-34).



(1) Lead diameter in this zone uncontrolled.
The marking band indicates the cathode.
The diodes are type branded.

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Average forward current (averaged over any 20 ms period)	$I_{F(AV)}$	max.	250 mA
Repetitive peak forward current	I_{FRM}	max.	250 mA
Total power dissipation	P_{tot}	max.	500 mW*
		max.	400 mW**
Non-repetitive peak reverse power dissipation $t = 100\ \mu s$; $T_j = 150\ ^oC$	P_{ZSM}	max.	30 W
Storage temperature	T_{stg}	−65 to + 200	^oC
Junction temperature	T_j	max.	200 ^oC

THERMAL RESISTANCE

From junction to tie-point	$R_{th\ j\text{-}tp}$		0,30 K/mW*
From junction to ambient	$R_{th\ j\text{-}a}$	=	0,38 K/mW**

VOLTAGE REFERENCE DIODES FOR SURFACE MOUNTING

Voltage reference diodes in a SOD-80 envelope. They have a low temperature coefficient and are primarily intended for use as voltage reference sources.

The SM diode is a leadless diode in a hermetically sealed glass SOD-80 envelope with tinplated metal discs at each end. It is suitable for "automatic placement" and as such it can withstand immersion soldering.

The diodes are delivered in bulk or in "super 8" tape.

Reference voltage at I_Z = 7,5 mA		V_{ref}	>	5,89 V
			typ.	6,20 V
			<	6,51 V

	BZV81	$\lvert S_Z\rvert$	<	0,005 %/K
Differential resistance at I_Z = 7,5 mA		r_{diff}	<	15 Ω

Notes

1. Tolerance and stability of I_Z.
   The quoted values of ΔV_{ref} are based on a constant current I_Z. Two factors can cause V_{ref} to change with I_Z, namely the differential resistance r_{diff} and the temperature coefficient S_Z.
   a. Each change of I_Z can result in a maximum change of V_{ref} as follows:
   $$\Delta V_{ref}\ (\text{mV}) = \Delta I_Z\ (\text{mA}) \times 15\ \Omega$$
   taking into account r_{diff} is max. 15 Ω.
   b. The temperature coefficient of the reference voltage is also a function of I_Z. However, for these reference diodes S_Z varies max. ± 0,05 mV/K or ± 0,001 %/K when I_Z is between 6 and 10 mA, so this effect can be neglected in practice for these types.

2. The temperature coefficient of the reference voltage is obtained from the following equation.
   $$S_Z = \frac{(V_{ref\ 1} - V_{ref\ 2})}{(T_{amb\ 2} - T_{mab\ 1})} \times \frac{100}{V_{ref\ nom}}\ \%/\text{K}$$

Model for calculating the static working voltage ($V_{Z\ stat}$).

This model can be derived from $V_{Z\ stat} = V_{Z\ dyn} + \Delta V_Z$ of which $V_{Z\ dyn}$ is given in the preceding tables and can be derived from the typical dynamic characteristic curves (Figs 2, 3, 4 and 5)
$\Delta V_Z = \Delta T \times S_Z$. For S_Z see tables and graphs S_Z versus T_j.
$\Delta T = P_{tot} \times R_{th\ j\text{-}a} = I_Z \times V_{Z\ dyn} \times R_{th\ j\text{-}a}$.
Following $\Delta V_Z = I_Z \times V_{Z\ dyn} \times R_{th\ j\text{-}a} \times S_Z$ and the model will be:

$$V_{Z\ stat} = V_{Z\ dyn} + I_Z \times V_{Z\ dyn} \times R_{th\ j\text{-}a} \times S_Z$$

Calculating example

BZV90-C24 mounted on an epoxy printed circuit board of 40 mm x 40 mm x 1.5 mm; at I_Z = 7 mA.

$V_{Z\ stat} = 24 + (0.007 \times 24 \times 0.095 \times 20.4)$

$= 24 + 0.32 = 24.32$ V

VOLTAGE REGULATOR DIODES

Silicon planar diodes in DO-35 envelopes intended for use as low voltage stabilizers or voltage references. They are available in four series; each series having a different tolerance rating, one series is to the international standardized E24 (± 5%) range, the other three have tolerances of 1%, 2% and 3% on working voltage. Each series consists of 37 types with nominal working voltages ranging from 2,4 V to 75 V.

QUICK REFERENCE DATA

Working voltage range	V_Z	nom.	2,4 to 75	V
Total power dissipation	P_{tot}	max.	500	mW *
Non-repetitive peak reverse power dissipation	P_{ZSM}	max.	30	W
Junction temperature	T_j	max.	200	^oC
Thermal resistance from junction to tie-point	$R_{th\ j\text{-}tp}$	=	0,30	K/mW *

* If leads are kept at T_{tp} = 50 ^oC at 8 mm from body.

SILICON PLANAR VOLTAGE REGULATOR DIODES

Low power general purpose voltage regulator diodes in a micro miniature plastic envelope. They are available in three series; one to the international standardized E24 (± 5%) range, one in a tolerance of ± 2% and the other in a tolerance of ± 1%.
Each series consists of 37 types with nominal working voltages from 2.4 V to 75 V.

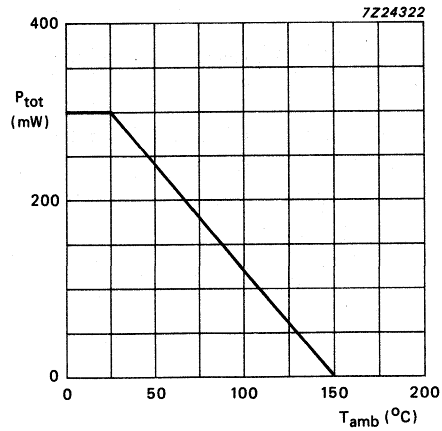

Fig. 2 Power derating curve.

Model for calculating the static working voltage ($V_{Z\ stat}$).

This model can be derived from $V_{Z\ stat} = V_{Z\ dyn} + \Delta V_Z$ of which $V_{Z\ dyn}$ is given in the preceding tables and can be derived from the typical dynamic characteristic curves in Figs 3 to 6.
$\Delta V_Z = \Delta T \times S_Z$. For S_Z see tables and graphs S_Z versus T_j.
$\Delta T = P_{tot} \times R_{th\ j\text{-}a} = I_Z \times V_{Z\ dyn} \times R_{th\ j\text{-}a}$.
Following $\Delta V_Z = I_Z \times V_{Z\ dyn} \times R_{th\ j\text{-}a} \times S_Z$ and the model will be:

$$V_{Z\ stat} = V_{Z\ dyn} + I_Z \times V_{Z\ dyn} \times R_{th\ j\text{-}a} \times S_Z$$

Calculating example

BZX84-C24 mounted on a ceramic substrate of 8 x 10 x 0.7 mm; at I_Z = 7 mA.

$$V_{Z\ stat} = 24 + \left(\frac{7}{1000} \times 24 \times \frac{430}{1000} \times 20.4\right)$$
$$= 24 + 1.47 = 25.47\ \text{V}.$$

OPERATING NOTE

Calculation of $I_{F(AV)}$-rating

For Schottky barrier diodes thermal runaway has to be considered, as in some applications the reverse power losses are a significant part of the total power losses. For that reason the starting point for the calculation of the $I_{F(AV)}$-rating should be the maximum permissible junction temperature $T_{j\,max}$.

Method of calculation

1. Input:
   type
   V_{RWM} and its duty cycle δ
   T_{amb}
   $a = I_{F(RMS)}/I_{F(AV)}$
2. Determine the maximum permissible junction temperature $T_{j\,max}$ (125 °C or the temperature at which thermal runaway occurs, whichever is lowest) from Figs 7, 9 or 11.
3. Determine the reverse power losses P_R from Figs 8, 10 or 12 and multiply P_R by 150 K/W, giving a certain number of degrees centigrade (this being the increase of junction temperature caused by reverse power dissipation).
4. Calculate T_R by subtracting the calculated number of degrees centigrade (15 °C or less) from the maximum permissible junction temperature.
5. Substract T_{amb} from T_R (giving the admissible increase of junction temperature caused by forward dissipation) and calculate the admissible forward power dissipation by means of the formula;
   $P_F = (T_R - T_{amb})/R_{th\,j\text{-}a}$.
6. Determine the $I_{F(AV)}$-rating from Figs 4, 5 or 6.

   Example: PRLL5818; V_{RWM} = 22 V; δ = 0.5; T_{amb} = 60 °C; a = 1.42.

   Find $T_{j\,max}$ from Fig.9: 112 °C.

   Find P_R from Fig.10: 0.1 W.
   $P_R \times R_{th\,j\text{-}a}$ = 0.1 x 150 = 15 °C.

   Calculate T_R: 112 − 15 = 97 °C.
   Calculate P_F : (97 − 60)/150 = 0.25 W.
   Find $I_{F(AV)max}$ from Fig.5, for a = 1.42: $I_{F(AV)max}$ = 0.5 A.

Notes

1. I_Z tolerance and stability of I_Z.

   The quoted values of ΔV_{ref} are based on a constant current I_Z. Two factors can cause V_{ref} to change, namely the differential resistance r_{diff} and the temperature coefficient S_Z.

   a. As the max. r_{diff} of the device can be 15 Ω, a change of 0,01 mA in the current through the reference diode will result in a ΔV_{ref} of 0,01 mA x 15 Ω = 0,15 mV. This level of ΔV_{ref} is not significant on a 1N821 ($\Delta V_{ref} < 96$ mV), it is however very significant on a 1N829 ($\Delta V_{ref} < 5$ mV).

   b. The temperature coefficient of the reference voltage S_Z is a function of I_Z. Reference diodes are classified at the specified test current and the S_Z of the reference diode will be different at different levels of I_Z. The absolute value of I_Z is important, however, the stability of I_Z, once the level has been set, is far more significant. This applies particularly to the 1N829.

   The effect of I_Z stability on S_Z is shown in Fig. 5.

2. Voltage excursion (ΔV_{ref} and temperature coefficient).

   All reference diodes are characterized by the 'box method'. This guarantees a maximum voltage excursion (ΔV_{ref}) over the specified temperature range, at the specified test current (I_Z), verified by tests at indicated temperature points within the range. V_Z is measured and recorded at each temperature specified. The ΔV_{ref} between the highest and lowest values must not exceed the maximum ΔV_{ref} given. The temperature coefficient, therefore is given only as a reference; but may be derived from:

$$S_Z = \frac{(V_{ref\ 1} - V_{ref\ 2}) \times 100}{(T_{amb\ 2} - T_{amb\ 1}) \times V_{ref\ nom}} \ \%/K$$

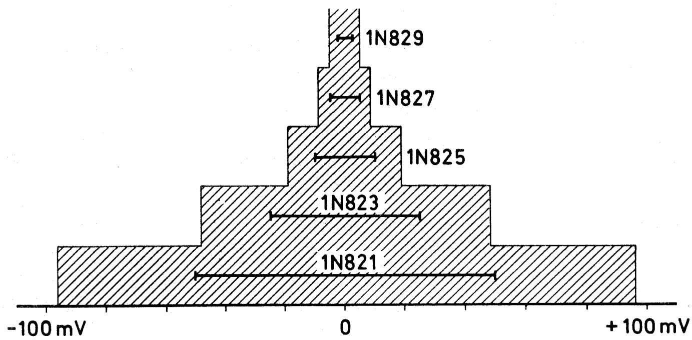

Fig. 2.

Maximum reference voltage variation (line section) caused by temperature variations within the range from −55 °C to + 100 °C at a constant working current of 7,5 mA. The voltage variations may shift horizontally within the shaded area. The zero point may vary from 5890 mV to 6510 mV and differs from diode to diode.

FAST SOFT-RECOVERY RECTIFIER DIODES

Glass passivated rectifier diodes in hermetically sealed axial-leaded ID * envelopes. They are intended for television and industrial applications, such as switched-mode power supplies, scan rectifiers in TV receivers and also for use in inverter and converter applications. The devices feature non-snap-off (soft-recovery) switching characteristics.

Schottky barrier diodes

DESCRIPTION

Schottky barrier diodes in hermetically sealed SOD81 ID (note 1) envelope, intended for use in low output voltage, low power switched-mode power supplies and high-frequency circuits in general, where low conduction and switching losses are important.

OPERATING NOTE

Calculation of $I_{F(AV)}$ rating

For Schottky barrier diodes thermal runaway has to be considered, as in some applications the reverse power losses are a significant part of the total power losses. For that reason the starting point for the calculation of the $I_{F(AV)}$ rating should be the maximum permissible junction temperature T_{jmax}.

Method of calculation

1. Input: type
   V_{RWM} and its duty cycle δ
   T_{amb}
   $a = I_{F(RMS)}/I_{F(AV)}$

2. Determine the maximum permissible junction temperature T_{jmax} (125 °C or the temperature at which thermal runaway occurs, whichever is lowest) from Figs 7, 9 or 11.

3. Determine the reverse power losses P_R from Figs 8, 10 or 12 and multiply P_R by 100 K/W, giving a certain number of degrees centigrade (this being the increase of junction temperature caused by reverse power dissipation).

4. Calculate T_R by subtracting the calculated number of degrees centigrade (15 °C or less) from the maximum permissible junction temperature.

5. Subtract T_{amb} from T_R (giving the admissible increase of junction temperature caused by forward dissipation) and calculate the admissible forward power dissipation using the formula:
   $P_F = (T_R - T_{amb})/R_{th\ j-a}$

6. Determine the $I_{F(AV)}$ rating from Figs 4, 5 or 6.

   Example: 1N5818; V_{RWM} = 22 V;
   δ = 0.5; T_{amb} = 60 °C;
   a = 1.42

   - find T_{jmax} from Fig.9 : 109 °C
   - find P_R from Fig.10 : 0.15 W;
     $P_R \times R_{thj-a}$ = 0.15 x 100
     = 15 °C
   - calculate T_R :
     109 - 15 = 94 °C
   - calculate P_F :
     (94 - 60)/100 = 0.34 W
   - find $I_{F(AV)max}$ from Fig.5, for
     a = 1.42 : $I_{F(AV)max}$ = 0.6 A.

DATA HANDBOOK SYSTEM

DATA HANDBOOK SYSTEM

Our Data Handbook System comprises more than 60 books with specifications on electronic components, subassemblies and materials. It is made up of seven series of handbooks:

INTEGRATED CIRCUITS

DISCRETE SEMICONDUCTORS

DISPLAY COMPONENTS

PASSIVE COMPONENTS*

PROFESSIONAL COMPONENTS**

MAGNETIC PRODUCTS*

LIQUID CRYSTAL DISPLAYS

The contents of each series are listed on pages iii to ix.

The data handbooks contain all pertinent data available at the time of publication, and each is revised and reissued periodically.

Where application is given it is advisory and does not form part of the product specification.

Condensed data on the preferred products of Philips Components is given in our Preferred Type Range catalogue (issued annually).

Information on current Data Handbooks and how to obtain a subscription for future issues is available from any of the Organizations listed on the back cover.
Product specialists are at your service and enquiries will be answered promptly.

* Will replace the Components and materials (green) series of handbooks.
** Will replace the Electron tubes (blue) series of handbooks.

INTEGRATED CIRCUITS

This series of handbooks comprises:
