PHILIPS

2-channel I²C switch with interrupt logic and reset PCA9543

FEATURES

- 1-of-2 bi-directional translating switches
- I²C interface logic; compatible with SMBus standards
- 2 Active Low Interrupt Inputs
- Active Low Interrupt Output
- Active Low Reset Input
- 2 address pins allowing up to 4 devices on the I²C bus
- Channel selection via I²C bus, in any combination
- Power up with all switch channels deselected
- Low Rds_{ON} switches
- Allows voltage level translation between 1.8 V, 2.5 V, 3.3 V and 5 V buses
- No glitch on power-up
- Supports hot insertion
- Low stand-by current
- Operating power supply voltage range of 2.3 V to 5.5 V
- 5 V tolerant Inputs
- 0 to 400 kHz clock frequency
- ESD protection exceeds 2000 V HBM per JESD22-A114, 150 V MM per JESD22-A115 and 1000 V per JESD22-C101
- Latchup testing is done to JESDEC Standard JESD78 which exceeds 100 mA
- Package Offer: SO14, TSSOP14

DESCRIPTION

The PCA9543 is a bi-directional translating switch, controlled by the I²C bus. The SCL/SDA upstream pair fans out to two downstream pairs, or channels. Any individual SCx/SDx channels or combination of channels can be selected, determined by the contents of the programmable control register. Two interrupt inputs, $\overline{INT0}$ to $\overline{INT3}$, one for each of the downstream pairs, are provided. One interrupt output $\overline{INT}$, which acts as an AND of the two interrupt inputs, is provided.

An active-LOW reset input allows the PCA9543 to recover from a situation where one of the downstream I²C buses is stuck in a LOW state. Pulling the $\overline{RESET}$ pin LOW resets the I²C state machine and causes all the channels to be deselected, as does the internal power on reset function.

The pass gates of the switches are constructed such that the V_{DD} pin can be used to limit the maximum high voltage which will be passed by the PCA9543. This allows the use of different bus voltages on each SCx/SDx pair, so that 1.8 V, 2.5 V, or 3.3 V parts can communicate with 5 V parts without any additional protection. External pull-up resistors pull the bus up to the desired voltage level for each channel. All I/O pins are 5 V tolerant.

PIN CONFIGURATION

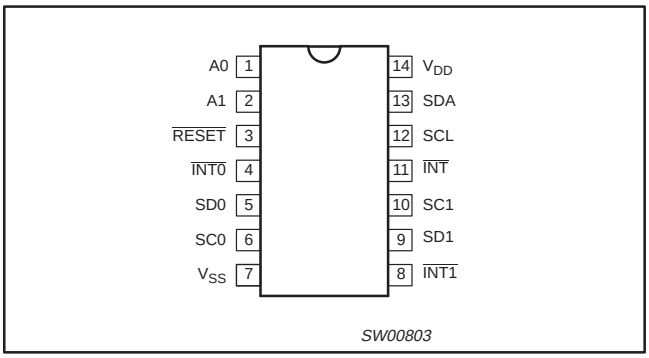

Figure 1. Pin configuration

PIN DESCRIPTION

PIN NUMBER	SYMBOL	FUNCTION
1	A0	Address input 0
2	A1	Address input 1
3	$\overline{RESET}$	Active LOW reset input
4	$\overline{INT0}$	Interrupt input 0
5	SD0	Serial data 0
6	SC0	Serial clock 0
7	V_{SS}	Supply ground
8	$\overline{INT1}$	Interrupt input 1
9	SD1	Serial data 1
10	SC1	Serial clock 1
11	$\overline{INT}$	Interrupt output
12	SCL	Serial clock line
13	SDA	Serial data line
14	V_{DD}	Supply voltage

ORDERING INFORMATION

PACKAGES	TEMPERATURE RANGE	ORDER CODE	DRAWING NUMBER
14-Pin Plastic SO	–40 to +85 °C	PCA9543D	SOT108-1
14-Pin Plastic TSSOP	–40 to +85 °C	PCA9543PW	SOT402-1

Standard packing quantities and other packaging data is available at www.philipslogic.com/packaging.

BLOCK DIAGRAM

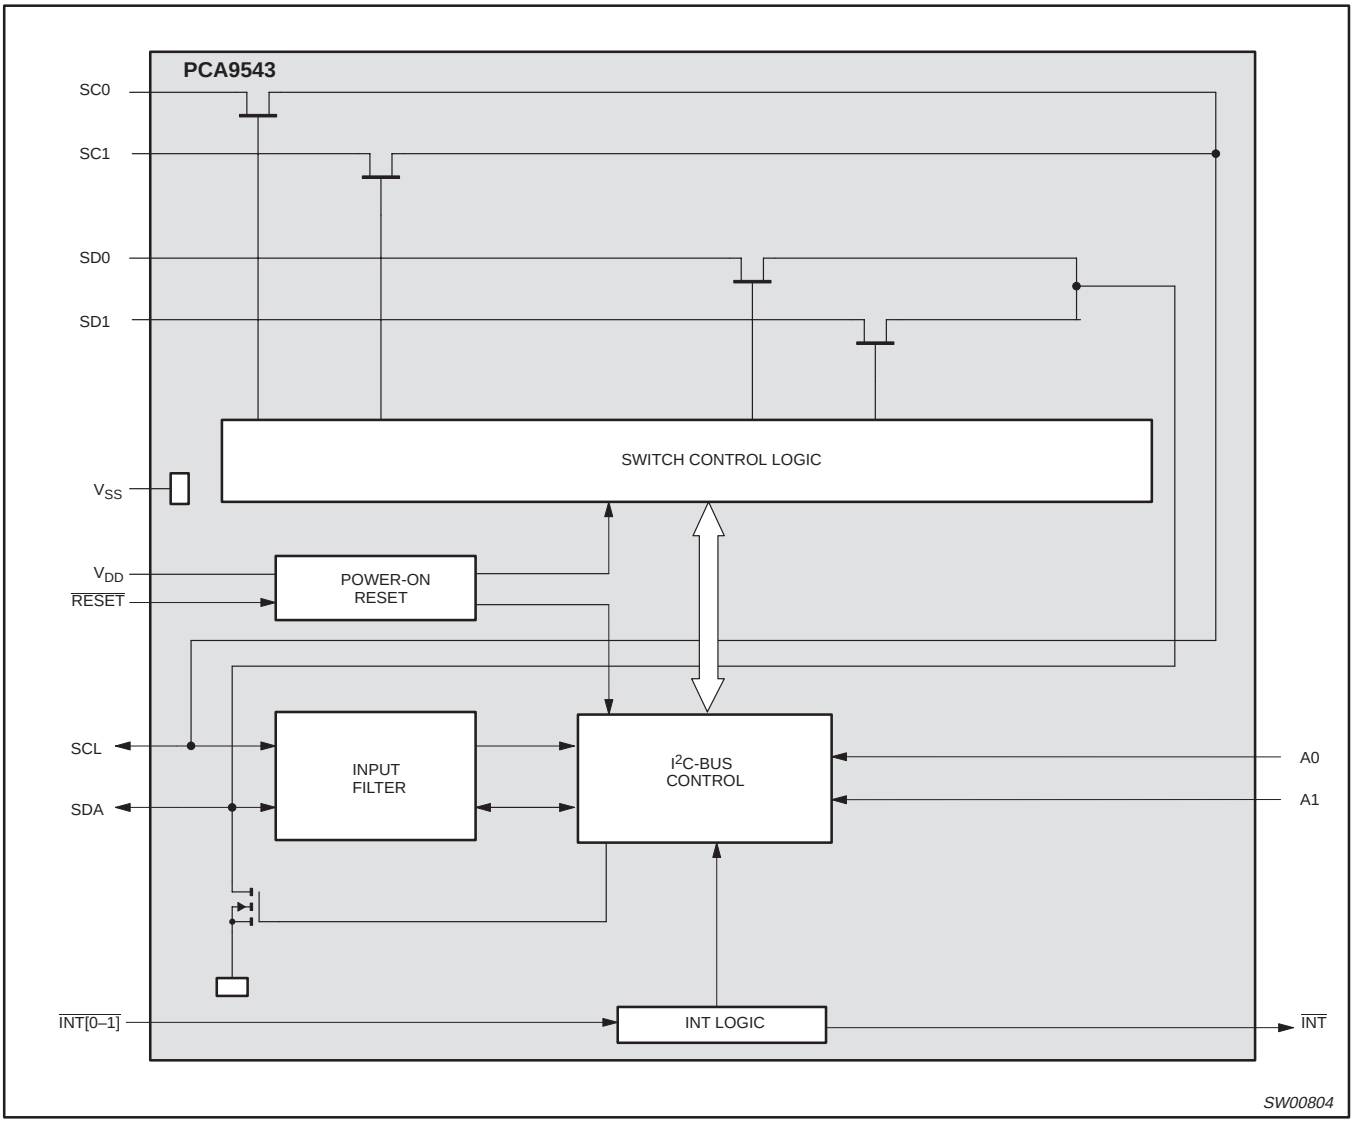

Figure 2. Block diagram

DEVICE ADDRESS

Following a START condition the bus master must output the address of the slave it is accessing. The address of the PCA9543 is shown in Figure 3. To conserve power, no internal pullup resistors are incorporated on the hardware selectable address pins and they must be pulled HIGH or LOW.

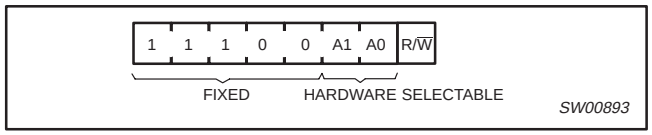

Figure 3. Slave address

The last bit of the slave address defines the operation to be performed. When set to logic 1, a read is selected while a logic 0 selects a write operation.

CONTROL REGISTER

Following the successful acknowledgement of the slave address, the bus master will send a byte to the PCA9543, which will be stored in the control register. If multiple bytes are received by the PCA9543, it will save the last byte received. This register can be written and read via the I²C bus.

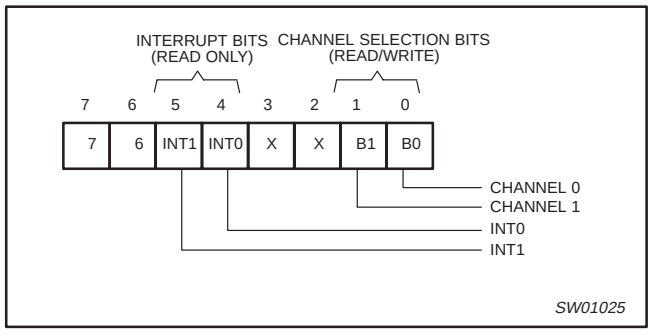

Figure 4. Control Register

CONTROL REGISTER DEFINITION

One or several SCx/SDx downstream pair, or channel, is selected by the contents of the control register. This register is written after the PCA9543 has been addressed. The 2 LSBs of the control byte are used to determine which channel is to be selected. When a channel is selected, the channel will become active after a stop condition has been placed on the I²C bus. This ensures that all SCx/SDx lines will be in a HIGH state when the channel is made active, so that no false conditions are generated at the time of connection.

Table 1. Control Register; Write — Channel Selection/ Read — Channel Status

D7	D6	INT1	INT0	D3	D2	B1	B0	COMMAND
X	X	X	X	X	X	X	0	Channel 0 disabled
							1	Channel 0 enabled
X	X	X	X	X	X	0	X	Channel 1 disabled
						1		Channel 1 enabled

NOTE: Channel 0 and 1 can be enabled at the same time. Care should be taken not to exceed the maximum bus capacitance.

INTERRUPT HANDLING

The PCA9543 provides 2 interrupt inputs, one for each channel, and one open drain interrupt output. When an interrupt is generated by any device, it will be detected by the PCA9543 and the interrupt output will be driven LOW. The channel need not be active for detection of the interrupt. A bit is also set in the Control Register.

Bits 4 – 5 of the Control Register correspond to the $\overline{INT0}$ and $\overline{INT1}$ inputs of the PCA9543, respectively. Therefore, if an interrupt is generated by any device connected to channel 1, the state of the interrupt inputs is loaded into the control register when a read is accomplished. Likewise, an interrupt on any device connected to channel 0 would cause bit 4 of the control register to be set on the read. The master can then address the PCA9543 and read the contents of the Control Register to determine which channel contains the device generating the interrupt. The master can then reconfigure the PCA9543 to select this channel, and locate the device generating the interrupt and clear it.

It should be noted that more than one device can be providing an interrupt on a channel, so it is up to the master to ensure that all devices on a channel are interrogated for an interrupt.

The interrupt inputs may be used as general purpose inputs if the interrupt feature is not required.

If unused, interrupt input(s) must be connected to V_{DD} through a pull-up resistor.

Table 2. Control Register Read — Interrupt

7	6	INT1	INT0	3	2	B1	B0	COMMAND
X	X	X	0	X	X	X	X	No interrupt on channel 0
			1					Interrupt on channel 0
X	X	0	X	X	X	X	X	No interrupt on channel 1
		1						Interrupt on channel 1

NOTE: The two interrupts can be active at the same time.

$\overline{RESET}$ INPUT

The $\overline{RESET}$ input is an active-LOW signal which may be used to recover from a bus fault condition. By asserting this signal LOW for a minimum of t_{WL}, the PCA9543 will reset its registers and I²C state machine and will deselect all channels. The $\overline{RESET}$ input must be connected to V_{DD} through a pull-up resistor.

POWER-ON RESET

When power is applied to V_{DD}, an internal Power On Reset holds the PCA9543 in a reset state until V_{DD} has reached V_{POR}. At this point, the reset condition is released and the PCA9543 registers and I²C state machine are initialized to their default states, all zeroes causing all the channels to be deselected.

VOLTAGE TRANSLATION

The pass gate transistors of the PCA9543 are constructed such that the V_{DD} voltage can be used to limit the maximum voltage that will be passed from one I²C bus to another.

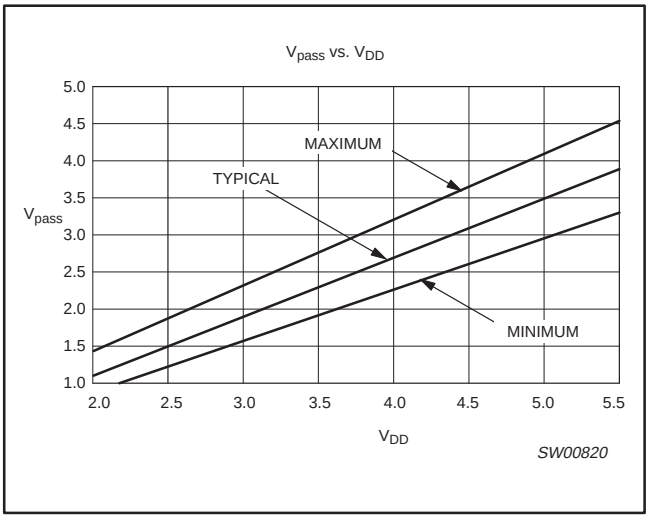

Figure 5. V_{pass} voltage

Figure 5 shows the voltage characteristics of the pass gate transistors (note that the graph was generated using the data specified in the DC Characteristics section of this datasheet). In order for the PCA9543 to act as a voltage translator, the V_{pass} voltage should be equal to, or lower than the lowest bus voltage. For example, if the main bus was running at 5 V, and the downstream buses were 3.3 V and 2.7 V, then V_{pass} should be equal to or below 2.7 V to effectively clamp the downstream bus voltages. Looking at Figure 5, we see that V_{pass} (max.) will be at 2.7 V when the PCA9543 supply voltage is 3.5 V or lower so the PCA9543 supply voltage could be set to 3.3 V. Pull-up resistors can then be used to bring the bus voltages to their appropriate levels (see Figure 12).

More Information can be found in Application Note AN262 *PCA954X family of I²C/SMBus multiplexers and switches.*

CHARACTERISTICS OF THE I²C-BUS

The I²C-bus is for 2-way, 2-line communication between different ICs or modules. The two lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse as changes in the data line at this time will be interpreted as control signals (see FIgure 6).

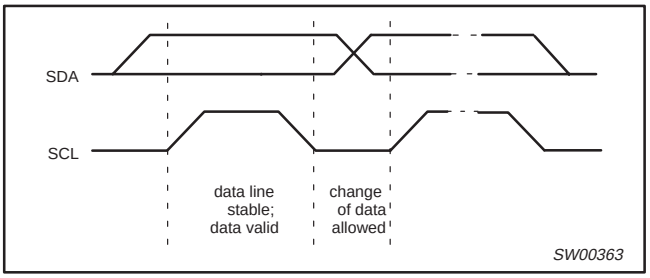

Figure 6. Bit transfer

Start and stop conditions

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH is defined as the start condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the stop condition (P) (see Figure 7).

System configuration

A device generating a message is a transmitter: a device receiving is the receiver. The device that controls the message is the master and the devices which are controlled by the master are the slaves (see Figure 8).

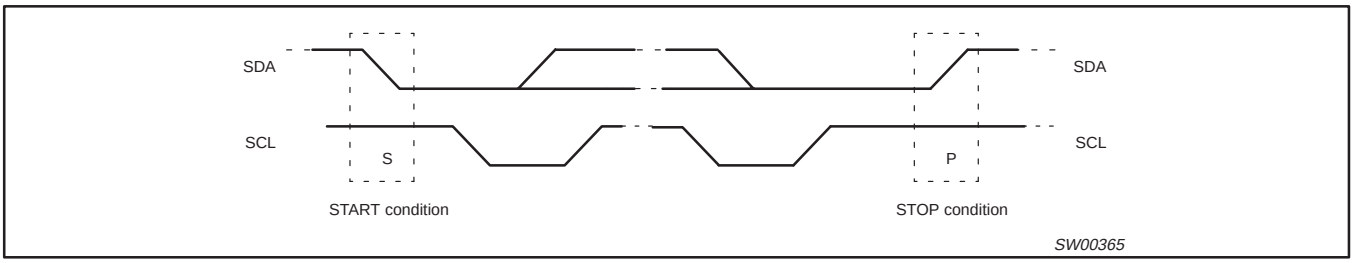

Figure 7. Definition of start and stop conditions

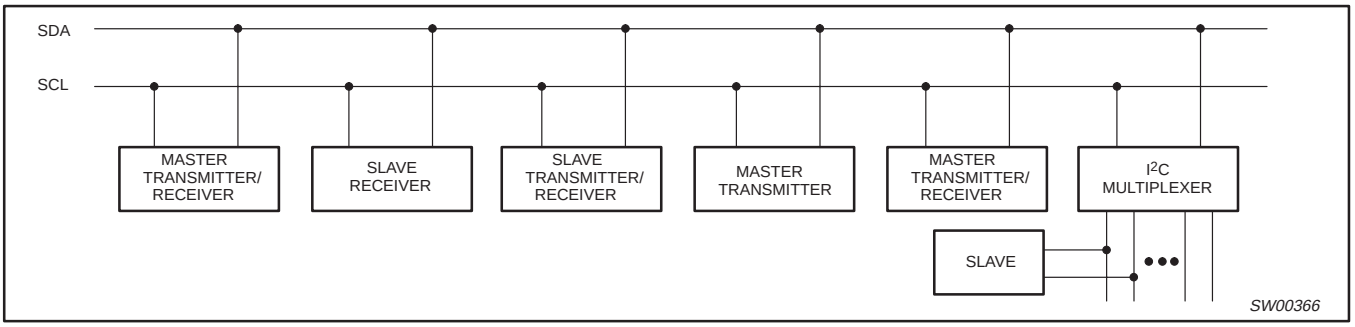

Figure 8. System configuration

Acknowledge

The number of data bytes transferred between the start and the stop conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one acknowledge bit. The acknowledge bit is a HIGH level put on the bus by the transmitter whereas the master generates an extra acknowledge related clock pulse.

A slave receiver which is addressed must generate an acknowledge after the reception of each byte. Also a master must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges has to pull down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse, set-up and hold times must be taken into account.

A master receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event, the transmitter must leave the data line HIGH to enable the master to generate a stop condition.

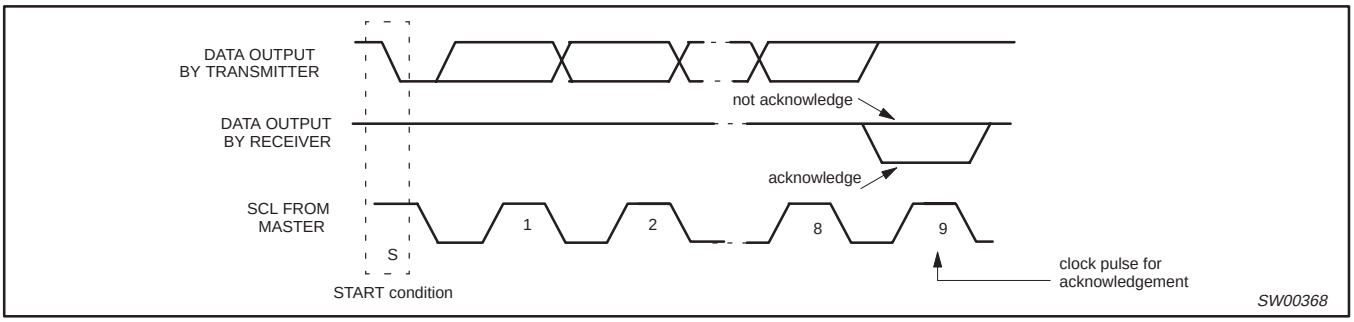

Figure 9. Acknowledgement on the I²C-bus

TYPICAL APPLICATION

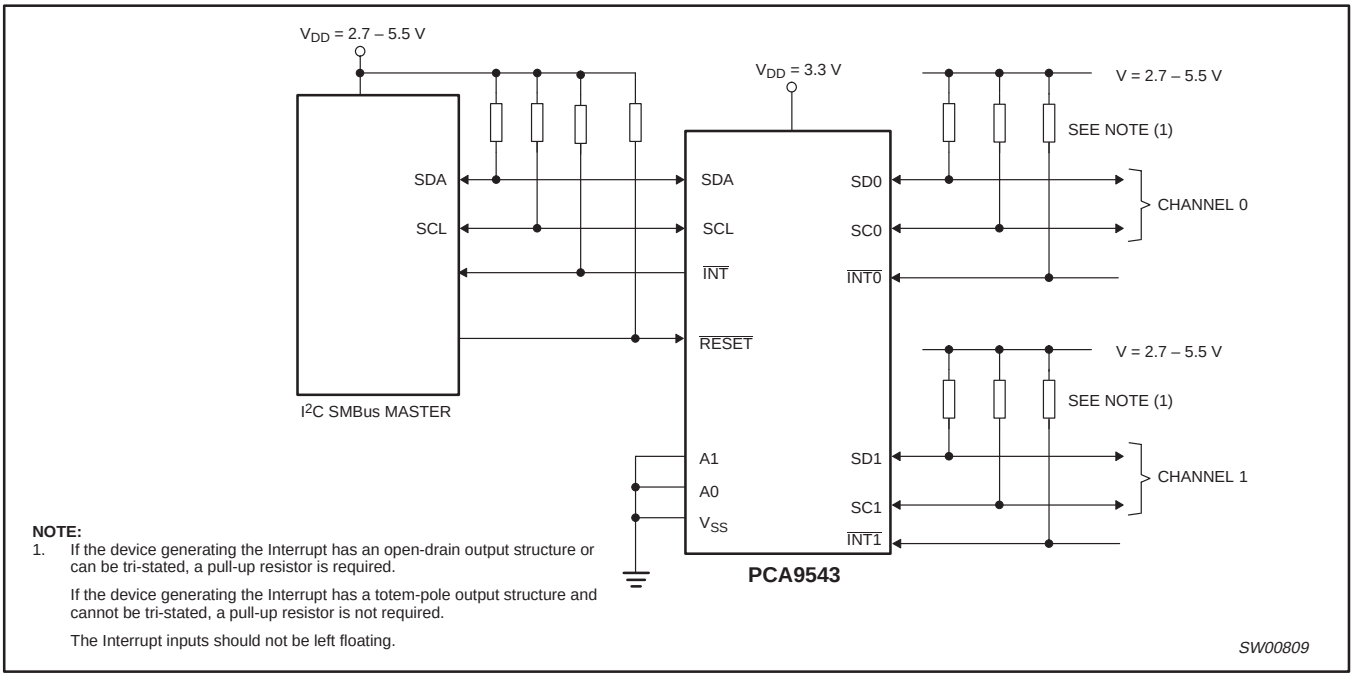

Figure 12. Typical application

ABSOLUTE MAXIMUM RATINGS[1, 2]

In accordance with the Absolute Maximum Rating System (IEC 134).Voltages are referenced to GND (ground = 0 V).

SYMBOL	PARAMETER	CONDITIONS	RATING	UNIT
V_{DD}	DC supply voltage		–0.5 to +7.0	V
V_I	DC input voltage		–0.5 to +7.0	V
I_I	DC input current		±20	mA
I_O	DC output current		±25	mA
I_{DD}	Supply current		±100	mA
I_{SS}	Supply current		±100	mA
P_{tot}	total power dissipation		400	mW
T_{stg}	Storage temperature range		–60 to +150	°C
T_{amb}	Operating ambient temperature		–40 to +85	°C

NOTES:

1. Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
2. The performance capability of a high-performance integrated circuit in conjunction with its thermal environment can create junction temperatures which are detrimental to reliability. The maximum junction temperature of this integrated circuit should not exceed 150°C.

DC CHARACTERISTICS

V_{DD} = 2.3 to 3.6 V; V_{SS} = 0 V; T_{amb} = –40 °C to +85 °C; unless otherwise specified. (See page 10 for V_{DD} = 3.6 to 5.5 V)

L_{pwr}	LOW level pulse width rejection or $\overline{INTn}$ inputs	1	—	1	—	ns
H_{pwr}	HIGH level pulse width rejection or $\overline{INTn}$ inputs	500	—	500	—	ns
RESET						
$t_{WL(rst)}$	Pulse width low reset	4	—	4	—	ns
t_{rst}	Reset time (SDA clear)	500	—	500	—	ns
$t_{REC:STA}$	Recovery to Start	0	—	0	—	ns

NOTES:
1. Pass gate propagation delay is calculated from the 20 Ω typical R_{ON} and and the 15 pF load capacitance.
2. A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the VIH_{min} of the SCL signal) in order to bridge the undefined region of the falling edge of SCL.
3. C_b = total capacitance of one bus line in pF.

Definitions

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Disclaimers

Life support — These products are not designed for use in life support appliances, devices or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
