Low voltage dual-band RF front-end   SA3600

DESCRIPTION

The SA3600 is an integrated dual-band RF front-end that operates at both cellular (AMPS and TDMA) and PCS (TDMA) frequencies, and is designed in a 20 GHz f_T BiCMOS process—QUBiC2.

The low-band (LB) receiver is a combined low-noise amplifier (LNA) and mixer. The LNA has a 1.7 dB noise figure (NF) at 881 MHz with 17 dB of gain and an IIP3 of –7 dBm. The wide-dynamic range mixer has a 9.5 dB NF at 881 MHz with 9.5 dB of gain and an IIP3 of +6 dBm.

The high-band (HB) receiver is a combined low-noise amplifier (LNA) and mixer, with the low-band and high-band mixers sharing the same mixer output. The LNA has a 2.2 dB NF at 1960 MHz with 16 dB of gain and an IIP3 of –5 dBm. The wide-dynamic range mixer has a 8.5 dB NF at 1960 MHz with 8.5 dB of gain and an IIP3 of +5.5 dBm.
FEATURES

- Low current consumption: LB I_{CC} = 14.5 mA; HB I_{CC} = 20.5 mA
- Outstanding low- and high-band noise figure
- LNAs with gain control (30 dB gain step)
- LO input and output buffers
- Selectable frequency doubler
- On chip logic for network selection and power down
- Very small outline package

APPLICATIONS

- 800 to 1000 MHz analog and digital receivers
- 1800 to 2000 MHz digital receivers
- Portable radios
- Mobile communications equipment

Low voltage dual-band RF front-end

SA3600

OPERATION

The SA3600 is a highly integrated dual-band radio frequency (RF) front-end integrated circuit (IC) targeted for TDMA applications. This IC is split into separate low-band (LB) and high-band (HB) receivers. The LB receiver contains a low noise amplifier (LNA) and mixer that are designed to operate in the cellular frequency range (869–894MHz). The HB receiver contains an LNA and mixer that are designed to operate in the PCS frequency range (1930–1990 MHz). The SA3600 also contains a frequency doubler that can drive the HB mixer local oscillator (LO) port, allowing a single-band voltage controlled oscillator (VCO) to be used to drive both mixers. Modes for bypassing the doubler are also provided, in the case where a dual-band VCO is used.

The SA3600 has eight modes of operation that control the LNAs, mixers, LO buffers and doubler. The select pins (PD1,2,3) are used to change modes of operation. The internal select logic powers the device down (0,0,0), turns on the LB LO buffer for use in transmit mode (0,0,1), enables cellular receive mode for high and low gain (0,1,X), enables PCS receive mode for high and low gain both without doubler (1,1,X) and with doubler (1,0,X).

Low-Band Receive Section

The LB circuit contains a LNA followed by a wide dynamic range active mixer. In a typical application circuit, the LNA output uses an external pull-up inductor to VCC and is AC coupled. The mixer IF outputs are differential and are combined with the high-band IF mixer outputs thereby eliminating the need for extra output pins. External inductors and capacitors can be used to convert the differential mixer outputs to single-ended. Furthermore, the LNA provides two gain settings: high gain (17dB) and low gain (–15 dB). The desired gain state can be selected by setting the logic pins (PD1,PD2,PD3) appropriately.

High-Band Receive Section

The HB circuit contains a LNA followed by a Gilbert cell mixer with differential inputs. The LNA output uses an internal pull-up inductor to VCC , which eliminates the need for an external pull-up. The mixer IF outputs are differential and are combined with the low-band IF mixer outputs thereby eliminating the need for extra output pins. Similar to the LB LNA, the HB LNA has two gain settings: high gain (16 dB) and low gain (–15 dB).

Control Logic Section

Pins PD1, PD2, and PD3, control the logic functions of the SA3600. The PD1 selects between LB and HB operations. In LB receive mode, the LB LNA is in high gain mode (or on) when PD1,2,3 are (0,1,1). In all other modes, the LB LNA is off. The LB mixer is on when PD1,2,3 are (0,1,X). In all other modes, the LB mixer is off. During transmit mode when PD1,2,3 are (0,0,1), the LB LO buffer is on, enabling use of the LO signal for the transmitter.

In HB receive mode, the HB LNA is in high gain mode (or on) when PD1,2,3 are (1,X,1). In all other modes, the HB LNA is off. The HB mixer is on when PD1,2,3 are (1,X,X), and is off in all other modes. The on-chip frequency doubler (X2) is on in (1,0,X) modes. When the frequency doubler is on, the input signal from the LB LO buffer is doubled in frequency, which can then be used to drive the HB mixer LO port. The frequency doubler can also be bypassed in modes (1,1,X), in which case the HB mixer is driven directly by an external 2 GHz LO signal.

Local Oscillator (LO) Section

The LB LO buffers are on for all modes except sleep mode, when PD1,2,3 are (0,0,0), and for HB receive mode without doubler, PD1,2,3 are (1,1,X). The HB LO buffers are on only when PD1,2,3 are (1,1,X). The PD1,2,3 pins are used to power-up/down all LO input buffers, which minimizes the pulling effect on the external VCO when entering receive or transmit mode.

Low voltage dual-band RF front-end

Data sheet status

Data sheet status	Product status	Definition [1]
Objective specification	Development	This data sheet contains the design target or goal specifications for product development. Specification may change in any manner without notice.
Preliminary specification	Qualification	This data sheet contains preliminary data, and supplementary data will be published at a later date. Philips Semiconductors reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.
Product specification	Production	This data sheet contains final specifications. Philips Semiconductors reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.

[1]   Please consult the most recently issued datasheet before initiating or completing a design.

Definitions

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Disclaimers

Life support — These products are not designed for use in life support appliances, devices or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.

Let's make things better.
