DATA SHEET

UAA3500HL
Pager receiver

Preliminary specification
Supersedes data of 1999 Mar 30
File under Integrated Circuits, IC17

2000 Jan 18

Philips
Semiconductors

PHILIPS

FEATURES

- Double frequency conversion, zero-IF receiver with:
  - Configurable in all paging bands (130 to 930 MHz)
  - Low noise amplifier featured with four step Automatic Gain Control (AGC)
  - Down-conversion mixers
  - On-chip, zero-IF channel filter
  - I/Q, non-demodulated outputs
  - Highpass filters to remove DC offsets.
- External Voltage Controlled Oscillator (VCO):
  - Both Local Oscillators (LOs) derived from the VCO.

APPLICATIONS

- FLEX™, ERMES and POCSAG pagers
- Remote control terminals.

GENERAL DESCRIPTION

The UAA3500HL is a one-chip pager receiver complying with POCSAG, FLEX™ and ERMES standards. The IC performs in accordance with specifications in the −10 to +55 °C temperature range.

The UAA3500HL contains a front-end receiver, which can be configured through external components for any frequency band between 130 and 930 MHz. The back-end receiver consists of the channel filter and limiters. An external VCO ensures the Local Oscillator (LO) for the front-end. Designed in an advanced BiCMOS process, it combines high performance with low-power consumption and a high degree of integration, thus reducing external component costs and total radio size.

Its first advantage is to remove the expensive SAW filter necessary in a superhet architecture, replacing it by an integrated, elliptic channel filter that provides 70 dB adjacent channel rejection. The receive front-end section consists of a low-noise amplifier that drives mixers through an external LC image rejection filter. The output drives the I and Q second mixers, whose outputs are at zero frequency. The receiver back-end section consists of filters (channel filtering), limiters (limited output required) and high-pass filters (DC block) to remove DC offsets. Outputs are I and Q, undemodulated signals.

Its second advantage is to provide the two LO signals from one VCO only, tuned by a PLL. An on-chip frequency divider-by-2 and buffers provide the LO sources.

Its third advantage is to provide two voltage regulators, allowing to obtain 1.0 and 1.8 V regulated voltages.

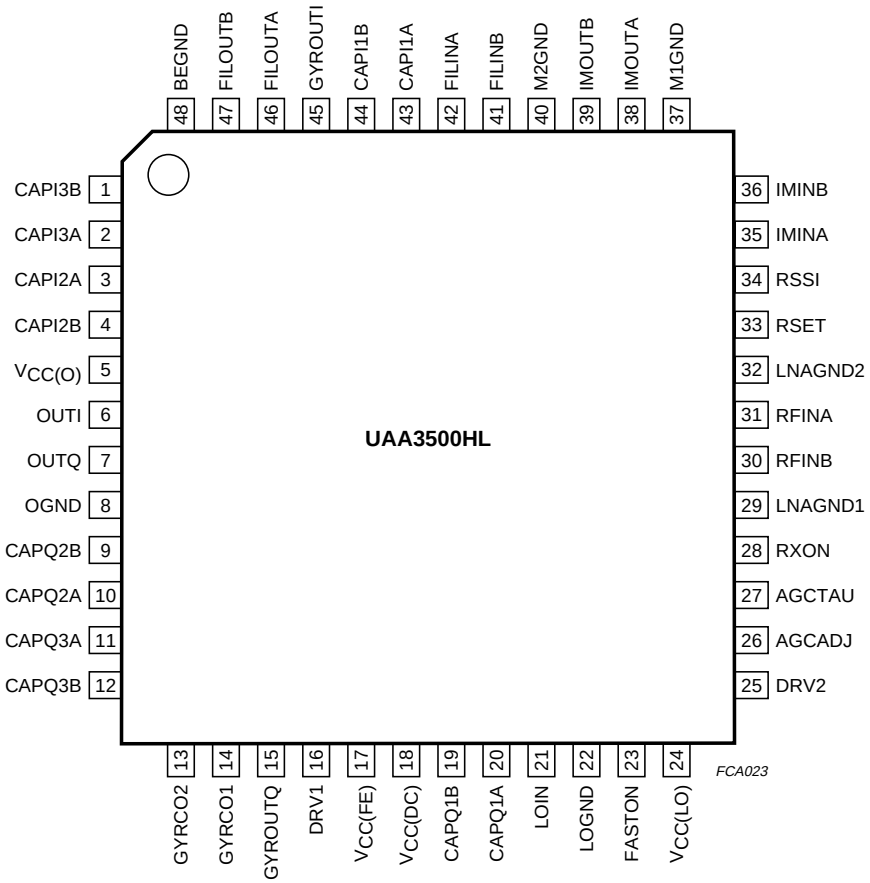

Fig.2 Pin configuration.

FUNCTIONAL DESCRIPTION

Receiver front-end section

The receiver front-end consists of an LNA, followed by the first and the second mixers. For operation at low frequency (160 and 280 MHz, for instance), the first mixer can be bypassed, saving some current. The image rejection is done by an external LC filter placed between the LNA, the first mixer and the antenna selectivity. The IF band is filtered by an external filter placed between the first mixer and the second mixers for the I and Q paths. The RF signals are in phase, and the LO signals are shifted by 90°. The output signals are at zero frequency.

To increase the immunity to interferers, an AGC loop controls the LNA gain by attenuating the RF input signal. Four steps of attenuation are possible (each having 8 dB), ranging therefore from 0 to 32 dB. The AGC loop threshold level and time constant may be controlled externally at pins AGCADJ and AGCTAU. The second LO I/Q phase shift is made by a quadrature divider, whose input is the VCO oscillating signal.

The LNA current is setup by an external resistor. All the receivers (front-end and back-end) are turned on by pin RXON.

Receiver back-end section

The down-converted signal is amplified and then filtered by a Sallen-Key filter, which shows a notch at 15 kHz and about 6 dB rejection out-of-band. Then comes the first high-pass filter (DC block), followed by the gyrator filter, which performs an elliptic, 7-pole low-pass filtering. The signal is then amplified by the first limiter, filtered by the second DC block, amplified again, and filtered again by the third DC block. Finally, an output stage delivers the signal with rail-to-rail logic levels.

The first, second and third DC block frequencies are set at 4, 8 and 12 Hz respectively by external 330 nF capacitors.

The two voltage regulators are also activated by RXON.

At the output of the gyrator filter, the signal is buffered and logarithmically converted. It then controls the AGC loop.

To rapidly reach the DC operating point, a fast mode is built into the three DC blocks.

LO

The external VCO is AC-coupled at input LOIN. It is then buffered to drive the first mixer. LOIN also enters a quadrature divider-by-2, whose output signals are also buffered to drive the second mixers. The VCO frequency should be $^2/_3$ of the input RF signal.

The LO signal must be generated with an external frequency synthesizer and VCO or with a crystal oscillator.

OPERATING MODES

To use the IC, all V_{CC} pins must be connected to the supply voltage B++ (2.1 V). The 1.8 V regulated voltage sinks current from B++ and the 1.0 V regulated voltage from B+ (1.4 V). In a typical application, the B+ supply is the battery and the B++ supply is the DC/DC converter located in the baseband chip.

In normal operating mode, the receiver should be powered-on in fast mode. The fast mode can be turned off after several milliseconds.

Table 1 gives the definition of the polarity of the switching signals on the receive section.

Table 1 Switching signals on the receiver

SIGNAL	SECTION	LEVEL	ON/OFF
RXON	receive section powered-on	HIGH	on
	receive section powered-off	LOW	off
FASTON	fast mode powered-on	HIGH	on
	fast mode powered-off	LOW	off

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{CC}	supply voltage		–	6	V
ΔGND	difference in ground supply voltage applied between all grounds	note 1	–	0.3	V
$P_{I(max)}$	maximum power input		–	20	dBm
$T_{j(max)}$	maximum operating junction temperature		–	150	°C
$P_{(max)}$	maximum power dissipation	in stagnant air at 25 °C	–	500	mW
T_{stg}	storage temperature		–65	+150	°C

Note

1. Pins short circuited internally must be short circuited externally.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	VALUE	UNIT
$R_{th(j-a)}$	thermal resistance from junction to ambient	in free air	90	K/W

HANDLING

All pins withstand the ESD test in accordance with *"MIL-STD-883C class 2 (method 3015.5)"*.

DC CHARACTERISTICS

V_{CC} = 2.1 V; T_{amb} = 25 °C; 930 MHz band application, 3% BER and 1600 bits/s 2 level; unless otherwise specified.

SOLDERING

Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"Data Handbook IC26; Integrated Circuit Packages"* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering is not always suitable for surface mount ICs, or for printed-circuit boards with high population densities. In these situations reflow soldering is often used.

Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several methods exist for reflowing; for example, infrared/convection heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to 250 °C. The top-surface temperature of the packages should preferable be kept below 230 °C.

Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
  - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
  - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

  The footprint must incorporate solder thieves at the downstream end.
- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time is 4 seconds at 250 °C. A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

Suitability of surface mount IC packages for wave and reflow soldering methods

PACKAGE	SOLDERING METHOD	
	WAVE	REFLOW(1)
BGA, SQFP	not suitable	suitable
HLQFP, HSQFP, HSOP, HTSSOP, SMS	not suitable(2)	suitable
PLCC(3), SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended(3)(4)	suitable
SSOP, TSSOP, VSO	not recommended(5)	suitable

Notes

1. All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the *"Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods"*.
2. These packages are not suitable for wave soldering as a solder joint between the printed-circuit board and heatsink (at bottom version) can not be achieved, and as solder may stick to the heatsink (on top version).
3. If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
4. Wave soldering is only suitable for LQFP, TQFP and QFP packages with a pitch (e) equal to or larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
5. Wave soldering is only suitable for SSOP and TSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
