PREFERRED TYPE RANGE CATALOGUE 1989

The preferred type range
Although Philips Components manufactures over 100 000 different products, only about a third of them regularly appears on the majority of customer orders.
This part of our total range is named the preferred type range. In this catalogue, type numbers, catalogue numbers, selection guides and brief technical data for the preferred type range are presented.

CECC approved products
Where information is available, products approved to the CECC (Cenelec Electronic Components Committee – harmonized system for electronic components of assessed quality) are listed at the end of each product section.

Status code
Within the preferred type range, status of products is indicated by code P (Preferred) or C (Common). Generally, these components can be supplied quickly.

Packaging quantities
With many products there is an indication of the packaging quantities; these units, or multiples of them, should be used when ordering.

The Philips Data Handbook System
For complete specifications of the components listed in this catalogue, please refer to the relevant volumes of the Philips Data Handbook System, which are indicated in the heading of each section in this catalogue.

The Philips Data Handbook System comprises over sixty volumes, divided into six series as follows:

Integrated circuits
Discrete semiconductors
Display components
Passive components
Professional components
Materials

The contents of these series are listed in the section entitled Data Handbook System at the end of this catalogue.

If you cannot find the information you need in this catalogue or the appropriate data handbook, please consult your nearest Philips Components sales organization or industrial distributor (for addresses, see the back cover of this catalogue).

How to use this catalogue
The 'Integrated circuits' and 'Discrete semiconductors' sections of this catalogue are also published separately under the titles 'Integrated circuits catalogue 1989' and 'Discrete semiconductors catalogue 1989' respectively.
The pages of this catalogue have, therefore, been numbered per section, as shown on the index pages. To enable you to find the beginning of each section, thumbmarks have been provided.
There is a contents page at the beginning of each section, and all these contents pages have been combined into a general index at the beginning of the book (so the same contents list appears twice); we hope this facilitates the perusal of this catalogue.

Please note that all dimensions given in tables and drawings are in mm, unless stated otherwise.

CMOS HE4000B FAMILY SPECIFICATIONS

CMOS HE4000B FAMILY SPECIFICATIONS

The LOCMOS HE4000B range is a fully buffered digital integrated circuit family which meets the Jedec–B specification. The members of this family are plug–in replacements for the well–known CMOS 4000 and 14500 ranges.

The HE family has the same advantages as conventional CMOS circuits, plus the additional LOCMOS advantages.

Advantages of CMOS

- low power dissipation – typically 10 nW per gate (static)
- wide operating supply voltage range
- wide operating temperature ranges:
  −40 to +85 °C for standard temperature range (HEF)
  −55 to +125 °C for extended temperature range (HEC)
- high DC fan–out
- inputs and outputs are protected against electrostatic voltages

In addition to these, the **LOCMOS HE4000B** range has:

- buffered outputs on **all** circuits
- higher speed
- higher packing density – essential for MSI/LSI
- excellent noise immunity

Recommended supply voltage range 3 to 15 V.

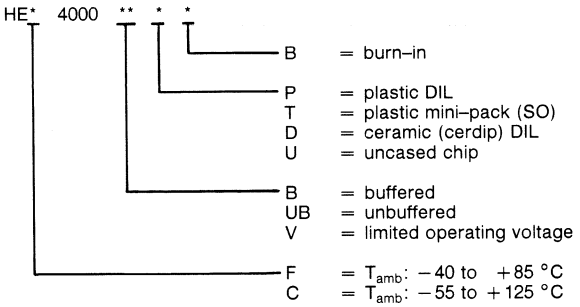
LOCMOS means Local Oxidation Complementary MOS

Inputs and outputs are protected against electrostatic effects in a wide variety of device–handling situations. However, to be totally safe, handling precautions should be taken into account.

Type number designation

Type numbers have a suffix which signifies the type of package and burn–in option.

HE*4000**** complete type number which can be split up as follows:



CMOS HE4000B FAMILY SPECIFICATIONS (cont.)

HCMOS PC74 FAMILY SPECIFICATIONS

General

These specifications cover the electrical ratings and characteristics that are common to the entire HCMOS PC74 family, unless otherwise specified in the data sheet of an individual device.

Introduction

The HCMOS family of logic ICs is manufactured using a self–aligning 3 μm polycrystalline silicon–gate CMOS process combined with local oxidation of silicon (LOCOS). HCMOS ICs have the low power consumption, high immunity to input noise and wide operating temperature range of earlier silicon–gate CMOS circuits together with the high–speed and drive capability of bipolar, low–power Schottky TTL (LSTTL). They are also immune to latch–up and all types are available in DIL packages and in space–saving SO packages.

Many HCMOS circuits are pin–compatible with existing 54/74 LSTTL and HE4000B CMOS logic ICs. HCT types are ideal replacements for LSTTL. HCT types can also interface between TTL and CMOS ICs.

Three types of HCMOS ICs are available:

74HC CMOS input switching levels 30%V_{CC} and 70%V_{CC} (typical switching threshold 50%V_{CC}), supply voltage 2 V to 6 V

74HCT TTL input switching levels 0,8 V and 2 V (typical switching threshold 28%V_{CC}), supply voltage 5 V ±10%

74HCU CMOS input switching levels 20%V_{CC} and 80%V_{CC} (typical switching threshold 50%V_{CC}), supply voltage 2 V to 6 V; unbuffered to allow operation in the linear mode

The HCMOS family also includes several complex circuits for switching or multiplexing analog signals. These circuits have low crosstalk and feedthrough, and a very large frequency bandwidth. There are also two FIFOs and two PLLs in the HCMOS range, of which one (HC/HCT297) is a fully digital type.

Handling MOS devices

Inputs and outputs are protected against electrostatic effects in a wide variety of device–handling situations. However, to be totally safe, it is desirable to take handling precautions into account.

HCMOS features

- Very low power dissipation
- The switching levels of 74HC types are 30% and 70% of V_{CC}
- DC noise margin of 74HC types three times that of TTL ICs
- Logic output levels 0,1 V and V_{CC} – 0,1 V
- All types, except 74HCU are fully buffered
- Typical gate propogation delay of 8 ns
- Can operate up to 60 MHz (typical)
- Fanout capability of 10 LSTTL loads (4 mA); this is increased to 15 LSTTL loads (6 mA) for types with bus–driver outputs
- Wide supply voltage range
- Latch–up free
- Inputs protected against electrostatic discharge
- Functions and pinning identical to most popular LSTTL and CMOS HE4000B families
- Analog switching types operating up to 10 V
- Symmetrical output sourcing and sinking currents and equal output rise and fall times
- All types available in plastic SO packages for surface mounting and plastic DIL packages
- Choice of operating temperature range: –40 to +85 °C or –40 to +125 °C
- Approved to JEDEC standard No. 7A
- Alternate source is RCA

ACL 74 FAMILY SPECIFICATIONS

General

These family specifications cover the common electrical ratings and characteristics of the entire ACL 74 family, unless otherwise specified in the individual device data sheet.

Introduction

The 74AC/ACT11XXX 1 μm CMOS logic family combines the low power advantages of CMOS family with the high speed and drive capability of FAST TTL.
The basic family of devices, designated as 74AC11XXX, will operate at CMOS input logic levels for high noise immunity, negligible quiescent supply and input current. It operates from a power supply of 3 to 5.5 V.
A subset of the family, designated as 74ACT11XXX, with the same features and functions as the "AC–types", will operate at standard TTL power supply voltage (5 V ± 10%) and logic input levels (0,8 to 2,0 V).

Handling MOS devices

Inputs and outputs are protected against electrostatic effects in a wide variety of device–handling situations. However, to be totally safe, it is desirable to take handling precautions into account.

Features

- Comprehensive type range from simple gates to shift registers and counters
- All types available in 74AC versions (CMOS input levels) and ACT versions (TTL input levels)
- All types available in small outline (SO) and plastic dual in–line (PLDIL) packages
- Completely latch–up free
- Highly immune to electrostatic discharge
- Low power dissipation
- 24 mA sink/source current
- Input current only 1 μA in the HIGH or LOW state. The fan–out to other CMOS ICs) is therefore limited only by load capacitance and not by DC load considerations
- More than three times the noise immunity of TTL
- Input switching threshold level varies by only ±60 mV over the entire temperature range (±300 mV is specified for advanced TTL families)
- Wide supply voltage range:
  3 to 5.5 V for 74AC devices (internal logic states are maintained down to 2 V)
  5 V ± 10% for 74ACT devices
- On–chip propagation delay for a single gate is 0.5 ns; with a 5 V supply and 50 pF load, average propagation delay for a device is 5 ns (HIGH–to–LOW or LOW–to–HIGH)
- Outputs have edge–control circuits that reduce switching noise
- Output buffers are standardized to allow symmetrical output current sourcing and sinking for equal output rise and fall times
- Centre supply pins and flow–through architecture minimize ground and supply rail glitches during simultaneous switching of outputs, and simplify board layout
- All inputs that control more than one output have a new (patented) dynamic hysteresis that reduces susceptibility to slow input edges
- Wide operating temperature range: −40 to +85 °C
- Alternate source is TI

TTL FAMILY CHARACTERISTICS COMPARISON

	SSI gates propagation delay	flip–flops toggle rate	MSI ALU 4–bit add time
STANDARD TTL (STD: basic type number 74XX) 7400 Series SSI and MSI 8200 Series MSI 9300 and 9600 Series MSI Standard "gold doped" TTL is the industry's longest selling digital logic family still in high volume production. New system designs generally favor the Low Power Schottky TTL equivalent functions.	10 ns at 10 mW	25 MHz	27 ns
LOW POWER SCHOTTKY TTL (LS) 74LS00 Series SSI and MSI Low power Schottky provides the same speed as standard TTL at 1/5 the power. The power savings and LSI potential are encouraging the use of 74LS in most new system designs.	10 ns at 2 mW	30 MHz	21 ns
SCHOTTKY TTL (S) 74S00 Series SSI, MSI and 82S00 Series MSI Schottky TTL uses a diode clamp design to ensure the highest speed possible at TTL logic levels.	3 ns at 30 mW	90 MHz	11 ns
FAST TTL (F) 74F00 Series SSI and MSI New FAST Series offers higher speeds than Schottky TTL.	3 ns at 4 mW	–	–

ECL 10 000 FAMILY SPECIFICATIONS

The 10K family of ECL silicon monolithic integrated circuits is designed for high speed central processors and digital communication systems.
With 2 ns typical propagation delay and only 25 mW power dissipation per gate, this family offers an excellent speed–power product and therefore is recommended for large high–speed system design.

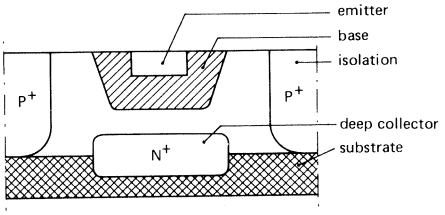
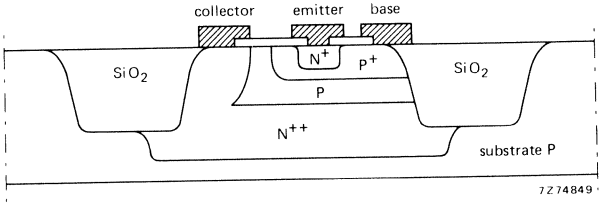
ECL 100 000 FAMILY SPECIFICATIONS

To satisfy the needs of new generations of computer and telecommunication systems in standard and LSI circuit design, a new technological process has been developed using oxide lateral isolation. The process is called SUBILO and permits the manufacture of integrated circuits with ultra–high speeds and high integration density.
Instead of conventional planar junction isolation technology, SUBILO uses a process that results in a considerable reduction in transistor area and an increased integration density. By using an increase in silicon oxide instead of isolation diffusion 'p', and removing the part between the emitter and isolation oxide, SUBILO technology results in a further reduction of transistor area. At the same time, the collector–base capacitance decreases, which is an important improvement in the dynamic performance of the transistor.



Junction–isolated PLANAR technique used for ECL 10 000.



The SUBILO process uses silicon oxide between devices instead of the p^+ regions used in the planar process.

Alphanumeric Index

In the alphanumeric index six columns are given (see next page). The first column shows the full (extended) IC type numbers in alpha–numeric sequence. The second, third and fourth columns give package information; the fifth column is a reference to the catalogue page number where the functional placing, the basic type number and brief description of the IC are given. The sixth column refers to the relevant Handbook (IC.., see list below) in which the IC data is published. Where the data is available only on loose data sheet or if handbook data has been superseded by a loose data sheet, this column shows 'DS'; a hyphen (–) indicates that **NO** data are available at date of printing this publication.

D.C. supply voltage range	10 to 30 V
Output current at V_B = 10 to 30 V	max. 200 mA
Switching distance; depends on R_x and oscillator coil	typ. 1 to 5 mm
Hysteresis is switching distance	3 to 10%
Operating frequency	< 5 kHz
Operating substrate temperature range	−40 to +85 °C

Hybrid integrated circuits intended for inductive proximity detectors in tubular construction, especially the M8 hollow stud. The OM386M is for positive supply voltage and the OM387M is for negative supply voltage. The circuit consists of a voltage regulator, an oscillator, a rectifier stage, a Schmitt trigger, an output stage and a protection circuit.

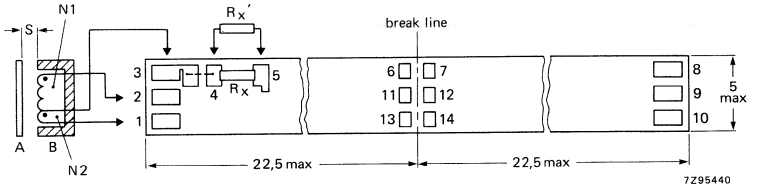
The circuit performs a make function: when actuated the current flows through the load, which can be, for example, the coil of an electromagnetic relay, a LED or a photocoupler. Compared to the types OM386B/OM387B the substrate length is drastically reduced.

S

Features

- extra small dimensions
- protection against short–circuit and overload
- protection of output transistor against transients by a voltage regulator diode
- protection against false polarity of the three connection leads
- choice between two methods to adjust the operating (switching) distance i.e. trimming a resistor integrated on the substrate or mounting a resistor
- possibility of connecting a LED for function control

The devices are thin–film circuits deposited on ceramic substrates. They may be potted, together with the oscillator coil, in a non–magnetic tube.



Mechanical outline and connections. The supply polarities to points 8 and 10 are given for the OM386; for OM387 the polarities are point 8: $-V_B$ and point 10: $+V_B$. S is the switching distance. The thickness of assembled hybrid (two parts glued together back to back) is max. 3.8 mm.

- four encapsulations – SOT-23, SOT-89, SOT-143 and SOD-80, all suitable for wave and reflow soldering.
- unimetal bonding of SOT-23 switching diodes for long life
- avalanche diodes – BAS29, BAS31 and BAS 35
- SOD-80 is a hermetically sealed glass encapsulation
- performance and reliability of all types comparable to that of axial leaded DO-34 and DO-35 diodes (the same crystals are used)

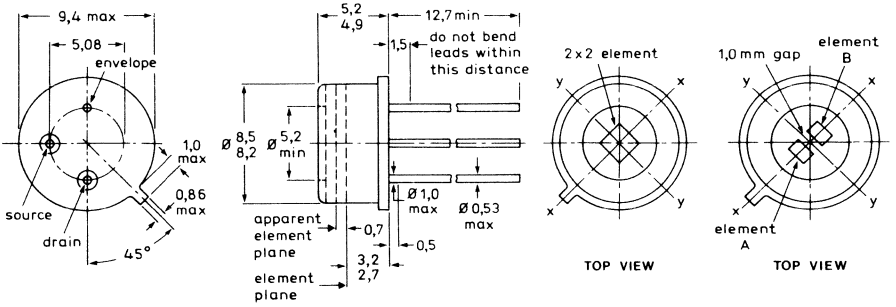
SOT–49H



S

The ceramic pyroelectric detector consists of an infrared sensitive element, a low–noise impedance–matching network, and an infrared window, all in a TO–5 encapsulation. The devices are rugged, low–cost components ideally suited for use in intruder detection systems, infrared radiometry and similar applications.

A range of standard products are available. For more information refer to Handbook S14.

Standard LCD cells
A range of standard LCD cells are available for multiple applications fields e.g. clocks, counters, point of sales equipment etc.

Standard LCD modules
A range of standard LCD modules are available for multiple applications fields. An LCD module combines an LCD cell with driver circuitry in a compact unit. Our LCD modules are classified as:

segment types (mainly for application in telephony equipment)
character types, displaying 1 or more lines of 5 x 7 characters (used in a variety of applications e.g. typewriters, point of sales equipment etc).
dot matrix types intended for full graphic applications e.g. PCs, measuring equipment etc.

LCDs custom design facilities

For detailed information on these types see Data Handbook S14

Custom design facilities
We offer a complete custom design service for LCD cells in which the following can be customer specified:

- dimensions
- display pattern
- electro–optical characteristics
- connection method

Our custom design facility has been divided into two categories: semi–standard products and custom products each category has different priorities on design flexibility versus development cost.

Semi–standard productsare a custom designed display pattern incorporated with a variety of standfard options. These options include a range of standard glass sizes and a selection of electro–optical characteristics. Semi–standard products are characterized by simple product definition, fast development time and low development cost.

For more information please refer to the Data Handbook S14 which has a section dedicated to semi–standard
products, or to the nearest Philips Components sales organization (see back cover for details).

Custom products offer more flexibility in dimensions and electro–optical characteristics and are best suited to when semi–standard products do not meet with user requirements.

For more information please refer to the Data Handbook S14 which has a section dedicated to custom products, or to the nearest Philips Components sales organization (see back cover for details).

Electron tubes

On most pages, directly underneath the title, reference is made to a 'Data Handbook'. That Handbook is part of Philips Data Handbook System which is a comprehensive source of information on electronic components, subassemblies and materials. For this catalogue section the following Handbooks are of interest:

book	title
T3	Klystrons
T5	Cathode–ray tubes
T6	Geiger–Müller tubes
T8 (DC01)	Colour display systems
T9	Photo and electron multipliers
T10	Plumbicon camera tubes and accessories
T11	Microwave diodesand sub–assemblies
T12	Vidicon and Newvicon camera tubes and deflection units
T13	Image intensifiers and infrared detectors
T16	Monochrome tubes and deflection units

General description
The frame transfer sensor is a solid state imaging device which produces two interlaced 294–line fields (NXA1011/1021) and 251–line fields (NXA1031/1041)
(including 6 lines for dark reference and testing) with an aspect ratio of 4:3.
NXA1011: The device is compatible with CCIR TV standards and has a 7.5 mm image diagonal matching the half–inch camera tube format.
NXA1021: The sensor is equipped with an on–chip colour stripe filter. The device is compatible with PAL and SECAM TV standards and has a 7.5 mm image diagonal matching the half–inch camera tube format.
NXA1031: The device is compatible with EIA TV standards and has a 7.5 mm image diagonal matching the half–inch camera tube format.

Inductive proximity detectors

For detailed information on these and other types see Data Handbook S13

D.C. supply voltage range	4.5 to 30 V
Output current at V_B = 24 V	max. 250 mA
Switching distance; depends on R_x and oscillator coil	typ. 1 to 5 mm
Hysteresis in switching distance	3 to 10%
Operating frequency	< 5 kHz
Operating substrate temperature range	−40 to +85 °C

Hybrid integrated circuits intended for inductive proximity detectors in tubular construction, especially the M8 hollow stud. The OM286 and OM286M are for positive and the OM287 and OM287M are for negative supply voltage. The circuit consists of an oscillator, a rectifier stage, a Schmitt trigger and an output stage.
The circuit performs a make function: when actuated the current flows trough the load, which can be, for example, the coil of an electromagnetic relay, a LED or a photocoupler.

The output transistor is protected against transients from the inductive load by a voltage regulator diode. The circuit is protected against false polarity connection of the supply voltage.

The devices OM286/OM287 are thick–film circuits and the OM286M/OM287M are thin–film circuits deposited on ceramic substrates. They may be potted, together with the oscillator coil and a resistor (R_x), in a non–magnetic tube.

S is the switching distance. The maximum height of the circuits including the substrate thickness is 1.7 mm.

D.C. supply voltage range	10 to 30 V
Output current at V_B = 10 to 30 V	max. 250 mA
Switching distance; depends on R_x and oscillator coil	typ. 1 to 5 mm
Hysteresis is switching distance	3 to 10%
Operating frequency	< 5 kHz
Operating substrate temperature range	−40 to +85 °C

Hybrid integrated circuits intended for inductive proximity detectors in tubular construction, especially the M8 hollow stud. The OM386B is for positive supply voltage and the OM387B is for negative supply voltage. The circuit consists of a voltage regulator, an oscillator, a rectifier stage, a Schmitt trigger, an output stage and a protection circuit.

The circuit performs a make function: when actuated the current flows through the load, which can be, for example, the coil of an electromagnetic relay, a LED or a photocoupler.

Features

- protection against short–circuit and overload
- protection of output transistor against transients by a voltage regulator diode
- protection against false polarity of the three connection leads
- choice between two methods to adjust the operating (switching) distance, i.e. trimming a resistor integrated on the substrate or mounting a resistor
- possibility of connecting a LED for function control

The devices are thin–film circuits deposited on ceramic substrates. They may be potted, together with the oscillator coil, in a non–magnetic tube.

Resistors R

On most pages, directly underneath the title, reference is made to a 'Data Handbook'. That Handbook is part of the Philips Data Handbook System which is a comprehensive source of information on electronic components, subassemblies and materials. For this catalogue section the following Handbooks are of interest:

book	title
C11	Varistors, thermistors and sensors
C12	Potentiometers, encoders and switches
C13	Fixed resistors

As an example, details of standard packaging of SFR resistors are given here.
Complete details of packaging of all resistor ranges are given in Data Handbook C13.

Standard packaging:

Resistors having axial leads are supplied on tape. These tapes, or bandoliers, are either reeled or concertinaed in a cardboard box ('ammopack').

On most pages, directly underneath the title, reference is made to a 'Data Handbook'.
That Handbook is part of the Philips Data Handbook System which is a comprehensive source of information on electronic components, subassemblies and materials.
For this catalogue section the following Handbooks are of interest:

Applications

The main applications are:

- distortion–free voltage control for measuring equipment and voltage stabilizers;
- power control for electric heating, heat sealing of plastics;
- current control for galvanizing plants, electric marking pens:
- lighting control;

Types

Single variable transformers have an output current range from 0.5 to 32 A.
Most are auto–transformers; transformers with separate windings are available.
All auto–transformers are available as panel model and some also as bench model or laboratory model.
A panel model is a transformer of which the live parts are not protected (IP 00).
A bench model is a transformer in a protective housing and has a knob and dial (IP 20).
A laboratory model is a bench model with a handle, an input cable with plug and a fused outlet socket.
The transformers with separate windings are available as a panel model or a laboratory model. The laboratory
model is a bench model with a handle, overload protection, a voltmeter for indicating the output voltage, a cable with plug for input connection, and an outlet socket.

Features

- continuous/stepless voltage control;
- small size and high efficiency by using high quality core material;
- very low stray losses and carefully treated track surface for low and stable contact resistance between brush and track resulting in low losses at the most critical place; under normal conditions, the brush track needs no maintenance;
- corrosion proof;
- long life carbon brushes;
- simple replacement of carbon brushes;
- adjustable sliding spindle;
- low winding resistance;
- high overload capability.

The majority of the transformers meet the safety requirements laid down in SEV1003; the relevant types have SEV approval, which is indicated on the transformer.
Variable mains transformers can be electrically connected in parallel, in series or in three phase circuits.
Chokes can be supplied to ensure correct current distribution for transformers connected in parallel.
For mechanical ganging of two or three variable transformers ganging units can be used, which are supplied either in an assembly kit or completely assembled including transformers.
Most transformers, either ganged or individual, can be provided with a remote–controlled motor drive.
Motor drive kits and base plate assemblies are available for this purpose. Alternatively, the units can be supplied
completely assembled and tested.
Instructions for assembling come with all kits.
Replacement carbon brushes are available for all variable transformers.
For panel model transformers control knobs with dials are available, which can be locked in any position on the spindle by means of a clamping collet.

For detailed information see Data Handbook C8

- The given nominal input voltage may continuously be exceeded by 10%.
- The transformers may be used at frequencies between 50 and 400 Hz.
- The ambient temperature range is −15 to +40 °C for auto–transformers, and −10 to +40 °C for transformers with separate windings.
- The insulation resistance between live and non–live parts after the damp heat test (IEC 68–2–3, test Ca, 21 days) is > 5 MΩ.
- All auto–transformers are tested for 1 min at 2000 V, 50 Hz between live and non–live parts. The transformers with separate windings are tested for 1 min at 3500 V, 50 Hz (size code E2.1) or 5000 V, 50 Hz (size code E7.1).
- The air gap between live and non–live parts is ⩾ 4 mm.
- The leakage path between live and non–live parts is ⩾ 5 mm.
- The total angle of rotation is ≃ 320°.
- The guaranteed life of the carbon brushes, if used within the ratings, is 100000 two–way turns, however, the life expectancy is well beyond 250000 two–way turns.
- The climatic category, according to IEC68, is 15/040/21 for auto–transformers, and 10/040/21 for transformers with separate windings.

Survey

In the tables below the transformers are listed in order of their nominal input voltages, and for each input voltage in order of their output currents.

Note: In addition to the standard transformers listed in the tables, a variety of transformers made to customer's specification are available from running production, and further versions can be designed upon request.

ΔΔ No standard chokes are available for transformer size codes E2, E3, E3.1, E4 and E4.1 since a single transformer of the standard range with larger size code, is a more economic proposition than ganging these smaller size transformers.

** The effective rotation angle of the variable mains transformers is 320°, so the actual rotation time between end stops is $^{320}/_{360}$ x listed rotation time.

AC stabilizer module

For detailed information see Data Handbook C8

Input voltage	220 V, +10%, −15%
Frequency range	50–60 Hz
Stabilized output voltage	
transformers 220 V/0–220 V	5 to 100% of input voltage
transformers 220 V/0–260 V	5 to 115% of input voltage
Maximum stabilization accuracy	±0,5 V
Ambient temperature range	−10 to +45 °C
catalogue number	**2422 532 00071**

This automatic stabilizer module can be used in combination with motor driven transformers for correction of
voltage variations. Its main use will be in those applications where the speed of response is of secondary importance to waveform distortion, and where the price per kVA of controlled power must be kept low.
Application areas are in test and research laboratories, service centres, and factories.
The module can also be used as a voltage, light or temperature–sensitive control for power sources.
It is not intended for transformers with separate windings.

A complete a.c. stabilizer circuit consists of:
- one or more mains transformers;
- a transformer ganging unit, if two or three transformers are used;
- a motor drive with 220 V reversible synchronous motor;
- the a.c. stabilizer module;
- a control potentiometer.

A dry reed switch is an assembly containing ferromagnetic contact blades, hermetically sealed in a glass envelope filled with an inert gas and operated by a magnetic field, externally generated by a coil or magnet. The following data is for Form–A dry reed switches only.

Features
- low resistance when closed and almost infinite resistance when open (complete galvanic seperation)
- reliable switch
- environmentally non–sensitive
- magnetic sensitive
- low operating power required

Application areas
- reed relays
- keyboards
- keyswitches
- automotive systems
- proximity switches
- security systems
- pace–makers
- games

Product survey	(all types are single–pole, single–throw with normally–open contacts. They all meet the requirements of IEC 255–9).
RI–23 series:	a general–purpose micro reed switch series for low and intermediate loads, designed to fit into a relay bobbin with a 0.1" internal diameter.
RI–25 series:	this micro reed switch series provides a high power capability (up to 25 W on the operate–AT range) in a compact package. Ideal for use in high load relays, this series also has an excellent switching performance at low voltages and currents.
RI–27 series:	very small 'pico' reed switches, ideal for use in DIP, SIP and SMDrelays. The hybrid contact layer, which ensures high reliability and long life, makes the RI–27 series suitable for other switching applications.
RI–29 series:	similar in size to the RI–27 series, the RI–29 series is specifically designed to switch higher currents, while still providing excellent switching performance at low voltages and currents.
RI–45:	reed switch for switching inductive loads driven by mains voltages up to 250 V. Breakdown voltage >750 V.
RI–46 series:	high–power reed switches capable of switching up to 40 W loads with breakdown voltages >1 kV DC, depending on the operate–AT value. Ideal for telephone applications and for driving solid state switches, as well as many high current applications that require a low contact resistance.

RM–coilformers are well adapted to automatic winding and are made of a phenolic thermosetting resin (UI 94–Vo).
The clips deliver adequate clamping force for high stability. Round back clips may also be used, however, their clamping force is lower.

P–cores for proximity switches

For detailed information on these and other types see Data Handbook C4/C5

An inductive proximity detector operates as follows. A metal object, A approaches– or recedes from an open potcore half with coil, B. The change in the Q of the oscillator is used to generate an electrical signal that can be used to drive an electromechanical relay, an audible alarm or similar devices.

Potcore halves with diameters up to9.4 mm are manufactured in Ferroxcube grade 3D3 and potcore halves with diameters 14 mm and larger, in Ferroxcube 3H1. This is because the operating frequency of oscillators with small potcore halves is higher than that of oscillators with large potcore halves.

Suitable coil formers are available for all potcore halves. The polycarbonate material of the coilformer limits the maximum potting temperature to 110°C. The potting material should be somewhat flexible to avoid high mechanical stress on the Ferroxcube potcore halves.

EF–cores have been dimensionally optimized for the use of ferrite, where E–cores have the same dimensions as metal lamination cores. We offer an extensive range in 3C8, 3C85, 3F3 and 3C11. For gapped cores see handbook C4/C5.

Coil formers and clips

The PBTP coil former is suitable for single spindle or automatic machine winding.
It is terminated after winding, to integral pins. The two cores are assembled to the coil former in one operation, as shown in figure below.

Two stainless steel clips retain the cores in the coil former assembly, maintaining adequate pressure at the mating pole faces.

The complete assembly is suitable for mounting on a printed–wiring board.

I15, I20, I25
These U–cores are for use in power supplies. Their excellent magnetic and electrical properties make them the designer's choice for small, light weight and highly efficient power supplies. U–cores are ideal in suppression applications. In case of pre–magnetisation, the influence of d.c. on the inductance of the choke can be reduced by using U–cores in combination with spacers to get an airgap.

U–I93, U–I100
High power to several kilowatts? Simple. Just stack up several U–cores into one big E–core with a square centre leg, or use UI and UU combinations. The result: low losses and high efficiency without weight penalty.

Ring cores are widely used for pulse and broad band transformers. In the field of RFI–suppression an important application is as a current compensated choke.
When used as a power transformer the main advantages are the long winding length and the very weak stray field (3C85 and 3F3).
The special grade 3R1 ia a rectangular loop ferrite suitable for magnetic amplifiers and spike suppression.
Our extensive range of sizes includes types proposed in IEC 525 plus many other current sizes.
The ring cores are isolated with a coat of nylon 11 (0.1 – 0.3 mm) to give good HV – isolation between core and winding (1.5 – 2 kV).

Iron powder ring cores

For detailed information on these and other types see Data Handbook C4/C5

These ring cores are made from electrolytic iron mixed with a small amount of resin to prevent excessive eddy currents. Due to their high saturation flux density (more than 1500 mT) they are very suitable for output chokes carrying high DC currents. The cores are coated with nylon 11 (0.1 – 0.3 mm thickness to give good HV insulation between core and winding (2 kV).

Generally, ferrite rods are used as the core of solenoidal coils for two main applications:
- tuning: moving the core adjusts the coil to the required inductance value
- RFI–suppression: the inductance of the core is increased by the ferrite core

In cases where the RFI–suppression coil carries a high DC current the inductance will not be lowered much because the magnetic circuit is very open.

Curvature and mechanical tolerances of the standard range fullfil the requirements of DIN 41 291 or its equivalent IEC 233–1966.

The features of a typical impeder core are high magnetic saturation flux density and low losses at the normal working conditions (commonly 100–500 kHz and 80–120°C). Slots in rods decrease the eddy current losses and have an additional cooling effect. Listed in the table are our preferred types.

Tubes can be used in solenoid coils to increase the inductance value. The effect is almost the same as with rods. In RFI applications tubes may also be shifted over wires. Because the magnetic flux path is then closed a steep increase in impedance will result. In such cases the sensitivity for DC currents however, may be rather high.

Curvature and mechanical tolerances of the standard range fullfil the requirements of DIN 41 291 or its equivalent IEC 233–1966.

RFI-suppression beads

For detailed information on these and other types see Data Handbook C4/C5

Thread the beads onto leads of a domestic appliance, or even a diode in a TV power supply, and perhaps it's all you need to meet the requirements for interference suppression. Special grades of materials have been developed for this application: 3S1 and 4S2. Minimum bead impedances are guaranteed at the frequencies in the table below. Beads are listed according to their magnetic effectiveness which is calculated by the formula L. ln D/d.

Wide band HF chokes are used for interference suppression, e.g. in electric motors. Double chokes are used for twin leads, in which case the advantage of mutual inductance can be utilized.

The chokes can be supplied with six axial holes through which 1.5, 2.5, or 2 x 1.5 (double chokes) turns of tinned copper wire are threaded.

The solderability of the leads is determined by the test TA, method 1 and ageing time as described in IEC 68–2–28.

Shapes and applications

For detailed information see Data Handbook C16

Rare earth magnets and Ferroxdure are among the most advanced permanent magnet materials available today. Magnets are made from these materials in a vast range of shapes and sizes, and the cost/weight/performance factor is excellent. Properly used, the strength of these magnets will remain practically unchanged throughout an indefinite lifetime. They are used mostly to transduce energy from one form to another, or to exert a force. This catalogue contains only a small selection of what is already being done: much more is possible.

Energy transduction

- **Electrical/mechanical**: in motors, meters, loudspeakers, beam deflectors, mass spectrometers
- **Mechanical/electrical**: in generators, alternators, dynamos, microphones, pick–ups
- **Mechanical/heat**: in hysteresis/torque and eddy–current instruments

Force exertion

- **On a magnetic material**: in attraction, repulsion, holding, lifting
- **On a moving electrical charge**: in magnetrons, klystrons, image intensifiers

Materials and shapes

- **Anisotropic ceramic Ferroxdure**
  (see Data Handbook C16 for type list)
  segments: in motors, magnetos
  rings: in loudspeakers, motors, magnetos
  disc and blocks: in metal seperators, chucks, clamping rings

- **Anisotropic plastic–bonded Ferroxdure**
  (see Data Handbook C16 for type list)
  wide range of shapes

- **Isotropic plastic–bonded Ferroxdure**
  (see Data Handbook C16 for type list)
  wide range of shapes: where flexible products and/or complex magnetizing patterns are required

- **Anisotropic sintered rare earth magnets**
  (see Data Handbook C16 for type list)
  blocks, slugs, segments: in applications requiring highest magnetic energies

High–power actuators

The high–power actuators produces in the 33 mode displacements far greater than those possible with simple PXE transducers operating in the 31 or 33 modes. It comprises a pile of PXE discs, held in compression with a force of about 1000 N by a cylindrical steel spring and interleaved with copper foil electrodes. The high compressive forces give the structure exceptional rigidity by eliminating all free play between the discs.

A voltage between the electrodes causes the discs to expand, stretching the cylindrical spring and producing an overall extension of the actuator. The actuator has a response time of around 200 μs.

Introduction

Our Data Handbook System comprises more than 60 books with specifications on electronic components, subassemblies and materials. It is made up of six series of handbooks:

INTEGRATED CIRCUITS
DISCRETE SEMICONDUCTORS
DISPLAY COMPONENTS
PASSIVE COMPONENTS
PROFESSIONAL COMPONENTS
MATERIALS

The data handbooks contain all pertinent data available at the time of publication, and each is revised and reissued periodically.
When ratings or specifications differ from those published in the preceding edition they are indicated with arrows in the page margin. Where application information is given it is advisory and does not form part of the product specification.
Information on current Data Handbooks and on how to obtain a subscription for future issues is available from any of the Organizations listed on the back cover.
Product specialists are at your service and enquiries will be answered promptly.
