RCA Solid State

DATABOOK Series

Linear Integrated Circuits and MOS Devices

This DATABOOK contains complete data on linear integrated circuits and MOS field-effect devices presently available from RCA Solid State Division as standard products. For ease of reference, data sheets on linear IC's are grouped in the following categories: (1) AM/FM communications circuits, (2) TV circuits and audio (stereo) circuits, (3) arrays, (4) broadband video amplifiers and differential amplifiers, (5) operational amplifiers, (6) power-control circuits, (7) special-function circuits. Application notes on both linear IC's and MOS devices are included in a separate DATABOOK, SSD-202.

A feature of this DATABOOK is a Selection Guide to the complete line of RCA solid-state devices (including COS/MOS digital integrated circuits, power transistors, power hybrid circuits, rf power devices, thyristors, rectifiers, and other diodes, as well as linear IC's and MOS devices). The complete Index to Devices at the back of the book identifies the volume of the DATABOOK series in which each type appears.

New solid-state devices and related publications announced during the year are described in a monthly newsletter entitled "What's New in Solid State". Copies of data sheets on new devices and other publications can be obtained by request to RCA Solid State Division, Box 3200, Somerville, N.J. 08876; RCA Limited, Lincoln Way, Windmill Road, Sunbury-on-Thames, Middlesex, England; or RCA S/A Parc-Industriel des Hauts-Sarts, Herstal, Liege, Belgium. If you wish to receive the monthly announcement newsletter, please fill out the form bound into the back of the book and return it to RCA.

	Page No.
Solid-State Selection Guide	4
Key to Linear Integrated Circuits and MOS Devices	9
Operating Considerations for RCA Solid-State Devices	10
Symbols for Linear IC's and MOS Devices	15
AM/FM Communications Circuits	17
TV Circuits and Audio (Stereo) Circuits	73
Linear IC Arrays	157
Broadband Video Amplifiers and Differential Amplifiers	225
Operational Amplifiers	357
Power-Control Circuits	433
Special-Function Circuits	459
Linear IC Chips and Beam-Lead (Sealed-Junction) Types	481
MOS Field-Effect Devices	509
Types Not Recommended for New Equipment Design	629
Index to RCA Solid-State Devices	633
Subscription Form for Announcement Newsletter	639

SOLID-STATE SELECTION GUIDE

This Selection Guide classifies RCA solid-state devices by category, by function, by material, and by performance level. This guide is particularly useful for an initial selection of suitable devices for a specific application. Complete data on these devices are given in the technical data sheets included in the respective DATABOOKS (see Index to RCA Solid-State Devices at back of book).

Operating Considerations for RCA Solid State Devices

Solid state devices are being designed into an increasing variety of electronic equipment because of their high standards of reliability and performance. However, it is essential that equipment designers be mindful of good engineering practices in the use of these devices to achieve the desired performance.

This Note summarizes important operating recommendations and precautions which should be followed in the interest of maintaining the high standards of performance of solid state devices.

The ratings included in RCA Solid State Devices data bulletins are based on the Absolute Maximum Rating System, which is defined by the following Industry Standard (JEDEC) statement:

Absolute-Maximum Ratings are limiting values of operating and environmental conditions applicable to any electron device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

The device manufacturer chooses these values to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in device characteristics.

The equipment manufacturer should design so that initially and throughout life no absolute-maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations in device characteristics.

It is recommended that equipment manufacturers consult RCA whenever device applications involve unusual electrical, mechanical or environmental operating conditions.

GENERAL CONSIDERATIONS

The design flexibility provided by these devices makes possible their use in a broad range of applications and under many different operating conditions. When incorporating these devices in equipment, therefore, designers should anticipate the rare possibility of device failure and make certain that no safety hazard would result from such an occurrence.

The small size of most solid state products provides obvious advantages to the designers of electronic equipment. However, it should be recognized that these compact devices usually provide only relatively small insulation area between adjacent leads and the metal envelope. When these devices are used in moist or contaminated atmospheres, therefore, supplemental protection must be provided to prevent the development of electrical conductive paths across the relatively small insulating surfaces. For specific information on voltage creepage, the user should consult references such as the JEDEC Standard No. 7 "Suggested Standard on Thyristors," and JEDEC Standard RS282 "Standards for Silicon Rectifier Diodes and Stacks".

The metal shells of some solid state devices operate at the collector voltage and for some rectifiers and thyristors at the anode voltage. Therefore, consideration should be given to the possibility of shock hazard if the shells are to operate at voltages appreciably above or below ground potential. In general, in any application in which devices are operated at voltages which may be dangerous to personnel, suitable precautionary measures should be taken to prevent direct contact with these devices.

Devices should not be connected into or disconnected from circuits with the power on because high transient voltages may cause permanent damage to the devices.

TRANSISTORS WITH FLEXIBLE LEADS

Flexible leads are usually soldered to the circuit elements. It is desirable in all soldering operations to provide some slack or an expansion elbow in each lead, to prevent excessive tension on the leads. It is important during the soldering operation to avoid excessive heat in order to prevent possible damage to the devices. Some of the heat can be absorbed if the flexible lead of the device is grasped between the case and the soldering point with a pair of pliers.

TRANSISTORS WITH MOUNTING FLANGES

The mounting flanges of JEDEC-type packages such as the TO-3 or TO-66 often serve as the collector or anode terminal. In such cases, it is essential that the mounting flange be securely fastened to the heat sink, which may be the equipment chassis. UNDER NO CIRCUMSTANCES, HOWEVER, SHOULD THE MOUNTING FLANGE BE SOLDERED DIRECTLY TO THE HEAT SINK OR CHASSIS BECAUSE THE HEAT OF THE SOLDERING OPERATION COULD PERMANENTLY DAMAGE THE DEVICE.

Such devices can be installed in commercially available sockets. Electrical connections may also be made by soldering directly to the terminal pins. Such connections may

be soldered to the pins close to the pin seals provided care is taken to conduct excessive heat away from the seals; otherwise the heat of the soldering operation could crack the pin seals and damage the device.

During operation, the mounting-flange temperature is higher than the ambient temperature by an amount which depends on the heat sink used. The heat sink must have sufficient thermal capacity to assure that the heat dissipated in the heat sink itself does not raise the device mounting-flange temperature above the rated value. The heat sink or chassis may be connected to either the positive or negative supply.

In many applications the chassis is connected to the voltage-supply terminal. If the recommended mounting hardware shown in the data bulletin for the specific solid-state device is not available, it is necessary to use either an anodized aluminum insulator having high thermal conductivity or a mica insulator between the mounting-flange and the chassis. If an insulating aluminum washer is required, it should be drilled or punched to provide the two mounting holes for the terminal pins. The burrs should then be removed from the washer and the washer anodized. To insure that the anodized insulating layer is not destroyed during mounting, it is necessary to remove the burrs from the holes in the chassis.

It is also important that an insulating bushing, such as glass-filled nylon, be used between each mounting bolt and the chassis to prevent a short circuit. However, the insulating bushing should not exhibit shrinkage or softening under the operating temperatures encountered. Otherwise the thermal resistance at the interface between transistor and heat sink may increase as a result of decreasing pressure.

PLASTIC POWER TRANSISTORS AND THYRISTORS

RCA power transistors and thyristors (SCR's and triacs) in molded-silicone-plastic packages are available in a wide range of power-dissipation ratings and a variety of package configurations. The following paragraphs provide guidelines for handling and mounting of these plastic-package devices, recommend forming of leads to meet specific mounting requirements, and describe various mounting arrangements, thermal considerations, and cleaning methods. This information is intended to augment the data on electrical characteristics, safe operating area, and performance capabilities in the technical bulletin for each type of plastic-package transistor or thyristor.

Lead-Forming Techniques

The leads of the RCA VERSAWATT in-line plastic packages can be formed to a custom shape, provided they are not indiscriminately twisted or bent. Although these leads can be formed, they are not flexible in the general sense, nor are they sufficiently rigid for unrestrained wire wrapping

Before an attempt is made to form the leads of an in-line package to meet the requirements of a specific application, the desired lead configuration should be determined, and a lead-bending fixture should be designed and constructed. The use of a properly designed fixture for this operation eliminates the need for repeated lead bending. When the use of a special bending fixture is not practical, a pair of long-nosed pliers may be used. The pliers should hold the lead firmly between the bending point and the case, but should not touch the case.

When the leads of an in-line plastic package are to be formed, whether by use of long-nosed pliers or a special bending fixture, the following precautions must be observed to avoid internal damage to the device:

1. Restrain the lead between the bending point and the plastic case to prevent relative movement between the lead and the case.
2. When the bend is made in the plane of the lead (spreading), bend only the narrow part of the lead.
3. When the bend is made in the plane perpendicular to that of the leads, make the bend at least 1/8 inch from the plastic case.
4. Do not use a lead-bend radius of less than 1/16 inch.
5. Avoid repeated bending of leads.

The leads of the TO-220AB VERSAWATT in-line package are not designed to withstand excessive axial pull. Force in this direction greater than 4 pounds may result in permanent damage to the device. If the mounting arrangement tends to impose axial stress on the leads, some method of strain relief should be devised.

Wire wrapping of the leads is permissible, provided that the lead is restrained between the plastic case and the point of the wrapping. Soldering to the leads is also allowed. The maximum soldering temperature, however, must not exceed 275°C and must be applied for not more than 5 seconds at a distance not less than 1/8 inch from the plastic case. When wires are used for connections, care should be exercised to assure that movement of the wire does not cause movement of the lead at the lead-to-plastic junctions.

The leads of RCA molded-plastic high-power packages are not designed to be reshaped. However, simple bending of the leads is permitted to change them from a standard vertical to a standard horizontal configuration, or conversely. Bending of the leads in this manner is restricted to three 90-degree bends; repeated bendings should be avoided.

Mounting

Recommended mounting arrangements and suggested hardware for the VERSAWATT transistors are given in the data bulletins for specific devices and in RCA Application Note AN-4124. When the transistor is fastened to a heat sink, a rectangular washer (RCA Part No. NR231A) is recommended to minimize distortion of the mounting flange. Excessive distortion of the flange could cause damage to the transistor. The washer is particularly important when the size of the mounting hole exceeds 0.140 inch (6-32 clearance). Larger holes are needed to accommodate insulating bushings; however, the holes should not be larger than necessary to provide hardware clearance and, in any case, should not exceed a diameter of 0.250 inch.

Flange distortion is also possible if excessive torque is used during mounting. A maximum torque of 8 inch-pounds

is specified. Care should be exercised to assure that the tool used to drive the mounting screw never comes in contact with the plastic body during the driving operation. Such contact can result in damage to the plastic body and internal device connections. An excellent method of avoiding this problem is to use a spacer or combination spacer-isolating bushing which raises the screw head or nut above the top surface of the plastic body. The material used for such a spacer or spacer-isolating bushing should, of course, be carefully selected to avoid "cold flow" and consequent reduction in mounting force. Suggested materials for these bushings are diallphtalate, fiberglass-filled nylon, or fiberglass-filled polycarbonate. Unfilled nylon should be avoided.

Modification of the flange can also result in flange distortion and should not be attempted. The transistor should not be soldered to the heat sink by use of lead-tin solder because the heat required with this type of solder will cause the junction temperature of the transistor to become excessively high.

The TO-220AA plastic transistor can be mounted in commercially available TO-66 sockets, such as UID Electronics Corp. Socket No. PTS-4 or equivalent. For testing purposes, the TO-220AB in-line package can be mounted in a Jetron Socket No. CD74-104 or equivalent. Regardless of the mounting method, the following precautions should be taken:

1. Use appropriate hardware.
2. Always fasten the transistor to the heat sink before the leads are soldered to fixed terminals.
3. Never allow the mounting tool to come in contact with the plastic case.
4. Never exceed a torque of 8 inch-pounds.
5. Avoid oversize mounting holes.
6. Provide strain relief if there is any probability that axial stress will be applied to the leads.
7. Use insulating bushings to prevent hot-creep problems. Such bushings should be made of diallphthalate, fiberglass-filled nylon, or fiberglass-filled polycarbonate.

The maximum allowable power dissipation in a solid state device is limited by the junction temperature. An important factor in assuring that the junction temperature remains below the specified maximum value is the ability of the associated thermal circuit to conduct heat away from the device.

When a solid state device is operated in free air, without a heat sink, the steady-state thermal circuit is defined by the junction-to-free-air thermal resistance given in the published data for the device. Thermal considerations require that a free flow of air around the device is always present and that the power dissipation be maintained below the level which would cause the junction temperature to rise above the maximum rating. However, when the device is mounted on a heat sink, care must be taken to assure that all portions of the thermal circuit are considered.

To assure efficient heat transfer from case to heat sink when mounting RCA molded-plastic solid state power devices, the following special precautions should be observed:

1. Mounting torque should be between 4 and 8 inch-pounds.
2. The mounting holes should be kept as small as possible.
3. Holes should be drilled or punched clean with no burrs or ridges, and chamfered to a maximum radius of 0.010 inch.
4. The mounting surface should be flat within 0.002 inch/inch.
5. Thermal grease (Dow Corning 340 or equivalent) should always be used on both sides of the insulating washer if one is employed.
6. Thin insulating washers should be used. (Thickness of factory-supplied mica washers range from 2 to 4 mils).
7. A lock washer or torque washer, made of material having sufficient creep strength, should be used to prevent degradation of heat sink efficiency during life.

A wide variety of solvents is available for degreasing and flux removal. The usual practice is to submerge components in a solvent bath for a specified time. However, from a reliability stand point it is extremely important that the solvent, together with other chemicals in the solder-cleaning system (such as flux and solder covers), do not adversely affect the life of the component. This consideration applies to all non-hermetic and molded-plastic components.

It is, of course, impractical to evaluate the effect on long-term transistor life of all cleaning solvents, which are marketed with numerous additives under a variety of brand names. These solvents can, however, be classified with respect to their component parts, as either acceptable or unacceptable. Chlorinated solvents tend to dissolve the outer package and, therefore, make operation in a humid atmosphere unreliable. Gasoline and other hydrocarbons cause the inner encapsulant to swell and damage the transistor. Alcohol and unchlorinated freons are acceptable solvents. Examples of such solvents are:

1. Freon TE
2. Freon TE-35
3. Freon TP-35 (Freon PC)
4. Alcohol (isopropanol, methanol, and special denatured alcohols, such as SDA1, SDA30, SDA34, and SDA44)

Care must also be used in the selection of fluxes for lead soldering. Rosin or activated rosin fluxes are recommended, while organic or acid fluxes are not. Examples of acceptable fluxes are:

1. Alpha Reliaros No. 320-33
2. Alpha Reliaros No. 346
3. Alpha Reliaros No. 711
4. Alpha Reliafoam No. 807
5. Alpha Reliafoam No. 809
6. Alpha Reliafoam No. 811-13
7. Alpha Reliafoam No. 815-35
8. Kester No. 44

If the completed assembly is to be encapsulated, the effect on the molded-plastic transistor must be studied from both a chemical and a physical standpoint.

RECTIFIERS AND THYRISTORS

A surge-limiting impedance should always be used in series with silicon rectifiers and thyristors. The impedance value must be sufficient to limit the surge current to the value specified under the maximum ratings. This impedance may be provided by the power transformer winding, or by an external resistor or choke.

A very efficient method for mounting thyristors utilizing packages such as the JEDEC TO-5 and "modified TO-5" is to provide intimate contact between the heat sink and at least one half of the base of the device opposite the leads. These packages can be mounted to the heat sink mechanically with glue or an epoxy adhesive, or by soldering. Soldering to the heat sink is preferable because it is the most efficient method.

The use of a "self-jigging" arrangement and a solder preform is recommended. Such an arrangement is illustrated in RCA Publication MHI-300B, "Mounting Hardware Supplied with RCA Semiconductor Devices". If each unit is soldered individually, the heat source should be held on the heat sink and the solder on the unit. Heat should be applied only long enough to permit solder to flow freely. For more detailed thyristor mounting considerations, refer to Application Note AN3822, "Thermal Considerations in Mounting of RCA Thyristors".

MOS FIELD-EFFECT TRANSISTORS

Insulated-Gate Metal Oxide-Semiconductor Field-Effect Transistors (MOS FETs), like bipolar high-frequency transistors, are susceptible to gate insulation damage by the electrostatic discharge of energy through the devices. Electrostatic discharges can occur in an MOS FET if a type with an unprotected gate is picked up and the static charge, built in the handler's body capacitance, is discharged through the device. With proper handling and applications procedures, however, MOS transistors are currently being extensively used in production by numerous equipment manufacturers in military, industrial, and consumer applications, with virtually no problems of damage due to electrostatic discharge.

In some MOS FETs, diodes are electrically connected between each insulated gate and the transistor's source. These diodes offer protection against static discharge and in-circuit transients without the need for external shorting mechanisms. MOS FETs which do not include gate-protection diodes can be handled safely if the following basic precautions are taken:

1. Prior to assembly into a circuit, all leads should be kept shorted together either by the use of metal shorting springs attached to the device by the vendor, or by the insertion into conductive material such as "ECCOSORB* LD26" or equivalent.
   (NOTE: Polystyrene *insulating* "SNOW" is not sufficiently conductive and should not be used.)
2. When devices are removed by hand from their carriers, the hand being used should be grounded by any suitable means, for example, with a metallic wristband.
3. Tips of soldering irons should be grounded.
4. Devices should never be inserted into or removed from circuits with power on.

*Trade Mark: Emerson and Cumming, Inc.

INTEGRATED CIRCUITS

In any method of mounting integrated circuits which involves bending or forming of the device leads, it is extremely important that the lead be supported and clamped between the bend and the package seal, and that bending be done with care to avoid damage to lead plating. In no case should the radius of the bend be less than the diameter of the lead, or in the case of rectangular leads,such as those used in RCA 14-lead and 16-lead flat-packages, less than the lead thickness. It is also extremely important that the ends of the bent leads be straight to assure proper insertion through the holes in the printed-circuit board.

COS/MOS (Complementary-Symmetry MOS) Integrated Circuits

Although protection against electrostatic effects is provided by built-in circuitry, the following precautions should be taken in handling these circuits:

1. Soldering-iron tips and test equipment should be grounded.
2. Devices should not be inserted in non-conductive containers such as conventional plastic snow or trays. A conductive material such as "ECCOSORB LD26" or equivalent should be used.

Low-source-impedance pulse generators connected to the inputs of these devices must be disconnected before the dc power supply is turned off. All unused input leads must be connected to either V_{SS} or V_{DD}, whichever is appropriate for the logic circuit operation desired.

SOLID STATE CHIPS

Solid state chips, unlike packaged devices, are non-hermetic devices, normally fragile and small in physical size, and therefore, require special handling considerations as follows:

1. Chips must be stored under proper conditions to insure that they are not subjected to a moist and/or contaminated atmosphere that could alter their electrical, physical, or mechanical characteristics. After the shipping container is opened, the chip must be stored under the following conditions:
   A. Storage temperature, 40°C max.
   B. Relative humidity, 50% max.
   C. Clean, dust-free environment.
2. The user must exercise proper care when handling chips to prevent even the slightest physical damage to the chip.
3. During mounting and lead bonding of chips the user must use proper assembly techniques to obtain proper electrical, thermal, and mechanical performance.
4. After the chip has been mounted and bonded, any necessary procedure must be followed by the user to insure that these non-hermetic chips are not subjected to

moist or contaminated atmosphere which might cause the development of electrical conductive paths across the relatively small insulating surfaces. In addition, proper consideration must be given to the protection of these devices from other harmful environments which could conceivably adversely affect their proper performance.

SOLID STATE LASERS AND EMITTING DIODES

Optoelectronic devices should employ the same mounting and heat-sink procedures utilized with other solid state devices. The temperature ratings established for storing, mounting, and operating these devices must not be exceeded to avoid damaging the emitters. Because the extremely small size and high driving-current requirements of some of these devices preclude the use of polarity marks on the housing and package configurations, care must be taken to insure that voltage is always applied in the proper direction. It is important, therefore, to refer to the data bulletin for the proper polarity before applying voltage to the device. Pulse driving circuitry should be designed to prevent transients (positive or negative) or momentary surges from exceeding drive conditions. The following suggestions are offered:

1. High-speed clipping diodes should be placed at terminals to bypass negative transients.
2. High-speed, sense-and-clamp circuitry should be used to prevent overdrive in peak or average current by clamping or disconnect techniques. For short pulses, ordinary thermal fuses should not be used because they do not provide adequate device protection.

The characteristics of solid state emitters vary substantially with changes in ambient temperature. Threshold, the point at which lasing starts, is highly dependent on temperature and requires compensation of drive current in applications where operation over a wide temperature range is a design requirement. A room-temperature laser can be damaged if a constant drive current is maintained while the ambient temperature is reduced to cryogenic levels. Published data bulletins for individual devices specify safe levels of operation.

In most cases, the voltage drop across a solid state emitter is of comparatively low amplitude; however, the required drive current may be many amperes. As in the case of other high-operating-current devices, therefore, clean and low-impedance contacts are required in all applications.

High voltage may be present in pulse-driven circuits utilizing these devices. Therefore, consideration should be given to the possibility of shock hazard which may result from contact with these high voltages. In general, where devices are operating at potentials which may be dangerous to personnel, suitable precautionary measures should be taken to prevent direct contact with these devices.

Radiation Safety Considerations

Injection laser diodes emit electromagnetic radiation at wavelengths which may be invisible to the human eye. Suitable precautions must be taken to avoid possible damage to the eye from overexposure to this radiant energy. Precautionary measures include the following:

1. *In Systems with No External Lens* – Avoid viewing the laser source at close range. Since the emitted beam is not collimated, increasing the distance to the laser source greatly reduces the risk of overexposure.
2. *In Systems Utilizing External Optics* – Avoid viewing the emitter directly along the optical axis of the radiated beam.
3. *Reflections From Surfaces* – Minimize unwanted specular reflections in the system.

ADDITIONAL DATA

Additional information on handling, mounting, and operating RCA Solid State Devices is given in the following publications which are available on request from RCA/ Commercial Engineering, Harrison, N.J. 07029.

I_{DSS}	zero-gate (bias) drain current (single-gate types)
I_{GS}	gate terminal current (single-gate types)
I_{G1S}	gate-no. 1-terminal current (dual-gate types)
I_{G2S}	gate-no. 2-terminal current (dual-gate types)
I_{GSSF}	gate-to-source forward leakage current, all other terminals shorted to source (single-gate types)
I_{G1SSF}	gate-no. 1-to-source forward leakage current, all other terminals shorted to source (dual-gate types)
I_{G2SSF}	gate-no. 2-to-source forward leakage current, all other terminals shorted to source (dual-gate types)
I_{GSSR}	gate-to-source reverse leakage current, all other terminals shorted to source (single-gate types)
I_{G1SSR}	gate-no. 1-to-source reverse leakage current, all other terminals shorted to source (dual-gate types)
I_{G2SSR}	gate-no. 2-to-source reverse leakage current, all other terminals shorted to source (dual-gate types)
i_n	equivalent open-circuit input noise current (pA/ $\sqrt{Hz}$)
MAG	maximum available power gain
MUG	maximum usable power gain (unneutralized)
NF	noise figure
P_T	transistor dissipation
$r_{ds(off)}$	small-signal drain-to-source off-state resistance
$r_{ds(on)}$	small-signal drain-to-source on-state resistance
$r_{DS(on)}$	static drain-to-source on-state resistance
R_{GS}	gate-leakage-current resistance
r_{iss}	small-signal short-circuit common-source input resistance
r_{oss}	small-signal, short-circuit, common-source output resistance
T_A	ambient temperature
$V_{(BR)GSSF}$	dc gate-to-source forward breakdown voltage, all other terminals shorted to source (single-gate types)
$V_{(BR)G1SSF}$	dc gate-no. 1-to-source forward breakdown voltage, all other terminals shorted to source (dual-gate types)
$V_{(BR)G2SSF}$	dc gate-no. 2-to-source forward breakdown voltage, all other terminals shorted to source (dual-gate types)
$V_{(BR)GSSR}$	dc gate-to-source reverse breakdown voltage, all other terminals shorted to source (single-gate types)
$V_{(BR)G1SSR}$	dc gate-no. 1-to-source reverse breakdown voltage, all other terminals shorted to source (dual-gate types)
$V_{(BR)G2SSR}$	dc gate-no. 2-to-source reverse breakdown voltage, all other terminals shorted to source (dual-gate types)
V_{DG}	drain-to-gate voltage (single-gate types)
V_{DG1}	drain-to-gate-no. 1 voltage (dual-gate types)
V_{DG2}	drain-to-gate-no. 2 voltage (single-gate types)
V_{DS}	drain-to-source voltage
V_{GS}	gate-to-source voltage (single-gate types)
$V_{GS(off)}$	gate-to-source cutoff voltage (single-gate types)
V_{G1S}	gate-no. 1-to-source voltage (dual-gate types)
$V_{G1S(off)}$	gate-no. 1-to-source cutoff voltage (dual-gate types)
V_{G2S}	gate-no. 2-to-source voltage (dual-gate types)
$V_{G2S(off)}$	gate-no. 2-to-source cutoff voltage (dual-gate types)
V_{knee}	protective diode knee voltage (protected gate types)
$\lvert y_{fs} \rvert$	magnitude of small-signal common-source, short-circuit forward transadmittance
$\angle y_{fs}$	phase angle of small-signal, common-source, short-circuit forward transfer admittance (transadmittance)
y_{is}	small-signal, common-source, short-circuit input admittance (conductance real part of admittance; susceptance imaginary part of admittance)
y_{os}	small-signal, common-source, short-circuit output admittance (conductance real part of admittance; susceptance imaginary part of admittance)
$\lvert y_{os} \rvert$	magnitude of small-signal, common-source, short-circuit output admittance
$\lvert y_{rs} \rvert$	magnitude of small-signal, common-source, short-circuit reverse transadmittance
$\angle y_{rs}$	phase angle of small-signal, common-source, short-circuit reverse transadmittance
Θ_{rs}	angle of reverse transadmittance, common-source circuit

OPERATING-TEMPERATURE RANGE ..... -55 to +125° C
STORAGE-TEMPERATURE RANGE ..... -65 to +150° C
MAXIMUM INPUT-SIGNAL VOLTAGE:
Between Terminals 1 and 2 ..... ±3 V
MAXIMUM DEVICE DISSIPATION ..... 300 mW
RECOMMENDED MINIMUM DC SUPPLY VOLTAGE (V_{CC}) .. 5.5 V

Example of Use of LIMITS TABLE:

For RCA-3012, a maximum voltage of ±3 volts may be applied to Terminal 1 under the following conditions:

Terminal 2 is at the same dc potential as Terminal 1
Terminal 3: do not apply external voltage
Terminal 4 is at any dc potential between +2.5 and +10 volts
Terminal 5 is at a dc potential of +10 volts
Terminals 6, 7, and 9 are at 0 dc potential (NOT USED)
Terminal 8 is at dc ground potential
Terminal 10 is at a dc potential of +10 volts

DEFINITIONS OF TERMS

Input Unbalance Voltage

The difference in the dc voltages at the two input terminals.

Input Unbalance Current

The difference in the currents in the two input terminals.

Input Bias Current

The average value (one-half the sum) of the currents at the two input terminals.

Quiescent Operating Voltage

The dc voltage at either output terminal, with respect to ground, with no ac input signal applied.

Device Dissipation

The total power drain of the device with no signal applied and no external load current.

Power Gain

The ratio of the signal power developed at the output of the device to the signal power applied to the input, expressed in dB.

Total Harmonic Distortion

The ratio of the total rms voltage of all harmonics to the rms voltage of the Fundamental, expressed in per cent. This voltage is measured at either output terminal with respect to ground.

Common-Mode Voltage Gain

The ratio of the signal voltages developed between the two output terminals to the signal voltage applied to the two input terminals connected in parallel for ac.

Differential Voltage Gain

The ratio of the change in output voltage at either output terminal with respect to ground, to a change in input voltage at either input terminal with respect to ground, with the other input terminal at ac ground.

Common-Mode Rejection Ratio

The ratio of the full differential voltage gain to the common-mode voltage gain.

Input Impedance

The ratio of the change in input voltage to the change in input current measured at either input terminal with respect to ground, with the other input terminal at ground potential for ac.

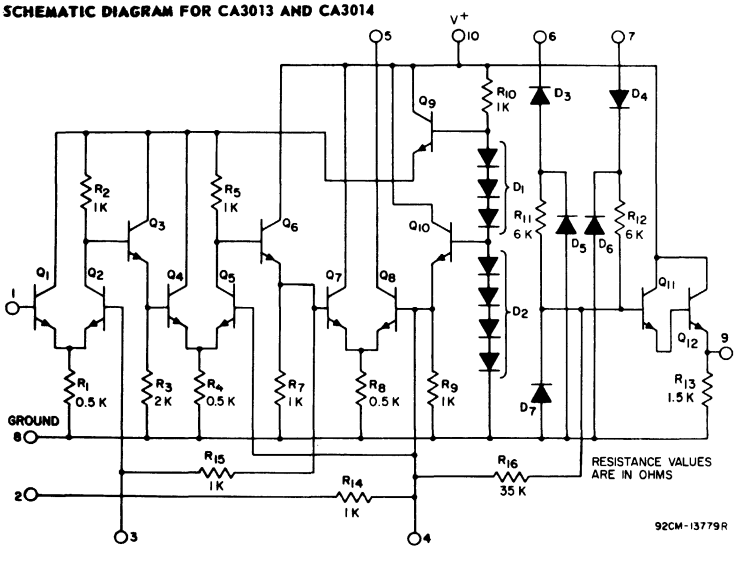
Monolithic Silicon

SCHEMATIC DIAGRAM FOR CA3013 AND CA3014



FEATURES & APPLICATIONS:

- **exceptionally high gain:**
  power gain at 4.5 MHz — 75 dB typ.
- **excellent limiting characteristics — input limiting voltage (knee) = 300 μV typ. at 4.5 MHz**
- **excellent AM rejection: > 50 dB at 4.5 MHz**
- **high audio-voltage recovery — 220 mV typ. at 4.5 MHz 25 kHz deviation**
- **wide frequency capability — 100 kHz to > 20 MHz**
- **comprehensive circuit functions:**
  if amplifier, AM and noise limiter, FM detector, audio preamplifier

MAXIMUM DEVICE DISSIPATION. . . . . 300 mW

RECOMMENDED MINIMUM DC SUPPLY VOLTAGE (V_{CC}). . . . . 5.5 V

Example of use of LIMITS TABLE:

For RCA-CA3013, a maximum voltage of ±3 volts may be applied to Terminal 1 under the following conditions:

Terminal 2 is at the same dc potential as Terminal 1
Terminal 3: do not apply external voltage
Terminal 4 is at any dc potential between +2.5 and +7.5 volts
Terminal 5 is at a dc potential of +7.5 volts
Terminals 6 and 7 are at the same dc potential as Terminal 4
Terminal 8 is at dc ground potential
Terminal 9 is used as the af output terminal
Terminal 10 is at a dc potential of +7.5 volts

TYPICAL CHARACTERISTICS AND TEST SETUPS

DISSIPATION TEST SETUP

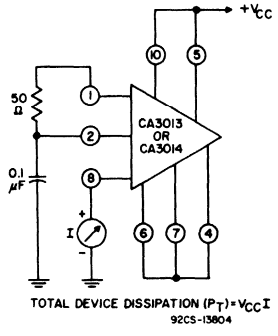

Fig.3

DISSIPATION vs. TEMPERATURE

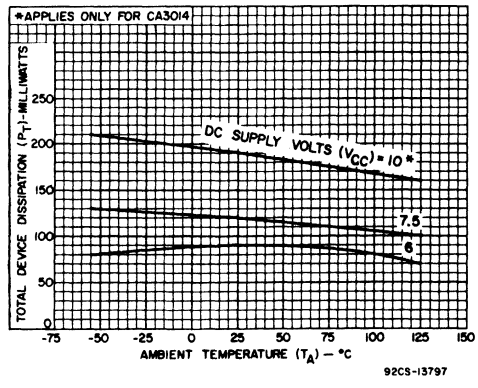

Fig.4

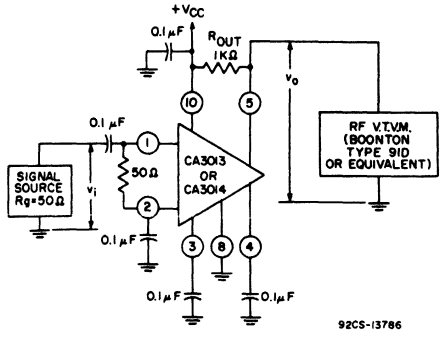
VOLTAGE-GAIN TEST SETUP



PROCEDURE:

1) Set input frequency at desired value, v_i = 100 μV rms.
2) Record v_o.
3) Calculate Voltage Gain A from $A = 20 \log_{10} v_o/v_i$.
4) Repeat Steps 1, 2, and 3 for each frequency and/or temperature desired.

TYPICAL CHARACTERISTICS AND TEST SETUPS

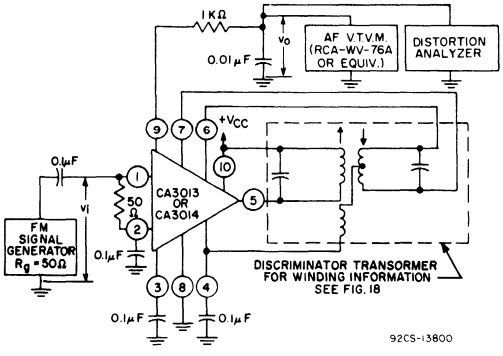
INPUT LIMITING VOLTAGE, RECOVERED AF VOLTAGE, AND TOTAL HARMONIC DISTORTION TEST SETUP



PROCEDURE:

A - Recovered-AF Voltage Output:

1) Set input frequency = 4.5 Mc/s, v_i = 100 mV rms, modulating frequency = 1 kc/s, frequency deviation = ±25 kc/s.

2) Record v_o as Recovered-AF Voltage Output.

B - Input Limiting Voltage (Knee):

1) Repeat Steps A1 and A2, using v_i = 100 mV rms.

2) Decrease v_i to the level at which v_o is 3 dB below its value for v_i = 100 mV.

3) Record v_i as Input Limiting Voltage (Knee).

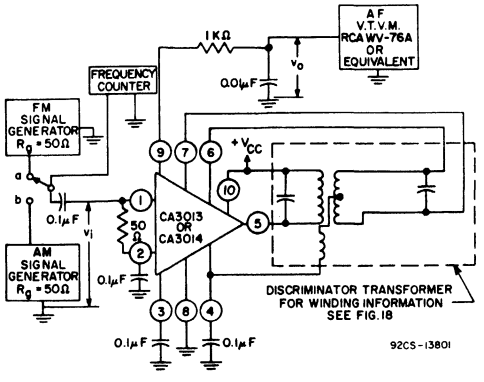
AM-REJECTION TEST SETUP



PROCEDURE:

1) With Switch S in position "a", set input frequency = 4.5 Mc/s, v_i = 10 mV rms, modulating frequency = 1 kc/s, frequency deviation = ±25 kc/s.
2) Record v_o.
3) Place Switch S in position "b", and set input frequency = 4.5 Mc/s, v_i = 10 mV rms, modulating frequency = 1 kc/s, % modulation = 50.
4) Measure v_o, and record value in dB below value in Step 2 as AM Rejection.

4. Measure from Max. øD.
5. N_1 is the quantity of allowable missing leads.
6. N is the maximum quantity of lead positions.

RCA Solid State Division

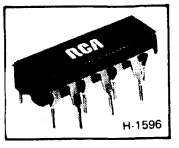
Linear Integrated Circuits

CA3041

WIDE-BAND AMPLIFIER, FM DETECTOR AF PREAMPLIFIER/DRIVER

Monolithic Silicon

For Sound Sections of TV Receivers Using Tube-Type AF Output Amplifiers



RCA Integrated Circuit Type CA3041 provides, in a single monolithic silicon chip, a major subsystem for the sound sections of TV receivers. As shown in the Schematic Diagram (Fig.1) and the TV Receiver Block Diagrams (Fig.2) the CA3041 contains a multistage wide-band if-amplifier/limiter section, an FM-detector stage, a Zener-diode-regulated power-supply section, and an af-amplifier section specifically designed to drive directly a 6AQ5 beam power tube or other audio output tube of similar characteristics.

In FM receivers, the CA3041 can be used to provide if amplification and limiting, FM detection, and af preamplification.

The CA3041 provides exceptional versatility of circuit design because the if-amplifier/limiter section, FM detector section, and af-preamplifier/driver section can be used independently of each other.

The CA3041 utilizes a 14-lead dual-in-line plastic package with leads specially formed to facilitate automatic insertion of the device in suitably punched printed-circuit boards. Templates showing recommended layout of printed-circuit boards for the CA3041 are provided in this bulletin (Figs. 13, 14 and 15).

FEATURES

- **high-sensitivity – input limiting voltage (knee) = 150 μV typ. at 4.5 MHz**
- **large audio drive voltage capability**
- **excellent AM rejection – 58 dB typ. at 4.5 MHz**
- **inherent high stability – internally shielded**
- **internal Zener-diode-regulated voltage supply**
- **low harmonic radiation**
- **wide frequency capability – <100 kHz to > 20 MHz**
- **low harmonic distortion**

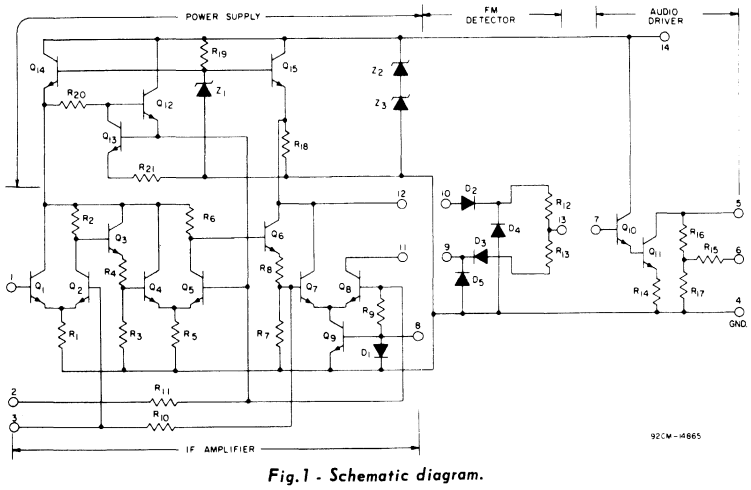


Fig. 1 - Schematic diagram.

ABSOLUTE-MAXIMUM VOLTAGE AND CURRENT LIMITS AT T_A = 25°C

Indicated voltage or current limits for each terminal may be applied under the specified voltage conditions for other terminals. All voltages are with respect to ground (Terminal 4).

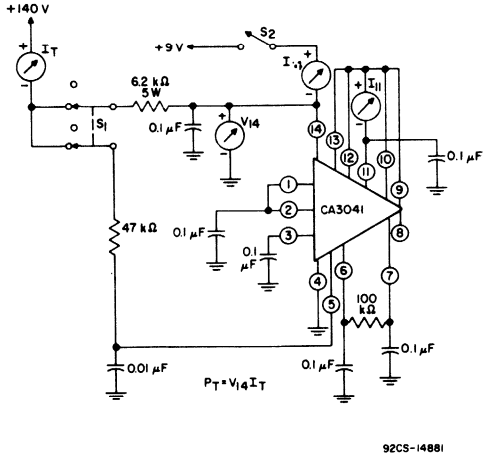
* TRW Electronics, Des Plaines, Illinois. Part No. EO23874, or equivalent.

Fig.2 - Block diagram of typical TV receiver using CA3041.



PROCEDURES:

Total Device Dissipation:

1. Close S_1, open S_2.
2. Measure and record V_{14} and I_T.
3. Determine Total Device Dissipation from $P_T = V_{14} I_T$.

Quiescent Operating Current into Terminal 11:

1. Close S_1, open S_2.
2. Measure I_{11} and record as Quiescent Operating Current into Terminal 11.

9-Volt Current Drain:

1. Open S_1, close S_2.
2. Measure I_{14} and record as 9-Volt Current Drain.

Fig.3 - Test setup for total dissipation, quiescent operating current into terminal No.11, and 9-volt current drain.

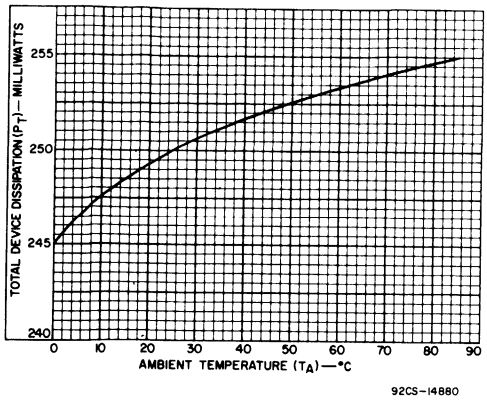


Fig.4 - Typical dissipation characteristic for CA3041.

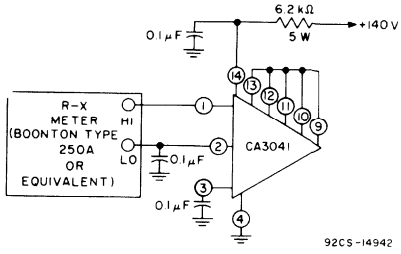

Fig.5 - Test setup for measurement of input-impedance components.

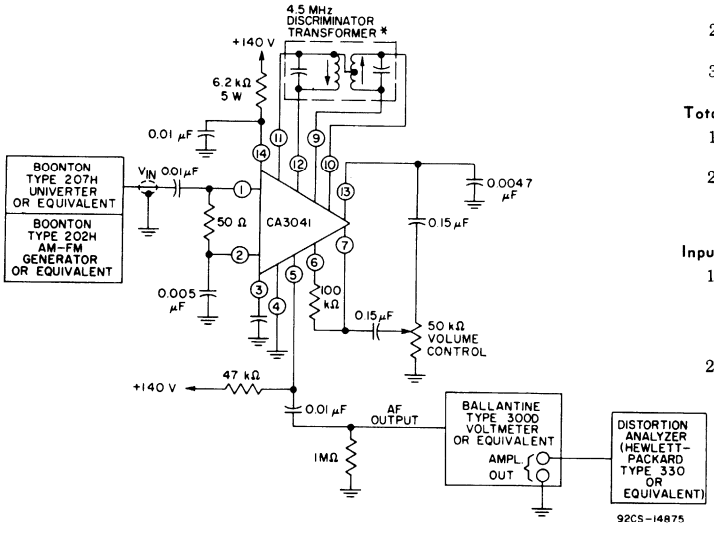


PROCEDURES:

Recovered AF Voltage:

1. Set Input Signal Generator as follows:
   Output frequency = 4.5 MHz
   Modulating frequency = 1 kHz
   Deviation = ± 25 kHz
   Output level for V_{in} = 100 mV rms
2. Set volume control for maximum af output.
3. Measure af output voltage and record as Recovered AF Voltage.

Total Harmonic Distortion:

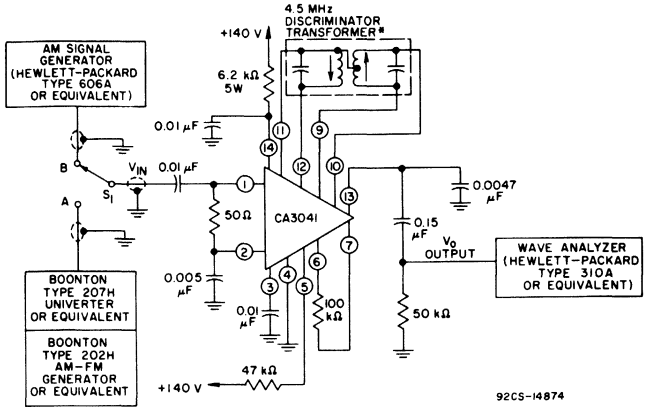
1. Adjust volume control for an af output voltage of 300 mV rms.
2. Measure Total Harmonic Distortion of the output signal in accordance with the Operating Instructions for the Distortion Analyzer.

Input Limiting Voltage (Knee):

1. Decrease V_{in} until the af output voltage is 3 dB less than the value set in Step 1 of the procedure for measurement of Total Harmonic Distortion (300 mV - 3 dB = 210 mV)
2. Measure resulting value of V_{in} and record as Input Limiting Voltage (Knee).

* TRW Electronics, Des Plaines, Illinois. Part No. EO23874, or equivalent.

Fig.6 - Test setup for measurement of input limiting voltage (Knee), recovered AF voltage, and total harmonic distortion.



PROCEDURES:

1. Set FM Signal Generator as follows:
   Output frequency = 4.5 MHz
   Modulating frequency = 1000 Hz
   Deviation = ± 25 kHz
   Output level for V_{in} = 100 mV rms
2. Set AM Signal Generator as follows:
   Output frequency = 4.5 MHz
   Modulating frequency = 1000 Hz
   Per cent modulation = 30
   Output level for V_{in} = 10 mV rms
3. With S_1 in Position A measure AF Output Voltage and record as $V_{o(FM)}$.
4. With S_1 in Position B measure AF Output Voltage and record as $V_{o(AM)}$.
5. Determine AM Rejection from
   $AMR = V_{o(FM)}/V_{o(AM)}$

* TRW Electronics, Des Plaines, Illinois. Part No. EO23874, or equivalent.

Fig.7 - Test setup for measurement of AM rejection.

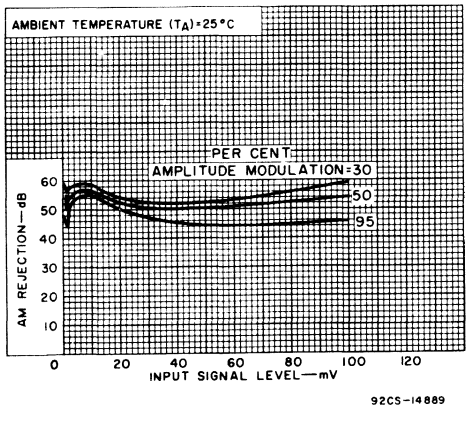


Fig.8 - Typical AM rejection characteristics for CA3041.

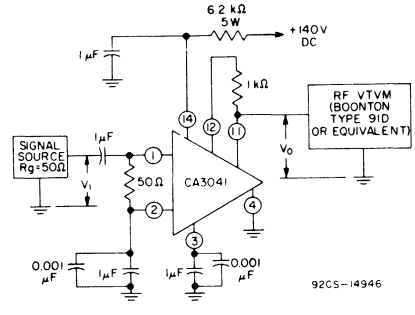

PROCEDURE:

A - Voltage Gain:

1) Set input frequency at desired value, v_i = 100 μV rms.
2) Record v_o.
3) Calculate Voltage Gain A from $A = 20 \log_{10} v_o/v_i$
4) Repeat Steps 1, 2, and 3 for each frequency and/or for temperature desired.

DEFINITIONS OF TERMS

Total Device Dissipation (P_T)

The total power drain of the device with no signal applied and no external load current.

Voltage Gain (A)

The ratio of the signal voltage developed at the output of the device to the signal voltage applied to the input, expressed in dB.

Input Impedance

The ratio of a change in input voltage to a change in input current, measured at the input terminal of the device, with respect to ground.

Output Impedance

The ratio of a change in output voltage to a change in output current, measured at the output terminal of the device, with respect to ground.

Input Limiting Voltage (Knee) [v_i(lim)]

The input signal voltage which will cause the output signal to decrease 3 dB from its maximum level.

Recovered AF Voltage [v_o(af)]

The rms value of the AF output voltage of the device produced by a specified frequency deviation of an FM input signal.

Amplitude-Modulation Rejection (AMR)

The ratio of the recovered AF output voltage produced by a specified frequency deviation of an FM input signal to the recovered AF output voltage produced by an amplitude-modulated input signal having the same carrier frequency, expressed in dB.

Discriminator Output Resistance [R_O(disc)]

The ratio of a change in AF output voltage to a change in output current, measured between the output terminal of the device and ground.

Total Harmonic Distortion (THD)

The ratio of the total rms voltage of all harmonics to the rms voltage of the fundamental, expressed in per cent. These voltages are measured at the af output terminal of the device, with respect to ground.

RCA Solid State Division

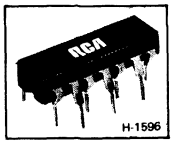
Linear Integrated Circuits

CA3042

WIDE-BAND AMPLIFIER, FM DETECTOR AF PREAMPLIFIER/DRIVER

Monolithic Silicon

For Sound Sections of TV Receivers Using Transistor-Type AF Output Amplifiers



RCA Integrated Circuit Type CA3042 provides, in a single monolithic silicon chip, a major sub-system for the sound sections of TV receivers. As shown in the Schematic Diagram (Fig.1) and the TV Receiver Block Diagrams (Figs.2A and 2B) the CA3042 contains a multistage wide-band if-amplifier section, an FM-detector stage, a Zener-diode-regulated power-supply section, and an af-amplifier section specifically designed to drive directly an n-p-n audio output transistor or a high-gain audio output pentode tube.

In FM receivers, the CA3042 can be used to provide if amplification and limiting, FM detection, and af preamplification.

The CA3042 provides exceptional versatility of circuit design because the if-amplifier/limiter section, FM detector section, and af-preamplifier/driver section can be used independently of each other.

The CA3042 utilizes a 14-lead dual-in-line plastic package with leads specially formed to facilitate automatic insertion of the device in suitably punched printed-circuit boards. Templates showing recommended layout of printed-circuit boards for the CA3042 are provided in this bulletin (Figs.13 & 14).

FEATURES

- high sensitivity – input limiting voltage (knee) 150 μV_s typ. at 4.5 MHz
- 6-mA audio drive capability
- excellent AM rejection – 58 dB typ. at 4.5 MHz
- inherent high stability – internally shielded
- internal Zener-diode-regulated voltage supply
- low harmonic radiation
- wide frequency capability – 100 kHz to 20 MHz
- low harmonic distortion

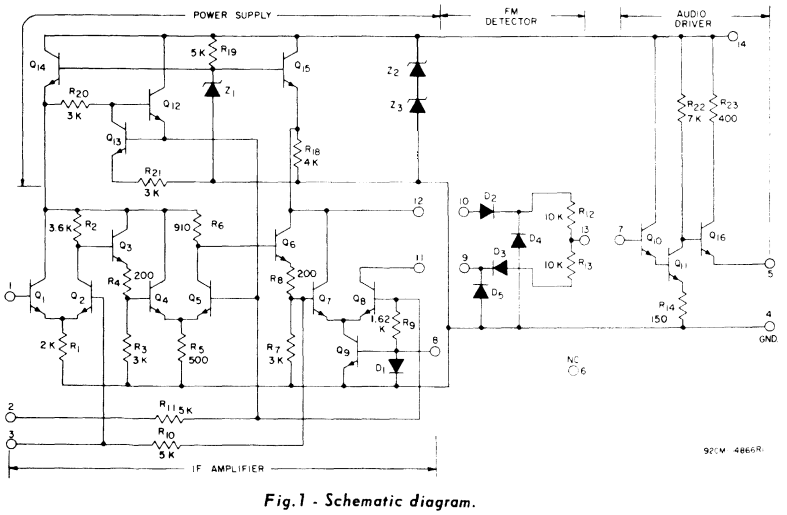


Fig.1 - Schematic diagram.

ABSOLUTE-MAXIMUM VOLTAGE AND CURRENT LIMITS AT T_A = 25°C

Indicated voltage or current limits for each terminal may be applied under the specified voltage conditions for other terminals. All voltages are with respect to ground (Terminal 4).

DEFINITIONS OF TERMS

Total Device Dissipation (P_T)

The total power drain of the device with no signal applied and no external load current.

Voltage Gain (A)

The ratio of the signal voltage developed at the output of the device to the signal voltage applied to the input, expressed in dB.

Input Impedance

The ratio of a change in input voltage to a change in input current, measured at the input terminal of the device, with respect to ground.

Output Impedance

The ratio of a change in output voltage to a change in output current, measured at the output terminal of the device, with respect to ground.

Input Limiting Voltage (Knee) [v_i(lim)]

The input signal voltage which will cause the output signal to decrease 3 dB from its maximum level.

Recovered AF Voltage [v_o(af)]

The rms value of the AF output voltage of the device produced by a specified frequency deviation of an FM input signal.

Amplitude-Modulation Rejection (AMR)

The ratio of the recovered AF output voltage produced by a specified frequency deviation of an FM input signal to the recovered AF output voltage produced by an amplitude-modulated input signal having the same carrier frequency, expressed in dB.

Discriminator Output Resistance [R_O(disc)]

The ratio of a change in AF output voltage to a change in output current, measured between the output terminal of the device and ground.

Total Harmonic Distortion (THD)

The ratio of the total rms voltage of all harmonics to the rms voltage of the fundamental, expressed in per cent. These voltages are measured at the af output terminal of the device, with respect to ground.

Special-Function Sub-System

Monolithic Silicon

HIGH-GAIN IF AMPLIFIER, LIMITER, FM DETECTOR, AND AF PREAMPLIFIER/DRIVER

For FM IF Amplifier Applications in Communications Receivers and High-Fidelity FM Receivers up to 20 MHz

RCA Integrated Circuit Type CA3043 provides in a single monolithic silicon chip, a major sub-system for the IF sections of Communications and high-fidelity FM receivers. As shown in the Schematic Diagram (Fig.2) and the FM Receiver Block Diagram (Fig.1), the CA3043 contains a multistage if-amplifier/limiter section, an FM-detector stage, a Zener-diode regulated power-supply section, and an af-amplifier section. In FM receivers, the CA3043 can be used to provide if amplification and limiting, FM detection, and af preamplification. The CA3043 provides exceptional versatility of circuit design because the if-amplifier/limiter section, FM detector section, and af-preamplifier/driver section can be used independently of each other.

The four stage emitter-follower-coupled if amplifier section provides 80-dB voltage gain at 10.7 MHz, and features an output stage with exceptionally good limiting characteristics because of its transistor constant-current sink.

The FM detector section is distinguished by circuitry which provides forward bias to the detector diodes, D2 and D3, and also provides a reference voltage for AFC.

The audio amplifier provides a low-impedance drive for subsequent audio amplifiers.

The power supply section provides zener-regulated, decoupled voltages for the IF amplifier, detector, and audio amplifier sections.

FEATURES

- high sensitivity - - input limiting voltage (knee) 50 μV typ. at 10.7 MHz
- excellent AM rejection - - 58 dB typ. at 10.7 MHz
- inherent high stability - - internally shielded
- internal Zener-diode regulated voltage supply
- low harmonic radiation
- wide frequency capability - - <100 kHz to >20 MHz
- low harmonic distortion

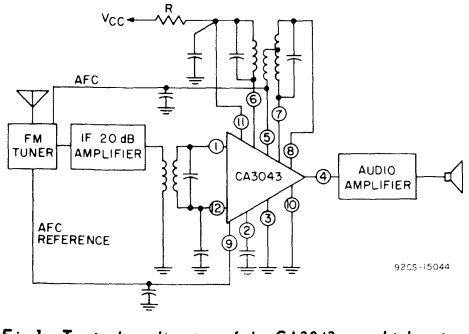

Fig.1 - Typical application of the CA3043 as a high-gain limiter, amplifier-detector in an FM receiver.

Notes:

S = Substrate

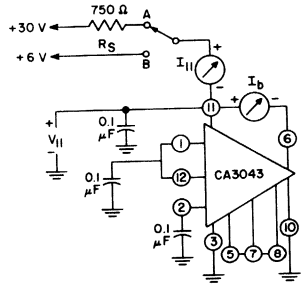
Terminal No.3 wire-connected to the case.

Terminal No.10 connected to the case through the substrate.

Terminals No.3 and 10 which are connected to the substrate should be connected to the most negative point in the circuit.

Diodes D_4 and D_5, act as capacitors and are used to balance the detector substrate capacitances.

Fig.2 - Schematic diagram.

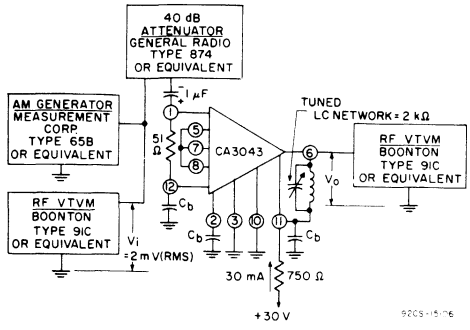


Switch in Position A for:

Regulator-Voltage, Quiescent-Operating-Current, and Device Dissipation Test

Switch in Position B for Current into Pin No.11

Fig.3 - Regulator voltage, device dissipation, quiescent operating current, and current at 6 volts into Pin No.11.



Voltage Gain = $20 \log_{10} 100 \frac{v_o}{v_i}$

C_b - Bypass Capacitor, 0.1 μF electrolytic in parallel with 0.01 μF

$I_{6(lim)} = \frac{v_o}{2K\Omega}$, v_i = 100 mV(RMS)

* Output circuit should be completely shielded from the input circuit at the socket.

Fig.4 - Voltage gain test circuit.

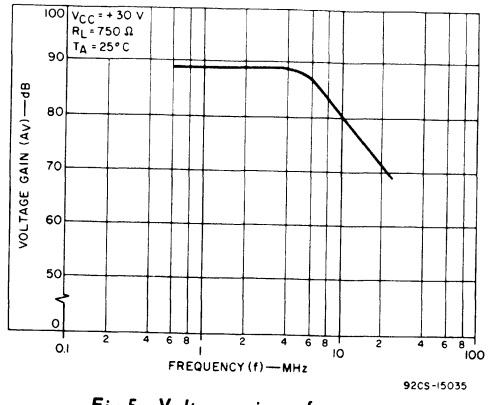


Fig.5 - Voltage gain vs frequency.

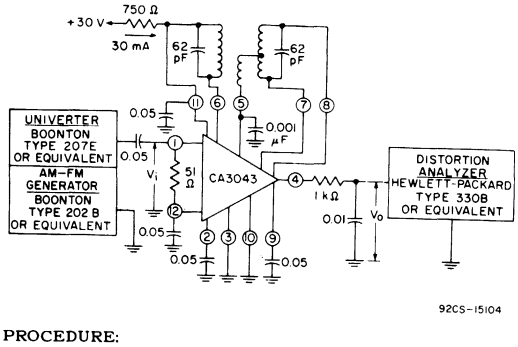

PROCEDURE:

1. Recovered Audio Voltage $v_{o(af)}$ –
   Set input frequency to 10.7 MHz,
   v_i = 1 mV(RMS), modulating frequency = 1 kHz
   Deviation = ±75 kHz
   Record v_o as measured on the Distortion Analyzer meter scale.
   This is the recovered Audio Voltage $v_{o(af)}$
2. 3 dB Limiting Sensitivity $v_{i(lim)}$ –
   Reduce v_i until $v_{o(af)}$ drops 3 dB.
   Record this value of v_i as $v_{i(lim)}$
3. Total Harmonic Distortion THD –
   Reset v_i to 1 mV(RMS) and operate Distortion Analyzer per manufacturer's instructions to measure THD.

* See Fig.9 for details on Discriminator Transformer.

Fig.6 - Input limiting voltage (knee), recovered AF voltage, and total harmonic distortion test circuit.

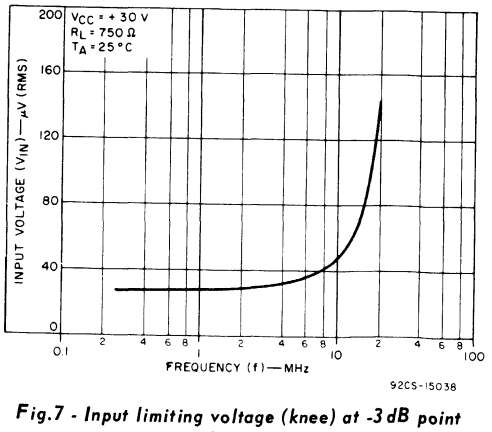

Fig.7 - Input limiting voltage (knee) at -3 dB point vs frequency.

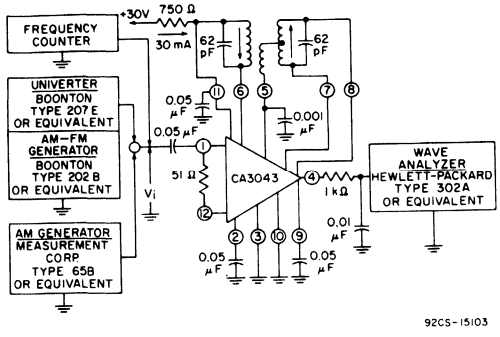

PROCEDURE:

A. Connect FM Generator to CA3043 input.

Set frequency to 10.7 MHz, v_i = 10 mV, modulating frequency = 1 kHz

Deviation = ±75 kHz.

Tune Wave Analyzer to peak reading at 1 kHz and record recovered Audio Voltage $v_{o(af)FM}$.

B. Disconnect FM Generator and Connect AM Generator to CA3043 input.

Set frequency to 10.7 MHz, v_i = 10 mV, modulating frequency = 1 kHz, percent modulation = 50%.

Tune Wave Analyzer to peak reading and record recovered audio voltage $v_{o(af)AM}$

Amplitude Modulation Rejection Ratio = $20 \log_{10} \frac{v_{o(af)FM}}{v_{o(af)AM}}$

FM IF Amplifier - Limiter, Detector, and Audio Preamplifier

For FM IF Amplifier Applications Up To 20 MHz In Communications Receivers And High-Fidelity Receivers

Features:

- Good sensitivity: Input limiting voltage (knee) = 250 μV typ. at 10.7 MHz
- Excellent AM rejection: 55 dB typ. at 10.7 MHz
- Internal Zener diode regulation for the IF amplifier section
- Low harmonic distortion
- Differential peak detection: Permits simplified single-coil tuning
- Audio preamplifier voltage gain: 21 dB typ.
- Minimum number of external parts required

RCA CA3075 is an integrated circuit which provides, in a single monolithic chip, an FM IF subsystem for Communications and High-Fidelity Receivers. This device, shown in the schematic diagram (Fig. 2), consists of a multistage IF amplifier-limiter section with a Zener regulated power supply, an FM detector stage, and an AF preamplifier section. A typical application of the CA3075, in FM receiver circuits, is shown in the block diagram (Fig. 1).

The three-stage, emitter-follower-coupled IF amplifier section provides a 60-dB typ. voltage gain at an operating frequency of 10.7 MHz and features, because of its transistor constant-current sink, an output stage with exceptionally good limiting characteristics.

The FM detector section, which utilizes a differential-peak-detection circuit, requires only a single coil in the associated outboard detector circuit; hence, tuning the detector circuit is a simple procedure.

The audio preamplifier circuit provides a 21-dB voltage gain with low impedance output for driving subsequent audio amplifier stages.

The CA3075 utilizes a 14-lead dual-in-line plastic package with leads in a special quad-formed arrangement.

High-Gain Wide-Band IF Amplifier-Limiter

For FM IF Amplifier Applications in Communications Receivers

Features:

- exceptionally good sensitivity: input limiting voltage (knee) = 50 μV typ. at 10.7 MHz
- high gain: 80 dB with 2-kilohm load
- internal voltage supply regulator
- wide frequency capability: > 20 MHz

RCA CA3076, monolithic integrated circuit, is a high-gain wide-band amplifier-limiter for use in the IF sections of Communications and High-Fidelity FM Receivers. The CA3076, shown in the schematic diagram (Fig. 2), consists of a four stage IF amplifier-limiter section with a voltage regulator section. A typical application of the CA3076 in FM receiver circuits is shown in the block diagram (Fig. 1).

The four-stage emitter-follower-coupled IF amplifier section provides an 80-dB voltage gain with a 2-kilohm load at a frequency of 10.7 MHz. The output stage has exceptionally good limiting characteristics because of its transistor constant-current sink. The voltage regulator section provides zener-regulated, decoupled voltages for the IF amplifier.

The CA3076 utilizes an hermetically-sealed 8-lead TO-5 package.

16-Lead Dual-In-Line Plastic Package

AM Receiver Subsystem and General-Purpose Amplifier Array

Includes: AM Converter, IF Amplifiers, Detector and Audio Preamplifier

For Applications in a Variety of AM Broadcast and Communications Receivers and Applications Requiring an Array of Amplifiers

Features:

- **Excellent overload characteristics**
- **AGC for IF amplifier**
- **Buffered output signal for tuning meter**
- **Low harmonic distortion (THD)**
- **Delayed AGC for RF amplifier**
- **Terminals for optional inclusion of tone control**
- **Internal Zener diode provides voltage regulation**
- **Two IF amplifier stages**
- **Low-noise converter and first IF amplifier**
- **Operates from wide range of power supplies: V^+ = 6 to 16 volts**
- **Optional AC and/or DC feedback on wide-band amplifier**
- **Array of amplifiers for general-purpose applications**
- **Suitable for use with optional external RF stage, either MOS or bipolar**

RCA-CA3088E*, a monolithic integrated circuit, is an AM subsystem that provides the converter, IF amplifier, detector, and audio preamplifier stages for an AM receiver.

The CA3088E also provides internal AGC for the first IF amplifier stage, delayed AGC for an optional external RF amplifier, a buffer stage to drive a tuning meter, and terminals facilitating the optional use of a tone control.

Fig. 2 is a functional diagram of the CA3088E. The signal from the low-noise converter is applied to the first IF amplifier and is then coupled to the second IF amplifier. This IF signal is then detected and externally filtered. The resultant audio signal is applied to an audio preamplifier. Optionally, a tone control circuit may be connected at the junction of the detector circuit and the audio preamplifier. The gain of the first IF amplifier stage is controlled by an internal AGC circuit. The CA3088E supplies a delayed AGC signal output for use with an external RF amplifier. A buffered output signal is also available for driving a tuning meter. A DC voltage, internally regulated by a Zener diode, supplies the second IF amplifier, the AGC and tuning meter circuits and may also be used with any other stage.

The CA3088E features four independent transistor amplifiers, each incorporating internal biasing for temperature tracking. These amplifiers are particularly useful in general-purpose amplifier, oscillator, and detector applications in a wide variety of equipment designs.

The CA3088E utilizes a 16-lead dual-in-line plastic package and operates over an ambient temperature range of −40°C to +85°C.

*Formerly Developmental Type TA5842.

16-Lead Dual-in-Line Plastic Package H 1622

FM IF System

Includes---IF Amplifier, Quadrature Detector, AF Preamplifier, and Specific Circuits for AGC, AFC, Muting (Squelch), and Tuning Meter

For FM IF Amplifier Applications in High-Fidelity, Automotive, and Communications Receivers

Features:

- **Exceptional limiting sensitivity: 12 μV typ. at −3 dB point**
- **Low distortion: 0.1% typ. (with double-tuned coil)**
- **Single-coil tuning capability**
- **High recovered audio: 425 mV typ.**
- **Provides specific signal for control of interchannel muting (squelch)**
- **Provides specific signal for direct drive of a tuning meter**
- **Provides delayed AGC voltage for RF amplifier**
- **Provides a specific circuit for flexible AFC**
- **Internal supply-voltage regulators**

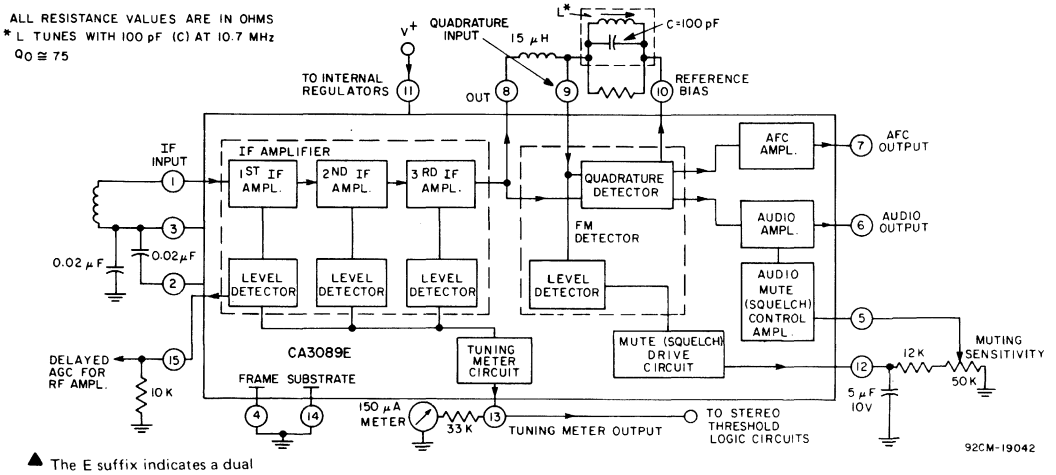
RCA-CA3089E* is a monolithic integrated circuit that provides all the functions of a comprehensive FM-IF system. Fig. 1 is a block diagram showing the CA3089E features, which include a three-stage FM-IF amplifier/limiter configuration with level detectors for each stage, a doubly balanced quadrature FM detector and an audio amplifier that features the optional use of a muting (squelch) circuit.

The advanced circuit design of the IF system includes desirable deluxe features such as delayed AGC for the RF tuner, an AFC drive circuit, and an output signal to drive a tuning meter and/or provide stereo switching logic. In addition, internal power supply regulators maintain a nearly constant current drain over the voltage supply range of +8.5 to +16 volts.

The CA3089E is ideal for high-fidelity operation. Distortion in a CA3089E FM-IF System is primarily a function of the phase linearity characteristic of the outboard detector coil.

The CA3089E utilizes the 16-lead dual-in-line plastic package and can operate over the ambient temperature range of −40°C to +85°C.

* Formerly Developmental Type No. TA5628.



▲ The E suffix indicates a dual in-line plastic package.

Linear Integrated Circuits

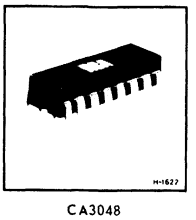
CA3048

Amplifier Array

Monolithic Silicon

FOUR INDEPENDENT AC AMPLIFIERS

For Low-Noise and General AC Applications In Industrial Service



CA3048

The RCA CA3048 is a silicon monolithic integrated circuit consisting of four independent identical AC amplifiers which can operate from a single-ended power supply.

The amplifiers include internal DC bias and feedback to provide temperature-stabilized operation. They may be used in a wide variety of AC applications in which operational amplifiers have previously been used.

Each high gain amplifier has a high impedance non-inverting input, and a lower impedance inverting input for the application of feedback. Two power-supply terminals and two ground terminals are provided to reduce internal and external coupling between amplifiers.

The CA3048 is supplied in a 16-lead dual-in-line plastic package.

APPLICATIONS

- Multi-channel or cascade operation
- Low-level preamplifiers
- Equalizers
- Linear signal mixers
- Tone generators
- Multivibrators
- AC integrators

FEATURES

- Four AC amplifiers on a common substrate
- Independently accessible inputs and outputs
- Operates from single-ended supply

EACH AMPLIFIER

- Noise figure at 1 kHz ..... 2 dB typ.
- High voltage gain ..... 53 dB min.
- High input resistance ..... 90 kΩ typ.
- Undistorted output voltage ..... 2 V rms min.
- Output Impedance ..... 1 kΩ typ.
- Open-loop bandwidth ..... 300 kHz typ.

OPERATING CONSIDERATIONS

Economical Gain Control

The CA3048 is designed to permit flexibility in the methods by which amplifier gain can be controlled. Fig.14 shows a curve of the gain of an amplifier when the internal resistive feedback of the device is used in conjunction with an external resistor. Although measured gain of various amplifiers will not be uniform, because of tolerances of internal resistances, this method is very economical and easy to apply.

Stability

The CA3048, as in other devices having high gain-bandwidth product, requires some attention to circuit layout, design, and construction to achieve stability.

Should the CA3048 be left unterminated, socket capacitance alone will provide sufficient feedback to cause high frequency oscillations; therefore, all test circuits in this data bulletin include loading networks that provide stability under all conditions.

Linear Integrated Circuits

CA3052

Special-Function Sub-System Stereo Preamplifier

The RCA CA3052 is a silicon monolithic integrated circuit designed specifically for stereo preamplifier service. The circuit consists of four independent AC amplifiers which can operate from a single-ended supply.

The CA3052 can operate as an equalizer amplifier in tape recorders, magnetic cartridge phonograph applications, and tone control amplifiers. The CA3052 can provide all of the amplification necessary for a full-function stereo preamplifier.

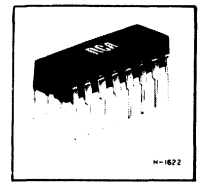
The CA3052 is supplied in a 16-lead dual-in-line plastic package.

APPLICATIONS

- Full-function stereo preamplifiers
- Tape recorder and playback preamplifiers
- Tone Generators

FOUR INDEPENDENT AC AMPLIFIERS

For Stereo Preamplifiers, Magnetic Pickups, Tape Heads, etc.



CA3052

Stereo Multiplex Decoder

For FM Stereo Multiplex Systems

Features:

- **Requires the use of only one low-inductance tuning coil**
- **Automatic stereo switching**
- **Includes driver for stereo-lamp indicator**
- **Operates from a wide range of power supplies: 10 to 16 volts**
- **Requires only one adjustment for alignment**
- **Switching from monaural to stereo and stereo to monaural produces no audible thumps**
- **Low distortion: under 0.5%**
- **High signal output: directly drives audio amplifiers**
- **Excellent SCA (storecast) rejection: 55 dB typ.**
- **High audio channel separation: 40 dB typ.**

RCA-CA3090Q*, a monolithic silicon integrated circuit, is a stereo decoder intended for FM multiplex systems.

This stereo multiplex decoder requires only one low-inductance tuning coil (requires only one adjustment for complete alignment), provides automatic stereo switching, energizes a stereo indicator lamp, and operates from a wide range of voltage supplies.

Figure 2 shows the block diagram for the CA3090Q. The input signal from the detector is amplified by a low-distortion preamplifier and simultaneously applied to both the 19-kHz and 38-kHz synchronous detectors. A 76-kHz signal, generated by a local voltage-controlled oscillator (VCO), is counted down by two frequency dividers to a 38-kHz signal and to two 19-kHz signals in phase quadrature. The 19-kHz pilot-tone supplied by the FM detector is compared to the locally generated 19-kHz signal in a synchronous detector. The resultant signal controls the voltage controlled oscillator (VCO) so that it produces an output signal to phase-lock the stereo decoder with the pilot tone. A second synchronous detector compares the locally generated 19-kHz signal with the 19-kHz pilot tone. If the pilot tone exceeds an externally adjustable threshold voltage, a Schmitt trigger circuit is energized. The signal from the Schmitt trigger lights the stereo indicator, enables the 38-kHz synchronous detector, and automatically switches the CA3090Q from monaural to stereo operation. The output signal from the 38-kHz detector and the composite signal from the preamplifier are applied to a matrixing circuit from which emerge the resultant left and right channel audio signals. These signals are applied to their respective left and right post amplifiers for amplification to a level sufficient to drive most audio amplifiers.

An internal power regulator circuit permits the CA3090Q to operate satisfactorily over wide variations of supply voltage. The internal lamp-driver circuit can, by controlling an external transistor (p-n-p or n-p-n), drive a lamp of higher power than the 14-mA lamp shown in Fig. 2 To drive a p-n-p transistor, Terminal 13 is grounded and Terminal 12 is connected to its base. To drive an n-p-n transistor, Terminal 12 is connected to the power supply and Terminal 13 is connected to its base.

The CA3090Q utilizes the 16-lead quad-in-line plastic package and operates over the ambient temperature range of $-40^{o}C$ to $+85^{o}C$.

*Formerly Developmental Type No. TA5932.

MAXIMUM RATINGS,
Absolute Maximum Values at $T_A = 25^{o}C$

DC Supply Voltage	16 V
Current at Term. 12	17 mA
Input Signal Voltage (Composite)■	400 mV

Linear Integrated Circuits

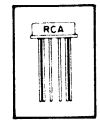
CA3035
CA3035V1

Ultra-High-Gain
Wide-Band Amplifier Array

Monolithic Silicon

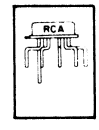
- Three Individual General-Purpose Amplifiers
- Ideal for service in Remote-Control Amplifiers — — e.g., TV Receivers
- Available in two electrically identical versions: CA3035 with straight leads; CA3035V1 with formed leads

CA3035



10-LEAD
TO-5

CA3035V1



FORMED-LEAD
10-LEAD TO-5

HIGHLIGHTS

- Three separate amplifiers — gain and bandwidth for each amplifier can be adjusted with suitable external circuitry
- Amplifiers operable independently or in cascade
- Exceptionally high cascade voltage gain — 129 dB typ. at 40 kHz
- Low noise performance
- Wide-band response
- All amplifiers single-ended — only one power supply required
- Wide operating temperature range — -55°C to +125°C
- Built-in temperature compensation
- Hermetically sealed, all-welded 10-lead TO-5-style metal package with straight or formed leads

Linear Integrated Circuits

CA3044
CA3044V1

Special-Function Sub-System

Monolithic Silicon

The RCA CA3044 and CA3044V1 represent a second generation of integrated circuits designed primarily for AFC (Automatic-Frequency-Control) applications.

The CA3044 and CA3044V1 are functionally similar to the CA3034 and CA3034V1 with the additional feature of an internal zener regulated power supply which had to be supplied externally for the CA3034 and CA3034VI. The CA3044 and CA3044V1 are designed to replace the earlier types in existing systems with only minor system circuit changes.

The CA3044V1 is electrically identical to the CA3044 but is supplied with formed leads for easier PC board design and construction.

DYNAMIC CONTROL VOLTAGE CHARACTERISTICS

The CA3044 and CA3044VI are specifically intended for use in the AFT system of color television receivers. Each device is tested so that the control voltages generated by the circuit meet the critical requirements of the system. Figure 5 is the schematic diagram of the test circuit.

Figure 6 and 7 show the control voltages generated at terminals 4 and 5 of the Integrated Circuit as a function of the frequency deviation from the nominal center frequency. Figure 6 shows the region within 25 KHz of the center frequency while Figure 7 covers the entire bandwidth of the system. The horizontal reference lines on the figures are generated by a voltage divider connected between the power supply voltage on Terminal 10 and ground. The dynamic control voltages are compared with these references according to the Output vs Frequency Deviation Table. For example: when the frequency deviation is -25 KHz the control voltage at Terminal 4 is greater than the reference A voltage; the control voltage at Terminal 5 is less than the reference B voltage.

The shape of the correction voltage characteristics is dependent to a large degree upon transformer characteristics and the parts layout. In order to closely duplicate the curves shown, the printed circuit board shown in Figure 8 and the parts layout shown in Figure 9 should be followed as closely as possible.

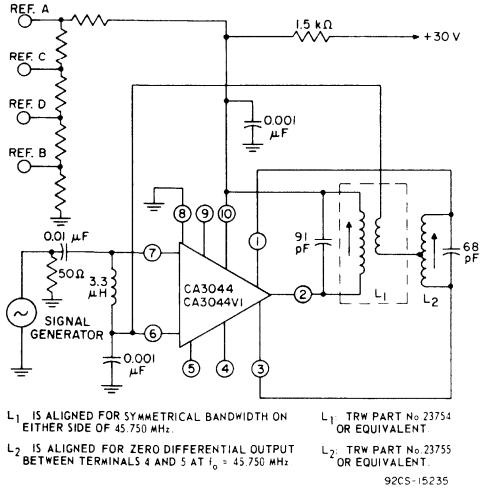

Fig.5 - Correction voltage test circuit for CA3044 and CA3044VI.

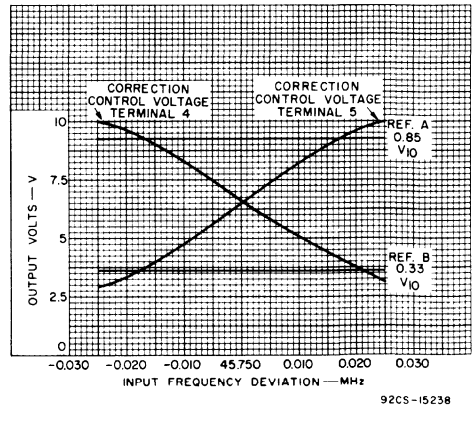

Fig.6 - Typical narrow-band dynamic control voltage characteristics.

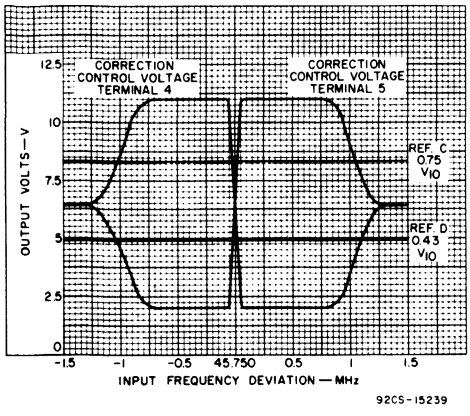

Fig.7 - Typical wide-band dynamic control voltage characteristics.

DEFINITIONS OF TERMS

Input Limiting Voltage (Knee) $[v_i(lim)]$

The input signal voltage which will cause the output signal to decrease 3 dB from its maximum level.

Total Device Dissipation (P_T)

The total power drain of the device with no signal applied and no external load current.

Quiescent Operating Voltage

The dc voltage at the output terminal, with respect to ground, with no signal applied.

Quiescent Operating Current

The average (dc) value of the current in either output, terminal, with no signal applied.

Output Offset Voltage

The dc voltage between output terminals with no signal applied.

Control Voltage

The dc voltage at either output terminal with respect to ground with an RF signal of specified frequency applied.

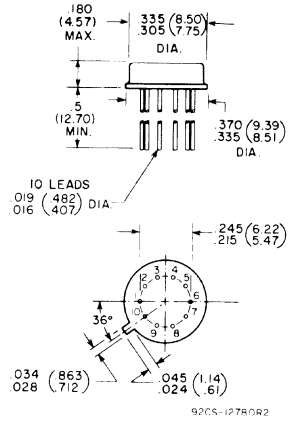
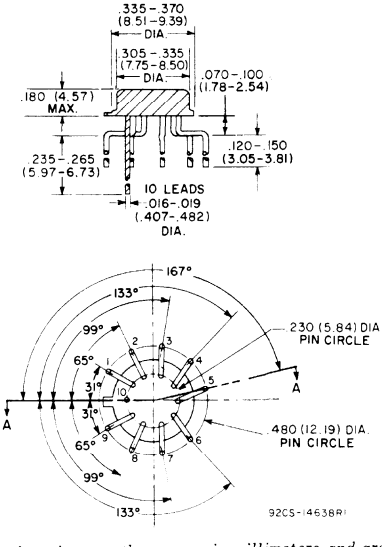
DIMENSIONAL OUTLINES

CA3044



CA3044VI



Dimensions in parentheses are in millimeters and are derived from the basic inch dimensions as indicated.

RCA Solid State Division

Linear Integrated Circuits

CA3064

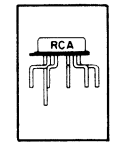
RCA CA3064 represents the third generation of integrated circuits designed primarily for AFC (Automatic Frequency Control) applications.

The CA3064 is functionally similar to the CA3044 and CA3044V1 but embodies a higher gain input amplifier which provides a 20dB improvement in sensitivity. The increased sensitivity extends the application of a proven AFT system to TV receivers with low level IF amplifiers.

The CA3064 is supplied with formed leads for easier PC board design and construction.

Because the CA3064 is functionally similar to the CA3044, refer to Application Note ICAN 5831, "Application of the RCA CA3044 and CA3044V1 Integrated Circuits in Automatic Fine-Tuning Systems," for general application information.

WIDE-BAND AMPLIFIER, DIFFERENTIAL DETECTOR, DC AMPLIFIER and ZENER DIODE VOLTAGE REGULATOR



FORMED 10-LEAD TO-5

FEATURES

- High Gain Input Amplifier (18 mV input for rated output)
- Formed Leads for Easier PC Board Design
- Wide Operating Temperature Range; -40°C to +85°C

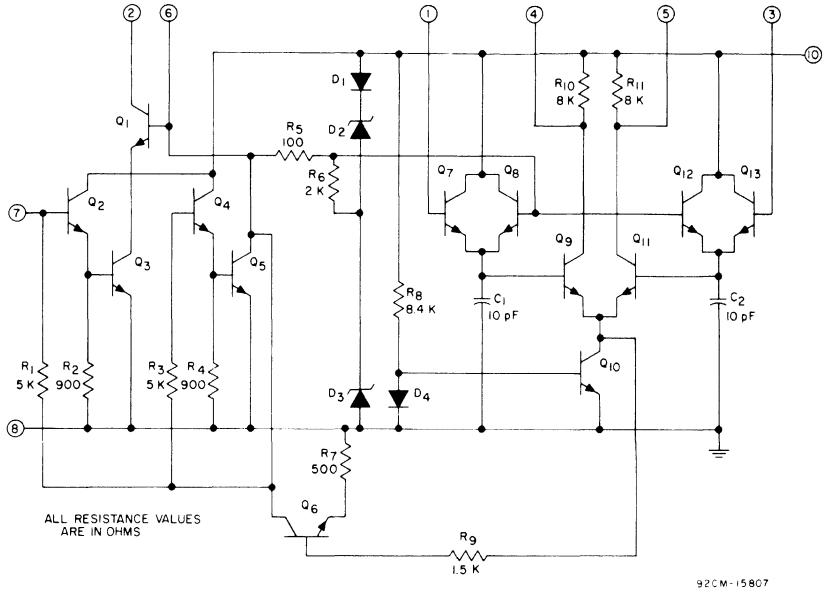

Fig.2 - Schematic diagram for CA3064

The CA3064 is specifically intended for use in the AFT system of color television receivers. This device is tested so that the control voltages generated by the circuit meet the critical requirements of the system. Figure 4(a) is the schematic diagram of the test circuit.

Figures 5 and 6 show the control voltages generated at terminals 4 and 5 of the Integrated Circuit as a function of the frequency deviation from the nominal center frequency. Figure 5 shows the region within 30 kHz of the center frequency while Figure 6 covers the entire bandwidth of the system. The horizontal reference lines on the figures are generated by a voltage divider connected between the power supply voltage on terminal 10 and ground. The dynamic control voltages are compared with these references according to the Output vs Frequency Deviation Table. For example: when the frequency deviation is −30 kHz the control voltage at terminal 4 is greater than the reference A voltage; the control voltage at terminal 5 is less than the reference B voltage.

The shape of the correction voltage characteristics is dependent to a large degree upon transformer characteristics and the parts layout. In order to closely duplicate the curves shown, the printed circuit board shown in Figure 7 and the parts layout shown in Figure 8 should be followed as closely as possible.

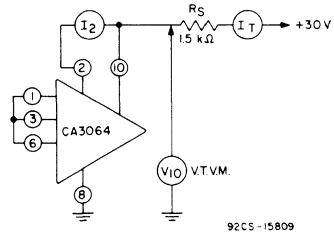

Fig.3 - Test setup: Measurement of total device dissipation, Zener regulating voltage, quiescent operating current (terminal 2).

Linear Integrated Circuits

CA3065

IF AMPLIFIER-LIMITER, FM DETECTOR, ELECTRONIC ATTENUATOR, AUDIO DRIVER

For Television Sound-System Applications

The RCA CA3065* Television Sound System is a monolithic integrated circuit which combines a multistage IF amplifier limiter, an FM detector, an electronic attenuator, a zener diode regulated power supply, and an audio amplifier-driver that is designed to directly drive an npn power transistor or high-transconductance tube. Because the circuit is so inclusive, a minimum number of external components is required. A block diagram of the integrated circuit television sound system is shown in Fig. 1.

The CA3065 with its advanced circuit design provides a high-performance multistage subsystem for the sound system of a television receiver. A particular feature of the CA3065 is the electronic attenuator which performs the conventional volume control function. Volume control is accomplished when the bias levels in the attenuator are changed by means of a variable resistor connected between Terminal 6 and ground (attenuation in excess of 60 dB is attained). Because no audio signal is present in this control, hum or noise pickup can be bypassed. In most cases, only a single unshielded wire is required between the IF board and the variable resistor (volume control).

The CA3065 utilizes a 14-lead dual-in-line plastic package with leads specially formed to facilitate automatic insertion of the device into suitably punched printed-circuit boards.

*Formerly TA5814

FEATURES:

- Electronic attenuator - replaces conventional volume control
- Differential peak detector - requires one single tuned coil
- Internal Zener diode regulated supply
- Inherent high stability
- Excellent AM rejection - 50 dB typ. at 4.5 MHz
- Low harmonic distortion
- High sensitivity - 200 μV limiting (knee) at 4.5 MHz
- Audio drive capability - 6 mA p-p
- Undistorted audio output voltage - 7 V p-p

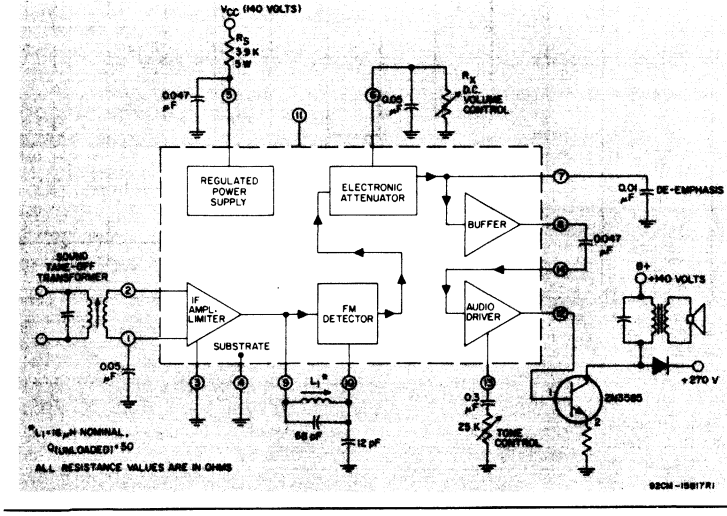

Fig. 1 - Block diagram of CA3065 in a typical circuit application.

OPERATING CONSIDERATIONS

The CA3065 may be used to drive a video output transistor or a high-transconductance output tube.

As in all TV receivers, precaution should be taken to prevent destruction of the CA3065 in the event of cascade arcs originating in the picture tube or in the output tube. In the case of arcing in the output tube a resistor of 150k in series with terminal No. 12 and the grid of the tube is usually sufficient protection.

To prevent damage from picture tube arcs, a careful analysis of board layout and coupling modes (electrostatic or magnetic) may be necessary to suggest alternate layouts or appropriate locations for the placement of spark gaps to absorb the high energy discharge.

Television Chroma System

The RCA CA3066 and CA3067 are monolithic silicon integrated circuits that constitute a complete chroma system for color television receivers. The CA3066 provides subcarrier regeneration and total chroma signal processing prior to demodulation; the CA3067 performs the demodulation and tint control functions. Each device utilizes a 16-lead quad-in-line plastic package.

System Features

CA3066
CHROMA SIGNAL PROCESSOR

- Complete Color Sync Circuit
- Blanked Chroma Amplifier
- Chroma Band-Pass Amplifier
- Low Output Impedance Chroma Driver
- ACC Detector-Amplifier
- Killer Detector-Amplifier
- DC Chroma Gain Control
- Zener Diode for Regulated Voltage Reference
- Short-Circuit Protection on All Terminals

CA3067
CHROMA DEMODULATOR

- Balanced Chroma Demodulators
- Color Difference Matrix
- DC Tint Control
- Three Low Output Impedance Drivers for Direct Coupling
- Reference Subcarrier Limiter
- Zener Diode for Regulated Voltage Reference
- Internal RF Filtering

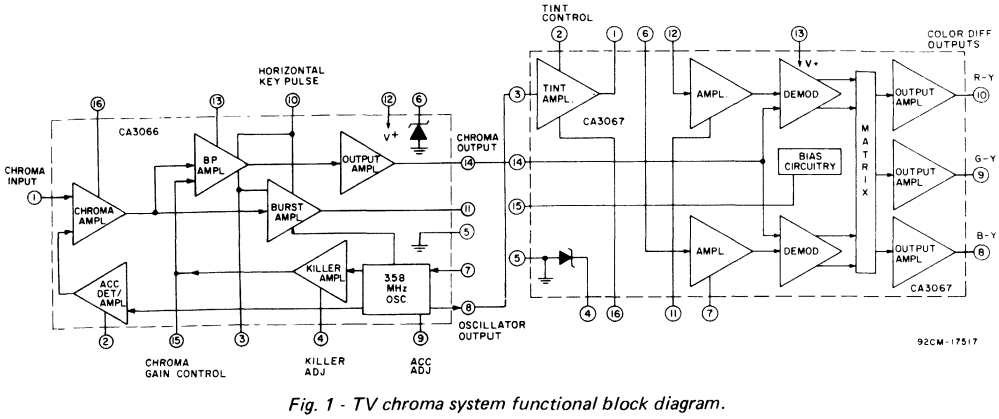

Fig. 1 - TV chroma system functional block diagram.

CA3066 Chroma Signal Processor

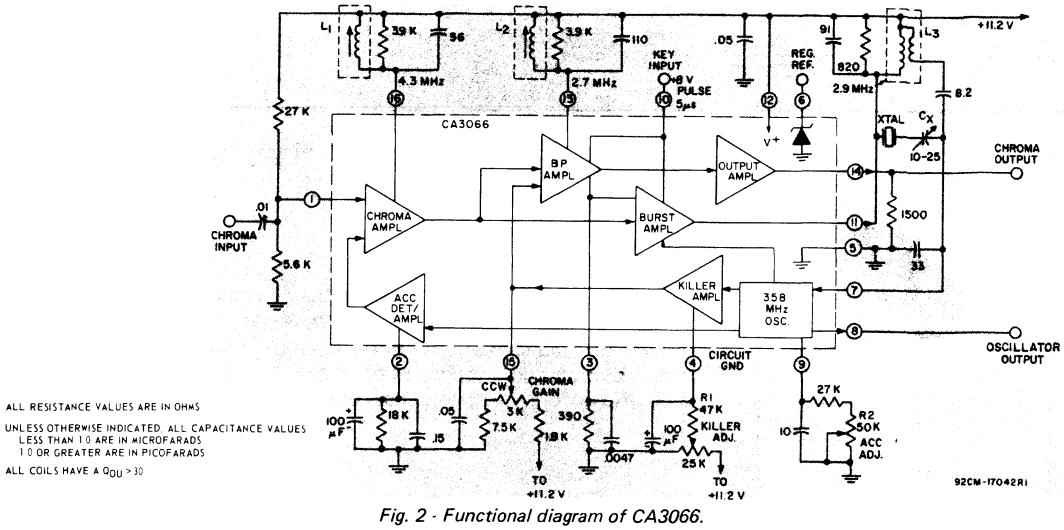

Fig. 2 - Functional diagram of CA3066.

The CA3066 contains substantially all the color processing circuitry exclusive of the tint control and demodulating circuits. The chroma amplifier sections of the CA3066 consist of the chroma and bandpass amplifiers. The chroma amplifier receives the chroma input signal at terminal No. 1. This amplifier is gain controlled by the automatic chroma control (ACC) detector-amplifier. The chroma signal is internally coupled from the output of the chroma amplifier to the input of the chroma bandpass amplifier and burst separator amplifier. The horizontal keying pulse (+8V) is used to gate the burst portion of the chroma signal from the input of the bandpass amplifier to the input of the burst separator amplifier. The bandpass amplifier is gain controlled by the dc chroma gain control and can also be controlled by the killer detector-amplifier. The bandpass amplifier output is internally coupled to the chroma output amplifier stage of the CA3066. The coils of the chroma amplifier and the bandpass amplifier are stagger-tuned to provide a combined typical bandpass of 3.08 to 4.08 MHz. The burst separator amplifier injects the burst signal into the 3.58 MHz oscillator. The oscillator amplitude is dependent on the terminal No. 9 impedance to ground and is also responsive to the burst signal amplitude at terminal No. 11. The ACC detector and killer detector sense the burst level or absence of burst, respectively, by monitoring the oscillators response to the burst injection level. The thresholds for the ACC and killer are independently adjusted by resistors R2 and R1 at terminals No. 9 and No. 4, respectively. The chroma output is at terminal No. 14 and the oscillator output is at terminal No. 8. Terminal No. 6 is a zener diode for use as a regulated voltage reference at 11.9 volts. When the zener reference element is not used, the power supply voltage should be maintained at 11.2 ± 0.5 volts.

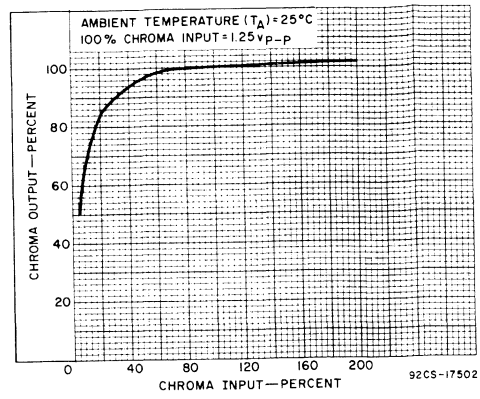

Fig. 5 - Typical ACC characteristic of chroma output vs chroma input.

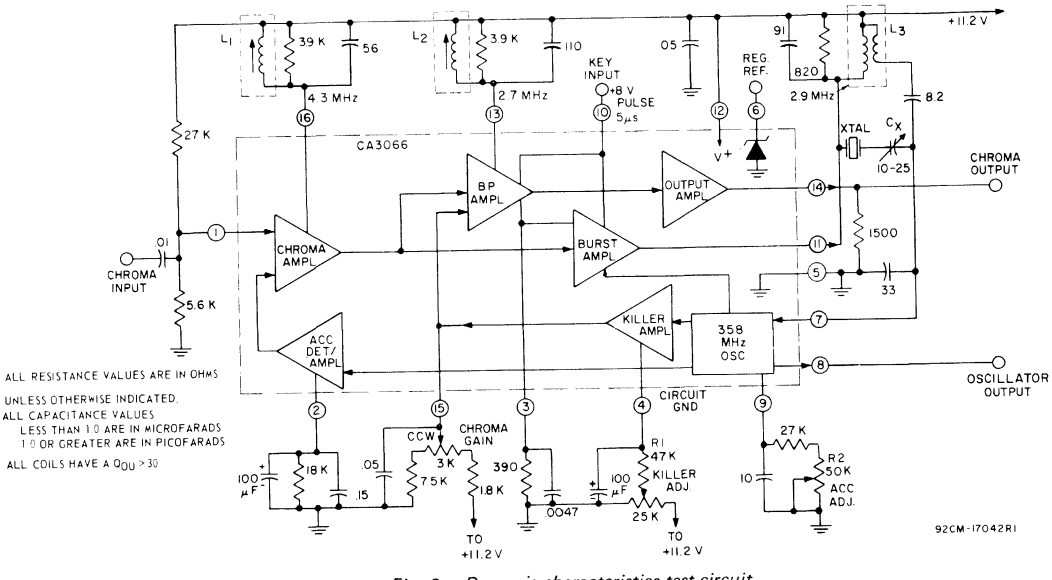

Fig. 6 - Dynamic characteristics test circuit.

DYNAMIC CHARACTERISTICS TEST PROCEDURE

Steps 1, 2, and 3 are performed with no Chroma input ($v_1 = 0$)

1. Adjust ACC potentiometer for $V_2 = +0.65V$.
2. Adjust Killer potentiometer for $V_4 = +1.2V$.
3. Adjust capacitor C_x (crystal trimmer) so that frequency of oscillator is 3.579545 MHz.
4. Unless otherwise noted, the chroma gain control is at maximum gain (fully clockwise).
5. The chroma input test signal is a 52.5 μs "line" at subcarrier frequency, and 10 cycles of burst at 46.5% of the "line" amplitude. The chroma input (v_1) is in peak-to-peak volts of "line" amplitude.
6. The chroma output (v_{14}) is the same as the chroma input (v_1) except that the burst is removed and keying overshoot occurs in the retrace period. The chroma output is in peak-to-peak volts of "line" amplitude.
7. The oscillator output (v_8) is the CW output at terminal No. 8 and is in peak-to-peak volts. Some modulation of oscillation dampening between burst injection is visible.

Fig. 7 - Functional diagram of CA3067.

The CA3067 contains the separate functional systems of a dc tint control and a demodulator. The phase shift of the tint amplifier system is accomplished by functional control of the fixed phase signal from the CA3066 oscillator output. This regenerated reference subcarrier is applied to terminal No. 3 and driven differentially into phase shift circuits. The tint adjustment controls the vector addition of phase shifted signals after which a limiting amplifier removes any remaining amplitude modulation. The output of the tint amplifier at terminal No. 1 is phase separated for the required reference subcarrier phase at terminal No. 6 and No. 12 (terminal No. 12 lags terminal No. 6 by approximately 76°). These terminals are inputs to the demodulator drive amplifiers. The demodulators consist of two sets of balanced detectors which receive their reference subcarrier from the demodulator drive amplifiers. The chroma signal input from the CA3066 is applied to terminal No. 14. The chroma signal differentially drives the demodulators. The demodulation components are matrixed and dc-shifted in voltage to give R–Y, G–Y, and B–Y color difference components with close dc balance and proper amplitude ratios. The output amplifiers of the CA3067 are specially designed to meet the low-impedance driving source requirements of the high-level color output amplifiers. A special feature of the CA3067 is R–C filtering of high frequency demodulation components. Terminal No. 4 is a zener diode for use as a regulated voltage reference at 11.9V. When the zener reference element is not used, the power supply should be maintained at +11.2 ±0.5 volts.

DYNAMIC CHARACTERISTICS TEST PROCEDURE

1. The reference subcarrier input (v_3) is a 3.58 MHz CW signal from a 50Ω source.
2. The chroma input (v_{14}) is a 3.53 MHz CW signal from a 50Ω source.
3. Phase and amplitude at terminal Nos. 1, 3, 6 and 12 are measured with a vector voltmeter (HP8405A or equivalent).
4. Signals at terminal Nos. 8, 9, and 10 are measured with an ac voltmeter (HP400E or equivalent) or an oscilloscope.
5. Unless otherwise noted the Tint control is at maximum resistance.

Application Information

TYPICAL CHROMA SYSTEM UTILIZING THE CA3066 AND THE CA3067

CA3066

A typical circuit using the CA3066 is shown in Fig. 13. This circuit is designed for a peak-to-peak chroma input level (v_1) of 1.25 volts, a horizontal keying pulse amplitude (V_{10}) of +8 peak volts, and a regulated supply votlage (V_{12}) of +11.2 volts. The chroma signal should be derived from the 1st or 2nd video amplifier and the luminance should be filtered out before the signal is applied to the CA3066 chroma input at terminal No. 1. For proper switching, the horizontal keying pulse (V_{10}) should be at least +7.5 peak volts but must not exceed the dc supply voltage level (V_{12}) which should be maintained at the recommended value of +11.2V. The dc supply can be externally regulated or the regulation circuit shown in Fig. 13 may be used. An RCA 2N3053 (or equivalent) transistor in an emitter follower configuration is used as a basic regulator in the circuits shown in Figs. 13 or 17. The zener diodes (connected to terminal No. 6 in the CA3066 or terminal No. 4 in the CA3067) are intended as reference-voltage sources for this circuit and may be used separately.

If either the CA3066 or CA3067 can be separately removed from the operating circuit, paralleling the zeners (to establish a regulator reference) is recommended to avoid excessive voltage on the remaining unit. For best voltage tracking and bias stability the zener diode reference element of the CA3066 should be used for the CA3066 supply voltage regulator circuit. The setup adjustments for the circuit of Fig. 13 are the killer (R_1), automatic chroma control (R_2), and oscillator frequency (c_x). The chroma gain control is a dc adjustment that controls the color drive level to the demodulator circuit and is normally a front panel adjustment. The killer and ACC adjustments are initial setup controls to optimize performance. The killer control (R_1) setting adjusts the threshold level at which the chroma bandpass amplifier will be cutoff. This threshold level is normally set at +1.2 V at terminal No. 4. The ACC adjustment (R_2) controls the oscillator loop gain and sets the ACC threshold level at which the chroma output signal ceases to increase linearly with increases in the chroma-input-signal level. When R_2 is properly adjusted, the voltage at terminal No. 2 is +0.6 to +0.7 volts (normally set at +0.65 volts).

The L_1 coil in Fig. 13 has two slugs, one for setting the frequency and another which serves as a Q "spoiler." In this way it is possible to control the tilt of the chroma bandpass frequency response and to compensate for overall-system phase errors. Coils L_1 and L_2 are single-tuned; the transformer T_1 is fix-tuned. The secondary of T_1 provides the reverse phase signal to neutralize the 3.58 MHz crystal and, with the series 12 pF capacitor, provides the correct compensation to terminal No. 7. An adjustable trimmer capacitor in series with the crystal is set for a free-running frequency of 3.579545 MHz ±10 Hz and will, for the typical circuit shown, stay within a nominal drift variation of 30 Hz during warm up.

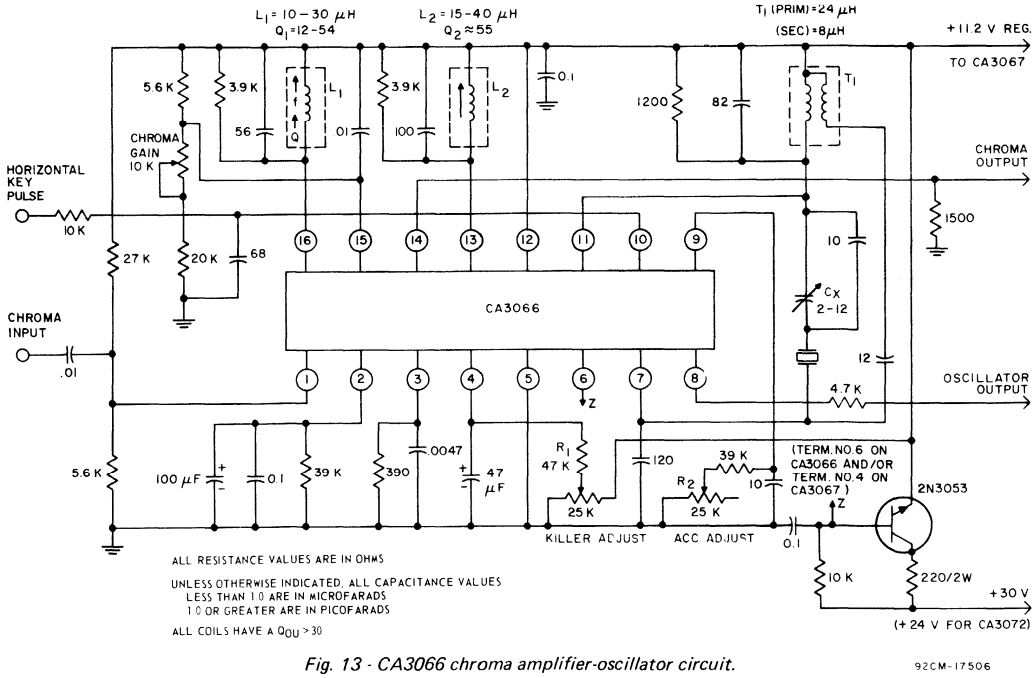

Fig. 13 - CA3066 chroma amplifier-oscillator circuit.

System performance curves for the CA3066 are shown in Fig. 14. The chroma and oscillator outputs and the killer and ACC reference voltage are plotted as a function of the input chroma signal. Because the killer threshold is a function of the killer reference voltage, a typical curve for the threshold variation is shown in Fig. 15. This curve was generated for various settings of R_1 (killer reference points) with no signal applied to terminal No. 1. At each setting a signal was applied and reduced in magnitude until the bandpass amplifier was cutoff by the killer amplifier. Oscilloscope photographs of the terminal voltage signals and frequency response curves are shown in Fig. 16.

CA3067

The Tint Amplifier-Demodulator, CA3067 is shown in Fig. 17. The oscillator output from Terminal No. 8 of the CA3066 is buffer-connected through a 4.7 KΩ resistor to the reference subcarrier input, Terminal No. 3. The chroma output from the CA3066, available on Terminal No. 14, is connected through a series tuned circuit consisting of a 150 pF capacitor, a 560Ω resistor, and a 47 μH coil to terminal Nos. 14 and 15. Terminal Nos. 14 and 15 are biased through an interconnected choke network to provide a balanced bias to the chroma demodulator drivers Q13 and Q14. If desired, the phase polarity of the output of the CA3067 circuit can be reversed by reversing the input connections at terminal Nos. 14 and 15. The regulated 11.2 V dc supply voltage for the CA3067 is obtained from Terminal No. 12 of the CA3066.

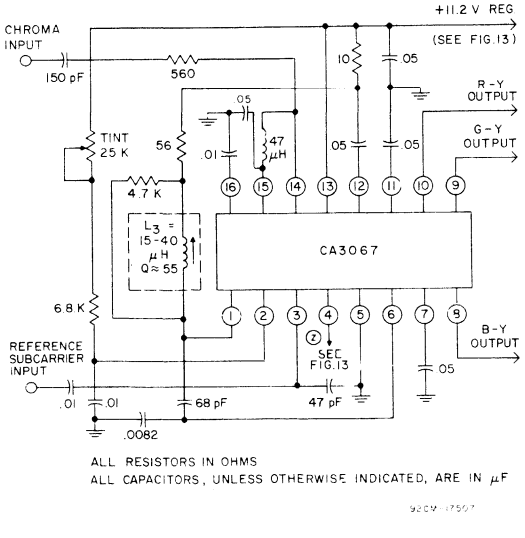

Fig. 17 - CA3067 tint control-chroma demodulator circuit.

In Table I the amplitude and phase values are given with the 0° phase reference at terminal No. 3 and the tint amplifier adjusted to a B–Y signal reference which can be recognized by the waveform on terminal No. 8. Typical terminal voltage values are given for the CA3066 and CA3067 in Table II.

10	0	5.0
11	11.2	5.0
12	11.2	5.7
13	11.2	11.2
14	4.6	3.0
15	4.4	3.0
16	11.2	4.8

The demodulation angles are determined by the phase of the reference subcarrier signals at terminal Nos. 6 and 12. These signals are amplified and applied to the demodulators such that their respective demodulated signals are present at terminal Nos. 8 and 10. The phase shift network from terminal No. 1 resolves the signal into two components that are phase separated by 76°. Relative to the terminal No. 6 phase, which is directly represented by the B–Y phase, the terminal No. 12 phase is shifted 180° and the demodulation angle at terminal No. 10 is 180° minus 76° or typically 104°. While the output signals at terminals Nos. 8, 9, and 10 are given as B–Y, G–Y, and R–Y respectively, it is obvious that the phase angles as recognized by the waveforms in the oscilloscope photographs of Fig. 18 are not precisely the NTSC standard representation of color difference signals. The latest developments in color TV picture tubes, such as the 18VANP22, require some phase shift for color correction.

The tint amplifier of the CA3067 is unique in that all phase shift requirements are satisfied by dc bias control to terminal No. 2. Resistor R1 and capacitor C1 of Fig. 8 provide the basic requirements for a phase shifting of the tint-controlled signal. The reference subcarrier signal at terminal No. 3 is separated 180° by the differential amplifier Q2 and Q3. The output of Q2 is shifted in phase by the R1, C1 time constant. The output of Q3 is directed to a recombination adder junction at the collector of Q4. The tint control determines the Q4 output signal by directing more or less signal to ac ground through diode, D2. The tint-controlled signal is then passed through an amplifier-limiter circuit to terminal No. 1.

The output amplifiers of the CA3067 are very-low-impedance followers that allow for direct coupling to high-level amplifiers. As shown in Figs. 11 and 12, the difference outputs vary linearly with voltage and temperature. Typically, the red and blue difference outputs have a 3-volt peak-to-peak maximum voltage-swing capability with a 5 $k\Omega$ load.

CA3072 Alternate Demodulator Circuit

The circuit shown in Fig. 19 represents an alternate tint amplifier-chroma demodulator. This circuit provides greater color-difference output levels than the CA3067. When the CA3072-2N3933 demodulator and tint amplifier circuit is used in conjunction with the CA3066, +24 volts should be used to provide the proper V^+ for the CA3072. Both the 2N3053 and 2N3933 are typical of the type of transistors that may be used with the CA3066, CA3067, and CA3072 integrated circuits. For complete data information on the RCA types 2N3053, 2N3933, and CA3072, refer to their respective Technical Bulletins.

Construction Information

Fig. 20 is a photograph and template of a circuit board layout for the CA3066 and CA3067 combination. Particular information for most of the components is given in Figs. 13 and 17. Special attention must be given to bypassing at terminal Nos. 2 and 15 in the CA3066. Terminal No. 2 requires a high-Q capacitor (0.1 μF) in parallel with the 100 μF electrolytic bypass. Terminal No. 15 requires bypassing to the power supply lines for best results. To assure complete cutoff at the minimum chroma-gain-control setting, the power supply side of L2 must be well bypassed to ground, and preferably to a common ground point that also includes the 1500-ohm resistor at terminal No. 14 and the CA3067 terminal No. 15 bypass.

The RCA CA3070, CA3071, and CA3072 are monolithic silicon integrated circuits that constitute a complete chroma system for color television receivers. The CA3070 is a complete subcarrier regeneration system featuring a new concept of phase control applied to the oscillator circuit. The CA3071 is a chroma amplifier system and the CA3072 performs the demodulation function.

The CA3070 utilizes the 16-lead plastic dual-in-line package; the CA3071 and CA3072 are supplied 14-lead plastic dual-in-line packages.

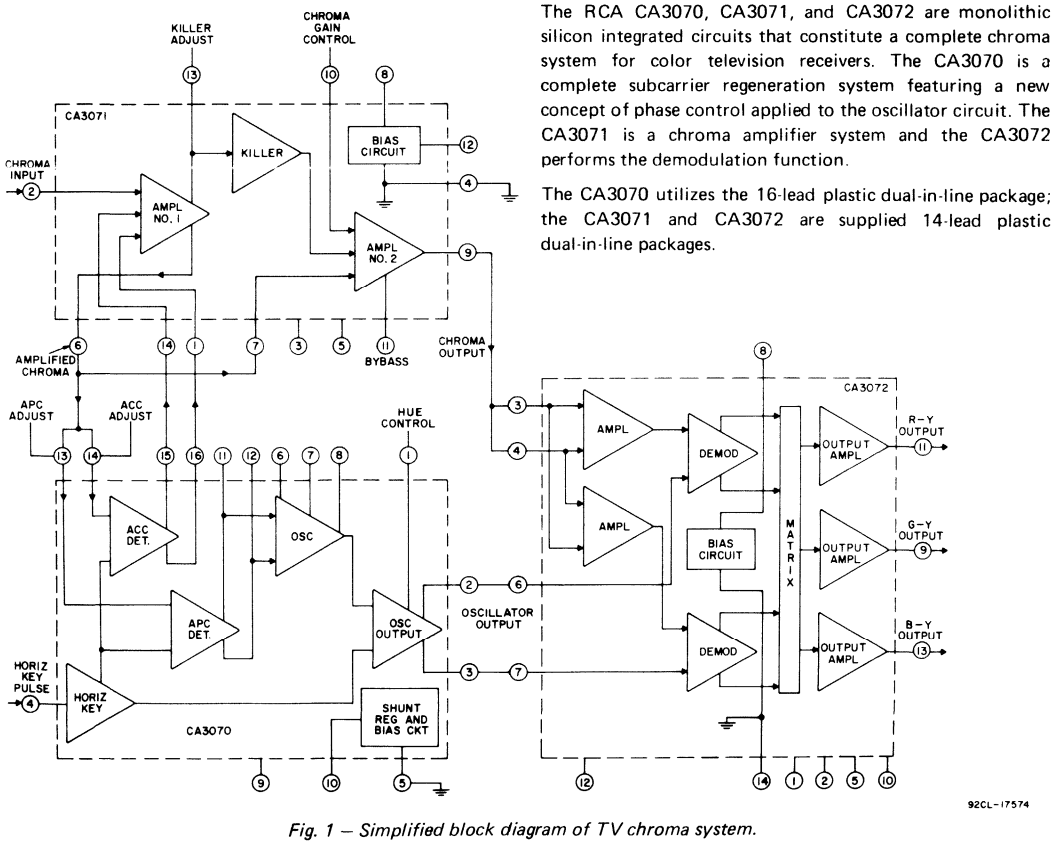

Fig. 1 – Simplified block diagram of TV chroma system.

CA3070 Chroma Signal Processor

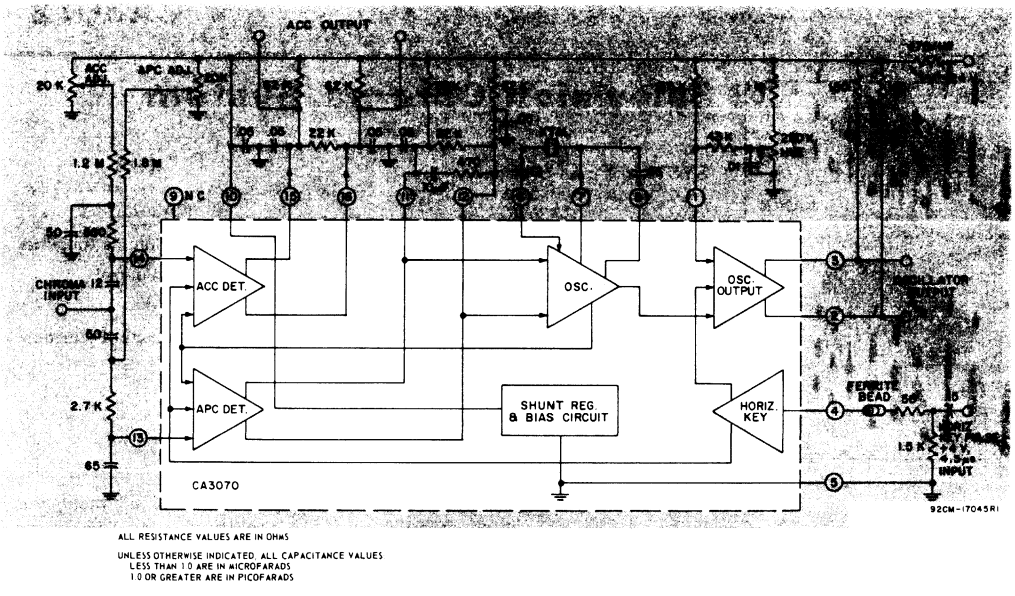

Fig. 2 – Functional diagram of RCA-CA3070.

The CA3070 is a complete subcarrier regeneration system with automatic phase control applied to the oscillator. An amplified chroma signal from the CA3071 is applied to terminals No. 13 and No. 14, which are the automatic phase control (APC) and the automatic chroma control (ACC) inputs. APC and ACC detection is keyed by the horizontal pulse which also inhibits the oscillator output amplifier during the burst interval.

The ACC system uses a synchronous detector to develop a correction voltage at the differential output terminal Nos. 15 & 16. This control signal is applied to the input terminal Nos. 1 & 14 of the CA3071. The APC system also uses a synchronous detector. The APC error voltage is internally coupled to the 3.58 MHz oscillator at balance; the phase of the signal at terminal No. 13 is in quadrature with the oscillator.

To accomplish phasing requirements, an RC phase shift network is used between the chroma input and terminal Nos. 13 and 14. The feedback loop of the oscillator is from terminal Nos. 7 and 8 back to No. 6. The same oscillator signal is available at terminal Nos. 7 and 8, but the dc output of the APC detector controls the relative signal levels at terminal Nos. 7 or 8. Because the output at terminal No. 8 is shifted in phase compared to the output at terminal No. 7, which is applied directly to the crystal circuit, control of the relative amplitudes at terminal Nos. 7 and 8 alters the phase in the feedback loop, thereby changing the frequency of the crystal oscillator. Balance adjustments of dc offsets are provided to establish an initial no-signal offset control in the ACC output, and a no-signal, on-frequency adjustment through the APC detector-amplifier circuit which controls the oscillator frequency. The oscillator output stage is differentially controlled at terminal Nos. 2 and 3 by the hue control input to terminal No. 1. The hue phase shift is accomplished by the external R, L, and C components that couple the oscillator output to the demodulator input terminals. The CA3070 includes a shunt regulator to establish a 12-volt dc supply.

Dynamic Test Initial Adjustments

1. APC ADJUST: With S2 in "OFF" position adjust the "APC ADJ" potentiometer to set oscillator frequency at 3.57945 MHz ±25 Hz. With S1 in position 1 measure frequency at terminal No. 2 output, using crystal probe shown in Fig. 6.
2. ACC ADJUST: With S2 in "OFF" position adjust "ACC ADJ" potentiometer to give an ACC output reading of 0 ±2 mV.

Procedure to Pull-in Range Measurement

1. Set S1 in position 1 and connect the crystal probe to terminal No. 2.
2. Turn S2 to "OFF" and set "APC ADJ." arm to ground.
3. Turn S2 to "ON" and gradually adjust "APC ADJ" until oscillator "locks" as witnessed by a sharp increase in ACC output voltage between terminal Nos. 15 and 16.
4. Turn S2 to "OFF" and adjust capacitor Cp of crystal probe for maximum deflection on Ballantine Meter.
5. Switch Ballantine meter to "Amplifier" position and read oscillator frequency on counter.
6. Repeat steps 2 – 5 with "APC ADJ" arm set to terminal No. 10 instead of to ground.

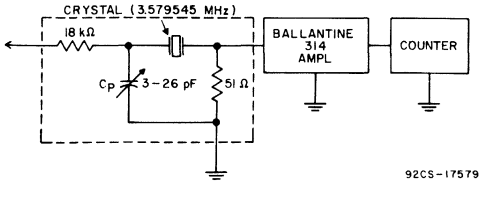

Fig. 6 – Crystal probe for frequency measurements.

CA3071 Chroma Amplifier

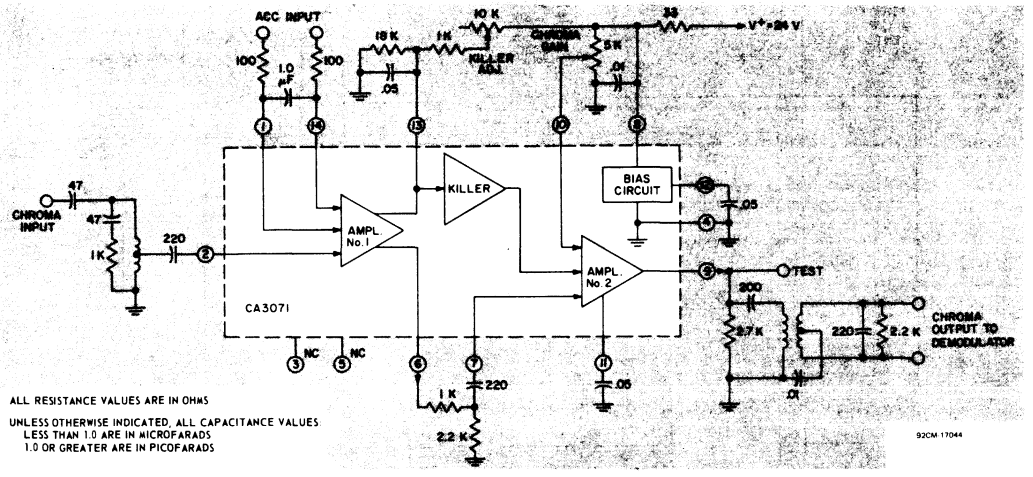

Fig. 7 – Functional diagram of RCA-CA3071.

The CA3071 is a combined two-stage chroma amplifier and functional control circuit. The input signal is received from the video amplifier and applied to terminal No. 2 of the input amplifier stage. The first amplifier stage is part of the ACC system and is controlled by differential adjustment from the ACC input terminal Nos. 1 and 14. The output of the 1st amplifier is directed to terminal No. 6 from where the signal may be applied to the ACC detection system of the CA3070 or an equivalent circuit. The output at terminal No. 6 is also applied to terminal No. 7 which is the input to the 2nd amplifier stage. Another output of the 1st amplifier at terminal No. 13 is directed to the killer adjustment circuit.

The dc voltage level at terminal No. 13 rises as the ACC differential voltage decreases with a reduction in the burst amplitude. At a pre-set condition determined by the killer adjustment resistor the killer circuit is activated and causes the 2nd chroma amplifier stage to be cut off. The 2nd chroma amplifier stage is also gain controlled by the adjustment of dc voltage at terminal No. 10. The output of the 2nd chroma amplifier stage is available at terminal No. 9. The typical output termination circuit that is shown, provides differential chroma drive signal to the demodulator circuit. Both amplifier outputs utilize emitter-followers with short-circuit protection.

CA3072 Chroma Demodulator

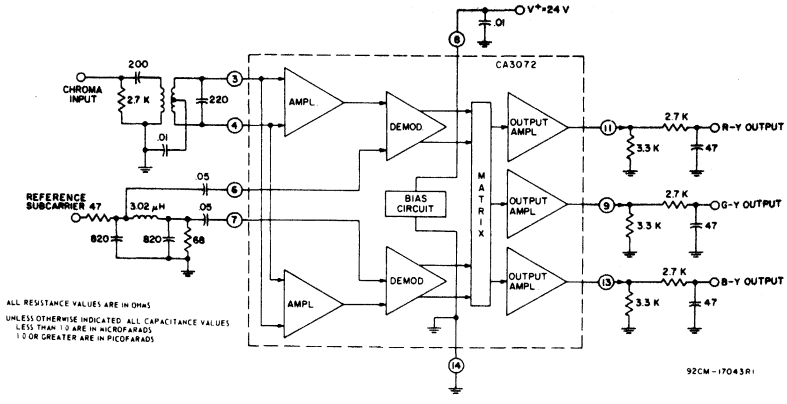

Fig. 14 – Functional diagram of RCA-CA3072.

The CA3072 has two sets of synchronous detectors with matrix circuits to achieve the R-Y, G-Y, and B-Y color difference output signals. The chroma input signal is applied to terminal Nos. 3 and 4 while the oscillator injection signal is applied to terminal Nos. 6 and 7. The color difference signals, after matrix, have a fixed relationship of amplitude and phase nominally equal dc voltage levels. The outputs of the CA3072 are suitable for driving high level color difference or R, G, B output amplifiers. Emitter-follower output stages used to drive the high level color amplifiers have short-circuit protection.

Application Information

TYPICAL APPLICATION CIRCUIT FOR THE CHROMA SYSTEM

The circuit of Fig. 18 is a complete signal processing system for color TV. The RCA types CA3070, CA3071 and CA3072 monolithic integrated circuits are respectively used as the subcarrier regenerator, chroma amplifier, and chroma demodulator.

The input to the system is the chroma signal which may be taken from the first or second video stage and is coupled into the CA3071 chroma amplifier through a bandpass filter. The outputs from the system are the color difference signals which are intended to drive high level amplifiers. Luminance mixing may be external to the picture tube or, the difference signals may be amplified and applied to the picture tube grid or cathode, where they are internally mixed with the luminance signal.

Other input requirements to the system are the power supply voltage of +24 volts and the horizontal keying pulse. The power supply voltage should be maintained within ±3 volts of the recommended value of +24 volts. The total current for the system is approximately 70 milliamperes. The horizontal keying pulse input to the subcarrier regenerator is approximately +4 volts peak and centered on the burst as seen at terminal Nos. 13 and 14 of the CA3070. The pulse width should be maintained as close as possible to the recommended value of 4.5 microseconds.

CA3070 Circuit Operation

The CA3070 circuit as shown in Fig. 3, consists of an oscillator, automatic phase control (APC) detector, automatic chroma control (ACC) detector, gated oscillator output amplifier and a shunt regulator. The shunt regulator provides the necessary bias stability for the 3.579545 MHz oscillator, as well as the bias to all functions of the CA3070 circuit. The regulation voltage is nominally +12 volts as measured at terminal No. 10.

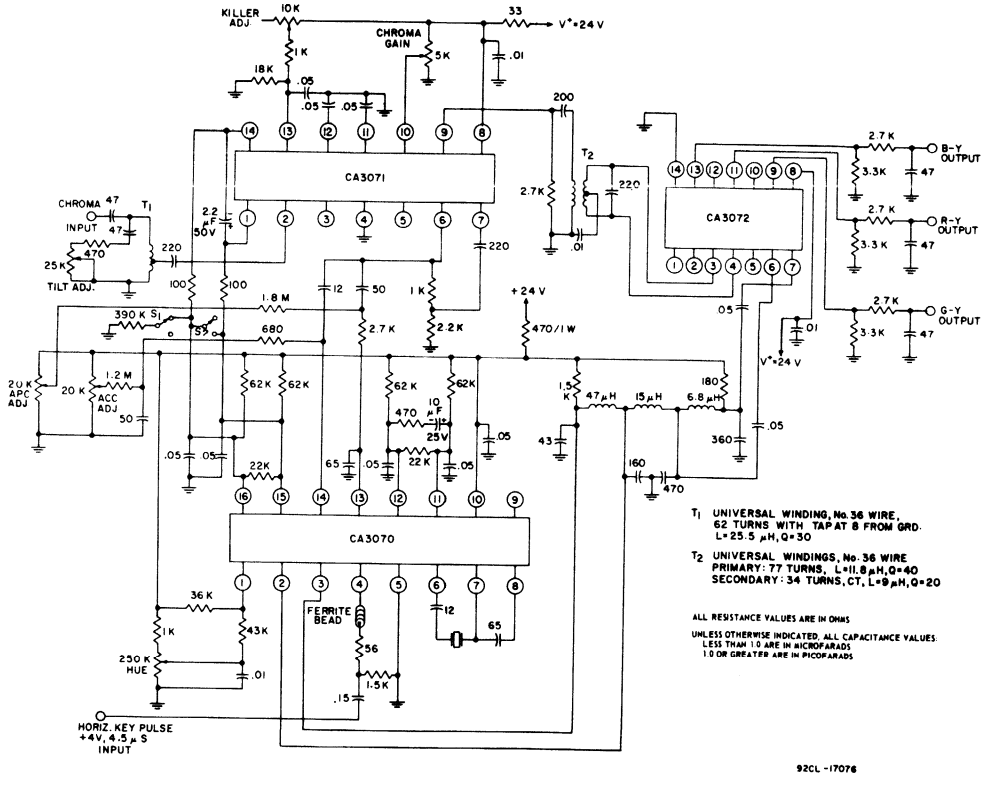

Fig. 18 – Typical chroma system for color-TV receivers utilizing RCA-CA3070, CA3071, and CA3072.

The APC and ACC detectors are synchronous detectors which are keyed by the horizontal input pulse. This form of detection eliminates the need for a burst separator as an individual amplifier stage. When a positive pulse is present at terminal No. 4, the oscillator output is cutoff and the oscillator drive signal is diverted to the APC and ACC detectors. Referring to Fig. 3, the APC detector (Q_9 & Q_{10}) and the ACC detector (Q_5 & Q_6) are emitter driven from the oscillator transistor (Q_{17}), when the oscillator output amplifier transistors (Q_2 & Q_3) are cutoff. The chroma signal is applied to terminal Nos. 13 and 14. There is oscillator current drive to the APC and ACC detectors during the keying interval; burst separation is effectively accomplished by the gating action of the detectors. A further advantage of the keying action is the high gain made possible as a result of the low average current flow of the APC and ACC detectors. High resistor values of 62 kilohms at the detector output terminals provide proper detector bias consistent with the duty factor of the keying pulse. For a wider keying pulse, it is necessary that smaller values of detector load resistors be used.

In the absence of the keying pulse (line period), the resistor, R_{20}, biases the oscillator's output amplifier transistors (Q_2 & Q_3) on by keeping their emitters at a higher potential than the base bias voltages of Q_5, Q_6, Q_9, and Q_{10}. The 3.58 MHz signal is now present at terminal Nos. 2 & 3. Photographs of oscilloscope traces for one line period at the terminal Nos. 1, 2, and 3 are shown in Fig. 19 The effect of the keying pulse is shown in Fig. 19a, and the cutoff of the oscillator output amplifier is shown in Fig. 19b and 19c.

The oscillator section of the CA3070 consists of the loop formed by Q_{18} and the emitter driven differential pair, Q_{13} & Q_{14}. The signal output from terminal Nos. 7 & 8 is coupled through the series tuned crystal circuit back through terminal No. 6 to Q_{16} & Q_{17}. The collector of Q_{17} drives the oscillator output amplifier and the APC & ACC detectors. Q_{17} is emitter coupled to transistor Q_{18}. The oscillator frequency and phase control is accomplished by the differential drive from the APC detector to transistors Q_{12} & Q_{15} which control the balance of Q_{13} & Q_{14}. The resulting phase of the feedback loop is determined by the relative amplitudes of the oscillator output signal at terminal Nos. 7 and 8. The 65 pF capacitor between terminal No. 7 and 8 provides the phase shifting component as the balance of Q_{13} and Q_{14} is varied. In this way the APC detector controls the crystal frequency at which the phase shift is cancelled in the feedback loop.

The controls for the CA3070 subcarrier regenerator circuit are the APC balance, the ACC balance, and the hue control. The hue control is a dc balance adjustment of the oscillator output amplifier transistors Q_2 & Q_3. A phase delay network between the output terminals Nos. 2 & 3 determines the range of the hue control, which for the value shown in Fig. 18, is approximately 90°.

The ACC adjustment sets the initial balance of the ACC drive to the input of the CA3071 in Fig. 18 (terminal Nos. 1 and 14 of the CA3071). The APC is a frequency adjustment of the oscillator through the balance control of the APC detector.

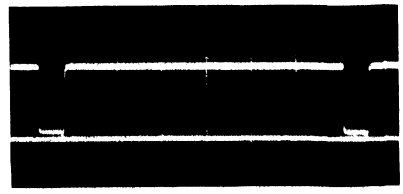

Fig. 19(a) - CA3070 terminal No. 1 7.5 V oscillator "gate off" pulse.

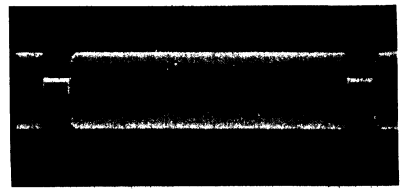

Fig. 19(b) - CA3070 terminal No. 2, 3.5 $V_{p\text{-}p}$ oscillator output; one horizontal line, (gated off during burst).

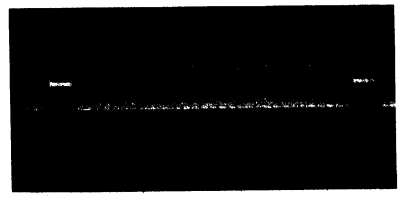

Fig. 19(c) - CA3070 terminal No. 3, 2.0 $V_{p\text{-}p}$ oscillator output; one horizontal line, (gated off during burst).

As a setup adjustment, for both the ACC and APC, switch S1 is opened and S2 is closed. The chroma input to the system is removed and the dc voltage at terminal No. 6 of the CA3071 is noted. The switch S2 is then opened and the ACC adjusted to set the voltage at terminal No. 6 to that previously noted. Alternatively, the differential dc voltage at terminal Nos. 15 & 16 of the CA3070 may be set to 0 mV (±2 mV) when S1 and S2 are open, and the CA3071 is removed from the circuit.

With the chroma signal still removed, the APC adjustment sets the frequency of the oscillator to 3.579545 MHz. Due to the gated off interval, a counter will not accurately record the frequency at the oscillator output amplifier terminals. Two simple and accurate methods are as follows: (1) a buffered crystal filter circuit, connected to the oscillator output amplifier terminals will continue to ring and fill the gated off window providing the proper interface to a counter; (2) the other method involves monitoring the demodulated output at the color difference output terminals

of the CA3072. A zero beat signal, at the color difference outputs may be seen on an oscilloscope.

When these adjustments are made, similar oscilloscope traces should be seen as shown in Fig. 20.

Fig. 20(c) - CA3070 terminal No. 8, oscillator waveform 1.6 $V_{p\text{-}p}$ 3.58 MHz.

CA3071 CIRCUIT OPERATION

The CA3071 is the basic amplifier and control circuit of the chroma system. It contains the gain control functions of the ACC loop, the color killer, and the dc chroma gain control. The CA3071 is a wide band amplifier having two stages of voltage gain. Curves of frequency-response and linearity are shown in Figs. 12 & 13 for the wideband circuits shown in Fig. 11. This is the same basic amplifier as the one in the system shown in Fig. 18 except for the omission of the tuned circuits and the ACC loop connection. The amplifiers have bandwidths of greater than 10 MHz. and are usable well beyond 30 MHz. The signal swing of the wide band amplifier is in excess of 5 $V_{p\text{-}p}$., even with the typical load coupling as shown in Fig. 18. Fig. 21 (a, b and c) show the oscilloscope traces for an NTSC signal at the chroma input. The overall frequency-response curves are shown in Fig. 22.

CA3071 operation is as follows (Refer to Figs. 10 & 18). The input chroma signal is applied to terminal No. 2. This signal is amplified in a cascode differential circuit from Q_{10} to Q_{12}

Fig. 21(a) - CA3071 chroma input 1.25 $V_{p\text{-}p}$; one horizontal line of NTSC input signal.

Fig. 21(b) - CA3071 terminal No. 6, amplifier No. 1 chroma output 2.3 $V_{p\text{-}p}$; one horizontal line for 1.25 $V_{p\text{-}p}$ chroma input

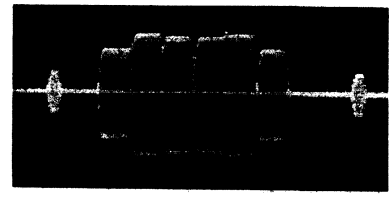

Fig. 21(c) - CA3071 terminal No. 9, amplifier No. 2 chroma output 5.5 $V_{p\text{-}p}$; one horizontal line for 1.25 $V_{p\text{-}p}$ chroma input

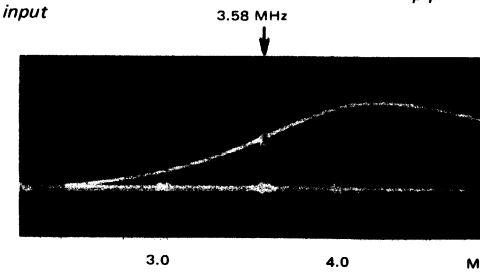

Fig. 22(a) - Frequency response sweep curve between terminal Nos. 2 & 6 for CA3071. f = 250 KHz/div.

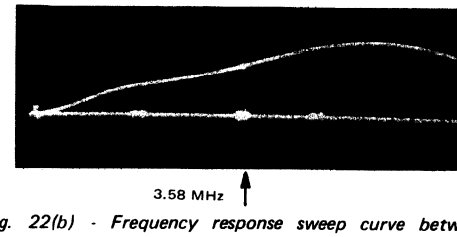

Fig. 22(b) - Frequency response sweep curve between terminal No. 2 of CA3071 and terminal No. 3 of CA3072. f = 250 KHz/div.

and the output is an emitter follower, Q_{14} (Terminal No. 6.) The signal is divided in the Q_9 & Q_{12} differential amplifier, depending on the applied ACC error signal amplitude at terminal Nos. 1 & 14. The ACC error signal is derived from terminal Nos. 15 & 16 of the CA3070 and after filtering, is applied to terminal Nos. 1 & 14 of the CA3071.

At low signal drive, the 390 kilohm resistor at switch S1 (normally closed) unbalances the differential amplifier for high signal gain through Q_{12}. As the burst level at the chroma input increases, the ACC drive changes differentially in a positive direction at terminal No. 14 and a negative direction at terminal No. 14 and a negative direction at terminal No. 1. At strong signal levels the gain is reduced by diverting the balance of ac current in the differential amplifier from Q_{12} to Q_9, which is shunted to ac ground at terminal Nos. 12 and 13. The ACC loop is completed through the chroma signal at terminal No. 6 of the CA3071 to terminal No. 14 (input) of the CA3070. A typical ACC characteristic is shown in Fig. 23.

The chroma signal is buffer connected from terminal No. 6 to terminal No. 7 of the CA3071 and is amplified in the 2nd

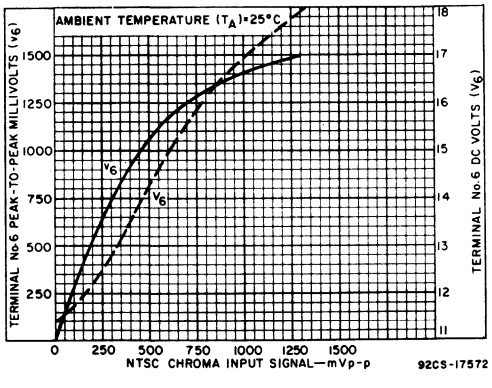

Fig. 23 - Typical ACC characteristics for chroma system of Fig. 18

stage of voltage gain. Both the color killer adjustment and the dc chroma gain control are applied to the 2nd stage to control the chroma output at terminal No. 9. The color killer section of the CA3071 is a Schmitt trigger & amplifier circuit consisting of transistors Q_1, Q_2 and Q_3. Under maximum chroma output conditions, the diode D_2 is reversed biased, and the signal path is through Q_{15}, Q_4 and Q_5 to terminal No. 9. When the color killer circuit is actuated, or the chroma gain control is adjusted to a higher positive voltage at terminal No. 10, the anode voltage of diode D_2 is increased to draw current from the signal path at the emitter of Q_4. This decreases the chroma gain as the potential at terminal No. 10 is increased. When the potential at terminal No. 10 is the same as terminal No. 8, the chroma output at terminal 9 is cutoff.

The color killer circuit provides an abrupt voltage swing at the anode of D_2 to cutoff the chroma output when the Schmitt trigger circuit is forward biased at terminal No. 13. In the circuit of Fig. 18, the color killer adjustment is a resistance divider circuit which establishes the threshold of burst level at which the killer operates the chroma amplifier.

CA3072 CIRCUIT OPERATION

The CA3072 is a chroma demodulator having full color difference signal demodulation capability. The chroma signal is applied to terminal Nos. 3 & 4 and the reference subcarrier signal is applied to terminals Nos. 6 & 7 of the CA3072. The output color difference signals are B-Y at terminal No. 13, R-Y at terminal No. 11, and G-Y at terminal No. 9. The typical level of differential chroma drive required at terminal Nos. 3 & 4 is 400 mV_{p-p}. The amplitude of chroma at terminal No. 6 & 7 is approximately 1.0 volt at 104° relative phase difference which results in a B-Y output amplitude of $5V_{p-p}$. The voltages of the R-Y & G-Y outputs are at 3.8 and 1.0 V_{p-p} respectively, when there is $5V_{p-p}$ output at B-Y. These comparative signals are based upon a complete phase rotation of the chroma relative to the subcarrier signal reference. The relative demodulation phase and amplitude ratios of the Fig. 18 circuit are shown in the oscilloscope trace photographs of Fig. 24. Using the hue control setting for B-Y phase at the B-Y output, the G-Y color-difference signal is approximately −104° and the R-Y color-difference signal is approximately +106°. Since the amplitude ratios are a function of the applied signal phase relationship, the NTSC color difference output signals are shown here primarily for phase reference conditions.

CHROMA SYSTEM CONSTRUCTION

Fig. 25 shows the complete CA3070, CA3071 and CA3072 chroma system in the Fig. 18 circuit. Table I lists the dc terminal voltages for the system. The chroma gain and hue controls, as well as the switches S1 and S2 are removed. The template circuit board layout is also shown for duplication purposes. It should be noted that a few component values are modified in Fig. 18 from the dynamic circuit values of the data sheet. These are necessary for system matching and overall filter requirements.

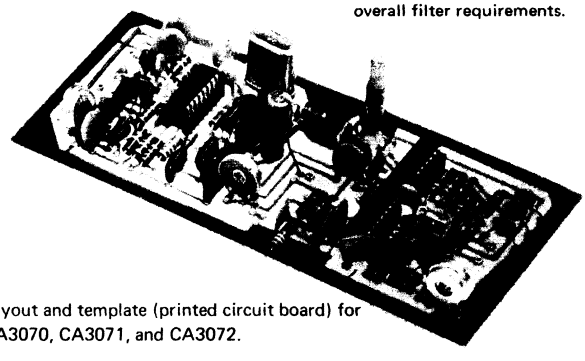

Fig. 25 (a) - Circuit layout and template (printed circuit board) for TV chroma system CA3070, CA3071, and CA3072.

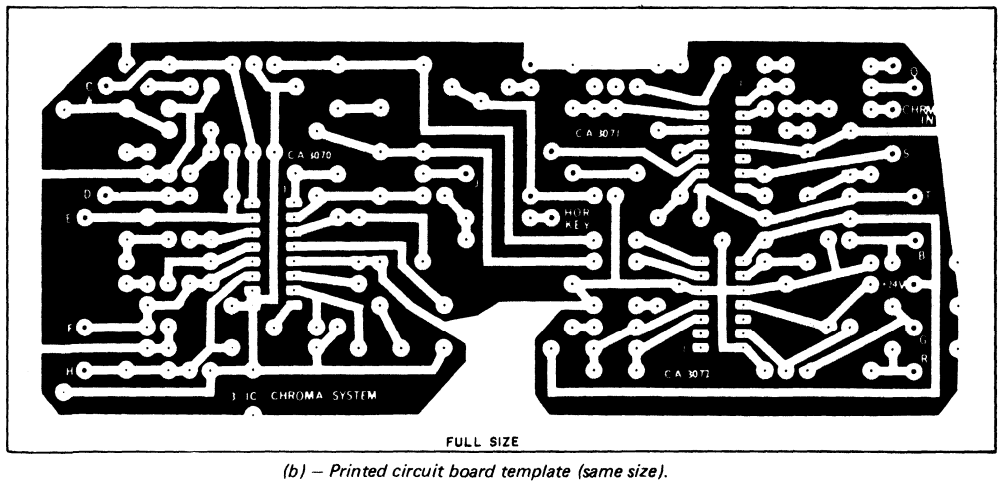

(b) – Printed circuit board template (same size).

Television Video IF System

FEATURES:

- High-gain wide-band IF amplifier: 75 dB typ. at 45 MHz
- Gain reduction with excellent stability: 50 dB typ. at 45 MHz
- Video detector with linear characteristics
- Video amplifier: 12 dB gain
- Impulse noise limiter
- Keyed AGC with noise immunity circuits
- Delayed AGC for tuner
- Buffered AFT output
- Separate sound IF intercarrier amplification
- Sound carrier detector
- 4.5 MHz sound carrier amplifier
- Isolated zener reference diode for regulated voltage supply

RCA-CA3068* is a monolithic integrated circuit that incorporates an entire video TV-IF subsystem on a single chip. Innovations in integrated circuit design, in addition to the many active devices and closely matched components utilized in the circuit, make the CA3068 ideally suited for use in color and black-and-white TV receivers.

The primary functions performed by the IF subsystem are video IF amplification, linear detection, video output amplification, AGC from a keyed supply, AGC delay for tuner, sound carrier detection, sound carrier amplification, and a buffered AFT output. The advanced circuit design of the CA3068 also includes secondary functions for improved noise immunity and minimal airplane flutter. An isolated zener reference diode, incorporated in the IC, provides a convenient and economical means for controlling the regulated voltage supply. The inherent wide bandwidth capability (10-70 MHz) and high overall gain (87 dB) make the CA3068 suitable for other AM IF applications whose frequencies range within this bandwidth.

The CA3068 utilizes a unique 20-lead quad-in-line plastic package. This package also includes a wrap-around shield that serves to minimize interlead capacitances.

Fig. 7b – Color TV-IF amplifier with associated waveform and test circuit.

Alignment of the IF Amplifier

1. Apply a 2 to 4 mV signal from a sweep generator, Telonic SV13 or equivalent to the input of the IF amplifier.
2. Apply a negative DC supply voltage, to the Gain Adjust Terminal.
3. Set the gain supply voltage to provide a peak-to-peak output of 6 volts.
4. The overall response curve should conform to the waveform shown in Fig. 7b.

A TYPICAL COLOR–TV VIDEO SYSTEM

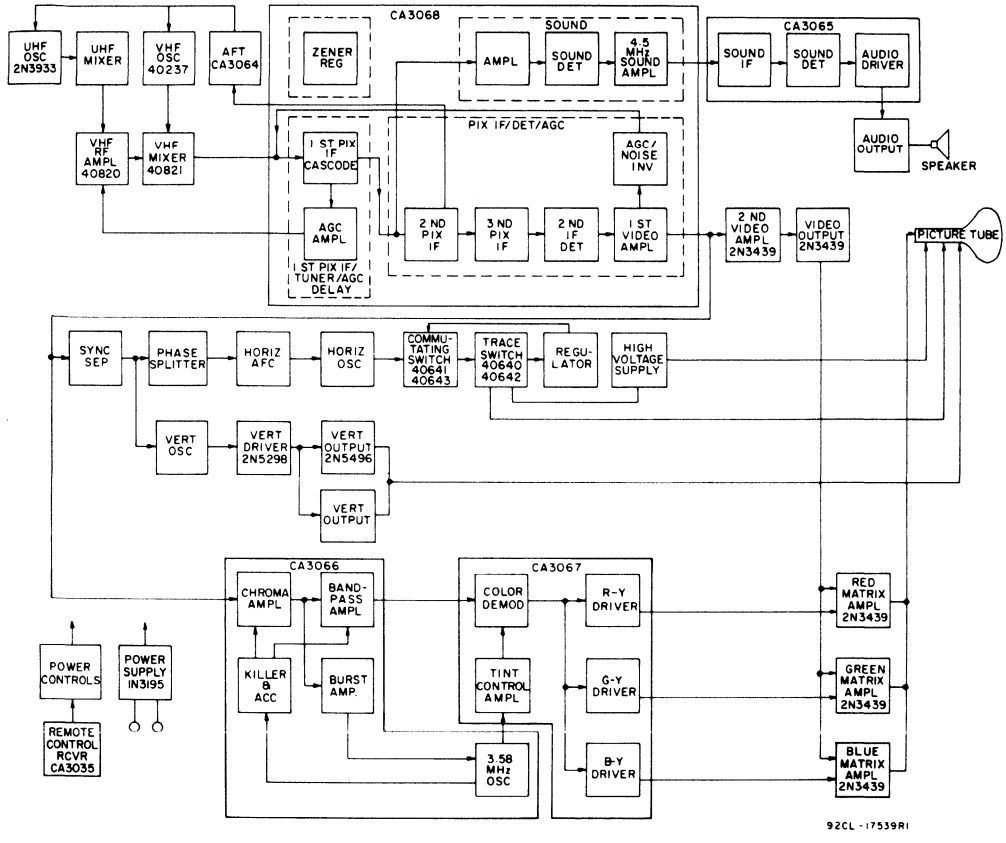

Fig. 8 – Block diagram of a typical color TV receiver utilizing the CA3068.

Application Information

A block diagram of a typical color TV application of the CA3068 is shown in Fig. 8. The input from the TV tuner is applied to the IF cascode amplifier of the IC. The cascode amplifier has a gain reduction of 50 dB typ. and a gain of 35 dB typ. The cascode output is coupled to succeeding stages via the IC lead interconnections. Associated with the cascode amplifier is an AGC delay network that provides gain control for the RF amplifier. This arrangement enables the circuit designer to introduce the desired bandpass-shaping circuitry between the cascode input stages and the remaining IF stages. These IF stages provide an additional gain of 40 dB typ. The output, taken from the emitter of the second IF stage, also provides a buffered AFT signal that is designed to drive the RCA-CA3064 TV Automatic Fine-Tuning IC.

The IF detector circuit provides an extremely linear output signal that is DC coupled to the first video amplifier. The first video amplifier has a voltage gain of 12 dB typ. The detector and video amplifier circuits provide a signal which has in addition to its linear output an extremely sharp limiting characteristic. The maximum video output level is approximately 7 volts peak-to-peak. The sharp limiting action of this circuit clips any signal (e.g. impulse noise) that exceeds this 7-volt value.

The video amplifier also provides a signal which drives a keyed AGC signal. The unique keyed AGC circuits utilize active devices that virtually eliminate noise from interfering with the action of the AGC. A separate sound section provides amplification at intercarrier frequencies, sound carrier detection, and sound carrier amplification. This sound section is designed to drive the RCA-CA3065 TV Sound System IC.

A color IF circuit with associated performance data is shown in Fig. 7. For a more detailed description of the CA3068 and related performance and IF printed circuit construction information, refer to the RCA Application Note AN-4544.

CA3019

DIODE ARRAY

One Diode "Quad" and Two Isolated Diodes on a Common Substrate

Monolithic Silicon

The CA3019 consists of one Diode "Quad" and two Isolated Diodes on a Common Substrate.

10-Pin TO-5

- **Designed for use in Telemetry, Data-Processing, Instrumentation, and Communication Equipment**
- **Built-in Temperature Stability for Operation from -55°C to +125°C**
- **10-Terminal TO-5 Package**
- **Hermetically Sealed**
- **Companion Application Note, ICAN-5299 "Application of the RCA CA3019 Integrated-Circuit Diode Array"**

HIGHLIGHTS

- **Excellent Diode Match**
- **Low Leakage Current**
- **Low Pedestal Voltage when Gating**

APPLICATIONS

- **Modulator**
- **Mixer**
- **Balanced Modulator**
- **Analog Switch**
- **Diode Gate for Chopper-Modulator Applications**

Linear Integrated Circuits

CA3039

Diode Array

Six Matched Diodes on a Common Substrate
Monolithic Silicon

The RCA-CA3039 consists of six ultra-fast, low capacitance diodes on a common monolithic substrate. Integrated circuit construction assures excellent static and dynamic matching of the diodes, making the array extremely useful for a wide variety of applications in communication and switching systems.

Five of the diodes are independently accessible, the sixth shares a common terminal with the substrate.

For applications such as balanced modulators or ring modulators where capacitive balance is important, the substrate should be returned to a DC potential which is significantly more negative (with respect to the active diodes) than the peak signal applied.

ULTRA-FAST LOW-CAPACITANCE MATCHED DIODES

For Applications in Communications and Switching Systems

12-Lead TO-5

APPLICATIONS

- Balanced modulators or demodulators
- Ring modulators
- High speed diode gates
- Analog switches

FEATURES

- Excellent reverse recovery time – 1 ns typ.
- Matched monolithic construction – V_F matched within 5 mV
- Low diode capacitance – C_D = 0.65 pF typical at V_R = – 2 V

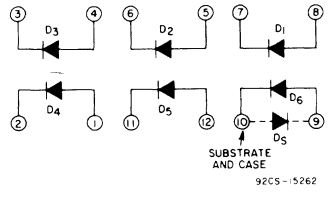

Fig. 1 - Schematic Diagram for CA3039

Linear Integrated Circuits

CA3018
CA3018A

General-Purpose Transistor Arrays

Monolithic Silicon

The CA3018 and CA3018A consist of four general purpose silicon n-p-n transistors on a common monolithic substrate.

Two of the four transistors are connected in the Darlington configuration. The substrate is connected to a separate terminal for maximum flexibility.

The transistors of the CA3018 and the CA3018A are well suited to a wide variety of applications in low-power systems in the DC through VHF range. They may be used as discrete transistors in conventional circuits but in addition they provide the advantages of close electrical and thermal matching inherent in integrated circuit construction.

The CA3018A is similar to the CA3018 but features tighter control of current gain, leakage, and offset parameters making it suitable for more critical applications requiring premium performance.

APPLICATIONS

- General use in signal processing systems in DC through VHF range
- Custom designed differential amplifiers
- Temperature compensated amplifiers
- See RCA Application Note, ICAN-5296 "Application of the RCA CA3018 Integrated-Circuit Transistor Array" for suggested Applications.

TWO ISOLATED TRANSISTORS AND A DARLINGTON-CONNECTED TRANSISTOR PAIR

For Low-Power Applications at Frequencies from DC Through the VHF Range

12-Lead TO-5 Style

FEATURES

- Matched monolithic general purpose transistors
- H_{FE} matched ± 10%
- V_{BE} matched ± 2 mV CA3018A (± 5mV CA3018)
- Operation from DC to 120 MHz
- Wide operating current range
- CA3018A performance characteristics controlled from 10 μA to 10mA
- Low noise figure - - 3.2 dB typical at 1KHz
- Full military temperature range capability (-55 to + 125°C)

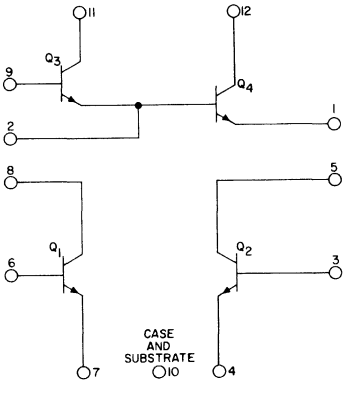

Fig. 1 - Schematic Diagram for CA3018 and CA3018A

Maximum Ratings, Absolute-Maximum Values, at TA=25°C

	CA3018	CA3018A	
Power Dissipation, P:			
Any one transistor	300	300	mW
Total package	450	450	mW
Derate at 5 mW/°C for $T_A > 85°C$			
Temperature Range:			
Operating	-55 to + 125	-55 to + 125	°C
Storage	-65 to + 150	-65 to + 150	°C

The following ratings apply for each transistor in the device:

	CA3018	CA3018A	
Collector-to-Emitter Voltage, V_{CEO}	15	15	V
Collector-to-Base Voltage, V_{CBO}	20	30	V
Collector-to-Substrate Voltage, V_{CIO}*	20	40	V
Emitter-to-Base Voltage, V_{EBO}	5	5	V
Collector Current, I_C	50	50	mA

*The collector of each transistor of the CA3018 and CA3018A is isolated from the substrate by an integral diode. *The substrate (terminal 10) must be connected to the most negative point in the external circuit to maintain isolation between transistors and to provide for normal transistor action.*

Characteristics apply for each transistor in the CA3018 and CA3018A as specified.

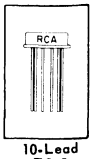
Linear Integrated Circuits

CA3036

DUAL DARLINGTON ARRAY

Monolithic Silicon

- Two independent low-noise wide-band amplifier channels
- Particularly useful for preamplifier and low-level amplifier applications in single-channel and stereo systems
- Wide application in low-noise industrial instrumentation amplifiers



10-Lead
TO-5

HIGHLIGHTS

- Matched transistors with emitter-follower outputs
- Low-noise performance
- 200-MHz gain-bandwidth product
- Operation from -55°C to +125°C
- Hermetically sealed, all-welded 10-lead TO-5-style metal package

APPLICATIONS

- Stereo phonograph preamplifiers
- Low-level stereo and single channel (8) amplifier stages
- Low-noise, emitter-follower differential amplifiers
- Operational amplifier drivers

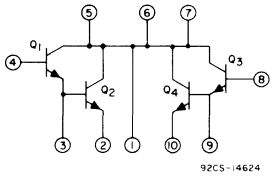


Fig.1 - Schematic Diagram for CA3036.

Maximum Ratings, Absolute-Maximum Values

Power Dissipation, P:

Any one transistor	300 max.	mW
Total for array	600 max.	mW

Temperature Range:

Operating	-55 to +125	°C
Storage	-65 to +150	°C

The following ratings apply for each transistor in the array:

Collector-to-Emitter Voltage, V_{CEO}	15 max.	V
Collector-to-Base Voltage, V_{CBO}	30 max.	V
Emitter-to-Base Voltage, V_{EBO}	5 max.	V
Collector Current, I_C	50 max.	mA

Linear Integrated Circuits

CA3045
CA3046

General-Purpose Transistor Arrays

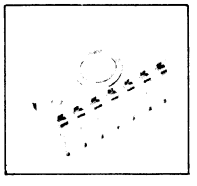
Monolithic Silicon

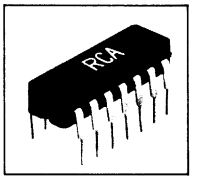
The CA3045 and CA3046 each consist of five general purpose silicon n-p-n transistors on a common monolithic substrate. Two of the transistors are internally connected to form a differentially-connected pair.

The transistors of the CA3045 and CA3046 are well suited to a wide variety of applications in low power systems in the DC through VHF range. They may be used as discrete transistors in conventional circuits however, in addition, they provide the very significant inherent integrated circuit advantages of close electrical and thermal matching.

The CA3045 is supplied in an hermetic 14-lead Dual-In-Line ceramic package rated for operation over the full military temperature range.

The CA3046 is electrically identical to the CA3045 but is supplied in a dual-in-line plastic package for applications requiring only a limited temperature range.





CA3045 CA3046

THREE ISOLATED TRANSISTORS AND ONE DIFFERENTIALLY-CONNECTED TRANSISTOR PAIR

For Low-Power Applications at Frequencies from DC through the VHF Range

APPLICATIONS

- General use in all types of signal processing systems operating anywhere in the frequency range from DC to VHF
- Custom designed differential amplifiers
- Temperature compensated amplifiers
- See RCA Application Note, ICAN-5296 "Application of the RCA-CA3018 Integrated-Circuit Transistor Array" for suggested applications.

FEATURES

- Two matched pairs of transistors
  V_{BE} matched ± 5 mV
  Input offset current 2 μA max. at I_C = 1 mA
- 5 general purpose monolithic transistors
- Operation from DC to 120 MHz
- Wide operating current range
- Low noise figure - - 3.2 dB typ. at 1 kHz
- Full military temperature range for CA3045
  -55 to +125°C

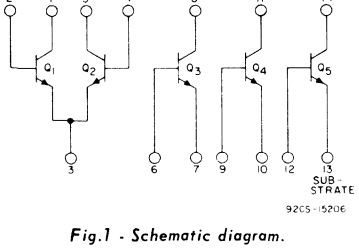


Fig.1 - Schematic diagram.

High Reliability Types
for Aerospace, Military and
other Critical Applications

RCA-CA3045/1, CA3045/2, CA3045/3, CA3045/4 are high-reliability integrated circuits for critical applications in aerospace, military and industrial equipment operating at frequencies up to 120 MHz.

These types are electrically and mechanically interchangeable with the RCA- CA3045 but are specially processed and tested in accordance with the Aerospace and Military electrical, environmental, and physical test methods and procedures established for microelectronic devices in MIL-STD-883.

The curves of Typical Static and Dynamic Characteristics shown in the technical data bulletin (File No. 341) for the CA3045 also apply for these high reliability versions.

The number following the slash (/) mark in each type designation, e.g., CA3045/1 indicates the screening levels employed by RCA to achieve the quality and reliability commensurate with the intended application. A description of these levels (1, 2, 3, and 4) is given on page 2.

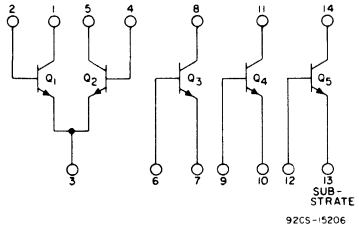

Fig. 1 - Schematic Diagram.

High Reliability

Transistor Arrays

Three Isolated Transistors and One Differentially-Connected Transistor Pair

H-1553

- Examinations and Tests performed in accordance with MIL-STD-883 "Test Methods & Procedures for Microelectronics"
- Total Lot Screening (100% testing) plus "group A" (electrical) and "group B" (environmental) Sampling Test Programs
- Internal Visual (Precap) Inspection Performed on all 4 Screening Levels in accordance with Condition A, Method 2010 MIL-STD-883
- Choice of 4 distinct Screening Levels

FEATURES

- Two Matched pairs of transistors:
  Matched V_{BE} . . . ± 5 mV
  Input offset current
  at I_C = 1 mA . . . 2μA max.
- Operation from DC to 120 MHz
- Wide operating current range
- Low noise figure
  at 1 kHz . . . 3.2 dB typ.
- Full military temperature range . . .
  -55 to +125°C

MAXIMUM RATINGS, ABSOLUTE-MAXIMUM VALUES, AT TA= 25°C

Power Dissipation, P:
- Any one transistor . . . . . 300 mW
- Derate 3.5 mW/°C
- Total package . . . . . 750 mW
- Derate at 8 mW/°C for $T_A > 75°C$

Temperature Range:
- Operating. . . . . -55 to +125°C
- Storage . . . . . -65 to +150°C

The following ratings apply for each transistor in the device:

Collector-to-Emitter Voltage, V_{CEO} . . . . . 15 V

Collector-to-Base Voltage, V_{CBO} . . . . . 20 V
Collector-to-Substrate Voltage, V_{CIO}* . . . . . 20 V
Emitter-to-Base Voltage, V_{EBO} . . . . . 5 V
Collector Current, I_C . . . . . 50 mA

**The collector of each transistor of the CA3045 is isolated from the substrate by an integral diode. The substrate (terminal 13) must be connected to the most negative point in the external circuit to maintain isolation between transistors and to provide for normal transistor action.*

RCA INTEGRATED CIRCUIT SCREENING LEVELS

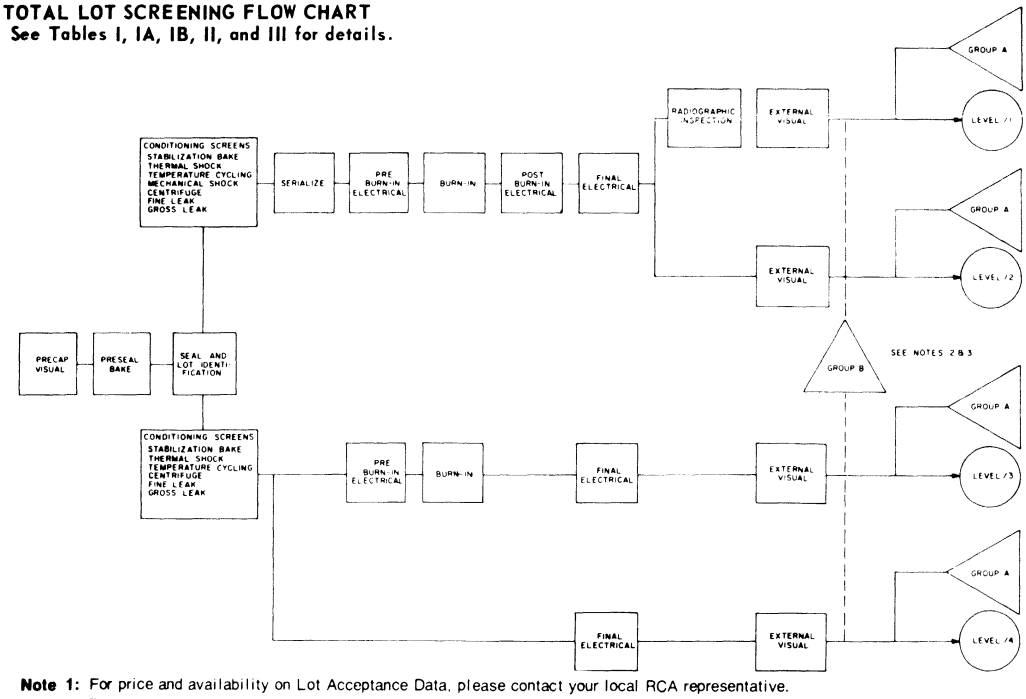
RCA Level	MIL-STD-883 Equivalent	Application	Description
/1, /2	Class A	Aerospace & Missiles	For devices intended for use where maintenance and replacement are extremely difficult or impossible and Reliability is Imperative
/3	Class B	Military & Industrial For example, in Airborne Electronics	For devices intended for use where maintenance and replacement can be performed but are difficult and expensive
/4	Class C (Class B without Burn-In)	Military & Industrial For example, on Ground Based Electronics	For devices intended for use where replacement can readily be accomplished

RCA Screening Level '1 is equivalent to MIL-STD-883 Class A except that Reverse Bias Burn-in is performed only in Group B.

RCA Screening Level '2 is the same as Level '1 but Radiographic Inspection is not performed.

TOTAL LOT SCREENING FLOW CHART

See Tables I, IA, IB, II, and III for details.



Note 1: For price and availability on Lot Acceptance Data, please contact your local RCA representative.
Note 2: For Life — Based on established data for devices having similar electrical characteristics
Note 3: For M & E — Based on established data for devices having a specific package configuration e.g. TO-5, Dual-In-Line Ceramic, Flat Pack

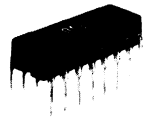
Linear Integrated Circuits

Monolithic Silicon

CA3081
CA3082



16-Lead Dual-In-Line Plastic Package

H-1622

General-Purpose High-Current N-P-N Transistor Arrays

CA3081–Common-Emitter Array CA3082–Common-Collector Array

Directly Drive 7-Segment Incandescent Displays and Light-Emitting-Diode (LED) Displays

Features

- **7 transistors permit a wide range of applications in either a common-emitter (CA3081) or common-collector (CA3082) configuration**
- **High I_C: 100 mA max.**
- **Low $V_{CE\ sat}$ (at 50 mA): 0.4 V typ.**

Applications

- **Drivers for:**
  - **Incandescent display devices (e.g. RCA NUMITRON DR2000 Series and lamps)**
  - **LED (e.g. RCA-40736R GaAs High-Efficiency Emitting Diode)**
  - **Relay control**
  - **Thyristor firing**

RCA-CA3081* and CA3082* consist of seven high-current (to 100 mA) silicon n-p-n transistors on a common monolithic substrate. The CA3081 is connected in a common-emitter configuration and the CA3082 is connected in a common-collector configuration.

The CA3081 and CA3082 are capable of directly driving seven-segment displays, such as the RCA NUMITRON devices (DR2000 and DR2010), and light-emitting diode (LED) displays. These types are also well-suited for a variety of other driver applications, including relay control and thyristor firing.

The CA3081 and CA3082 utilize a 16-lead dual-in-line plastic package which includes a separate substrate connection for maximum flexibility in circuit design.

* Formerly developmental types TA5858 and TA6033, respectively.

Fig.1–Functional diagrams of types CA3081 and CA3082.

MAXIMUM RATINGS, Absolute-Maximum Values at T_A = 25°C

Power Dissipation:

Any one transistor	500	mW
Total package	750	mW
Above 55°C	Derate linearly 6.67	mW/°C

Ambient Temperature Range:

Operating	−40 to +85	°C
Storage	−65 to + 150	°C

The following ratings apply for each transistor in the device:

Collector-to-Emitter Voltage (V_{CEO})	16	V
Collector-to-Base Voltage (V_{CBO})	20	V
Collector-to-Substrate Voltage (V_{CIO})*	20	V
Emitter-to-Base Voltage (V_{EBO})	5	V
Collector Current (I_C)	100	mA
Base Current (I_B)	20	mA

* The collector of each transistor of the CA3081 and CA3082 is isolated from the substrate by an integral diode. The substrate must be connected to a voltage which is more negative than any collector voltage in order to maintain isolation between transistors and provide normal transistor action. To avoid undesired coupling between transistors, the substrate terminal (5) should be maintained at either DC or signal (AC) ground. A suitable bypass capacitor can be used to establish a signal ground.

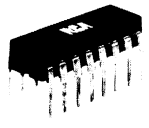
RCA Solid State Division

Linear Integrated Circuits

CA3083



H-1622

16-Lead Dual-In-Line Plastic Package

General-Purpose High-Current N-P-N Transistor Array

Applications

- Signal processing and switching systems operating from DC to VHF
- Lamp and relay driver
- Differential amplifier
- Temperature-compensated amplifier
- Thyristor firing
- See RCA Application Note, ICAN-5296 "Application of the RCA-CA3018 Circuit Transistor Array" for suggested applications

RCA-CA3083* is a versatile array of five high-current (to 100mA) n-p-n transistors on a common monolithic substrate. In addition, two of these transistors (Q1 and Q2) are matched at low currents (i.e. 1mA) for applications in which offset parameters are of special importance.

Independent connections for each transistor plus a separate terminal for the substrate permit maximum flexibility in circuit design. The CA3083 utilizes the 16-lead dual-in-line plastic package.

*Formerly developmental type TA5998

Features

- High I_C: 100mA max.
- Low V_{CEsat} (at 50mA): 0.7V max.
- Matched pair (Q1 and Q2)–
  V_{IO} (V_{BE} matched): ± 5 mV max.
  I_{IO} (at 1mA): 2.5 μA max.
- 5 independent transistors plus separate substrate connection

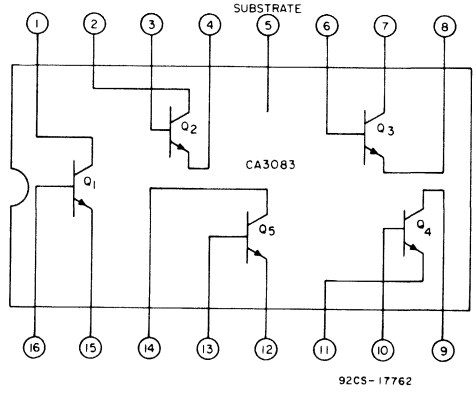


Fig. 1–Functional diagram of the CA3083.

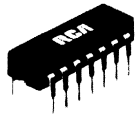
RCA Solid State Division

Linear Integrated Circuits

Monolithic Silicon

CA3084



H-1517

14-Lead Dual-In-Line Plastic Package

General-Purpose P-N-P Transistor Array

FEATURES

- **Matched transistor pair (Q1 and Q2)**
  V_{IO} (V_{BE} matched): ± 6mV max.
  I_{IO} (at 100 μA): ± 0.6 μA
- **Wide operating current range**
- **Low noise figure - - 3.2 dB typ. at 1 kHz**

RCA-CA3084* is a general-purpose silicon p-n-p transistor array incorporating two independent transistors, a Darlington circuit, and a current-mirror pair with a shared diode.

The two independent transistors in the array may be used in a variety of circuit applications. The Darlington pair may be employed as the equivalent of a single high-beta transistor. The current-mirror pair is well suited for constant-current applications and can also be used as the active loads in a differential amplifier which uses n-p-n transistors.

The total array is especially useful for a wide range of applications in systems having low-power and low-frequency requirements. Although the transistors may be used as discrete units in conventional circuits, they offer the advantages inherent in integrated-circuit construction, that is, to provide close electrical and thermal matching.

The CA3084 utilizes the 14-lead dual-in-line plastic package.

*Formerly developmental type TA5799A.

APPLICATIONS

- **General use in signal processing systems having low-power and low-frequency requirements**
- **Differential amplifiers**
- **Temperature compensated amplifiers**
- **Active loads for differential amplifiers using n-p-n transistors**
- **Complementary uses with RCA n-p-n transistor arrays**

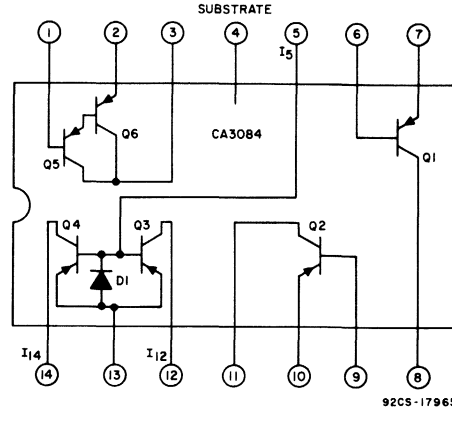


Fig. 1 – Functional diagram of the CA3084.

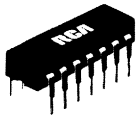
Linear Integrated Circuits

CA3086



H-1517

14-Lead Dual-In-Line Plastic Package

General-Purpose N-P-N Transistor Array

Three Isolated Transistors and One Differentially–Connected Transistor Pair

For Low–Power Applications from DC to 120MHz

Applications

- **General-purpose use in signal processing systems operating in the DC to 120-MHz range**
- **Temperature compensated amplifiers**
- **See RCA Application Note, ICAN-5296 "Application of the RCA-CA3018 Integrated-Circuit Transistor Array" for suggested applications.**

RCA-CA3086* consists of five general-purpose silicon n-p-n transistors on a common monolithic substrate. Two of the transistors are internally connected to form a differentially-connected pair.

The transistors of the CA3086 are well suited to a wide variety of applications in low-power systems at frequencies from DC to 120 MHz. They may be used as discrete transistors in conventional circuits. However, they also provide the very significant inherent advantages unique to integrated circuits, such as compactness, ease of physical handling and thermal matching.

The CA3086 is supplied in a 14-lead dual-in-line plastic package.

*Formerly developmental type TA6044

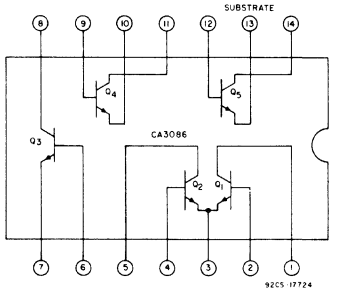


Fig. 1 – Functional diagram of the CA3086.

MAXIMUM RATINGS, Absolute–Maximum Values at T_A = 25°C

Dissipation:		
Any one transistor	300	mW
Total package up to T_A = 55°C	750	mW
Above T_A = 55°C	derate linearly 6.67	mW/°C
Ambient Temperature Range:		
Operating	–40 to + 85	°C
Storage	–65 to + 150	°C
The following ratings apply for each transistor in the device:		
Collector-to-Emitter Voltage, V_{CEO}	15	V
Collector-to-Base Voltage, V_{CBO}	20	V
Collector-to-Substrate Voltage, V_{CIO}*	20	V
Emitter-to-Base Voltage, V_{EBO}	5	V
Collector Current, I_C	50	mA

*The collector of each transistor in the CA3086 is isolated from the substrate by an integral diode. The substrate (terminal 13) must be connected to the most negative point in the external circuit to maintain isolation between transistors and to provide for normal transistor action. To avoid undesirable coupling between transistors, the substrate (terminal 13) should be maintained at either DC or signal (AC) ground. A suitable bypass capacitor can be used to establish a signal ground.

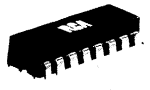
RCA Solid State Division

Linear Integrated Circuits

Monolithic Silicon

CA3093E



16-Lead Dual-In-Line Plastic Package H1622

General-Purpose High-Current N-P-N Transistor-Zener Diode-Diode Array

Applications

- Signal processing and switching systems operating from DC to VHF
- Lamp and relay driver
- Differential amplifier
- Temperature-compensated amplifier
- Thyristor firing
- Temperature-compensated shunt regulator
- Temperature-compensated series regulator
- Level shifting
- Voltage-level clamping
- Current regulator
- Voltage clamping
- Simple off-line regulated supply
- See RCA Application Note, ICAN-5296 "Application of the RCA-CA3018 Circuit Transistor Array" for applications in addition to those given on pages 5 & 6 of this bulletin.

RCA CA3093E* is a versatile array of three high-current (to 100mA) NPN transistors, two 10%-tolerance Zener diodes and one conventional diode, all on a common monolithic substrate. Two of the transistors (Q_1 and Q_2) are matched at 1 mA for applications in which offset parameters are of special importance. The combination of positive Zener voltage temperature coefficients and negative forward base-emitter voltage temperature coefficients provides a unique temperature compensation capability.

Independent connections for each transistor and diode plus a separate terminal for the substrate permit maximum flexibility in circuit design.

*Formerly developmental type TA6119

#Z_1, Z_2 and D1 are transistors internally connected as shown below.

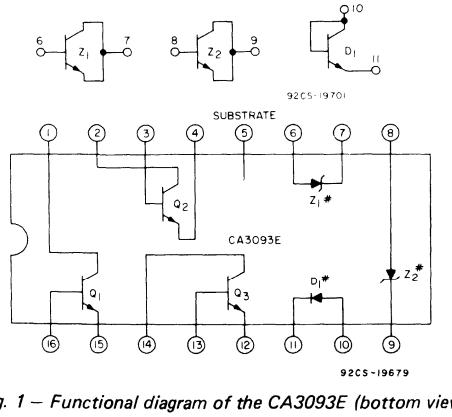


Fig. 1 – Functional diagram of the CA3093E (bottom view)

Features:

- **6 independent devices plus separate substrate connection**
- **Compensating temperature coefficients – V_{BE} and V_{D1} VS. V_Z**

Transistors

- **High I_C (100mA max)**
- **Matched pair (Q1 & Q_2)**
  V_{IO} = ± 5mV max
  I_{IO} = 2.5 μA max
  } at I_C = 1mA
  $\Delta V_{IO}/\Delta T$ = 5 μV/°C typ
- **h_{FE} = 40 min @ I_C = 10mA or 50mA**
- **Low V_{CEsat} . . . 0.7V max @ 50mA**

Zener Diodes

- **Two 1/4W Zeners**
- **V_Z = 7V ± 10%**
- **z_Z = 15Ω typ**

Diode

- **Close forward voltage match to V_{BE}'s of Q_1 and Q_2**
- **V_{PIV} = 5.5V min.**

MAXIMUM RATINGS, *Absolute-Maximum Values at T_A = 25°C*

Power Dissipation:

Any one transistor	500	mW
Any one Zener Diode	250	mW
Total package	750	mW
Above 25°C ..... Derate linearly	6.67	mW/°C
Ambient Temperature Range:		
Operating	-40 to +85	°C
Storage	-55 to +150	°C

The following maximum ratings apply for each transistor

Collector-to-Emitter Voltage (V_{CEO})	15	V
Collector-to-Base Voltage (V_{CBO})	20	V
Collector-to-Substrate Voltage (V_{CIO})*	20	V
Emitter-to-Base Voltage (V_{EBO})	5.5	V
Collector Current (I_C)	100	mA
Base Current (I_B)	35	mA

The following maximum ratings apply for each Zener Diode or Diode

Zener Diode dc Current (I_Z)	35	mA
Zener Diode-to-Substrate Voltage (V_{ZIO})*	20	V
Diode (D1) Forward Current (I_{DF})	50	mA
Diode (D1) Reverse Voltage (V_{DR})	5.5	V
Diode (D1)-to-Substrate Voltage (V_{DIO})*	20	V

*The collector of each transistor, the cathode of each Zener diode, and the anode of the diode are isolated from the substrate by an internal diode. The substrate must be connected to a voltage which is more negative than any of these isolated terminals in order to maintain isolation between devices and provide normal transistor action. To avoid undesired coupling between devices, the substrate terminal (5) should be maintained at either dc or signal (ac) ground. A suitable bypass capacitor can be used to establish a signal ground.

ELECTRICAL CHARACTERISTICS at T_A = 25°C

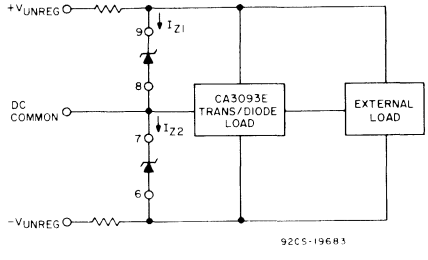
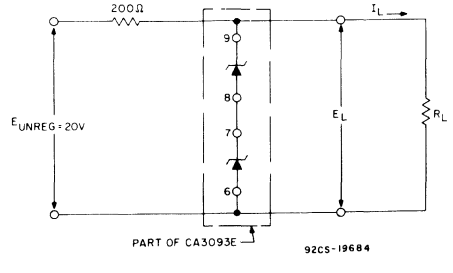
TYPICAL APPLICATIONS

a) ±7V Regulator supplying CA3093E Transistors plus an external load.



b) 14V Regulator for Q1, Q2, Q3



Sample Computation for Determining Permissible Zener Dissipation at +25°C.

CA3093E Ratings at T_A = +25°C
Total Diss. Max = 750 mW (Derate @ 6.67 mW/°C above 25°C)
Each Zener Diss. Max = 250 mW
Max. Zener Current = 35 mA

Assume CA3093E Transistor/Diode Load Dissipation = 350 mW then max. total Zener Diss. ($P_{Z1} + P_{Z2}$) = 750 - 350 = 400 mW

$$(I_{Z1} + I_{Z2}) \text{ max} = \frac{400 \text{ mW}}{7V} = 57 \text{ mA}$$

(Note: Max. current rating on each Zener is 35 mA)

Typical Load Regulation for I_L = 0 to 25 mA

$\Delta E_L/E_L \times 100 \approx -6\%$
(no load to full load)

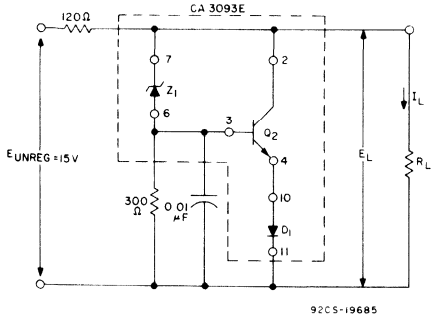
Typical Line Regulation

$$\frac{(\Delta E_L/E_L) \times 100}{\Delta E \text{ unreg.}} \approx \pm 0.9\%/V$$

Typical Temperature Characteristic

$$\frac{\Delta E_L/E_L}{\Delta T} \times 100 = +0.05\%/°C$$

c) 8.6V Temp.-Compensated Shunt Regulator



Typical Temperature Characteristic @ R_L = 330Ω

$$\frac{\Delta E_L/E_L}{\Delta T} \times 100 = \pm\ 0.007\%/^{\circ}C$$

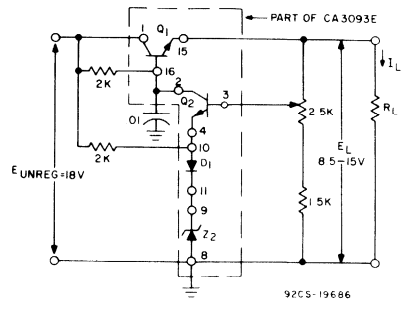
Typical Load Regulation I_L = 0 to 40 mA

$(\Delta E_L/E_L) \times 100 = -3\%$ (no load to full load)

Typical Line Regulation at R_L = 330Ω

$$\frac{\Delta E_L/E_L}{\Delta E \text{ unreg.}} \times 100 = \pm\ 0.55\%/V$$

d) Temp.-Compensated Series Voltage Regulator



Typical Temperature Characteristic @ E_L = 12V

$$\frac{\Delta E_L/E_L}{\Delta T} \times 100 = \pm\ 0.009\%/^{\circ}C$$

Typical Load Regulation @ E_L = 12V

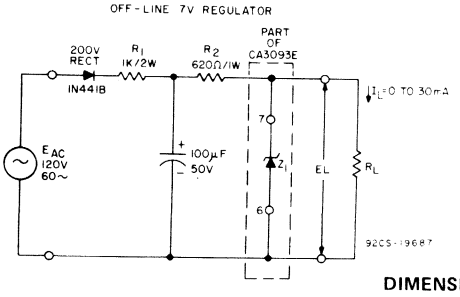
I_L = 0 to 40 mA

$$\frac{\Delta E_L}{E_L} \times 100 = \pm\ 0.4\% \text{ (no load to full load)}$$

Typical Line Regulation @ E_L = 12V

$$\frac{(\Delta E_L/E_L) \times 100}{\Delta E \text{ unreg.}} = \pm\ 0.45\%/V$$

e) Off-Line 7V Regulator



Typical E_L Ripple Voltage = 70 $mV_{p\text{-}p}$

Typical Load Regulation = $\frac{\Delta E_L}{E_L} \times 100 = -8.5\%$ (no load to full load)

I_L = 0 to 30 mA

Typical Line Regulation = $\frac{(\Delta E_L/E_L) \times 100}{\Delta E_{AC}} = \pm\ .075\%/V$

NOTES

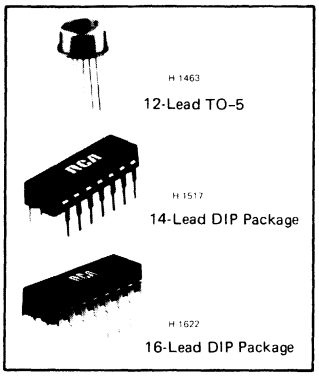
1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads within 0.005" (0.12 mm) radius of True Position (TP) at guage plane with maximum material condition and unit installed.
3. e_A applies in zone L_2 when unit installed.
4. α applies to spread leads prior to installation.
5. N is the maximum quantity of lead positions.
6. N_1 is the quantity of allowable missing leads.

RCA Solid State Division

Linear Integrated Circuits

Monolithic Silicon

CA3118AT CA3146AE CA3183AE
CA3118T CA3146E CA3183E



High-Voltage Transistor Arrays

Applications

- General use in signal processing systems in DC through VHF range
- Custom designed differential amplifiers
- Temperature compensated amplifiers
- Lamp and relay drivers (CA3183AE, E)
- Thyristor firing (CA3183AE, E)

Features

- Matched general-purpose transistors
- V_{BE} matched ±5mV max.
- Operation from DC to 120 MHz (CA3118AT, T; CA3146AE, E)
- Low-noise figure: 3.2dB typ. at 1kHz (CA3118AT, T; CA3146AE, E)
- High I_C: 75mA max. (CA3183AE, E)

RCA-CA3118AT, CA3118T, CA3146AE, CA3146E, CA-3183AE, and CA3183E* are general-purpose high-voltage silicon n-p-n transistor arrays on a common monolithic substrate.

Types CA3118AT and CA3118T consist of four transistors with two of the transistors connected in a Darlington configuration. These types are well suited for a wide variety of applications in low-power systems in the DC through VHF range. Both types are supplied in a hermetically sealed 12-lead TO-5 type package and operate over the full military temperature range. (CA3118AT and CA3118T are high-voltage versions of the popular predecessor type CA3018.

Types CA3146AE and CA3146E consist of five transistors with two of the transistors connected to form a differentially-connected pair. These types are recommended for low-power applications in the DC through VHF range. Both types are supplied in a 14-lead dual-in-line plastic package and operate over the ambient temperature range of −40°C to +85°C. (CA3146AE and CA3146E are high-voltage versions of the popular predecessor type CA3046.)

Types CA3183AE and CA3183E consist of five high-current transistors with independent connections for each transistor. In addition two of these transistors (Q1 and Q2) are matched at low-current (i.e. 1mA) for applications where offset parameters are of special importance. A special substrate terminal is also included for greater flexibility in circuit design. Both types are supplied in a 16-lead dual-in-line plastic package and operate over the ambient temperature range of −40°C to +85°C. (CA3183AE and CA3183E are high-voltage versions of the popular predecessor type CA3083.)

The types with an "A" suffix are premium versions of their non-"A" counterparts and feature tighter control of breakdown voltages making them more suitable for higher voltage applications.

For detailed application information, see companion Application Note, ICAN-5296 "Application of the RCA CA3018 Integrated Circuit Transistor Array."

● Caution on Total Package Power Dissipation: The maximum total package dissipation rating for the CA3118 Series circuits is 450 mW at temperatures up to +85°C, then derate linearly at 5 mW°C. The maximum total package dissipation rating for the CA3146 and CA3183 Series circuits is 750 mW at temperatures up to +55°C, then derate linearly at 6.67 mW°C.

See page 2 for a comparison of related predecessor types with types in this data bulletin.

MAXIMUM RATINGS, Absolute-Maximum Values at $T_A = 25^oC$

Power Dissipation:		
Any one transistor –		
CA3118AT, CA3118T, CA3146AE, CA3146E	300	mW
CA3183AE, CA3183E	500	mW
Total package –		
Up to 85°C (CA3118AT, CA3118T)	450	mW
Up to 55°C (CA3146AE, CA3146E, CA3183AE, CA3183E)	750	mW
Above 85°C (CA3118AT, CA3118T)	derate linearly 5	mW/°C
Above 55°C (CA3146AE, CA3146E, CA3183AE, CA3183E)	derate linearly 6.67	mW/°C
Ambient Temperature Range:		
Operating –		
CA3118AT, CA3118T	–55 to +125	°C
CA3146AE, CA3146E, CA3183AE, CA3183E	–40 to +85	°C
Storage (all types)	–65 to +150	°C
The following ratings apply for each transistor in the device:		
Collector-to-Emitter Voltage (V_{CEO}):		
CA3118AT, CA3146AE, CA3183AE	40	V
CA3118T, CA3146E, CA3183E	30	V
Collector-to-Base Voltage (V_{CBO}):		
CA3118AT, CA3146AE, CA3183AE	50	V
CA3118T, CA3146E, CA3183E	40	V
Collector-to-Substrate Voltage (V_{CIO}): ■		
CA3118AT, CA3146AE, CA3183AE	50	V
CA3118T, CA3146E, CA3183E	40	V
Emitter-to-Base Voltage (V_{EBO}) all types	5	V
Collector Current –		
CA3118AT, CA3118T, CA3146AE, CA3146E	50	mA
CA3183AE, CA3183E	75	mA
Base Current (I_B) – CA3183AE, CA3183E	20	mA

■ The collector of each transistor is isolated from the substrate by an integral diode. The substrate must be connected to a voltage which is more negative than any collector voltage in order to maintain isolation between transistors and provide normal transistor action. To avoid undesired coupling between transistors, the substrate terminal should be maintained at either DC or signal (AC) ground. A suitable bypass capacitor can be used to establish a signal ground.

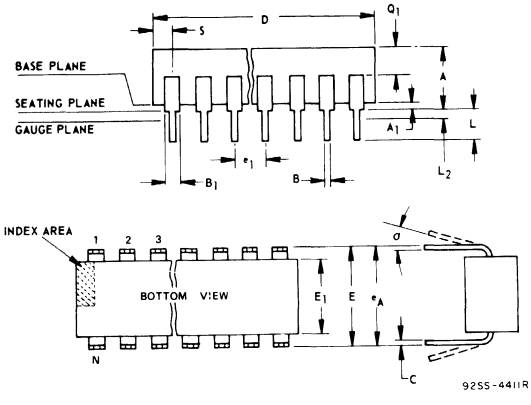
NOTES

1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads at gauge plane within .007" (.178 mm) radius of True Position (TP) at maximum material condition.
3. ⌀B applies between L_1 and L_2. ⌀B_2 applies between L_2 and .500" (12.70 mm) from seating plane. Diameter is uncontrolled in L_1 and beyond .500" (12.70 mm).
4. Measure from Max. ⌀D.
5. N_1 is the quantity of allowable missing leads.
6. N is the maximum quantity of lead positions.



NOTES:

1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads within .005" (.12 mm) radius of True Position (TP) at gauge plane with maximum material condition and unit installed.
3. e_A applies in zone L_2 when unit installed.

Broadband Video Amplifiers and Differential Amplifiers

RCA Solid State Division

Linear Integrated Circuits

CA3040

The RCA CA3040 is a monolithic silicon integrated circuit designed to meet the requirements of a wide variety of applications requiring high gain and wide bandwidth. The cascode-connected differential amplifier achieves a double-ended gain of 37 dB with a typical 3 dB bandwidth of 55 MHz. Emitter-Follower input and output stages provide the desirable high input impedance and output impedance for coupling to other circuits.

The CA3040 includes two biasing options, allowing the user to optimize his design over the entire military temperature range of -55 to +125°C. **Bias Mode A** yields a substantially constant voltage at the output terminals for applications using DC coupling to succeeding stages or requiring maximum dynamic range over the temperature range. DC output voltage varies less than 0.1 volt (typically) over the entire temperature range while gain varies ±2 dB. **Bias Mode B** provides extremely stable gain over the temperature range. Gain variation is 0 dB (typically) in this Bias Mode. DC variation is ±0.8 volt.

Provisions are also made for stabilizing the operating point for either single or split power supplies.

VIDEO and WIDE-BAND AMPLIFIER

For Industrial and Commercial Equipment at Frequencies up to 200 MHz

12-Lead TO-5

FEATURES

- High Differential Push-Pull Voltage Gain ..... 37 dB typ.
  Single-Ended Voltage Gain ..... 31 dB typ.
- Wide (3dB) Bandwidth ..... 55 MHz typ.
- Balanced Input and Output
- High Input Resistance ..... 150 kΩ typ.
- Low Output Resistance ..... 125 Ω typ.
- Bias Options for Temperature Compensation:
  Bias Mode A: "Constant" Voltage
  Bias Mode B: "Constant" Gain

APPLICATIONS

- Video Amplifier
- Modulator
- Mixer
- Schmitt Trigger
- IF Amplifier
- DC Amplifier
- Sense Amplifier

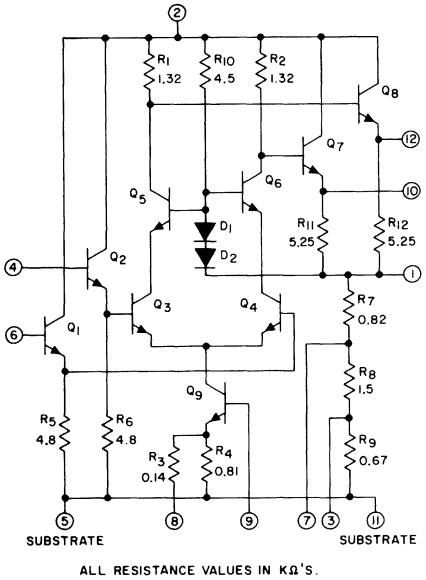

Fig. 1 - Schematic Diagram for CA3040

The resistance values included on the schematic diagram have been supplied as a convenience to assist Equipment Manufacturers in optimizing the selection of "outboard" components of equipment designs. The values shown may vary as much as ±30%.

RCA reserves the right to make any changes in the Resistance Values provided such changes do not adversely affect the published performance characteristics of the device.

OPERATING CONSIDERATIONS

General

The CA3040 is designed to provide flexibility in the selection of power supply configurations and to provide the circuit designer the choice between two modes of temperature-compensated performance. Mode A, which provides constant DC output voltage, is recommended for most applications. The control of the operating point provided by this mode maintains the dynamic range of the device while gain variation over most of the range is less than ±1 dB. Mode B provides constant gain for applications where this consideration is critical, but will exhibit a reduction of dynamic range at the temperature extremes.

Power Supply Considerations

Figures 2 and 3 illustrate the use of the CA3040 with balanced dual supplies and single power supplies, respectively. Both figures demonstrate that the inputs may be directly referenced to the center point of the supply (ground in Fig.2) by closing the included switch. This is the natural connection in Fig.2. This connection is optional, however, and need not be made. Use of this connection in Fig.3 implies the presence of another DC supply or a "stiff" bleeder. If such a source is present its use is suggested in order to maintain maximum common mode range. Dynamic performance and dynamic range of the output circuit are unaffected by the choice of biasing scheme used so that in most cases direct connection of Terminal No.1 to the center point of the supply is not required. Where direct connection is not used, Terminals No.4 and No.6 must be biased from Terminal No.1 for proper operation.

High-Frequency Considerations

Stable high-frequency operation requires that proper high-frequency construction techniques be followed. The photograph of Fig.6 illustrates the precautions taken in the construction of the test circuit of Fig.3.

Extreme caution is required because of the extended gain bandwidth capability of the device. Oscillations have been observed in the 400-to-800 MHz range when precautions were not taken. In addition to normal considerations of shielding, parts layout, and isolation, the following specific suggestions are made:

1. Use sockets only when necessary. Sockets, when used, must provide shielding within the pin circle. The socket shown in the chassis of Fig.6 is a Barnes MG-1201, or equivalent, modified by drilling a 1/8" hole in the center and inserting a grounded brass pin.
2. Do not bypass Terminal No.9 in normal operation. Fig.3 shows the use of neutralization between Terminal No.9 and one output to balance the amplifier at high frequencies. Experience shows that stable operation, while possible, is difficult to achieve if Terminal No.9 is bypassed to ground.
3. In DC testing, 1 kΩ, 1/4 W carbon resistors should be soldered directly to the socket Terminals No.4 and No.6 to suppress parasitic oscillations. All current carrying connections are made at the other end of the resistors. Direct sensing of Terminal No.4 or No.6 voltage should not be attempted.

CA3021
CA3022
CA3023

Low-Power Video and Wideband Amplifiers

Monolithic Silicon

RCA-CA3021, CA3022, and CA3023 are low-power integrated-circuit wideband amplifiers with a wide range of applications in industrial, military, and commercial communications equipment. Each consists of a multistage amplifier circuit and unconnected diodes on a single chip, hermetically sealed in a 12-lead TO-5 style package. The diodes may be connected to provide limiting in FM applications.

The CA3021, CA3022, and CA3023 have the same maximum ratings, and differ principally in dissipation (dc power requirements) and bandwidth capability. All three devices are designed for operation over the temperature range from -55° C to +125° C.

HIGHLIGHTS

- Low DC Power Drain:
  P_D { CA3021 = 4 mW typ. / CA3022 = 12.5 mW typ. / CA3023 = 35 mW typ. } at V_{CC} = 6 V
- Excellent frequency response:
  -3 dB BW { CA3021 = 2.4 MHz typ. / CA3022 = 7.5 MHz typ. / CA3023 = 16 MHz typ.
- High Voltage Gain:
  A { CA3021 = 56 dB typ. at 0.5 MHz / CA3022 = 57 dB typ. at 2.5 MHz / CA3023 = 53 dB typ. at 5 MHz
- Wide AGC Range: 33 dB typ.
- Only one power supply (4.5 to 12 V) required
- Hermetically Sealed 12-Lead TO-5-style package
- Operation from -55° C to +125° C

APPLICATIONS

- Gain-Controlled Linear Amplifiers
- AM/FM IF Amplifiers • Video Amplifiers • Limiters

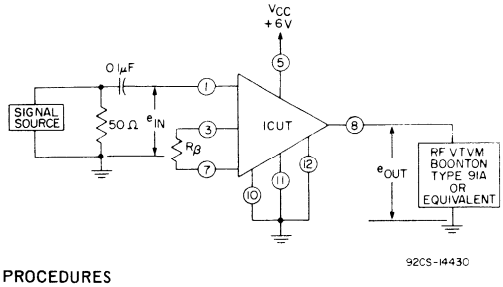
TEST SETUP FOR MEASUREMENTS OF VOLTAGE-GAIN, -3dB BANDWIDTH, AND MAXIMUM OUTPUT VOLTAGE



PROCEDURES

Voltage Gain:

(a) Set e_{in} = 0.5 mV at frequency specified, read e_{out} Voltage Gain

(A) = $20 \text{ Log}_{10} \frac{e_{out}}{e_{in}}$

Bandwidth:

(a) Set e_{out} to a convenient reference voltage at f = 100 kHz and record corresponding value of e_{in}.

(b) Increase the frequency, keeping e_{in} constant until e_{out} drops 3-dB. Record Bandwidth.

NOTES:
1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads at gauge plane within 0.007" (0.178 mm) radius of True Position (TP) at maximum material condition.
3. ØB applies between L_1 and L_2. $ØB_2$ applies between L_2 and 0.500" (12.70 mm) from seating plane. Diamerer is uncontrolled in L_1 and beyond 0.500" (12.70 mm).
4. Measure from Max. ØD.
5. N_1 is the quantity of allowable missing leads.
6. N is the maximum quantity of lead positions.

RCA Solid State Division

Linear Integrated Circuits

CA3020
CA3020A

Multipurpose Wide-Band Power Amplifiers

Monolithic Silicon

The RCA-CA3020 and CA3020A are Integrated-Circuit, Multistage, Multipurpose, Wide-Band Power Amplifiers on a single monolithic silicon chip. They employ a highly versatile and stable direct-coupled circuit configuration featuring wide frequency range, high voltage and power gain, and high power output. These features plus inherent stability over a wide temperature range make the CA3020 and CA3020A extremely useful for a wide variety of applications in military, industrial, and commercial equipment.

The CA3020 and CA3020A are particularly suited for service as Class B power amplifiers. The CA3020A can provide a maximum power output of 1 watt from a 12-volt DC supply with a typical power gain of 75 dB. The CA3020 provides 0.5 watt power output from a 9-volt supply with the same power gain.

These types are supplied in hermetically sealed, TO-5 style 12-lead packages.

SCHEMATIC DIAGRAM FOR CA3020 AND CA3020A

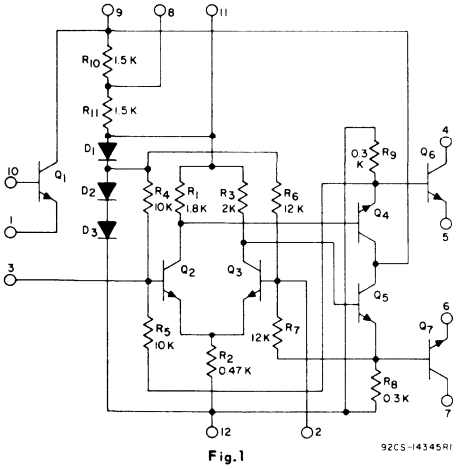

Fig.1

92CS-14345R1

The resistance values included on the schematic diagram have been supplied as a convenience to assist Equipment Manufacturers in optimizing the selection of "outboard" components of equipment designs. The values shown may vary as much as ± 30%.

RCA reserves the right to make any changes in the Resistance Values provided such changes do not adversely affect the published performance characteristics of the device.

MULTIPURPOSE WIDE-BAND POWER AMPLIFIERS

For Military, Industrial, and Commercial Equipment at Frequencies up to 8 MHz

12-Lead TO-5

FEATURES

- High power output - class B amplifier --
  CA3020 .... 0.5 watt typ. at V_{CC} = +9V
  CA3020A ... 1.0 watt typ. at V_{CC} = + 12V
- Wide frequency range --
  Up to 8 MHZ with resistive loads
- High power gain ..... 75db typ.
- Single power supply for class B operation with transformer --
  CA3020 ..... 3 to 9V
  CA3020A ..... 3 to 12V
- Built-in temperature-tracking voltage regulator provides stable operation over -55°C to +125°C temperature range

APPLICATIONS

- AF power amplifiers for portable and fixed sound and communications systems
- Servo-control amplifiers
- Wide-band linear mixers
- Video power amplifiers
- Transmission-line driver amplifiers (balanced and unbalanced)
- Fan-in and fan-out amplifiers for computer logic circuits
- Lamp-control amplifiers
- Motor-control amplifiers
- Power multivibrator
- Power switches
- Companion Application Note, ICAN 5766 "Application of CA3020 and CA3020A Integrated Circuit Multipurpose Wide-Band Power Amplifiers."

8	-	-
9	20	-
10	1	-
11	20	-
12	-	-

Note 1: This voltage is established by the maximum current rating.

Note 2: The emitters of Q_6 and Q_7 may be returned to a negative voltage supply through emitter resistors. Current into terminal No.9 should not be exceeded and the total device dissipation should not be exceeded.

Note 3: Terminal No.8 may be connected to terminals Nos.9, 11, or 12.

* Voltages are not normally applied between these terminals. Voltages appearing between these terminals will be safe if the specified limits between all other terminals are not exceeded.

▲ Higher value is for CA3020A.

MEASUREMENT OF BANDWIDTH AT -3 dB POINTS

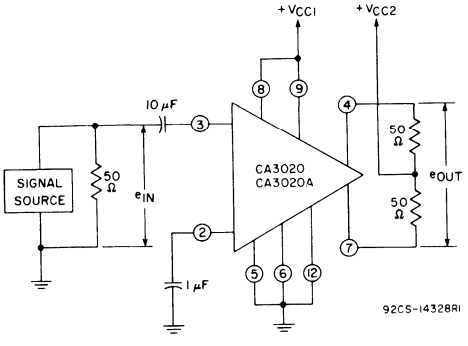

Fig.9

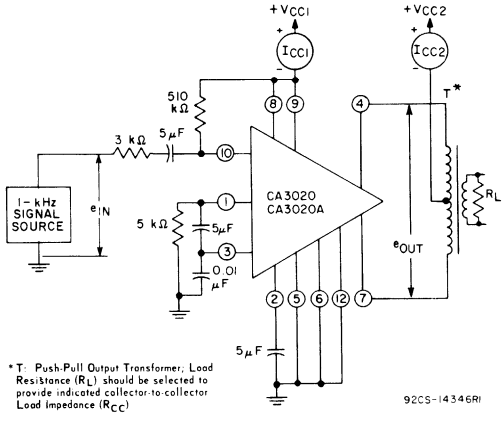
PROCEDURES:

1. Apply desired value of V_{CC_1} and V_{CC_2}
2. Apply 1 kHz input signal and adjust for e_{IN} = 5 mV (rms)
3. Record the resulting value of e_{OUT} in dB (reference value)
4. Vary input-signal frequency, keeping e_{IN} constant at 5 mV, and record frequencies above and below 1 kHz at which e_{OUT} decreases 3 dB below reference value.
5. Record bandwidth as frequency range between -3 dB points.

MEASUREMENTS OF ZERO-SIGNAL DC CURRENT DRAIN, MAXIMUM-SIGNAL DC CURRENT DRAIN, MAXIMUM POWER OUTPUT, CIRCUIT EFFICIENCY, SENSITIVITY, AND TRANSDUCER POWER GAIN



*T: Push-Pull Output Transformer; Load Resistance (R_L) should be selected to provide indicated collector-to-collector Load Impedance (R_{CC})

Fig.10

PROCEDURES:

Zero-Signal DC Current Drain

1. Apply desired Value of V_{CC_1} and V_{CC_2} and reduce e_{IN} to 0V
2. Record resulting values of I_{CC_1} and I_{CC_2} in mA as Zero-Signal DC Current Drain.

Maximum-Signal DC Current Drain, Maximum Power Output, Circuit Efficiency, Sensitivity, and Transducer Power Gain

1. Apply desired value of V_{CC_1} and V_{CC_2} and adjust e_{IN} to the value at which the Total Harmonic Distortion in the output of the amplifier = 10%
2. Record resulting value of I_{CC_1} and I_{CC_2} in mA as Maximum-Signal DC Current Drain
3. Determine resulting amplifier power output in watts and record as Maximum Power Output (P_{OUT})
4. Calculate Circuit Efficiency (η) in % as follows:

$$\eta = 100\,\frac{P_{OUT}}{V_{CC_1}I_{CC_1}+V_{CC_2}I_{CC_2}}$$

where P_{OUT} is in watts, V_{CC_1} and V_{CC_2} are in volts, and I_{CC_1} and I_{CC_2} are in amperes.

5. Record value of e_{IN} in mV^2 (rms) required in Step 1 as Sensitivity (e_{IN})
6. Calculate Transducer Power Gain (G_p) in dB as follows:

$$G_p = 10\log_{10}\frac{P_{OUT}}{P_{IN}}$$

where P_{IN} (in mW) = $\dfrac{e_{IN}^2}{3000 + R_{IN(10)}}$

MEASUREMENT OF INPUT RESISTANCE

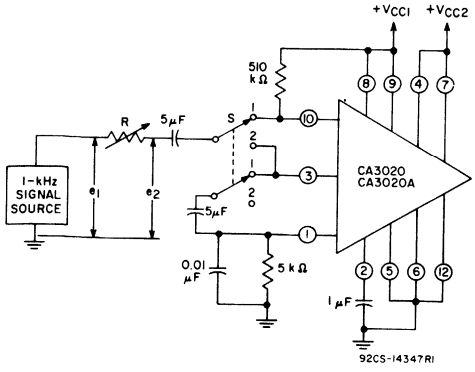


Fig.11

PROCEDURES:

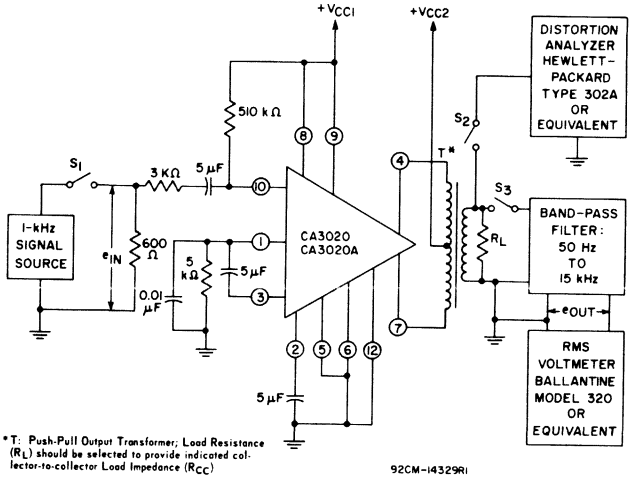
Input Resistance Terminal 10 to Ground ($R_{IN_{10}}$)

1. Apply desired value of V_{CC_1} and V_{CC_2} and set S in Position 1
2. Adjust 1-kHz input for desired signal level of measurement
3. Adjust R for $e_2 = e_1/2$
4. Record resulting value of R as $R_{IN_{10}}$

Input Resistance Terminal 3 to Ground (R_{IN_3})

1. Apply desired value of V_{CC_1} and V_{CC_2} set S in Position 2
2. Adjust 1-kHz input for desired signal level of measurement
3. Adjust R for $e_2 = e_1/2$
4. Record resulting value of R as R_{IN_3}

MEASUREMENT OF SIGNAL-TO-NOISE RATIO AND TOTAL HARMONIC DISTORTION



*T: Push-Pull Output Transformer; Load Resistance (R_L) should be selected to provide indicated collector-to-collector Load Impedance (R_{CC})

92CM-14329RI

PROCEDURES:

Signal-to-Noise Ratio

1. Close S_1 and S_3; open S_2
2. Apply desired values of V_{CC_1} and V_{CC_2}
3. Adjust e_{IN} for an amplifier output of 150mW and record resulting value of E_{OUT} in dB as e_{OUT_1} (reference value)
4. Open S_1 and record resulting value of e_{OUT} in dB as e_{OUT_2}
5. Signal-to-Noise Ratio (S/N) = $20\log_{10} \frac{e_{OUT_1}}{e_{OUT_2}}$.

Total Harmonic Distortion

1. Close S_1 and S_2; open S_3
2. Apply desired values of V_{CC_1} and V_{CC_2}
3. Adjust e_{IN} for desired level amplifier output power
4. Record Total Harmonic Distortion (THD) in %

NOTES:

1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads at gauge plane within 0.007" (0.178 mm) radius of True Position (TP) at maximum material condition.
3. øB applies between L_1 and L_2. $øB_2$ applies between L_2 and 0.500" (12.70 mm) from seating plane. Diameter is uncontrolled in L_1 and beyond 0.500" (12.70 mm).
4. Measure from Max. øD.
5. N_1 is the quantity of allowable missing leads.
6. N is the maximum quantity of lead positions.

RCA Solid State Division

Linear Integrated Circuits

CA3002/1 CA3002/3
CA3002/2 CA3002/4

High Reliability Types
for Aerospace, Military and other Critical Applications

RCA-CA3002/1, CA3002/2, CA3002/3, CA3002/4 are high-reliability integrated circuits especially designed for critical applications in aerospace, military, and industrial equipment.

These types are electrically and mechanically interchangeable with the RCA-CA3002 but are specially processed and tested in accordance with the Aerospace and Military electrical, environmental, and physical test methods and procedures established for microelectronic devices in MIL-STD-883.

The curves of Typical Static and Dynamic Characteristics shown in the technical data bulletin (File No. 123) for the CA3002 also apply for these high reliability versions.

The number following the slash (/) mark in each type designation, e.g., CA3002/1 indicates the screening levels employed by RCA to achieve the quality and reliability commensurate with the intended application. A description of these levels (1, 2, 3, and 4) is given on page 2.

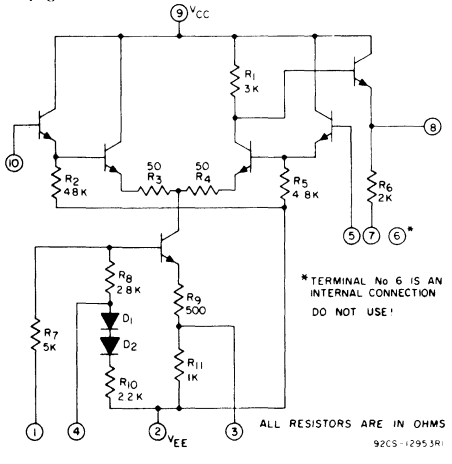

Fig. 1 - Schematic diagram.

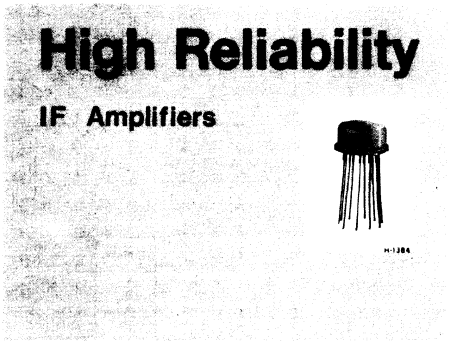
The resistance values included on the schematic diagram have been supplied as a convenience to assist Equipment Manufacturers in optimizing the selection of "outboard" components of equipment designs. The values shown may vary as much as ±30%.

RCA reserves the right to make any changes in the resistance values provided such changes do not adversely affect published performance characteristics of the device.



- Examinations and tests performed in accordance with MIL-STD-883, "Test Methods & Procedures for Microelectronics."
- Total Lot Screening (100% testing) + "Group A" (electrical) and "Group B" (environmental) Sampling Test Programs.
- Internal visual (Precap) inspection performed on all 4 Screening Levels in accordance with Condition "A", Method 2010 MIL-STD-883.
- Choice of 4 distinct Screening Levels.

ELECTRICAL FEATURES

- Balanced diffential amplifier with controlled constant-current source.
- Built-in temperature stability for operation from -55° C to +125° C
- AGC Range . . . . . 80 dB typ
- Bandwidth . . . . . 11 MHz typ
- Input Resistance . . . . . 100 kΩ typ
- Output Resistance . . . . . 70 Ω typ
- Voltage Gain . . . . . 24 dB typ
- Input Unbalance Current . . . . . 2.2 μA typ
- Companion Application Note ICAN 5036 "Application of the RCA-CA3002 Integrated-Circuit IF Amplifier," covers different operational modes, gain-control, cross-modulation, 4-stage amplifier design, and an envelope and product detector analysis.

MAXIMUM RATINGS, ABSOLUTE-MAXIMUM VALUES

Power Dissipation, P: . . . . . 300 mW

Temperature Range:

Operating . . . . . -55 to + 125 °C

Storage . . . . . -65 to + 150 °C

Single-ended Input-Signal Voltage . . . . . ±3.5 V

Maximum Voltage Ratings at T_A = 25° C

The following chart gives the range of voltages which can be applied to the terminals listed vertically with respect to the terminals listed horizontally. For example, the voltage range between vertical terminal 2 and horizontal terminal 3 is +5 to -5 volts.

Terminal No.	1	2	3	4	5	6	7	8	9	10
1		+16 -5	*	*	*	Internal Connection Do not use	*	*	0 -16	*
2		Ref. Sub-strate	+5 -5	+5 -10	0 -16▲		*	*	0 -16	0 -16▲
3				*	*		*	*	0 -16	*

7								0 -12	0 -16	*
8									0 -12	*
9										+12 0
10										
Case	Connected to Terminal #2 – Do Not Ground									

Maximum Current Ratings

Terminal No.	I_{IN} mA	I_{OUT} mA
1	–	–
2	–	–
3	–	–
4	–	–
5	1	0.1
6	–	–
7	–	–
8	–	–
9	–	–
10	1	0.1

*Voltages are not normally applied between these terminals. Voltages appearing between these terminals will be safe if the specified limits between all other terminals are not exceeded.

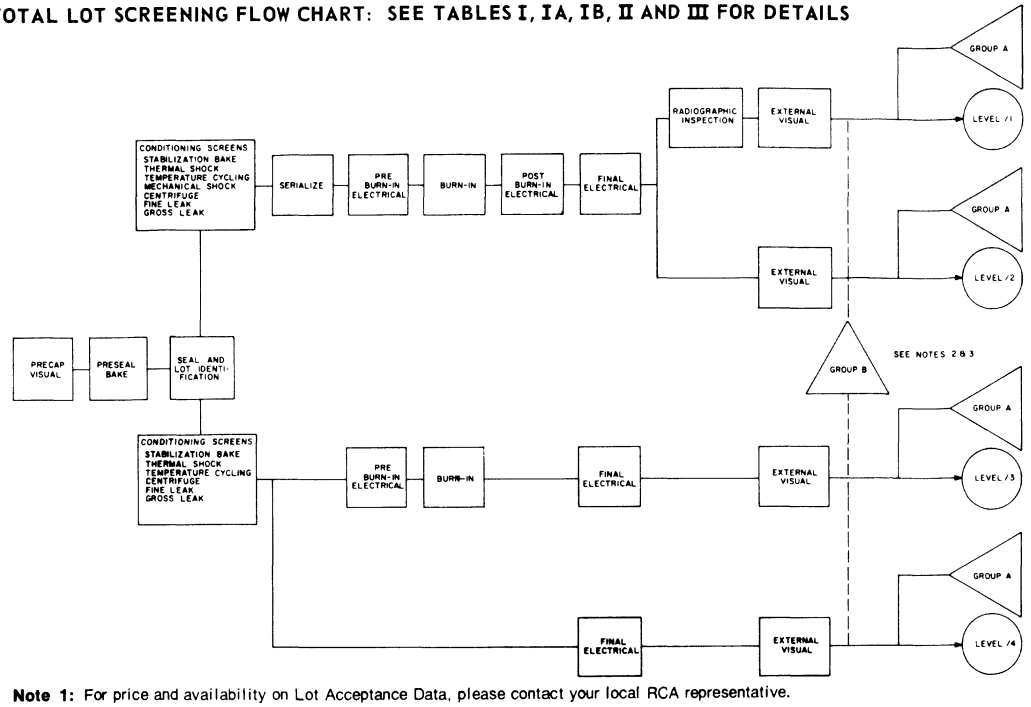
▲ This rating applies to the more positive of Terminals 5 or 10.

RCA INTEGRATED CIRCUIT SCREENING LEVELS

RCA Level	MIL-STD-883 Equivalent	Application	Description
/1, /2	Class A	Aerospace & Missiles	For devices intended for use where maintenance and replacement are extremely difficult or impossible and Reliability is Imperative
/3	Class B	Military & Industrial For example, in Airborne Electronics	For devices intended for use where maintenance and replacement can be performed but are difficult and expensive
/4	Class C (Class B without Burn-In)	Military & Industrial For example, on Ground Based Electronics	For devices intended for use where replacement can readily be accomplished

RCA Screening Level /1 is equivalent to MIL-STD-883 Class A except that Reverse Bias Burn-In is performed only in Group B.
RCA Screening Level /2 is the same as Level /1 but Radiographic Inspection is not performed.

TOTAL LOT SCREENING FLOW CHART: SEE TABLES I, IA, IB, II AND III FOR DETAILS



Note 1: For price and availability on Lot Acceptance Data, please contact your local RCA representative.

Note 2: For Life — Based on established data for devices having similar electrical characteristics

Note 3: For M & E — Based on established data for devices having a specific package configuration e.g. TO-5, Dual-In-Line Ceramic, Flat Pack

NOTES

1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads at gauge plane within .007" (.178 mm) radius of True Position (TP) at maximum material condition.
3. ⌀B applies between L_1 and L_2. ⌀B_2 applies between L_2 and .500" (12.70 mm) from seating plane. Diameter is uncontrolled in L_1 and beyond .500" (12.70 mm).
4. Measure from Max. ⌀D.
5. N_1 is the quantity of allowable missing leads.
6. N is the maximum quantity of lead positions.

RCA
Solid State
Division

Linear Integrated Circuits

CA3050
CA3051

Dual Differential Amplifiers

Monolithic Silicon

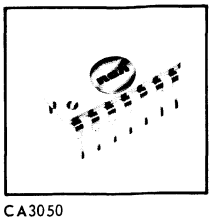
The CA3050 and CA3051 each consists of two differential amplifiers with associated constant current transistors on a common substrate. Each amplifier is driven by Darlington-connected emitter follower inputs to provide high input impedance, low bias current, and low offset current. A string of diodes is included to provide temperature-compensated bias to the constant current transistors and a low impedance bias point for the inputs to the differential amplifiers when a single power supply is used.

The CA3050 is supplied in an hermetic 14-lead Dual-In-Line ceramic package rated for operation over the full military temperature range of -55°C to +125°C.

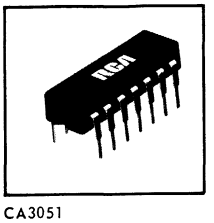
The CA3051 is supplied in a Dual-In-Line plastic package for applications requiring only a limited temperature range of -40°C to +85°C.

TWO DARLINGTON-CONNECTED DIFFERENTIAL AMPLIFIERS WITH DIODE BIAS STRING

For Low-Power Applications at Frequencies from DC to 20 MHz



CA3050



CA3051

FEATURES

- Input offset current . . . . . 70 nA max.
- Input bias current . . . . . 500 nA max.
- Input offset voltage . . . . . 5 mV max.
- Input impedance . . . . . 460 kΩ typ.
- Independently accessible inputs and outputs

APPLICATIONS

- Matched dual amplifiers
- Dual sense amplifiers
- Dual Schmitt triggers
- Dual multivibrators
- Doubly balanced detectors and modulators
- Balanced quadrature detectors
- Synthesizer mixers
- Product detectors

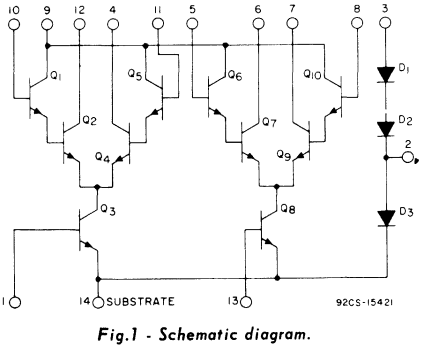


Fig.1 - Schematic diagram.

MAXIMUM RATINGS, ABSOLUTE-MAXIMUM VALUES, AT T_A = 25°C

	CA3050	CA3051	
Power Dissipation, P:			
Any one transistor	150	150	mW
Total package	900	750	mW
For $T_A > 55°C$, Derate at	8	6.67	mW/°C
Temperature Range:			
Operating	-55 to +125	-40 to +85	°C
Storage	-65 to +150	-65 to +150	°C

The following ratings apply for each transistor in the device:

Collector-to-Emitter Voltage, V_{CEO}	15	V
Collector-to-Base Voltage, V_{CBO}	20	V
Collector-to-Substrate Voltage, V_{CIO} *	20	V
Emitter-to-Base Voltage, V_{EBO}	5	V
Collector Current, I_C	50	mA

* The collector of each transistor of the CA3050 and CA3051 is isolated from the substrate by an integral diode. *The substrate (terminal 14) must be more negative than all collectors to maintain isolation between transistors and to provide for normal transistor action.*

MAXIMUM VOLTAGE RATINGS

The following chart gives the range of voltages which can be applied to the terminals listed vertically with respect to the terminals listed horizontally. For example, the voltage range between vertical terminal 2 and horizontal terminal 3 is +5 to -2 volts.

TERMINAL No.	1	2	3	4	5	6	7	8	9	10	11	12	13	14
1	–	*	*	*	*	*	*	*	*	*	*	*	*	+1 -5

Linear Integrated Circuits

CA3001

Video and Wide-band Amplifier

Monolithic Silicon

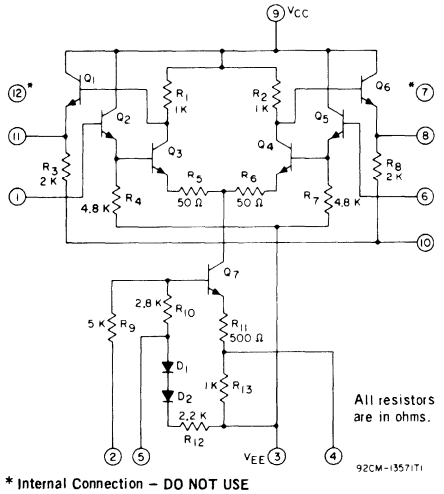
- Designed for use in Video Systems and Communication Equipment
- Balanced differential amplifier configuration with controlled constant-current source provides outstanding versatility
- Built-in temperature stability for operation from -55°C to +125°C
- Emitter follower input & output
- Companion Application Note ICAN5038 "Application of the RCA-CA3001 Integrated-Circuit Video Amplifier", covers different operating modes, gain control, distortion, swing capability, 3 stage amplifier design, and a Schmitt trigger study.

APPLICATIONS

- Schmitt Trigger
- Mixer
- Modulator
- DC, IF, & Video Amplifier

HIGHLIGHTS

Push-Pull Input & Output	
AGC Range	60 dB typ.
Bandwidth	29 MHz
Input Resistance	150 kΩ typ.
Output Resistance	45 Ω typ.
Voltage Gain	19 dB typ.
Input Offset Voltage	1.5 mV typ.



* Internal Connection – DO NOT USE

Fig.1 - Schematic Diagram.

ABSOLUTE-MAXIMUM VOLTAGE AND CURRENT LIMITS at T_A = 25°C

Indicated voltage or current limits for each terminal can be applied under the specified conditions for other terminals. All Voltages are with respect to ground (common terminal of Positive and Negative DC Supplies).

Linear Integrated Circuits

CA3001/1 CA3001/3
CA3001/2 CA3001/4

High Reliability Types
for Aerospace, Military and other Critical Applications

RCA-CA3001/1, CA3001/2, CA3001/3, CA3001/4 are high-reliability integrated circuits especially designed for critical applications in aerospace, military, and industrial equipment.

These types are electrically and mechanically interchangeable with the RCA-CA3001 but are specially processed and tested to meet the Aerospace and Military electrical, environmental, and physical test methods and procedures established for microelectronic devices in MIL-STD-883.

The curves of Typical Static and Dynamic Characteristics shown in the technical data bulletin (File No. 122) for the CA3001 also apply for these high reliability versions.

The number following the slash (/) mark in each type designation, e.g., CA3001/1 indicates the Screening levels employed by RCA to achieve the quality and reliability commensurate with the intended application. A description of these levels (1, 2, 3, and 4) is given on page 2.

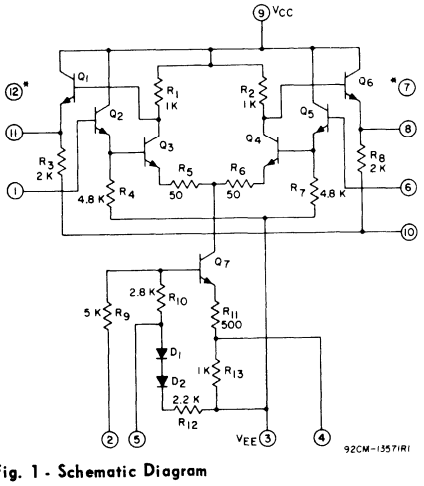

Fig. 1 - Schematic Diagram

*Internal Connection - DO NOT USE

The resistance values included on the schematic diagram have been supplied as a convenience to assist Equipment Manufacturers in optimizing the selection of "outboard" components of equipment designs. The values shown may vary as much as ±30%.

RCA reserves the right to make any changes in the resistance values provided such changes do not adversely affect published performance characteristics of the device.

High Reliability
Differential Amplifiers

12-Lead TO-5

- Examinations and tests performed in accordance with MIL-STD-883, "Test Methods & Procedures for Microelectronics."
- Total Lot Screening (100% testing) + "Group A" (electrical) and "Group B" (environmental) Sampling Test Programs.
- Internal visual (Precap) inspection performed on all 4 Screening Levels in accordance with Condition "A", Method 2010 MIL-STD-883.
- Choice of 4 distinct Screening Levels.

ELECTRICAL FEATURES

- Balanced diffential amplifier with controlled constant-current source.
- Built-in temperature stability for operation from -55° C to +125° C
- AGC Range . . . . . 60 dB typ
- Bandwidth . . . . . 29 MHz
- Input Resistance . . . . . 150 kΩ typ
- Output Resistance . . . . . 45 Ω typ
- Voltage Gain . . . . . 19 dB typ
- Input Offset Voltage . . . . . 1.5 mV typ
- Companion Application Note ICAN 5038 "Application of the RCA-CA3001 Integrated-Circuit Video Amplifier," covers different operating modes, gain control, distortion, swing capability, 3 stage amplifier design, and a Schmitt trigger study.

Maximum Ratings, Absolute-Maximum Values

Power Dissipation, P: . . . . . 300 mW
Temperature Range:
Operating . . . . . -55 to + 125 °C
Storage . . . . . -65 to + 150 °C

Single-ended Input-Signal Voltage . . . . . ±2.5 V
Common-Mode Input-Signal Voltage . . . . . ±2.5 V

Maximum Voltage Ratings at T_A = 25° C

The following chart gives the range of voltages which can be applied to the terminals listed vertically with respect to the terminals listed horizontally. For example, the voltage range between vertical terminal 3 and horizontal terminal 4 is +5 to -5 volts.

Terminal No.	1	2	3	4	5	6	7	8	9	10	11	12
1		*	+16 0 Note 1	*	*	+4 -4	Internal Connection Do Not Use	*	0 -12	*	+2 -12	Internal Connection - Do Not Use

Maximum Current Ratings

Terminal No.	I_{IN} mA	I_{OUT} mA
1	1	0.1
2	–	–
3	–	–
4	–	–
5	–	–
6	1	0.1
7	–	–
8	–	–
9	–	–
10	–	–
11	–	–
12	–	–

Note 1: This rating applies to the more positive of the terminals 1 or 6.

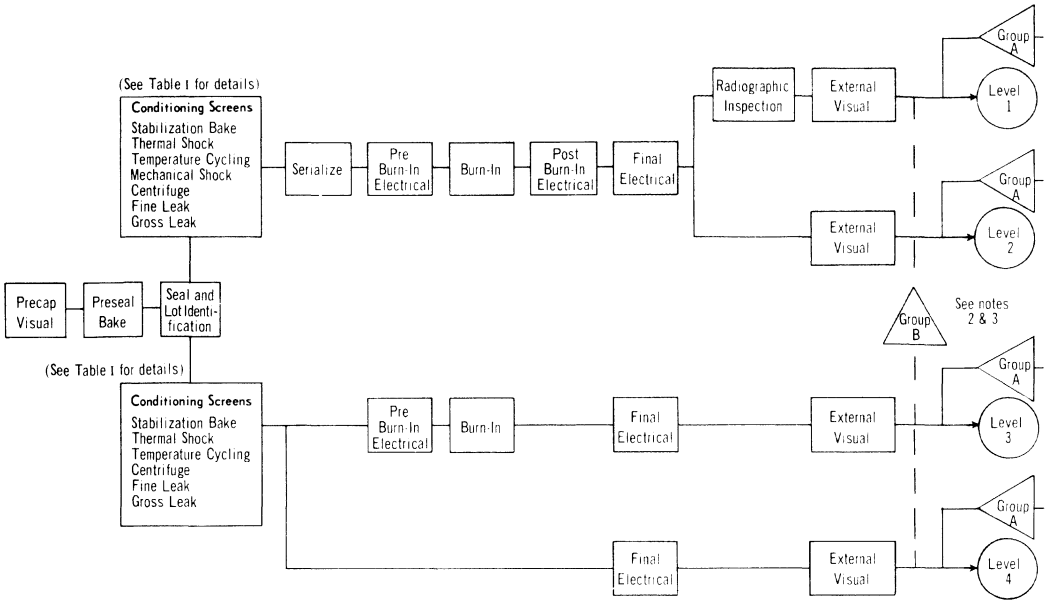
*Voltages are not normally applied between these terminals. Voltages appearing between these terminals will be safe if the specified limits between all other terminals are not exceeded.

RCA Integrated Circuit Screening Levels

RCA Level	MIL-STD-883 Equivalent	Application	Description
/1 ,/2	Class A	Aerospace & Missiles	For devices intended for use where maintenance and replacement are extremely difficult or impossible and Reliability is Imperative
/3	Class B	Military & Industrial For example, in Airborne Electronics	For devices intended for use where maintenance and replacement can be performed but are difficult and expensive
/4	Class C (Class B without Burn-In)	Military & Industrial For example, on Ground Based Electronics	For devices intended for use where replacement can readily be accomplished

RCA Screening Level /1 is equivalent to MIL-STD-883 Class A except that Reverse Bias Burn-In is performed only in Group B.
RCA Screening Level /2 is the same as Level /1 but Radiographic Inspection is not required.

Total Lot Screening Flow Chart



Lot Acceptance Data

	Levels	Included With Order	On Request
Conditioning Screens (100% Testing, See Table I)			
a) Attributes Data on Burn-in	/1, /2, /3	√	–
b) Attributes Data on Radiographic Inspection	/1	√	–
c) Variables Data on Burn-In	/1, /2	–	√
Group A (Lot Sampling, See Table II)			
a) Attributes Data	/1, /2, /3, /4	√	–
b) Variables Data	/1, /2, /3, /4	–	√
Group B (Lot Sampling, See Table III)			
a) Attributes Data	/1, /2, /3, /4	√	–
b) Variables Data	/1, /2, /3, /4	–	√

Note 1: If several shipments are made from a specific production lot, data will be supplied for only the first shipment.

Note 2: For Life (Subgroups 7, 8, 9 Table III) - - Based on established data for devices having similar electrical characteristics

Note 3: For M & E (Subgroups 1, 2, 3, 4, 5, 6, 10 Table III) - - Based on established data for devices having a specific package configuration e.g. TO-5, Dual-In-Line Ceramic, Flat Pack

Linear Integrated Circuits

CA3000

DC Amplifier

Monolithic Silicon

- Designed for use in Communication, Telemetry, Instrumentation, and Data-Processing Equipment
- Balanced differential-amplifier configuration with controlled constant-current source to provide outstanding versatility
- Built-in temperature stability for operation from -55°C to +125°C
- Companion Application Note, ICAN 5030 "Applications of RCA CA3000 Integrated Circuit DC Amplifier" covers characteristics of different operating modes, frequency considerations, 10 MHz narrow band tuned amplifier design, crystal oscillator design, and many other application aids

HIGHLIGHTS

- Input Impedance . . . . . 195 KΩ typ.
- Voltage Gain. . . . . 30 dB typ.
- Common-Mode Rejection Ratio . . . 98 dB typ.
- Input Offset Voltage. . . . . 1.4 mV typ.
- Push-Pull Input and Output
- Frequency Capability
  DC to 30 MHz (with external C and R)
- Wide AGC Range. . . . . 90 dB typ.

APPLICATIONS

- Schmitt Trigger
- RC-Coupled Feedback Amplifier
- Mixer
- Comparator
- Modulator
- Crystal Oscillator
- Sense Amplifier

NOTES:

1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads at gauge plane within 0.007" (0.178 mm) radius of True Position (TP) at maximum material condition.
3. øB applies between L_1 and L_2. $øB_2$ applies between L_2 and 0.500" (12.70 mm) from seating plane. Diameter is uncontrolled in L_1 and beyond 0.500" (12.70 mm).
4. Measure from Max. øD.
5. N_1 is the quantity of allowable missing leads.
6. N is the maximum quantity of lead positions.

Linear Integrated Circuits

CA3000/1 CA3000/3
CA3000/2 CA3000/4

High Reliability Types
for Aerospace, Military and
other Critical Applications

RCA-CA3000/1, CA3000/2, CA3000/3, CA3000/4 are high-reliability integrated circuits especially designed for amplifier applications in critical aerospace, military, and industrial equipment operating at frequencies up to 30 MHz.

These standard Aerospace and Military types are electrically and mechanically interchangeable with the RCA-CA3000 but are specially processed and tested to meet the electrical, environmental, and physical test methods and procedures established for microelectronic devices used in aerospace and military equipment.

The curves of Typical Static and Dynamic Characteristics shown in the technical data bulletin (File No. 121) for the CA3000 also apply for these high-reliability versions.▲

The number following the slash (/) mark in each type designation, e.g. CA3000/1 indicates the screening levels employed by RCA to achieve the quality and reliability commensurate with the intended application. A description of these levels (1, 2, 3, and 4) is given on page 2.

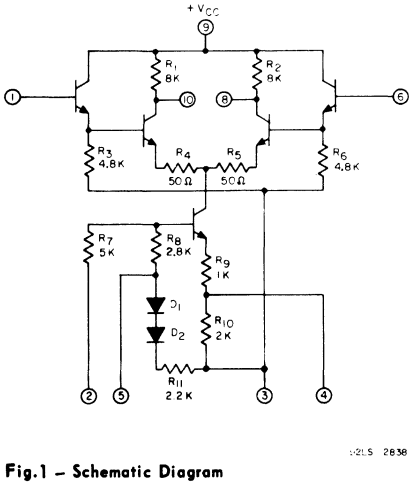

Fig. 1 – Schematic Diagram

▲RCA publication, ICAN 5030, "Applications of RCA CA3000 Integrated Circuit DC Amplifier" provides useful application information.

- Examinations and tests performed in accordance with MIL-STD-883, "Test Methods & Procedures for Microelectronics."
- Total Lot Screening (100% testing) "Group A" (electrical) and "Group B" (environmental) sampling test program.
- Internal visual (Precap) inspection performed on all 4 screening levels in accordance with Condition "A", Method 2010 of MIL-STD-883.
- Choice of 4 distinct screening levels

Electrical Features

- Input Impedance . . . . . 195 kΩ typ.
- Voltage Gain . . . . . 37 dB typ.
- Common-Mode Rejection Ratio . . . . . 98 dB typ.
- Input Offset Voltage . . . . . 1.4 mV typ.
- Push-Pull Input and Output
- Frequency Capability
  DC to 30 MHz (with external
  C and R)
- Wide AGC Range . . . . . 90 dB typ.

The resistance values included on the schematic diagram have been supplied as a convenience to assist Equipment Manufacturers in optimizing the selection of "outboard" components of equipment designs. The values shown may vary as much as ± 30%.

RCA reserves the right to make any changes in the resistance values provided such changes do not adversely affect the published performance characteristics of the device.

Maximum Ratings, Absolute-Maximum Values

Operating-Temperature Range ..... -55° C to +125° C
Storage-Temperature Range ..... -65° C to +150° C
Maximum Single-Ended Input-Signal Voltage ..... ±2 V
Maximum Common-Mode Input-Signal Voltage ..... ±2 V
Maximum Device Dissipation ..... 300 mW

Maximum Voltage Ratings at T_A = 25° C

The following chart gives the range of voltages which can be applied to the terminals listed vertically with respect to the terminals listed horizontally. For example, the voltage range of the vertical terminal 1 with respect to terminal 9 is 0 to -12 volts.

Terminal No.	1	2	3	4	5	6	7	8	9	10
1		*	+16▲ 0	*	*	+4 -4	Internal Connection Do not use	*	0 -12	+1 -12
2			+16 -5	*	*	*		*	0 -16	*
3				+5 -5	+5 -10	0 -16		*	0 -16	*
4					*	*		*	0 -16	*
5						*		*	0 -16	*
6								+1 -12	0 -12	*
7	Internal Connection Do not use									
8									0 -16	*
9										+16 0
10										
Case	Connected to Terminal #3 – Do Not Ground									

Maximum Current Ratings

Terminal No.	I_{IN} mA	I_{OUT} mA
1	1	0.1
2	–	–
3	–	–
4	–	–
5	1	0.1
6	–	–
7	–	–
8	–	–
9	–	–
10	–	–

*Voltages are not normally applied between these terminals. Voltages appearing between these terminals will be safe if the specified limits between all other terminals are not exceeded.

▲ This rating applies to the more positive of Terminals #1 or #6.

RCA Integrated Circuit Screening Levels

RCA Level	MIL-STD-883 Equivalent	Application	Description
/1 ,/2	Class A	Aerospace & Missiles	For devices intended for use where maintenance and replacement are extremely difficult or impossible and Reliability is Imperative
/3	Class B	Military & Industrial For example, in Airborne Electronics	For devices intended for use where maintenance and replacement can be performed but are difficult and expensive
/4	Class C (Class B without Burn-In)	Military & Industrial For example, on Ground Based Electronics	For devices intended for use where replacement can readily be accomplished

RCA Screening Level /1 is equivalent to MIL-STD-883 Class A except that Reverse Bias Burn-In is performed only in Group B.
RCA Screening Level /2 is the same as Level /1 but Radiographic Inspection is not required.

Total Lot Screening Flow Chart

DEFINITIONS OF TERMS

Input Offset Voltage

The difference in the dc voltages which must be applied to the input terminals to obtain equal quiescent operating voltages (zero output offset voltage) at the output terminals.

Input Offset Current

The difference in the currents at the two input terminals when the quiescent operating voltages at the two output terminals are equal.

Input Bias Current

The average value (one-half the sum) of the currents at the two input terminals when the quiescent operating voltages at the two output terminals are equal.

Quiescent Operating Current

The average (dc) value of the current in either output terminal.

Quiescent Operating Current Ratio

The ratio of the Quiescent operating currents in the two output terminals.

Device Dissipation

The total power drain of the device with no signal applied and no external load current.

Power Gain

The ratio of the signal power developed at the output of the device to the signal power applied to the input, expressed in dB.

Noise Figure

The ratio of the total noise power of the device and a resistive signal source to the noise power of the signal source alone, the signal source representing a generator of zero impedance in series with the source resistance.

Common-Mode Rejection Ratio

The ratio of the full differential voltage gain to the common-mode voltage gain.

Common-Mode Voltage Gain

The ratio of the signal voltages developed between the two output terminals to the signal voltage applied to the two input terminals connected in parallel for ac.

Differential Voltage Gain

The ratio of the change in output voltage at either output terminal with respect to ground, to a change in input voltage at either input terminal with respect to ground, with the other input terminal at ac ground.

AGC Range

The total change in voltage gain (from maximum gain to complete cutoff) which may be achieved by application of the specified range of dc voltage to the AGC input terminal of the device.

Linear Integrated Circuits

CA3006/1 CA3006/3
CA3006/2 CA3006/4

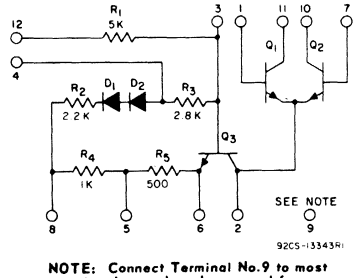
High Reliability Types
for Aerospace, Military and other Critical Applications

RCA-CA3006/1, CA3006/2, CA3006/3, CA3006/4 are high-reliability integrated circuits especially designed for critical applications in aerospace, military and inductrial equipment operating at frequencies up to 100 MHz.

These types are electrically and mechanically interchangeable with the RCA-CA3006 but are specially processed and tested to meet the Aerospace and Military electrical, environmental, and physical test methods and procedures established for microelectronic devices in MIL-STD-883.

The curves of Typical Static and Dynamic Characteristics shown in the technical data bulletin (File No.125) for the CA3006 also apply for these high reliability versions.

The number following the slash (/) mark in each type designation, e.g., CA3006/1 indicates the screening levels employed by RCA to achieve the quality and reliability commensurate with the intended application. A description of these levels (1, 2, 3, and 4) is given on page 2.

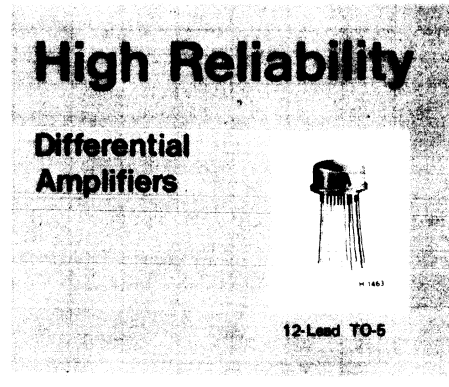


NOTE: Connect Terminal No.9 to most positive dc supply voltage used for circuit.

Fig.1- Schematic Diagram

The resistance values included on the schematic diagram have been supplied as a convenience to assist Equipment Manufacturers in optimizing the selection of "outboard" components of equipment designs. The values shown may vary as much as ±30%.

RCA reserves the right to make any changes in the resistance values provided such changes do not adversely affect the published performance characteristics of the device.



- Examinations and Tests performed in accordance with MIL-STD-883 "Test Methods & Procedures for Microelectronics"
- Total Lot Screening (100% testing) plus "group A" (Electrical) and "group B" (Environmental) Sampling Test Programs
- Internal Visual (Precap) Inspection Performed on all 4 Screening Levels in accordance with Condition A, Method 2010 MIL-STD-883
- Choice of 4 distinct Screening Levels

ELECTRICAL FEATURES

- -55 to +125°C Operating Temperature Range
- -65 to +150° C Storage Temperature Range
- 1 mV max. Input Offset Voltage
- 60 dB min. AGC Range at 1.75 MHz
- 20 dB typ. Cascode Power Gain at 100 MHz
- Operation from DC to 100 MHz
- Sharp Limiting Characteristics
- Balanced Input and Output
- Uncommitted Bases and Collectors

Maximum Ratings, Absolute Maximum Values

Operating-Temperature Range	-55°C to +125°C
Storage-Temperature Range	-65°C to +150°C

RCA Integrated Circuit Screening Levels

RCA Level	MIL-STD-883 Equivalent	Application	Description
/1 ,/2	Class A	Aerospace & Missiles	For devices intended for use where maintenance and replacement are extremely difficult or impossible and Reliability is Imperative
/3	Class B	Military & Industrial For example, in Airborne Electronics	For devices intended for use where maintenance and replacement can be performed but are difficult and expensive
/4	Class C (Class B without Burn-In)	Military & Industrial For example, on Ground Based Electronics	For devices intended for use where replacement can readily be accomplished

RCA Screening Level 1 is equivalent to MIL-STD-883 Class A except that Reverse Bias Burn-In is performed only in Group B.
RCA Screening Level 2 is the same as Level 1 but Radiographic Inspection is not required.

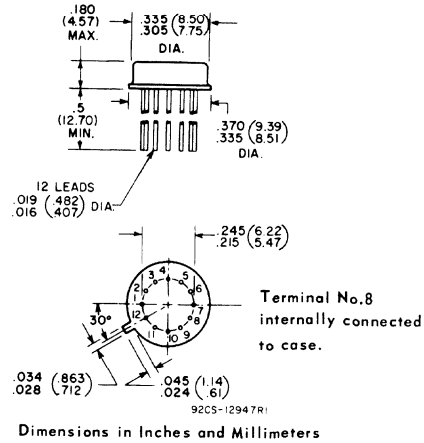
DIMENSIONAL OUTLINE



Dimensions in Inches and Millimeters

Dimensions in parentheses are in millimeters and are derived from the basic inch dimensions as indicated.

RCA
Solid State
Division

Linear Integrated Circuits

CA3028A
CA3028B
CA3053

Differential/Cascode Amplifiers

Monolithic Silicon

The CA3028A and CA3028B are differential/cascode amplifiers designed for use in communications and industrial equipment operating at frequencies from dc to 120 MHz.

The CA3028B is like the CA3028A but is capable of premium performance particularly in critical dc and differential amplifier applications requiring tight controls for input offset voltage, input offset current, and input bias current.

The CA3053 is similar to the CA3028A and CA3028B but is recommended for IF amplifier applications.

DIFFERENTIAL/CASCODE AMPLIFIERS

For Communications and Industrial Equipment at Frequencies from DC to 120 MHz

8-Lead TO-5

FEATURES

- Controlled for Input Offset Voltage, Input Offset Current, and Input Bias Current ▲
- Balanced Differential Amplifier Configuration with Controlled Constant-Current Source to Provide Unexcelled Versatility
- Single- and Dual-Ended Operation
- Operation from DC to 120 MHz
- Balanced-AGC Capability
- Wide Operating-Current Range

APPLICATIONS

- RF and IF Amplifiers (Differential or Cascode)
- DC, Audio, and Sense Amplifiers
- Converter in the Commercial FM Band
- Oscillator • Mixer • Limiter
- Companion Application Note, ICAN 5337 "Application of the RCA CA3028 Integrated Circuit Amplifier in the HF and VHF Ranges." This note covers characteristics of different operating modes, noise performance, mixer, limiter, and amplifier design considerations.

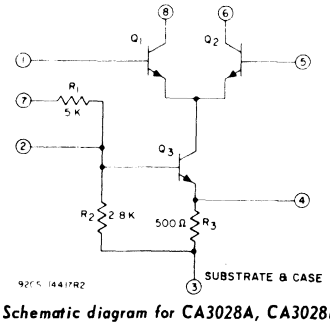


Fig.1 - Schematic diagram for CA3028A, CA3028B and CA3053.

ABSOLUTE-MAXIMUM RATINGS at T_A = 25°C:

DISSIPATION:

At T_A = 25°C ..... 450 mW
At T_A = 25°C to T_A = 85°C ..... 450 mW
Above T_A = 85°C ..... Derate linearly 5 mW/°C

TEMPERATURE RANGE:

Operating ..... -55°C to +125°C
Storage ..... -65°C to +150°C

MAXIMUM VOLTAGE RATINGS at T_A = 25°C

TERMINAL No.	1	2	3	4	5	6	7	8

4					+15♦ to 0	*	*	*
5						+20⊕ to 0	*	*
6							*	*
7								*
8								

This chart gives the range of voltages which can be applied to the terminals listed horizontally with respect to the terminals listed vertically. For example, the voltage range of the horizontal terminal 4 with respect to terminal 2 is -1 to +5 volts.

‡ Terminal #3 is connected to the substrate and case.

* Voltages are not normally applied between these terminals. Voltages appearing between these terminals will be safe, if the specified voltage limits between all other terminals are not exceeded.

▲ Limit is -12V for CA3053

⊕ Limit is +15V for CA3053

♦ Limit is +12V for CA3053

● Limit is +24V for CA3028B and +18V for CA3053

DEFINITIONS OF TERMS

AGC Bias Current

The current drawn by the device from the AGC-voltage source, at maximum AGC voltage.

AGC Range

The total change in voltage gain (from maximum gain to complete cutoff) which may be achieved by application of the specified range of dc voltage to the AGC input terminal of the device.

Common-Mode Rejection Ratio

The ratio of the full differential voltage gain to the common-mode voltage gain.

Device Dissipation

The total power drain of the device with no signal applied and no external load current.

Input Bias Current

The average value (one-half the sum) of the currents at the two input terminals when the quiescent operating voltages at the two output terminals are equal.

Input Offset Current

The difference in the currents at the two input terminals when the quiescent operating voltages at the two output terminals are equal.

Input Offset Voltage

The difference in the dc voltages which must be applied to the input terminals to obtain equal quiescent operating voltages (zero output offset voltage) at the output terminals.

Noise Figure

The ratio of the total noise power of the device and a resistive signal source to the noise power of the signal source alone, the signal source representing a generator of zero impedance in series with the source resistance.

Power Gain

The ratio of the signal power developed at the output of the device to the signal power applied to the input, expressed in dB.

Quiescent Operating Current

The average (dc) value of the current in either output terminal.

Voltage Gain

The ratio of the change in output voltage at either output terminal with respect to ground, to a change in input voltage at either input terminal with respect to ground, with the other input terminal at ac ground.

NOTES

1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads at gauge plane within 0.007" (0.178mm) radius of True Position (TP) at maximum material condition.
3. øB applies between L_1 and L_2. $øB_2$ applies between L_2 and 0.500" (12.70mm) from seating plane. Diameter is uncontrolled in L_1 and beyond 0.500" (12.70mm).
4. Measure from Max. øD.
5. N_1 is the quantity of allowable missing leads.
6. N is the maximum quantity of lead positions.

Linear Integrated Circuits

CA3028B/1 CA3028B/3
CA3028B/2 CA3028B/4

High Reliability Types
for Aerospace, Military and other Critical Applications

RCA-CA3028B/1, CA3028B/2, CA3028B/3, CA3028B/4 are high-reliability integrated circuits for critical applications in aerospace, military and industrial equipment operating at frequencies up to 120 MHz.

These types are electrically and mechanically interchangeable with the RCA-CA3028B but are specially processed and tested in accordance with the Aerospace and Military electrical, environmental, and physical test methods and procedures established for microelectronic devices in MIL-STD-883.

The curves of Typical Static and Dynamic Characteristics shown in the technical data bulletin (File No. 327) for the CA3028B also apply for these high reliability versions.

The number following the slash (/) mark in each type designation, e.g., CA3028B/1 indicates the screening levels employed by RCA to achieve the quality and reliability commensurate with the intended application. A description of these levels (1, 2, 3, and 4) is given on page 2.

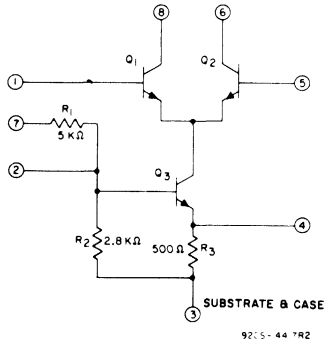

Fig. 1 - Schematic Diagram.

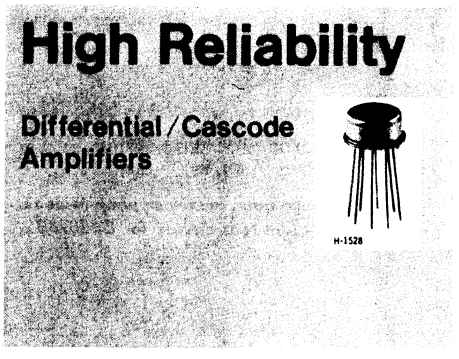
The resistance values included on the schematic diagram have been supplied as a convenience to assist Equipment Manufacturers in optimizing the selection of "outboard" components of equipment designs. The values shown may vary as much as ±30%.

RCA reserves the right to make any changes in the resistance values provided such changes do not adversely affect published performance characteristics of the device.



- Examinations and Tests performed in accordance with MIL-STD-883 "Test Methods & Procedures for Microelectronics"
- Total Lot Screening (100% testing) plus "group A" (electrical) and "group B" (environmental) Sampling Test Programs
- Internal Visual (Precap) Inspection Performed on all 4 Screening Levels in accordance with Condition A, Method 2010 MIL-STD-883
- Choice of 4 distinct Screening Levels

ELECTRICAL FEATURES

- Controlled for Input Offset Voltage, Input Offset Current, and Input Bias Current
- Balanced Differential Amplifier Configuration with Controlled Constant-Current Source to Provide Unexcelled Versatility
- Single- and Dual-Ended Operation
- Operation from DC to 120 MHz
- Balanced-AGC Capability
- Wide Operating-Current Range

ABSOLUTE-MAXIMUM RATINGS

DISSIPATION:

At T_A = 25°C to T_A = 85°C . . . . . 450 mW

Above T_A = 85°C . . . . . Derate linearly 5 mW/°C

TEMPERATURE RANGE:

Operating . . . . . -55°C to +125°C

Storage. . . . . -65°C to +150°C

INPUT SIGNAL VOLTAGE . . . . . 6 V p-p

MAXIMUM VOLTAGE RATINGS at T_A = 25°C

The following chart gives the range of voltages which can be applied to the terminals listed vertically with respect to the terminals listed horizontally. For example, the voltage range between vertical terminal 1 and horizontal terminal 5 is +5 to -5 volts.

TERMINAL No.	1	2	3	4	5	6	7	8
1		0 to -15	0 to -15	0 to -15	+5 to -5	*	*	+20 to 0
2			+5 to -11	+0 to -1	+15 to 0	+30 to 0	+15 to 0	+30 to 0
3				+10 to 0	+15 to 0	+30 to 0	+15 to 0	+30 to 0
4					+15 to 0	+30 to 0	*	+30 to 0
5						+20 to 0	*	*
6							*	*
7								*
8								

*Voltages are not normally applied between these terminals. Voltages appearing between these terminals will be safe if the specified limits between all other terminals are not exceeded.

MAXIMUM CURRENT RATINGS

TERMINAL No.	I_{IN} mA	I_{OUT} mA
1	0.6	0.1
2	4	0.1
3	0.1	23
4	20	0.1
5	0.6	0.1
6	20	0.1
7	4	0.1
8	20	0.1

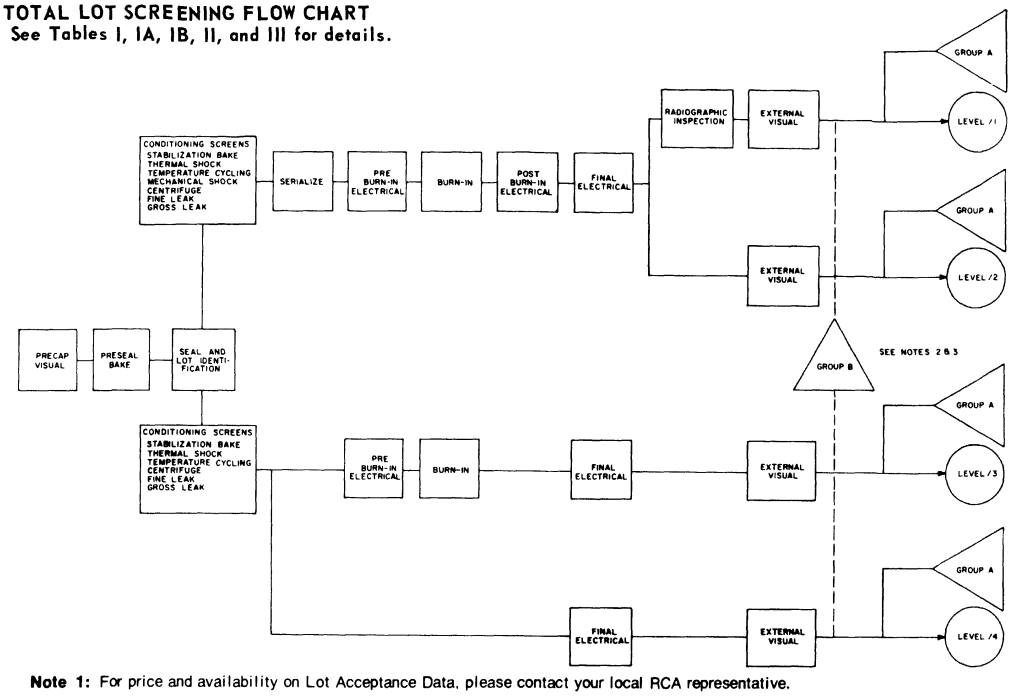
RCA INTEGRATED CIRCUIT SCREENING LEVELS

RCA Level	MIL-STD-883 Equivalent	Application	Description
/1, /2	Class A	Aerospace & Missiles	For devices intended for use where maintenance and replacement are extremely difficult or impossible and Reliability is Imperative
/3	Class B	Military & Industrial For example, in Airborne Electronics	For devices intended for use where maintenance and replacement can be performed but are difficult and expensive
/4	Class C (Class B without Burn-In)	Military & Industrial For example, on Ground Based Electronics	For devices intended for use where replacement can readily be accomplished

RCA Screening Level /1 is equivalent to MIL-STD-883 Class A except that Reverse Bias Burn-in is performed only in Group B.

RCA Screening Level /2 is the same as Level /1 but Radiographic Inspection is not performed.

TOTAL LOT SCREENING FLOW CHART
See Tables I, IA, IB, II, and III for details.



Note 1: For price and availability on Lot Acceptance Data, please contact your local RCA representative.
Note 2: For Life — Based on established data for devices having similar electrical characteristics
Note 3: For M & E — Based on established data for devices having a specific package configuration e.g. TO-5, Dual-In-Line Ceramic, Flat Pack

TABLE I. DESCRIPTION OF TOTAL LOT SCREENING X = 100% Testing S = Sample Test Only (LTPD = 5%).

CA3026
CA3054

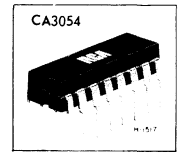
Transistor Array

Monolithic Silicon

DUAL INDEPENDENT DIFFERENTIAL AMPLIFIERS

For Low-Power Applications at Frequencies from DC to 120 MHz

12-Lead TO-5



14-Lead
Dual-In-Line
Plastic Package

The CA3026 and CA3054 each consists of two independent differential amplifiers with associated constant-current transistors on a common monolithic substrate. The six n-p-n transistors which comprise the amplifiers are general purpose devices which exhibit low 1 f noise and a value of f_T in excess of 300 MHz. These features make the CA3026 and CA3054 useful from dc to 120 MHz. Bias and load resistors have been omitted to provide maximum application flexibility.

The monolithic construction of the CA3026 and CA3054 provides close electrical and thermal matching of the amplifiers. This feature makes these devices particularly useful in dual channel applications where matched performance of the two channels is required.

The CA3026 is supplied in a hermetic 12-lead TO-5 style package and is rated for full military operating-temperature range of -55°C to +125°C.

The CA3054 is supplied in a 14-lead plastic Dual-in-line package with a limited temperature range. The availability of extra terminals allows the introduction of an independent substrate connection for maximum flexibility.

APPLICATIONS

- Dual sense amplifiers
- Dual Schmitt triggers
- Multifunction combinations -- RF Mixer Oscillator; Converter IF
- IF amplifiers (differential and or cascode)
- Product detectors
- Doubly balanced modulators and demodulators
- Balanced quadrature detectors
- Cascode limiters
- Synchronous detectors
- Pairs of balanced mixers
- Synthesizer mixers
- Balanced (push-pull) cascode amplifiers

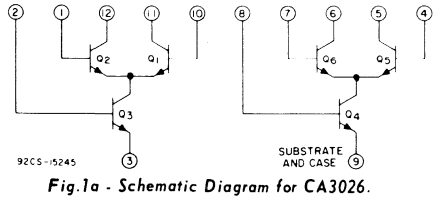


Fig.1a - Schematic Diagram for CA3026.

FEATURES

- Two differential amplifiers on a common substrate
- Independently accessible inputs and outputs
- Maximum input offset voltage -- ± 5 mV
- Full military temperature range capability -- -55°C to +125°C
- Limited temperature range -- 0°C to 85°C for CA3054

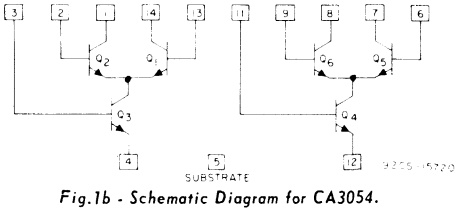

Fig.1b - Schematic Diagram for CA3054.

CAUTION: Substrate MUST be maintained negative with respect to all collector terminals of this device. See Maximum Voltage Ratings chart.

MAXIMUM RATINGS, ABSOLUTE-MAXIMUM VALUES, AT T_A = 25°C

Power Dissipation, P:	CA3026	CA3054	
Any one transistor	300	300	mW
Total package	600	750	mW
For T_A > 55°C	Derate at 5	6.67	mW/°C
Temperature Range:			
Operating	-55 to + 125	-40 to +85	°C
Storage	-65 to + 150	-65 to +150	°C

The following ratings apply for each transistor in the device:

Collector-to-Emitter Voltage, V_{CEO}	15	V
Collector-to-Base Voltage, V_{CBO}	20	V
Collector-to-Substrate Voltage, V_{CIO}*	20	V
Emitter-to-Base Voltage, V_{EBO}	5	V
Collector Current, I_C	50	mA

* The collector of each transistor of the CA3026 and CA3054 is isolated from the substrate by an integral diode. *The substrate must be connected to a voltage which is more negative than any collector voltage in order to maintain isolation between transistors and provide for normal transistor action. The substrate should be maintained at signal (AC) ground by means of a suitable grounding capacitor, to avoid undesired coupling between transistors.*

Maximum Voltage Ratings

The following chart gives the range of voltages which can be applied to the terminals listed vertically with respect to the terminals listed horizontally. For example, the voltage range between vertical terminal 1† and horizontal terminal 3† is +15 to -5 volts.

† For CA3026; corresponding terminals for CA3054 are vertical terminal 2 and horizontal terminal 4.

CA3054 TERMINAL No. →		13	14	1	2	3	4	6	7	8	9	11	12	5

9	7											*	+15 -5	*
11	8												+1 -5	*
12	9													*
5	9													Ref Sub-strate

* Voltages are not normally applied between these terminals. Voltages appearing between these terminals will be safe if the specified limits between all other terminals are not exceeded.

Note 1: In the CA3026 terminal No.9 is connected to the emitter of Q_4, the reference substrate, and the case; therefore, the case should not be grounded. Two terminal 9 columns (CA3026) appear in the voltage rating chart because it is a composite chart for both the CA3026 and the CA3054. Wherever an asterisk is shown in one column 9 and a rating is shown in the other column 9, the asterisk should be ignored.

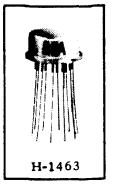
CA3049

Transistor Array

Monolithic Silicon

DUAL INDEPENDENT DIFFERENTIAL AMPLIFIERS

For Low-Power Applications at Frequencies up to 500 MHz



12-Lead TO-5

The CA3049 consists of two independent differential amplifiers with associated constant-current transistors on a common monolithic substrate. The six n-p-n transistors which comprise the amplifiers are general purpose high frequency devices which exhibit a value of f_T in excess of 1000 MHz. These features make the CA3049 useful to 500 MHz. Bias and load resistors have been omitted to provide maximum application flexibility.

The monolithic construction of the CA3049 provides close electrical and thermal matching of the amplifiers. This feature makes this device particularly useful in dual channel applications where matched performance of the two channels is required.

FEATURES

- Power Gain 23 dB (typ.) at 200 MHz
- Noise Figure 4.6 dB (typ.) at 200 MHz
- Two differential amplifiers on a common substrate
- Independently accessible inputs and outputs
- Full military temperature range capability– - 55°C to + 125°C

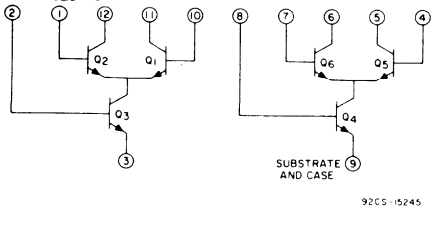


Fig. 1 - Schematic Diagram for CA3049

APPLICATIONS

- VHF amplifiers
- VHF mixers
- Multifunction combinations -- RF/Mixer/Oscillator; Converter/IF
- IF amplifiers (differential and/or cascode)
- Product detectors
- Doubly balanced modulators and demodulators
- Balanced quadrature detectors
- Cascade limiters
- Synchronous detectors
- Balanced mixers
- Synthesizers
- Balanced (push-pull) cascode amplifiers
- Sense amplifiers

RCA
Solid State
Division

Linear Integrated Circuits

CA3007

- Designed for use in Sound Systems and Communication Equipment
- Balanced differential-amplifier configuration with controlled constant-current source provides for both audio amplification and phase inversion
- Built-in temperature stability for operation from -55°C to +125°C
- Eliminates need for audio driver transformer
- Companion Application Note, ICAN 5037 "Application of the RCA-CA3007 Integrated Circuit Audio Driver" covers design of a dual supply audio driver in a direct-coupled audio amplifier, and a single supply audio driver in a capacitor-coupled audio amplifier

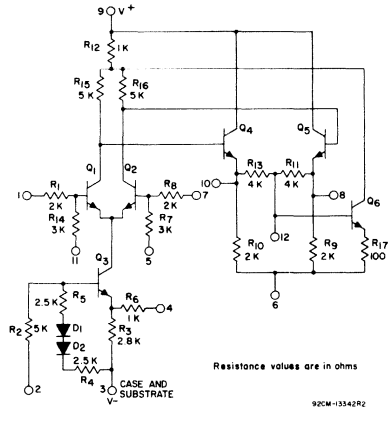
HIGHLIGHTS

- Input Impedance. . . . 4 kΩ typ.
- Output Impedance . . . 60 Ω typ.
- Power Gain . . . . . 22 dB typ.
- Push-Pull Input & Output
- Direct Coupling to Class B Audio Output Stage

APPLICATIONS

- Audio Amplifier
- Audio Driver

SCHEMATIC DIAGRAM



ABSOLUTE-MAXIMUM VOLTAGE LIMITS, at T_{FA} = 25° C

Indicated voltage limits for each terminal can be applied under the specified operating conditions for other terminals. All voltages are with respect to ground ($-V_{CC}$, $+V_{EE}$, or common terminal of Positive and Negative DC supplies).

TERMINAL	VOLTAGE LIMITS		CONDITIONS

NOTES:

1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads at gauge plane within 0.007" (0.178 mm) radius of True Position (TP) at maximum material condition.
3. øB applies between L_1 and L_2. ϕB_2 applies between L_2 and 0.500" (12.70 mm) from seating plane. Diamerer is uncontrolled in L_1 and beyond 0.500" (12.70 mm).
4. Measure from Max. øD.
5. N_1 is the quantity of allowable missing leads.
6. N is the maximum quantity of lead positions.

Operational Amplifiers

High-Gain Single and Dual Operational Amplifiers
For Military, Industrial and Consumer Applications

Applications:

- **Comparator**
- **DC amplifier**
- **Integrator or differentiator**
- **Multivibrator**
- **Narrow-band or band-pass filter**
- **Summing amplifier**

Features:

- **Input bias current (all types): 500 nA max.**
- **Input offset current (all types): 200 nA max.**

RCA-CA3458T, CA3558T (dual types); CA3741CT, CA3741T (single-types); CA3747CE, CA3747CT, CA3747E, CA3747T (dual types); and CA3748CT, CA3748T (single types) are general-purpose, high-gain operational amplifiers for use in military, industrial, and consumer applications.

These monolithic silicon integrated-circuit devices provide output short-circuit protection and latch-free operation. These types also feature wide common-mode and differential-mode signal ranges and have low-offset voltage nulling capability when used with an appropriately valued potentiometer. A 5-megohm potentiometer is used for offset nulling types CA3748CT, CA3748T (See Fig. 9); a 10-kilohm potentiometer is used for offset nulling types CA3741CT, CA3741T, CA3747CE, CA3747E, (See Fig. 8); and types CA3458T, CA3558T, CA3747CT, CA3747T have no specific terminals for offset nulling. Each type consists of a differential-input amplifier that effectively drives a gain and level-shifting stage having a complementary emitter-follower output.

This operational amplifier line also offers the circuit designer the option of operation with internal or external phase compensation. Types CA3748CT and CA3748T, which are externally phase compensated (terminals 1 and 8) permit a choice of operation for improved bandwidth and slew-rate capabilities. Unity gain with external phase compensation can be obtained with a single 30-pF capacitor. All the other types are internally phase-compensated.

The table, shown below, lists the package configuration, the operating temperature ranges (full military temperature range types, −55°C to +125°C), and compatibility with industry types for each of the RCA operational amplifiers.

RCA's manufacturing process makes it possible to produce IC operational amplifiers with low-burst ("popcorn") noise characteristics. Type CA6741T, a low-noise version of the CA3741T, gives limit specifications for burst noise in the data bulletin, File No. 530. Contact your RCA Sales Representative for information pertinent to other operational amplifier types that meet low-burst noise specifications.

NOTE:

Types CA3458T and CA3558T were formerly developmental type TA6111.

Types CA3741CT and CA3741T were formerly types CA3056/741C and CA3056A/741, respectively.

Types CA3747CE, CA3747CT, CA3747E, and CA3747T were formerly developmental type TA6157.

Types CA3748CT and CA3748T were formerly developmental type TA6037.

RCA* Type No.	No. of Ampli.	Phase Comp.	Package Type	Offset Volt. Null	A_{OL} (min.)	V_{IO} (max.)	T_A Operating Range	Compatible with Industry Type(s)

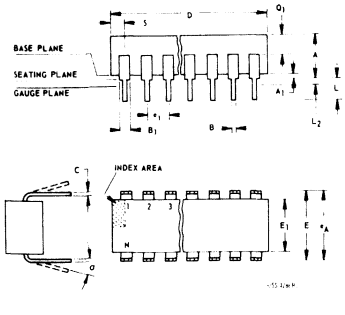
NOTES

1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads at gauge plane within 0.007" (0.178mm) radius of True Position (TP) at maximum material condition.
3. øB applies between L_1 and L_2. $øB_2$ applies between L_2 and 0.500" (12.70mm) from seating plane. Diameter is uncontrolled in L_1 and beyond 0.500" (12.70mm).
4. Measure from Max. øD.
5. N_1 is the quantity of allowable missing leads.
6. N is the maximum quantity of lead positions.

14-LEAD DUAL-IN-LINE PLASTIC PACKAGE JEDEC MO-001-AB



NOTES:

1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads within 0.005" (0.12 mm) radius of True Position (TP) at guage plane with maximum material condition and unit installed.
3. e_A applies in zone L_2 when unit installed.
4. α applies to spread leads prior to installation.
5. N is the maximum quantity of lead positions.
6. N_1 is the quantity of allowable missing leads.

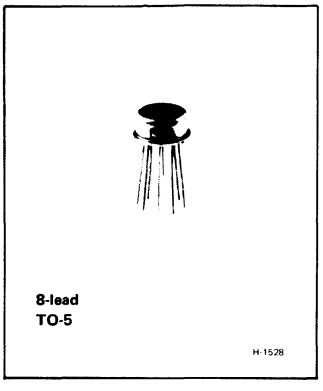
RCA Solid State Division

Linear Integrated Circuits

CA3080
CA3080A



Operational Transconductance Amplifiers

Gateable-Gain Blocks

Features:

- **Slew rate (unity gain, compensated): 50 V/μs**
- **Adjustable power consumption: 10μW to 30 mW**
- **Flexible supply voltage range: ± 2 V to ± 15 V**
- **Fully adjustable gain: 0 to $g_m R_L$ limit**
- **Tight g_m spread: CA3080 (2:1), CA3080A (1.6:1)**
- **Extended g_m linearity: 3 decades**
- **Hermetic package: 8-lead TO-5 style**

Applications:

- **Sample and hold**
- **Multiplex**
- **Voltage follower**
- **Multiplier**
- **Comparator**

RCA-CA3080* and CA3080A* are Gateable-Gain Blocks which utilize the same unique OTA (Operational Transconductance Amplifier) concept first introduced in the RCA-CA3060.

The CA3080 and CA3080A have Differential Input and a Single-Ended, Push-Pull, Class A Output. In addition, these types have an Amplifier Bias Input which may be used either for Gating or for Linear Gain Control. These types also have an High Output Impedance and their Transconductance (g_m) is directly proportional to the Amplifier Bias Current (I_{ABC}).

The CA3080 and CA3080A are notable for their excellent Slew Rate (50V/μs), which make them especially useful for Multiplex and Fast Unity-Gain Voltage Followers. These types are especially applicable for Multiplex applications because power is only consumed when the devices are in the "ON" Channel state.

The CA3080A is rated for operation over the full military temperature range and its characteristics are specifically controlled for Sample-Hold applications in addition to the normal CA3080 functions. Fig. 21 illustrates a complete and economical Sample-Hold circuit utilizing the CA3080A and an RCA-3N138 MOS FET. This circuit provides an acquisition time of 3 microseconds.

*Formerly developmental type TA5816

Operational Transconductance Amplifier Arrays

APPLICATIONS

- For low power conventional operational amplifier applications
- Active filters
- Comparators
- Gyrators
- Mixers
- Modulators
- Multiplexers
- Multipliers
- Strobing and gating functions
- Sample and hold functions

FEATURES

- Low power consumption — as low as 100 μW per amplifier
- Independent biasing for each amplifier
- High forward transconductance
- Programmable range of input characteristics
- Low input bias and input offset current
- High input and output impedance
- No effect on device under output short-circuit conditions
- Zener diode bias regulator

RCA-CA3060AD, CA3060BD, CA3060D, and CA3060E, monolithic integrated circuits, are arrays of three independent Operational Transconductance Amplifiers. This type of amplifier is a new circuit concept that has the generic characteristics of an operational voltage amplifier with the exception that the forward gain characteristic is best described by transconductance rather than voltage gain (open-loop voltage gain is the product of the transconductance and the load resistance, $g_m R_L$). When operated into a suitable load resistor and with provisions for feedback, these amplifiers are well suited for a wide variety of operational-amplifier and related applications. In addition, the extremely high output impedance makes these types particularly well suited for service in active filters.

The three amplifiers in the CA3060 family are identical push-pull Class A types which can be independently biased to achieve a wide range of characteristics for specific applications. The electrical characteristics of each amplifier are a function of the amplifier bias current (I_{ABC}). This feature offers the system designer maximum flexibility with regard to output current capability, power consumption, slew rate, input resistance, input bias current, and input offset current. The linear variation of the parameters with respect to bias and the ability to maintain a constant dc level between input and output of each amplifier also makes the CA3060 suitable for a variety of non-linear applications such as mixers, multipliers, and modulators.

In addition, the types in the CA3060 family incorporate a unique Zener diode regulator system that permits current regulation below supply voltages normally associated with such systems.

Generic applications of the OTA are described in ICAN-6668, Applications of the CA3080 and CA3080A High-Performance Operational Transconductance Amplifiers.

The CA3060AD, CA3060BD, and CA3060D are supplied in a hermetic 16-lead dual-in-line ceramic package which can be operated over the full military temperature range, -55°C to +125°C. The CA3060E is supplied in a 16-lead dual-in-line plastic package and is operational from -40°C to +85°C.

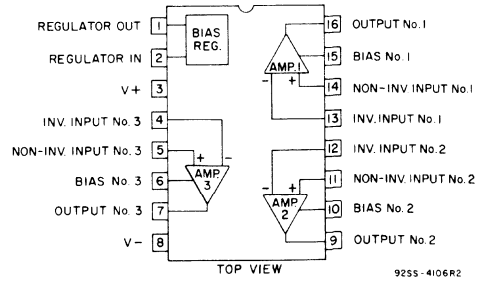

Fig. 1—Functional block diagram for each type in the CA3060 family.

MAXIMUM RATINGS, *Absolute Maximum Values at T_A = 25°C*

DC Supply Voltage (between V^+ and V^- terminals):

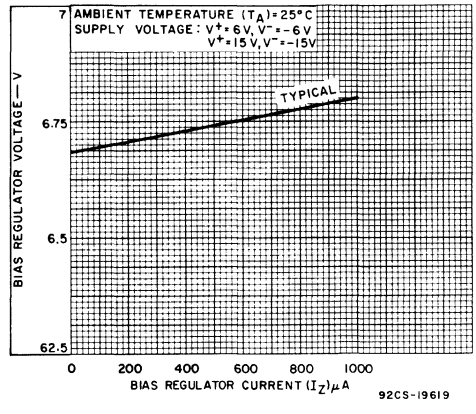

Fig. 15—Bias regulator voltage vs. bias regulator current.

OPERATING CONSIDERATIONS*

The CA3060 consists of three operational amplifiers similar in form and application to conventional operational amplifiers but sufficiently different from the standard operational amplifier (op-amp) to justify some explanation of their characteristics. The amplifiers incorporated in the CA3060 are best described by the term Operational Transconductance Amplifier (OTA). The characteristics of an ideal OTA are similar to those of an ideal op-amp except that the OTA has an extremely high output impedance. Because of this inherent characteristic the output signal is best defined in terms of current which is proportional to the difference between the voltages of the two input terminals. Thus, the transfer characteristic is best described in terms of transconductance rather than voltage gain. Other than the difference given above, the characteristics tabulated on pages 3 and 4 of this data bulletin are similar to those of any typical op-amp.

The OTA circuitry incorporated in the CA3060 (See Fig. 16) provides the equipment designer with a wider variety of circuit arrangements than does the standard op-amp; because as the curves in the data bulletin indicate, the user may select the optimum circuit conditions for a specific application simply by varying the bias conditions of each amplifier. If low power consumption, low bias, and low offset current, or high input impedance are primary design requirements, then low current operating conditions may be selected. On the other hand, if operation into a moderate load impedance is the primary consideration, then higher levels of bias may be used.

Bias Considerations for Op-Amp Applications

The operational transconductance amplifiers allow the circuit designer to select and control the operating conditions of the circuit merely by the adjustment of the input bias current I_{ABC}. This enables the designer to have complete control over transconductance, peak output current and total power consumption independent of supply voltage.

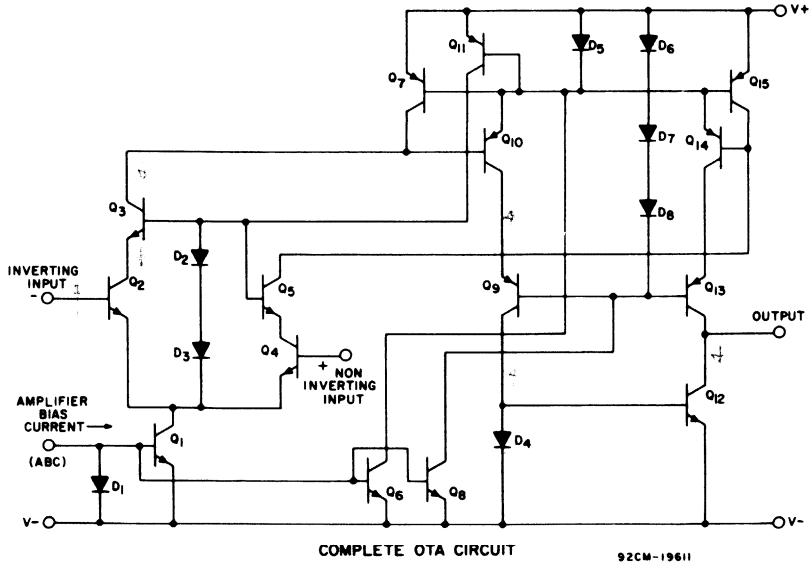

Fig. 16—Complete schematic diagram showing bias regulator and one of the three operational transconductance amplifiers.

In addition, the high output impedance makes these amplifiers ideal for applications where current summing is involved.

The design of a typical operational amplifier circuit (See Fig. 17) would proceed as follows:

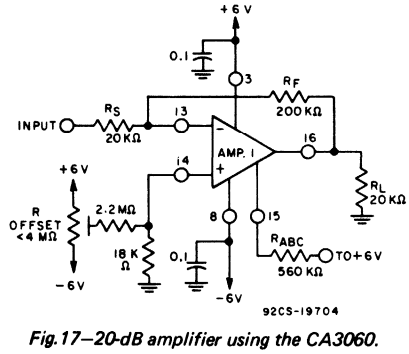

Fig. 17—20-dB amplifier using the CA3060.

Circuit Requirements
Closed loop voltage gain = 10 (20 dB)
Offset voltage adjustable to zero
Current drain as low as possible
Supply voltage = ±6 V
Maximum input voltage = ±50 mV
Input resistance = 20 kΩ
Load resistance = 20 kΩ
Device: CA3060

Calculation

1. Required transconductance g_{21}.
   Assume that the open loop gain A_{OL} must be at least ten times the closed loop gain. Therefore, the forward transconductance required is given by

$$g_{21} = A_{OL}/R_L$$

$$= 100/18\ k\Omega$$

$$\cong 5.5\ mmho$$

(R_L = 20 kΩ in parallel with 200 kΩ

≅ 18 kΩ)

2. Selection of suitable amplifier bias current.
   The amplifier bias current is selected from the minimum value curve of transconductance (Fig. 10a) to assure that the amplifier will provide sufficient gain. For the required g_{21} of 5.5 mmho an amplifier bias current I_{ABC} of 20 μA is suitable.

3. Determination of Output Swing Capability.
   For a loop gain of 10 the output swing is ±0.5 V and the peak load current 25 μA. However, the amplifier must also supply the necessary current through the feedback resistor and for R_S = 20 kΩ than R_F = 200 kΩ if A_{OL} = 10. Therefore, the feedback loading = 0.5/200 kΩ = 2.5 μA.

   The total amplifier current output requirements are, therefore, ±27.5 μA. Referring to the data given in Fig. 6a we see that for an amplifier bias current of 20 μA the amplifier output current is ±40 μA. This is obviously adequate and it is not necessary to change the amplifier bias current I_{ABC}.

4. Calculation of bias resistance.
   For minimum supply current drain the amplifier bias current I_{ABC} should be fed directly from the supplies and not from the bias regulator. The value of the resistor R_{ABC} may be directly calculated using Ohm's law.

$$R_{ABC} = \frac{V_{SUP} - V_{ABC}}{I_{ABC}}$$

$$R_{ABC} = \frac{12 - 0.63}{20 \times 10^{-6}}$$

$$= 568.5\ k\Omega \text{ or } \cong 560\ k\Omega$$

5. Calculation of offset adjustment circuit.
   In order to reduce the loading effect of the offset adjustment circuit on the power supply, the offset control should be arranged to provide the necessary offset current. The source resistance of the non-inverting input is made equal to the source resistance of the inverting input.

i.e. $$\frac{20 \times 200 \times 10^6 \text{ ohms}}{220 \times 10^3} \cong 18\ k\Omega$$

Because the maximum offset voltage is 5 mV and an additional increment due to the offset current (Fig. 4) flowing through the source resistance

(i.e. $200 \times 10^{-9} \times 18 \times 10^3$ volts), therefore,

the Offset Voltage Range = 5 mV + 3.6 mV = ±8.6 mV

The current necessary to provide this offset is

$$\frac{8.6 \times 10^{-3}}{18 \times 10^3} \text{ or } 0.48\ \mu A$$

With a supply voltage of ±6 V, this current can be provided by a 10 MΩ resistor. However, the stability of such a resistor is often questionable and a more realistic value of 2.2 MΩ was used in the final circuit.

OTHER CONSIDERATIONS

Capacitance Effects

The CA3060 is designed to operate at such low power levels that high impedance circuits must be employed. In designing such circuits, particularly feedback amplifiers, stray circuit capacitance must always be considered because of its adverse effect on frequency response and stability. For example a 10-kΩ load with a stray capacitance of 15 pF has a time constant of 1 MHz. Fig. 18 illustrates how a 10-kΩ 15-pF load modifies the frequency characteristic.

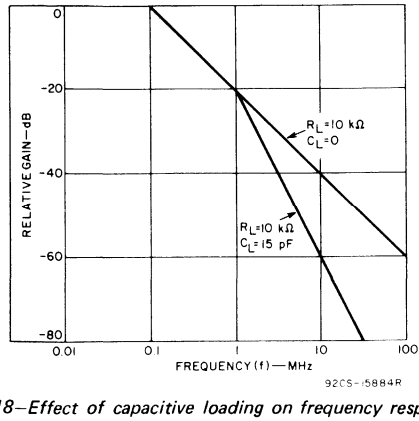

Fig. 18—Effect of capacitive loading on frequency response.

Capacitive loading also has an effect on slew rate; because the peak output current is established by the amplifier bias current, I_{ABC} (see Fig. 6a), the maximum slew rate is limited to the maximum rate at which the capacitance can be charged by the I_{OM}. Therefore,

$$SR = dV/dt = I_{OM}/C_L$$

where C_L is the total load capacitance including strays. This relationship is shown graphically in Fig. 19. When measuring slew rate for this data bulletin, care was taken to keep the total capacitive loading to 13 pF.

Phase Compensation

In many applications phase compensation will not be required for the amplifiers of the CA3060. When needed, compensation may easily be accomplished by a simple RC network at the input of the amplifier as shown in Fig. 13. The values given in Fig. 13 provide stable operation for the critical unity gain condition, assuming that capacitive loading on the output is 13 pF or less. Input phase compensation is recommended in order to maintain the highest possible slew rate.

In applications such as integrators, two OTAs may be cascaded to improve current gain. Compensation is best accomplished in this case with a shunt capacitor at the output of the first amplifier. The high gain following compensation assures a high slew rate.

APPLICATIONS

Having determined the operating points of the CA3060 amplifiers, they can now function in the same manner as conventional op-amps, and thus, are well suited for most op-amp applications, including inverting and non-inverting amplifiers, integrators, differentiators, summing amplifiers etc.

TRI-LEVEL COMPARATOR

Tri-level comparator circuits are an ideal application for the CA3060 since it contains the requisite three amplifiers. A tri-level comparator has three adjustable limits. If either the upper or lower limit is exceeded, the appropriate output is activated until the input signal returns to a selected intermediate limit. Tri-level comparators are particularly suited to many industrial control applications.

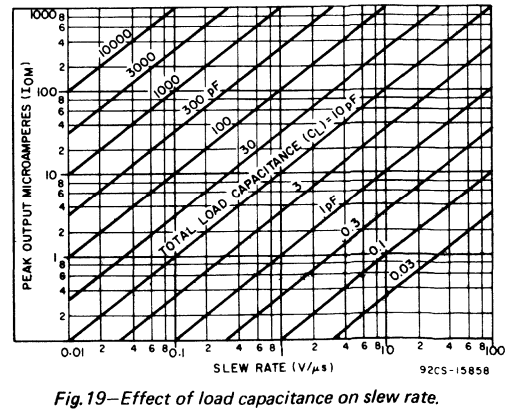

Fig. 19—Effect of load capacitance on slew rate.

Circuit Description

Fig. 20 shows the block diagram of a tri-level comparator using the CA3060. Two of the three amplifiers are used to compare the input signal with the upper-limit and lower-limit reference voltages. The third amplifier is used to compare the input signal with a selected value of intermediate-limit reference voltage. By appropriate selection or resistance ratios this intermediate-limit may be set to any voltage between the upper-limit and lower-limit values. The output of the upper-limit and lower-limit comparator sets the corresponding upper or lower-limit flip-flop. The activated flip-flop retains its state until the third comparator (intermediate-limit) in the CA3060 initiates a reset function, thereby indicating that the signal voltage has returned to the intermediate-limit selected. The flip-flops employ two CA3086 transistor-array IC's, with circuitry to provide separate "SET" and "POSITIVE OUTPUT" terminals.

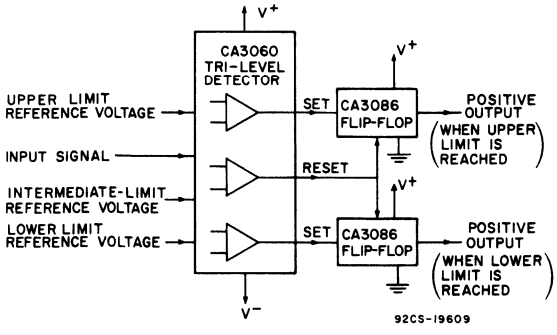

Fig.20—Functional block diagram of a tri-level comparator.

The circuit diagram of a tri-level comparator appears in Fig. 21. Power is provided for the CA3060 via terminals 3 and 8 by ±6-volt supplies and the built-in regulator provides amplifier-bias-current (I_{ABC}) to the three amplifiers via terminal 1. Lower-limit and upper-limit reference voltages are selected by appropriate adjustment of potentiometers R1 and R2, respectively. When resistors R3 and R4 are equal in value (as shown), the intermediate-limit reference voltage is automatically established at a value midway between the lower-limit and upper-limit values. Appropriate variation of resistors R3 and R4 permits selection of other values of intermediate-limit voltages. Input signal (E_S) is applied to the three comparators via terminals 5, 12, and 14. The "SET" output lines trigger the appropriate flip-flop whenever the input signal reaches a limit value. When the input signal returns to an intermediate-value, the common flip-flop "RESET" line is energized. The loads in the circuits, shown in Fig. 21 are 5-V, 25-mA lamps.

Active Filters — Using the CA3060 as a Gyrator

The high output impedance of the OTAs makes the CA3060 ideally suited for use as a gyrator in active filter applications. Fig. 22 shows two OTAs of the CA3060 connected as a gyrator in an active filter circuit. The OTAs in this circuit can make a 3-μF capacitor function as a floating 10-kilohenry inductor across Terminals A and B. The measured Q of 13 (at a frequency of 1 Hz) of this inductor compares favorably with a calculated Q of 16. The 20-kilohm to 2-megohm attenuators in this circuit extend the dynamic range of the OTA by a factor of 100. The 100-kilohm potentiometer, across V+ and V⁻, tunes the inductor by varying the g_{21} of the OTAs, thereby changing the gyration resistance.

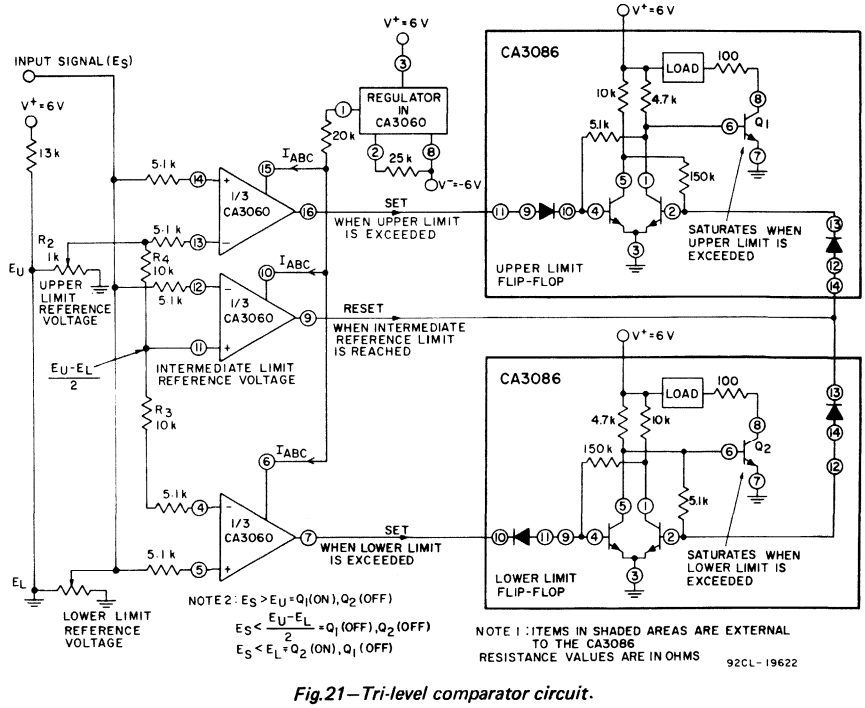

Fig.21—Tri-level comparator circuit.

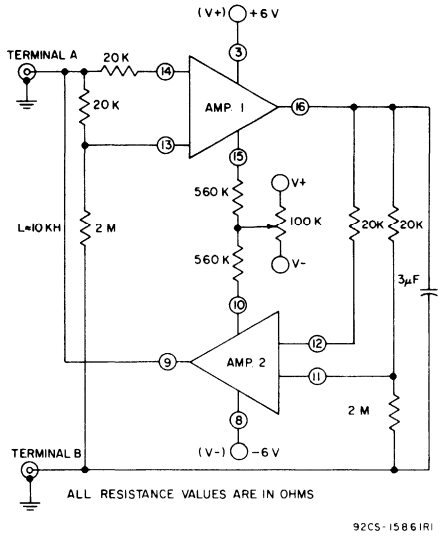

Fig.22—Two operational transconductance amplifiers of the CA3060 connected as a gyrator in an active filter circuit.

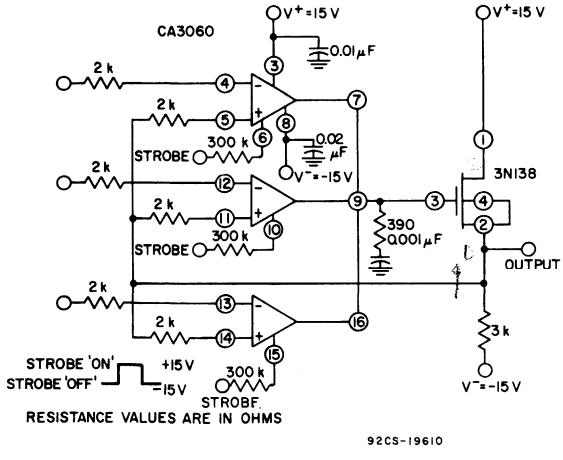

Fig.23—Three-channel multiplexer.

THREE CHANNEL MULTIPLEXER

Fig. 23 shows a schematic of a three channel multiplexer using a single CA3060 and a 3N138 MOS/FET as a buffer and power amplifier.

When the CA3060 is connected as a high-input impedance voltage follower, and strobe "ON," each amplifier is activated and the output swings to the level of the input of that amplifier. The cascade arrangement of each CA3060 amplifier with the MOS/FET provides an open loop voltage gain in excess of 100 dB, thus assuring excellent accuracy in the voltage follower mode with 100% feedback.

Operation at ±6 volts is also possible with several minor changes. First, the resistance in series with amplifier bias current (I_{ABC}) terminal of each amplifier should be decreased to maintain 100 μA of strobe-"ON" current at this lower supply voltage. Second, the drain resistance for the MOS/FET should be decreased to maintain the same value of source current. The low cost dual-gate protected MOS/FET, RCA-40841, may be used when operating at the low supply voltage.

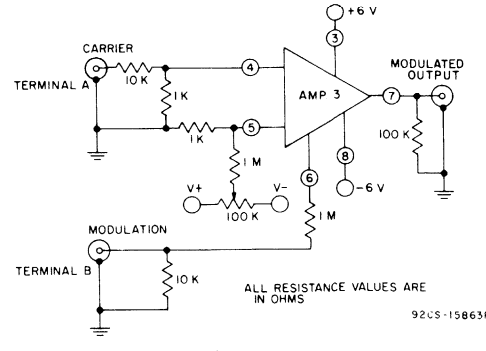
The phase compensation network consists of a single 390Ω resistor and a 1000-pF capacitor, located at the interface of the CA3060 output and the MOS/FET gate. The bandwidth of the system is 1.5 MHz and the slew rate is 0.3 volts/μsec. The system slew rate is directly proportional to the value of the phase compensation capacitor. Thus, with higher gain settings where lower values of phase compensation capacitors are possible, the slew rate is proportionally increased.

NON LINEAR APPLICATIONS

AM Modulator (Two-Quadrant Multiplier)

Fig. 24 shows Amplifier No. 3 of the CA3060 used in an AM modulator or 2-quadrant multiplier circuit. When modulation is applied to the amplifier bias input, Terminal B, and the carrier frequency to the differential input, Terminal A, the waveform, shown in Fig. 24, is obtained. Fig. 24 is a result of adjusting the input offset control to balance the circuit so that no modulation can occur at the output without a carrier input. The linearity of the modulator is indicated by the solid trace of the superimposed modulating frequency. The maximum depth of modulation is determined by the ratio of the peak input modulating voltage to V^-.

The two-quadrant multiplier characteristic of this modulator is easily seen if modulation and carrier are reversed as shown in Fig. 24. The polarity of the output must follow that of the differential input; therefore, the output is positive only during, the positive half cycle of the modulation and negative only in the second half cycle. Note, that both the input and output signals are referenced to ground. The output signal is zero when either the differential input or I_{ABC} are zero.



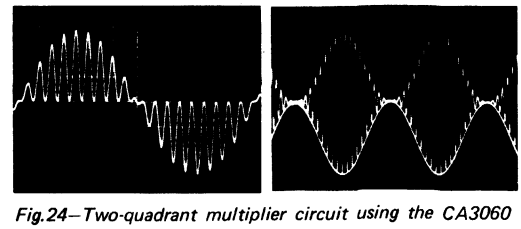


Fig.24—Two-quadrant multiplier circuit using the CA3060 with associated waveforms.

Four-Quadrant Multiplier

The CA3060 is also useful as a four-quadrant multiplier. A block diagram of such a multiplier, utilizing Amplifier Nos. 1, 2, and 3, is shown in Fig. 25 and a typical circuit is shown in Fig. 26. The multiplier consists of a single CA3060 and, as in the two-quadrant multiplier, exhibits no level shift between input and output. In Fig. 25, Amplifier No. 1 is connected as an inverting amplifier for the X-input signal. The output current of Amplifier No. 1 is calculated as follows:

$$I_O(1) = [-V_X]\ [g_{21}(1)] \qquad \text{(Eq.3)}$$

Ampl. No. 2 is a non-inverting amplifier so that

$$I_O(2) = [+V_X]\ [g_{21}(2)] \qquad \text{(Eq. 4)}$$

Because the amplifier output impedances are high, the load current is the sum of the two output currents, for an output voltage

$$V_O = V_X R_L\ [g_{21}(2) - g_{21}(1)] \qquad \text{(Eq. 5)}$$

The transconductance is approximately proportional to the amplifier bias current; therefore, by varying the bias current the g_{21} is also controlled. Amplifier No. 2 bias current is proportional to the Y-input signal and is expressed as

$$I_{ABC(2)} \approx \frac{(V\text{-}) + V_Y}{R_1} \qquad \text{(Eq. 6)}$$

Hence,

$$g_{21}(2) \approx k\ [(V\text{-}) + V_Y]. \qquad \text{(Eq. 7)}$$

Bias for Amplifier No. 1 is derived from the output of Amplifier No. 3 which is connected as a unity-gain inverting amplifier. $I_{ABC(1)}$, therefore, varies inversely with V_Y. And by the same reasoning as above

$$g_{21}(1) \approx k\ [(V\text{-}) - V_Y]. \qquad \text{(Eq. 8)}$$

Combining equation 5, 7, and 8 yields:

$$V_O \approx V_X \cdot k \cdot R_L \left\{[(V\text{-}) + V_Y] - [(V\text{-}) - V_Y]\right\} \text{ or}$$

$$V_O \approx 2\,k\,R_L\,V_X\,V_Y$$

Fig. 26 shows the actual circuit including all the adjustments associated with differential input and an adjustment for equalizing the gains of Amplifiers No. 1 and No. 2. Adjustment of the circuit is quite simple. With both the X and Y voltages at zero, connect Terminal 10 to Terminal 8. This procedure disables Amplifier No. 2 and permits adjusting the offset voltage of Amplifier No. 1 to zero by means of the 100-kΩ potentiometer. Next, remove the short between Terminals 10 and 8 and connect Terminal 15 to Terminal 8. This step disables Amplifier No. 1 and permits Amplifier No. 2 to be zeroed with the other potentiometer. With AC signals on both the X and Y input, R3 and R11 are adjusted for symmetrical output signals. Fig. 27 shows the output waveform with the multiplier adjusted. The voltage waveform in Fig. 27a shows suppressed carrier modulation of 1-kHz carrier with a triangular wave.

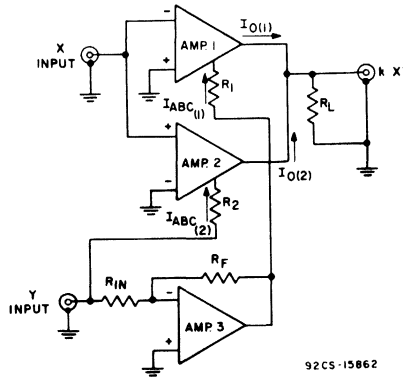

Fig.25—Four-quadrant multiplier using the CA3060.

Figures 27b and 27c, respectively, show the squaring of a triangular wave and a sine wave. Notice that in both cases the outputs are always positive and return to zero after each cycle.

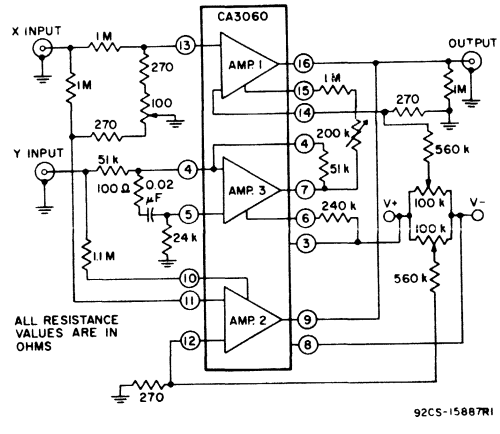

Fig.26—Typical four-quadrant multiplier circuit.

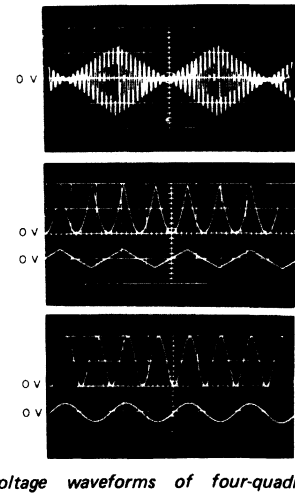

Fig.27—Voltage waveforms of four-quadrant multiplier circuit.

DEFINITIONS OF TERMS

Amplifier Bias Current (I_{ABC}) - The current supplied to the amplifier bias terminal of each amplifier to establish its operating point.

Amplifier Supply Current (I_A) - The current drawn by each operating amplifier from the positive supply source. The total supply current which includes the sum of the amplifier supply current, the amplifier bias currents, and the bias regulator current is not to be mistaken for the amplifier supply current.

Bias Regulator Current (I_2) - The current flowing from Terminal 2, set by an external source, which establishes the operating conditions of the bias regulator.

Bias Terminal Voltage (V_{ABC}) - The voltage existing between any amplifier bias terminal and Terminal 8.

Peak Output Current (I_{OM}) - The maximum current which will be either drawn from a short circuit on the output of each amplifier (positive I_O) or the maximum current delivered into a short circuit load (negative I_O). Peak-to-peak current swing is twice the peak output current (I_{OM}).

Peak Output Voltage (V_{OM}) - The maximum positive voltage swing (V_{OM}+) or the maximum negative voltage swing (V_{OM}-) for a specific supply voltage and amplifier bias.

Power Consumption (P): The product of the sum of the supply voltages and the sum of each of the amplifier supply currents = $[(V+) + (V-)]\ [\Sigma I_A]$. This is not the total power consumed by an operating circuit. The power in the regulator must also be included for total power consumed.

Zener Regulator Voltage (V_Z) - The voltage, across Terminals 1 and 8, measured with current flowing in the bias regulator.

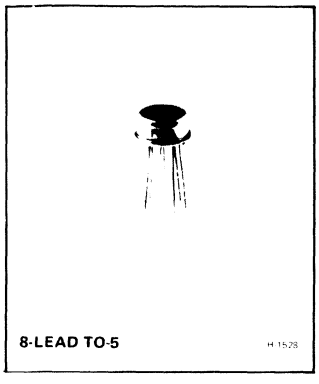
RCA
Solid State
Division

Linear Integrated Circuits

Monolithic Silicon

CA3078T
CA3078AT



Micropower Operational Amplifier

Features:

- Low standby power: as low as 700 nW
- Wide supply voltage range: ±0.75 to ±15 V
- High peak output current: 6.5 mA min.
- Adjustable quiescent current
- Output short-circuit protection

Applications:

- Portable electronics
- Medical electronics
- Instrumentation
- Telemetry

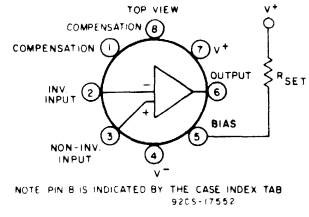


Fig.1-Functional diagram of the CA3078T and CA3078AT.

The RCA CA3078T* and CA3078AT▲ are high-gain monolithic operational amplifiers which can deliver milliamperes of current yet only consume microwatts of standby power. Their operating points are externally adjustable and frequency compensation may be accomplished with one external capacitor. The CA3078T and CA3078AT provide the designer with the opportunity to tailor the frequency response and improve the slew rate without sacrificing power. Operation with a single 1.5-volt battery is a practical reality with these devices.

The CA3078AT is a premium device having a supply voltage range of $V^{\pm}$ = 0.75V to $V^{\pm}$ = 15V and an operating temperature range of -55°C to +125°C. The CA3078T has the same lower supply voltage limit but the upper limit is V^{+} = +6V and V^{-}=-6V. The operating temperature range is from 0°C to +70°C.

OPERATING CONSIDERATIONS

Compensation Techniques

The CA3078AT and CA3078T can be phase-compensated with one or two external components depending upon the closed-loop gain, power consumption, and speed desired. The recommended compensation is a resistor in series with a capacitor connected from terminal 1 to terminal 8. Values of the resistor and capacitor required for compensation as a function of closed loop gain are shown in Figs. 24 and 25. These curves represent the compensation necessary at quiescent currents of 20 μA and 100 μA, respectively, for a transient response with 10% overshoot. Figs. 21 and 22 show the slew rates that can be obtained with the two different compensation techniques. Higher speeds can be achieved with input compensation, but this increases noise output.

Compensation can also be accomplished with a single capacitor connected from terminal 1 to terminal 8, with speed being sacrificed for simplicity. Table 1 gives an indication of slew rates that can be obtained with various compensation techniques at quiescent currents of 20 μA and 100 μA.

Single Supply Operation

The CA3078AT and CA3078T can operate from a single supply with a minimum total supply voltage of 1.5 volts. Figs. 27 and 28 show the CA3078AT or CA3078T in inverting and non-inverting 20-dB amplifier configurations utilizing a 1.5-volt type "AA" cell for a supply. The total power consumption for either circuit is approximately 675 nanowatts. The output voltage swing in this configuration is 300 mV p-p with a 20 kΩ load.

NOTES

1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads at gauge plane within .007" (.178 mm) radius of True Position (TP) at maximum material condition.
3. ⌀B applies between L_1 and L_2. ⌀B_2 applies between L_2 and .500" (12.70 mm) from seating plane. Diameter is uncontrolled in L_1 and beyond .500" (12.70 mm).
4. Measure from Max. ⌀D.
5. N_1 is the quantity of allowable missing leads.
6. N is the maximum quantity of lead positions.

RCA-CA3033 is a high-performance integrated circuit operational amplifier featuring high input impedance, high gain, high power output, and low input-offset voltage and current. The device consists of two differential amplifiers in cascade and a single-ended class-B power output stage on a single monolithic silicon chip.

RCA-CA3033A has all the superior features and characteristics of the CA3033 but, in addition, can be operated at higher supply voltages to provide higher gain, higher common mode rejection, greater maximum output voltage swing, and more than double the power output.

RCA-CA3033 and CA3033A are hermetically sealed in 14-lead "dual-in-line" ceramic packages and are designed for operation over the full military temperature range of −55 °C to +125 °C.

The RCA-CA3047 and CA3047A are electrically identical to the CA3033 and CA3033A, respectively, but are limited in operating and storage temperature range.

The RCA-CA3047 and CA3047A are supplied in 14-lead, "dual-in-line" plastic packages and are designed to operate over the temperature range of 0°C to +70 °C, ambient.

Companion Application Note, ICAN-5641 "Application of RCA CA3033 and CA3033A High Performance Integrated-Circuit Operational Amplifiers."

The resistance values included on the schematic diagram have been supplied as a convenience to assist Equipment Manufacturers in optimizing the selection of "outboard" components of equipment designs. The values shown may vary as much as ±30%.

RCA reserves the right to make any changes in the Resistance Values provided such changes do not adversely affect the published performance characteristics of the device.

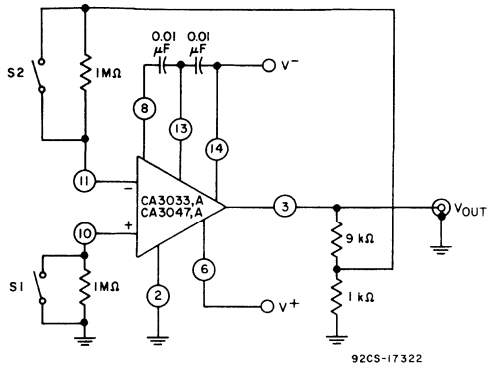

Fig. 3a - Input offset current and input bias current test circuit.

PROCEDURES:

A. Inverting Input Current

Set switch, S_1 in closed position and set switch, S_2 in open position.

Measure output voltage and convert this reading to inverting input current using the following relation:

$$I_I \text{ inverting (in } \mu A) = \frac{V_{OUT} \text{ (in volts)}}{10}$$

B. Non-inverting Input Current

Set switch, S_1 in open position and set switch, S_2 in closed position.

Measure output voltage and convert this reading to non-inverting input current using the following relation:

$$I_I \text{ non-inverting (in } \mu A) = \frac{-V_{OUT} \text{ (in volts)}}{10}$$

C. Input Offset Current

Set switches, S_1 and S_2 in open positions.

Measure output voltage and convert this reading to input offset current using the following relation:

$$I_{IO} \text{ (in } \mu A) = \frac{V_{OUT} \text{ (in volts)}}{10}$$

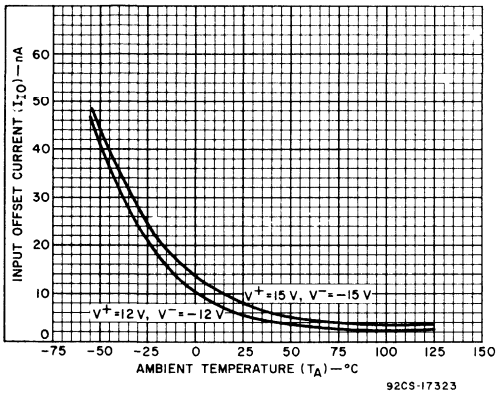

Fig. 3b - Typical input offset current vs. ambient temperature.

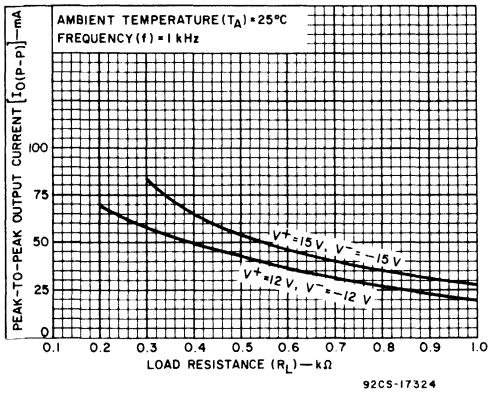

Fig. 6 - Typical peak-to-peak output current vs. load resistance.

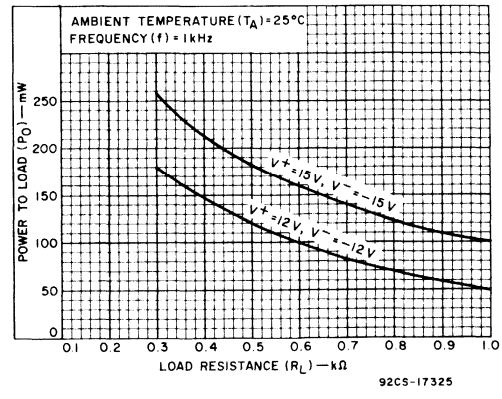

Fig. 7 - Typical power output vs. load resistance.

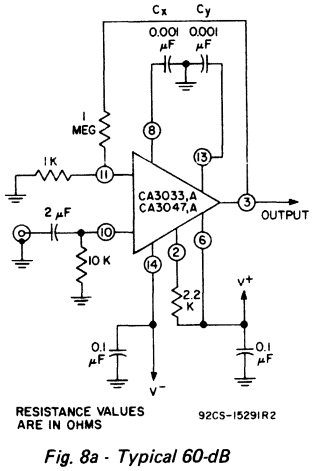

Fig. 8a - Typical 60-dB amplifier.

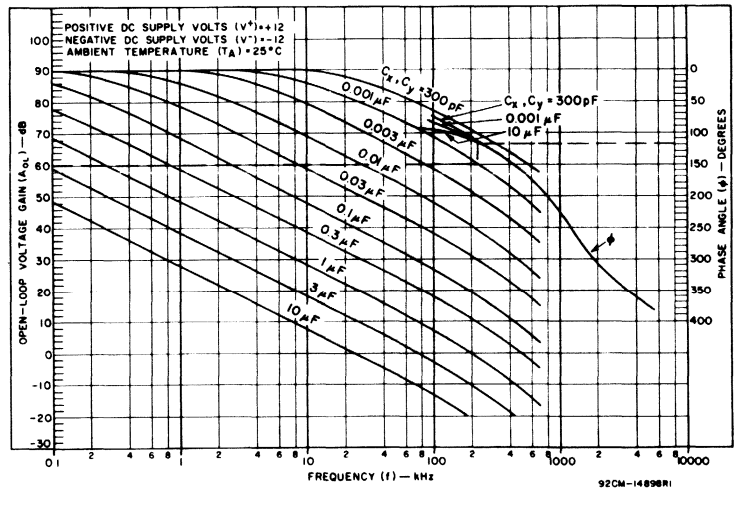

Fig. 8b - Typical phase compensation characteristics for CA3033, CA3047 (V^+ = +12 V, V^- = −12 V)

For any desired closed loop gain (in decibels), read horizontally along the gain line to the attenuation curve which provides the desired closed loop bandwidth. The required values for the compensation capacitors is shown on the curve. Move vertically from the intersection of the gain and attenuation lines until the phase angle curve (ϕ) is reached and read the phase angle between the input and output on the right-hand scale. The difference between the indicated phase angle and 180° is the typical phase margin. (A minimum phase margin of 45° is recommended to allow for component variations and differences among amplifiers.) If the phase margin is smaller than required, the desired bandwidth can be stably achieved through the use of a more complex feedback network. As the closed loop gain approaches unity, the compensating capacitors required (0.3 μF to 1.0 μF) are bulky and costly. A capacitor one-half the value shown on the chart, connected between terminals 8 and 13, and a 0.001 μF capacitor from either terminals 8 or 13 to ground or V^- is an acceptable alternative method. This arrangement provides the same gain-phase roll-off shown on the curves and permits the use of more readily available, lower-voltage disc capacitors which are smaller and cost less. For linear operation, the maximum expected difference voltage between the two collectors is less than 1 volt.

Figure 8a shows the phase compensating capacitors (C_X, C_Y) returned to ground. In some systems with large parasitic impedances in the power supply system, returning these capacitors to the negative (V^-) supply may result in more stable operation.

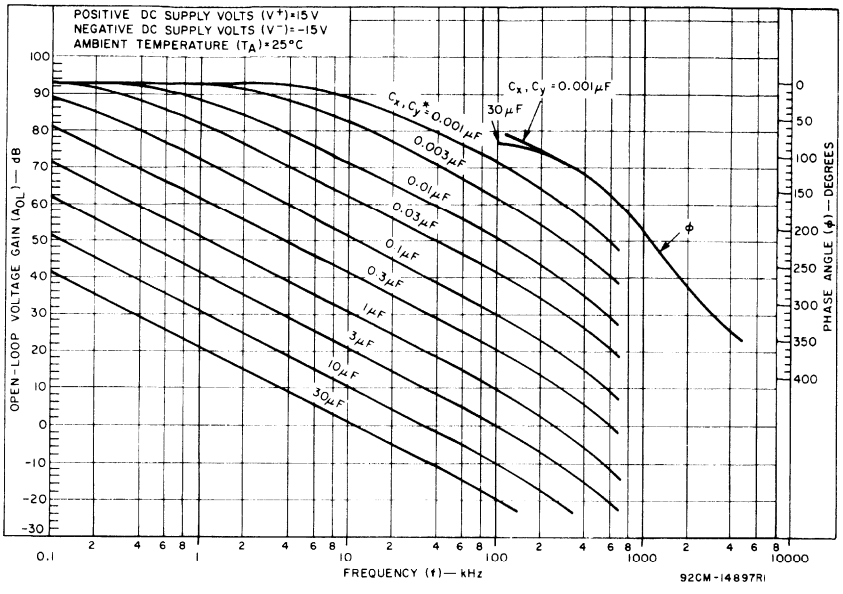

Fig. 8c - Typical phase compensation characteristics for CA3033A, CA3047A (V^+ = 15 V, V^- = −15 V).

Fig. 9 - Amplifier with single voltage supply and associated pulse response waveforms and distortion curves.

OPERATING CONSIDERATIONS

The CA3033, CA3033A, CA3047, and CA3047A operational amplifiers have very high peak-pulse current capability. The open-loop output impedance is typically less than 30 ohms at 10 kHz and the peak short circuit output current may exceed 100 milliamperes. To prevent possible damage to the chip because of excessive dissipation it is important that the output stage is not subjected to sustained high peak currents. To minimize the possibility of damage from accidental shorts, it is recommended that a 51-ohm resistor be placed in series with the output circuit.

When high peak output currents are required of the amplifier, it is desirable to provide a current-limiting resistor of about 2200 ohms in series with the collector of transistor Q_{14}. This resistor may be returned to ground, or, if its value is increased to 4700 ohms; it may be returned to the V^+ terminal.

INPUT OFFSET VOLTAGE AND CURRENT

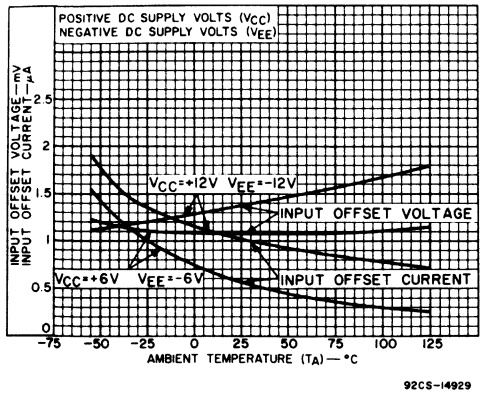

Fig.2

INPUT BIAS CURRENT

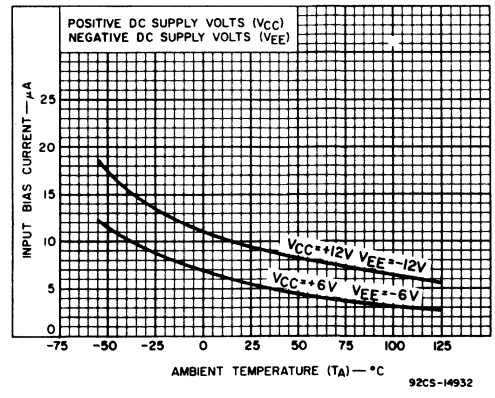

Fig.3

INPUT OFFSET VOLTAGE, INPUT OFFSET VOLTAGE SENSITIVITY, AND DEVICE DISSIPATION TEST CIRCUIT

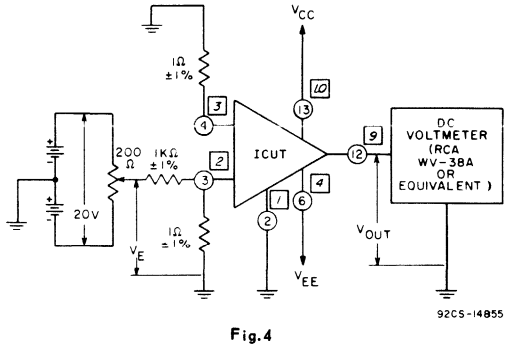

Fig.4

INPUT OFFSET CURRENT AND INPUT BIAS CURRENT TEST CIRCUIT

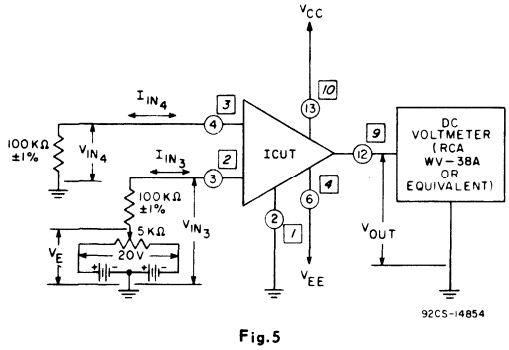

Fig.5

Procedure:

Input Offset Voltage

1. Adjust V_E for a DC Output Voltage (V_{OUT}) of 0 ± 0.1 volts.
2. Measure V_E and record Input Offset Voltage in millivolts as $V_E/1000$.

Input Offset Voltage Sensitivity

1. Adjust V_E for a DC Output Voltage (V_{OUT}) of 0 ± 0.1 volts.
2. Increase $|V_{CC}|$ by 1 volt and record output voltage (V_{OUT}).
3. Decrease $|V_{CC}|$ by 1 volt and record output voltage (V_{OUT}).
4. Divide the diference between V_{OUT} measured in steps 2 and 3 by the change in V_{CC} in steps 2 and 3.

$$\frac{V_{OUT}}{V_{CC}} = \frac{V_{OUT}\ (\text{Step 2}) - V_{OUT}\ (\text{Step 3})}{2\ \text{volts}}$$

5. Refer the reading to the input by dividing by Open Loop Voltage Gain (A_{OL}).

$$V_{IO}/V_{CC} = \frac{V_{OUT}/V_{CC}}{A_{OL}}$$

6. Repeat procedures 1 through 5 for the Negative Supply (V_{EE}).
7. Device Dissipation

$P_T = V_{CC}I_C + V_{EE}I_E$

I_C = Direct Current into Terminal (13) or *10*

I_E = Direct Current out of Terminal (6) or *4*

Procedure:

Input Bias Current and Input Offset Current

1. Adjust V_E for $|V_{OUT}| < 0.1$ V DC.
2. Measure and record V_E and V_{IN_4}.
3. Calculate the Input Bias Current using the following equation:

$$I_{I4} = \frac{V_{IN_4}}{100\ k\Omega}$$

4. Calculate the Input Offset Current using the following equation:

$$I_{IO} = V_E/100\ k\Omega$$

OPEN-LOOP VOLTAGE GAIN vs. FREQUENCY FOR CA3029 AND CA3030

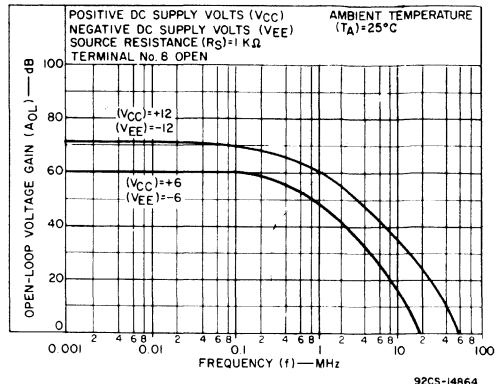

Fig.7

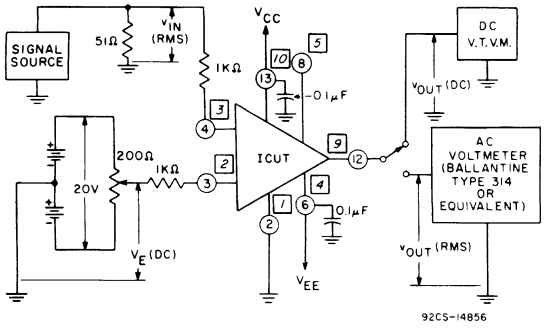
OPEN-LOOP DIFFERENTIAL VOLTAGE GAIN, MAXIMUM PEAK-TO-PEAK OUTPUT VOLTAGE, AND OPEN-LOOP BANDWIDTH AT -3 dB POINT TEST CIRCUIT



Procedure:

1. Adjust V_E for V_{OUT} = ±0.1 V DC.
2. Measure Open-Loop Differential Voltage Gain (A_{OL}) at f = 1 kHz.

$$A_{OL} = 20 \log_{10} \frac{V_{OUT}}{V_{IN}}$$

3. Measure Maximum Peak-to-Peak Output Voltage at f = 1 kHz.
4. Measure Open-Loop Bandwidth at -3 dB Point.
   Reference Level = A_{OL} at 1 kHz.

MAXIMUM PEAK-TO-PEAK OUTPUT VOLTAGE vs. LOAD RESISTANCE FOR CA3029 AND CA3030

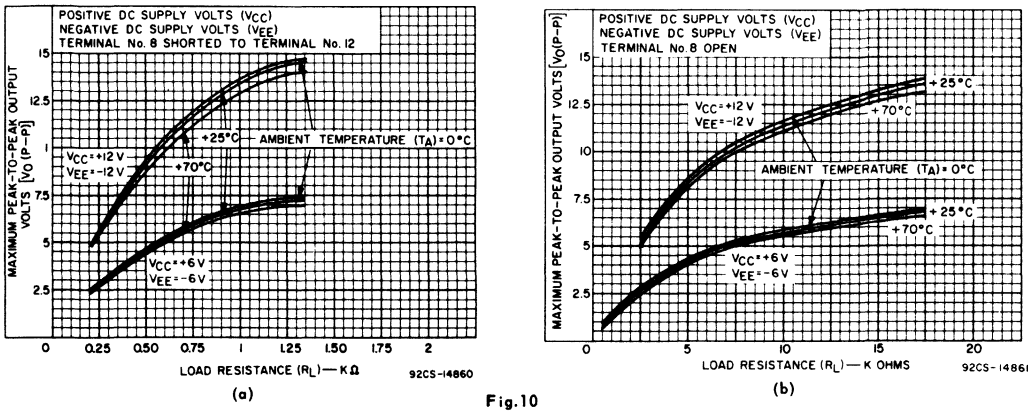

Fig.10

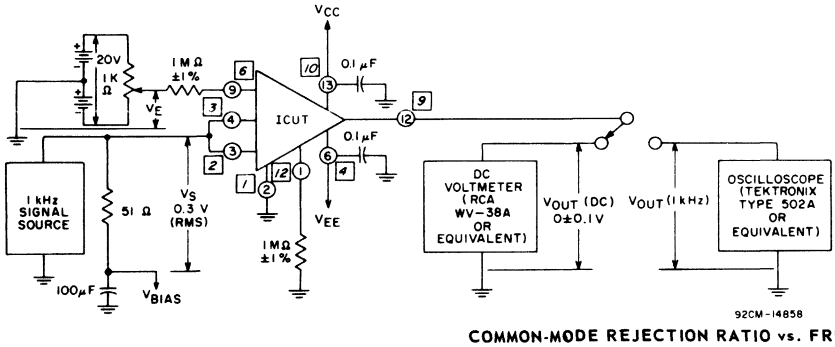
COMMON-MODE REJECTION RATIO AND COMMON-MODE INPUT-VOLTAGE-RANGE TEST CIRCUIT



Procedures:

Common-Mode Rejection Ratio:

1. Set V_{BIAS} = 0. Adjust V_E for V_{OUT}(DC) = 0 ± 0.1 V.
2. Apply 1-kHz sinusodial input signal and adjust for V_S = 0.3 V (RMS).
3. Measure and record the RMS value of V_{OUT}. An oscilloscope is used for this measurement so that the output signal may be visually separated.from noise output.
4. Calculate Common-Mode Voltage Gain:

$$A_{CM} = V_{OUT}/V_S$$

$$A_{CM} \text{ in dB} = -20 \log_{10} V_S/V_{OUT}$$

5. Calculate Common-Mode Rejection Ratio:

$$CMR \text{ in dB} = A_{DIFF} \text{ in dB} - A_{CM} \text{ in dB}.$$

Common-Mode Input-Voltage Range:

1. Calculate and record CMR for various positive and negative values of V_{BIAS} within the maximum limits shown on Page 2. The Common-Mode Input-Voltage Range limits are those values of V_{BIAS} at which CMR is 6 dB less than that calculated in Step 5 of the procedure given above.

CA3037A	CA3038A	14-Lead Ceramic Dual In-Line (TO-116)

- These new types have all the desirable features and characteristics of their prototypes plus lower noise figures and improved input characteristics for offset voltage, offset current, bias current, and impedance.
- All types are electrically identical within their voltage groups
- Designed for use in Telemetry, Data-Processing, Instrumentation, and Communication Equipment
- Built-in temperature stability from -55°C to +125°C for Flatpack, TO-5 style, and ceramic dual in-line packages; 0°C to +70°C for plastic dual in-line package
- Companion Application Notes ICAN-5290, "Integrated Circuit Operational Amplifiers"; ICAN-5213, "Application of the RCA-CA3015, CA3016 Integrated Circuit Operational Amplifiers"; and ICAN-5015, "Application of the RCA-CA3008, CA3010 Integrated Circuit Operational Amplifiers" cover Bode characteristics, phase compensation, frequency shaping, and amplifier design.

TYPICAL STATIC CHARACTERISTICS AND TEST CIRCUITS

Terminal Numbers in Circles are for CA3008A, CA3016A, CA3029A, CA3030A, CA3037A, CA3038A; Italic Numbers in Square Boxes are for CA3010A, CA3015A

INPUT OFFSET VOLTAGE AND CURRENT

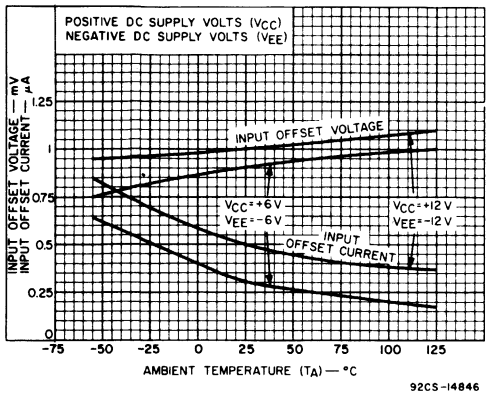

Fig.2

INPUT BIAS CURRENT

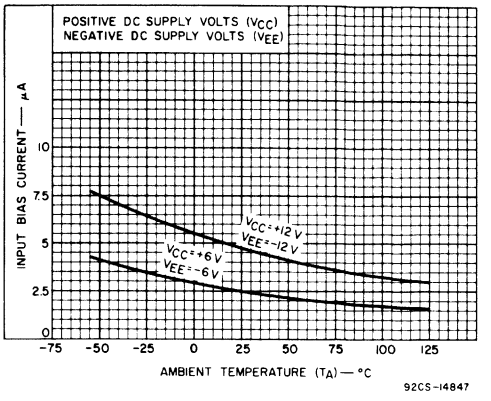

Fig.3

INPUT OFFSET VOLTAGE, INPUT OFFSET VOLTAGE SENSITIVITY, AND DEVICE DISSIPATION TEST CIRCUIT

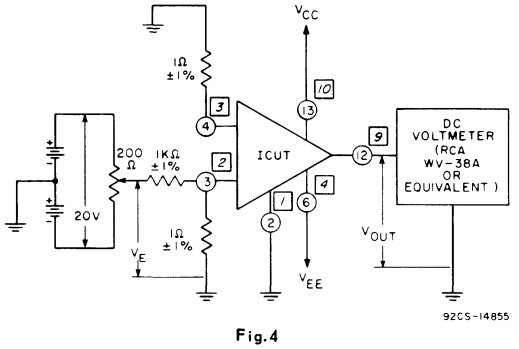

Fig.4

INPUT OFFSET CURRENT AND INPUT BIAS CURRENT TEST CIRCUIT

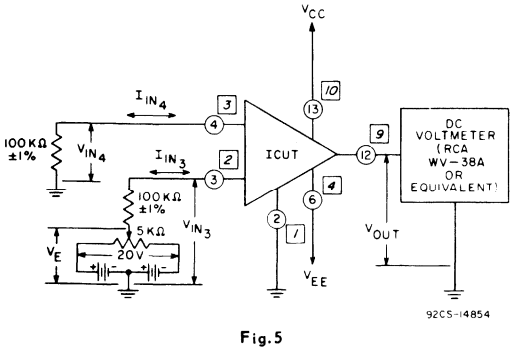

Fig.5

Procedure:

Input Offset Voltage

1. Adjust V_E for a DC Output Voltage (V_{OUT}) of 0 ± 0.1 volts.
2. Measure V_E and record Input Offset Voltage in millivolts as $V_E/1000$.

Input Offset Voltage Sensitivity

1. Adjust V_E for a DC Output Voltage (V_{OUT}) of 0 ± 0.1 volts.
2. Increase $|V_{CC}|$ by 1 volt and record output voltage (V_{OUT}).
3. Decrease $|V_{CC}|$ by 1 volt and record output voltage (V_{OUT}).
4. Divide the diference between V_{OUT} measured in steps 2 and 3 by the change in V_{CC} in steps 2 and 3.

$$\frac{V_{OUT}}{V_{CC}} = \frac{V_{OUT}\ (\text{Step 2}) - V_{OUT}\ (\text{Step 3})}{2\ \text{volts}}$$

5. Refer the reading to the input by dividing by Open Loop Voltage Gain (A_{OL}).

$$V_{IO}/V_{CC} = \frac{V_{OUT}/V_{CC}}{A_{OL}}$$

6. Repeat procedures 1 through 5 for the Negative Supply (V_{EE}).
7. Device Dissipation

$P_T = V_{CC}I_C + V_{EE}I_E$

I_C = Direct Current into Terminal 13 or *10*

I_E = Direct Current out of Terminal 6 or *4*

Procedure:

Input Bias Current and Input Offset Current

1. Adjust V_E for $|V_{OUT}| < 0.1$ V DC.
2. Measure and record V_E and V_{IN4}
3. Calculate the Input Bias Current using the following equation:

$$I_{I4} = \frac{V_{IN4}}{100\ k\Omega}$$

4. Calculate the Input Offset Current using the following equation:

$$I_{IO} = V_E/100\ k\Omega$$

TYPICAL DYNAMIC CHARACTERISTICS AND TEST CIRCUITS

OPEN LOOP VOLTAGE GAIN vs. FREQUENCY FOR CA3029A AND CA3030A.

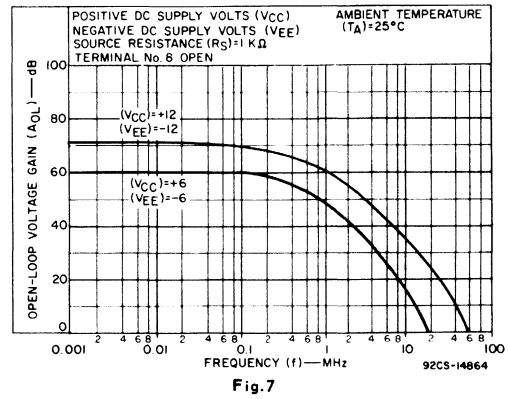

Fig.7

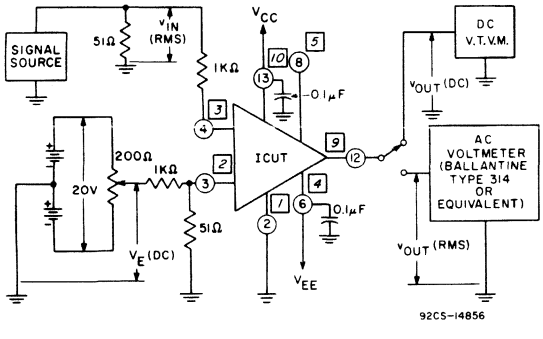
OPEN-LOOP DIFFERENTIAL VOLTAGE GAIN, MAXIMUM PEAK-TO-PEAK OUTPUT VOLTAGE, AND OPEN-LOOP BANDWIDTH AT -3 POINT TEST CIRCUIT



Procedure:

1. Adjust V_E for V_{OUT} = ±0.1 V DC.
2. Measure Open-Loop Differential Voltage Gain (A_{OL}) at f = 1 kHz

$$A_{OL} = 20 \log_{10} \frac{V_{OUT}}{V_{IN}}$$

3. Measure Maximum Peak-to-Peak Output Voltage at f = 1 kHz
4. Measure Open-Loop Bandwidth at -3 dB Point

Reference Level = A_{OL} at 1 kHz

Fig.8

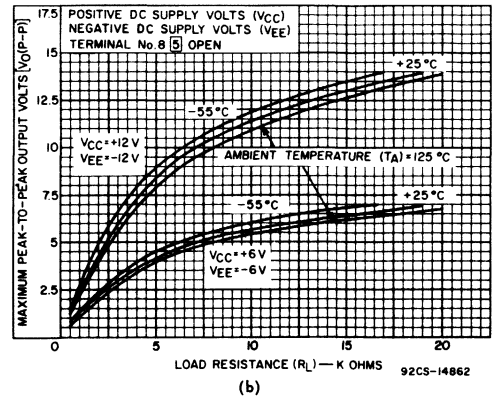
(a)



(b)

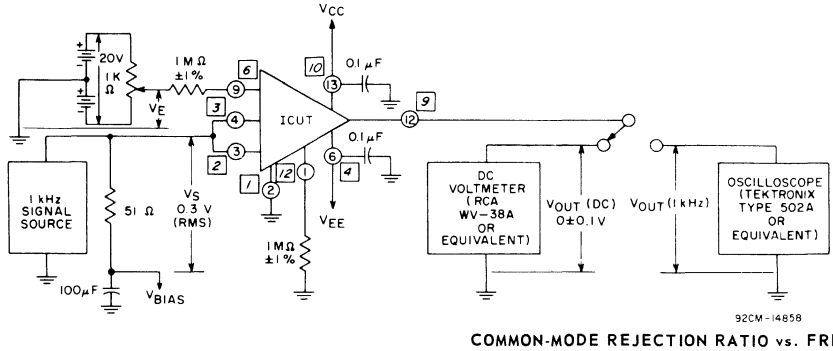
Fig.10

COMMON-MODE REJECTION RATIO AND COMMON-MODE INPUT-VOLTAGE-RANGE TEST CIRCUIT



Procedures:

Common-Mode Rejection Ratio:

1. Set V_{BIAS} = 0. Adjust V_E for V_{OUT}(DC) = 0 ± 0.1 V.
2. Apply 1-kHz sinusodial input signal and adjust for V_S = 0.3 V (RMS).
3. Measure and record the RMS value of V_{OUT}. An oscilloscope is used for this measurement so that the output signal may be visually separated from noise output.
4. Calculate Common-Mode Voltage Gain:

$$A_{CM} = V_{OUT}/V_S$$

$$A_{CM} \text{ in dB} = -20 \log_{10} V_S/V_{OUT}$$

5. Calculate Common-Mode Rejection Ratio:

$$CMR \text{ in dB} = A_{DIFF} \text{ in dB} - A_{CM} \text{ in dB}.$$

Common-Mode Input-Voltage Range:

1. Calculate and record CMR for various positive and negative values of V_{BIAS} within the maximum limits shown on Page 2. The Common-Mode Input-Voltage Range limits are those values of V_{BIAS} at which CMR is 6 dB less than that calculated in Step 5 of the procedure given above.

NOTES

1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads within 0.005" (0.12 mm) radius of True Position (TP) at gauge plane with maximum material condition and unit installed.
3. e_A applies in zone L_2 when unit installed.
4. α applies to spread leads prior to installation.
5. N is the maximum quantity of lead positions.
6. N_1 is the quantity of allowable missing leads.

RCA Solid State Division

Linear Integrated Circuits

CA3015A/1 CA3015A/3
CA3015A/2 CA3015A/4

High Reliability Types
for Aerospace, Military and other Critical Applications

RCA-CA3015A/1, CA3015A/2, CA3015A/3, CA3015A/4 are high-reliability integrated circuits especially designed for critical applications in aerospace, military and industrial equipment.

These types are electrically and mechanically interchangeable with the RCA-CA3015A but are specially processed and tested to meet the Aerospace and Military electrical, environmental, and physical test methods and procedures established for microelectronis devices in MIL-STD-883.

The curves of Typical Static and Dynamic Characteristics shown in the technical data bulletin(File No.310) for the CA3015A also apply for these high reliability versions.

The number following the slash (/) mark in each type designation, e.g., CA3015A/1 indicates the Screening levels employed by RCA to achieve the quality and reliability commensurate with the intended application. A description of these levels (1, 2, 3, and 4) is given on page 3.

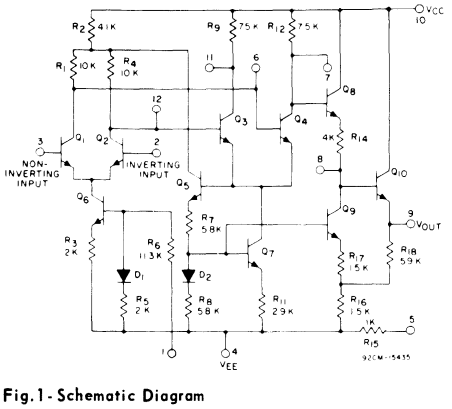

Fig.1- Schematic Diagram

The resistance values included on the schematic diagram have been supplied as a convenience to assist Equipment Manufacturers in optimizing the selection of "outboard" components of equipment designs. The values shown may vary as much as ±30%.

RCA reserves the right to make any changes in the Resistance Values provided such changes do not adversely affect the published performance characteristics of the device.

High Reliability

Operational Amplifiers

12-Lead TO-5

- Examinations and tests performed in accordance with MIL-STD-883, "Test Methods & Procedures for Microelectronics."
- Total Lot Screening (100% testing) "Group A" (electrical) and "Group B" (environmental) sampling test program.
- Internal visual (Precap) inspection performed on all 4 screening levels in accordance with Condition "A", Method 2010 of MIL-STD-883.
- Choice of 4 distinct screening levels.

ELECTRICAL FEATURES

- Open-Loop Voltage Gain . . . . . 70 dB typ.
- Common-Mode Rejection Ratio . . . . . 103 dB typ.
- Input Impedance . . . . . 10 kΩ typ.
- Input Offset Voltage . . . . . 1 mV typ.
- Input Offset Current . . . . . 0.5 μA typ.
- Input Bias Current . . . . . 4.7 μA typ.
- Static Power Drain at ± 12V . . . . . 175 mW typ.

Maximum Ratings, Absolute-Maximum Values:

Operating-Temperature Range . . . . . -55°C to +125°C
Storage-Temperature Range. . . . . -65°C to +150°C
Maximum Input-Signal Voltage . . . . . -8 V, +1 V
Maximum Device Dissipation:*
At Ambient Temperatures { Up to 70°C . . . . . 700 mW; Above 70°C . . . . . Derate at 6.7 mW/°C
At Case Temperatures { Up to 125°C . . . . . 830 mW

* Based on package capabilities.

Maximum Voltage Ratings at T_A = 25°C

The following chart gives the range of voltages wnich can be applied to the terminals listed vertically with respect to the terminals listed horizontally. For example, the voltage range of the vertical terminal 12 with respect to terminal 10 is 0 to -15 volts.

TERMINAL No.	12	1	2	3	4▲	5	6	7	8	9	10	11

▲ CA3015A Case is internally connected to the substrate (Terminal Lead #4), DO NOT GROUND.

Note 1: For normal circuit operation, external voltages should **not** be applied to terminals 5,6,8, and 12.

Note 2: This rating applies **only** to the more positive terminal of terminals 2 or 3.

Note 3: Carefully observe maximum dissipation ratings.

* Voltages are not normally applied between these terminals. Voltages appearing between these terminals will be safe if the specified limits between all other terminals are not exceeded.

RCA Integrated Circuit Screening Levels

RCA Level	MIL-STD-883 Equivalent	Application	Description
1, 2	Class A	Aerospace & Missiles	For devices intended for use where maintenance and replacement are extremely difficult or impossible and Reliability is Imperative
3	Class B	Military & Industrial For example, in Airborne Electronics	For devices intended for use where maintenance and replacement can be performed but are difficult and expensive
4	Class C (Class B without Burn-In)	Military & Industrial For example, on Ground Based Electronics	For devices intended for use where replacement can readily be accomplished

RCA Screening Level 1 is equivalent to MIL-STD-883 Class A except that Reverse Bias Burn-In is performed only in Group B.
RCA Screening Level 2 is the same as Level 1 but Radiographic Inspection is not required.

Total Lot Screening Flow Chart

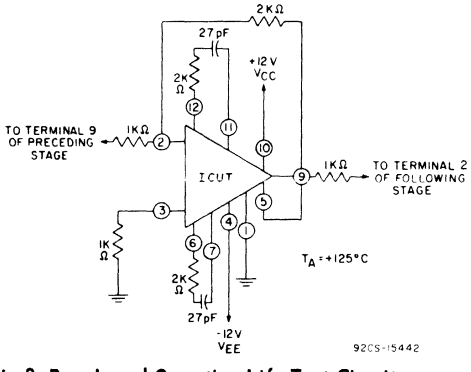

Fig.2- Burn-In and Operating Life Test Circuit (One Stage of Ring Oscillator)

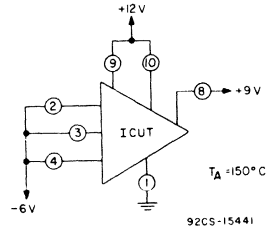

Fig.3- Steady State Reverse Bias Life Test Circuit

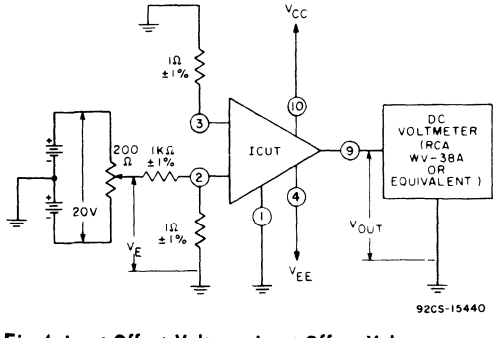

Fig.4- Input Offset Voltage, Input Offset Voltage Sensitivity, and Device Dissipation Test Circuit

Procedure:

Input Offset Voltage:

1. Adjust V_E for a DC Output Voltage (V_{OUT}) of 0 ± 0.1 volts.
2. Measure V_E and record Input Offset Voltage in millivolts as $V_E/1000$.

Input Offset Voltage Sensitivity:

1. Adjust V_E for a DC Output Voltage (V_{OUT}) of 0 ± 0.1 volts.
2. Increase $|V_{CC}|$ by 1 volt and record output voltage (V_{OUT}).
3. Decrease $|V_{CC}|$ by 1 volt and record output voltage (V_{OUT}).
4. Divide the diference between V_{OUT} measured in steps 2 and 3 by the change in V_{CC} in steps 2 and 3.

$$\frac{V_{OUT}}{V_{CC}} = \frac{V_{OUT}\text{ (Step 2)} - V_{OUT}\text{ (Step 3)}}{2\text{ volts}}$$

5. Refer the reading to the input by dividing by Open Loop Voltage Gain (A_{OL}).

$$V_{IO}/V_{CC} = \frac{V_{OUT}/V_{CC}}{A_{OL}}$$

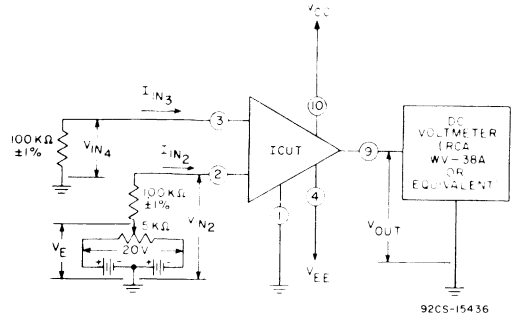
6. Repeat procedures 1 through 5 for the Negative Supply (V_{EE}).

Device Dissipation:

$P_T = V_{CC}I_C + V_{EE}I_E$

I_C = Direct Current into Terminal 10

I_E = Direct Current out of Terminal 4



Procedure:

Input Bias Current and Input Offset Current

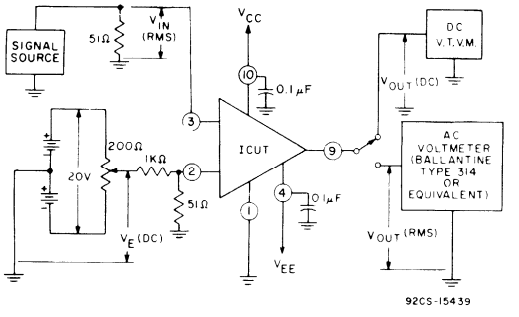
1. Adjust V_E for $|V_{OUT}| < 0.1$ V DC.
2. Measure and record V_E and V_{IN_3}
3. Calculate the Input Bias Current using the following equation:

$$I_{IN3} = \frac{V_{IN_3}}{100\ k\Omega}$$

4. Calculate the Input Offset Current using the following equation:

$$I_{IO} = V_E/100\ k\Omega$$

Fig.5- Input Offset Current and Input Bias Current Test Circuit



Procedure:

1. Adjust V_E for $V_{OUT} = \pm 0.1$ V DC.
2. Measure Open-Loop Differential Voltage Gain (A_{OL}) at f = 1 kHz

$$A_{OL} = 20\ Log_{10} \frac{V_{OUT}}{V_{IN}}$$

3. Measure Maximum Peak-to-Peak Output Voltage at f = 1 kHz
4. Measure Open-Loop Bandwidth at -3 dB Point

Reference Level = A_{OL} at 1 kHz

Fig.6- Open-Loop Differential Voltage Gain, Maximum Peak-to-Peak Output Voltage, and Open-Loop Bandwidth at-3 Point Test Circuit

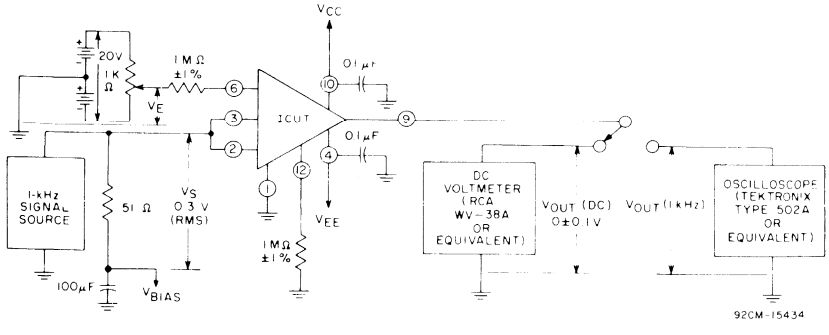


Fig.7 - Common-Mode Rejection Ratio and Common-Mode Input-Voltage-Range Test Circuit

Procedures:

Common-Mode Rejection Ratio:

1. Set $V_{BIAS} = 0$. Adjust V_E for V_{OUT}(DC) = 0 ± 0.1 V.
2. Apply 1-kHz sinusodial input signal and adjust for V_S = 0.3 V (RMS).
3. Measure and record the RMS value of V_{OUT}. An oscilloscope is used for this measurement so that the output signal may be visually separated from noise output.
4. Calculate Common-Mode Voltage Gain:

$$A_{CM} = V_{OUT}\ V_S$$

$$A_{CM} \text{ in dB} = -20\ LOG_{10}\ V_S\ V_{OUT}$$

5. Calculate Common-Mode Rejection Ratio:

$$CMR \text{ in dB} = A_{DIFF} \text{ in dB} - A_{CM} \text{ in dB}.$$

Common-Mode Input-Voltage Range:

1. Calculate and record CMR for various positive and negative values of V_{BIAS} within the maximum limits shown on Page 2.* The Common-Mode Input-Voltage Range limits are those values of V_{BIAS} at which CMR is 6 dB less than that calculated in Step 5 of the procedure given above.

* +18V to -5V

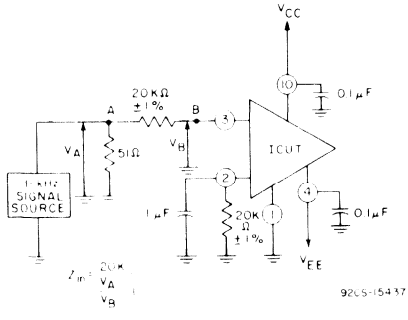

Fig.8 - Single-Ended Input Impedance Test Circuit

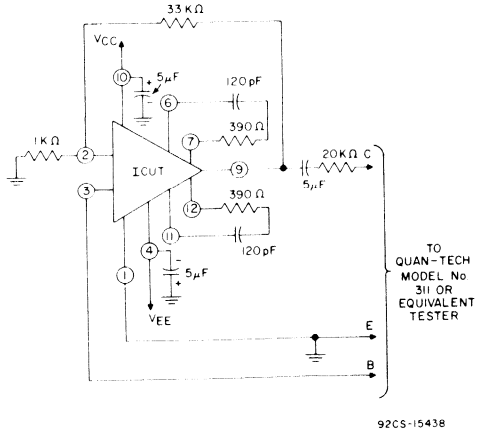

Fig.9 - Noise Figure Test Circuit

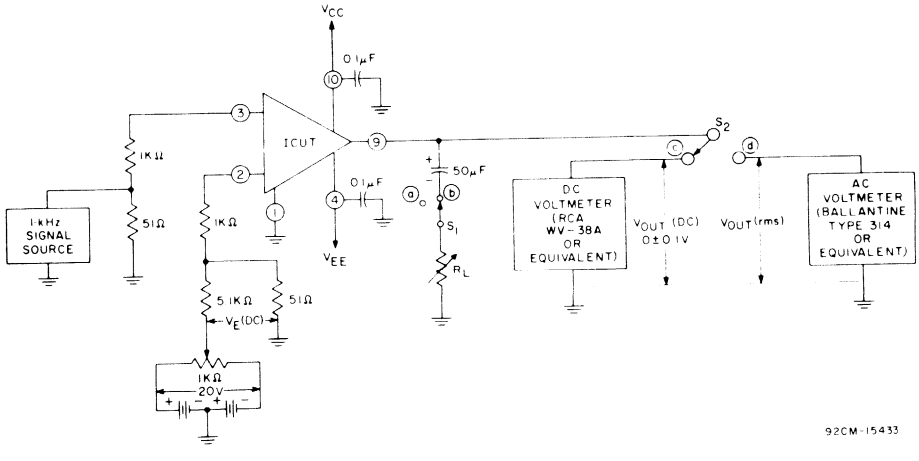

Fig. 10 - Output Impedance Test Circuit

Procedure:

1. With S_2 in position (c), adjust V_E for $V_{OUT}(DC) = 0 \pm 0.1$ volt.
2. With S_1 in position (a), and S_2 in position (d), record $V_{OUT_1}(rms)$.
3. With Switch S_1 in position (b) and S_2 in position (d) adjust R_L until $V_{OUT_2}(rms) = \frac{V_{OUT_1}(rms)}{2}$. Record value of R_L as Z_{OUT}.

DEFINITIONS OF TERMS

Open-Loop Differential Voltage Gain

The ratio of the change in output voltage ($\triangle V_{OUT}$) produced by a change in input voltage ($\triangle V_{IN}$) to the change in input voltage, both voltages expressed with respect to ground.

Open-Loop Bandwidth at -3-dB Point

The frequency at which the voltage gain of the device is 3 dB below the voltage gain at a specified lower frequency.

Maximum Output Voltage Swing

The maximum peak-to-peak output-voltage swing, measured with respect to ground, which can be achieved without clipping of the signal waveform.

Input Impedance

The ratio of the change in input voltage to the change in input current measured at either input terminal with respect to ground, with the other input terminal at ground potential for ac.

Output Impedance

The ratio of the change in output voltage to the change in output current measured at the output terminal with respect to ground.

Common-Mode Input-Voltage Range

The range of voltage which may be applied to the input terminals of the device without decreasing the Common-Mode Rejection Ratio (CMR) by more than 6 dB.

Input Offset Voltage

The difference in the dc voltages which must be applied to the input terminals to obtain a quiescent operating voltage equal to zero at the output terminal.

Input Offset Current

The difference in the currents at the two input terminals when the quiescent operating voltage at the output terminal is zero.

Input Bias Current

The average value (one-half the sum) of the currents at the two input terminals when the quiescent operating voltage at the output terminal is zero.

Input-Offset-Voltage Sensitivity ($\triangle V_{IO}/\triangle V_{CC}$ or $\triangle V_{IO}/\triangle V_{EE}$)

The change in Input Offset Voltage produced by a change in a dc supply voltage (V_{CC} or V_{EE}) expressed in mV/V.

Device Dissipation

The total power drain of the device with no signal applied and no external load current.

Common-Mode Rejection Ratio

The ratio of the full differential voltage gain to the common-mode voltage gain.

Operational Amplifier

General-Purpose High-Gain Type Intended for Applications where Low Noise (Burst +1/f) is a Prime Requirement

Applications:

- **Comparator**
- **Integrator or differentiator**
- **Summing amplifier**
- **DC amplifier**
- **Multivibrator**
- **Narrow-band or band-pass filter**

Features:

- **Virtually free from "popcorn" (burst) noise: device rejected if any noise burst exceeds 20 μV (peak), referred to input over a 30-second time period**
- **Internal phase compensation**
- **Open-loop voltage gain: 50,000 (94 dB) min.**
- **Input bias current: 500 nA max.**
- **Input offset voltage: 5 mV max.**
- **Input offset current: 200 nA max.**

RCA-CA6741T* is the first of a new line of low-noise linear IC operational amplifiers that is virtually free of "popcorn" (burst) noise.

This low-noise version of the CA3741T is a result of improved processing developments and rigid burst-noise inspection criteria. A highly selective test circuit (See Fig. 2) assures that each CA6741T meets the rigid low-noise standards shown in the data section. This low-burst-noise property also assures excellent performance throughout the 1/f noise spectrum.

In addition the CA6741T offers the same features incorporated in the CA3741T, including: internal phase compensation, output short-circuit protection, latch-free operation, wide common-mode and differential-mode signal ranges, and low-offset nulling capability.

For detailed data, characteristics curves, schematic diagram, dimensional outline, and test circuits, refer to the Operational Amplifier Data Bulletin, File No. 531. In addition, for details of considerations in burst-noise measurements, refer to Application Note, ICAN-6732, "Measurement of Burst ("Popcorn") Noise in Linear IC's".

The CA6741T utilizes the hermetically sealed 8-lead TO-5 type package and operates over the full military temperature range of −55°C to +125°C.

* Formerly Developmental Type TA5979.

MAXIMUM RATINGS, *Absolute-Maximum Values at* $T_A = 25^oC$

DC Supply Voltage (between V^+ and V^- terminals)	44	V
Differential-Mode Input Voltage	±30	V
Common-Mode DC Input Voltage▲	±15	V
Device Dissipation:		
Up to 75°C	500	mW
Above 75°C	Derate linearly 5 mW/°C	
Temperature Range:		
Operating	−55 to +125	°C
Storage	−65 to +150	°C
Output Short-Circuit Duration●	No limitation	
Lead Temperature (During soldering):		
At distance 1/16 ±1/32 inch (1.59 ±0.79 mm) from case for 10 seconds max.	300	°C

▲ If Supply Voltage is less than ±15 volts, the Absolute Maximum Input Voltage is equal to the Supply Voltage

● Short circuit may be applied to ground or to either supply.

ELECTRICAL CHARACTERISTICS

Photo Detector and Power Amplifier

For Photoelectric Control Applications

Features

- 100 mA output-current capability – can drive a relay or thyristor directly
- 5 to 15 volt dc supply voltage
- Compact – complete system in a TO-5 style package
- Compatible with RCA-40736R Infrared Emitter

The CA3062* is an integrated circuit consisting of a photosensitive section, an amplifier, and a pair of high-current output transistors on a single monolithic chip.

The photosensitive section consists of Darlington pairs and affords high sensitivity. The power amplifier has a differential configuration which provides complementing outputs in response to a light input – normally "ON" and normally "OFF". The separate photodetector, amplifier, and high-current switch provide flexibility of circuit arrangement. This feature plus the high current capability of the output section, can now provide the user with a complete system particularly useful in photoelectric control applications utilizing IR emitters and visible-light sources.

*Formerly developmental type TA5371B.

Applications

- Counters
- Sorting
- Level controls
- Inspection
- Intrusion alarms
- Position sensor
- Edge monitoring
- Isolators

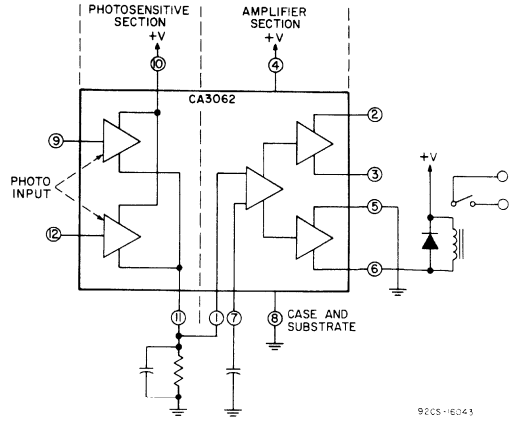

Fig. 1 - Light operated relay using CA3062.

ABSOLUTE-MAXIMUM RATINGS

DISSIPATION:
- Up to T_A = 55°C . . . . . 700 mW
- Above T_A = 55°C . . . . . Derate linearly 5.6 mW/°C
- At Case Temperature (T_C) ≤ 55°C . . . . . 1.5 W
- Above T_C = 55°C . . . . . Derate linearly 16 mW/°C

TEMPERATURE RANGE:
- Operating . . . . . -55°C to +125°C
- Storage . . . . . -65°C to +150°C

LEAD TEMPERATURE (During soldering):
- At distance ≥ 1/32 in (3.17 mm) from seating plane for 10 s max . . . . . +300°C

Maximum Voltage Ratings

The following chart gives the range of voltages which can be applied to the terminals listed vertically with respect to the terminals listed horizontally. For example, the voltage range between vertical terminal 2 and horizontal terminal 3 is +15 to 0 volts.

OPERATING CONSIDERATIONS

Switching Service

The CA3062 is primarily intended to provide "ON-OFF" output in response to a light signal. Optimum performance of this device is achieved when the output transistors are operated at values of load current sufficient to saturate the device in the "ON" state. Operation of the CA3062 at values of load current between the condition of no load current and saturation will cause substantial power to be dissipated in the silicon chip. This condition of operation is therefore not recommended because the heat rise in the silicon chip induced by the increased power dissipation causes the load current to shift in the same direction as though additional illumination were applied to the CA3062, a condition which will substantially alter the switching characteristics of the device.

The signal voltages at the input terminals (terminal No. 1 and No. 7) must not exceed 3 volts, because any increase in the signal voltage beyond the value specified will cause both output transistors to be turned "ON". In the circuit shown in Fig. 7, this condition will occur for values of illumination greater than 60 lumens/ft ^{2}. This adverse operating condition can be avoided by either limiting the maximum illumination or by clamping the input so that the voltage does not exceed 3 volts.

Linear Service

The CA3062 can be connected as shown in Fig. 16 to give a linear output. The value of the load resistor should be greater than 1000 ohms in order to limit the power dissipation and thus minimize the heating effects. Because of the many possible variations in circuit configurations, the CA3062 has not been characterized for linear service applications. A guide-line circuit for this class of service is shown in Fig. 16.

Specific inquiries for use of the CA3062 in this type of service should be addressed to your local RCA Field Technical Representative.

Precautions

Because of the high amplification of the CA3062, care should be taken, when wiring, to keep all lead lengths as short as possible. A recommended breadboard layout is shown in Fig. 17.

If the CA3062 is operated with an inductive load impedance, such as a relay, it is recommended that a diode be connected across the load to absorb the energy of the pulse voltages generated during switching.

Many of the graphs are shown with two sets of abscissa values for light energy input, one expressed in illumination values (lumens/sq. ft.) and the other in irradiance values (μW/sq. cm.)

Correlation between these two sets of abscissa values is accomplished by having the light source operating at the maximum sensitivity wavelength of the CA3062. See Notes on page three.

Linear Integrated Circuits

CA3085, CA3085A, CA3085B

8-LEAD TO-5 H 1528

Positive Voltage Regulators

For Regulated Voltages from 1.7 V to 46 V at Currents up to 100 mA

Features

- **Up to 100 mA output current**
- **Input and output short-circuit protection**
- **Load and line regulation: 0.025%**
- **Pin compatible with LM100 Series**
- **Adjustable output voltage**

Type	V_{IN} Range V	V_{OUT} Range V	Max. I_{OUT} mA	Max. Load Regulation % V_{OUT}
CA3085	7.5 to 30	1.8 to 26	12*	0.1
CA3085A	7.5 to 40	1.7 to 36	100	0.15
CA3085B	7.5 to 50	1.7 to 46	100	0.15

* This value may be extended to 100 mA; however, regulation is not specified beyond 12 mA.

RCA-CA3085, CA3085A, and CA3085B are silicon monolithic integrated circuits designed specifically for service as voltage regulators at output voltages ranging from 1.7 to 46 volts at currents up to 100 milliamperes.

A block diagram of the CA3085 Series is shown in Fig. 1. The diagram shows the connecting terminals that provide access to the regulator circuit components. The voltage regulators provide important features such as: frequency compensation, short-circuit protection, temperature-compensated reference voltage, current limiting, and booster input. These devices are useful in a wide range of applications for regulating high-current, switching, shunt, and positive and negative voltages. They are also applicable for current and dual-tracking regulation.

The CA3085A and CA3085B have output current capabilities up to 100 mA and the CA3085 up to 12 mA without the use of external pass transistors. However, all the devices can provide voltage regulation at load currents greater than 100 mA with the use of suitable external pass transistors. The CA3085 Series has an unregulated input voltage ranging from 7.5 to 30 V (CA3085), 7.5 to 40 V (CA3085A), and 7.5 to 50 V (CA3085B) and a minimum regulated output voltage of 26 V (CA3085), 36 V (CA3085A), and 46 V (CA3085B).

The CA3085 Series is supplied in the hermetic 8-lead TO-5 style package and is rated for operation over the full military temperature range of −55°C to +125°C.

The CA3085A is unilaterally interchangeable with the CA3055.

Applications

- **Shunt voltage regulator**
- **Current regulator**
- **Switching voltage regulator**
- **High-current voltage regulator**
- **Combination positive and negative voltage regulator**
- **Dual tracking regulator**

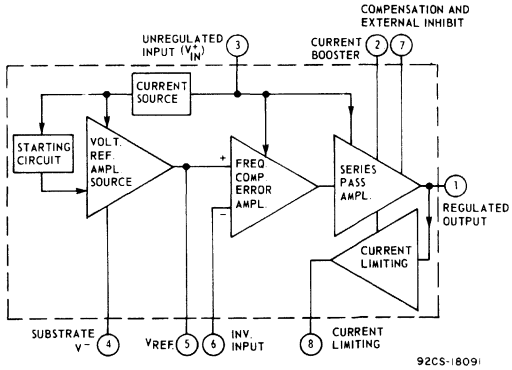

Fig. 1—Block diagram of CA3085 Series. For schematic diagram see Fig. 2.

TEST PROCEDURES FOR TEST CIRCUIT FOR RIPPLE REJECTION AND OUTPUT RESISTANCE

Output Resistance

Conditions:

1. V_{IN} = +25V, C_{REF} = 0, Short E_1
2. Set E_{S2} at 1kHz so that E_2 = 4V rms
3. Read V_{OUT} on a VTVM, such as a Hewlett-Packard, HP400D or equivalent
4. Calculate R_{OUT} from $R_{OUT} = V_{OUT}(R_L/E_2)$

Ripple Rejection — I

Conditions:

1. V_{IN} = +25V, C_{REF} = 0, Short E_2
2. Set E_{S1} at 1kHz so that E_1 = 3V rms
3. Read V_{OUT} on a VTVM, such as a Hewlett-Packard, HP400D or equivalent
4. Calculate Ripple Rejection from 20 log (E_1/V_{OUT})

Ripple Rejection — II

Conditions:

1. Repeat Ripple Rejection I with C_{REF} = 2 μF

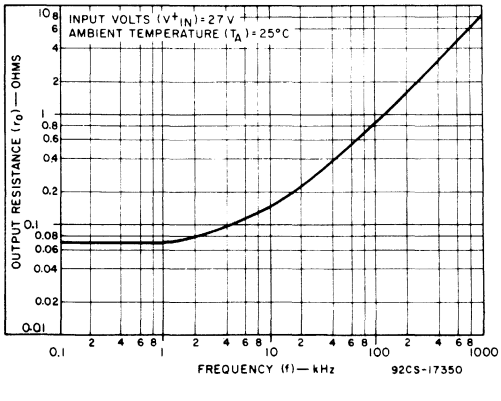

Fig.13—r_O vs. f.

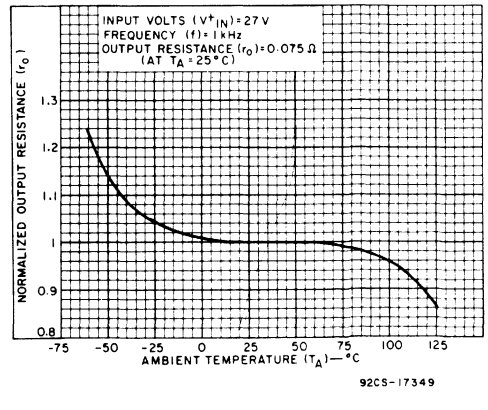

Fig.14—Normalized r_O vs. T_A.

NOTES

1. Refer to Rules for Dimensioning Axial Lead Product Outlines.
2. Leads at gauge plane within 0.007" (0.178mm) radius of True Position (TP) at maximum material condition.
3. ϕB applies between L_1 and L_2. ϕB_2 applies between L_2 and 0.500" (12.70mm) from seating plane. Diameter is uncontrolled in L_1 and beyond 0.500" (12.70mm).
4. Measure from Max. ϕD.
5. N_1 is the quantity of allowable missing leads.
6. N is the maximum quantity of lead positions.

RCA CA3058, CA3059, and CA3079 zero-voltage switches are monolithic silicon integrated circuits designed to control a thyristor in a variety of AC power switching applications for AC input voltages of 24 V, 120 V, 208/230 V, and 277 V at 50/60 and 400 Hz. Each of the zero-voltage switches incorporates 4 functional blocks (See Fig. 2) as follows:

1. Limiter-Power Supply - - Permits operation directly from an AC line.
2. Differential On/Off Sensing Amplifier - - Tests the condition of external sensors or command signals. Hysteresis or proportional-control capability may easily be implemented in this section.
3. Zero-Crossing Detector - - Synchronizes the output pulses of the circuit at the time when the AC cycle is at zero voltage point; thereby eliminating radio-frequency interference (RFI) when used with resistive loads.
4. Triac Gating Circuit - - Provides high-current pulses to the gate of the power controlling thyristor.

In addition, the CA3058 and CA3059 provide the following important auxiliary functions (See Fig. 2):

1. A built-in protection circuit that may be actuated to remove drive from the triac if the sensor opens or shorts.
2. Thyristor firing may be inhibited through the action of an internal diode gate connected to Terminal 1.
3. High-power dc comparator operation is provided by overriding the action of the zero-crossing detector. This is accomplished by connecting Terminal 12 to Terminal 7. Gate current to the thyristor is continuous when Terminal 13 is positive with respect to Terminal 9.

For an explanation of these functions see Operating Considerations, page 8. For detailed application information, see companion Application Notes, ICAN-6158 (formerly ICAN-4158) "Applications of the RCA-CA3058 or RCA-CA3059 Zero-Voltage Switch in Thyristor Circuits" and ICAN-6268 "Applications and Extended Operating Characteristics for the RCA-CA3059 IC Zero-Voltage Switch".

The CA3058 is designed to operate over the full military temperature range of -55°C to +125°C and is supplied in a hermetic 14-lead dual-in-line ceramic package. Types CA3059 and CA3079 are designed to operate over the temperature range of -40°C to +85°C and are supplied in 14-lead dual-in-line plastic packages.

Applications

- Relay control ■ Heater control ■ Photosensitive control
- Valve control ■ Lamp control ■ Power one-shot control
- Synchronous switching of flashing lights
- On-off motor switching
- Differential comparator with self-contained power supply for industrial applications

This chart gives the range of voltages which can be applied to the terminals listed horizontally with respect to the terminals listed vertically. For example, the voltage range of horizontal Terminal 6 to vertical Terminal 4 is 2 to - 10 volts.

Note 1 – Resistance should be inserted between Term. 5 and external supply or line voltage for limiting current into Term. 5 to less than 50 mA.

Note 2 – Resistance should be inserted between Term. 14 and external supply for limiting current into Term. 14 to less than 2 mA.

NOTE 3: For the CA3079 indicated terminal is internally connected and therefore, should not be used.

▲For CA3079 (0 to-10V)

*Voltages are not normally applied between these terminals; however, voltages appearing between these terminals are safe, if the specified voltage limits between all other terminals are not exceeded.

OPERATING CONSIDERATIONS

Power Supply Considerations for CA3058, CA3059 and CA3079

The CA3058, CA3059 and CA3079 are intended for operation as self-powered circuits with the power supplied from an AC line through a dropping resistor. The internal supply is designed to allow for some current to be drawn by the auxiliary power circuits. Typical power supply characteristics are given in Figs. 3b and 3c.

Power Supply Considerations for CA3058 and CA3059

The output current available from the internal supply may not be adequate for higher power applications. In such applications an external power supply with a higher voltage should be used with a resulting increase in the output level. (See Fig. 5 for the peak output current characteristics). When an external power supply is used, Terminal 5 should be connected to Terminal 7 and the synchronizing voltage applied to Terminal 12 as illustrated in Fig. 5a.

Operation of Built-in Protection for the CA3058, CA3059

A special feature of the CA3058 and CA3059 is the inclusion of a protection circuit which, when connected, removes power from the load if the sensor either shorts or opens. The protection circuit is activated by connecting Terminal 14 to Terminal 13 as shown in Fig. 2. To assure proper operation of the protection circuit the following conditions should be observed:

1. Use the internal supply and limit the external load current to 2mA with a 5k Ω dropping resistor.
2. Set the value of Rp and sensor resistance (R_X) between 2k Ω and 100k Ω.
3. The ratio of R_X to Rp, typically, should be greater than 0.33 and less than 3. If either of these ratios is not met with an unmodified sensor over the entire anticipated temperature range, then either a series of shunt resistor must be added to avoid undesired activation of the circuit.

If operation of the protection circuit is desired under conditions other than those specified above, then apply the data given in Fig. 13.

External Inhibit Function for the CA3058 and CA3059

A priority inhibit command may be applied to Terminal 1. The presence of at least + 1.2V at 10 μA will remove drive from the thyristor. This required level is compatible with DTL or T^2L logic. A logical 1 activates the inhibit function.

DC Gate Current Mode for the CA3058 and CA3059

Connecting Terminals 7 and 12 disables the zero-crossing detector and permits the flow of gate current on demand from the differential sensing amplifier. This mode of operation is useful when comparator operation is desired or when inductive loads are switched. Care must be exercised to avoid overloading the internal power supply when operating in this mode. A sensitive gate thyristor should be used with a resistor placed between Terminal 4 and the gate in order to limit the gate current.

Companion Application Notes, ICAN-6168 and ICAN-6268 provide detailed descriptions of the circuit operation and include many useful control applications for the zero-voltage switches.

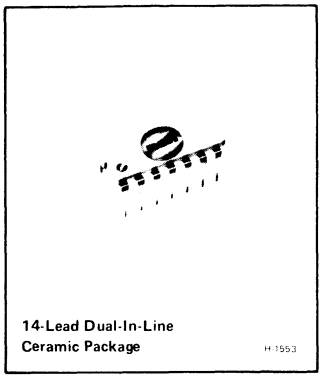
Linear Integrated Circuits

Monolithic Silicon

CA3091D



14-Lead Dual-In-Line
Ceramic Package H-1553

Four-Quadrant Multiplier

Applications:

- Multiplier ■ Divider ■ Squarer ■ Square Rooter
- Power-series approximator
- Full-wave rectifier
- Automatic level controller
- RMS converter
- Frequency discriminator
- Voltage-controlled filters and oscillators

RCA-CA3091D*, a monolithic silicon integrated circuit, is a four-quadrant multiplier that provides an output voltage that is the product of two input (x and y) voltages.

This device functions as a multiplier, divider, squarer, square rooter, and power-series approximator. In addition, this device is useful in applications such as ideal full-wave rectifiers, automatic level controllers, RMS converters, frequency discriminators, and voltage-controlled filters and oscillators.

The CA3091D comprises five basic circuits (See Fig. 1), including: a multiplier block, two linearity compensators, a current converter, a current source for biasing, and a regulator (reference voltage). A brief description of the operation, functions and typical applications is given in the section "Operating Considerations". In addition there is a separate section on "Symbols, Terms, and Definitions" that defines the terms and symbols used throughout the data bulletin.

The CA3091D is supplied in 14-lead dual-in-line ceramic package and operates over the full military temperature range of -55°C to +125°C.

* Formerly Developmental Type TA5855A.

Features: •

- "Accuracy": ±4% (max.)
- "Linearity": 3.0% (max.)
- Feedthrough: 9 mV p-p (typ.)
- 3-db bandwidth: 4.4 MHz
- Low power operation capability: ±6.0 V, 4 mW drain
- Low power-supply sensitivity: 36 mV/V typ.
- Smooth overload characteristics — no foldback if full-scale input signal is exceeded
- Negligible warm-up drift
- Broadband operation capability (flat to 1 MHz) — both inputs have similar characteristics for reduced high-frequency phase shift between the inputs
- Low-level linearity correction circuitry minimizes low-level feedthrough for improved small-signal accuracy
- All multiplication is performed with wideband circuitry — this permits two signals of frequencies much higher than the -3 db frequency of the multiplier to produce a difference frequency that is within the multiplier's bandwidth
- High immunity to parasitic oscillation
- Essentially free from excess peaking — provides improved frequency response
- Requires no level shifting at the output — current-source operation at the output permits output signal to be referenced to ground or other levels within the output voltage swing capabilities of the multiplier
- Internal bias regulator

SYMBOLS, TERMS AND DEFINITIONS

Output Offset Current
The multiplier output current produced when both of the multiplier input signals are in the zero state.

Output Zero
Sets the output at the zero level when the x and y inputs are in the zero state. (It is implied that all other zeroing adjustments have been effected.)

R_I
Input Resistance — Converts the input voltage to an input current.

R_L
Output (Load) Resistance — Converts the output current to a voltage.

R_O
Output Resistance — See V_O and I_O for the equations associated with these properties.

Regulator Diode
A temperature compensated Zener diode, included in the multiplier circuit, to provide a stable I_{IB}.

Scale Factor or k factor (k)
Represents the basic gain of the multiplier as expressed in the equation $V_O = kV_XV_Y$

The equation indicates the ideal transfer function for the multiplier. The normalized k factor is expressed by $k_N = k/k_{ref}$ where k_{ref} is the ideal or reference k factor. The ideal factor, k_{ref} is the value at which the k factor is set when the k-factor adjust control is trimmed. Optimum operation of the CA3091D is achieved when the k-factor is 0.1.

V_{IM}
The maximum ac sine-wave voltage to be applied to the multiplier; a 20-volt p-p sine wave is the nominal maximum swing voltage recommended for use with 50-kilohm input resistors.

V_{MID}
An ac or dc voltage that approximately satisfies the equation

$$V_{MID} = V_{IM}/\sqrt{2}.$$

V_O
The output product voltage derived from the expression

$$(kV_XV_Y = V_O)$$

V_{ref}.
Temperature compensated zener connected to the −15 volt supply to provide a reference voltage as an aid in setting up a stable I_{IB}.

V_X, V_Y
The input voltages to be multiplied.

x-Balance Circuit
Sets the output to the zero level when the x-input is in the zero state.

y-Balance Circuit
Sets the output to the zero level when the y-input is in the zero state.

SYMBOLS, TERMS AND DEFINITIONS — continued

Accuracy
Accuracy defines the degree of error encountered in the operation of the multiplier. It is portrayed on a contour map by isomers (contour lines). Isomers with the highest values indicate "less-accurate" operation of the multiplier. (See illustrative Contour Map in Fig. 12.)

Contour Map
The contour map, shown in Fig. 12, is a graphical portrayal of the multiplier errors in the x, y input plane. Each contour line, termed "isomer", connects those points whose error values (in millivolts) are equal in magnitude. For example, a −20 mV contour line with points at V_X = 5V and V_Y = −3V indicates that the output voltage is 20 mV less than the theoretical output product (kV_XV_Y). This error voltage, presented in percent of full-scale input (±10 V), defines the "accuracy" of the device. Thus, a 20-mV error voltage represents an "accuracy" of 0.2% as derived from the equation:

$$\text{Accuracy} = 20\ \text{mV}/10 \times 100\% = 0.2\%.$$

A contour map provides a true indication of multiplier performance in each of the four quadrants. Each CA3091D is comprehensively tested and must provide the specified accuracy in the four quadrants.

Current Converter
This portion of the IC combines the multiplier's differential-amplifier output currents and converts them to a single-ended output current.

Current Sources
These circuits provide the biasing currents for the various circuits in the IC. The I_{IB} terminal provides the control current for the current-source circuit.

Feedthrough
Feedthrough occurs when an output signal is produced even though one of the input signals is zero. Consequently, feedthrough signal characteristics constitute a source of error in the operation of a multiplier. In the CA3091D, for example, the feedthrough signal output is specified to be less than 20 mV p-p when either terminal is set at 20 V p-p and the other terminal is set to zero.

I_{IB}
Circuit biasing control current.

I_{IC}
See I_{OC}.

I_O
Output product current ($k_I I_X I_Y = I_O$), where $k_I = kR_I^2 / R_L$

I_{OC}, I_{IC}
Compensatory input and output currents required to correct unlinearity along the x axis. (Optional for low-level signal use.)

I_X, I_Y
Input currents to be multiplied.

k
Voltage Scale Factor (determines the gain of the multiplier).

k_I
Current Scale Factor (k_I) = $(R_I^2 / R_L)k$.

k adjust
Scale-Factor Adjustment.

Linearity
"Linearity" indicates the degree of multiplier error (i.e. deviation from "straight-line" characteristics) along each of the four boundaries of the input x, y field. These boundaries are formed when one input is held at one of the two maximum values (10 volts or −10 volts) and the other input is swept through the voltage range. (See Contour Map for additional information.)

Linearity Adjust
An external circuit to provide vernier adjustment for optimum linearity. This control should be adjusted before adjusting the y-balance control.

Linearity Balance Circuit (Low-Level)
This circuit makes the multiplier's transfer function linear for low-level x-input signals.

Linearity Compensator
Internal circuitry that converts input current into a non-linear voltage, a requisite for producing a linear output in the differential amplifiers of the multiplier circuit.

Multiplier Circuitry
Provides the product of the two input voltages.

Multiplier Transfer Function
This function mathematically describes the interaction of the two inputs and the resulting output signal. The basic transfer function for a multiplier is

$$k(V_X + V_{Xe})(V_Y + V_{Ye}) = V_O + V_{Oe}$$

where: k = k factor and represents the basic gain of the multiplier

V_X, V_Y = the external inputs to be multiplied

V_O = the desired value of the product output signal

V_{Xe}, V_{Ye} = the "effective" errors that occur at the inputs of the multiplier and cause an output signal when either input is in a zero state.

V_{Oe} = the error voltage that develops at the output of the multiplier

DC correction factors are added to the multiplier inputs and output to compensate for the errors and offset variations. A complex linearity error term appears in the transfer function; however, this term is not included in the above equation for the purpose of clarity.

OPERATING CONSIDERATIONS

Operation of a Multiplier

A multiplier is, essentially, a gain-controlled amplifier (See Fig. 13) that multiplies the input signal (V_X) with the external gain controlling signal (V_Y) to produce the resultant output (V_O). The gain is externally adjustable by a coefficient (k). Stated simply, a multiplier produces an output voltage that is the linear product of two input voltages.

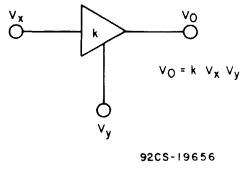

Fig. 13—Gain-controlled amplifier.

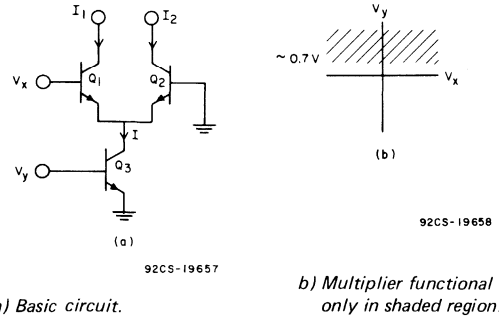
The basic multiplier, shown in Fig. 14a, is a two-quadrant multiplier. The input signal (V_X) may have either a positive or negative polarity whereas, the external gain-controlling signal (V_Y) must be positive and greater than the base-to-emitter voltage (Fig. 14b). The output current ($I_1 - I_2$) of the differential amplifier, comprised of transistors Q1 and Q2, is related to both the input signal (V_X) and the current source (I). Since the current source (I) is related to the gain controlling signal (V_Y) the output current ($I_1 - I_2$), therefore, is related to both V_X and V_Y.



a) Basic circuit.

b) Multiplier functional only in shaded region.

Fig. 14—Two-quadrant multiplier.

This relationship is essentially non-linear; thus an appropriate linearization circuit must be provided in the input stage to achieve the following linear relationship:

$$I_1 - I_2 = k' V_X V_Y \qquad \text{(Eq. 1)}$$

where k' is a constant

Figure 15 shows a typical arrangement of three differential amplifiers to form a four-quadrant multiplier. This arrangement incorporates the operating principles of the two-quadrant multiplier, but, in addition, it permits both of the input signals (V_X and V_Y) to have positive or negative polarities (or zero). When either input is zero, the output current ($I_1 - I_2$) must, theoretically, be zero as is shown by the following:

1. Assume $V_X = 0$,
   then $i_1 = i_2$ and $i_3 = i_4$
   therefore $i_1 + i_4 = i_2 + i_3$.
   Since $I_1 = i_1 + i_4$ and $I_2 = i_2 + i_3$,
   then $I_1 = I_2$.
   This equality is independent of V_Y
2. Now assume $V_Y = 0$,
   then $i_5 = i_6$.
   Sine $i_5 = i_1 + i_2$ and $i_6 = i_3 + i_4$,
   then $i_1 + i_2 = i_3 + i_4$.
   Since $i_1 = i_3$ and $i_2 = i_4$
   then $i_1 + i_4 = i_3 + i_2$.
   Therefore $I_1 = I_2$.
   This equality is independent of V_X.

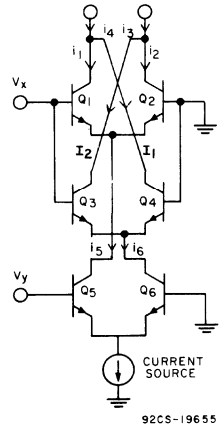


Fig. 15—Basic four-quadrant multiplier.

The multiplying operation discussed in the previous section applies when neither V_X nor V_Y is zero. The output current ($I_1 - I_2$) then satisfies Equation 1,

$$I_1 - I_2 = k' V_X V_Y.$$

The multiplying action of the four-quadrant multiplier is dependent on current unbalance in the three differential amplifiers. Ideally, the multiplying operation should not occur if either V_X or V_Y is O. However, in practical applications slight current unbalances do exist. It is necessary, therefore, to null out such unbalances with external potentiometers prior to operation.

TYPICAL OPERATING CONSIDERATIONS

The RCA-CA3091D, shown in Fig. 2, is a four-quadrant multiplier that incorporates the basic multiplier principle, previously discussed in "Operation of a Multiplier". Because the design of this multiplier is based on the multiplication of two input currents to produce an output current it is necessary to convert the input voltages to input currents and the output current to an output voltage by inserting resistors at both input and output terminals. Fig. 1 shows the four-quadrant multiplier with its peripheral circuitry for nulling current unbalances.

The Bias Current (I_{IB}) at Term. 3 sets the operating current level for the entire multiplier circuit by means of a current-source circuit. Therefore, it is essential that this bias current level remain constant under all operating conditions. To maintain this steady state, a temperature compensated zener diode is provided on the chip and connected to the Reference Voltage (Term.6).

Linearity of the differential amplifier transconductance function is accomplished by linearity compensators as shown in Fig. 1. To correct low-level signal unbalances that may occur between Differential Amplifiers A and B, an external potentiometer is connected to Terminals 7 and 8 (See Fig. 1). The Current Converter circuit, which consists of a set of current mirrors, supplies the output current ($I_1 - I_2$). It is important that circuit unbalances be corrected prior to operation. Table I describes the alignment procedures for correcting these unbalances.

A multifunctional circuit board (Figs. 16 and 17) is available for performing the four basic applications, such as, multiplying, dividing, squaring and taking the square root.

When the CA3091D is used as a multiplier (Fig. 18) or as a squarer (Fig. 18) only the basic pheripheral circuitry on the multifunctional circuit board is utilized and the general-purpose operational amplifier (CA3741T) is disabled from operation. Follow the ac alignment procedures for these two applications before operating the circuit.

When the CA3091D is used as a divider (Fig. 20), the operational amplifier is required in order to provide the proper negative feedback. The limitations for operation as a divider are that $O < V_Y \leqslant 10V$ and $-10V \leqslant V_Z \leqslant 10V$. Note, the range of V_Y is limited to the positive polarity; if V_Y was permitted to go negative, the feedback loop would go positive and, thereby, create an unstable operating condition.

Alignment of the divider (Fig. 19) differs from multiplier and squarer alignment because of the additional variances introduced by the operational amplifier. A coupling capacitor is

Table I

AC Alignment Procedures For CA3091D, Four-Quadrant Multiplier

(Refer to Fig. 16, for circuit pertaining to following alignment procedures.)

Step No.	Voltage Setting		Control Adjust	Test Equipment Used	Measure	Notes
	V_X	V_Y				
1	–	–	–	–	–	Set all potentiometers to center of range.

3	O	V_{IM}	Linearity	AC VM	V_O	Adjust for a minimum reading.
4	–	–	–	–	–	Repeat Steps 1 and 2 until no further improvement is noted.
5	V_{IM}	O	y Balance	AC VM	V_O	Adjust for a minimum reading.
6	O	O	Zero Output	DC VM	V_O	Adjust for zero output.
7	V_{MID}	V_{MID}	R_k	AC/DC VM	V_O	Adjust for $V_{MID}^2/10$ at the output.
8	–	–	–	–	–	Check multiplier for alignment in all four quadrants.

V_{IM} – Is the maximum AC swing of the sine wave that will be applied to the multiplier. A 20-volt p-p value is the nominal maximum swing of the AC sine wave with input resistors of 50 kilohms.

V_{MID} – An AC or DC voltage that approximately satisfies the equation $V_{MID} = V_{IM}/\sqrt{2}$. For example, if a 50-kilohm resistor is used with a 7-volt input, then R_k should be adjusted for a 4.9-volt output.

provided at the output of the divider alignment circuit in order to separate the ac signal from the dc signal and, thus, avoid interaction between the calibrating potentiometers.

The alignment procedure for the square-rooter function (Fig. 21) is identical to the alignment procedure for the divider function. The input voltage range is limited to $0 < V_I \leqslant 10V$. This limitation is necessary in order to prevent the output voltage (V_O) from latching to the negative output saturation voltage of the operational amplifier. Table II describes the divider alignment procedure.

RCA Solid State Division

Linear Integrated Circuits

Monolithic Silicon

CA3541D

14-Lead Dual-In-Line Ceramic Package H-1553

Dual-Input Memory Sense Amplifier

Features

- Complete dual input core memory sense amplifier
- Two available outputs: —Saturated logic output
  —Linear output (positive output for either polarity input)
- Nominal threshold voltage: 17 mV
- Adjustable threshold: 10 to 35 mV
- Low threshold uncertainty range: ±3 mV
- Fast overload recovery time: —Differential-Mode: 15 ns typ.
  —Common-Mode: 30 ns typ.
- Independent channel gate and strobe terminals compatible with saturated logic levels
- Suitable for core memories having cycle times $\leq$ 0.4 μs
- Input offset voltage: 6 mV max.

RCA-CA3541D*, a monolithic silicon integrated circuit, is a dual-input memory sense amplifier intended for core memory applications.

The sense amplifier, consisting of two differential input amplifiers, a common second stage amplifier, and an output logic gate (See Fig. 1), converts low-level core-memory "1" pulses to saturated logic-level output pulses. Either one of the input amplifiers may be gated ON with a saturated logic signal so that an incoming "1" pulse of positive or negative polarity can be detected from either of two sense lines.

The CA3541D features an external switching threshold adjustment, plus its gate and strobe inputs are compatible with saturated logic levels. The sense amplifier is suitable for operation with core memories having cycle times equal to or greater than 0.4 μs and is unilaterally interchangeable with industry types 1541L and 1441.

The CA3541D is supplied in 14-lead dual-in-line ceramic package and is rated for operation over the full military temperature range of −55°C to +125°C.

*Formerly Developmental Type TA5820.

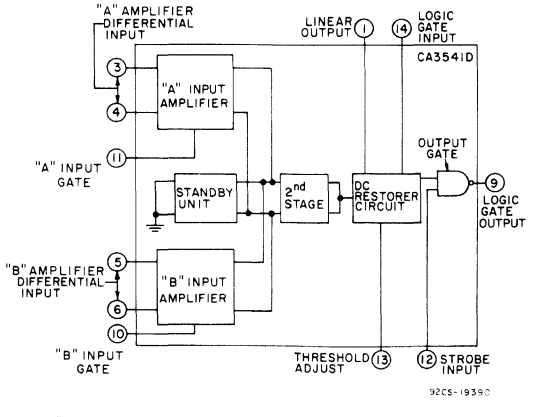

Fig. 1 – Functional block diagram of the CA3541D.

MAXIMUM RATINGS, Absolute Maximum Values, at T_A = 25°C

Except for Differential Input Voltage, all voltages are measured with respect to ground (Term. 8).

DC Supply Voltage:	
V^+ (Term. 2)	+10 V
V^- (Term. 7)	−10 V
Differential Input Voltage	±5 V
Common-Mode Input Voltage	±5 V

TERMS, SYMBOLS, AND DEFINITIONS

TERMS	SYMBOLS	DEFINITIONS
*Input Bias Current	I_{IB}	The average input current defined as $(I_3+I_4+I_5+I_6)/4$.
Channel Gate Lead Current	I_G	The amount of current drain from the circuit when the channel gate input (Term. 10 or 11) is grounded.
Channel Gate Reverse Current	I_{GR}	The leakage current when the channel gate input (Term. 10 or 11) is high.
*Input Offset Current	I_{IO}	The difference between amplifier input current values $\lvert I_3-I_4\rvert$ or $\lvert I_5-I_6\rvert$.
Strobe Load Current	I_S	The amount of current drain from the circuit when the strobe terminal is grounded.
Strobe Reverse Current	I_{SR}	The leakage current when the strobe input is high.
*Power Dissipation	P_D	The amount of power dissipated in the unit.
Common-Mode Recovery Time	t_{CMR}	The time required for the voltage at Term. 14 to be within 100 mV of the DC value (after overshoot or ringing) as referenced to the 10% point of the trailing edge of a common mode overload signal.
Differential Recovery Time	t_{DR}	The time required for the device to recover from the specified differential input prior to strobe enable as referenced to the 10% point of the trailing edge of an input pulse. The device is considered recovered when the threshold with the overload signal applied is within 1.0 mV of the threshold with no overload input.
Minimum Time Between Channel Gate Input and Signal Input	t_{GI}	The minimum time between 50% point of channel gate input (Term. 10 or 11) and 50% point of signal input (Terms, 3, 4, 5, or 6) that still allows a full width signal at amplifier output.
Propagation Delay – Channel Gate Input to Amplifier Output	t_{GA}	The time required for the amplifier output at Term 1 to reach 50% of its final value as referenced to 50% of the input gate pulse at Term. 10 or 11 (amplifier input = 25 mV DC).
Propagation Delay – Input to Amplifier Output	t_{IA}	The time required for the amplifier output pulse at Term. 1 to achieve 50% of its final value referenced to 50% of the input pulse at Terms. 3 and 4 or 5 and 6.
Propagation Delay – Input to Output	t_{IO}	The time required for the gate output pulse at Term. 9 to reach the 1.5-volt level as referenced to 50% of the input at Terms. 3 and 4 or 5 and 6.

Terms, Symbols, and Definitions continued on next page.

TERMS, SYMBOLS, AND DEFINITIONS – cont'd

TERMS	SYMBOLS	DEFINITIONS
Strobe Propagation Delay to Output	t_{SO}	The time required for the output pulse at Term. 9 to reach the 1.5-volt level as referenced to the 1.5-volt level of the strobe input at Term. 12.
Maximum Common-Mode Input Range	V_{ICR}	The common-mode input voltage which causes the output voltage level of the amplifier to decrease by 100 mV. (This is independent of the channel gate input level.)
Maximum Differential Input Range – Gate Input High	V_{DH}	The differential input signal which causes the input stage to begin saturation.
Maximum Differential Input Range – Gate Input Low	V_{DL}	The differential input signal which causes the output voltage level of the amplifier to decrease by 100 mV.
Channel Gate Input Voltage High	V_{GH}	The gate pulse amplitude that allows the amplifier output pulse to just reach 100% of its final value. (Amplifier input is set at 25 mV DC).
Channel Gate Input Voltage Low	V_{GL}	The gate pulse amplitude that allows the amplifier output to just reach a 100-mV level. (Amplifier input is set at 25 mV DC).
Input Offset Voltage	V_{IO}	The difference in V_{TH} between inputs at Terms. 3 and 4 or 5 and 6.
*Output Voltage High	V_{OH}	The high-level output voltage when the output gate is turned off.
*Output Voltage Low	V_{OL}	The low-level output voltage when the output gate is saturated and the output sink current is 10 mA.
Input Threshold	V_{TH}	The input pulse amplitude at Terms. 3, 4, 5, or 6 that causes the output gate to just reach the low-level output voltage (V_{OL}).

RCA Linear integrated circuits are provided in chip form to allow customer design of special and complex circuits to suit individual needs. Linear chips are electrically identical and offer the features of their counterparts sealed in ceramic and plastic packages. This data bulletin provides mounting considerations, packaging, shipping and storage criteria, visual inspection criteria, testing criteria, and bonding pad layout and dimensions for each chip. For maximum ratings, electrical characteristics, schematics, features, and other pertinent data refer to the Technical Data Bulletins listed on page 2.

Mounting Considerations

All Linear chips are non-gold backed and require the use of epoxy mounting. DuPont No. 5504A conductive silver paste or other pastes (either conductive or non-conductive) having equivalent strength, curing requirements etc., are recommended. In any case the manufacturer's recommendations for storage and use should be followed. If DuPont No. 5504A paste is used, the bond should be cured at temperatures between 185° and 200°C for 75 minutes.

Packing, Shipping, and Storage Criteria

Solid state chips, unlike packaged devices, are non-hermetic devices, normally fragile and small in physical size, and therefore, require special handling considerations as follows:

1. Chips must be stored under proper conditions to insure that they are not subjected to a moist and/or contaminated atmosphere that could alter their electrical, physical, or mechanical characteristics. After the shipping container is opened, the chip must be stored under the following conditions:
   A. Storage temperature, 40°C max.
   B. Relative humidity, 50% max.
   C. Clean, dust-free environment.
2. The user must exercise proper care when handling chips to prevent even the slightest physical damage to the chip.
3. During mounting and lead bonding of chips the user must use proper assembly techniques to obtain proper electrical, thermal, and mechanical performance.
4. After the chip has been mounted and bonded, any necessary procedure must be followed by the user to insure that these non-hermetic chips are not subjected to moist or contaminated atmosphere which might cause the development of electrical conductive paths across the relatively small insulating surfaces. In addition, proper consideration must be given to the protection of these devices from other harmful environments which could conceivably adversely affect their proper performance.

These unmounted and unencapsulated chips are tested electrically and visually inspected to meet RCA's specifications when they are shipped by RCA. Written notification of non-conformance to such specifications must be made to RCA within 90 days of the date of the shipment by RCA. After shipment from RCA, RCA assumes no responsibility for chips that have been subjected to further processing, such as, but not limited to, lead bonding or chip mounting operations. RCA reserves the right to change the chip design and processing without notification.

Visual Inspection Criteria

All Linear chip visual inspection procedures are followed in strict accordance with the requirements specified in MIL-STD-883, method 2010.1, condition B.

Testing Criteria

Linear chips are DC electrically tested 100% in accordance with the same standards prescribed for RCA devices in standard packages.

Beam Lead Devices for Hybrid Circuit Applications

- **Transistor Arrays**
- **Diode Arrays**
- **Differential Amplifiers**
- **Operational Amplifiers**

The beam-lead sealed-junction integrated circuits described in this bulletin are fabricated by a technology which involves the utilization of a passivated layer to seal delicate semiconductor junctions and a multilayered interconnection system of unique design which is stable, highly corrosion-resistant, and readily bondable for attachment to a suitable substrate containing thick or thin film wiring.

Beam Lead identifies a structure in which gold beam leads are extended over the semiconductor chip edges as cantilever beams. **Sealed Junction** indicates that the integrated circuit chip is completely protected from the deteriorating effects of humidity and other surface contaminants without the need for a hermetic package enclosure.

General Considerations

Conventional IC technology has made very substantial contributions to the reliability of solid state electronics despite the fact that the conventional IC chip is non-hermetic and employs an aluminum-film interconnection system. These considerations have forced the use of hermetic packages or elaborate bulky plastic packages to guard the integrated circuit chip against even modest amounts of humidity. In addition, connection to the aluminum metallization on the chip is customarily accomplished by the use of tiny wires. The reliability of these wired connections to the chip and its external circuit is dependent on human skill and accuracy to a considerable extent.

The culmination of continuing research and development in the quest for IC's having greater reliability, has led to the development of sealed-junction technology for IC fabrication. The beam-lead, sealed-junction device is a truly hermetic IC chip which is impervious to the deteriorating effects of moisture and other potential contaminants. Furthermore, circuit interconnections on and to the chip are accomplished by the use of gold conductors to further enhance reliability. The precious metal interconnection system on the chip, which is integral with the chip, is, in turn, connected to tiny gold beams (.003" x .006" x 0005") which extend over the edge of the chip to serve as leads to external circuit paths and components.

Features

Assembly

- **Simplified repairability**
- **Use of non-hermetic packages possible**
- **Silicon nitride passivated**
- **Platinum silicide ohmic contacts**
- **Batch handling of chips, batch bonding of beam leads and external lead connections**
- **Precious metal interconnection metallization**
- **Precious metal beam leads**
- **Broad beam leads make interconnect paths less critical; bonds easier to inspect, and defective chips easier to replace**
- **Batch fabrication techniques provide devices with high reliability at lowest possible cost.**

Performance

- **Exceptional reliability results from use of sealed-junction beam-lead technology**
- **Inspectable bonds**
- **Low-stress, high-strength bonds achieved**
- **Reliable operation over full military temperature range $-55^{o}C$ to $+125^{o}C$**

The beam lead integrated circuit chip with its gold leads has ideal mechanical characteristics for use in connection with automated handling methods of attachment to film type wiring on a suitable substrate thus making it possible to achieve a higher order of reliability in the interconnection system than has been achieved heretofore.

A brief resume of the manufacturing process used in producing beam lead IC's is included in the APPENDIX following the OPERATING CONSIDERATIONS.

OPERATING CONSIDERATIONS

When a beam lead device is being bonded to a substrate, certain minimal precautions (listed below), with reference to pattern screening must be taken to prevent stress that can result in breakage, or separation of the conductor paths:

1) Do not mount components within the outside dimension of the bonding tool.
2) Do not use any cross-over or insulation within this dimension.
3) Do not use any resistor terminations within this dimension.
4) Use individual pads for bonding leads wherever feasible.

Adequate cooling, as in any design must be considered. Temperature rise in a beam-lead device, when mounted in a particular assembly is a direct result of the dissipation within the device, the distribution of other heat sources within the assembly, and the ability of the assembly to dissipate the total heat generated.

Specific factors which govern the heat flow within such assemblies are:

1. Beam-lead width and thickness
2. Number of beam leads
3. Thermal characteristics of the substrate
4. Thermal characteristics of the ambient surrounding the beam-lead device.

Because of these factors it is, therefore, impractical to specify thermal ratings for beam-lead device assemblies. In consideration of these factors, it is recommended that the chip temperature be checked by direct measurement to avoid exceeding a maximum chip junction temperature of 150°C.

TERMINAL LAYOUT DIAGRAMS

RCA beam lead devices will normally be designed utilizing the outline shown in Fig. 1 viewed with the metallization down.

The resistance values included on the schematic diagrams are typical values and have been supplied as a convenience to assist Equipment Manufacturers in optimizing the selection of "outboard" components of equipment designs.

RCA reserves the right to make any changes in the resistance values provided such changes do not adversely affect the published performance characteristics of the device.

The following list includes several manufacturers of substrates, pattern screening, and bonders. For other manufacturers of similar equipment, it is recommended that the user refer to the various electronic buyers guides available in industry.

APPENDIX

Beam-Lead Manufacturing Processes

An integral passivation layer of silicon nitride protects the beam-lead device from the deteriorating effects of both moisture and contaminants. Low-resistance ohmic contacts to the device junctions are made with platinum silicide which is an extremely stable, non-corrosive intermetallic compound. Gold is used for both the chip interconnections and for the cantilevered beams because it provides high conductivity, is corrosion-resistant, and is readily bondable to a wide variety of substrates and materials. This combination of metallurgically stable components offers the user a chip structure having excellent reliability as compared with the performance of aluminum metallization used in conventional IC designs.

As indicated in the preceding paragraphs, beam-lead technology encompasses a passivating (sealant) layer, a multilayered metal system, and uniquely designed metallization. The metallization consists of a contact of platinum silicide and a layered structure of titanium, platinum, and gold. The metallized pattern which is brought out to the grid, and the subsequent processing are designed to produce a chip in which the attaching leads extend over the edge of the chip. The processing procedure involves the removal of the silicon and the oxide in the grid to leave the beams cantilevered over

NOTES

1. Refer to Rules for Dimensioning Peripheral Lead Outlines.
2. e_A is basic distance from centerline of Z to centerline of first adjacent counter-clockwise beam position, e_B is basic distance from centerline of first adjacent counter-clockwise beam position, etc. Beam position located by e_A, e_B etc. lies at beam pattern if N_A etc. odd; at first counter-clockwise beam position from pattern if N_A etc. even.
3. N_A is the maximum quantity of lead positions on side "A", N_B on side "B" etc. Picture represents case where N = 22, $N_A = N_C = 5$ and $N_B = N_D = 6$. Applicable number of lead positions, both on each side and total, are as tabulated for each variation.
4. Leads shall be held within .001 total of True Position (TP) at Least Material Condition (LMC) and within .002 total of TP at Maximum Material Condition (MMC). Both location requirements to be checked at Z and Z_1 limits.
5. Number one lead position is counter-clockwise end lead position on a side of minimum width. This index lead shall be distinctively marked if existing; if not existing the first clockwise lead shall be so marked. Any projection shall not extend more than .002" over B maximum nor any notch less than .001 under B minimum.
6. N is the maximum quantity of lead positions.

Fig. 1— Terminal layout for all beam-lead devices. See data bulletins for specific information on individual devices.

the edge of the chip and available for easy attachment to a package or substrates.

RCA's beam lead technology consists of the following processes:

a) deposition of silicon nitride
b) contact openings
c) deposition and formation of conducting paths (contacts and interconnections)
d) circuit separation
e) bonding

A brief description of these processes follows.

deposition of silicon nitride

Silicon nitride which functions as the passivating (sealant) layer is deposited over the surface of the wafer following the diffusion and oxidation steps required to form the individual components of the device.

contact openings

After the entire wafer has been covered with the protective layer of silicon nitride, appropriate windows are opened both in this and the previously formed oxide layer to permit contact with the junction areas of the individual components.

deposition of contacts and interconnections

To integrate the individual components into the circuits, the exposed terminal areas are interconnected with gold leads formed by electroplating. The gold leads are underlaid with titanium, and platinum in that order, over a platinum silicide layer in the contact openings to attain a low-resistance ohmic contact to the silicon. Two electroplating steps are used to form both the gold metallization network and the gold beam leads by means of which appropriate circuit terminals can be connected to external electrical contacts.

circuit separation

A thinning and etching technique is next used to separate the completed circuit chip from the wafer in which they are formed. This separation involves removal of the silicon from the grids between the chips by a very precise chemical etching process which physically separates the circuits from each other but leaves them firmly held in a matrix position. In this position, the individual circuits can be evaluated by an automatic test set operating in conjunction with an automatic probe set.

beam-lead, bonding (See Fig. 2)

The actual bonding of the beam leads to a metallized package or a substrate is performed by a thermocompression technique as follows:

The chip is aligned to the generated pattern on the substrate using the precise techniques of an optical alignment system. The chip is positioned to a reference recticle in a microscope eyepiece.

Following alignment, the chip is picked up by a vacuum needle which is concentric with and mounted inside the bonding point. After the chip has been picked up, the substrate is moved up and aligned to the reference reticle image. Following the alignment of the chip and the substrate, the beam leads are bonded to the substrate contacts by a gold-to-gold bond using thermocompression. This technique involves the use of a preset force applied through the bonding tip which physically deforms the lead. With the addition of heat (about 300°C for 1 or 2 seconds) applied during the deformation, a thermocompression bond is effected. The integrity of the beam lead bonding operation is readily evaluated by both visual and mechanical inspection.

Any faulty chips can be rebonded. The most significant advantages of the beam lead technology are in this bonding process--

1. Manufacturing the silicon chip beam leads as an integral part of the device eliminates the necessity of bonding to the chip and immediately reduces the number of bonds to be made for an equivalent interconnection.
2. Furthermore, since each lead is an integral part of the contact and not a mechanically-made connection, the reliability of the circuit is greatly enhanced.
3. In addition, the single metal system gold-to-gold employed between contacts and leads not only obviates a reliability factor often associated with bonds with contacts made between dissimilar metals, but also insures a bond completely free from corrosion.
4. And finally, all bonds for a single chip can be made simultaneously providing both technical and economic advantages.

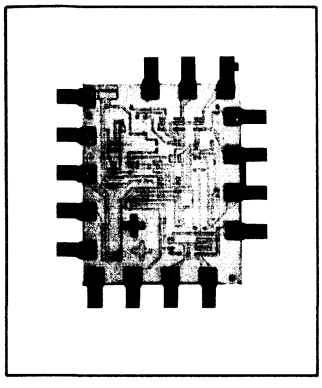
CA3015L



Beam-Lead Operational Amplifier

Applications

- Narrow-Band and Bandpass Amplifier
- Operational Functions
- Feedback Amplifier
- DC and Video Amplifier
- Multivibrator
- Oscillator
- Comparator
- Servo Driver
- Scaling Adder
- Balanced Modulator-Driver

The RCA CA3015L is the beam-lead version of the CA3015 operational amplifier family. The beam leads of this device are formed as an integral part of the IC chip during the batch fabrication process.

The CA3015L is particularly suited for applications in hybrid circuits where hermetic packaging, low cost, and reliable operation are prime considerations.

For applications of the CA3015 family of operational amplifiers see the companion Application Notes, ICAN-5290 "Integrated Circuit Operational Amplifiers", ICAN-5213 "Application of the RCA-CA3015, CA3016 Integrated Circuit Operational Amplifiers,"and ICAN-5015 "Application of the RCA-CA3008, CA3010 Integrated Circuit Operation Amplifiers".

CAUTION: ALTHOUGH RCA-CA3015L is electrically similar to CA3015, it is not a pin-for-pin replacement.

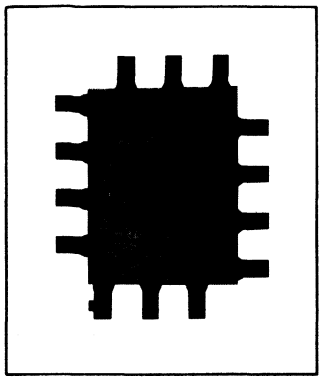
CA3018L



Beam-Lead General-Purpose Transistor Array

Two Isolated Transistors and a Darlington-Connected Transistor Pair

FOR LOW-POWER APPLICATIONS AT FREQUENCIES FROM DC THROUGH THE VHF RANGE

The CA3018L is a beam-lead version of the RCA CA3018 and consists of four general purpose silicon n-p-n transistors on a common monolithic substrate. The beam leads of this device are formed as an integral part of the IC chip during the batch fabrication process.

Two of the four transistors are connected in the Darlington configuration. The substrate is connected to a separate terminal for maximum flexibility.

The CA3018L is particularly suited for applications in hybrid circuits where hermetic packaging, low costs, and reliable operation are prime considerations. For applications of the general purpose transistors see RCA Application Note, ICAN-5296 "Application of the RCA CA3018 Integrated-Circuit Transistor Array".

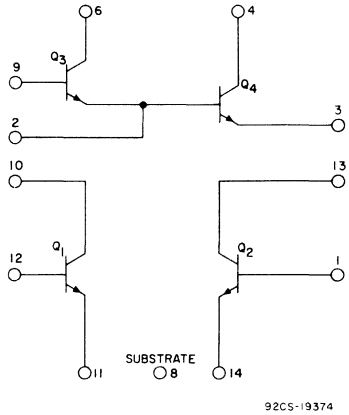


Fig. 2-1– Schematic diagram of CA3018L

Applications

- **General use in signal processing systems in DC through VHF range**
- **Custom designed differential amplifiers**
- **Temperature compensated amplifiers**

Features

- **Matched monolithic general purpose transistors**
- **h_{FE} matched ±10%**
- **V_{BE} matched ±5 mV**
- **Operation from DC to 120 MHz**
- **Wide operating current range**
- **Low noise figure – 3.4 dB typical at 1 KHz**
- **Operation over the full military temperature range: -55 to +125°C**

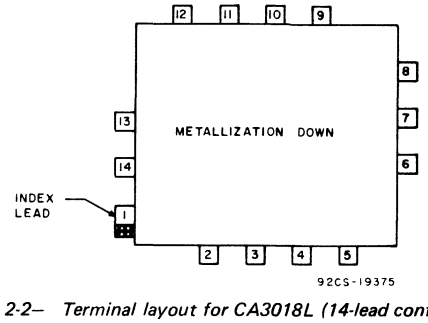

Fig. 2-2– Terminal layout for CA3018L (14-lead configuration)

CAUTION: ALTHOUGH RCA-CA3018L is electrically similar to CA3018, it is not a pin-for-pin replacement.

MAXIMUM RATINGS, *Absolute-Maximum Values, at* $T_A = 25^oC$

The following ratings apply for each transistor in the device:

Temperature Range:
- Operating ..... -55 to +125°C
- Storage ..... -65 to +150°C

Collector-to-Emitter Voltage, V_{CEO} ..... 15 V
Collector-to-Base Voltage, V_{CBO} ..... 20 V
Collector-to-Substrate Voltage, V_{CIO}* ..... 20 V
Emitter-to-Base Voltage, V_{EBO} ..... 5 V
Collector Current, I_C ..... 50 mA

*The collector of each transistor of CA3018L is isolated from the substrate by an integral diode. *The substrate (terminal 8) must be connected to the most negative point in the external circuit to maintain isolation between transistors and to provide for normal transistor action.*

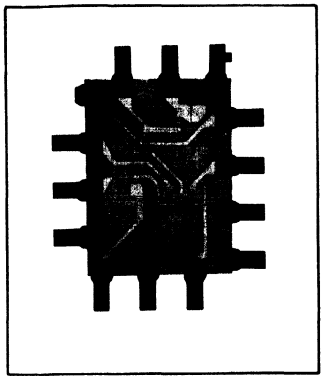
Monolithic Silicon

CA3028AL



Beam-Lead Differential/Cascode Amplifier

FOR COMMUNICATIONS AND INDUSTRIAL EQUIPMENT AT FREQUENCIES FROM DC to 120 MHz

Applications

- **RF and IF Amplifiers (Differential or Cascode)**
- **DC, Audio, and Sense Amplifiers**
- **Converter in the Commercial FM Band**
- **Oscillator • Mixer • Limiter**

RCA CA3028AL is the beam-lead version of the CA3028A family of differential/cascode amplifiers designed for use in communications and industrial equipment operating at frequencies from dc to 120 MHz. The beam leads of this device are formed as an integral part of the IC chip during the batch fabrication process.

The CA3028AL is particularly suited for applications in hybrid circuits where hermetic packaging, low cost, and reliable operation are prime considerations.

For applications of the CA3028AL see the companion Application Note ICAN-5337 "Application of the RCA CA3028 Integrated Circuit Amplifier in the HF and VHF Ranges".

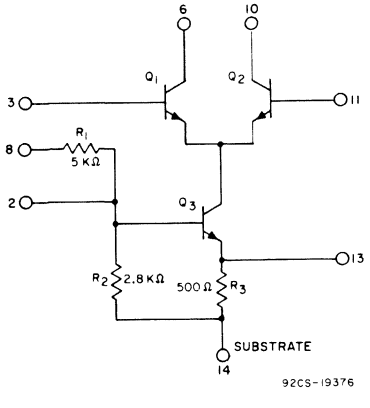


Fig. 3-1– Schematic diagram of CA3028AL

Features

- **Controlled for input bias current**
- **Balanced differential amplifier configuration with controlled constant-current source to provide unexcelled versatility**
- **Single- and dual-ended operation**
- **Operation from dc to 120 MHz**
- **Balanced-AGC capability**
- **Wide operating-current range**
- **Operation over the full military temperature range: -55 to +125°C**

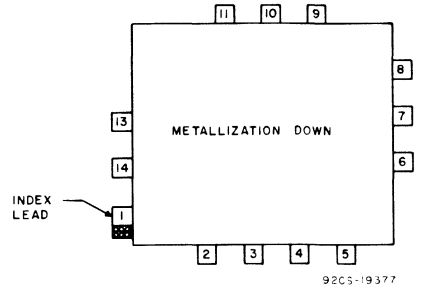

Fig. 3-2– Terminal layout for CA3028AL (14-lead configuration)

CAUTION: ALTHOUGH RCA-CA3028L is electrically similar to CA3028, it is not a pin-for-pin replacement.

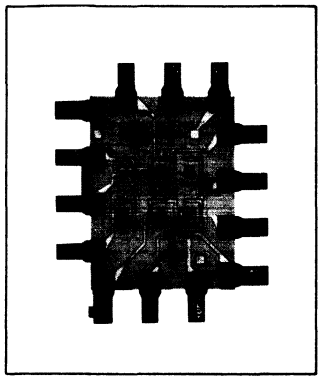
Linear Integrated Circuits

Monolithic Silicon

CA3039L



Beam-Lead Diode Array

6 Matched Diodes Ultra-Fast Low-Capacitance

FOR APPLICATIONS IN COMMUNICATIONS AND SWITCHING SYSTEMS

Applications

- **Balanced modulators or demodulators**
- **Ring modulators**
- **High speed diode gates**
- **Analog switches**

RCA CA3039L is the beam-lead version of the CA3039 which consists of six ultra-fast, low capacitance diodes on a common monolithic substrate. The beam leads of the device are formed as an integral part of the IC chip during the batch fabrication process.

CA3039L is particularly suited for applications in hybrid circuits where hermetic packaging, low cost and reliable operation are prime considerations.

Five of the diodes are independently accessible, the sixth shares a common terminal with the substrate.

For applications such as balanced modulators or ring modulators where capacitive balance is important, the substrate should be returned to a dc potential which is significantly more negative (with respect to the active diodes) than the peak signal applied.

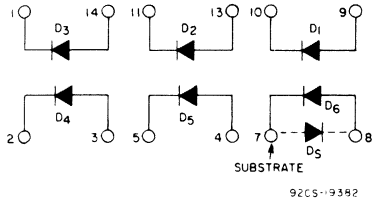


Fig. 4-1– Schematic diagram of CA3039L

Features

- **Excellent reverse recovery time 1 ns typ.**
- **Matched monolithic construction-V_F matched ±5 mV**
- **Low diode capacitance-C_D = 0.65 pF typical at V_R = -2 V**
- **Operation over the full military temperature range: -55 to +125°C**

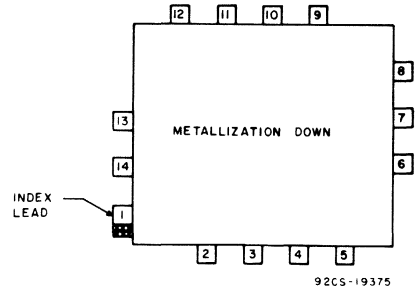

Fig. 4-2– Terminal layout for CA3039L (14-lead configuration)

CAUTION: ALTHOUGH RCA-CA3039L is electrically similar to CA3039, it is not a pin-for-pin replacement.

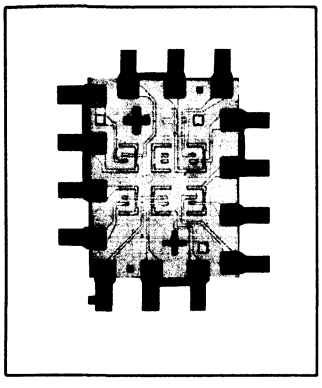
Monolithic Silicon

CA3045L



Beam-Lead General Purpose N-P-N Transistor Array

Three Isolated Transistors and One Differentially Connected Transistor Pair.

FOR LOW-POWER APPLICATIONS AT FREQUENCIES FROM DC THROUGH THE VHF RANGE

Applications

- General use in various types of signal processing systems operating anywhere in the frequency range from DC to VHF
- Custom designed differential amplifiers
- Temperature compensated amplifiers

RCA CA3045L is a beam-lead version of the CA3045 and contains an array of general-purpose transistors for use in signal-level applications at frequencies up to more than 120 MHz. The beam leads of this device are formed as an integral part of the IC chip during the batch fabrication process.

The CA3045L is particularly suited for use in hybrid type construction where compactness, hermeticity, ultra-reliability, and low cost are prime requirements. For suggested applications of transistor arrays, see RCA Application Note, ICAN-5296 "Application of the RCA-CA3018 Integrated-Circuit Transistor Array"; and RCA reprint ST-3859 "Design Ideas for RCA Linear Arrays".

Features

- Two matched pairs of transistors: V_{BE} matched ±5 mV, Input offset current 2 μA max. at I_C = 1 mA
- 5 general-purpose monolithic transistors
- Operation from DC to more than 120 MHz
- Wide operating current range
- h_{FE} (each transistor) = 100 typ. at V_{CE} = 3 V, I_C = 1 mA
- Low-noise figure: 3.2 dB typ. at 1 kHz
- Operation over the full military temperature range: -55 to +125°C

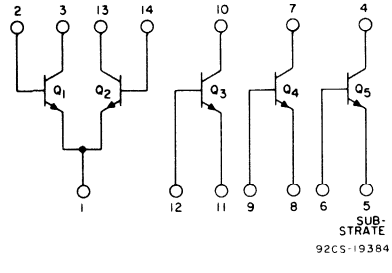


Fig. 5-1— Schematic diagram of CA3045L

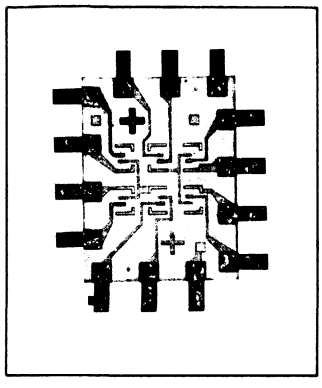
Monolithic Silicon

CA3054L



Beam-Lead Dual Independent Differential Amplifiers

FOR LOW-POWER APPLICATIONS AT FREQUENCIES FROM DC TO 120 MHz

Applications

- **Dual sense amplifiers**
- **Dual Schmitt triggers**
- **Multifunction combinations – RF/Mixer/Oscillators; Converter/IF**
- **IF amplifiers (differential and/or cascode)**
- **Product detectors**
- **Doubly-balanced modulators and demodulators**
- **Balanced quadrature detectors**
- **Cascade limiters**
- **Synchronous detectors**
- **Pairs of balanced mixers**
- **Synthesizer mixers**
- **Balanced (push-pull) cascode amplifiers**

The RCA CA3054L is the beam-lead version of the CA3054, and consists of two independent differential amplifiers with associated constant-current transistors on a common monolithic substrate. The beam leads of this device are formed as an integral part of the IC chip during the batch fabrication process.

The CA3054L is particularly suited for applications in hybrid circuits where hermetic packaging, low cost, and reliable operation are prime considerations.

Features

- **Two differential amplifiers on a common substrate**
- **Independently accessible inputs and outputs**
- **Maximum input offset voltage – ±5 mV**
- **Operation over the full military temperature range: -55 to +125°C**

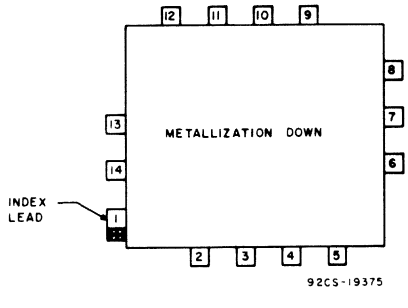


Fig. 6-1– Terminal layout for CA3054L (14-lead configuration)

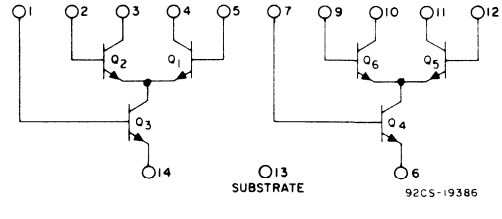

Fig. 6-2– Schematic diagram of CA3054L

CAUTION: ALTHOUGH RCA-CA3054L is electrically similar to CA3054, it is not a pin-for-pin replacement.

CAUTION: Substrate MUST be maintained negative with respect to all collector terminals of this device.

MAXIMUM RATINGS, *Absolute-Maximum Values, at* $T_A = 25^oC$

The following ratings apply for each transistor in the device:

Collector-to-Emitter Voltage, V_{CEO} . . . . . 15 V
Collector-to-Base Voltage, V_{CBO} . . . . . 20 V
Collector-to-Substrate Voltage, V_{CIO}* . . . . . 20 V
Emitter-to-Base Voltage, V_{EBO} . . . . . 5 V
Collector Current, I_C . . . . . 50 mA
Temperature Range:
Operating . . . . . -55 to +125°C
Storage . . . . . -65 to +150°C

*The collector of each transistor of the CA3054L is isolated from the substrate by an integral diode. *The substrate must be connected to a voltage which is more negative than any collector voltage in order to maintain isolation between transistors and provide for normal transistor action. The substrate should be maintained at signal (AC) ground by means of a suitable grounding capacitor, to avoid undesired coupling between transistors.*

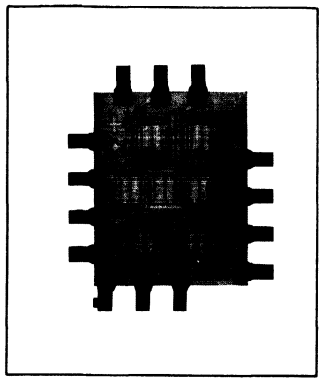
Linear Integrated Circuits

Monolithic Silicon

CA3084L



Beam-Lead General Purpose P-N-P Transistor Array

Applications

- General use in signal processing systems having low-power and low-frequency requirements
- Differential amplifiers
- Temperature compensated amplifiers
- Active loads for differential amplifiers using n-p-n transistors
- Complementary uses with RCA n-p-n transistor arrays

RCA CA3084L is the beam lead version of the CA3084, a general-purpose silicon p-n-p transistor array incorporating two independent transistors, a Darlington circuit, and a current-mirror pair with a shared diode. The beam leads of this device are formed as an integral part of the IC chip during the batch fabrication process.

The CA3084L is particularly suited for applications in hybrid circuits where hermetic packaging, low cost, and reliable operation are prime considerations.

The two independent transistors in the array may may be used in a variety of circuit applications. The Darlington pair may be employed as the equivalent of a single high-beta transistor. The current-mirror pair is well suited for constant-current applications and can also be used as the active loads in a differential amplifier which uses n-p-n transistors.

Features

- Matched transistor pair (Q1 and Q2)
  V_{IO} (V_{BE} matched): ±6.0 mV max.
  I_{IO} (at 100 μA): ±0.6 μA
- Wide operating current range
- Low noise figure – 3.2 dB typ. at 1 kHz
- Operation over the full military temperature range: -55 to +125°C

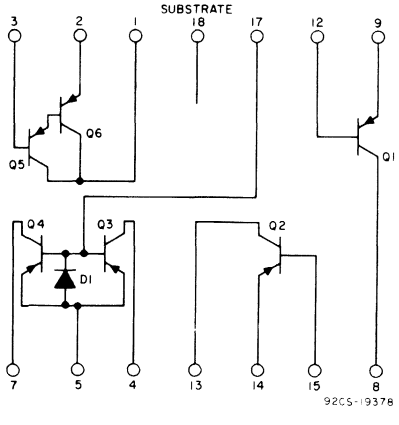


Fig. 7-1– Schematic diagram of CA3084L

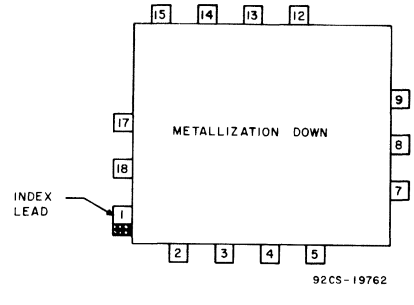

Fig. 7-2– Terminal layout for CA3084L (18-lead configuration)

CAUTION: ALTHOUGH RCA-CA3084L is electrically similar to CA3084, it is not a pin-for-pin replacement.

MAXIMUM RATINGS, *Absolute-Maximum Values at $T_A = 25^oC$*

The following ratings apply for each transistor in the device:

Collector-to-Emitter Voltage (V_{CEO}) . . . . . −40 V
Ambient Temperature Range:
Operating . . . . . -55° to +125°C
Storage . . . . . -65 to +150°C
Collector-to-Base Voltage (V_{CBO}) . . . . . −40V
Base-to-Substrate Voltage (V_{BIO})* . . . . . −40 V
Emitter-to-Base Voltage (V_{EBO}) . . . . . −40 V
Collector Current (I_C) . . . . . −10 mA

*The base of each transistor of the CA3084L is isolated from the substrate by an integral diode. *The substrate must be connected to a voltage which is more negative than any base voltage in order to maintain isolation between transistors and provide normal transistor action. To avoid undesired coupling between transistors, the substrate terminal 18 should be maintained at either DC or signal (AC) ground. A suitable bypass capacitor can be used to establish a signal ground.*

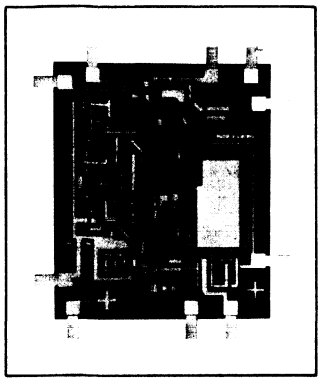
Monolithic Silicon

CA3741L



Beam-Lead Operational Amplifier

High-Gain Operational Amplifiers With Internal Phase Compensation

FOR MILITARY, INDUSTRIAL AND CONSUMER APPLICATIONS

Applications

- **Comparator**
- **Integrator or differentiator**
- **Summing amplifier**
- **DC amplifier**
- **Multivibrator**
- **Narrow-band or band-pass filter**

RCA CA3741L is the beam-lead version of the CA3741, a general purpose high-gain, monolithic operational amplifier which features internal phase compensation. In addition it provides output short-circuit protection, and latch-free operation. This type also features large common mode and differential mode signal ranges and has a low offset voltage and nulling capability. The CA3741L consists of a differential-input amplifier with an effectively double-ended output that drives a gain and level-shifting stage having a complementary emitter-follower output. The beam leads of this device are formed as an integral part of the IC chip during the batch fabrication process.

Features

- **No external phase compensation required.**
- **Open-loop voltage gain: 50,000 min.**
- **Input bias current: 500 nA max.**
- **Input offset current: 200 nA max.**
- **Input offset voltage: 5 mV max.**
- **Operation over the full military temperature range: -55 to +125°C**

Silicon MOS Transistors

For Amplifier, Mixer, & Oscillator Applications in Military & Industrial VHF Communications Equipment Operating up to 250 MHz

Applications

- **VHF amplifiers, mixers, converters and if-amplifiers in communication receivers.**
- **High-impedance timing circuits**
- **Detectors, oscillators, frequency multipliers, phase splitters, pulse stretchers and current limiters**
- **Electrometer amplifiers**
- **Voltage-controlled attenuators**
- **High impedance differential amplifiers**

RCA-3N128 and 3N143 are N-channel depletion-type silicon insulated-gate field-effect transistors utilizing the MOS* construction. The 3N128 is intended primarily for VHF amplifier service in military and industrial applications. It also is extremely well suited for use in dc and low-frequency amplifier applications requiring a transistor having high power gain, very high input impedance, and low gate leakage.

The 3N143 is designed for use as a VHF mixer and oscillator. Because of their improved transfer characteristic and increased dynamic range the 3N128 and 3N143 provide substantially better cross-modulation performance in linear amplifier applications than conventional (bipolar) transistors and are free from diode-current loading common to junction type FET's. These transistors are hermetically sealed in JEDEC TO-72 metal packages.

Application data for RCA-3N128, including biasing requirements, basic circuit configurations, selection of optimum operating point, and methods for automatic gain control are given in RCA Application Note AN-3193, "Application Considerations for the RCA-3N128 VHF MOS Field-Effect Transistor".

* Metal-Oxide-Semiconductor.

Performance Features

- **Large dynamic range**
- **Greatly reduces spurious responses in rceiver front ends**
- **Permits use of vacuum-tube biasing techniques**
- **Excellent thermal stability**
- **Superior crossmodulation capability**

Device Features

- **Low noise figure (3N128) – 3.5 dB typ. at 200 MHz**
- **High VHF amplifier gain (3N128) – 16 dB typ. at 200 MHz**
- **Low input capacitance – 5.5 pF typ.**
- **High transconductance – 7500 μmho typ.**
- **High input resistance – 10^{14} Ω typ.**
- **High conversion gain (3N143, mixer) – 13.5 dB typ. at 200 MHz**

Maximum Ratings, *Absolute-Maximum Values at* T_A = 25° C:

OPERATING CONSIDERATIONS

The flexible leads of the 3N128 and 3N143 are usually soldered to the circuit elements. As in the case of any high-frequency semiconductor device, the tips of soldering irons should be grounded, and appropriate precautions should be taken to protect the devices against high electric fields.

This device should not be connected into or disconnected from circuits with the power on because high transient voltages may cause permanent danage to the device.

MOS Field-Effect Transistors

3N138

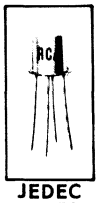
Applications

- Servo Amplifiers
- Telemetry Amplifiers
- Computer Operational Amplifiers
- Sampling Circuits
- Electrometer Amplifiers

Features

- excellent thermal stability
- zero inherent offset voltage
- low leakage current: 10 pA max.
- low "on" resistance — $r_{DS}(on)$ = 240Ω typ. (V_{GS} = 0V)
- high "off" resistance — $R_{DS}(off)$ = 10^{10}Ω typ.
- low feedback capacitance — C_{rss} = 0.18pF typ.
- low input capacitance — C_{iss} = 3pF typ.

SILICON INSULATED-GATE FIELD-EFFECT TRANSISTOR N-Channel Depletion Type



JEDEC TO-72

For Critical Chopper Applications and Multiplex Service up to 60 MHz: in Military Communications, Navigation, and Instrumentation Equipment in Industrial Instrumentation and Control Circuits

RCA-3N138‡ is a silicon, insulated-gate field-effect transistor of the N-channel depletion type, utilizing the MOS* construction. It is intended primarily for critical chopper and multiplex applications up to 60MHz.

The insulated gate provides a very high value of input resistance (10^{14} ohms typ.) which is relatively insensitive to temperature and is independent of gate-bias conditions (positive, negative, or zero bias). The 3N138 also features extremely low feed-through capacitance (0.18pF typ.) and zero inherent offset voltage.

The 3N138 is hermetically sealed in the JEDEC TO-72 package and features a gate metallization that covers the entire source-to-drain channel.

Maximum Ratings, Absolute-Maximum Values:

* In measurements of Offset Voltage, thermocouple effects and contact potentials in the measurement setup may cause erroneous readings of 1 microvolt or more. These errors may be minimized by the use of solder having a low thermal e.m.f., such as Leeds & Northrup No. 107-1.0.1, or equivalent.

OPERATING CONSIDERATIONS

The flexible leads of the 3N138 are usually soldered to the circuit elements. As in the case of any high-frequency semiconductor device, the tips of soldering irons should be grounded, and appropriate precautions should be taken to protect the device against high electric fields.

This device should not be connected into or disconnected from circuits with the power on because high transient voltages may cause permanent damage to the device.

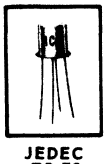
SILICON MOS TRANSISTOR

For Audio, Video, and RF Amplifier Applications in Military Communications, Instrumentation, & Navigation Equipment in Mobile and Fixed Communication Equipment in Industrial Instrumentation and Control Circuits



JEDEC TO-72

RCA 3N139+ is a silicon, insulated-gate field-effect transistor of the N-channel depletion type, utilizing the MOS* construction. It is a general purpose transistor especially suited for audio, video, and rf applications, and for wide-band amplifier designs. The insulated gate provides a very high input resistance (10^{14} Ω typ.) which is relatively insensitive to temperature and is independent of gate-bias conditions (positive, negative, or zero bias). The 3N139 also has a high transconductance, a low value of input capacitance (3 pF typ.), and a very low feedback capacitance (0.19 pF typ.).

The 3N139 is hermetically sealed in the standard 4-lead JEDEC TO-72 package.

FEATURES

- high input resistance $R_{GS} = 10^{14}$ Ω typ.
- low input capacitance $C_{iss} = 3$ pF typ.
- low feed back capacitance $C_{rss} = 0.2$ pF typ.
- low gate leakage current $I_{GSS} = 0.1$ nA typ.
- high drain-to-source voltage: +35 max. V

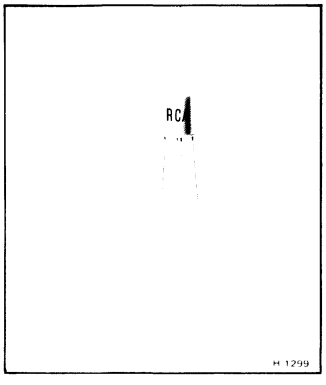
MOS Field-Effect Transistors

N-Channel Depletion Type

3N142



Silicon MOS Transistor

For Industrial and Military Applications to 175 MHz

Applications

- RF amplifier, Mixer, and Oscillator in:
  CB and Mobile Communication Receivers
  Aircraft and Marine Receivers
  CATV and MATV Equipment
- Industrial Control Circuits
- Variable Attenuators
- Current Limiters
- Instrumentation Equipment
- High-Impedance Timing Circuits

The-3N142 is a silicon, insulated-gate field-effect transistor of the N-channel depletion type utilizing the MOS■ construction.

The-3N142 is intended primarily for use as the rf amplifier in FM receivers and general amplifier applications at frequencies up to 175 MHz.

The wide dynamic range of the 3N142 reduces cross-modulation effects in AM receivers and minimizes the generation of spurious responses in FM receivers.

■ Metal-Oxide-Semiconductor

Performance Features

- Large dynamic range
- Enhanced signal-handling capability for low cross-modulation
- Dual-polarity gate permits positive and negative swing without degradation of input impedance
- Reduced spurious responses in FM receivers
- Permits use of vacuum-tube biasing techniques
- Excellent thermal stability for critical oscillator designs

Device Features

- High input resistance - 1000 megohms
- Low feedback capacitance - 0.35 pF max.
- Low noise figure - 2.5 dB typ.
- High useful power gain - neutralized - 16 dB min. at 100 MHz
- Hermetically sealed TO - 72 metal package

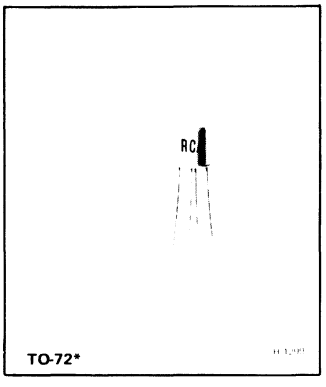
MOS Field-Effect Transistors

3N152



Silicon MOS Transistor

For Low-Noise RF Applications in Military & Industrial VHF Communications Equipment Operating up to 250 MHz

RCA-3N152 is an N-channel depletion-type silicon insulated gate field-effect transistor utilizing the MOS■ construction. It is intended primarily for VHF amplifier applications up to 250 MHz in military and industrial equipment.

Because of its improved transfer characteristic and exceptionally wide dynamic range, the 3N152 with the substrate in the reversed bias mode can provide substantially better cross-modulation performance in linear amplifier applications than conventional bipolar transistors. The insulated gate with its extremely low reverse (leakage) current eliminates the problem of diode-current loading of the input circuit under strong input conditions, which is common to junction-type FET's. These features in addition to low feedback capacitance permit the design of circuits providing superior high-frequency operation and high gain without neutralization. The 3N152 utilizes full-gate construction and is hermetically sealed in a JEDEC TO-72 metal package.

■ Metal-Oxide-Semiconductor.

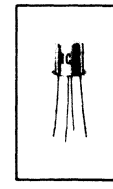
MOS Field-Effect Transistors

3N153

SILICON INSULATED GATE FIELD-EFFECT TRANSISTOR



JEDEC TO-72

N-Channel Depletion Type For Chopper and Multiplex Service In Communications, Navigation, and Instrumentation Equipment and in Industrial Control Circuits

RCA 3N153• is a silicon, insulated-gate field-effect transistor of the N-channel depletion type, utilizing the MOS* construction. It is intended primarily for critical chopper and multiplex applications up to 60 MHz.

The insulated gate provides a very high value of input resistance (10^{10} ohms typ) which is relatively insensitive to temperature and is independent of gate-bias conditions (positive, negative, or zero bias). The 3N153 also features extremely low feedback capacitance (0.34 pF typ) and virtually zero inherent offset voltage.

This transistor features a Terminal Arrangement in which the gate and source connections are interchanged to provide maximum isolation between the output (drain) and the input (gate) terminals. Although this new basing configuration does not appreciably change the measured device feedback capacitance, it permits the use of external inter-terminal shields to reduce the feedback due to external capacitances, particularly on printed circuit boards. This feature makes it possible to minimize feedthrough capacitance.

The 3N153 is hermetically sealed in the JEDEC TO-72 package and features a gate metallization that covers the entire source-to-drain channel.

At distance $\geq$ 1/32" to seating surface for 10 seconds max.	265	max.	°C

APPLICATIONS

- Choppers
- Multiplexers
- Servo Amplifiers
- Computer Operational Amplifiers
- Sampling Circuits
- Electrometer Amplifiers

FEATURES

- excellent thermal stability
- virtually zero inherent offset voltage
- low leakage current: 50 pA max.
- low "on" resistance — $r_{DS(on)}$ = 200 Ω typ.
- high "off" resistance — $R_{DS(off)}$ = 10^{10} Ω typ.
- low feedback capacitance — C_{rss} = 0.34 pF typ.
- low input capacitance — C_{iss} = 6 pF typ.

* In measurements of Offset Voltage, thermocouple effects and contact potentials in the measurement setup may cause erroneous readings of 1 microvolt or more. These errors may be minimized by the use of solder having a low thermal e.m.f., such as Leeds & Northrup No.107-1.0.1, or equivalent.

OPERATING CONSIDERATIONS

The flexible leads of the 3N153 are usually soldered to the circuit elements. As in the case of any high-frequency semiconductor device, the tips of soldering irons should be grounded, and appropriate precautions should be taken to protect the device against high electric fields.

This device should not be connected into or disconnected from circuits with the power on because high transient voltages may cause permanent damage to the device.

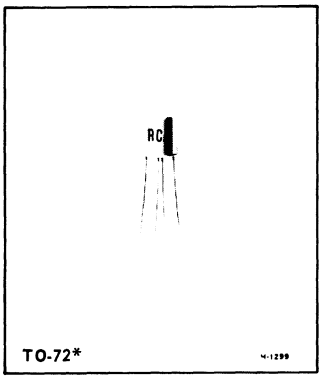
MOS Field-Effect Transistor

N-Channel Depletion Type

3N154



Silicon MOS Transistor

For Critical Amplifier Applications in Military & Industrial VHF Communications Equipment Operating up to 250 MHz

Device Feature:

- **Closely controlled I_{DSS} – 10 to 25 mA**
- **Low gate leakage current – I_{GSS} = 0.1 pA typ.**
- **Low feedback capacitance – C_{rss} = 0.25 pF typ.**
- **High forward transconductance – g_{fs} = 7500 μmho typ.**
- **High vhf power gain – G_{PS} = 16 dB typ. at 200 MHz**
- **Low vhf noise figure – NF = 3.5 dB typ. at 200 MHz**
- **Exceptionally good cross-modulation characteristics**

RCA 3N154 is an n-channel depletion-type silicon insulated-gate field-effect transistor utilizing the MOS■ construction. It is intended primarily for vhf amplifier applications up to 250 MHz in military and industrial equipment.

Because of its improved transfer characteristic and exceptionally wide dynamic range, the 3N154 can provide substantially better crossmodulation performance in linear amplifier applications than conventional bipolar transistors. The extremely low gate leakage current eliminates diode-current loading of the input circuit under strong signal conditions, a problem which is common to junction-type FET's. These features, in addition to low feedback capacitance, permit the design of circuits providing superior high-frequency operation and high gain without neutralization. The 3N154 utilizes full-gate construction and is hermetically sealed in a JEDEC TO-72 metal package.

■ Metal-Oxide-Semiconductor

Performance Features

- **Large dynamic range**
- **Greatly reduced spurious responses**
- **Permits use of vacuum-tube biasing techniques**
- **Excellent thermal stability**
- **Superior cross-modulation performance and greater dynamic range than bipolar transistors**

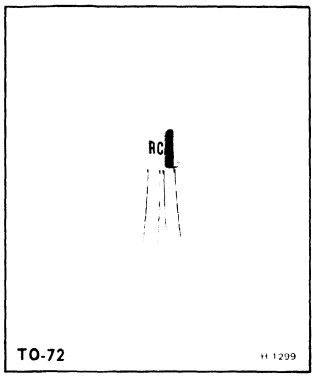
RCA Solid State Division

MOS Field-Effect Transistors

N-Channel Depletion Type

40467A



Silicon MOS Transistor

For VHF Tuners and Other VHF Amplifier Applications in Industrial & Commercial Electronic Equipment Operating up to 220 MHz

Device Features:

- **Low feedback capacitance - C_{rss} = 0.25 pF typ.**
- **High forward transconductance - g_{fs} = 7500 μmho typ.**
- **High vhf power gain - G_{PS} = 16 dB typ at 200 MHz**
- **Low vhf noise figure - NF = 3.5 dB typ at 200 MHz**
- **Exceptionally good cross-modulation characteristics**

Performance Features:

- **Large dynamic range**
- **Greatly reduced spurious responses**
- **Permits use of vacuum-tube biasing techniques**
- **Excellent thermal stability**
- **Superior cross-modulation performance and greater dynamic range than bipolar transistors**

RCA-40467A is an n-channel depletion-type silicon insulated-gate field-effect transistor utilizing the MOS■ construction. It is intended primarily for vhf-amplifier applications in industrial and commercial electronic equipment.

The 40467A is useful in vhf applications requiring devices capable of providing high useful power gains at frequencies up to approximately 220 MHz.

The 40467A features high forward transconductance, high dc gate-to-source resistance, and low feedback capacitance. Because of the improved transfer characteristic and increased dynamic range, the 40467A provides substantially better cross-modulation performance in linear-amplifier applications than conventional (bipolar) transistors and is free from diode-current loading, a problem that exists in junction type FET s. This device is hermetically sealed in the TO-72 metal case and utilizes full-gate construction.

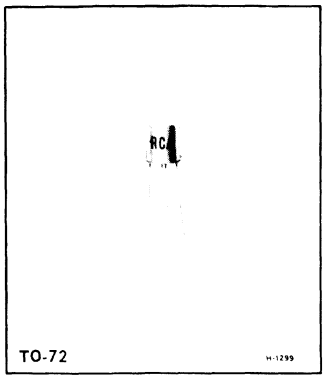
MOS Field-Effect Transistors

40468A
40559A



MOS Silicon Transistors

For RF Amplifier and Mixer Applications
in FM and AM/FM Receivers

Device Features:

- **high forward transconductance - -**
  gfs = 7500 μmho typ. for 40468A
- **low feedback capacitance - -**
  c_{rss} = 0.35 pF max. for 40468A
  0.38 pF max. for 40559A
- **high useful power gains - -**
  neutralized - 17 dB typ.
  unneutralized - 14 dB typ.
- **hermetically sealed in TO-72 metal package**

RCA-40468A and 40559A are silicon insulated-gate field-effect transistors of the n-channel depletion type utilizing the MOS* construction. They are intended primarily for use as the rf amplifier and mixer, respectively, in FM receivers covering the 88 to 108 MHz band, but can be used for general amplifier applications at frequencies up to 125 MHz. For circuit design and typical performance data refer to RCA Application Note AN3535 "An FM Tuner Using Single-Gate MOS Field-Effect Transistors as RF Amplifier and Mixer".

The wide dynamic range of these transistors reduces cross-modulation effects in AM receivers and minimizes the generation of spurious responses in FM receivers.

Operating as a neutralized amplifier at 100 MHz, the 40468A can provide a power gain of 17 dB (typ.). A power gain of 14 dB (typ.) can be realized without neutralization.

* Metal-Oxide-Semiconductor.

Performance Features:

- **reduced spurious responses in FM tuners**
- **reverse bias on substrate improves linearity**
- **reduced cross-modulation effects in AM receivers**

JEDEC TO-72

RCA-3N140 and 3N141* are n-channel silicon, depletion type, dual insulated-gate, field-effect transistors utilizing the MOS** construction. They have exceptional characteristics for rf-amplifier and mixer applications at frequencies up to 300 MHz. These transistors feature a series arrangement of two separate channels, each channel having an independent control gate.

The 3N140, used in a common-source configuration in which gate No.2 is ac grounded, reduces oscillator feedthrough to the antenna thereby minimizing oscillator radiation. The 3N141 provides excellent isolation between the oscillator and rf signals because each of the two signal frequencies being mixed has its own control element.

The mixing function performed by the 3N141 is unique in that the signal applied to gate No.2 is used to modulate the input-gate (gate No.1) transfer characteristic. This technique is superior to conventional "square law" mixing, which can only be accomplished in the nonlinear region of the device transfer characteristic.

The use of the 3N141 as described provides high useful conversion gains at all vhf frequencies, and the reduction in spurious responses is substantial and easily obtainable in simple circuits.

The 3N140 and 3N141 are hermetically sealed in metal JEDEC TO-72 packages.

* Formerly Dev. Nos. TA2644 and TA7274, respectively.

** Metal-Oxide-Semiconductor.

APPLICATIONS

- RF amplifier and mixer in military and industrial communications equipment
- aircraft and marine vehicular receivers
- CATV and MATV equipment
- telemetry and multiplex equipment

PERFORMANCE FEATURES

- wide dynamic range permits large-signal handling before overload
- dual-gate permits simplified agc circuitry
- virtually no agc power required
- greatly reduces spurious responses in fm receivers
- permits use of vacuum-tube biasing techniques
- excellent thermal stability
- superior cross-modulation performance and greater dynamic range than bipolar or single-gate FET's

DEVICE FEATURES

- low gate leakage currents - - I_{G1SS} & I_{G2SS} = 1 nA max. at T_A = 25°C
- high forward transconductance - - g_{fs} = 6000 μmho min.
- high unneutralized RF power gain - - G_{ps} = 16 dB min. at 200 MHz
- low VHF noise figure - - 4.5 dB max. at 200 MHz

OPERATING CONSIDERATIONS

The flexible leads of the 3N140 and 3N141 are usually soldered to the circuit elements. As in the case of any high-frequency semiconductor device, the tips of soldering irons should be grounded, and appropriate precautions should be taken to protect the devices against high electric fields.

These devices should not be connected into or disconnected from circuits with the power on because high transient voltages may cause permanent damage to the devices.

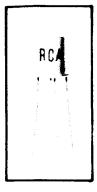
SILICON DUAL INSULATED-GATE FIELD-EFFECT TRANSISTORS



TO-72

N-Channel Depletion Types For VHF TV Receiver Applications

RCA 40600, 40601, and 40602* are n-channel depletion type, dual-insulated-gate, field-effect transistors utilizing the MOS construction. These devices have characteristics which make them highly desirable for rf-amplifier applications (40600), mixer applications (40601), and first-if-amplifier applications (40602) in vhf TV receivers and other types of commercial equipment operating at frequencies up to approximately 250 MHz.

These transistors feature a series arrangement of two separate channels, each channel having an independent control gate. In amplifier applications the 40600 and 40602 with their wide dynamic range provide substantially better cross-modulation performance than is obtainable with bipolar or single-gate field-effect transistors. In mixer applications the 40601 provides excellent isolation between the oscillator and rf signals because each of the two signal frequencies being mixed has its own control element. The wide dynamic range of the 40601 minimizes cross-modulation which is generally encountered in mixer stages.

Provision of two insulated gates also results in extremely low feedback capacitances (0.02 pF typ.), a feature which enables the 40600 and 40602 to provide high maximum useable power gains in unneutralized circuits – for example, 20 dB at 200 MHz typ. for the 40600, and 35 dB typ. at 44 MHz for the 40602. The gain of the rf and if stages can be controlled by applying agc voltage to gate No.2 and agc delay is easily obtained. Virtually no agc power is required for full gain reduction.

Types 40600, 40601, and 40602 are hermetically sealed in metal JEDEC TO-72 packages.

* Formerly dev. types TA7149, TA7262, TA7189, respectively.

APPLICATIONS

- **VHF TV Receiver**
  - **40600 for rf amplifier applications**
  - **40601 for mixer applications**
  - **40602 for first-if-amplifier applications**

PERFORMANCE FEATURES

- **superior cross-modulation performance and greater dynamic range than bipolar and single-gate field-effect transistors**
- **permits use of vacuum-tube biasing techniques**
- **excellent thermal stability**

DEVICE FEATURES

- **extremely low feedback capacitance**
  - C_{rss} = 0.02 pF typ.
- **high power gain**
  - MUG_u = 20 dB typ. for 40600
  - MAG = 35 dB typ. for 40602
  - MAG_c = 14 dB typ. for 40601

MOS Field-Effect Transistors

40603
40604

RCA 40603 and 40604* are n-channel silicon, depletion type, dual insulated-gate, field-effect transistors utilizing the MOS construction.

These devices have exceptional characteristics for rf-amplifier (40603) and mixer applications (40604) in FM tuners and other commercial equipment operating at frequencies up to approximately 150 MHz. These transistors feature a series arrangement of two separate channels, each channel having an independent control gate. For amplifier applications the 40603 with its wide dynamic range provides substantially better cross-modulation performance and relative freedom from spurious responses than is obtainable with bipolar or single-gate field-effect transistors. The mixing function performed by the 40604 is unique in that the signal applied to gate No.2 is used to modulate the input-gate (gate No.1) transfer characteristic. This technique is superior to conventional "square law" mixing, which can only be accomplished in the non-linear region of the device transfer characteristic.

Because of the low feedback capacitance (0.02 typ. pF) the 40603 can provide a power gain of 25 dB (typ.) at 100 MHz in an unneutralized amplifier circuit.

The gain of the rf stage can be controlled by applying agc voltage to gate No.2. Virtually no agc power is required for full gain reduction.

The 40603 and 40604 are hermetically sealed in JEDEC TO-72 packages.

* Formerly dev. types TA7150 and TA7151, respectively.

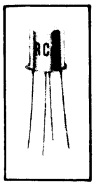
SILICON DUAL INSULATED-GATE FIELD-EFFECT TRANSISTORS



TO-72

N-Channel Depletion Types For FM Tuner Applications

PERFORMANCE FEATURES

- large dynamic range permits large-signal handling before overload
- dual gates allow product mixing with extremely low harmonic generation
- greatly reduces spurious responses in FM receivers
- permits use of vacuum-tube biasing techniques
- excellent thermal stability
- superior cross-modulation performance and greater dynamic range than bipolar and single-gate field-effect transistors

DEVICE FEATURES

- extremely low feedback capacitance
  C_{rss} = 0.02 pF typ.
- high unneutralized RF power gain
  MUG = 25 dB (typ.) for 40603
- low noise figure
  NF = 2.5 dB typ. for 40603

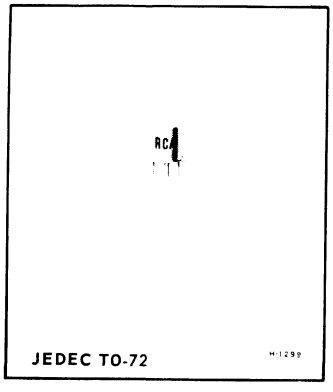
MOS Field-Effect Transistors

N-Channel Depletion Types

3N187



Silicon Dual Insulated-Gate Field-Effect Transistor

With Integrated Gate-Protection Circuits

For Military and Industrial Applications up to 300 MHz

Device Features

- Back-to-back diodes protect each gate against handling and in-circuit transients
- High forward transconductance — g_{fs} = 12,000 μmho (typ.)
- High unneutralized RF power gain — G_{ps} = 18 dB(typ.) at 200 MHz
- Low VHF noise figure — 3.5 dB(typ.) at 200 MHz

RCA-3N187● is an n-channel silicon, depletion type, dual insulated-gate field-effect transistor.

Special back-to-back diodes are diffused directly into the MOS▲ pellet and are electrically connected between each insulated gate and the FET's source. The diodes effectively bypass any voltage transients which exceed approximately ±10 volts. This protects the gates against damage in all normal handling and usage.

A feature of the back-to-back diode configuration is that it allows the 3N187 to retain the wide input signal dynamic range inherent in the MOSFET. In addition, the junction capacitance of these diodes adds little to the total capacitance shunting the signal gate.

The excellent overall performance characteristics of the RCA-3N187 make it useful for a wide variety of rf-amplifier applications at frequencies up to 300 MHz. The two serially-connected channels with independent control gates make possible a greater dynamic range and lower cross-modulation than is normally achieved using devices having only a single control element.

The two-gate arrangement of the 3N187 also makes possible a desirable reduction in feedback capacitance by operating in the common-source configuration and ac-grounding Gate No. 2. The reduced capacitance allows operation at maximum gain *without neutralization;* and, of special importance in rf-amplifiers, it reduces local oscillator feedthrough to the antenna.

The 3N187 is hermetically sealed in the metal JEDEC TO-72 package.

● Formerly developmental type TA7669
▲ Metal-Oxide-Semiconductor

Applications

- RF amplifier, mixer, and IF amplifier in military, and industrial communications equipment
- Aircraft and marine vehicular receivers
- CATV and MATV equipment
- Telemetry and multiplex equipment

Performance Features

- Superior cross-modulation performance and greater dynamic range than bipolar or single-gate FET's
- Wide dynamic range permits large-signal handling before overload
- Virtually no agc power required
- Greatly reduces spurious responses in FM receivers

- Telemetry and multiplex equipment

RCA-3N200♦ is an n-channel silicon, depletion type, dual insulated-gate field-effect transistor.

Special back-to-back diodes are diffused directly into the MOS▲ pellet and are electrically connected between each insulated gate and the FET's source. The diodes effectively bypass any voltage transients which exceed approximately ±10 volts. This protects the gates against damage in all normal handling and usage.

A feature of the back-to-back diode configuration is that it allows the 3N200 to retain the wide input signal dynamic range inherent in the MOSFET. In addition, the low junction capacitance of these diodes adds little to the total capacitance shunting the signal gate.

The excellent overall performance characteristics of the RCA-3N200 make it useful for a wide variety of rf-amplifier applications at frequencies up to 500 MHz. The two serially-connected channels with independent control gates make possible a greater dynamic range and lower cross-modulation than is normally achieved using devices having only a single control element.

The two-gate arrangement of the 3N200 also makes possible a desirable reduction in feedback capacitance by operating in the common-source configuration and ac-grounding Gate No. 2. The reduced capacitance allows operation at maximum gain *without neutralization;* and, of special importance in rf-amplifiers, it reduces local oscillator feedthrough to the antenna.

The 3N200 is hermetically sealed in the metal JEDEC TO-72 package.

Maximum Ratings, *Absolute-Maximum Values, at* $T_A = 25^oC$

DRAIN-TO-SOURCE VOLTAGE, V_{DS}	-0.2 to +20	V
GATE No.1-TO-SOURCE VOLTAGE, V_{G1S}:		
Continuous (dc)	-6 to +3	V
Peak ac	-6 to +6	V
GATE No.2-TO-SOURCE VOLTAGE, V_{G2S}:		
Continuous (dc)	-6 to 30% of V_{DS}	V
Peak ac	-6 to +6	V
* DRAIN-TO-GATE VOLTAGE, V_{DG1} OR V_{DG2}	+20	V
* DRAIN CURRENT, I_D	50	mA
* TRANSISTOR DISSIPATION, P_T:		
At ambient temperatures up to 25°C	330	mW
At ambient temperatures above 25°C	derate linearly at 2.2 mW/°C	
* AMBIENT TEMPERATURE RANGE:		
Storage and Operating	-65 to +175	°C
* LEAD TEMPERATURE (During soldering):		
At distances ≥ 1/32 inch from seating surface for 10 seconds max.	265	°C

*In accordance with JEDEC registration data format (JS-9 RDF-19A)

▲ Metal-Oxide-Semiconductor.

♦ Formerly developmental type TA7684

Performance Features

- Superior cross-modulation performance and greater dynamic range than bipolar or single-gate FET s
- Wide dynamic range permits large-signal handling before overload
- Dual-gate permits simplified agc circuitry
- Virtually no agc power required
- Greatly reduces spurious responses in FM receivers

Device Features

- Back-to-back diodes protect each gate against handling and in-circuit transients
- High forward transconductance — g_{fs} = 15,000 μmho (typ.)
- High unneutralized RF power gain — G_{ps} = 12.5 dB (typ.) at 400 MHz = 19 dB (typ.) at 200 MHz
- Low VHF noise figure — 3.9 dB (typ.) at 400 MHz 3.0 dB (typ.) at 200 MHz

JEDEC TO-72

Silicon Dual-Insulated-Gate Field-Effect Transistor

With Integrated Gate-Protection Circuits

For RF Amplifier Applications up to 250 MHz

Device Features

- back-to-back diodes protect each gate against handling and in-circuit transients
- high forward transconductance: g_{fs} = 12,000 μmho (typ.)
- high unneutralized RF power gain: G_{ps} = 18 dB (typ.) at 200 MHz
- low VHF noise figure: 3.5 dB (typ.) at 200 MHz
- low gate leakage currents: I_{G1SS} & I_{G2SS} = 50 nA at T_A = 25° C
- increased drain-to-source voltage rating: V_{DS} = −0.2 to +25 V

RCA-40819 is an n-channel silicon, depletion type, dual insulated-gate field-effect transistor (FET).

The excellent overall performance characteristics of the RCA-40819 make it useful for a wide variety of rf-amplifier applications at frequencies up to 250 MHz. The two serially-connected channels with independent control gates make possible a greater dynamic range and lower cross-modulation than is normally achieved using devices having only a single control element.

The two-gate arrangement of the 40819 also makes possible a desirable reduction in feedback capacitance by operating in the common-source configuration and ac grounding Gate No.2. The reduced capacitance allows operation at maximum gain *without neutralization* and reduces local oscillator feedthrough to the antenna – features of special importance in rf and if amplifiers.

Special back-to-back diodes are diffused directly into the MOS* pellet and are electrically connected between each insulated gate and the FET's source. The diodes effectively bypass any voltage transients which exceed approximately ±10 volts and protect the gates against damage in all normal handling and usage.

The back-to-back diode configuration permits the 40819 to retain the wide input signal dynamic range inherent in the MOSFET. In addition, the low junction capacitance of these diodes adds little to the total capacitance shunting the signal gate.

Applications

- RF amplifier, mixer, and IF amplifier in military, industrial, and consumer communications equipment
- aircraft and marine vehicular receivers
- CATV and MATV equipment
- telemetry and multiplex equipment

Performance Features

- superior cross-modulation performance and greater dynamic range than bipolar or single-gate FET s
- wide dynamic range permits large-signal handling before overload
- virtually no agc power required
- greatly reduces spurious responses in FM receivers
- dual gate permits simplified AGC circuitry

The 25-volt drain-to-source rating permits the use of higher voltage power supplies.

The 40819 is hermtically sealed in the metal JEDEC TO-72 package.

*Metal-Oxide-Semiconductor

Maximum Ratings

Continuous Working Voltage#, at T_A = 25°C:

Gate No.1-to-Source Voltage, V_{G1S}	−6 to +3	V
Gate No.2-to-Source Voltage, V_{G2S}	−6 to +6 or 40% of V_{DS} (whichever value is less)	V
Drain-to-Gate Voltage, V_{DG1} or V_{DG2}	+25	V

#Continuous Working Voltage Ratings must be observed to maintain device characteristics. These ratings are based on long-term continuous voltage operation but may be exceeded for short durations (e.g. testing of device characteristics), provided the absolute Maximum Ratings are not exceeded.

Absolute Maximum Values, at T_A = 25°C:

Drain-to-Source Voltage, V_{DS}	−0.2 to +25	V
Gate Terminal Current, I_{G1S} or I_{G2S}	±100	μA
Drain-to-Gate Voltage, V_{DG1} or V_{DG2}	+31	V
Drain Current, I_D	50	mA
Transistor Dissipation, P_T:		
At T_A up to 25°C	330	mW
At T_A above 25°C	derate linearly 2.2 mW/°C	
Ambient Temperature Range:		
Operating and Storage	−65 to +175	°C
Lead Temperature (During Soldering):		
At distances 1/32 in from seating surface for 10 s max.	265	°C

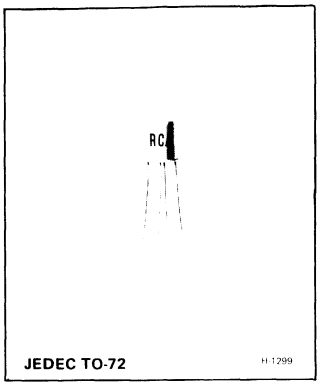
Division

MOS Field-Effect Transistors

N-Channel Depletion Types

40820—40821



Silicon Dual-Insulated-Gate Field-Effect Transistors

With Integrated Gate-Protection Circuits
For VHF-TV Tuner Applications

40820 – RF Amplifier **40821** – Mixer

Device Features

- back-to-back diodes protect each gate against handling and in-circuit transients
- high forward transconductance: g_{fs} = 12,000 μmho (typ.)
- high unneutralized RF power gain: G_{ps} = 17 dB (typ.) at 200 MHz (40820)
- low VHF noise figure: 3.5 dB (typ.) at 200 MHz (40820)
- low gate leakage currents: I_{G1SS} & I_{G2SS} = 50 nA

RCA-40820 and 40821 are n-channel silicon, depletion type, dual-insulated-gate, MOS▲ field-effect transistors for RF amplifier (40820) and mixer (40821) applications in VHF-TV receivers and other commercial equipment operating at frequencies up to 250 MHz.

These devices designed for VHF performance, provide excellent power gain, low-noise figures and have wide dynamic range. The dual-gate feature offers good cross-modulation performance over the AGC range and reduces feedback capacitance by shielding Gate No. 1 from the drain. The very low feedback capacitance also eliminates the need for circuit neutralization and reduces local oscillator feed-through to the antenna.

Virtually no AGC power is required because of the high gate input resistance of the MOS FET types. Automatic AGC delay can be achieved with a very slight change in the input impedance by the application of AGC voltage to Gate No. 2.

▲ Metal-Oxide-Semiconductor.

Performance Features

- superior cross-modulation performance and greater dynamic range than bipolar or single-gate FET s
- wide dynamic range permits large-signal handling before overload
- virtually no agc power required
- dual gate permits simplified AGC circuitry

The dual-gate arrangement also makes it possible to isolate the local oscillator signal from the incoming signal by applying each signal to a separate gate.

Integral back-to-back diodes protect the gates against damage in normal handling and usage by limiting transient voltages that exceed ±10 volts. The 40820 and 40821 are hermetically sealed in metal JEDEC TO-72 packages.

Silicon Dual-Insulated-Gate Field-Effect Transistors

With Integrated Gate-Protection Circuits

For FM Tuner Applications

40822 – RF Amplifier **40823** – Mixer

Device Features

- back-to-back diodes protect each gate against handling and in-circuit transients
- high forward transconductance: g_{fs} = 12,000 μmho (typ.)
- high unneutralized RF power gain: G_{ps} = 24 dB (typ.) at 100 MHz (40822)
- low VHF noise figure: 2 dB (typ.) at 100 MHz (40822)
- low gate leakage currents: I_{G1SS} & I_{G2SS} = 50 nA at T_A = 25°C

RCA-40822 and 40823 are n-channel silicon, depletion type, dual-insulated-gate, field-effect transistors for RF amplifier (40822) and mixer (40823) applications in FM receivers and other commercial equipment operating at frequencies up to 150 MHz.

These devices designed for VHF performance, provide excellent power gain, low-noise figures and have wide dynamic range. The dual-gate feature offers good cross-modulation performance over the AGC range and reduces feedback capacitance by shielding Gate No. 1 from the drain. The very low feedback capacitance also eliminates the need for circuit neutralization and reduces local oscillator feed-through to the antenna.

Virtually no power is required in AGC utilizing the 40822 and 40823. In addition, these devices minimize input impedance variations and automatically achieve AGC delay when AGC is applied to Gate No. 2. The dual-gate arrangement also makes it possible to isolate the local oscillator signal from the incoming signal by applying each signal to a specific gate.

Performance Features

- superior cross-modulation performance and greater dynamic range than bipolar or single-gate FET's
- wide dynamic range permits large-signal handling before overload
- virtually no agc power required
- greatly reduces spurious responses in FM receivers
- dual gate permits simplified AGC circuitry

Back-to-back diodes, diffused directly into the MOS pellet, protect the gates against damage in normal handling and usage by limiting transient voltages that exceed +10 volts. The 40822 and 40823 are hermetically sealed in metal JEDEC TO-72 packages.

Maximum Ratings

	40822	40823	
Continuous Working Voltage#, at T_A = 25°C:			
Gate No. 1-to-Source Voltage, V_{G1S}	−6 to +3	−4.5 to +3	V
Gate No. 2-to-Source Voltage, V_{G2S}	-6 to +6 or 40% of V_{DS} (whichever value is less)	-4.5 to +4.5 or 40% of V_{DS} (whichever value is less)	V
Drain-to-Gate Voltage, V_{DG1} or V_{DG2}	+20	+20	V
Absolute Maximum Values, at T_A = 25°C:			
Drain-to-Source Voltage, V_{DS}	−0.2 to +18	−0.2 to +18	V
Gate Terminal Current, I_{G1S} or I_{G2S}	±100	±100	μA
Drain-to-Gate Voltage, V_{DG1} or V_{DG2}	+24	+22.5	V
Drain Current, I_D	50	50	mA
Transistor Dissipation:			
At T_A up to 25°C	330	330	mW
At T_A above 25°C	derate linearly 2.2 mW/°C		
Ambient Temperature Range:			
Operating and Storage	−65 to +175	−65 to +175	°C
Lead Temperature (During Soldering):			
At distances 1/32 in from seating surface for 10 s max.	265	265	°C

Continuous Working Voltage Ratings must be observed to maintain device characteristics. These ratings are based on long-term continuous voltage operation but may be exceeded for short durations (e.g. testing of device characteristics), provided the Absolute Maximum Ratings are not exceeded.

40841

JEDEC TO-72 H-1299

Silicon Dual-Insulated Gate Field-Effect Transistor

With Integrated Gate-Protection Circuits

General-Purpose Economy Type for Applications from DC to 500 MHz

Applications:

- DC amplifiers
- RF amplifiers
- mixers
- IF amplifiers
- video amplifiers
- differential amplifiers
- frequency multipliers
- choppers
- voltage-controlled attenuators
- constant-current source
- voltage regulators
- telemetry & multiplex
- servo amplifiers
- proximity switches
- phase splitters
- thyristor trigger circuits
- industrial timers – long time delays

RCA-40841* is an n-channel silicon, depletion type, dual-insulated gate, field-effect transistor intended for general-purpose applications from DC to frequencies up to 500 MHz.

This MOS/FET provides excellent power gain, linear-circuit operation and has a wide dynamic operating range. Its square-law characteristics result in low cross-modulation performance over the AGC range. Its dual-gate construction reduces feedback capacitance by shielding Gate No. 1 from the drain, and makes it possible to isolate the local oscillator signal from the incoming signal bv applying the two signals to separate gates. The very low feedback capacitance of this device eliminates the need for neutralization in circuits using the dual-gate configuration. Use of the device in the RF input stage of a receiver reduces local oscillator feed-through to the antenna. The 40841 requires negligible AGC power, provides automatic delay when AGC is applied to Gate No. 2, and exhibits slight input impedance variations during AGC functioning. The device has exceptionally high input impedance, an attribute for timing-circuit design.

Back-to-back diodes are fabricated on the same monolithic silicon pellet as the MOS/FET to protect the gates against damage due to electrostatic charges frequently encountered during normal handling. These back-to-back diodes also function as "transient trappers" by limiting in-circuit transient voltages that exceed ±10 volts.

Maximum ratings and electrical characteristics are included in the data for operation of the 40841 as the equivalent of a single-gate device. For single-gate operation, connect Gate No. 1 (Term. 2) to Gate No. 2 (Term. 3), as shown in the Terminal Diagrams on Page 2. The 40841 MOS/FET is hermetically sealed in the metal JEDEC TO-72 package.

The following dual-gate MOS/FET types are specified for applications requiring premimum-grade performance: 3N200, 3N187, 40673, 40819, 40820, 40821, 40822, and 40823.

Device Features:

- back-to-back diodes protect gate insulation against damage due to static changes frequently encountered during handling
- high forward transconductance: g_{fs} = 12,000 μmho (typ.)
- high power gain: G_{ps} = 32 dB (typ.) at 44 MHz
- gate leakage currents: I_{G1SS} and I_{G2SS} = 60 nA (max.) at T_A = 25°C
- high input impedance
- excellent thermal stability

Performance Features:

- superior cross-modulation performance and greater dynamic range than bipolar and junction-gate FETs
- wide dynamic range permits large-signal handling before overloading
- virtually no agc power required
- greatly reduced spurious responses in AM and FM receivers
- dual-gate configuration permits simplified AGC circuitry
- operates at frequencies to 500 MHz without neutralization in circuits utilizing the dual-gate configuration
- operates up to UHF with low-noise performance

Detailed information, utilizing RCA dual-gate protected MOS/FETs in RF applications, is given in the following RCA Application Notes: AN-4431 "RF Applications of the Dual-Gate MOS/FET up to 500 MHz" and AN-4018 "Design of Gate-Protected MOS Field-Effect Transistors".

* Formerly Developmental Type TA8242.

Maximum Ratings	**Dual-Gate Configuration**	**Single-Gate Configuration**	
Absolute Maximum Values, at T_A = 25°C:			
Drain-to-Source Voltage, V_{DS}	−0.2 to +18	−0.2 to +18	V
Gate Terminal Current, I_{G1S} or I_{G2S}	±100	–	μA
Gate Terminal Current, I_{GS}	–	±100	μA
Drain-to-Gate Voltage, V_{DG1} or V_{DG2}	+24	–	V
Drain-to-Gate Voltage, V_{DG}	–	+24	V
Drain Current, I_D	50	50	mA
Transistor Dissipation:			
At T_A up to 25°C	330	330	mW
At T_A above 25°C	derate linearly 2.2 mW/°C		
Ambient Temperature Range:			
Operating and Storage	−65 to +175	−65 to +175	°C
Lead Temperature (During Soldering):			
At distances 1/32 in from seating surface for 10 s max.	265	265	°C
Continuous Working Voltage#, at T_A = 25°C:			
Gate No. 1-to-Source Voltage, V_{G1S}	−4.5 to +3	–	V
Gate No. 2-to-Source Voltage, V_{G2S}	-4.5 to +4.5 or 40% of V_{DS} (whichever value is less)	–	V
Gate-to-Source Voltage, V_{GS}	–	−4.5 to +3	V
Drain-to-Gate Voltage, V_{DG1} or V_{DG2}	+20	–	V
Drain-to-Gate Voltage, V_{DG}	–	+20	V

#Continuous Working Voltage Ratings must be observed to maintain device characteristics. These ratings are based on long-term continuous voltage operation but may be exceeded for short durations (e.g. testing of device characteristics), provided the Absolute Maximum Ratings are not exceeded.

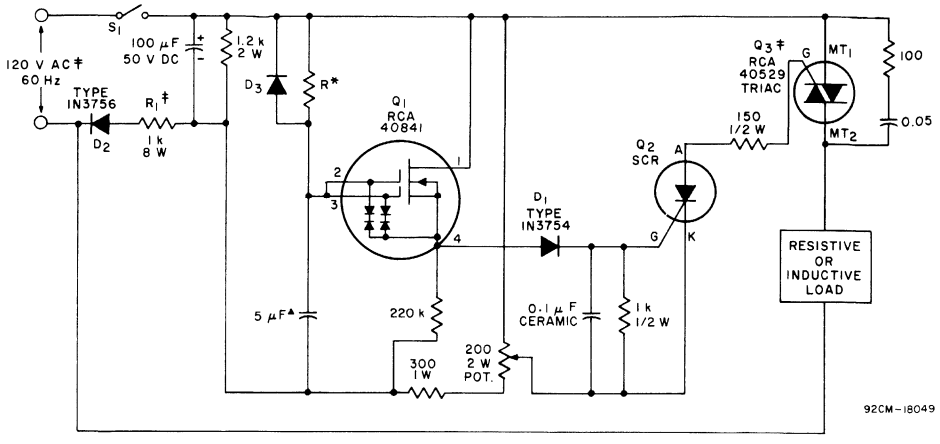
SOLID-STATE TIMER FOR INDUSTRIAL APPLICATIONS



▲ Cornell-Dubilier Electronics—Type MMW or equivalent.

* R controls duration of time delay. At R = 60 MΩ up to 5-minute delay (IRC resistor, Type CGH or equivalent)

‡ This circuit can also be used at supply voltages of 240 V AC and 24V AC (60Hz) by changing the values of R1 and Q3.

TIMING CIRCUIT CHARACTERISTICS

T_A = −25°C to +60°C

Accuracy: ±10% (over temperature)

Repeatability: ±3% (at 25°C)

Reset Time: Less than 150 ms

Q2: V_{DRM} = 60V, I_{GT} = 200μA, I_T = 0.8A

D3: I_R = 1 nA, V_R = 60V

Fig.12—Typical timing circuit utilizing the 40841 in a single-gate configuration.

OPERATING CONSIDERATIONS

The flexible leads of the 40841 are usually soldered to the circuit elements. As in the case with any high-frequency semiconductor device, the tips of soldering irons MUST be grounded.

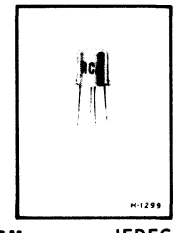
RCA Solid State Division

MOS Field-Effect Transistors

40673

SILICON DUAL INSULATED-GATE FIELD-EFFECT TRANSISTOR

N-Channel Depletion Type With Integrated Gate-Protection Circuits For RF Amplifier Applications up to 400 MHz



JEDEC TO-72

RCA-40673 is an n-channel silicon, depletion type, dual insulated-gate field-effect transistor.

Special back-to-back diodes are diffused directly into the MOS* pellet and are electrically connected between each insulated gate and the FET's source. The diodes effectively bypass any voltage transients which exceed approximately ±10 volts. This protects the gates against damage in all normal handling and usage.

A feature of the back-to-back diode configuration is that it allows the 40673 to retain the wide input signal dynamic range inherent in the MOSFET. In addition, the low junction capacitance of these diodes adds little to the total capacitance shunting the signal gate.

The excellent overall performance characteristics of the RCA-40673 make it useful for a wide variety of rf-amplifier applications at frequencies up to 400 MHz. The two serially-connected channels with independent control gates make possible a greater dynamic range and lower cross-modulation than is normally achieved using devices having only a single control element.

The two gate arrangement of the 40673 also makes possible a desirable reduction in feedback capacitance by operating in the common-source configuration and ac-grounding Gate No. 2. The reduced capacitance allows operation at maximum gain *without neutralization;* and, of special importance in rf-amplifiers, it reduces local oscillator feedthrough to the antenna.

The 40673 is hermetically sealed in the metal JEDEC TO-72 package.

*Metal-Oxide-Semiconductor.

Maximum Ratings, *Absolute-Maximum Values, at T_A = 25°C*

DRAIN-TO-SOURCE VOLTAGE, V_{DS}	-0.2 to +20	V
GATE No.1-TO-SOURCE VOLTAGE, V_{G1S}:

Peak ac	-6 to +6	V
GATE No.2-TO-SOURCE VOLTAGE, V_{G2S}:		
Continuous (dc)	-6 to 30% of V_{DS}	V
Peak ac	-6 to +6	V
DRAIN-TO-GATE VOLTAGE, V_{DG1} OR V_{DG2}	+20	V
DRAIN CURRENT, I_D	50	mA
TRANSISTOR DISSIPATION, P_T:		
At ambient temperatures up to 25°C	330	mW
At ambient temperatures above 25°C	derate linearly at 2.2 mW/°C	
AMBIENT TEMPERATURE RANGE:		
Storage and Operating	-65 to +175	°C
LEAD TEMPERATURE (During soldering):		
At distances ≥ 1/32 inch from seating surface for 10 seconds max.	265	°C

APPLICATIONS

- RF amplifier, mixer, and IF amplifier in military, industrial, and consumer communications equipment
- aircraft and marine vehicular receivers
- CATV and MATV equipment
- telemetry and multiplex equipment

PERFORMANCE FEATURES

- superior cross-modulation performance and greater dynamic range than bipolar or single-gate FET s
- wide dynamic range permits large-signal handling before overload
- dual-gate permits simplified agc circuitry
- virtually no agc power required
- greatly reduces spurious responses in fm receivers
- permits use of vacuum-tube biasing techniques
- excellent thermal stability

DEVICE FEATURES

- back-to-back diodes protect each gate against handling and in-circuit transients
- low gate leakage currents —— I_{G1SS} & I_{G2SS} = 20 nA(max.) at T_A = 25°C
- high forward transconductance —— g_{fs} = 12,000 μmho (typ.)
- high unneutralized RF power gain —— G_{ps} = 18 dB(typ.) at 200 MHz
- low VHF noise figure —— 3.5 dB(typ.) at 200 MHz

Division

Solid State Devices

Discontinued Types

This bulletin gives basic data for RCA Solid State Devices not recommended for new equipment design. These devices are classified into two categories:

(1) Devices that are no longer being manufactured by RCA and are available only to the extent of limited inventory.

(2) Devices that have recently been discontinued and are not available from RCA.

SYMBOL DEFINITIONS

A_{OL}	voltage gain, open loop
CMR	common-made rejection ratio
f_T	gain-bandwidth product
h_{FE}	static forward current transfer ratio
h_{fe}	small-signal forward current transfer ratio
i_{FM}	peak forward current
P_T	transistor dissipation
R_{OUT}	output resistance
t_{PHL}	high-to-low level propagation delay time
t_{PLH}	low-to-high level propagation delay time
V_{CEO}	collector-to-emitter voltage
$V_{CE(sat)}$	collector-to-emitter saturation voltage
V_{IO}	input offset voltage
V_{OH}	high-level output voltage
V_{OL}	low-level output voltage
V_{RM}	peak reverse voltage

PLEASE NOTE:

If you are presently receiving the RCA monthly announcement newsletter "What's New In Solid State", it is not necessary to send in this form . . . your name is already on the mailing list and a duplicate submission will only create problems.

If you purchased your DATABOOK(s) directly from RCA, it is not necessary to send in the form . . . your name was added to the newsletter mailing list at the time your purchase was recorded.

If you are not presently receiving the newsletter and have obtained one or more DATABOOKS from a source other than RCA, please fill out just one copy of the following form, detach it, and mail to RCA:

(a) from North and South America and Far East, mail to RCA Solid State Division, Box 3200, Somerville, N.J. 08876.

(b) from United Kingdom, mail to RCA Limited, Lincoln Way, Windmill Road, Sunbury-on-Thames, Middlesex, England.

(c) from Europe, Middle East and Africa, mail to RCA S/A Parc-Industriel des Hauts-Sarts, Herstal, Liege, Belgium.

Name (First) (Middle) (Last)

Company

Address (Number) (Street, RFD, P.O. Box)

Home ☐
Business ☐ (City) (State or Prov.)

(Country) (Zip or Pstl. Zone)

Job Function _____

Product Area of Interest _____

Company End Product _____
