

# TDC1047

## Monolithic Video A/D Converter

### 7-Bit, 20 Msps

#### Features

- 7-bit resolution
- 1/2 LSB linearity
- Sample-and-hold circuit not required
- 20 Msps conversion rate
- Selectable output format
- Available in 24-pin CERDIP

#### Applications

- Low-cost video digitizing
- Medical imaging
- TV special effects
- Video simulators
- Radar data conversion

#### Description

The TDC1047 is a 20 Msps (Megasample per second) full-parallel (flash) analog-to-digital converter, capable of converting an analog signal with full-power frequency components up to 7 MHz into 7-bit digital words. Use of a sample-and-hold circuit is not necessary. All digital inputs and outputs are TTL compatible.

The TDC1047 consists of 127 clocked latching comparators, combining logic, and an output buffer register. A single convert signal controls the conversion operation. The unit can be connected to give either true or inverted outputs in binary or offset two's complement coding.

The TDC1047 is pin and function compatible with the TDC1027, and offers increased performance with lower power dissipation.

#### Block Diagram

## Functional Description

### General Information

The TDC1047 has three functional sections: a comparator array, encoding logic, and output latches. The comparator array compares the input signal with 127 reference voltages to produce an N-of-127 code (sometimes referred to as a “thermometer” code, as all the comparators referred to voltages more positive than the input signal will be off, and those referred to voltages more negative than the input signal will be on). The encoding logic converts the N-of-127 code into binary or offset two’s complement coding, and can invert either output code. This coding function is controlled by DC signals on pins NMINV and NLINV. The output latch holds the output constant between updates.

### Power

The TDC1047 operates from two supply voltages, +5.0V and -5.2V. The return for ICC, the current drawn from the +5.0V supply, is DGND. The return for IEE, the current drawn from the -5.2V supply, is AGND. All power and ground pins must be connected.

### Reference

The TDC1047 converts analog signals in the range  $V_{RB} \leq V_{IN} \leq V_{RT}$  into digital form.  $V_{RB}$  (the voltage applied to the pin at the bottom of the reference resistor chain) and  $V_{RT}$  (the voltage applied to the pin at the top of the reference resistor chain) should be between +0.1V and -1.1V.  $V_{RT}$  should be more positive than  $V_{RB}$  within that range. The voltage applied across the reference resistor chain ( $V_{RT} - V_{RB}$ ) must be between 0.8V and 1.2V. The nominal voltages are  $V_{RT} = 0.00V$  and  $V_{RB} = -1.00V$ . These voltages may be varied dynamically up to 7MHz. Due to variation in the reference currents with clock and input signals,  $R_T$  and  $R_B$  should be low-impedance-to-ground points. For circuits in which the reference is not varied, a bypass capacitor to ground is recommended. If the reference inputs are exercised dynamically as in an Automatic Gain Control (AGC) circuit, a low-impedance reference source is recommended.

## Pin Assignments

### 24 Lead Ceramic DIP

|             |      |      |             |

65-1047-02

### Controls

Two function control pins, NMINV and NLINV are provided. These controls are for DC (i.e., steady state) use. They permit the output coding to be either straight binary or offset two’s complement, in either true or inverted sense, according to the Output Coding Table. These pins are active LOW as signified by the prefix “N” in the signal name. They may be tied to  $V_{CC}$  for a Logic 1 and DGND for a Logic 0.

### Convert

The TDC1047 requires a CONVert (CONV) signal. A sample is taken (the comparators are latched) within the Sampling Time Offset ( $t_{STO}$ ) of a rising edge on the CONV pin. The 127 to 7 encoding is performed on the falling edge of the CONV signal. The coded result is transferred to the output latches on the next rising edge. The outputs hold the previous data a minimum time ( $t_{HO}$ ) after the rising edge of the CONV signal. This permits the previous conversion result to be acquired by external circuitry at that rising edge, i.e., data for sample N is acquired by the external circuitry while the TDC1047 is taking input sample N+2.

### Analog Input

The TDC1047 uses strobed latching comparators which cause the input impedance to vary with the signal level, as comparator input transistors are cutoff or become active. For optimal performance, both  $V_{IN}$  pins must be used and the source impedance of the driving circuit must be less than 30 Ohms. The input signal will not damage the TDC1047 if it remains within the range of  $V_{EE}$  to +0.5V. If the input signal is between the  $V_{RT}$  and  $V_{RB}$  references, the output will be a binary number between 0 and 127 inclusive. A signal outside this range will indicate either full-scale positive or full-scale negative, depending on whether the signal is off-scale in the positive or negative direction.

### Outputs

The outputs of the TDC1047 are TTL compatible, and capable of driving four low-power Schottky TTL (54/74 LS) unit loads or the equivalent. The outputs hold the previous data a minimum time ( $t_{HO}$ ) after the rising edge of the CONV signal.

## Pin Definitions

| Pin Name            | Pin Number      | Value     | Pin Function Description         |
|---------------------|-----------------|-----------|----------------------------------|
| <b>Power</b>        |                 |           |                                  |

### Notes:

1. Absolute maximum ratings are limiting values applied individually while all other parameters are within specified operating conditions. Functional operation under any of these conditions is NOT implied.
2. Applied voltage must be current limited to specified range.
3. Forcing voltage must be limited to specified range.
4. Current is specified as positive when flowing into the device.

**Note:**  
 1. Voltages are code midpoints when calibrated (see Calibration Section).

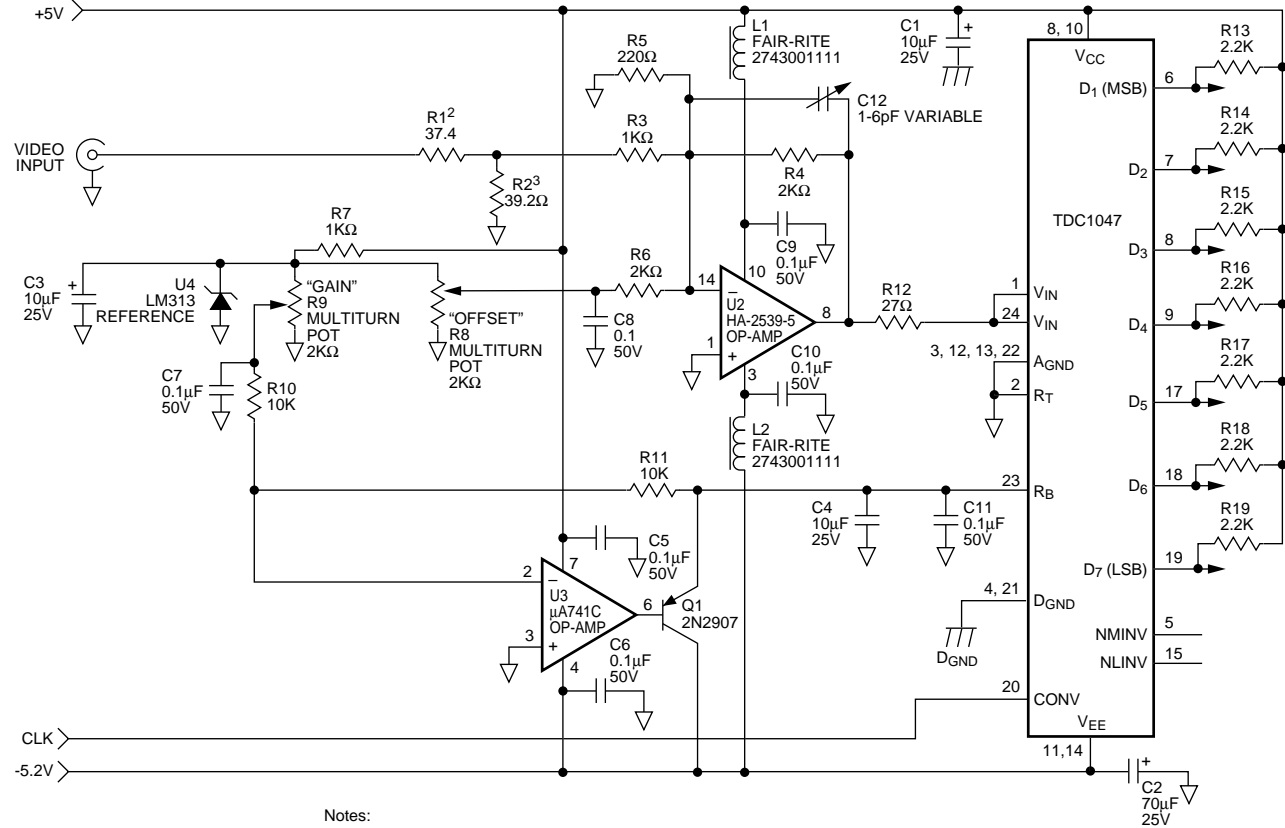

# Applications Discussion

## Calibration

To calibrate the TDC1047, adjust  $V_{RT}$  and  $V_{RB}$  to set the 1st and 127th thresholds to the desired voltages in the block diagram. Note that  $R_1$  is greater than  $R$ , ensuring calibration with a positive voltage on  $R_T$ . Assuming a 0V to -1V desired range, continuously strobe the converter with -0.0039V on

the analog input, and adjust  $V_{RT}$  for output toggling between codes 00 and 01. Then apply -0.9961V and adjust  $V_{RB}$  for toggling between codes 126 and 127. Instead of adjusting  $V_{RT}$ ,  $R_T$  can be connected to analog ground and the 0V end of the range calibrated with a buffer offset control.  $R_B$  is a convenient point for gain adjust that is not in the analog signal path. These techniques are employed in Figure 5

## Typical Interface Circuit

Notes:

1. Unless otherwise specified, all resistors are 1/4W, 2%.

$$2. R_1 = Z_{IN} - \left( \frac{1000 R_2}{1000 + R_2} \right)$$

$$3. R_2 = \frac{1}{\left( \frac{2V_{Range}}{V_{REF} Z_{IN}} \right) - 0.001}$$

|          | Min.     | Max.  | Min.        | Max.  |       |
| A        | —        | .225  | —           | 5.72  |       |
| b1       | .014     | .023  | .36         | .58   | 8     |
| b2       | .045     | .065  | 1.14        | 1.65  | 2, 8  |
| c1       | .008     | .015  | .20         | .38   | 8     |
| D        | —        | 1.290 | —           | 32.77 | 4     |
| E        | .500     | .610  | 12.70       | 15.49 | 4     |
| e        | .100 BSC |       | 2.54 BSC    |       | 5, 9  |
| eA       | .600 BSC |       | 15.24 BSC   |       | 7     |
| L        | .120     | .200  | 3.05        | 5.08  |       |
| Q        | .015     | .075  | .38         | 1.91  | 3     |
| s1       | .005     | —     | .13         | —     | 6     |
| $\alpha$ | 90°      | 105°  | 90°         | 105°  |       |

**Notes:**

1. Index area: a notch or a pin one identification mark shall be located adjacent to pin one. The manufacturer's identification shall not be used as pin one identification mark.
2. The minimum limit for dimension "b2" may be .023 (.58mm) for leads number 1, 12, 13 and 24 only.
3. Dimension "Q" shall be measured from the seating plane to the base plane.
4. This dimension allows for off-center lid, meniscus and glass overrun.
5. The basic pin spacing is .100 (2.54mm) between centerlines. Each pin centerline shall be located within  $\pm 0.010$  (.25mm) of its exact longitudinal position relative to pins 1 and 24.
6. Applies to all four corners (leads number 1, 12, 13, and 24).
7. "eA" shall be measured at the center of the lead bends or at the centerline of the leads when " $\alpha$ " is 90°.
8. All leads – Increase maximum limit by .003 (.08mm) measured at the center of the flat, when lead finish applied.
9. Twenty-two spaces.

## Ordering Information
