

**MULTISTANDARD COLOR TV DECODER**

- FULLY AUTOMATIC MULTISTANDARD SWITCHING : THE CIRCUIT INCLUDES A SCANNING CONTROL SYSTEM USED FOR THE AUTOMATIC STANDARD RECOGNITION
- NO CRYSTALS REQUIRED : ALL THE FREQUENCIES ARE SYNTHESIZED FROM THE EXTERNAL REFERENCE FREQUENCY OF 62.5kHz, AND FROM SPECIFIED DATA STORED IN AN INTERNAL ROM
- AUTOMATIC BELL FILTER ADJUSTMENT
- ONLY ONE DELAY LINE COMPENSATION ADJUSTMENT
- AUTOMATIC INTERNAL PAL AND NTSC OSCILLATOR ADJUSTMENT
- AUTOMATIC ADJUSTMENT FOR FOB AND FOR IN SECAM
- POSITIVE R-Y AND B-Y OUTPUTS

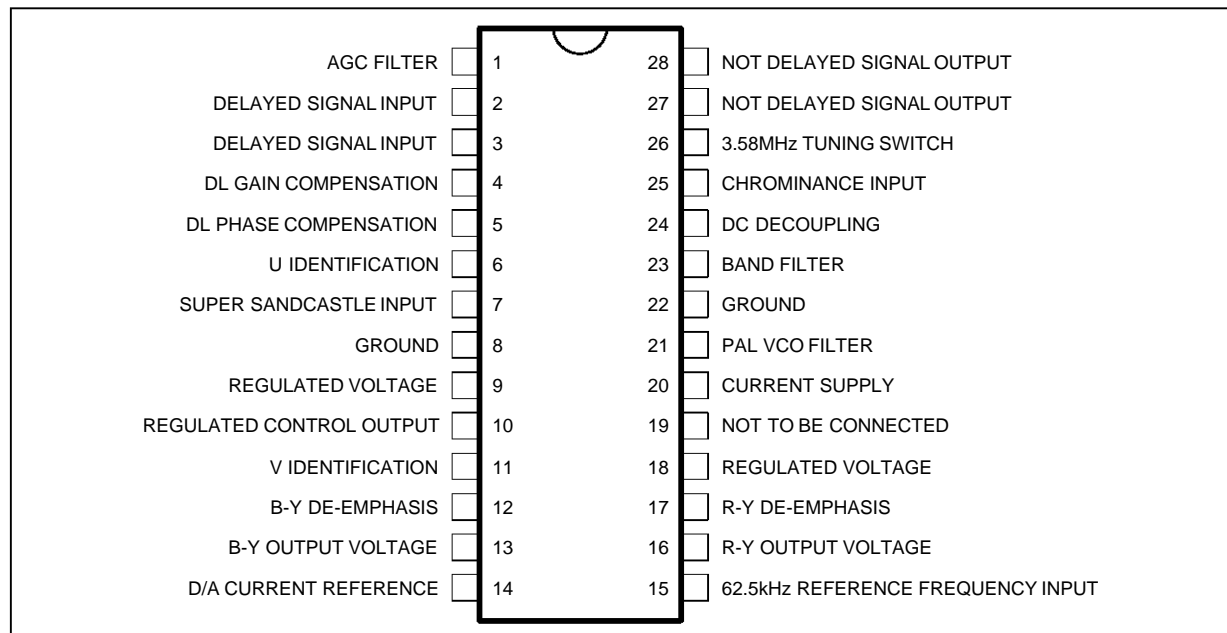

standard corresponding to the input signal. It produces all the reference frequencies required for decoding, which is achieved by a digital frequency synthesizer. Included on the chip are four numerical frequency locked loops that allow the elimination of PAL and NTSC crystals. The circuit uses an external reference frequency of 62.5kHz generally provided by the frequency synthesis tuner of the TV set.

**DESCRIPTION**

The TEA5640E is a multistandard TV decoder for PAL-SECAM NTSC1 (3.58MHz) and NTSC2 (4.43MHz). The circuit automatically selects the

## FEATURES

- Full automatic multistandard switching :  
The circuit includes a scanning control system that provides all the switchings required for the automatic standard recognition. This system is synchronized by the frame pulse.
- No crystal requirement :  
The PAL and NTSC frequencies are synthesized originally by the external reference frequency of 62.5kHz and data stored in the ROM.
- Automatic gain adjustment of the bell filter :  
By switching an internal capacitor network included in a digital loop.
- Automatic gain adjustment of the delay line compensations :  
This adjustment is made on the burst and is refreshed every line retrace
- Automatic adjustment for PAL and NTSC oscillator :  
This oscillator has a digital and an analogic loop. the PAL and NTSC frequencies are memorized in a ROM connected to the digital loop. The digital loop gives the right frequency and the

analogic one holds the phase.

- Automatic adjustment of F0R and F0B in SECAM :  
These frequencies are programmed in the ROM and are sent to two other digital loops when SECAM standard is selected.
- Automatic difference phase error compensation in PAL mode.  
The PAL VCO is locked on the burst and during the line, on the blue picture content (0° axis color vector).

## STANDARD SWITCHING AND INHIBITION

## NTSC inhibition

NTSC 1 and 2 standards can be inhibited by connecting pin 6 to the ground.

## 3.58MHz filter switching :

Pin 26 can be used to switch external filters when NTSC 1 is selected (For example luma filter).

## SECAM recognition :

- When SECAM on, Pin 12 and Pin 17 DC voltages are lower than 5V.
- For other standards, Pin 12 and Pin 17 DC voltages are regulated VCC (typical 8V).
