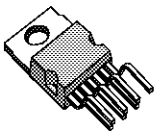
SGS-THOMSON MICROELECTRONICS

L4905

DUAL 5V REGULATOR WITH RESET

ADVANCE DATA

- DOUBLE BATTERY OPERATING
- OUTPUT CURRENTS : I_{01} = 200 mA
  I_{02} = 300 mA
- FIXED PRECISION OUTPUT VOLTAGE 5V ± 1 %
- RESET FUNCTION CONTROLLED BY INPUT VOLTAGE AND OUTPUT 1 VOLTAGE
- RESET FUNCTION EXTERNALLY PROGRAMMABLE TIMING
- RESET OUTPUT LEVEL RELATED TO OUTPUT 2
- OUTPUT 2 INTERNALLY SWITCHED WITH ACTIVE DISCHARGING
- LOW LEAKAGE CURRENT, LESS THAN 1µA AT OUTPUT 1
- LOW QUIESCENT CURRENT (input 1)
- INPUT OVERVOLTAGE PROTECTION UP TO 60V
- RESET OUTPUT HIGH
- OUTPUT TRANSSISTORS SOA PROTECTION
- SHORT CIRCUIT AND THERMAL OVERLOAD PROTECTION
- SHORT CIRCUIT AND THERMAL OVERLOAD PROTECTION



HEPTAWATT (Vertical)

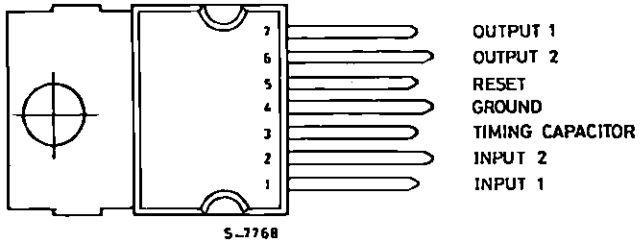
ORDERING NUMBER : L4905

DESCRIPTION

The L4905 is a monolithic low drop dual 5 V regulator designed mainly for supplying microprocessor systems.

Reset and data save functions during switch on/off can be realized.

PIN CONNECTION



PIN FUNCTIONS

N°	Name	Function
1	Input 1	Low Quiescent Current 200mA Regulator Input.
2	Input 2	300mA Regulator Input.
3	Timing Capacitor	If Reg. 2 is switched-ON the delay capacitor is charged with a 10µA constant current. When Reg. 2 is switched-OFF the delay capacitor is discharged.
4	GND	Common Ground
5	Reset Output	When pin 3 reaches 5V the reset output is switched high. Therefore $t_{RD} = C_t (\frac{5V}{10\mu A})$; t_{RD} (ms) = C_t (nF).
6	Output 2	5V – 300mA Regulator Output. Enabled if V_o 1 > V_{RT} and $V_{IN\,2}$ > V_{IT}. If Reg. 2 is switched-OFF the C_{o2} capacitor is discharged.
7	Output 1	5V – 200mA regulator output with low leakage (in switch-OFF condition).

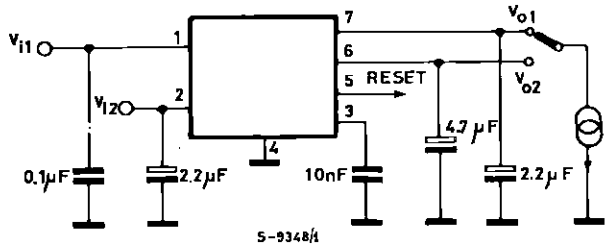
V_{RH}	Reset Output Voltage HIGH	I_R = 500µA	V_{02} – 1	4.12	V_{02}	V
V_{RL}	Reset Output Voltage LOW	I_R = – 5mA		0.25	0.4	V
t_{RD}	Reset Pulse Delay	C_t = 10nF	3	5	11	ms
t_d	Timing Capacitor Discharge Time	C_t = 10nF			20	µs
	Thermal Drift	$-20°C \leq T_{amb} \leq 125°C$		0.3 – 0.8		mV/°C
	Thermal Drift	$-20°C \leq T_{amb} \leq 125°C$		0.3 – 0.8		mV/°C
SVR1	Supply Voltage Rejection	f = 100Hz V_R = 0.5V I_o = 100mA	54 50	84		dB
SVR2	Supply Voltage Rejection		50	80		dB
T_{JSD}	Thermal Shut Down			150		°C

* The dropout voltage is defined as the difference between the input and the output voltage when the output voltage is lowered of 25 mV under constant output current condition.

TEST CIRCUIT



APPLICATION INFORMATION

In power supplies for µP systems it is necessary to provide power continuously to avoid loss of information in memories and in time of day clocks, or to save data when the primary supply is removed. The L4905 makes it very easy to supply such equipments ; it provides two voltage regulators (both 5 V high precision) with separate inputs plus a reset output for the data save function.

CIRCUIT OPERATION (see Figure 1)

After switch on Reg. 1 saturates until V_{01} rises to the nominal value.

When the input 2 reaches V_{IT} and the output 1 is higher than V_{RT} the output 2 (V_{02}) switches on and the reset output (V_R) also goes high after a programmable time T_{RD} (timing capacitor).

V_{02} and V_R are switched together at low level when one of the following conditions occurs :

- an input overvoltage ;
- an overload on the output 1 ($V_{01} < V_{RT}$) ;
- an switch off ($V_{IN} < V_{IT} - V_{ITH}$) ;

and they start again as before when the condition is removed.

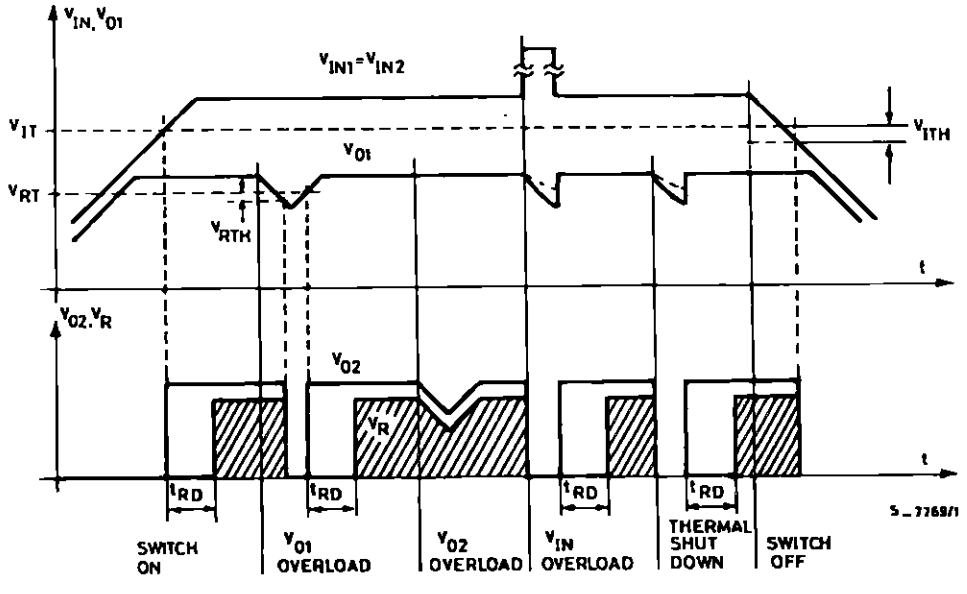
An overload on output 2 does not switch Reg. 2, and does not influence Reg. 1.

The V_{01} output features :

- 5 V internal reference without voltage divider between the output and the error comparator
- very low drop series regulator element utilizing current mirrors ;
- permit high output impedance and then very low leakage current error even in power down condition.

This output may therefore be used to supply circuits continuously, such as volatile RAMs, allowing the use of a back-up battery. The V_{01} regulator also features low consumption (0.6 mA typ.) to minimize battery drain in applications where the V_1 regulator is permanently connected to a battery supply.

Figure 1



The V_{02} output can supply other non essential 5 V circuits which may be powered down when the system is inactive, or that must be powered down to prevent uncorrect operation for supply voltages below the minimum value.
The reset output can be used as a "POWER DOWN INTERRUPT", permitting RAM access only in correct power conditions, or as a "BACK-UP ENABLE" to transfer data into in a NV SHADOW MEMORY when the supply is interrupted.

APPLICATION SUGGESTIONS

Figure 2 shows an application circuit for a MP system typically used in trip computers or in car radios with programmable tuning.

Reg. 1 is permanently connected to a battery and supplies a CMOS time-of-day clock and a CMOS microcomputer chip with volatile memory.

Reg. 2 may be switched OFF when the system is inactive.

Figure 4 shows the L4905 with a back-up battery on the V_{01} output to maintain a CMOS time-of-day clock and a stand by type N-MOS µP. The reset output makes sure that the RAM is forced into the low consumption stand by state, so the access to memory is inhibit and the back-up battery voltage cannot drop so low that memory contents are corrupted.

In this case the main on-off switch disconnects both regulators from the supply battery.
