

## LOW VOLTAGE PARALLEL ACCESS 16K (2K x 8) EEPROM WITH SOFTWARE DATA PROTECTION

- FAST ACCESS TIME: 200ns
- SINGLE LOW VOLTAGE OPERATION
- LOW POWER CONSUMPTION
- FAST WRITE CYCLE:
  - 64 Bytes Page Write Operation
  - Byte or Page Write Cycle: 3ms Max
- ENHANCED END OF WRITE DETECTION:
  - Ready/Busy Open Drain Output
  - Data Polling
  - Toggle Bit
- PAGE LOAD TIMER STATUS BIT
- HIGH RELIABILITY SINGLE POLYSILICON, CMOS TECHNOLOGY:
  - Endurance >100,000 Erase/Write Cycles
  - Data Retention >40 Years
- JEDEC APPROVED BYTEWIDE PIN OUT
- SOFTWARE DATA PROTECTION

### DESCRIPTION

The M28LV17 is a 2K x 8 low power Parallel EEPROM fabricated with SGS-THOMSON proprietary single polysilicon CMOS technology. The device offers fast access time with low power dissipation and requires a 2.7V to 3.6V power supply.

The M28LV17 offers the same features than the M28LV16, in addition to the Ready/Busy pin.

The circuit has been designed to offer a flexible microcontroller interface featuring both hardware

**Table 1. Signal Names**

|                 |                     |
|-----------------|---------------------|
| A0 - A10        | Address Input       |
| DQ0 - DQ7       | Data Input / Output |
| $\overline{W}$  | Write Enable        |
| $\overline{E}$  | Chip Enable         |
| $\overline{G}$  | Output Enable       |
| $\overline{RB}$ | Ready / Busy        |
| Vcc             | Supply Voltage      |
| Vss             | Ground              |

Warning: NC = No Connection.

**DESCRIPTION** (cont'd)

and software handshaking with Ready/Busy, Data Polling and Toggle Bit. The M28LV17 supports 64 byte page write operation. A Software Data Protection (SDP) is also possible using the standard JEDEC algorithm.

Figure 2D. TSOP Pin Connections

Warning: NC = No Connection.

**PIN DESCRIPTION**

**Addresses (A0-A10).** The address inputs select an 8-bit memory location during a read or write operation.

**Chip Enable (E-bar).** The chip enable input must be low to enable all read/write operations. When Chip Enable is high, power consumption is reduced.

**Table 2. Absolute Maximum Ratings** <sup>(1)</sup>

| Symbol           | Parameter   | Value                         | Unit |
|------------------|---|-------------------------------|------|
| T <sub>A</sub>   | Ambient Operating Temperature                                     | - 40 to 85                    | °C   |
| T <sub>STG</sub> | Storage Temperature Range   | - 65 to 150                   | °C   |
| V <sub>CC</sub>  | Supply Voltage  | - 0.3 to 6.5                  | V    |
| V <sub>IO</sub>  | Input/Output Voltage  | - 0.3 to V <sub>CC</sub> +0.6 | V    |
| V <sub>I</sub>   | Input Voltage   | - 0.3 to 6.5                  | V    |
| V <sub>ESD</sub> | Electrostatic Discharge Voltage (Human Body model) <sup>(2)</sup> | 4000                          | V    |

**Note:** 1. Except for the rating "Operating Temperature Range", stresses above those listed in the Table "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the SGS-THOMSON SURE Program and other relevant quality documents

2. 100pF through 1500Ω; MIL-STD-883C, 3015.7

**Table 3. Operating Modes** <sup>(1)</sup>

| Mode           | $\bar{E}$ | $\bar{G}$ | $\bar{W}$ | DQ0 - DQ7 |
|----------------|-----------|-----------|-----------|-----------|
| Standby        | 1         | X         | X         | Hi-Z      |
| Output Disable | X         | 1         | X         | Hi-Z      |
| Write Disable  | X         | X         | 1         | Hi-Z      |
| Read           | 0         | 0         | 1         | Data Out  |
| Write          | 0         | 1         | 0         | Data In   |

**Note:** 1. 0 = V<sub>IL</sub>; 1 = V<sub>IH</sub>; X = V<sub>IL</sub> or V<sub>IH</sub>.

**Output Enable ( $\bar{G}$ ).** The Output Enable input controls the data output buffers and is used to initiate read operations.

**Data In/ Out (DQ0 - DQ7).** Data is written to or read from the M28LV17 through the I/O pins.

**Write Enable ( $\bar{W}$ ).** The Write Enable input controls the writing of data to the M28LV17.

**Ready/Busy ( $\bar{R}\bar{B}$ ).** Ready/Busy is an open drain output that can be used to detect the end of the internal write cycle.

## OPERATION

In order to prevent data corruption and inadvertent write operations during power-up, a Power On Reset (POR) circuit resets all internal programming circuitry. Access to the memory in write mode is allowed after a power-up as specified in Table 6.

### Read

The M28LV17 is accessed like a static RAM. When  $\bar{E}$  and  $\bar{G}$  are low with  $\bar{W}$  high, the data addressed

is presented on the I/O pins. The I/O pins are high impedance when either  $\bar{G}$  or  $\bar{E}$  is high.

### Write

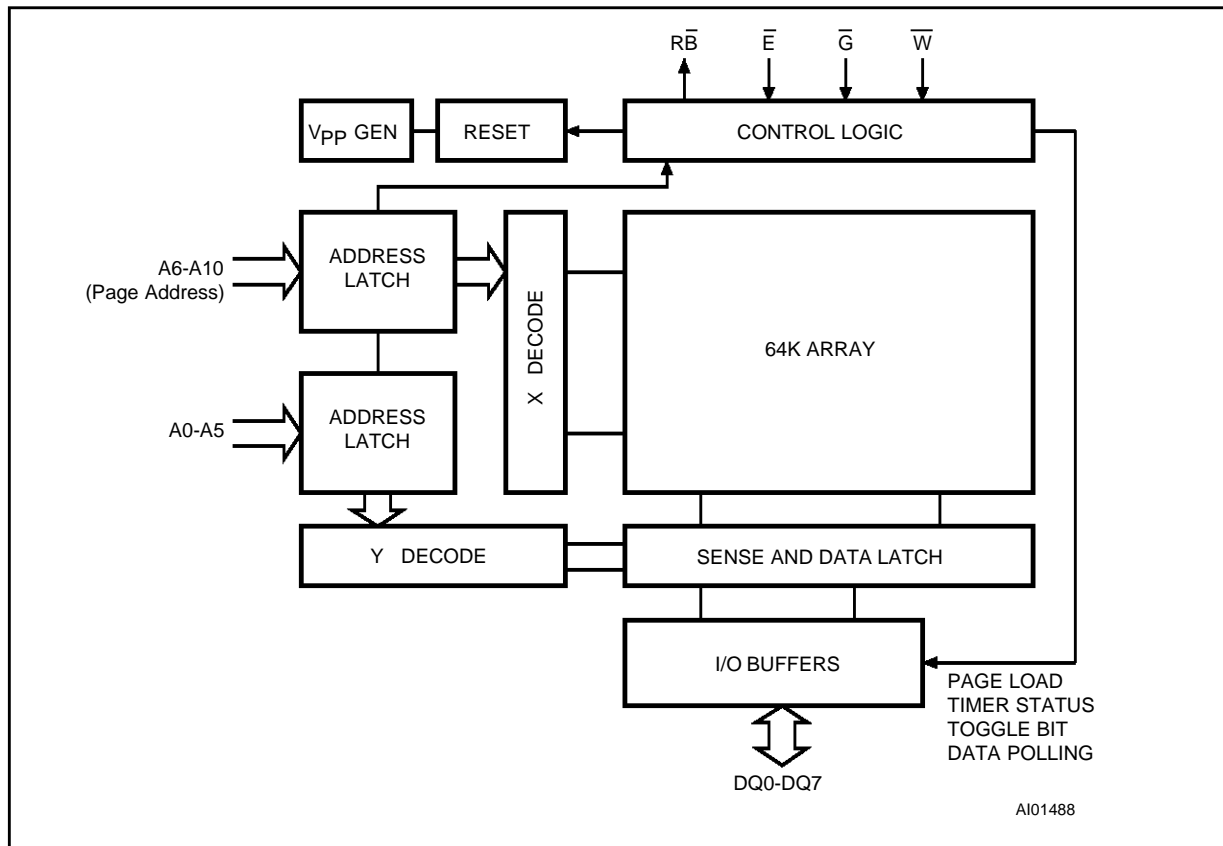

Write operations are initiated when both  $\bar{W}$  and  $\bar{E}$  are low and  $\bar{G}$  is high. The M28LV17 supports both  $\bar{E}$  and  $\bar{W}$  controlled write cycles. The Address is latched by the falling edge of  $\bar{E}$  or  $\bar{W}$  which ever occurs last and the Data on the rising edge of  $\bar{E}$  or  $\bar{W}$  which ever occurs first. Once initiated the write operation is internally timed until completion.

### Page Write

Page write allows up to 64 bytes to be consecutively latched into the memory prior to initiating a programming cycle. All bytes must be located in a single page address, that is A6-A10 must be the same for all bytes. The page write can be initiated during any byte write operation.

Following the first byte write instruction the host may send another address and data with a minimum data transfer rate of 1/t<sub>WHWH</sub> (see Figure 13). If a transition of  $\bar{E}$  or  $\bar{W}$  is not detected within t<sub>WHWH</sub>, the internal programming cycle will start.

Figure 3. Block Diagram

**Microcontroller Control Interface**

The M28LV17 provides two write operation status bits and one status pin that can be used to minimize the system write cycle. These signals are available on the I/O port bits DQ7 or DQ6 of the memory during programming cycle only, or as the RB signal on a separate pin.

Figure 4. Status Bit Assignment

| DQ7 | DQ6 | DQ5  | DQ4  | DQ3  | DQ2  | DQ1  | DQ0  |
|-----|-----|------|------|------|------|------|------|
| DP  | TB  | PLTS | Hi-Z | Hi-Z | Hi-Z | Hi-Z | Hi-Z |

DP = Data Polling  
 TB = Toggle Bit  
 PLTS = Page Load Timer Status

**Data Polling bit (DQ7).** During the internal write cycle, any attempt to read the last byte written will produce on DQ7 the complementary value of the

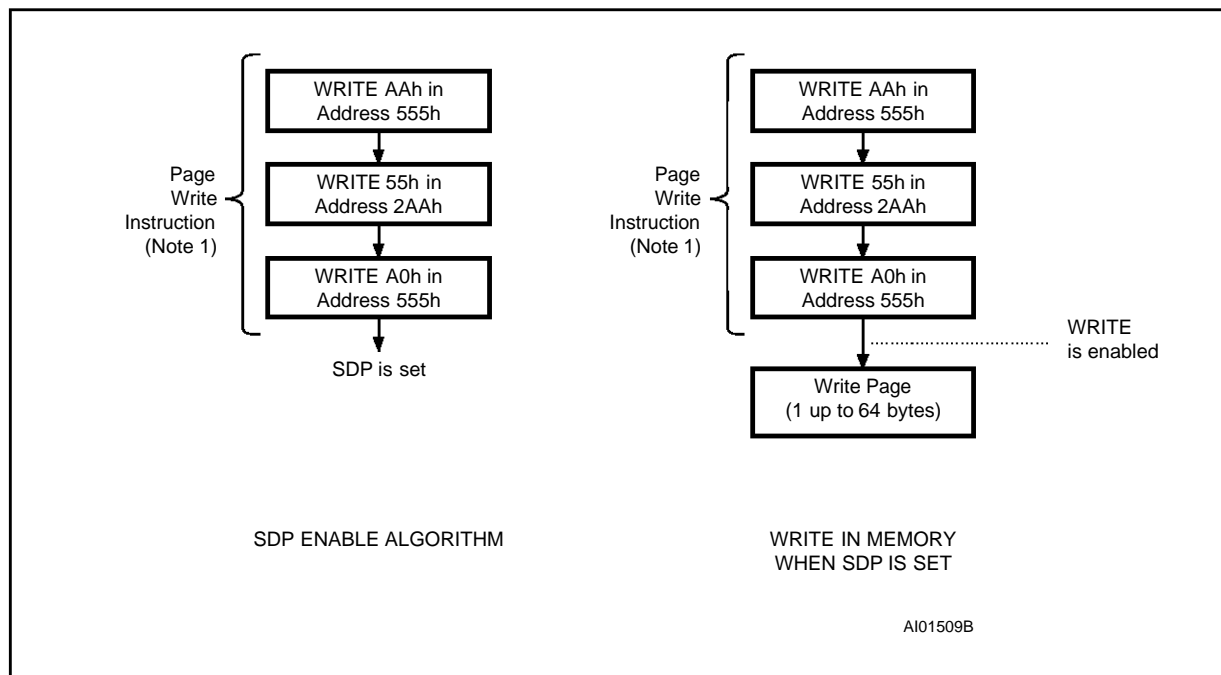

previously latched bit. Once the write cycle is finished the true logic value appears on DQ7 in the read cycle.

**Toggle bit (DQ6).** The M28LV17 offers another way for determining when the internal write cycle is completed. During the internal Erase/Write cycle, DQ6 will toggle from "0" to "1" and "1" to "0" (the first read value is "0") on subsequent attempts to read the memory. When the internal cycle is completed the toggling will stop and the device will be accessible for a new Read or Write operation.

**Page Load Timer Status bit (DQ5).** In the Page Write mode data may be latched by E or W. Up to 32 bytes may be input. The Data output (DQ5) indicates the status of the internal Page Load Timer. DQ5 may be read by asserting Output Enable Low (tPLTS). DQ5 Low indicates the timer is running, High indicates time-out after which the write cycle will start and no new data may be input.

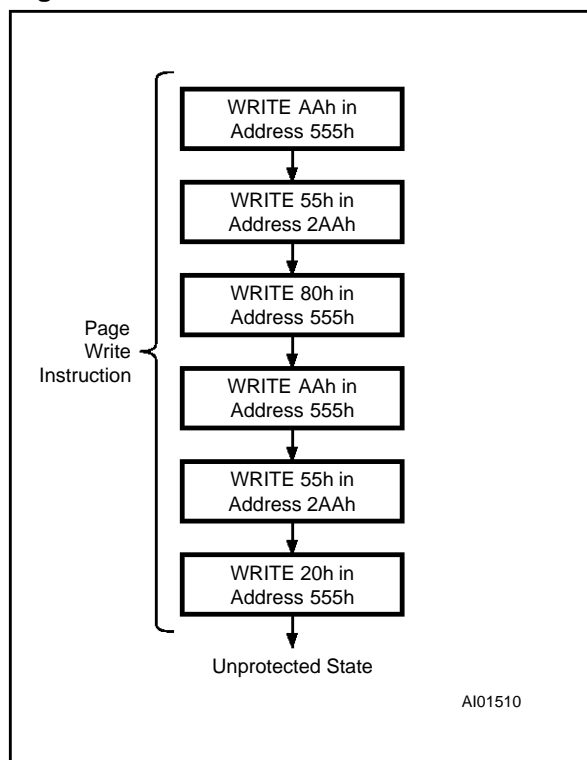

**Ready/Busy pin.** The RB pin provides a signal at its open drain output which is low during the erase/write cycle, but which is released at the completion of the programming cycle.

Figure 5. Software Data Protection Enable Algorithm and Memory Write

Note: 1. MSB Address bits (A6 to A10) differ during these specific Page Write operations.

Figure 6. Software Data Protection Disable Algorithm

### Software Data Protection

The M28LV17 offers a software controlled write protection facility that allows the user to inhibit all write modes to the device including the Chip Erase instruction. This can be useful in protecting the memory from inadvertent write cycles that may occur due to uncontrolled bus conditions.

The M28LV17 is shipped as standard in the "unprotected" state meaning that the memory contents can be changed as required by the user. After the Software Data Protection enable algorithm is issued, the device enters the "Protect Mode" of operation where no further write commands have any effect on the memory contents. The device remains in this mode until a valid Software Data Protection (SDP) disable sequence is received whereby the device reverts to its "unprotected" state. The Software Data Protection is fully non-volatile and is not changed by power on/off sequences.

To enable the Software Data Protection (SDP) the device requires the user to write (with a Page Write) three specific data bytes to three specific memory locations as per Figure 5. Similarly to disable the Software Data Protection the user has to write specific data bytes into six different locations as per Figure 6 (with a Page Write). This complex series ensures that the user will never enable or disable the Software Data Protection accidentally.

**AC MEASUREMENT CONDITIONS**

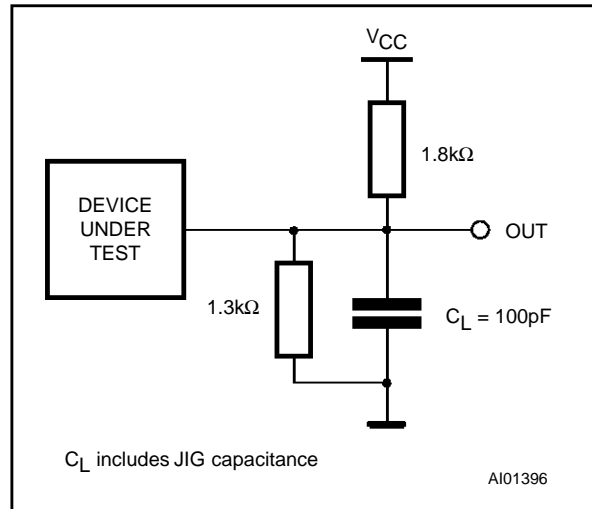

Input Rise and Fall Times  $\leq 20\text{ns}$   
 Input Pulse Voltages  $0\text{V to } V_{CC} - 0.3\text{V}$   
 Input and Output Timing Ref. Voltages  $1.5\text{V}$

Note that Output Hi-Z is defined as the point where data is no longer driven.
