PROGRAMMABLE TRANSIENT VOLTAGE SUPPRESSOR FOR SLIC PROTECTION

FEATURES

- DUAL PROGRAMMABLE TRANSIENT SUPPRESSOR.
- WIDE NEGATIVE FIRING VOLTAGE RANGE:
  V_{MGL} = -80 V max
- HOLDING CURRENT = 150 mA.
- LOW GATE TRIGGERING CURRENT:
  I_{GT} = 15 mA max.
- PEAK PULSE CURRENT :
  I_{PP} = 30 A , 10/1000 μs
- AVAILABLE IN SO 8 AND DIP 8.

DESCRIPTION

This device has been especially designed to protect subscriber line card interfaces (SLIC) against transient overvoltages.
Positive overloads are clipped with two diodes. When negative surges are suppressed by two protection thyristors, the breakdown voltage of which is referenced to the -Vbat.

This component presents a very low gate triggering current (I_{GT}) in order to reduce the current comsumption on PC board during the firing phase .
A particular attention has been given to the internal wire bonding . A "4-points configuration" ensures a reliable protection, eliminating the overvoltage introduced by the parasitic inductances of the wiring (Ldi/dt) especially for very fast transients.

APPLICATION NOTE

4- points structure lay-out.

In order to take advantage of the "4-points structure" of the LCPxxxx, the tip and Ring lines have to cross through the device. In this case, the device will eliminate the overvoltages generated by the parasitic inductances of the wiring (Ldi/dt), especially for very fast Transients.

TEST CIRCUIT FOR I_H AND V_{SGL} PARAMETERS

This is a GO-NOGO Test which allows to confirm the holding current (I_H) level, and to measure the dynamic switching voltage (V_{SGL}).

TEST PROCEDURE :

1) Adjust the current level at the I_H value by short circuiting the AK of the D.U.T.
2) Fire the D.U.T with a surge Current : Ipp = 30A , 10/1000 μs.
3) The D.U.T will come back to the OFF-State within a duration of 50 ms max.

■ The V_{SGL} is measured just before firing.

APPLICATION CIRCUIT

Typical slic protection concept
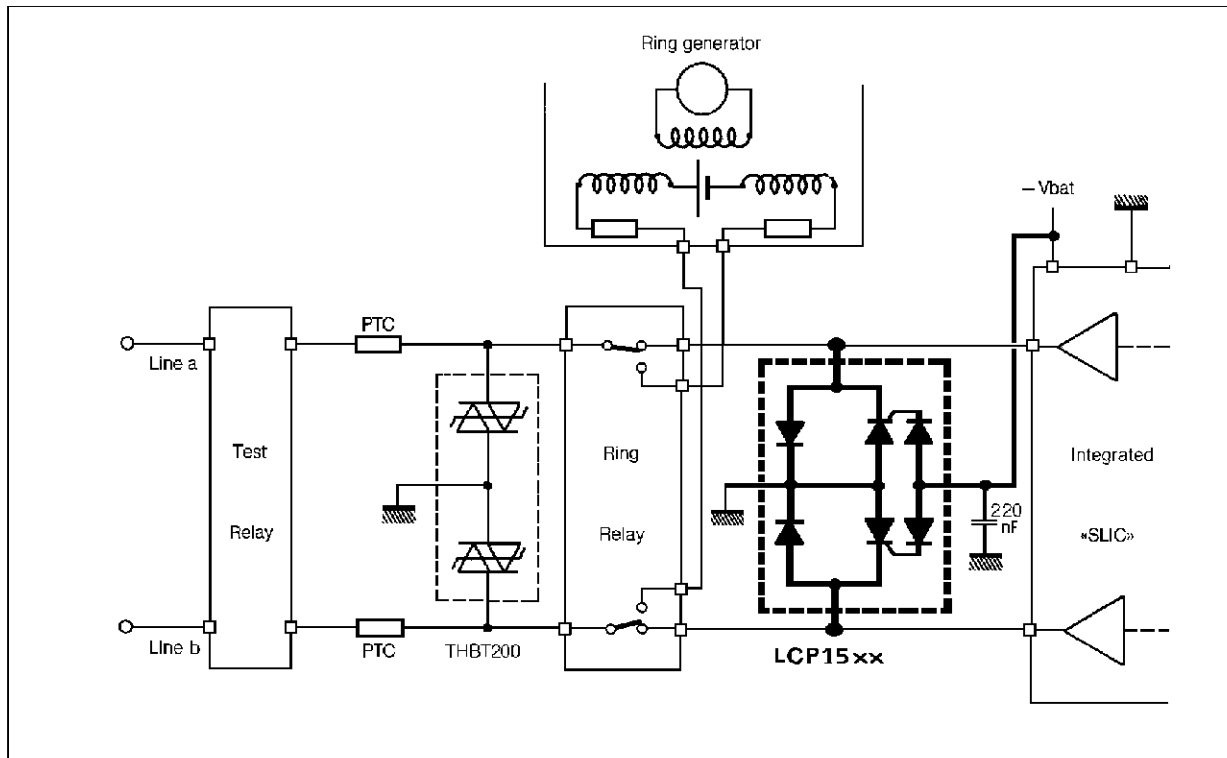

FUNCTIONAL DESCRIPTION

LINE A PROTECTION:
- For positive surges versus GND, the diode D1 will conduct.
- For negative surges versus GND, the protection device P1 will trigger at a voltage fixed by the -VBAT reference.

LINE B PROTECTION:
- For surges on Line B, the operating mode is the same , D2 or P2 is activated.

- A capacitor (C = 220nF) can be added close to the gate of the LCP15xx, in order to speed up the triggering.
