

## I<sup>2</sup>C BUS CONTROLLED 130MHz RGB PREAMPLIFIER

PRELIMINARY DATA

- 130MHz TYPICAL BANDWIDTH AT 2V<sub>PP</sub> OUTPUT WITH 12pF CAPACITIVE LOAD
- 2.8ns TYPICAL RISE/FALL TIME AT 2V<sub>PP</sub> OUTPUT WITH 12pF CAPACITIVE LOAD
- POWERFULL OUTPUT DRIVE CAPABILITY
- BRT, CONT, DRIVE, OUTPUT DC LEVEL, OSD CONTRAST, BACK-PORCH CLAMPING PULSE WIDTH ARE I<sup>2</sup>C BUS CONTROLLED
- INTERNAL BACK-PORCH CLAMPING PULSE GENERATOR
- OSD WHITE BALANCE TRACKING
- INTERNAL OSD SWITCHES
- BLANKING AND FAST-BLANKING INPUTS
- VERY LARGE DRIVE ADJUSTMENT RANGE (48dB)
- SEMI-TRANSPARENT BACKGROUND ON OSD PICTURE

### DESCRIPTION

The TDA9206 is a digitally controlled wideband video preamplifier intended for use in high resolution color monitor. All controls and adjustments are digitally performed thanks to I<sup>2</sup>C serial bus. Contrast, brightness and DC output level of RGB signals are common to the 3 channels and drive adjustment is separate for each channel. Three I<sup>2</sup>C gain controlled OSD inputs can be switched with RGB signals using fast blanking command. Clamping of RGB signals is performed thanks to a flexible integrated system. The white balance adjustment is effective on brightness, video and OSD signals. The TDA9206 works for application using AC or DC coupled CRT driver.

Because of its features and due to component saving the TDA9206 leads to a very performant and cost effective application.

### PIN CONNECTIONS

## FUNCTIONAL DESCRIPTION

### Input Stage

The R, G and B signals must be fed to the three inputs through coupling capacitors (100nF).

The maximum input peak-to-peak video amplitude is 1V.

The input stage includes a clamping function. This clamp is using the input serial capacitor as "memory capacitor" and is gated by an internally generated "Back-Porch-Clamping-Pulse (BPCP)".

The synchronization edge of the BPCP is selected according bit 0 of register R8.

When B0R8 is set to 1, the BPCP is synchronized on the leading edge of the blanking pulse BLK inputs on Pin 14 (see Figure 1).

Figure 1

When B0R8 is clear to 0, the BPCP is synchronized on the second edge of the horizontal pulse HSYNC inputs on Pin 24. An automatic function allows to use positive or negative horizontal pulse on Pin 24 (see Figure 2).

Figure 2

In both case BPCP width is adjustable by I<sup>2</sup>C, B1 and B2 of register R8 (see R8 Table P8).

### Contrast Adjustment (8 bits)

The contrast adjustment is made by controlling simultaneously the gain of three internal variable gain amplifiers through the I<sup>2</sup>C bus interface.

The contrast adjustment allows to cover a typical range of 48dB.

### Brightness Adjustment (8 bits)

As for the contrast adjustment, the brightness is controlled by I<sup>2</sup>C.

The brightness function consists to add the same DC offset to the three R, G, B signals after contrast amplification.

This DC-Offset is present only outside the blanking pulse (see Figure 3).

The DC output level during the blanking pulse, is forced to "INFRA-BLACK" level (V<sub>DC</sub>).

### Drive Adjustment (3 x 8 bits)

In order to adjust the white balance, the TDA9206 offers the possibility to adjust separately the overall gain of each complete video channel.

The gain of each channel is controlled by I<sup>2</sup>C (8bits each).

The very large drive adjustment range (48dB) allows different standard or custom color temperature.

It can also be used to adjust the output voltages at the optimum amplitude to drive the C.R.T drivers, keeping the whole contrast control for end-user only.

The drive adjustment is located after the CONTRAST, BRIGHTNESS and OSD switch blocks, so that the white balance will remains correct when BRT is adjusted, and will also be correct on OSD portion of the signal.

### OSD Inputs

The TDA9206 includes all the circuitry necessary to mix OSD signals into the RGB main-picture. Four pins are dedicated to this function as follow.

Three TTL RGB On Screen Display inputs (Pin 2, 5 and 8). These three inputs are connected to the three outputs of the corresponding ON-SCREEN-DISPLAY processor (ex : STV942x).

One Fast Blanking Input (FBLK, Pin 13) which is also connected to the FBLK output of the same ON-SCREEN-DISPLAY processor.

When a high level is present on FBLK, the IC will acts as follow :

- The three main picture RGB input signals are internally switched to the internal input clamp reference voltage.
- The three output signals are set to voltages corresponding to the state (0 or 1) on the three OSD inputs (see Figure 3).

*Example :*

If FBLK = 1 and OSD1, OSD2, OSD3) = 1, 0, 1 respectively.

Then OUT1, OUT2, OUT3 will be equal to V<sub>OSD</sub>, V<sub>BRT</sub>, V<sub>OSD</sub>,

where : V<sub>BRT</sub> = V<sub>BLACK</sub> + BRT

V<sub>OSD</sub> = V<sub>BRT</sub> + OSD

BRT is the brightness DC level I<sup>2</sup>C adjustable.

OSD is the On-Screen Display signal value I<sup>2</sup>C adjustable from 0V to 4.68V<sub>PP</sub> by step of 0.312V.

Semi-transparent function is controlled thanks to Bit 6 of R8 register (see Table 1).

When semi-transparent mode is activated, video signal is divided by 2 (CONT).

FUNCTIONAL DESCRIPTION (continued)

Table 1

FBLK	OSD1	OSD2	OSD3	B6R8	Output Signal (OUTn)
0	x	x	x	0	Video
1	x	x	x	0	OSD (1)
0	x	x	x	1	Video
1	0	x	x	1	OSD
1	x	1	x	1	OSD
1	x	x	0	1	OSD
1	1	0	1	1	Semi-transparent (2)

Notes : 1. All OSD colors are displayed.  
 2. One OSD color is displayed as semi-transparent video without effect on brightness and DC level adjustment.

Output Stage

The three output stages incorporate three functions which are :

- The blanking stage : When high level is applied to the BLK input (Pin 14), the three outputs are switched to a voltage which is 400mV lower than the BLACK level. The black level is the output voltage with minimum brightness when input signal video amplitude is equal to "0".
- The output stage itself : It is a large bandwidth output amplifier which allow to deliver up to 5V<sub>PP</sub> on the three outputs (for 0.7V video signal on the inputs). The typical bandwidth is 100MHz at -3dB measured with 4V<sub>PP</sub> output signal on 12pF load.

- The output CLAMP : The IC also incorporates three internal output clamp (sample and hold system) which allow to DC shift the three output signals. The DC output voltage is adjustable through I<sup>2</sup>C with 4 bits. Practically, the DC output level allow to adjust the BLK level (V<sub>DC</sub> = 400mV under V<sub>BLACK</sub>) from 0.9V to 2.9V with 12 x 165mV.

The overall waveforms of the output signal according to the different adjustment are shown in Figures 3 and 4.

Serial Interface

The 2-wires serial interface is an I<sup>2</sup>C interface. The slave address of the TDA9206 is DC (in hexadecimal).

A6	A5	A4	A3	A2	A1	A0	W
1	1	0	1	1	1	0	0

Data Transfer

The host MCU can write data into the TDA9206 registers. Read mode is not available.

To write data into the TDA9206, after a start, the MCU must send (see Figure 5) :

- The I<sup>2</sup>C address slave byte with a low level for the R/W bit.
- The byte of the internal register address where the MCU wants to write data(s).
- The data.

All bytes are sent MSB bit first and the write data transfer is closed by a stop.
