SGS-THOMSON MICROELECTRONICS

TD310

TRIPLE IGBT/MOS DRIVER

- THREE POWER IGBT/MOS AND PULSE TRANSFORMER DRIVERS
- CURRENT SENSE COMPARATOR WITH 1ms INHIBITION TIME FUNCTION
- INSTANTANEOUS SIGNAL TRANSMISSION
- 0.6 Amp PER CHANNEL PEAK OUTPUT CURRENT CAPABILITY
- LOW OUTPUT IMPEDANCE TYP : 7Ω at 200mA
- CMOS/LSTTL COMPATIBLE INVERTING INPUT WITH HYSTERESIS
- 4V TO 16V SINGLE SUPPLY OPERATION
- CURRENT AMPLIFIER
- LOW BIAS CURRENT TYP : 1.5mA
- ADJUSTABLE UNDERVOLTAGE LOCKOUT LEVEL
- STAND-BY MODE
- DURING POWER UP NO RANDOM OUTPUT STATE
- ENHANCED LATCH-UP IMMUNITY
- CHANNEL PARALLELING CAPABILITY

Part Number	Temperature Range	Package	
		N	D
TD310I	-40°C, +125°C	•	•

DESCRIPTION

The TD310 is designed to drive one, two or three Power IGBT/MOS and has driving capability for pulse transformer. So it is perfectly suited to interface control IC with Power Switches in low side or half-bridge configuration.

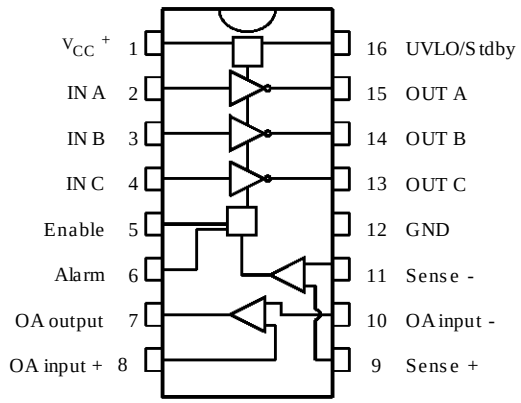
The typical application shown figure 1 implements the TD310 in a pulse controlled half-bridge drive. Positive and negative pulses are applied to the pulse transformer to charge and discharge the IGBT/MOS gate capacitance. More sophisticated secondary circuits provide low impedance gate drive and short-circuit protection as shown in application note n° AN461.

On Figure 2, TD310 is implemented as a low side driver in a typical 3 phase motor drive.

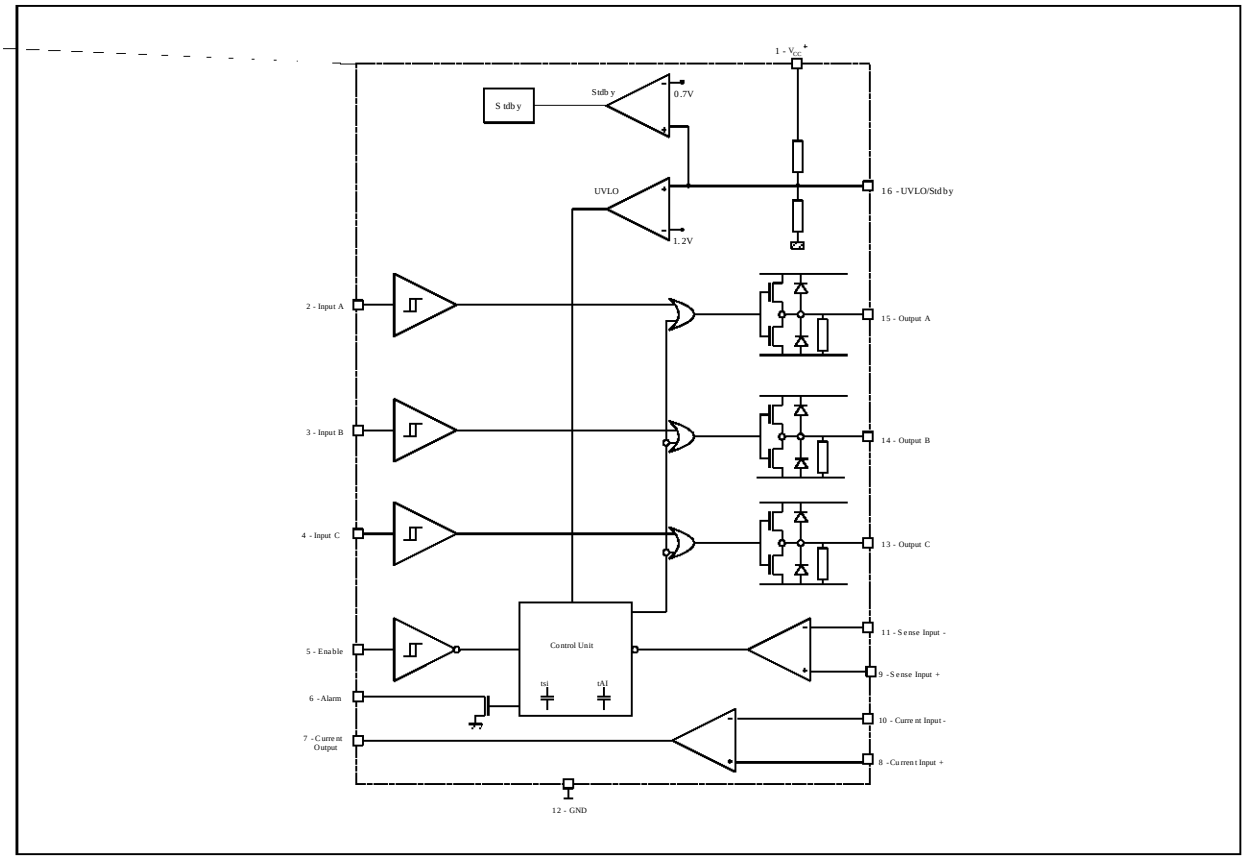
Figure 3 presents a general purpose low side gate drive.

In both case, the current amplifier provides interfacing between a sense resistor and an A/D converter.

PIN CONNECTIONS



BLOCK DIAGRAM



ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V_{CC}	Supply Voltage	18	V
V_i	Input Voltage	0 to V_{CC}	V
V_{is}	Sense Input Voltage	-0.3 to V_{CC}	V
T_j	Junction Temperature	-40 to 150	^oC
T_{amb}	Ambient Temperature	-40 to 125	^oC

OPERATING CONDITIONS

Symbol	Parameter	Value	Unit
V_{CC}	Supply Voltage	4 to 16	V

INSTRUCTIONS FOR USE

1 - The TD310 supply voltage must be decoupled with a 1µF min. capacitor.

2 - If the application involving TD310 requires maximum output current capability, this current must be pulsed : pulse width 1µsec, duty cycle 1% at T_{amb}.

ELECTRICAL CHARACTERISTICS

V_{CC} = 15V, T_{amb} = 25°C (unless otherwise specified)

Symbol	Parameter	Min.	Typ.	Max.	Unit
I_{CC}	Supply Current with Inputs in High State		1.5	2	mA
	LOGIC INPUT (all inputs)				
V_{IH}	High Input Voltage	2			V
V_{IL}	Low Input Voltage			0.8	V

V_{hys}	Threshold Hysteresis		0.8		V

UVLO/stbdy pin functionning modes

Due to the wide supply voltage range of the TD310, the UVLO function (Under Voltage Lock Out) is externally adjustable by a resistor bridge.

The bridge rate can be calculated in relation with the expected UVLO protection level as follows :

$$V_{UVLO} \times \frac{R1}{R1+R2} = 1.2V$$ (where R1 is the lower resistor of the bridge)

The internal resistor sets the default UVLO value to 12V (*) and might influence the external bridge rate if the values of the external resistors are too high.

The standby threshold value depends of the UVLO value as follows :

$V_{stdby} = 0.7/1.2\ V_{UVLO}$

Both UVLO and stdby functions can be inhibited by connecting the UVLO/stdby pin to V_{CC}^{+} via a pull up resistor (ex 150kΩ).

The following table summarizes the functions of the TD310 :

	Pin	16	9/11	5	2/3/4	15/14 /13	6	7/8/10	
	Configuration	UVLO/stdby	Sense+/Sense-	Enable	In A/B/C	Out A/B/C	Alarm	Op. Amp.	Consumption
Normal	1	H	+ > -	X	X	L	L	OK	H (1.5mA)
			+ < -	H	IN	$\overline{IN}$	H		
				L	X	L			
Stdby	2	L	+ > -	X	X	L	L	HZ	L (30µA)
			+ < -				H		
UVLO	3	M	X	X	X	L	L	OK	H

Configuration 1 : UVLO/stdby = H

The TD310 is in a normal consumption state (1.5mA), the operational amplifier is normally functionning and the buffer outputs are determined by the sense comparator inputs, the enable inputs and the buffer inputs.

Configuration 2 : UVLO/stdby = L

The TD310 is in a low consumption state (standby mode 30µA), the buffer outputs are set to low state and the operational amplifier is in high impedance state.

Configuration 3 : UVLO/stdby = M

The V_{CC} supply voltage is between V_{UVLO} and V_{stdby} (**). The TD310 remains in a normal consumption state and the operational amplifier is normally functionning but the buffer outputs and the alarm pin are set to low state.

(*) If the UVLO level remains unadjusted, it is recommended to bypass the UVLO/stdby pin with a 1nF capacitor.
(**) If the supply voltage falls below V_{stdby}, the TD310 is set in standby mode (configuration 2).
