COS/MOS B-SERIES DEVICES
3rd EDITION
ISSUED FEBRUARY 1982

INTRODUCTION

This databook contains data sheets on the SGS-ATES range of COS/MOS B-series integrated circuits. The information on each product, in accordance with EIA/JEDEC specifications, has been specially presented in order that the performance of the product can be readily evaluated within any required equipment design.
In addition general considerations that should be taken into account in the operation and application of COS/MOS integrated circuits are described and selection guides are included to simplify the task of choosing the best combination of circuits for a system.
The databook also contains the results of the Reliability studies and of the improvements made by SGS-ATES to its COS/MOS family.

SGS-ATES 4000B SERIES INFORMATION

The new SGS-ATES COS/MOS **HCC/HCF 4000B** series meets the industry standardized specifications co-ordinated by EIA/JEDEC Solid State Products Council.
The official JEDEC specifications for static parameters are primarily applicable to gates, inverters, high current (inverting) drivers and devices with Medium Scale Integration.
Special types such as analog switches, multiplexers and multivibrators do not have the same input-output standards as the B series specifications but are still given with a B suffix because they satisfy the remaining JEDEC specifications.

SGS-ATES **HCC/HCF 4000B** types have the following Absolute Maximum Ratings:

Symbol	Description	Limits
V_{DD}	Supply voltage: **HCC**	-0.5 to 20 V
	HCF	-0.5 to 18 V
V_i	Input voltage	-0.5 to V_{DD} +0.5 V
I_j	DC input current (any input)	± 10 mA
P_{tot}	Total power dissipation (per package)	200 mW
	Dissipation per output transistor for T_{op}= full package temp. range	100 mW
T_{op}	Operating temperature: **HCC** types	-55 to 125 °C
	HCF types	-40 to 85 °C
T_{stg}	Storage temperature	-65 to 150 °C

The Recommended Operating Conditions are specified as follows:

Symbol	Description	Limits
V_{DD}	Supply voltage: **HCC**	3 to 18 V
	HCF	3 to 15 V
V_i	Input voltage	0 to V_{DD} V
T_{op}	Operating temperature: **HCC** types	-55 to 125 °C
	HCF types	-40 to 85 °C

If these ratings are compared with the corresponding JEDEC values shown in table II and III it can be seen that the SGS-ATES **HCC/HCF 4000B** devices have much better limits than those of the JEDEC specifications.
The static electrical characteristics of the **HCC/HCF 4000B** series, excluding special devices such as analog switches, multiplexers, drivers, etc. are shown in table I.
The SGS-ATES **HCC/HCF 4000B** family has the quiescent leakage current (I_L) specified at 5, 10, 15, 20 V and the other static electrical characteristics at 5, 10, 15 V for both extended and intermediate temperature ranges.

HCC/HCF 4000B series features

The principal features of the **HCC/HCF 4000B** series are as follows:

- operating range for **HCC** 3-18V; **HCF** 3-15V
- Rationalised range of quiescent leakage current (I_L) specifications corresponding to gate, buffer and flip-flop, and Medium Scale Integration products.
- Maximum input leakage current (I_{IH}, I_{IL}) of $\pm$ 1 μA at V_{DD}= 18V for **HCC,** 15V for **HCF** with V_i = 0 to 18V for **HCC,** 0 to 15V for **HCF** over the full temperature range.
- Input and output logic levels completely independent of temperature.
- Input voltage levels which define a very high DC noise immunity (45% V_{DD} typical).
- Noise margins of 1 V min at 5V V_{DD}
  2 V min at 10V V_{DD}
  2.5V min at 15V V_{DD}
- Low (400 ohm typical) and constant output impedance in both logical states giving fixed and equal output transition times.
- Output current capable of driving

  a) two low power TTL loads
  b) one low power Schottky TTL load
  c) two HLL loads

  over the rated temperature range.
- Output current and input threshold independent of the number of inputs paralleled together.
- Square transfer voltage characteristics.

General COS/MOS characteristics

The main advantages offered by COS/MOS devices over corresponding bipolar devices (DTL, LPS, TTL, ECL, HLL) are:

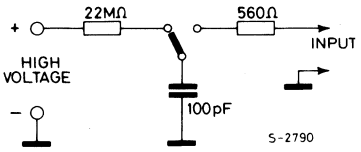
- very low quiescent power dissipation (typically 10 nW/gate, 10 μW/MSI)
- wide operating voltage range (3 to 18V for **HCC**; 3-15V for **HCF**)
- high input impedance (typically 10^{12} Ω)
- high DC noise immunity (typically 45% of supply voltage).

This digital family however has slower switching speeds than most bipolar families. For example the typical propagation times for COS/MOS and other logic families are:

	COS/MOS	ECL	LPS	TTL	DTL	HLL
Propagat. delay time (ns)	35	2	5	10	30	110

Moreover, due to the high input impedance of the MOS gates, COS/MOS devices require greater care in handling.
The normal gate oxide thickness is 800 to 1000 Å with a corresponding breakdown voltage between gate and substrate of 80 to 90V.
The electrostatic potential of the human body is much higher than this range, reaching 12 kV with a discharge capacity of approximately 100 pF. In fact an equivalent body discharge network is shown in fig. A.

Fig. A - Equivalent body discharge network



The characteristic values of electrostatic potential in an environment with relative humidity in the range 25% to 36% are as follow:

Source of electrostatic potential	Typical value (kV)	Maximum value (kV)
Person walking on a carpet	12	39
Person walking on vinyl tiles	4	13
Person working at a bench	0.5	3
16 pin DIP in a plastic box	3.5	12
16 pin DIP in plastic tubes used for shipping	0.5	3

Overvoltage protection networks are therefore used for the inputs of COS/MOS device.
The **HCC/HCF 4000B** devices use an improved protection network over that used in the **4000A** series. The level of protection for the **4000B** products has been raised to 4 kV, the previous solution for the **4000A** products protected the gate oxide against electrostatic discharges only up to approximately 1 kV. The following figures show the difference between the two input protection networks for a basic inverter:

Fig. B

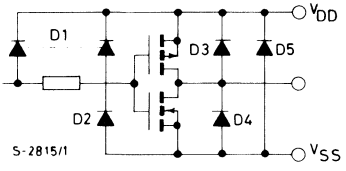


Fig. C

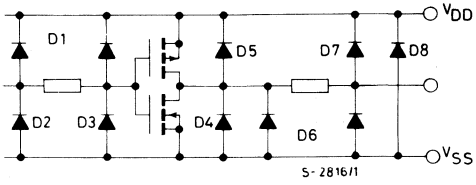

In COS/MOS as in Linear Integrated Circuits a "latch-up" phenomenon may appear. This is caused by an electrical pulse which, acting on an SCR structure of parasitic bipolar transistors inside COS/MOS devices (shown in fig. D), produces a low resistance path between supply voltage and ground that remains after the pulse has ceased leading rapidly to device destruction.

This phenomenon will occur either when V_{DD} is more than the maximum rating and approaches the breakdown voltage of the SCR structure or when the following conditions are verified:

a) the product of the gains of the two parasitic transistors is greater than or equal to unity;

b) the base-emitter junction of both transistors is forward biased;

c) supply voltage and input circuits are able to deliver a current equal to the holding current of the SCR (fig. E).

In particular, condition (b) may be caused by:

1) voltages induced through the oxide by based metallization;

2) lateral voltage drops between substrate and P-well due to photo current generated by radiation. These drops can forward bias the gate-cathode junction of the parasitic SCR.

This effect is particularly significant in buffers which are devices most subject to latch-up due to the combination of large geometry and low silicon resistivity.
For these reasons voltage transients or large output current surges occurring during operation near the maximum rating should be avoided.

Fig. D

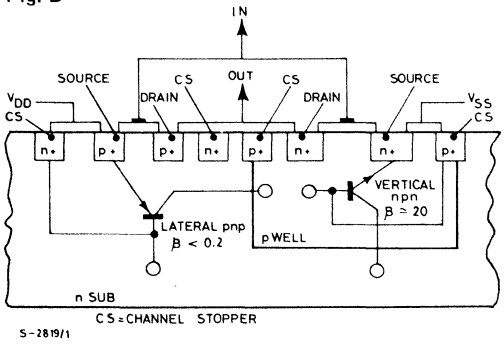

Fig. E

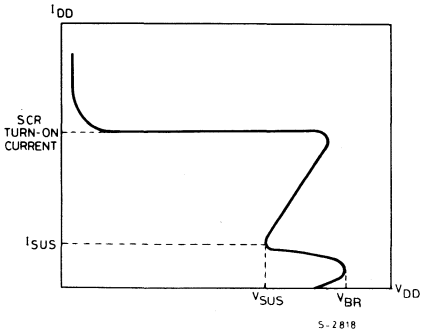

The B series devices are much better protected against latch-up than the A series because of their higher typical breakdown voltage:

Characteristic	A series	B series
V_{BR}	17 V	25 V
V_{SUS}	15 V	22 V
I_{SUS}	10 to 40 mA	50 to 100 mA

B series dynamic switching parameters

The dynamic electrical characteristics are specified at T_{amb}= 25°C under the following conditions:

- load capacitance (C_L) of 50 pF and load resistance (R_L) of 200 kΩ;
- input pulse amplitude equal to supply voltage (V_{DD});
- input rise and fall times of 20 ns;
- propagation delay times measured from 50% the point of the input voltage to the 50% point of the output voltage;
- transition times measured from 10% to 90% of the supply voltage (V_{DD}).

In some devices other time parameters are also specified:

a) Set up time
b) Hold time
c) Removal time
d) Tri-state disable delay times.

The figures below show the meaning of these parameters:

Fig. F

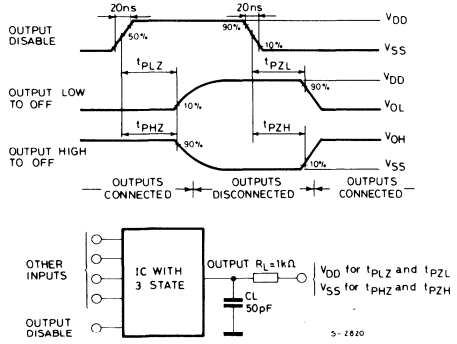

Fig. G

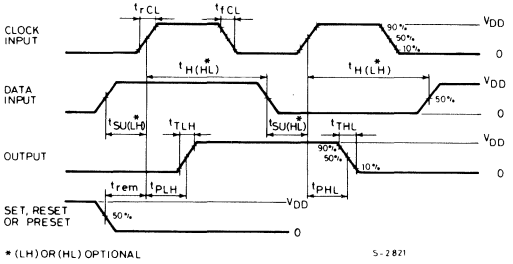


Comparison between B and UB devices

The **HCC/HCF 4000B** family also includes suffix UB products that only meet some of the B series electrical specifications.
These have logic outputs that are not buffered, and V_{IL} and V_{IH} that are specified as 20% V_{DD} and 80% V_{DD} respectively for V_{DD}= 5V and 10V and 17% V_{DD} and 83% V_{DD} respectively for V_{DD}= 15V.

The corresponding values of suffix B types are:

V_{IL}= 30% V_{DD}
V_{IH}= 70% V_{DD} for V_{DD}= 5V and 10V and V_{IL}= 27% V_{DD}
V_{IH}= 73% V_{DD} for V_{DD}= 15V

The other main differences between B and UB gates are summarized below:

Characteristic	Buffered	Unbuffered
Typical output impedance	Constant: 400 Ω (typ.) at V_{DD}= 5V	Variable: dependent on number of inputs paralleled together
Voltage transfer characteristic	Square and independent of the number of inputs tied together	Rounded (as A series) and shifted with different number of inputs paralleled together
Propagation delay	Moderate: 150 ns at V_{DD}= 5V 65 ns at V_{DD}= 10V 50 ns at V_{DD}= 15V	Fast: 60 ns at V_{DD}= 5V 30 ns at V_{DD}= 10V 25 ns at V_{DD}= 15V
AC gain	High and constant: ≃ 68 dB	Low and dependent on supply voltage: 28 dB at V_{DD}= 5V 23 dB at V_{DD}= 10V 18 dB at V_{DD}= 15V
AC band width	Low: 230 kHz at V_{DD}= 5V 280 kHz at V_{DD}= 10V 295 kHz at V_{DD}= 15V	High: 710 kHz at V_{DD}= 5V 885 kHz at V_{DD}= 10V 2800 kHz at V_{DD}= 15V
Input capacitance	Low: average 1 to 2 pF peak 2 to 4 pF	High: average 2 to 3 pF peak 5 to 10 pF
Noise margin	Excellent: 1V at V_{DD}= 5V 2V at V_{DD}= 10V 2.5V at V_{DD}= 15V	Good: 0.5V at V_{DD}= 5V 1V at V_{DD}= 10V 1V at V_{DD}= 15V
Output transition time	200 ns (typ.) at V_{DD}= 5V C_L = 50 pF	50 to 100 ns at V_{DD}= 5V C_L = 50 pF

If B and UB gates are presented with slow transition time signals the behaviour of the two types differs. In fact, because of high AC gain of B devices (obtained with the two extra inverters) the outputs tend to develop a few cycles of oscillation between V_{DD} and V_{SS} when input rise or fall time is more than 1 ms at V_{DD}= 5V and AC noise is reduced to 2 – 3 mV within the B device bandwidth.
The unbuffered gates (which have less gain) tend not to oscillate with the same input ramp unless a noise voltage of 200 to 300 mV is present within the device bandwidth.

GENERAL OPERATING AND HANDLING INSTRUCTIONS

Power source rules

1) Referring to standard input network protection of fig. B, when separate power supplies are used for V_{DD} and for the device inputs, the V_{DD} supply should always be turned on before the input signal source and the input signal should be turned off before the V_{DD} supply is turned off.
This rule will prevent the D1 input protection diode from overdissipation and possible damage when the device power supply is grounded.
When the device power supply is an open circuit, violation of this rule can result in undesired circuit operation although device damage may not result; AC inputs can be rectified by D1 input diode to act as a power supply.

2) The steady power-supply operating voltage should be kept within the recommended operating conditions and always below the maximum ratings.

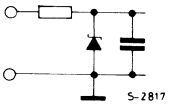
3) The power-supply polarity for COS/MOS circuits should not be reversed. The positive (V_{DD}) terminal should never be more than 0.5V negative with respect to the negative (V_{SS}) terminal ($V_{DD}-V_{SS} > -0.5V$). Reversal of polarities will forward-bias and short the structural and protection diode between V_{DD} and V_{SS}.

4) Power-source current capability should be limited to the minimum value which will assure good logic operation.

5) Large values of resistors in series with V_{DD} or V_{SS} should be avoided; transient turn-on of input protection diodes can result from drops across such resistors during switching.

A good practice is to use a zener protection diode in parallel with the power bus as shown in fig. H below.
The zener value should be above the expected maximum regulation excursion, but should not exceed the maximum supply voltage.
A current limiting resistor is included if the supply impedance is lower than the zener power dissipation rating allow for a given zener voltage.
The shunt capacitor value is chosen to supply required peak current switching transients.

Fig. H



Input signal rules

1) Signals should not be applied to the inputs while the device power supply is off unless the input current is limited to a steady-state value of less than 10 mA. Input-signal interfaces that swing the allowable 0.5V above V_{DD} or below V_{SS} should be current-limited to 10 mA or less.
Whenever the possibility of exceeding 10 mA of input current exists, a resistor in series with the input must be used. The value of this resistor can be as high as 10 kΩ without affecting static electrical characteristics. However, speed will be reduced because of the added RC time constant.
Particular attention should be given to long input-signal lines where high inductance can increase the likelihood of large-signal pickup in noisy environments. In these cases, series resistance with shunt capacitance at the IC input terminals is recommended. The shunt capacitance should be made as large as possible consistent with the system speed requirements.

2) All COS/MOS inputs should be terminated. When COS/MOS inputs are wired to edge card connectors with COS/MOS drive coming from another PC board, a shunt resistor should be connected to V_{DD} or V_{SS}.

3) When COS/MOS circuits are driven by TTL logic a pull-up resistor should be connected from the COS/MOS inputs to 5V.

4) Input signals should be maintained within the recommended input signal swing range.

5) Input rise and fall times for clocked devices must not exceed 15 μs in order to avoid high consumption, false triggering, etc. With slower inputs a Schmitt trigger must be employed.

Output rules

1) The power dissipation in a COS/MOS package should not exceed the rated value for the ambient temperature specified. The actual dissipation should be calculated when (a) shorting outputs directly to V_{DD} or V_{SS}, (b) driving low-impedance loads, or (c) directly driving the base of PNP or NPN bipolar transistors.

2) Output short circuits often result from testing errors or improper board assembly. Shorts on buffer outputs on power supplies greater than 5V can damage COS/MOS devices.

3) COS/MOS, like active pull-up TTL, cannot be connected in the "wire-OR" configuration because an "on" PMOS and an "on" NMOS transistor could be directly shorted across the power-supply rails. For applications with wire OR configurations it is necessary to use devices with tri-state logic outputs.

4) Paralleling gates is recommended only when the gates are within the same IC package.

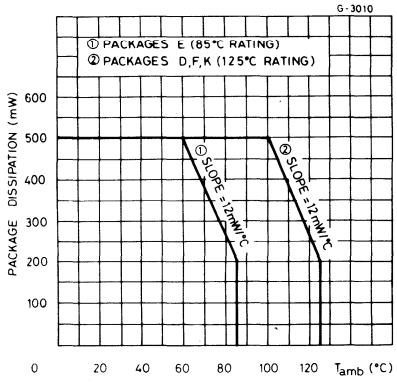
5) Output loads should return to a voltage within the supply-voltage range (V_{DD} to V_{SS}).

6) Large capacitive loads (greater than 5000 pF) on COS/MOS buffers or high-current drivers act like short circuits and may over-dissipate output transistors.

7) Output transistors may be over-dissipated by operating buffers as linear amplifiers or using these types as one-shot or astable multivibrators.

8) Shorting of output to V_{SS} or V_{DD} can cause the device power dissipation to exceed the safe value of 500 mW as shown in fig. I.
This is possible with supply voltage higher than 5V.
For cases in which a short circuited load is driven directly (base of PNP or NPN bipolar transistor) the requirements for gate operation must be determined by consulting the published data. Note that a individual output transistor dissipation must be limited to 100 mW.

Fig. I - Standard COS/MOS thermal derating chart



GENERAL OPERATING AND HANDLING INSTRUCTIONS (continued)

Noise Immunity and Noise Margin

DC Noise Immunity

The V_{IL} and V_{IH} characteristics define the maximum tolerable noise voltages at an input terminal when input signals are within 50 mV of supply lines.

Noise Margin

The noise margin voltage is the maximum voltage that can be added, at an input voltage $V_i = V_{OL}$ or V_{OH} of the preceding stage without upsetting the logic or causing the output to exceed the output voltage V_o.
In practice, DC noise immunity is much more significant than noise margin because the COS/MOS outputs are normally within 50 mV of supply lines. Noise immunity increases if the input pulse width becomes less than the propagation delay of the circuit.
This condition is often described as AC noise immunity.

Handling rules

Since each user's manufacturing environment is different it is only possible to give some general notes for avoiding damage from electrostatic voltages:

a) handling equipment, trays, table tops and transport carts should be conductive;

b) metal parts of fixtures, tools, soldering irons and table tops should be grounded to a common point;

c) operators should use grounded (metal or conductive) plastic wrist straps with a 1 MΩ series resistor;

d) packages should not be removed from their conductive or antistatic carriers until required; this should only be done by a grounded operator. Devices removed should be placed in a conductive tray;

e) all tests should be performed by a grounded operator and after completion of test, devices should be reinserted in conductive carriers;

f) the printed circuit boards should have shorting bars installed prior to assembly (soldering). When possible COS/MOS IC's should be the last component installed on PC boards.

Table I - STATIC ELECTRICAL CHARACTERISTICS (SGS-ATES 4000B and UB)

Parameter		Test conditions				Values						Unit
		V_I (V)	V_O (V)	$\|I_O\|$ (μA)	V_{DD} (V)	T_{Low}		25°C		T_{High}

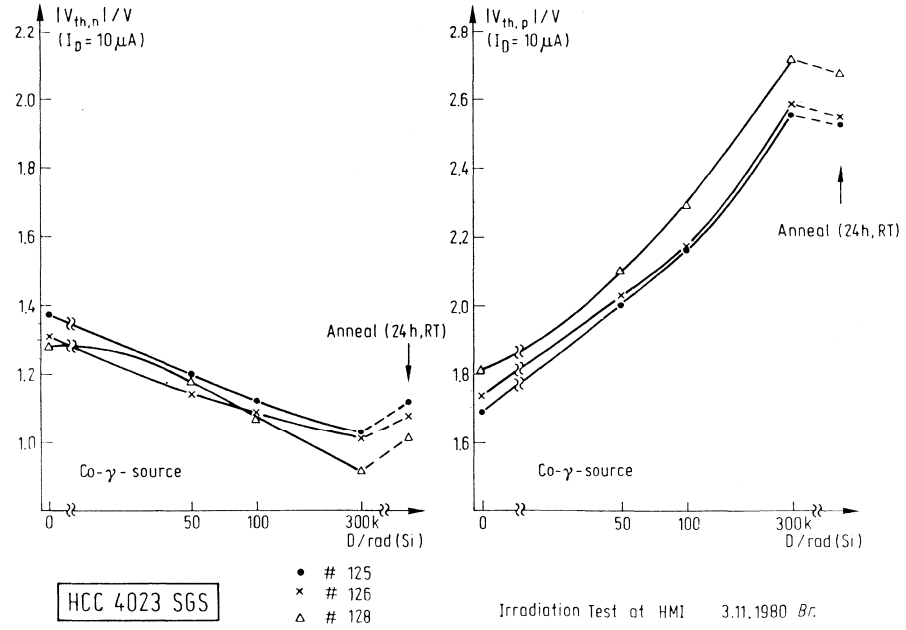
RADIATION HARDENED COS/MOS

RADIATION HARDENED C-MOS

Radiation Hardened versions of **HBC/HCC 4000** series types are offered by SGS-ATES for special application in Space, Biomedical and Military fields.
These devices are supplied in accordance to the relevant Hi-Rel processing and screening specifications requested in the particular field (MIL 883, SCC9000, GFWI0000, etc) and are electrically and mechanically identical to their non-hardened equivalent.
The package in which "RAD-HARD" C-MOS can be delivered are the ceramic metal seal Dual in Line (suffix D) or Flat (suffix K).
SGS-ATES "RAD-HARD" C-MOS are guaranteed to withstand a minimum ionising radiation dose of 100 Kilo rads (Si) and a Radiation Test Report, certifying the experimental verification of this performance on wafer/sample basis, is enclosed in each shipment.

Fig. 1 - Example of Threshold drifts versus radiation dose as measured on a sample of SGS RAD-HARD production tested by an independent laboratory. Parts tested were guaranteed to withstand 100 K rads, but all show voltage threshold shift well inside radiation spec limits even at 300 K rads (courtesy Hahn Meitner Institute, Berlin).



The actual radiation resistence of SGS-ATES RAD-HARD C-MOS parts can vary slightly from lot to lot and from type to type, but has repeatedly been demonstrated (see fig. 1) to be far in excess of the limit of 100K rads, normally requested for space and choosen by SGS-ATES as a standard reference for certification.

This achievement is the result of a small number of process modifications during wafer fabrication, capable of improving gate oxide characteristics, without affecting other performance of the devices. The hardening process as well as testing methods and control criteria have been incorporated in the Hi-Rel manufacturing flow chart, and have been evaluated and accepted by European-Space Agency as adequate for use in procuring SGS-ATES parts for space projects.

The first of such projects to which SGS-ATES C-MOS Hi-Rel parts have been delivered is the International Solar Polar Mission (ISPM), a joint ESA-NASA programme that will send two satellites on solar polar orbits after a swing around Jupiter, where they will be subjected to very high radiation doses in a very short time.

Fig. 2 is a reproduction of an actual Radiation Test Report for a device delivered to this project. The test is made in accordance to the Standard SGS-ATES procedure (QSR0234) that requires a minimum of 3 packaged devices for each silicon wafer to be subjected to 100K rads Gamma radiation from a Cobalt 60 source, with 10 Volts bias applied, pre and post test measurement of electrical characteristics and drift evaluation of channel threshold voltages and total leakage current.

A maximum drift of 1 Volt is accepted for both thresholds, while maximum leakage current limit after radiation depends on the device type and complexity.

Reproduction of an actual Radiation Test Report as enclosed in each shipment of RAD-HARD parts.

Fig. 2 - Reproduction of an actual Radiation Test Report as enclosed in each shipment of RAD-HARD parts.

PRELIMINARY DATA

18-STAGE STATIC SHIFT REGISTER

- PERMANENT REGISTER STORAGE WITH CLOCK LINE "HIGH" or "LOW" . . . . . NO INFORMATION RECIRCULATION REQUIRED
- FULLY STATIC OPERATION
- SHIFTING RATES UP TO 12 MHz @ 10V (TYP.)
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- 5V, 10V, AND 15V PARAMETRIC RATING
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4006B** (extended temperature range) and the **HCF 4006B** (standard temperature range), are monolithic integrated circuits, available in 14-lead dual in-line plastic or ceramic package and ceramic flat package. The types are comprised of 4 separate "shift register" sections; two sections of four stages and two sections of five stages with an output tap at the fourth stage. Each section has an independent "single rail" data path. A common clock signal is used for all stages. Data is shifted to the next stage on negative-going transitions of the clock. Through appropriate connections of inputs and outputs, multiple register sections of 4, 5, 8, and 9 stages or single register sections of 10, 12, 13, 14, 16, 17 and 18 can be implemented using one **HCC/HCF 4006B** package. Longer shift register sections can be assembled by using more than one **HCC/HCF 4006B**. To facilitate cascading stages when clock rise and fall times are slow, an optional output (D_1 + 4') that is delayed one-half clock-cycle, is provided (see Truth Table for Output from pin 2).

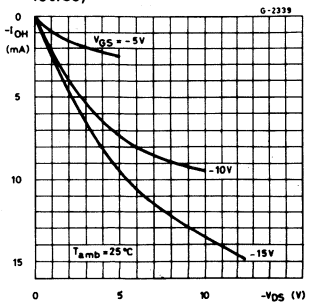
Minimum output high (source) current characteristics)



COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4007UB

DUAL COMPLEMENTARY PAIR PLUS INVERTER

- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- MEDIUM SPEED OPERATION t_{PHL}, t_{PLH} = 30 ns (TYP.) AT 10V
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4007UB** (extended temperature range) and **HCF 4007UB** (intermediate temperature range) are monolithic integrated circuit, available in 14-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.
The **HCC/HCF 4007UB** types are comprised of three n-channel and three p-channel enhancement-type MOS transistors. The transistor elements are accessible through the package terminals to provide a convenient means for constructing the various typical circuits as shown in typical applications. More complex functions are possible using multiple packages. Numbers shown in parentheses indicate terminals that are connected together to form the various configurations listed.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4008B

4-BIT FULL ADDER WITH PARALLEL CARRY OUTPUT

- 4 SUM OUTPUTS PLUS PARALLEL LOOK-AHERD CARRY-OUTPUT
- HIGH-SPEED OPERATION-SUM IN-TO-SUM OUT 160 ns (TYP.): CARRY IN-TO-CARRY OUT 50 ns (TYP.) AT V_{DD}= 10V, C_L= 50 pF.
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- 5V, 10V, AND 15V PARAMETRIC RATING
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4008B** (extended temperature range) and **HCF 4008B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.
The **HCC/HCF 4008B** types consist of four full adder stages with fast look ahead carry provision from stage to stage. Circuitry is included to provide a fast "parallel-carry-out" to permit high-speed operation in arithmetic sections using several **HCC/HCF 4008B's**.
HCC/HCF 4008B inputs include the four sets of bits to be added, A_1 to A_4 and B_1 to B_4, in addition to the "Carry In" bit from a previous section. **HCC/HCF 4008B** outputs include the four sum bits, S_1 to S_4. In addition to the high speed "parallel-carry-out" which may be utilized at a succeeding **HCC/HCF 4008B** section.

HCC/HCF 4013B

DUAL 'D' - TYPE FLIP-FLOP

- SET-RESET CAPABILITY
- STATIC FLIP-FLOP OPERATION - RETAINS STATE INDEFINITELY WITH CLOCK LEVEL EITHER "HIGH" OR "LOW"
- MEDIUM-SPEED OPERATION - 16 MHz (TYP.) CLOCK TOGGLE RATE AT 10V
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4013B** (extended temperature range) and **HCF 4013B** (intermediate temperature range) are monolithic integrated circuits, available in 14-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.
The **HCC/HCF 4013B** consists of two identical, independent data-type flip-flops. Each flip-flop has independent data, set, reset, and clock inputs and Q and $\overline{Q}$ outputs. These devices can be used for shift register applications, and, by connecting $\overline{Q}$ output to the data input, for counter and toggle applications. The logic level present at the D input is transferred to the Q output during the positive-going transition of the clock pulse. Setting or resetting is independent of the clock and is accomplished by a high level on the set or reset line, respectively.

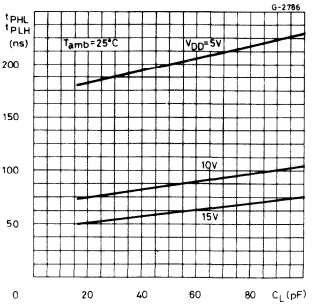
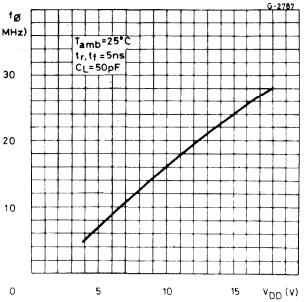
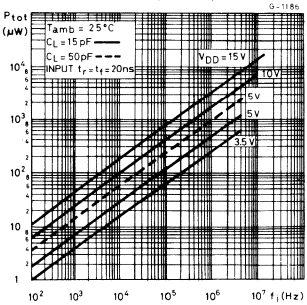
Typical propagation delay time vs. load capacitance (SET to $\overline{Q}$ or RESET to Q)



Typical maximum clock frequency vs. supply voltage



Typical power dissipation device vs. frequency



COS/MOS INTEGRATED CIRCUITS

HCC/HCF 4014B
HCC/HCF 4021B

PRELIMINARY DATA

8-STAGE STATIC SHIFT REGISTERS: 4014B-SYNCHRONOUS PARALLEL OR SERIAL INPUT/SERIAL OUTPUT 4021B-ASYNCHRONOUS PARALLEL INPUT OR SYNCHRONOUS SERIAL INPUT/ SERIAL OUTPUT

- MEDIUM-SPEED OPERATION-12 MHz (TYP.) CLOCK RATE AT V_{DD}-V_{SS}= 10V
- FULLY STATIC OPERATION
- 8 MASTER-SLAVE FLIP-FLOPS PLUS OUTPUT BUFFERING AND CONTROL GATING
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4014B, HCC 4021B** (extended temperature range) and the **HCF 4014B, HCF 4021B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 4014B** and **HCC/HCF 4021B** series types are 8-stage parallel-or serial-input/serial-output registers having common CLOCK and PARALLEL/SERIAL CONTROL inputs, a single SERIAL data input, and individual parallel "JAM" inputs to each register stage. Each register stage is a D type, master-slave flip-flop in addition to an output from stage 8, "Q" outputs are also available from stages 6 and 7. Parallel as well as serial entry is made into the register synchronously with the positive clock line transition in the **HCC/HCF 4014B**. In the **HCC/HCF 4021B** serial entry is synchronous with the clock but parallel entry is asynchronous. In both types, entry is controlled by the PARALLEL/SERIAL CONTROL input. When the PARALLEL/SERIAL CONTROL input is low, data is serially shifted into the 8-stage register synchronously with the positive transition of the clock line. When the PARALLEL/SERIAL CONTROL input is high, data is jammed into the 8-stage register via the parallel input lines and synchronous with the positive transition of the clock line. In the **HCC/HCF 4021B**, the CLOCK input of the internal stage is "forced" when asynchronous parallel entry is made. Register expansion using multiple package is permitted.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4015B

DUAL 4-STAGE STATIC SHIFT REGISTER WITH SERIAL INPUT/PARALLEL OUTPUT

- MEDIUM SPEED OPERATION: 12 MHz (TYP.) CLOCK RATE AT V_{DD}-V_{SS}= 10V
- FULLY STATIC OPERATION
- 8 MASTER-SLAVE FLIP—FLOPS PLUS INPUT AND OUTPUT BUFFERING
- HIGH NOISE IMMUNITY
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4015B** (extended temperature range) and **HCF 4015B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.

The **HCC/HCF 4015B** consists of two identical, independent, 4-stage serial-input/parallel-output registers. Each register has independent CLOCK and RESET inputs as well as a single serial DATA input. "Q" outputs are available from each of the four stages on both registers. All register stages are D-type, master-slave flip-flops. The logic level present at the DATA input is transferred into the first register stage and shifted over one stage at each positive-going clock transition. Resetting of all stages is accomplished by a high level on the reset line. Register expansion to 8 stages using one **HCC/HCF 4015B** package, or to more than 8 stages using additional **HCC/HCF 4015B**'s is possible.

- SWITCH ON RESISTANCE MATCHED TO WITHIN 10Ω TYP. OVER 15V SIGNAL INPUT RANGE
- HIGH ON/OFF OUTPUT-VOLTAGE RATIO: 65 dB TYP. @ f_{is} = 10 kHz, R_L = 10 kΩ
- HIGH DEGREE OF LINEARITY: < 0.5% DISTORTION TYP. @ f_{is} = 1 KHz, V_{is} = 5 V_{pp}, V_{DD}-V_{SS} ⩾ 10V, R_L = 10 kΩ
- EXTREMELY LOW OFF SWITCH LEAKAGE RESULTING IN VERY LOW OFFSET CURRENT AND HIGH EFFECTIVE OFF RESISTANCE: 100 pA TYP. @ V_{DD}-V_{SS} = 18V, T_{amb} = 25°C
- EXTREMELY HIGH CONTROL INPUT IMPEDANCE (CONTROL CIRCUIT ISOLATED FROM SIGNAL CIRCUIT 10^{12} Ω TYP.)
- LOW CROSSTALK BETWEEN SWITCHES: -50 dB TYP. @ f_{is} = 0.9 MHz, R_L = 1 kΩ
- MATCHED CONTROL-INPUT TO SIGNAL-OUTPUT CAPACITANCE: REDUCES OUTPUT SIGNAL TRANSIENTS
- FREQUENCY RESPONSE' SWITCH ON = 40 MHz (TYP.)
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4016B** (extended temperature range) and **HCF 4016B** (intermediate temperature range) are monolithic integrated circuit, available in 14-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.

The **HCC/HCF 4016B** Series types are quad bilateral switches intended for the transmission or multiplexing of analog or digital signals. Each of the four independent bilateral switches has a single control signal input which simultaneously biases both the p and n device in a given switch ON or OFF.

COUNTER/DIVIDERS: 4017B - DECADE COUNTER WITH 10 DECODED OUTPUTS
4022B - OCTAL COUNTER WITH 8 DECODED OUTPUTS

- FULLY STATIC OPERATION
- MEDIUM SPEED OPERATION-12 MHz (TYP.) AT V_{DD}= 10V
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4017B/4022B** (extended temperature range) and **HCF 4017B/4022B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **4022B** is also available in 16 pin plastic micropackage.
The **HCC/HCF 4017B** and **HCC/HCF 4022B** are 5-stage and 4-stage Johnson counters having 10 and 8 decoded outputs, respectively. Inputs include a CLOCK, a RESET, and a CLOCK INHIBIT signal. Schmitt trigger action in the CLOCK input circuit provides pulse shaping that allows unlimited clock input pulse rise and fall times. These counters are advanced one count at the positive clock signal transition if the CLOCK INHIBIT signal is low. Counter advancement via the clock line is inhibited when the CLOCK INHIBIT signal is high. A high RESET signal clears the counter to its zero count. Use of the Johnson decade-counter configuration permits high-speed operation, 2-input decimal-decode gating, and spike-free decoded outputs. Anti-lock gating is provided, thus assuring proper counting sequence. The decoded outputs are normally low and go high only at their respective decoded time slot. Each decoded output remains high for one full clock cycle. A CARRY-OUT signal completes one cycle every 10 clock input cycles in the **HCC/HCF 4017B** or every 8 clock input cycles in the **HCC/HCF 4022B** and is used to ripple-clock the succeeding device in a multi-device counting chain.

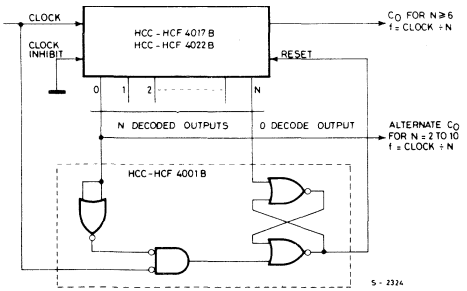
RECOMMENDED OPERATING CONDITIONS

V_{DD}	Supply voltage: **HCC** types	3 to 18	V
	HCF types	3 to 15	V
V_I	Input voltage	0 to V_{DD}	V
T_{op}	Operating temperature: **HCC** types	-55 to 125	°C
	HCF types	-40 to 85	°C

TYPICAL APPLICATIONS

Divide by N counter (N ⩽ 10) with N decoded outputs



When the N^{th} decoded output is reached (N^{th} clock pulse) the S-R flip-flop (constructed from two NOR gates of the **HCC/HCF 4001B**) generates a reset pulse which clears the **HCC/HCF 4017B** to its zero count. At this time, if the N^{th} decoded output is greater than or equal to 6, the C_{OUT} line goes high to clock the next **HCC/HCF 4017B** counter section. The "0" decoded output also goes high at this time. Coincidence of the clock low and decoded "0" output high resets the S-R flip flop to enable the **HCC/HCF 4017B**. If the N^{th} decoded output is less than 6, the C_{OUT} line will not go high and, therefore, cannot be used. In this case "0" decoded output may be used to perform the clocking function for the next counter.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4018B

PRESETTABLE DIVIDE-BY-N COUNTER

- MEDIUM SPEED OPERATION -10 MHz (TYP.) AT V_{DD}-V_{SS}= 10V
- FULLY STATIC OPERATION
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4018B** (extended temperature range) and **HCF 4018B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.

The **HCC/HCF 4018B** types consist of 5 Johnson-Counter stages, buffered $\overline{Q}$ outputs from each stage, and counter preset control gating. CLOCK, RESET, DATA, PRESET ENABLE, and 5 individual JAM inputs are provided. Divide by 10, 8, 6, 4, or 2 counter configurations can be implemented by feeding the $\overline{Q}5$, $\overline{Q}4$, $\overline{Q}3$, $\overline{Q}2$, $\overline{Q}1$ signals, respectively, back to the DATA input.

Divide-by-9, 7, 5, or 3 counter configurations can be implemented by the use of a **HCC/HCF 4011B** gate package to properly gate the feedback connection to the DATA input. Divide-by-functions greater than 10 can be achieved by use of multiple **HCC/HCF 4018B** units. The counter is advanced one count at the positive clock-signal transition. Schmitt Trigger action on the clock line permits unlimited clock rise and fall times. A high RESET signal clears the counter to an all-zero condition. A high PRESET-ENABLE signal allows information on the JAM inputs to preset the counter. Anti-lock gating is provided to assure the proper counting sequence.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4019B

QUAD AND/OR SELECT GATE

- MEDIUM SPEED OPERATION: $t_{PHL} = t_{PLH} = 60$ ns (TYP.) AT $C_L = 50$ pF, $V_{DD} = 10$V
- STANDARDIZED, SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4019B** (extended temperature range) and **HCF 4019B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.
The **HCC/HCF 4019B** types are comprised of four AND/OR select gate configurations, each consisting of two 2-input AND gates driving a single 2-input OR gate. Selection is accomplished by control bits K_a and K_b. In addition to selection of either channel A or channel B information, the control bits can be applied simultaneously to accomplish the logical A + B function.

ABSOLUTE MAXIMUM RATINGS

V_{DD}*	Supply voltage: **HCC** types	-0.5 to 20	V
	HCF types	-0.5 to 18	V

The **HCC 4XXXB** (extended temperature range) and **HCF 4XXXB** (intermediate temperature range) are monolithic integrated circuits, available in 14-lead dual in-line for **4024B** and 16-lead dual in-line for **4020B, 4040B.** The series types are supplied in plastic or ceramic dual in-line package and ceramic flat package. The **4024B** is also available in 14 pin plastic micropackage.
The **HCC/HCF 4020B, 4024B,** and **4040B** are ripple-carry binary counters. All counter stages are master-slave flip-flops. The state of a counter advances one count on the negative transition of each input pulse; a high level on the RESET line resets the counter to its all zeros stage. Schmitt trigger action on the input-pulse line permits unlimited clock rise and fall times. All inputs and outputs are buffered.

HCC/HCF 4026B
HCC/HCF 4033B

DECADE COUNTERS/DIVIDERS WITH DECODED 7-SEGMENT DISPLAY OUTPUTS AND: DISPLAY ENABLE 4026B RIPPLE BLANKING 4033B

- COUNTER AND 7-SEGMENT DECODING IN ONE PACKAGE
- EASILY INTERFACED WITH 7-SEGMENT DISPLAY TYPES
- FULLY STATIC COUNTER OPERATION: DC TO 6 MHz (TYP.) AT V_{DD}= 10V
- IDEAL FOR LOW-POWER DISPLAYS
- DISPLAY ENABLE OUTPUT -4026B
- "RIPPLE BLANKING" AND LAMP TEST - 4033B
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATING
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4026B/4033B** (extended temperature range) and **HCF 4026B/4033B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 4026B** and **HCC/HCF 4033B** each consist of a 5-stage Johnson decade counter and an output decoder which converts the Johnson code to a 7-segment decoded output for driving one stage in a numerical display. These devices are particularly advantageous in display applications where low power dissipation and/or low package count are important. Inputs common to both types are CLOCK, RESET, & CLOCK INHIBIT; common outputs are CARRY OUT and the seven decoded outputs (a, b, c, d, e, f, g). Additional inputs and outputs for the **HCC/HCF 4026B** include DISPLAY ENABLE input and DISPLAY ENABLE and UNGATED "C-SEGMENT" outputs. Signals peculiar to the **HCC/HCF 4033B** are RIPPLE-BLANKING INPUT AND LAMP TEST INPUT and a RIPPLE-BLANKING OUTPUT. A high RESET signal clears the decade counter to its zero count. The counter is advanced one count at the positive clock signal transition if the CLOCK INHIBIT signal is low. Counter advancement via the clock line is inhibited when the CLOCK INHIBIT signal is high. Antilock gating is provided on the JOHNSON counter, thus assuring proper counting sequence. The CARRY-OUT (C_{out}) signal completes one cycle every ten CLOCK INPUT cycles and is used to clock the succeeding decade directly in a multi-decade counting chain. The seven decoded outputs (a, b, c, d, e, f, g) illuminate the proper segments in a seven segment display device used for representing the decimal numbers 0 to 9. The 7-segment outputs go high on selection in the **HCC/HCF 4033B**; in the **HCC/HCF 4026B** these outputs go high only when the DISPLAY ENABLE IN is high.

HCC/HCF 4026B - When the DISPLAY ENABLE IN is low the seven decoded outputs are forced low regardless of the state of the counter. Activation of the display only when required results in significant power savings. This system also facilitates implementation of display-character multiplexing. The CARRY OUT and UNGATED "C-SEGMENT" signals are not gated by the DISPLAY ENABLE and therefore are available continuously. This feature is a requirement in implementation of certain divider functions such as divide-by-60 and divide-by-12.

HCC/HCF 4033B - The **HCC/HCF 4033B** has provisions for automatic blanking of the non-significant zeros in a multi-digit decimal number which results in an easily readable display consistent with normal writing practice. For example, the number 0050.07000 in an eight digit display would be displayed as 50.07. Zero suppression on the integer side is obtained by connecting the RBI terminal of the **HCC/HCF 4033B** associated with the most significant digit in the display to a low-level voltage and connecting the RBO terminal of that stage to the RBI terminal of the **HCC/HCF 4033B** in the next-lower significant position in the display. This procedure is continued for each succeeding **HCC/HCF 4033B** on the integer side of the display. On the fraction side of the display the RBI of the **HCC/HCF 4033B** associated with the least significant bit is connected to a low-level voltage and the RBO of that **HCC/HCF 4033B** is connected to the RBI terminal of the **HCC/HCF 4033B** in the next more-significant-bit position. Again, this procedure is continued for all **HCC/HCF 4033B's** on the fraction side of the display. In a purely fractional number the zero immediately preceding the decimal point can be displayed by connecting the RBI of that stage to a high level voltage (instead of to the RBO of the next more-significant-stage). For example: optional zero → 0.7346. Likewise, the zero in a number such as 763.0 can be displayed by connecting the RBI of the **HCC/HCF 4033B** associated with it to a high-level voltage. Ripple blanking of non-significant zeros provides an appreciable savings in display power. The **HCC/HCF 4033B** has a LAMP TEST input which, when connected to a high-level voltage, overrides normal decoder operation and enables a check to be made on possible display malfunctions by putting the seven outputs in the high state.

DJAL J-K MASTER-SLAVE FLIP-FLOP

- SET-RESET CAPABILITY
- STATIC FLIP-FLOP OPERATION - RETAINS STATE INDEFINITELY WITH CLOCK LEVEL EITHER "HIGH" OR "LOW"
- MEDIUM SPEED OPERATION -16 MHz (TYP. CLOCK TOGGLE RATE AT 10V
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4027B** (extended temperature range) and **HCF 4027B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.

The **HCC/HCF 4027B** is a single monolithic chip integrated circuit containing two identical complementary-symmetry J-K master-slave flip-flops. Each flip-flop has provisions for individual J, K, Set, Reset, and Clock input signals, Buffered Q and $\overline{Q}$ signals are provided as outputs. This input-output arrangement provides for compatible operation with the **HCC/HCF 4013B** dual D-type flip-flop.

The **HCC/HCF 4027B** is useful in performing control, register, and toggle functions. Logic levels present at the J and K inputs along with internal self-steering control the state of each flip-flop; changes in the flip-flop state are synchronous with the positive-going transition of the clock pulse. Set and reset functions are independent of the clock and are initiated when a high level signal is present at either the Set or Reset input.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4028B

BCD-TO-DECIMAL DECODER

- BCD-TO-DECIMAL DECODING OR BINARY-TO-OCTAL DECODING
- HIGH DECODED OUTPUT DRIVE CAPABILITY
- "POSITIVE LOGIC" INPUTS AND OUTPUTS: DECODED OUTPUTS GO HIGH ON SELECTION
- MEDIUM-SPEED OPERATION: t_{PHL}, t_{PLH} = 80 ns (TYP.) @ V_{DD} = 10V
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4028B** (extended temperature range) and **HCF 4028B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.
The **HCC/HCF 4028B** types are BCD-to-decimal or binary-to-octal decoders consisting of buffering on all 4 inputs, decoding-logic gates, and 10 output buffers. A BCD code applied to the four inputs, A to D, results in a high level at the selected one of 10 decimal decoded outputs. Similarly, a 3-bit binary code applied to inputs A through C is decoded in octal code at output 0 to 7 if D = "0". High drive capability is provided at all outputs to enhance dc and dynamic performance in high fan-out applications.

TYPICAL APPLICATIONS

The circuit shown in fig. 1 converts any 4-bit code to a decimal or hexadecimal code. Fig. 2 shows a number of codes and the decimal or hexadecimal number in these codes which must be applied to the input pins of the HCC/HCF 4028B to select a particular output. For example: in order to get a "high" on output n. 8 the input must be either an 8 expressed in 4-bit binary code, a 15 expressed in 4-bit Gray code, or a 5 expressed in Excess-3 code.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4029B

PRESETTABLE UP/DOWN COUNTER BINARY OR BCD-DECADE

- MEDIUM SPEED OPERATION - 8 MHz (TYP.) @ C_L = 50 pF AND V_{DD}-V_{SS} = 10V
- MULTI-PACKAGE PARALLEL CLOCKING FOR SYNCHRONOUS HIGH SPEED OUTPUT RESPONSE OR RIPPLE CLOCKING FOR SLOW CLOCK INPUT RISE AND FALL TIMES
- "PRESET ENABLE" AND INDIVIDUAL "JAM" INPUTS PROVIDED
- BINARY OR DECADE UP/DOWN COUNTING
- BCD OUTPUTS IN DECADE MODE
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4029B** (extended temperature range) and **HCF 4029B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 4029B** consists of a four-stage binary or BCD-decade up/down counter with provisions for look-ahead carry in both counting modes. The inputs consist of a single CLOCK, CARRY-IN (CLOCK ENABLE), BINARY/DECADE, UP/DOWN, PRESET ENABLE, and four individual JAM signals. Q1, Q2, Q3, Q4 and a CARRY OUT signal are provided as outputs. A high PRESET ENABLE signal allows information on the JAM INPUTS to preset the counter to any state asynchronously with the clock. A low on each JAM line, when the PRESET-ENABLE signal is high, resets the counter to its zero count. The counter is advanced one count at the positive transition of the clock when the CARRY-IN and PRESET ENABLE signals are low. Advancement is inhibited when the CARRY-IN or PRESET ENABLE signals are high. The CARRY-OUT signal is normally high and goes low when the counter reaches its maximum count in the UP mode or the minimum count in the DOWN mode provided the CARRY-IN signal is low. The CARRY-IN signal in the low state can thus be considered a CLOCK ENABLE. The CARRY-IN terminal must be connected to V_{SS} when not in use. Binary counting is accomplished when the BINARY/DECADE input is high; the counter counts in the decade mode when the BINARY/DECADE input is low. The counter counts Up when to UP/DOWN INPUT is high, and Down when the UP/DOWN INPUT is low. Multiple packages can be connected in either a parallel-clocking or a ripple-clocking arrangement as shown in cascading counter packages. Parallel clocking provides synchronous control and hence faster response from all counting outputs. Ripple-clocking allows for longer clock input rise and fall times.

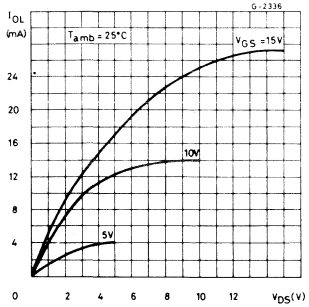
* From Up/Down, Binary/Decode, Carry In, or Preset Enable Control Inputs to Clock Edge.

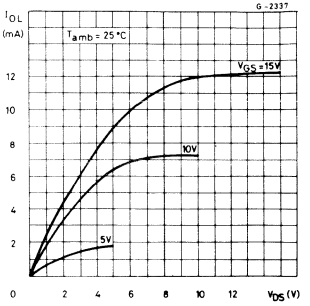
** If more than one unit is cascaded in the parallel clocked application, t_r should be made less than or equal to the sum of the fixed propagation dealy at 15 pF and the transition time of the carry output driving stage for the estimated capacitive load.

*** From Carry in to Clock Edge.

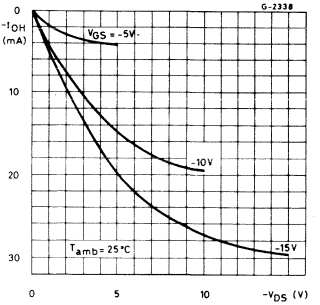
Typical output low (sink) current characteristics



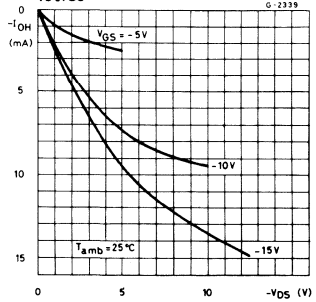
Minimum output low (sink) current characteristics



Typical output high (source) current characteristics

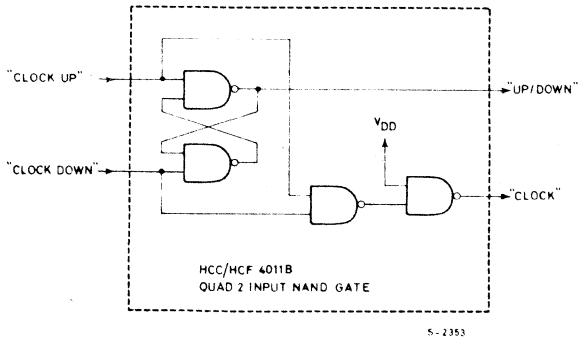


Minimum output high (source) current characteristics



APPLICATIONS

Conversion of clock up, clock down input signals to clock and up/down input signals.

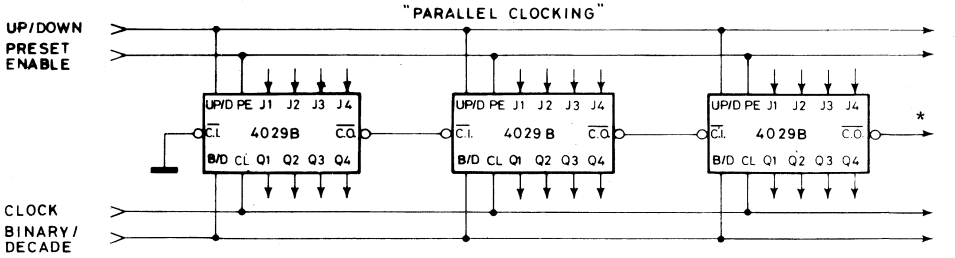


The **HCC/HCF 4029B** CLOCK and UP/DOWN inputs are used directly in most applications. In applications where CLOCK UP and CLOCK DOWN inputs are provided, conversion to the **HCC/HCF 4029B** CLOCK and UP/DOWN inputs can easily be realized by use of the circuit.

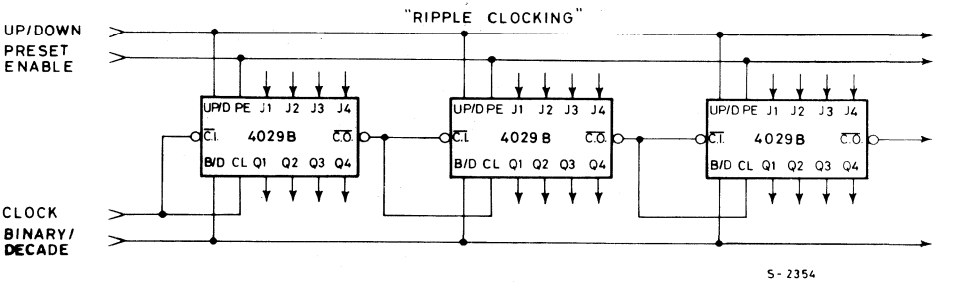
HCC/HCF 4029B changes count on positive transitions of CLOCK UP or CLOCK DOWN inputs. For the gate configuration shown below, when counting up the CLOCK DOWN input must be maintained high and conversely when couting down the CLOCK UP input must be maintained high.

APPLICATIONS (continued)

Cascading counter packages



* CARRY-OUT lines at the 2nd, 3rd, et., stages may have a negative-going glitch pulse resulting from differential delays of different **HCC/HCF 4029B** IC's. These negative-going glitches do not affect proper **HCC/HCF 4029B** operation, However, if the CARRY-OUT signals are used to trigger other edge-sensitive logic devices, such as FF's or counters, the CARRY-OUT signals should be gated with the clock signal using a 2-input NOR gate such as **HCC/HCF 4001B.**



Ripple Clocking Mode:
The Up/Down control can be changed at any count. The only restriction on changing the Up/Down control is that the clock input to the first counting stage must be high.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4030B

QUAD EXCLUSIVE - OR GATE

- MEDIUM-SPEED OPERATION - $t_{PHL} = t_{PLH} = 60$ ns (TYP.) @ $C_L = 50$ pF and $V_{DD}-V_{SS} = 10V$

	CO									

b)

			SIGN BIT							
-	=	X	1	1	1	1	1	1	1	0	- 2 +
- 5		Y	1	1	1	1	1	0	1	1	- 5
		$\bar{Y}$	0	0	0	0	0	1	0	0	+
		CI								1	
		S	1	0	0	0	0	0	1	1	= 3
		CO									

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4031B

64-STAGE STATIC SHIFT REGISTER

- FULLY STATIC OPERATION: DC TO 16 MHz (TYP.) @ V_{DD}-V_{SS}= 15V
- STANDARD TTL DRIVE CAPABILITY ON Q OUTPUT
- RECIRCULATION CAPABILITY
- THREE CASCADING MODES: DIRECT CLOCKING FOR HIGH-SPEED OPERATION
  DELAYED CLOCKING FOR REDUCED CLOCK DRIVE REQUIREMENTS
  ADDITIONAL 1/2 STAGE FOR SLOW CLOCKS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- STANDARDIZED, SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4031B** (extended temperature range) and **HCF 4031B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package.

The **HCC/HCF 4031B** is a static shift register that contains 64 D-type, master-slave flip-flop stages and one stage which is a D-type master flip-flop only (referred to as a 1/2 stage). The logic level present at the DATA input is transferred into the first stage and shifted one stage at each positive-going clock transition. Maximum clock frequencies up to 16 Megahertz (typical) can be obtained. Because fully static operation is allowed, information can be permanently stored with the clock line in either the low or high state. The **HCC/HCF 4031B** has a MODE CONTROL input that, when in the high state, allows operation in the recirculating mode. The MODE CONTROL input can also be used to select between two separate data sources. Register packages can be cascaded and the clock lines driven directly for high-speed operation. Alternatively, a delayed clock output (CL_D) is provided that enables cascading register packages while allowing reduced clock drive fan-out and transition-time requirements. A third cascading option makes use of the Q' output from the 1/2 stage, which is available on the next negative-going transition of the clock after the Q output occurs. This delayed output, like the delayed clock CL_D, is used with clocks having slow rise and fall times.

- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC/4032B/4038B** (extended temperature range) and **HCF 4032B/4038B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package.
The **HCC/HCF 4032B** and **HCC/HCF 4038B** types consist of three serial adder circuits with common CLOCK and CARRY-RESET inputs. Each adder has two provisions for two serial DATA INPUT signals and an INVERT command signal. When the command signal is a logical "1", the sum is complemented. Data words enter the adder with the least significant bit first; the sign bit trails. The output is the MOD 2 sum of the input bits plus the carry from the previous bit position. The carry is only added at the positive-going clock transition for the **HCC/HCF 4032B** or at the negative-going clock for the **HCC/HCF 4038B**, thus, for spike-free operation the input data transitions should occur as soon as possible after the triggering edge. The CARRY is reset to a logical "0" at the end of each word by applying a logical "1" signal to a CARRY-RESET input one-bit-position before the application of the first bit of the next word.

8-STAGE STATIC BIDIRECTIONAL PARALLEL/SERIAL INPUT/OUTPUT BUS REGISTER

- BIDIRECTIONAL PARALLEL DATA INPUT
- PARALLEL OR SERIAL INPUTS/PARALLEL OUTPUTS
- ASYNCHRONOUS OR SYNCHRONOUS PARALLEL DATA LOADING
- PARALLEL DATA-INPUT ENABLE ON "A" DATA LINES (3-STATE OUTPUT)
- DATA RECIRCULATION FOR REGISTER EXPANSION
- MULTIPACKAGE REGISTER EXPANSION
- FULLY STATIC OPERATIONAL DC-TO-5 MHz (TYP.) AT V_{DD} = 10V
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4034B** (extended temperature range) and **HCF 4034B** (intermediate temperature range) are monolithic integrated circuits, available in 24-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 4034B** is a static eight-stage parallel-or serial-input parallel-output register. It can be used to: 1) bidirectionally transfer parallel information between two buses; 2) convert serial data to parallel form and direct the parallel data to either of two buses; 3) store (recirculate) parallel data, or 4) accept parallel data from either of two buses and convert that data to serial form. Inputs that control the operations include a single-phase CLOCK (CL), A DATA ENABLE (AE), ASYNCHRONOUS/SYNCHRONOUS (A/S), A-BUS-TO-B-BUS/B-BUS-TO-A-BUS (A/B), and PARALLEL/SERIAL (P/S). Data inputs include 16 bidirectional parallel data lines of which the eight A data lines are inputs (3-state outputs) and the B data lines are outputs (inputs) depending on the signal level on the A/B input. In addition, an input for SERIAL DATA is also provided. All register stages are D-type master-slave flip-flops with separate master and slave clock inputs generated internally to allow synchronous or asynchronous data transfer from master to slave. Isolation from external noise and the effects of loading is provided by output buffering.

PARALLEL OPERATION – A high P/S input signal allows data transfer into the register via the parallel data lines synchronously with the positive transition of the clock provided the A/S input is low. If the A/S input is high the transfer is independent of the clock. The direction of data flow is controlled by the A/B input. When this signal is high the A data lines are inputs (and B data lines are outputs); a low A/B signal reverses the direction of data flow. The AE-input is an additional feature which allows many registers to feed data to a common bus. The A DATA lines are enabled only when this signal is high. Data storage through recirculation of data in each register stage is accomplished by making the A/B signal high and the AE signal low.

SERIAL OPERATION – A low P/S signal allows serial data to transfer into the register synchronously with the positive transition of the clock. The A/S input is internally disabled when the register is in the serial mode (asynchronous serial operation is not allowed). The serial data appears as output data on either the B lines (when A/B is high) or the A lines (when A/B is low and the AE signal is high). Register expansion can be accomplished by simply cascading **HCC/HCF 4034B** packages.

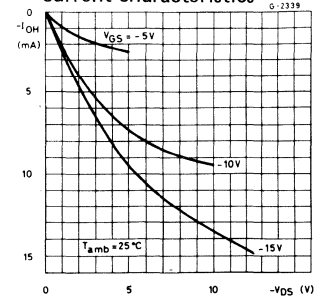
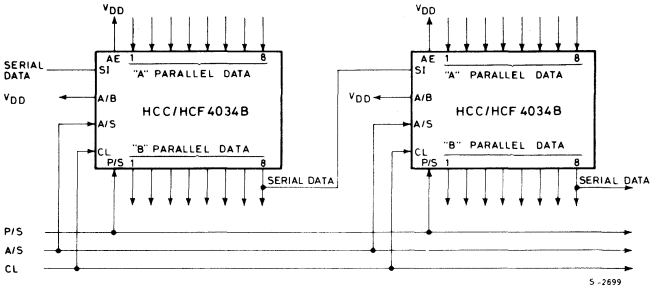
Minimum output high (source) current characteristics

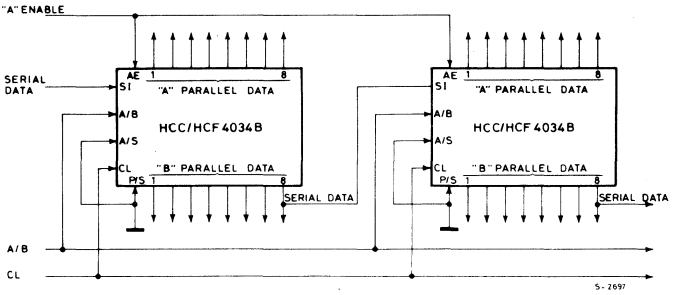


TYPICAL APPLICATIONS

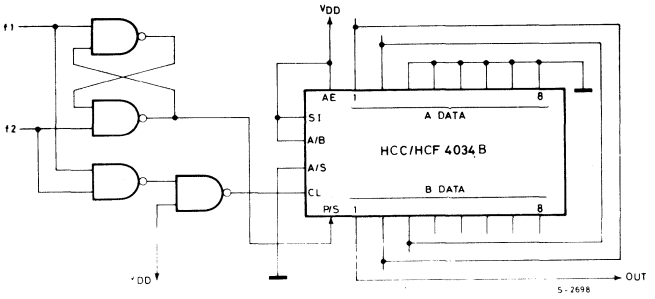
16-bit parallel in/parallel out, parallel in/serial out, serial in/parallel out, serial in/serial out register.



16-bit serial in/gated parallel out register

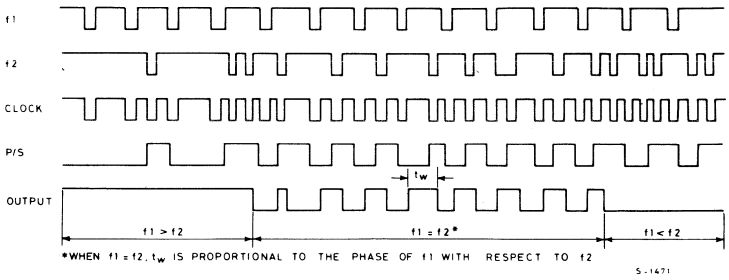


Frequency and phase comparator

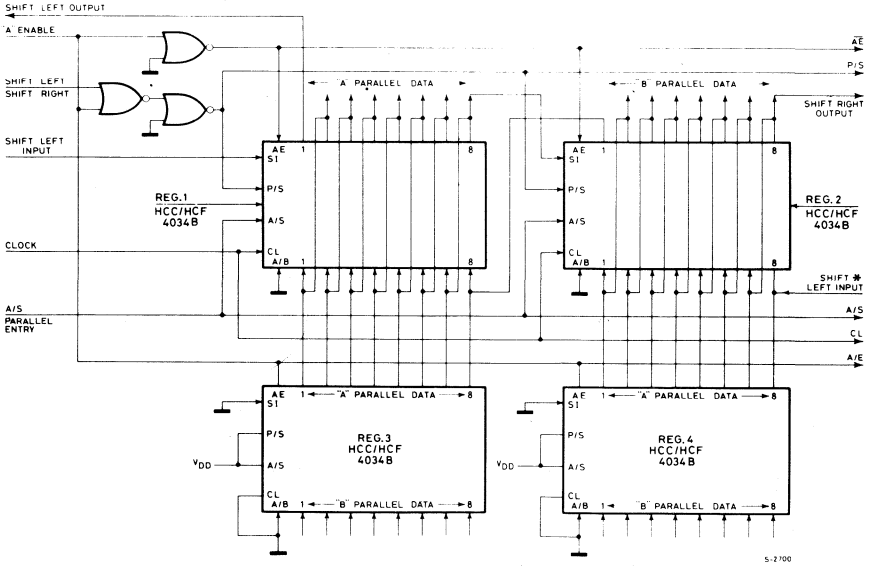


TYPICAL APPLICATIONS (continued)

Timing diagram



Shift right/shift left with parallel inputs

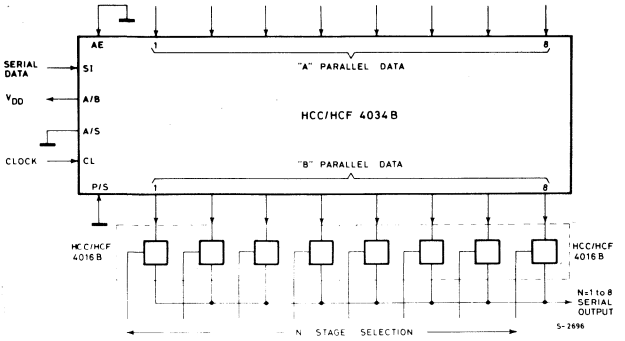


A "High" ("Low") on the Shift Left/Shift Right input allows serial data on the Shift Left Input (Shift Right Input) to enter the register on the positive transition of the clock signal. A "high" on the "A" Enable Input disables the "A" parallel data lines on Reg. 1 and 2 and enables the "A" data lines on registers 3 and 4 and allows parallel data into registers 1 and 2. Other logic schemes may be used in place of registers 3 and 4 for parallel loading. When parallel inputs are not used Reg. 3 and 4 and associated logic are not required.

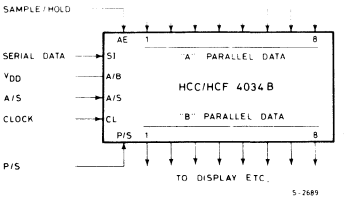
* Shift Left input must be disabled during parallel entry.

TYPICAL APPLICATIONS (continued)

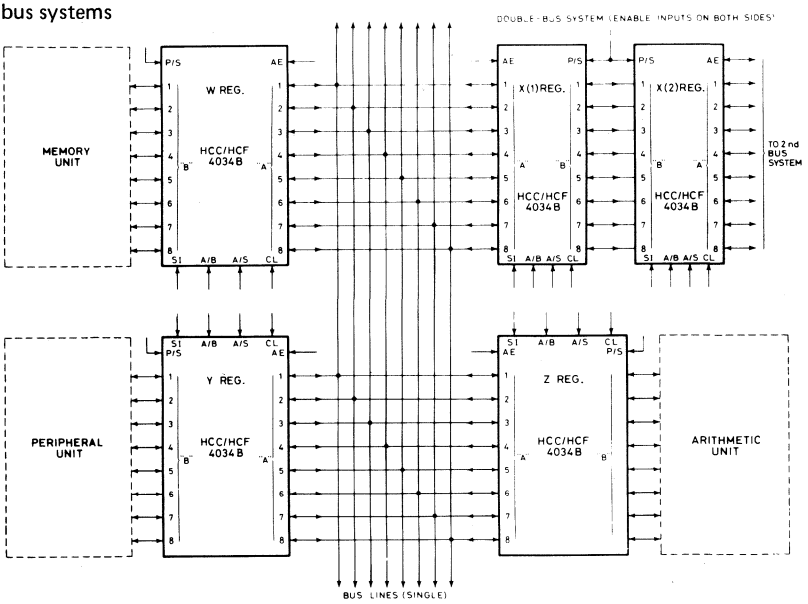
N-stage register with fixed serial output line



Sample and hold register-serial/parallel in-parallel out.



Single - and double - bus systems



The "A" enable (AE) and A/B signals control all combinations of transfer between the registers and bus systems.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4035B

4-STAGE PARALLEL IN/PARALLEL OUT SHIFT REGISTER

- 4-STAGE CLOCKED SHIFT OPERATION
- SYNCHRONOUS PARALLEL ENTRY ON ALL 4 STAGES
- $J\overline{K}$ INPUTS ON FIRST STAGE
- ASYNCHRONOUS TRUE/COMPLEMENT CONTROL ON ALL OUTPUTS
- STATIC FLIP-FLOP OPERATION; MASTER-SLAVE CONFIGURATION
- BUFFERED INPUTS AND OUTPUTS
- HIGH SPEED 12 MHz (TYP.) AT V_{DD}= 10V
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V and 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4035B** (extended temperature range) and **HCF 4035B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 4035B** is a four-stage clocked signal serial register with provision for synchronous PARALLEL inputs to each stage and SERIAL inputs to the first stage via $J\overline{K}$ logic. Register stages 2, 3, and 4 are coupled in a serial D flip-flop configuration when the register is in the serial mode (PARALLEL/SERIAL control low). Parallel entry into each register stage is permitted when the PARALLEL/SERIAL control is high. In the parallel or serial mode information is transferred on positive clock transitions. When the TRUE/COMPLEMENT control is high, the true contents of the register are available at the output terminals. When the TRUE/COMPLEMENT control is low, the outputs are the complements of the data in the register. The TRUE/COMPLEMENT control functions asynchronously with respect to the CLOCK signal. $J\overline{K}$ input logic is provided on the first stage SERIAL input to minimize logic requirements particularly in counting and sequence-generation applications. With $J\overline{K}$ inputs connected together, the first stage becomes a D flip-flop. An asynchronous common RESET is also provided.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4041 UB

QUAD TRUE/COMPLEMENT BUFFER

- BALANCED SINK AND SOURCE CURRENT; APPROXIMATELY 4 TIMES STANDARD "B" DRIVE
- EQUALIZED DELAY TO TRUE AND COMPLEMENT OUTPUTS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4041 UB** (extended temperature range) and **HCF 4041 UB** (intermediate temperature range) are monolithic integrated circuits, available in 14-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.

The **HCC/HCF 4041 UB** types are quad true/complement buffers consisting of n- and p-channel units having low channel resistance and high current (sourcing and sinking) capability. The **HCC/HCF 4041 UB** is intended for use as a buffer, line driver, or COS/MOS-to-TTL driver. It can be used as an ultra-low power resistor-network driver for A/D and D/A conversion, as a transmission-line driver, and in other applications where high noise immunity and low-power dissipation are primary design requirements.

- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4042B** (extended temperature range) and **HCF 4042B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.

The **HCC/HCF 4042B** types contain four latch circuits, each strobed by a common clock. Complementary buffered outputs are available from each circuit. The impedance of the n- and p-channel output devices is balanced and all outputs are electrically identical.

Information present at the data input is transferred to outputs Q and $\overline{Q}$ during the CLOCK level which is programmed by the POLARITY input. For POLARITY = 0 the transfer occurs during the 0 CLOCK level and for POLARITY = 1 the transfer occurs during the 1 CLOCK level. The outputs follow the data input providing the CLOCK and POLARITY levels defined above are present. When a CLOCK transition occurs (positive for POLARITY = 0 and negative for POLARITY = 1) the information present at the input during the CLOCK transition is retained at the outputs until an opposite CLOCK transition occurs.

NOTES:
1. FOR POSITIVE CLOCK EDGE, INPUT DATA IS LATCHED WHEN POLARITY IS LOW.
2. FOR NEGATIVE CLOCK EDGE, INPUT DATA IS LATCHED WHEN POLARITY IS HIGH.

QUAD 3-STATE R-S LATCHES: QUAD NOR R-S LATCH-4043B
QUAD NAND R-S LATCH-4044B

- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 3-LEVEL OUTPUTS WITH COMMON OUTPUT ENABLE
- SEPARATE SET and RESET INPUT for EACH LATCH
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- NOR and NAND CONFIGURATIONS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4043B, HCC 4044B,** (extended temperature range) and the **HCF 4043B, HCF 4044B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package, and plastic micropackage. The **HCC/HCF 4043B** types are quad cross-coupled 3-state COS/MOS NOR latches and the **HCC/HCF 4044B** types are quad cross-coupled 3-state COS/MOS NAND latches. Each latch has a separate Q output and individual SET and RESET inputs. The Q outputs are controlled by a common ENABLE input. A logic "1" or "high" on the ENABLE input connects the latch states to the Q outputs. A logic "0" or "low" on the ENABLE input disconnects the latch states from the Q outputs, resulting in an open circuit condition on the Q outputs. The open circuit feature allows common bussing of the outputs.

The **HCC 4045B** (extended temperature range) and **HCF 4045B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 4045B** is a timing circuit consisting of 21 counter stages, two output-shaping flip-flops, two inverter output drivers, and input inverters for use in a crystal oscillator. The **HCC/HCF 4045B** configuration provides 21 flip-flop counting stages, and two flip-flops for shaping the output waveform for a 3.125% duty cycle. Push-pull operation is provided by the inverter output drivers. The first inverter is intended for use as a crystal oscillator-amplifier. However, it may be used as a normal logic inverter if desired. A crystal oscillator circuit can be made less sensitive to voltage-supply variations by the use of source resistors. In this device, the sources of the p and n transistors have been brought out to package terminals. If external resistors are not required, the sources must be shorted to their respective substrates (S_p to V_{DD}, S_n to V_{SS}).

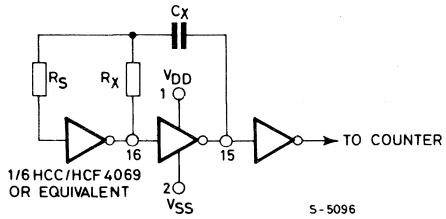
TYPICAL APPLICATIONS

Digital equipment in which ultra-low dissipation and/or operation using a battery source are primary design requirements.

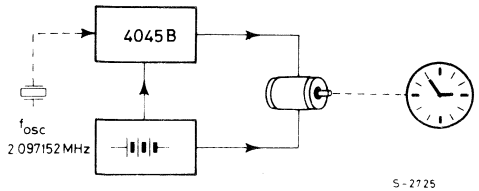
Accurate timing from a crystal oscillator for timing applications such as wall clocks, table clocks, automobile clocks, and digital timing references in any circuit requiring accurately timed outputs at various intervals in the counting sequence.

Driving miniature synchronous motors, stepping motors, or external bipolar transistors in push-pull fashion.

Typical RC circuit



Electronic watch application circuit



COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4046B

PRELIMINARY DATA

MICROPOWER PHASE-LOCKED LOOP

- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- VERY LOW POWER CONSUMPTION: 100 μW (TYP.) AT VCO f_o = 10 kHz, V_{DD} = 5V
- OPERATING FREQUENCY RANGE: UP TO 1.4 MHz (TYP.) AT V_{DD} = 10V
- LOW FREQUENCY DRIFT: 0.06%/°C (TYP.) AT V_{DD} = 10V
- CHOICE OF TWO PHASE COMPARATORS: 1) EXCLUSIVE - OR NETWORK
  2) EDGE-CONTROLLED MEMORY NETWORK WITH PHASE-PULSE OUTPUT FOR LOCK INDICATION
- HIGH VCO LINEARITY: 1% (TYP.)
- VCO INHIBIT CONTROL FOR ON-OFF KEYING AND ULTRA-LOW STANDBY POWER CONSUMPTION
- SOURCE-FOLLOWER OUTPUT OF VCO CONTROL INPUT (DEMOD. OUTPUT)
- ZENER DIODE TO ASSIST SUPPLY REGULATION
- 5V, 10V AND 15V PARAMETRIC RATING
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4046B** (extended temperature range) and **HCF 4046B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 4046B** COS/MOS Micropower Phase-Locked Loop (PLL) consists of a low-power, linear voltage-controlled oscillator (VCO) and two different phase comparators having a common signal-input amplifier and a common comparator input. A 5.2V zener diode is provided for supply regulation if necessary.

VCO Section

The VCO requires one external capacitor C1 and one or two external resistors (R1 or R1 and R2). Resistor R1 and capacitor C1 determine the frequency range of the VCO and resistor R2 enables the VCO to have a frequency offset if required. The high input impedance ($10^{12}\Omega$) of the VCO simplifiers the design of low-pass filters by permitting the designer a wide choice of resistor-to-capacitor ratios. In order not to load the low-pass filter, a source-follower output of the VCO input voltage is provided at terminal 10 (DEMODULATED OUTPUT). If this terminal is used, a load resistor (R_S) of 10 kΩ or more should be connected from this terminal to V_{SS}. If unused this terminal should be left open. The VCO can be connected either directly or through frequency dividers to the comparator input of the phase comparators. A full COS/MOS logic swing is available at the output of the VCO and allows direct coupling to COS/MOS frequency dividers such as the **HCC/HCF 4024B, HCC/HCF 4018B, HCC/HCF 4020B, HCC/HCF 4022B, HCC/HCF 4029B,** and **HBC/HBF 4059A**. One or more **HCC/HCF 4018B** (Presettable Divide-by-N Counter) or **HCC/HCF 4029B** (Presettable Up/Down Counter), or **HBC/HBF 4059A** (Programmable Divide-by-"N" Counter), together with the **HCC/HCF 4046B** (Phase-Locked Loop) can be used to build a micropower low-frequency synthesizer. A logic 0 on the INHIBIT input "enables" the VCO and the source follower, while a logic 1 "turns off" both to minimize stand-by power consumption.

Phase Comparators

The phase-comparator signal input (terminal 14) can be direct-coupled provided the signal swing is within COS/MOS logic levels [logic "0" $\leqslant$ 30% (V_{DD}-V_{SS}), logic "1" $\geqslant$ 70% (V_{DD}-V_{SS})]. For smaller swings the signal must be capacitively coupled to the self-biasing amplifier at the signal input. Phase. comparator I is an exclusive-OR network; it operates analagously to an over-driven balanced mixer. To maximize the lock range, the signal-and comparator-input frequencies must have a 50% duty cycle. With no signal or noise on the signal input, this phase comparator has an average output voltage equal to $V_{DD}/2$. The low-pass filter connected to the output of phase comparator I supplies the averaged voltage to the VCO input, and causes the VCO to oscillate at the center frequency (f_o). The frequency range of input signals on which the PLL will lock if it was initially out of lock is defined as the frequency capture range (2 f_c). The frequency range of input signals on which the loop will stay locked if it was initially in lock is defined as the frequency lock range (2 f_L). The capture range is $\leqslant$ the lock range. With phase

comparator I the range of frequencies over which the PLL can acquire lock (capture range) is dependent on the low-pass-filter characteristics, and can be made as large as the lock range. Phase-comparator I enables a PLL system to remain in lock in spite of high amounts of noise in the input signal. One characteristic of this type of phase comparator is that it may lock onto input frequencies that are close to harmonics of the VCO center-frequency. A second characteristic is that the phase angle between the signal and the comparator input varies between 0° and 180°, and is 90° at the center frequency. Fig. (a) shows the typical, triangular, phase-to-output response characteristic of phase-comparator I. Typical waveforms for a COS/MOS phase-locked-loop employing phase comparator I in locked condition of f_o is shown in Fig. (b). Phase-comparator II is an edge-controlled digital memory network. It consists of four flip-flop stages, control gating, and a three-stage output-circuit comprising p-and n-type drivers having a common output node. When the p-MOS or n-MOS drivers are ON they pull the output up to V_{DD} or down to V_{SS}, respectively. This type of phase comparator acts only on the positive edges of the signal and comparator inputs. The duty cycles of the signal and comparator inputs are not important since positive transitions control the PLL system utilizing this type of comparator. If the signal-input frequency is higher than the comparator-input frequency, the p-type output driver is maintained ON most of the time, and both the n-and p-drivers OFF (3 state) the remainder of the time. If the signal-input frequency is lower than the comparator-input frequency, the n-type output driver is maintained ON most of the time, and both the n-and p-drivers OFF (3 state) the remainder of the time. If the signal and comparator-input frequencies are the same, but the signal input lags the comparator input in phase, the n-type output driver is maintained ON for a time corresponding to the phase difference. If the signal and comparator-input frequencies are the same, but the comparator input lags the signal in phase, the p-type output driver is maintained ON for a time corresponding to the phase difference. Subsequently, the capacitor voltage of the low-pass filter connected to this phase comparator is adjusted until the signal and comparator inputs are equal in both phase and frequency. At this stable point both p-and n-type output drivers remain OFF and thus the phase comparator output becomes an open circuit and holds the voltage on the capacitor of the low-pass filter constant. Moreover the signal at the "phase pulses" output is a high level which can be used for indicating a locked condition. Thus, for phase comparator II, no phase difference exists between signal and comparator input over the full VCO frequency range. Moreover, the power dissipation due to the low-pass filter is reduced when this type of phase comparator is used because both the p-and n-type output drivers are OFF for most of the signal input cycle. It should be noted that the PLL lock range for this type of phase comparator is equal to the capture range, independent of the low-pass filter. With no signal present at the signal input, the VCO is adjusted to its lowest frequency for phase comparator II. Fig. (c) shows typical waveforms for a COS/MOS PLL employing phase comparator II in a locked condition.

Fig. (a) - Phase-comparator I characteristics at low-pass filter output

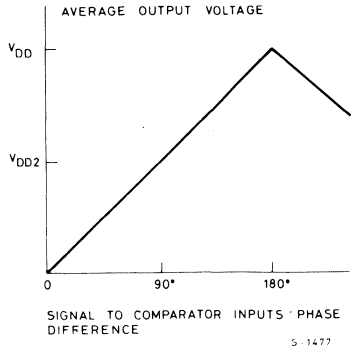


Fig. (b) - Typical waveforms for COS/MOS Phase-Locked-Loop employing phase comparator I in locked condition of f_o

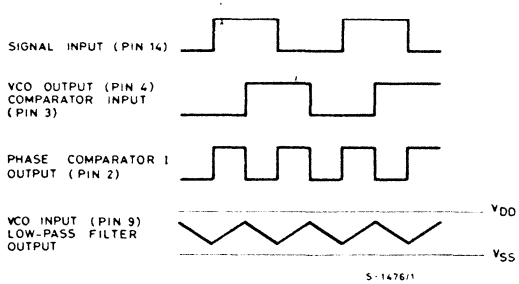

Fig.(c) - Typical waveforms for COS/MOS Phase-Locked Loop employing phase comparator II in locked condition

DESIGN INFORMATION

This information is a guide for approximating the values of external components for the **HCC/HCF 4046B** in a Phase-Locked-Loop system. The selected external components must be within the following ranges:

5 kΩ $\leqslant$ R1, R2, $R_S \leqslant$ 1 MΩ C1 $\geqslant$ 100 pF at $V_{DD} \geqslant$ 5V C1 $\geqslant$ 50 pF at $V_{DD} \geqslant$ 10V

CHARACTERISTICS	USING PHASE COMPARATOR I		USING PHASE COMPARATOR II	
	VCO WITHOUT OFFSET $R_2 = \infty$	VCO WITH OFFSET	VCO WITHOUT OFFSET $R_2 = \infty$	VCO WITH OFFSET
VCO Frequency				For No Signal Input	VCO in PLL system will adjust to centre frequency f_o		VCO in PLL system will adjust to lowest operating frequency, f_{min}	
Frequency Lock Range, $2f_L$	$2 f_L$ = full VCO frequency range $2 f_L = f_{max} - f_{min}$			
Frequency Capture Range, $2f_C$			$f_C = f_L$	
Loop Filter Component Selection				
Phase Angle between Signal and Comparator	90° at centre frequency (f_o), approximating 0° and 180° at ends of lock range ($2f_L$)		Always 0° in lock	
Locks on Harmonics of Centre Frequency	Yes		No	
Signal Input Noise Rejection	High		Low

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4047B

LOW-POWER MONOSTABLE/ASTABLE MULTIVIBRATOR

- LOW POWER CONSUMPTION: SPECIAL COS/MOS OSCILLATOR CONFIGURATION
- MONOSTABLE (ONE-SHOT) OR ASTABLE (FREE-RUNNING) OPERATION
- TRUE AND COMPLEMENTED BUFFERED OUTPUTS
- ONLY ONE EXTERNAL R AND C REQUIRED
- BUFFERED INPUTS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- STANDARDIZED, SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4047B** (extended temperature range) and **HCF 4047B** (intermediate temperature range) are monolithic integrated circuits, available in 14-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage. The **HCC/HCF 4047B** consists of a gatable astable multivibrator with logic techniques incorporated to permit positive or negative edge-triggered monostable multivibrator action with retriggering and external counting options. Inputs include + TRIGGER, − TRIGGER, ASTABLE, $\overline{\text{ASTABLE}}$, RETRIGGER, and EXTERNAL RESET. Buffered outputs are Q, $\overline{Q}$, and OSCILLATOR. In all modes of operation, an external capacitor must be connected between C-Timing and RC-Common terminals, and an external resistor must be connected between the R-Timing and RC-Common terminals. For operating modes see functional terminal connections and application notes.

APPLICATION INFORMATION

1 - Circuit description

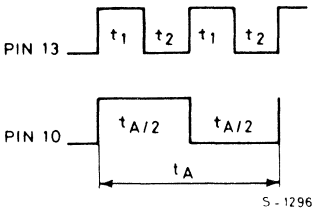
Astable operation is enabled by a high level on the ASTABLE input. The period of the square wave at the Q and $\overline{Q}$ Outputs in this mode of operation is a function of the external components employed. "True" input pulses on the ASTABLE input or "Complement" pulses on the $\overline{\text{ASTABLE}}$ input allow the circuit to be used as a gatable multivibrator. The OSCILLATOR output period will be half of the Q terminal output in the astable mode. However, a 50% duty cycle is not guaranteed at this output. In the monostable mode, positive-edge triggering is accomplished by application of a leading-edge pulse to the +TRIGGER input and a low level to the -TRIGGER input. For negative-edge triggering, a trailing-edge pulse is applied to the -TRIGGER and a high level is applied to the +TRIGGER. Input pulses may be of any duration relative to the output pulse. The multivibrator can be retriggered (on the leading edge only) by applying a common pulse to both the RETRIGGER and +TRIGGER inputs. In this mode the output pulse remains high as long as the input pulse period is shorter than the period determined by the RC components. An external countdown option can be implemented by coupling "Q" to an external "N" counter and resetting the counter with the trigger pulse. The counter output pulse is fed back to the $\overline{\text{ASTABLE}}$ input and has a duration equal to N times the period of the multivibrator. A high level on the EXTERNAL RESET input assures no output pulse during an "ON" power condition. This input can also be activated to terminate the output pulse at any time. In the monostable mode, a high-level or power-on reset pulse, must be applied to the EXTERNAL RESET whenever V_{DD} is applied.

APPLICATION INFORMATION (continued)

2 - Astable Mode

The following analysis presents worst-case variations from unit-to-unit as a function of transfer-voltage (V_{TR}) shift (33% - 67% V_{DD}) for free-running (astable) operation.

Astable mode waveforms



$$t_1 = -RC \ln \frac{V_{TR}}{V_{DD} + V_{TR}}$$

$$t_2 = -RC \ln \frac{V_{DD}-V_{TR}}{2\,V_{DD}-V_{TR}}$$

$$t_A = 2\,(t_1 + t_2) = -2\,RC \ln \frac{(V_{TR})\,(V_{DD}-V_{TR})}{(V_{DD} + V_{TR})\,(2\,V_{DD} - V_{TR})}$$

Typ : $V_{TR} = 0.5\ V_{DD}$ $t_A = 4.40\ RC$
Min : $V_{TR} = 0.33\ V_{DD}$ $t_A = 4.62\ RC$
Max : $V_{TR} = 0.67\ V_{DD}$ $t_A = 4.62\ RC$

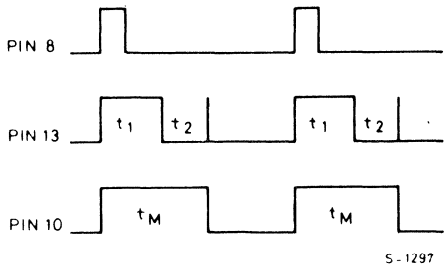
thus if $\boxed{t_A = 4.40\ RC}$ is used, the maximum variation will be (+5.0%, -0.0%)

In addition to variations from unit-to-unit, the astable period may vary as a function of frequency with respect to V_{DD} and temperature.

3 - Monostable Mode

The following analysis presents worst-case variations from unit-to-unit as a function of transfer-voltage (V_{TR}) shift (33% - 67% V_{DD}) for one-shot (monostable) operation.

Monostable waveforms



$$t_1 = -RC \ln \frac{V_{TR}}{2\,V_{DD}}$$

$$t_2 = -RC \ln \frac{V_{DD}-V_{TR}}{2\,V_{DD}-V_{TR}}$$

$$t_M = (t_1 + t_2) = -RC \ln \frac{(V_{TR})\,(V_{DD} - V_{TR})}{(2\,V_{DD} - V_{TR})\,(2\,V_{DD})}$$

APPLICATION INFORMATION (continued)

where t_M = monostable mode pulse width. Values for t_M are as follows:

Typ : $V_{TR} = 0.5\ V_{DD}$ $t_M = 2.48\ RC$
Min : $V_{TR} = 0.33\ V_{DD}$ $t_M = 2.71\ RC$
Max : $V_{TR} = 0.67\ V_{DD}$ $t_M = 2.48\ RC$

Thus if $\boxed{t_M = 2.48\ RC}$ is used, the maximum variation will be (+9.3%, -0.0%).

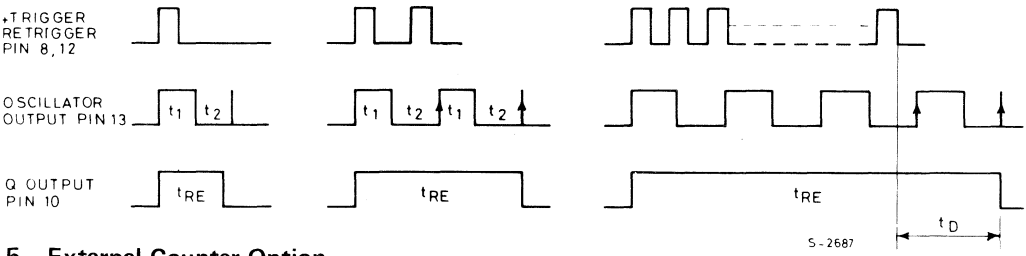
Note: In the astable mode, the first positive half cycle has a duration of T_M; succeeding durations are $t_A/2$.

In addition to variations from unit to unit, the monostable pulse width may vary as a function of frequency with respect to V_{DD} and temperature.

4 - Retrigger Mode

The **HCC/HCF 4047B** can be used in the retrigger mode to extend the output-pulse duration, or to compare the frequency of an input signal with that of the internal oscillator. In the retrigger mode the input pulse is applied to terminals 8 and 12, and the output is taken from terminal 10 or 11. As shown in Fig. A normal monostable action is obtained when one retrigger pulse is applied. Extended pulse duration is obtained when more than one pulse is applied. For two input pulses, $t_{RE} = t_1' + t_1 + 2t_2$. For more than two pulses, t_{RE} (Q OUTPUT) terminates at some variable time t_D after the termination of the last retrigger pulse. t_D is variable because t_{RE} (Q OUTPUT) terminates after the second positive edge of the oscillator output appears at flip-flop 4 (see logic diagram).

Fig. A - Retrigger-mode waveforms



5 - External Counter Option

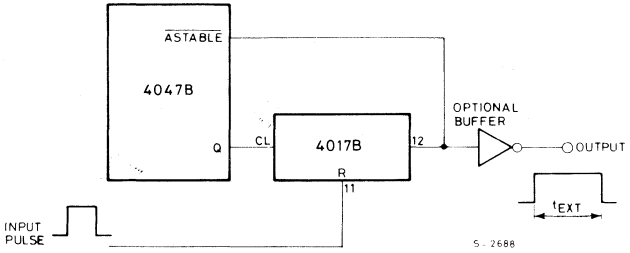
Time t_M can be extended by any amount with the use of external counting circuitry. Advantages include digitally controlled pulse duration, small timing capacitors for long time periods, and extremely fast recovery time.
A typical implementation is shown in Fig. B. The pulse duration at the output is

$$t_{ext} = (N - 1)\ (t_A) + (t_M + t_A/2)$$

where t_{ext} = pulse duration of the circuitry, and N is the number of counts used.

APPLICATION INFORMATION (continued)

Fig. B - Implementation of external counter option



6 - Power Consumption

In the standby mode (Monostable or Astable), power dissipation will be a function of leakage current in the circuit, as shown in the static electrical characteristics. For dynamic operation, the power needed to charge the external timing capacitor C is given by the following formula:

Astable Mode: $P = 2CV^2f$. (Output at Pin 13)
$P = 4CV^2f$. (Output at Pin 10 and 11)

Monostable Mode: $P = \frac{(2.9CV^2)\ (\text{Duty Cycle})}{T}$

(Output at Pin 10 and 11)

The circuit is designed so that most of the total power is consumed in the external components. In practice, the lower the values of frequency and voltage used, the closer the actual power dissipation will be to the calculated value.
Because the power dissipation does not depend on R, a design for minimum power dissipation would be a small value of C. The value of R would depend on the desired period (within the limitations discussed above).

7 - Timing-component limitations

The capacitor used in the circuit should be non-polarized and have low leakage(i.e. the parallel resistance of the capacitor should be an order of magnitude greater than the external resistor used). Three is no upper or lower limit for either R or C value to maintain oscillation.
However, in consideration of accuracy, C must be much larger than the inherent stray capacitance in the system (unless this capacitance can be measured and taken into account). R must be much larger than the COS/MOS "ON" resistance in series with it, which typically is hundreds of ohms. In addition, with very large values of R, some short-term instability with respect to time may be noted.
The recommended values for these components to maintain agreement with previously calculated formulas without trimming should be:

$C \geqslant$ 100 pF, up to any practical value, for astable modes;
$C \geqslant 1000$ pF, up to any practical value, for monostable modes.
$10\ K\Omega \leqslant R \leqslant 1\ M\Omega$.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4048B

MULTIFUNCTION EXPANDABLE 8-INPUT GATE

- THREE-STATE OUTPUT
- MANY LOGIC FUNCTIONS AVAILABLE IN ONE PACKAGE
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4048B** (extended temperature range) and **HCF 4048B** (intermediate temperature range) are monolithic integrated circuit,available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 4048B** is an 8-input gate having four control inputs. Three binary control inputs - Ka, Kb, and Kc - provide the implementation of eight different logic functions. These functions are OR, NOR, AND, NAND, OR/AND, OR/NAND, AND/OR and AND/NOR. A fourth control input - Kd- provides the user with a 3-state output. When control input Kd is high the output is either a logic 1 or a logic 0 depending on the inner states. When control input Kd is low, the output is an open circuit. This feature enables the user to connect this device to a common bus line. In addition to the eight input lines, an EXPAND input is provided that permits the user to increase the number of inputs to one **HCC/HCF 4048B**. For example, two **HCC/HCF 4048B**'s can be cascaded to provide a 16-input multifunction gate. When the EXPAND input is not used, it should be connected to V_{SS}.

HCC/HCF 4053B

PRELIMINARY DATA

ANALOG MULTIPLEXERS-DEMULTIPLEXERS:
4051B - SINGLE 8-CHANNEL
4052B - DIFFERENTIAL 4-CHANNEL
4053B - TRIPLE 2-CHANNEL

- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- LOW "ON" RESISTANCE: 125Ω (TYP.) OVER 15V p.p. SIGNAL-INPUT RANGE for V_{DD}-V_{EE}= 15V
- HIGH "OFF" RESISTANCE: CHANNEL LEAKAGE ±100 pA (TYP.) V_{DD}-V_{EE}= 18V
- BINARY ADDRESS DECODING ON CHIP
- VERY LOW QUIESCENT POWER DISSIPATION UNDER ALL DIGITAL CONTROL INPUT and SUPPLY CONDITIONS: 0.2 μW (TYP.), V_{DD}-V_{SS}= V_{DD}-V_{EE}= 10V
- MATCHED SWITCH CHARACTERISTICS: R_{ON}= 5Ω (TYP.) for V_{DD}-V_{EE}= 15V
- WIDE RANGE OF DIGITAL AND ANALOG SIGNAL LEVELS: DIGITAL 3 TO 20V, ANALOG TO 20V p.p.
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 mA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4051B, 4052B** and **4053B** (extended temperature range) and **HCF 4051B, 4052B** and **4053B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage. **HCC/HCF 4051B, HCC/HCF 4052B,** and **HCC/HCF 4053B** analog multiplexers/demultiplexers are digitally controlled analog switches having low ON impedance and very low OFF leakage current. These multiplexer circuits dissipate extremely low quiescent power over the full V_{DD}-V_{SS} and V_{DD}-V_{EE} supply-voltage ranges, independent of the logic state of the control signals. When a-logic "1" is present at the inhibit input terminal all channel are off. The **HCC/HCF 4051B** is a single 8-channel multiplexer having three binary control inputs, A, B, and C, and an inhibit input. The three binary signals select 1 of 8 channels to be turned on, and connect one of the 8 inputs to the output. The **HCC/HCF 4052B** is a differential 4-channel multiplexer having two binary control inputs, A and B, and an inhibit input. The two binary input signals select 1 of 4 pairs of channels to be turned on and connect the analog inputs to the outputs. The **HCC/HCF 4053B** is a triple 2-channel multiplexer having three separate digital control inputs, A, B, and C, and an inhibit input. Each control input selects one of a pair of channels which are connected in a singlepole double-throw configuration.

SPECIAL CONSIDERATIONS

Control of analog signals up to 20V peak-to-peak can be achieved by digital signal amplitudes of 4.5 to 20 V (if V_{DD}-V_{SS}= 3V, a V_{DD}-V_{EE} of up to 13V can be controlled; for V_{DD}-V_{EE} level differences above 13V, a V_{DD}-V_{SS} of at least 4.5V is required). For example, if V_{DD}= +5V, V_{SS}= 0, and V_{EE}= -13.5V, analog signals from -13.5V to +4.5V can be controlled by digital inputs of 0 to 4.5V. In certain applications, the external load-resistor current may include both V_{DD} and signal-line components. To avoid drawing V_{DD} current when switch current flows into the transmission gate inputs, the voltage drop across the bidirectional switch must not exceed 0,8 volt (valvulated from R_{ON} values shown in ELECTRICAL CHARACTERISTICS CHART). No V_{DD} current will flow through R_L if the switch current flows into lead 3 on the **HCC/HCF 4051**; leads 3 and 13 on the **HCC/HCF 4052**; leads 4, 14, and 15 on the **HCC/HCF 4053**.

HCC/HCF 4056B

LIQUID-CRYSTAL DISPLAY DRIVERS

4054B - 4-SEGMENT DISPLAY DRIVER - STROBED LATCH FUNCTION
4055B - BCD TO 7-SEGMENT DECODER/DRIVER, WITH "DISPLAY-FREQUENCY" OUTPUT
4056B - BCD TO 7-SEGMENT DECODER/DRIVER WITH STROBED LATCH FUNCTION

- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- OPERATION OF LIQUID CRYSTALS WITH COS/MOS CIRCUITS PROVIDES ULTRA-LOW-POWER DISPLAYS
- EQUIVALENT AC OUTPUT DRIVE FOR LIQUID-CRYSTAL DISPLAYS-NO EXTERNAL CAPACITOR REQUIRED
- VOLTAGE DOUBLING ACROSS DISPLAY [(V_{DD}-V_{EE}) = 18V)] RESULTS IN EFFECTIVE 36V (p-p) DRIVE ACROSS SELECTED DISPLAY SEGMENTS
- LOW-OR HIGH-OUTPUT LEVEL DC DRIVE FOR OTHER TYPES OF DISPLAYS
- ON-CHIP LOGIC-LEVEL CONVERSION FOR DIFFERENT INPUT AND OUTPUT-LEVEL SWINGS
- FULL DECODING OF ALL INPUT COMBINATIONS: "0-9, L, H, P, A-" AND BLANK POSITIONS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD NO. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4054B, HCC 4055B** and **HCC 4056B** (extended temperature range) and the **HCF 4054B, HCF 4055B** and **HCF 4056B** (intermediate temperature range) are monolithic integrated circuits available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage. The **HCC/HCF 4055B** and **HCC/HCF 4056B** types are single-digit BCD-to-7-segment decoder/driver circuits that provide level-shifting functions on the chip. This feature permits the BCD input-signal swings (V_{DD} to V_{SS}) to be the same as or different from the 7-segment output-signal swings (V_{DD} to V_{EE}). For example, the BCD input-signal swings (V_{DD} to V_{SS}) may be as low as 0 to -3V, whereas the output-display drive-signal swing (V_{DD} to V_{EE}) may be from 0 to -5V. If V_{DD} to V_{EE} exceeds 15V, V_{DD} to V_{SS} should be at least 4V. The 7-segment outputs are controlled by the DISPLAY-FREQUENCY (DF) input which causes the selected segment outputs to be low, high, or a square-wave output (for liquid-crystal displays). When the DF input is low the output segments will be high when selected by the BCD inputs. When the DF input is high, the output segments will be low when selected by the BCD inputs. When a square-wave is present at the DF input, the selected segments will have a square-wave output that is 180° out of phase with the DF input. Those segments which are not selected will have a square-wave output that is in phase with the input. DF square-wave repetition rates for liquid-crystal displays usually range from 30 Hz (well above flicker rate) to 200 Hz (well below the upper limit of the liquid-crystal frequency response). The **HCC/HCF 4055B** provides a level-shifted high-amplitude DF output which is required for driving the common electrode in liquid-crystal displays. The **HCC/HCF 4056B** provides a strobed-latch function at the BCD inputs. Decoding of all input combinations on the **HCC/HCF 4055B** and **HCC/HCF 4056B** provides displays of 0 to 9 as well as L, P, H, A, –, and a blank position. (See typical application for other letters). The **HCC/HCF 4054B** provides level shifting similar to the **HCC/HCF 4055B** and **HCC/HCF 4056B** independently strobed latches, and common DF control on 4 signal lines. The **HCC/HCF 4054B** is intended to provide drive-signal compatibility with the **HCC/HCF 4055B** and **HCC/HCF 4056B** 7-segment decoder types for the decimal point, colon, polarity, and similar display lines. A level-shifted high-amplitude DF output can be obtained from any **HCC/HCF 4054B** output line by connecting the corresponding input and strobe lines to a low and high level, respectively. The **HCC/HCF 4054B** may also be utilized for logic-level "up conversion" or "down conversion". For example, input-signal swings (V_{DD} to V_{SS}) from +5 to 0V can be converted to utput-signal swings (V_{DD} to V_{EE}) of +5 to -5V. The level-shifted function on all three types permits the use of different input-and output-signal swings. The input swings from a low level of V_{SS} to a high level of V_{DD} while the output swings from a low level of V_{EE} to the same high level of V_{DD}. Thus, the input and output swings can be selected independently of each other over a 3-to-18V range. V_{SS} may be connected to V_{EE} when no level-shift function is required. For the **HCC/HCF 4054B** and **HCC/HCF 4056B**, data are transferred from input to output by placing a high voltage level at the strobe input. A low voltage level at the strobe input latches the data input and the corresponding output segments remain selected (or non-selected) while the strobe is low. Whenever the level-shifting function is required, the **HCC/HCF 4055B** can be used by itself to drive a liquid-crystal display (Fig. 10 and Fig. 12).

The **HCC/HCF 4056B**, however, must be used together with a **HCC/HCF 4054B** to provide the common DF output (Fig. 14). The capability of extending the voltage swing on the negative end (this voltage cannot be extended on the positive end) can be used to advantage in the setup of Fig. 11. Fig. 9 is common to all three types.

TYPICAL APPLICATIONS (continued)

Fig. 12 - Single-digit liquid crystal display

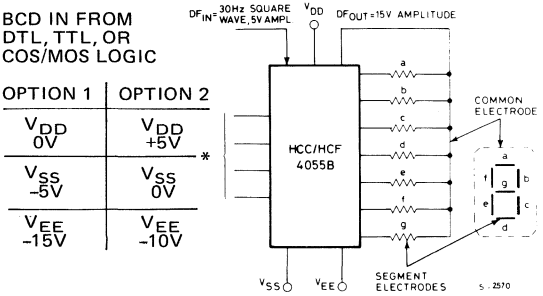

Fig. 13 - Conversion of "H" display to "F" display

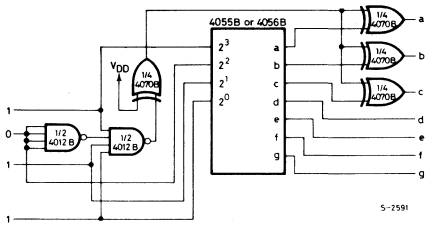

Fig. 14 - Typical 3½-digit liquid-crystal display: (V_{DD}=+5V, V_{SS}=0V, V_{EE}=-10V, DF_N=30Hz square wave)

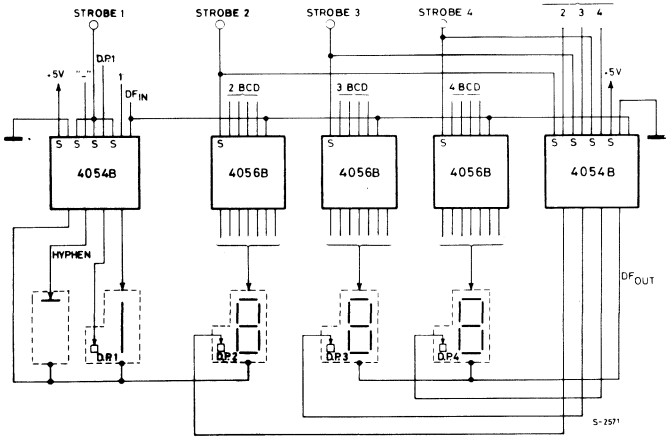

In addition to the letters L, H, P, and A, five other letters can be displayed through the use of simple logic circuits preceding and following the **HCC/HCF 4055B** or **HCC/HCF 4056B** devices. Fig. 13 is an example of a circuit that converts an "H" display, (code 1011) to an "F" display. One condition that must be met is that V_{EE}= V_{SS}. If $V_{EE} \neq V_{SS}$, the **HCC/HCF 4054B** must be used to level shift in the appropriate places. In a similar manner the letters C, E, J,and U can be displayed.These circuits can also be used to drive LED displays provided the exclusive-OR gates have sufficient output-current drive. The letters B, D, G, I, O, and S may be represented by the codes for numbers 8, 0, 6, 1, 0, and 5, respectively, when there is preknowledge that only letters are to be displayed.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4060B

14-STAGE RIPPLE-CARRY BINARY COUNTER/DIVIDER AND OSCILLATOR

- MEDIUM-SPEED OPERATION
- COMMON RESET
- FULLY STATIC OPERATION
- BUFFERED INPUTS AND OUTPUTS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4060B** (extended temperature range) and **HCF 4060B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 4060B** consists of an oscillator section and 14 ripple-carry binary counter stages. The oscillator configuration allows design of either RC or crystal oscillator circuits. A RESET input is provided which resets the counter to the all-0's state and disables the oscillator. A high level on the RESET line accomplishes the reset function. All counter stages are master-slave flip-flops. The state of the counter is advanced one step in binary order on the negative transition of ϕ_1 (and ϕ_0). All inputs and outputs are fully buffered. Schmitt trigger action on the clock line permits unlimited clock rise and fall times.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4063B

4-BIT MAGNITUDE COMPARATOR

- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- STANDARD B-SERIES OUTPUT DRIVE
- EXPANSION TO 8-16V ..... 4N BITS BY CASCADING UNITS
- MEDIUM SPEED OPERATION: COMPARES TWO 4-BIT WORDS IN 250 ns (TYP.) AT 10V
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4063B** (extended temperature range) and **HCF 4063B** (intermediate temperature range) are available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.
The **HCC/HCF 4063B** is a low-power 4-bit magnitude comparator designed for use in computer and logic applications that require the comparison of two 4-bit words. This logic circuit determines whether one 4-bit word (Binary or BCD) is "less than", "equal to" or "greater than" a second 4-bit word.
The **HCC/HCF 4063B** has eight comparing inputs (A3, B3, through A0, B0), three outputs ($A < B$, $A = B$, $A > B$) and three cascading inputs ($A < B$, $A = B$, $A > B$) that permit systems designers to expand the comparator function to 8, 12, 16 . . . . 4N bits. When a single **HCC/HCF 4063B** is used, the cascading inputs are connected as follows: ($A < B$) = low, ($A = B$) = high, ($A > B$) = low.
For words longer than 4 bits, **HCC/HCF 4063B** devices may be cascaded by connecting the outputs of the less-significant comparator to the corresponding cascading inputs of the more-significant comparator. Cascading inputs ($A < B$, $A = B$, and $A > B$) on the least significant comparator are connected to a low, a high, and a low level, respectively.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4066B

QUAD BILATERAL SWITCH FOR TRANSMISSION OR MULTIPLEXING OF ANALOG OR DIGITAL SIGNALS

- 15V DIGITAL OR ±7.5V PEAK-TO-PEAK SWITCHING
- 80Ω TYPICAL ON RESISTANCE FOR 15V OPERATION
- SWITCH ON RESISTANCE MATCHED TO WITHIN 5Ω OVER 15V SIGNAL-INPUT RANGE
- ON RESISTANCE FLAT OVER FULL PEAK-TO-PEAK SIGNAL RANGE
- HIGH ON/OFF OUTPUT-VOLTAGE RATIO: 65 dB TYP. @ f_{is} = 10 kHz, R_L = 10 kΩ
- HIGH DEGREE OF LINEARITY: < 0.5% DISTORTION TYP. @ f_{is} = 1 kHz, V_{is} = 5 Vp-p, V_{DD}-V_{SS} ≥ 10V, R_L = 10 kΩ
- EXTREMELY LOW OFF SWITCH LEAKAGE RESULTING IN VERY LOW OFFSET CURRENT AND HIGH EFFECTIVE OFF RESISTANCE; 10 pA TYP. @ V_{DD}-V_{SS} = 10V, T_A = 25°C
- EXTREMELY HIGH CONTROL INPUT IMPEDANCE (CONTROL CIRCUIT ISOLATED FROM SIGNAL CIRCUIT): 10^{12} Ω TYP.
- LOW CROSSTALK BETWEEN SWITCHES: -50 dB TYP. @ f_{is} = 0.9 MHz, R_L = 1 kΩ
- MATCHED CONTROL-INPUT TO SIGNAL-OUTPUT CAPACITANCE: REDUCES OUTPUT SIGNAL TRANSIENTS
- FREQUENCY RESPONSE, SWITCH ON = 40 MHz (TYP.)
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4066B** (extended temperature range) and **HCF 4066B** (intermediate temperature range) are monolithic integrated circuits, available in 14-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage. The **HCC/HCF 4066B** is a quad bilateral switch intended for the transmission or multiplexing of analog or digital signals. It is pin-for-pin compatible with **HCC/HCF 4016B**, but exhibits a much lower ON resistance. In addition, the ON resistance is relatively constant over the full input-signal range. The **HCC/HCF 4066B** consists of four independent bilateral switches. A single control signal is required per switch. Both the p and the n device in a given switch are biased ON or OFF simultaneously by the control signal. As shown in schematic diagram, the well of the n-channel device on each switch is either tied to the input when the switch is ON or to V_{SS} when the switch is OFF. This configuration eliminates the variation of the switch-transistor threshold voltage with input signal, and thus keeps the ON resistance low over the full operating-signal range. The advantages over single-channel switches include peak input signal voltage swings equal to the full supply voltage, and more constant ON impedance over the input-signal range. For sample-and-hold applications, however, the **HCC/HCF 4016B** is recommended.

- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4067B, HCC 4097B** (extended temperature range) and **HCF 4067B, HCF 4097B**(intermediate temperature range) are monolithic integrated circuits, available in 24-lead dual in-line plastic or ceramic package and ceramic flat package.

The **HCC/HCF 4067** and **HCC/HCF 4097** COS/MOS analog multiplexers/demultiplexers are digitally controlled analog switches having low ON impedance, low OFF leakage current, and internal address decoding. In addition, the ON resistance is relatively constant over the full input-signal range.

The **HCC/HCF 4067** is a 16-channel multiplexer with four binary control inputs, A, B, C, D, and an inhibit input, arranged so that any combination of the inputs selects one switch.

The **HCC/HCF 4097** is a differential 8-channel multiplexer having three binary control inputs A, B, C, and an inhibit input. The inputs permit selection of one of eight pairs of switches. A logic "1" present at the inhibit input turns all channels off.

APPLICATIONS INFORMATION

In applications where separate power sources are used to drive V_{DD} and the signal inputs, the V_{DD} current capability should exceed V_{DD}/R_L (R_L= effective external load). This provision avoids permanent current flow or clamp action on the V_{DD} supply when power is applied or removed from the **HCC/HCF 4067B** or **HCC/HCF 4097B**.

When switching from one address to another, some of the ON periods of the channels of the multiplexers will overlap momentarily, which may be objectionable in certain applications. Also when a channel is turned on or off by an address input, there is a momentary conductive path from the channel to V_{SS}, which will dump some charge from any capacitor connected to the input or output of the channel. The inhibit input turning on a channel will similarly dump some charge to V_{SS}.

The amount of charge dumped is mostly a function of the signal level above V_{SS}. Typically, at V_{DD}-V_{SS}= 10V, a 100 pF capacitor connected to the input or output of the channel will lose 3-4% of its voltage at the moment the channel turns on or off. This loss of voltage is essentially independent of the address or inhibit signal transition time, if the transition time is less than 1-2 μs. When the inhibit signal turns a channel off, there is no charge dumping to V_{SS}. Rather, there is a slight rise in the channel voltage level (65 mV typ.) due to capacitive coupling from inhibit input to channel input or output. Address inputs also couple some voltage steps onto the channel signal levels.

In certain applications, the external load-resistor current may include both V_{DD} and signal-line components. To avoid drawing V_{DD} current when switch current flows into the transmission gate inputs, the voltage drop across the bidirectional switch must not exceed 0.8 volt (calculated from R_{ON} values shown in ELECTRICAL CHARACTERISTICS CHART). No V_{DD} current will flow through R_L if the switch current flows into terminal 1 on the **HCC/HCF 4067B**, terminals 1 and 17 on the **HCC/HCF 4097B.**

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4068B

8-INPUT NAND/AND GATE

- MEDIUM-SPEED OPERATION - t_{PHL}, t_{PLH} = 75 ns (TYP.) AT 10V
- BUFFERED OUTPUT
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE

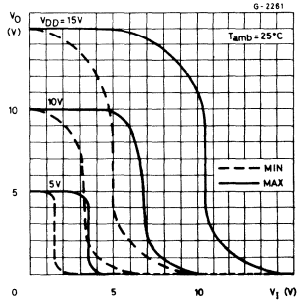
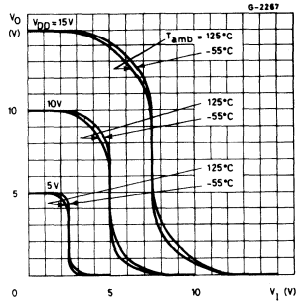
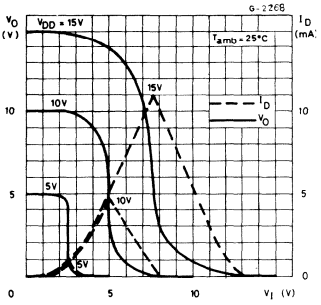
Minimum and maximum voltage transfer characteristics



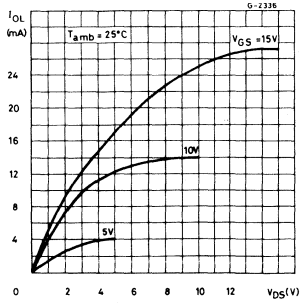
Typical voltage transfer characteristics as a function of temperature



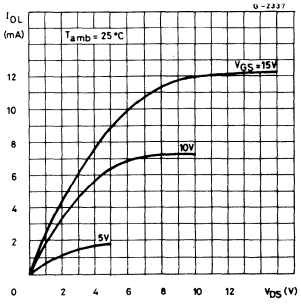
Typical current and voltage transfer characteristics



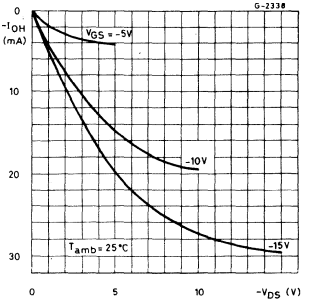
Typical output low (sink) current characteristics



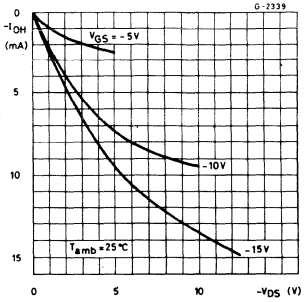
Minimum output low (sink) current characteristics



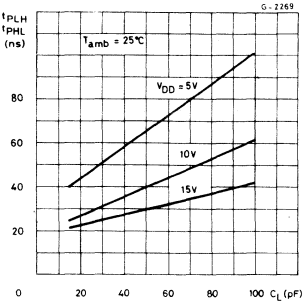
Typical output high (source) current characteristics



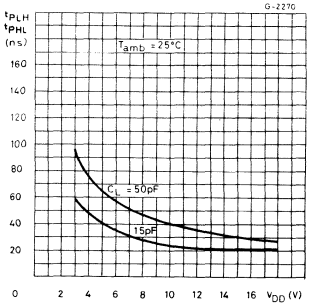
Minimum output high (source) current characteristics



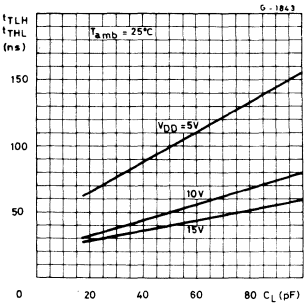
Typical propagation delay time vs. load capacitance



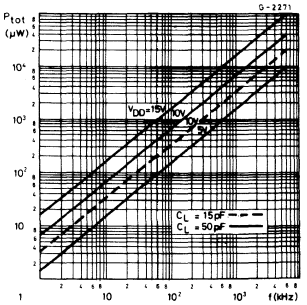
Typical propagation delay time vs. supply voltage



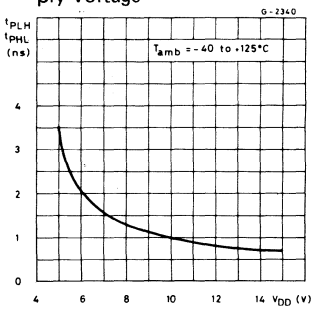
Typical transition time vs. load capacitance



Typical dynamic power dissipation/per inverter vs. frequency

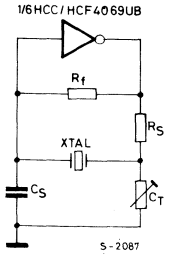


Variation of normalized propagation delay time (t_{PHL} and t_{PLH}) with supply voltage

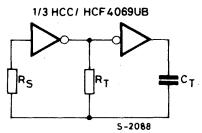


APPLICATIONS

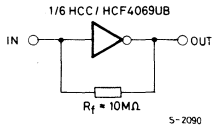
Typical crystal oscillator circuit



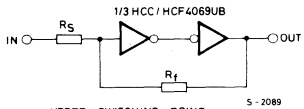
Typical RC oscillator circuit



High-input impedance amplifier



Input pulse shaping circuit (Schmitt trigger)



UPPER SWITCHING POINT

$$V_P = \frac{R_S \cdot R_f}{R_f} \cdot \frac{V_{DD}}{2}$$

LOWER SWITCHING POINT

$$V_N = \frac{R_f - R_S}{R_f} \cdot \frac{V_{DD}}{2}$$

$R_f > R_S$

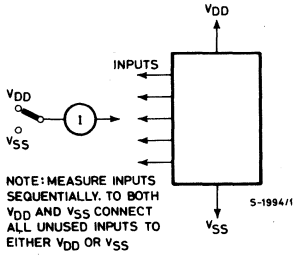
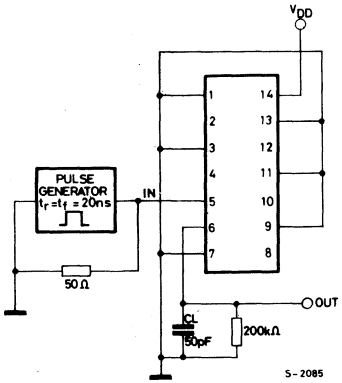
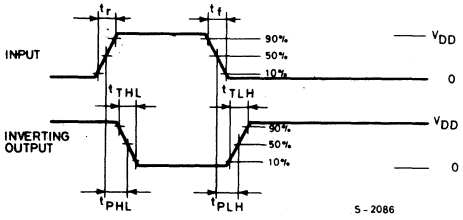
Input leakage current



Dynamic electrical characteristics and waveforms





4070B - QUAD EXCLUSIVE-OR GATE
4077B - QUAD EXCLUSIVE-NOR GATE

- MEDIUM-SPEED OPERATION $t_{PHL} = t_{PLH} = 70$ ns (TYP.) AT $V_{CC} = 10V$, $C_L = 50$ pF
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V AND 15V PARAMETRIC RATING
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4070B/4077B** (extended temperature range) and **HCF 4070B/4077B** (intermediate temperature range) are monolithic integrated circuits, available in 14-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.

The **HCC/HCF 4070B** contains four independent exclusive-OR gates.

The **HCC/HCF 4077B** contains four independent exclusive-NOR gates.

The **HCC/HCF 4070B** and **HCC/HCF 4077B** provide the system designer with a means for direct implementation of the exclusive-OR and exclusive-NOR function, respectively. For applications as Logical comparators, Adders/subtractors, Parity generators and checkers.

The **HCC 4076B** (extended temperature range) and **HCF 4076B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.

The **HCC/HCF 4076B** types are four-bit registers consisting of D-type flip-flops that feature three-state outputs. Data Disable inputs are provided to control the entry of data into the flip-flops. When both Data Disable inputs are low, data at the D inputs are loaded into their respective flip-flops on the next positive transition of the clock input. Output Disable inputs are also provided. When the Output Disable inputs are both low, the normal logic states of the four outputs are available to the load. The outputs are disabled independently of the clock by a high logic level at either Output Disable input, and present a high impedance.

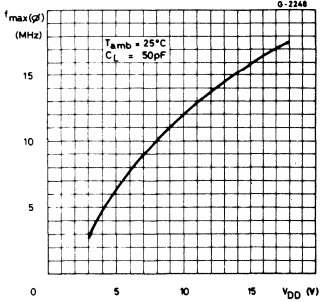
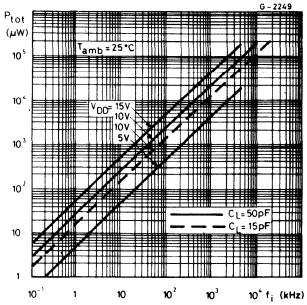
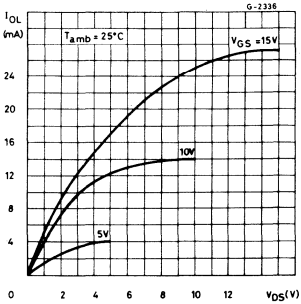
Typical maximum clock input frequency vs. supply voltage



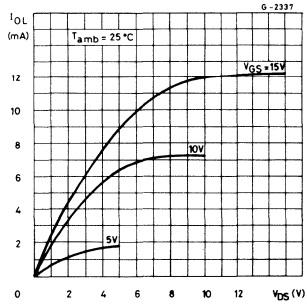
Typical dynamic power dissipation vs. frequency



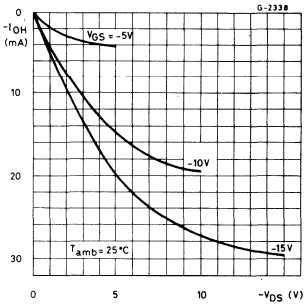
Typical output low (sink) current characteristics



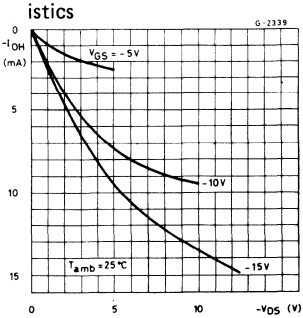
Minimum output low (sink) current characteristics



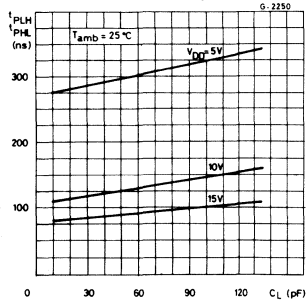
Typical output high (source) current characteristics



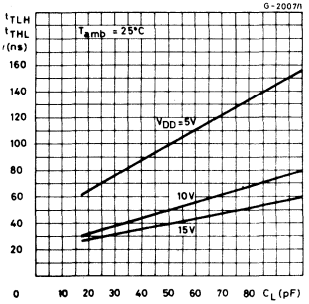
Minimum output high (source) current characteristics



Typical propagation delay time vs. load capacitance



Typical transition time vs. load capacitance



COS/MOS INTEGRATED CIRCUIT

8-INPUT NOR/OR GATE

- MEDIUM-SPEED OPERATION t_{PHL}, t_{PLH}= 75 ns (TYP.) AT V_{DD}= 10V
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4078B** (extended temperature range) and **HCF 4078B** (intermediate temperature range) are monolithic integrated circuit, available in 14-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.

The **HCC/HCF 4078B** NOR/OR Gate provides the system designer with direct implementation of the positive-logic-8-input NOR and OR function and supplements the existing family of COS/MOS gates.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4085B

DUAL 2-WIDE 2-INPUT AND-OR-INVERTER GATE

- MEDIUM-SPEED OPERATION - t_{PHL}= 90 ns; t_{PLH}= 125 ns (TYP.) AT 10V
- INDIVIDUAL INHIBIT CONTROLS
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4085B** (extended temperature range) and **HCF 4085B** (intermediate temperature range) are monolithic integrated circuit, available in 14-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.
The **HCC/HCF 4085B** contains a pair of AND-OR-INVERT gates, each consisting of two 2-input AND gates driving a 3-input NOR gate. Individual inhibit controls are provided for both A-O-I gates.

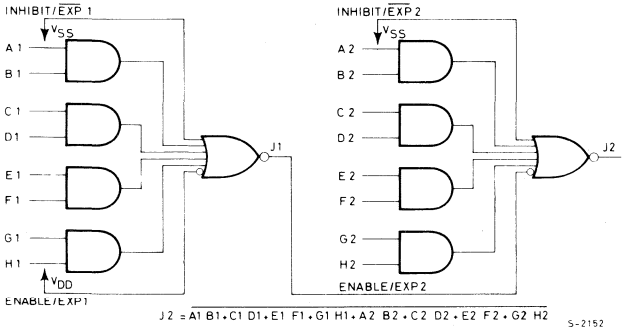
APPLICATION

Two 4086B connected as an 8-wide 2-input A-O-I gate



This application shows two **HCC/HCF 4086B** utilized to obtain an 8-wide 2-input A-O-I function. The output (J1) of one **HCC/HCF 4086B** is fed directly to the ENABLE/EXP 2 line of the second **HCC/HCF 4086B**. In a similar fashion, any NAND gate output can be fed directly into the ENABLE/EXP input to obtain a 5-wide A-O-I function. In addition, any AND gate output can be fed directly into the INHIBIT/$\overline{EXP}$ input with the same result.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4089B

BINARY RATE MULTIPLIER

- CASCADABLE IN MULTIPLES OF 4-BITS
- SET TO "15" INPUT AND "15" DETECT OUTPUT
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4089B** (extended temperature range) and **HCF 4089B** (intermediate temperature range) are monolithic integrated circuit available in 16-lead dual in-line plastic or ceramic package, and ceramic flat package.

The **HCC/HCF 4089B** is a low-power 4-bit digital rate multiplier that provides an output pulse rate that is the clock-input-pulse rate multiplied by 1/16 times the binary input. For example, when the binary input number is 13, there will be 13 output pulses for every 16 input pulses.

The **HCC/HCF 4089B** has an internal synchronous 4-bit counter which, together with one of the four binary input bits, produces pulse trains as shown in timing diagram.

If more than one binary input bit is high, the resulting pulse train is a combination of the above separate pulse trains. This device may be used to perform arithmetic operations (add, subtract, divide, raise to a power), solve algebraic and differential equations, generate natural logarithms and trigonometric functions, A/D and D/A conversions, and frequency division.

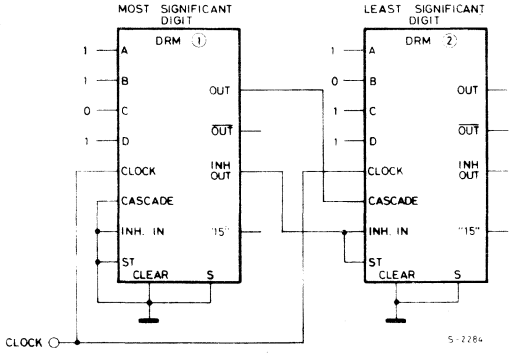
APPLICATION NOTES

For words of more than 4 bits, **HCC/HCF 4089B** devices may be cascaded in two different modes: an Add mode and a Multiply mode.

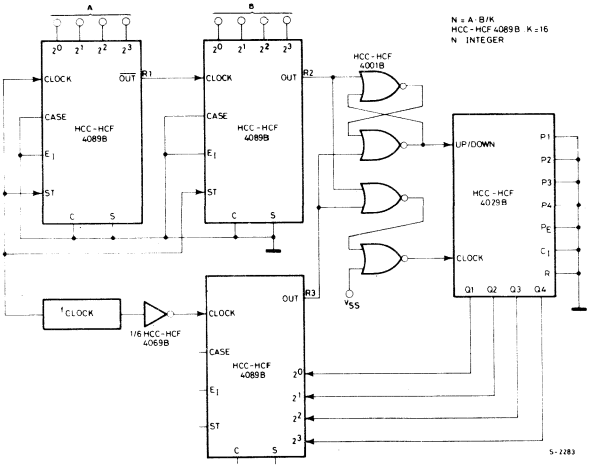
Two **HCC/HCF 4089B**'s cascaded in the "Add" mode with a preset number of 189.



Nota:
In the Add mode some of the gaps left by the more significant unit at the count of 15 are filled in by the less significant units. For example, when two units are cascaded in the Add mode and programmed to 11 and 13, respectively, the more significant unit will have 11 output pulses for every 16 input pulses and the other unit will have 13 output pulses for every 256 input pulses for a total of

$$\frac{11}{16} + \frac{13}{256} = \frac{189}{256}$$

Two **HCC/HCF 4089B**'s cascaded in the Multiply mode for Multiplication of two variables A and B with loop circuit control.



When the loop stabilises rate R_2= rate R_3, thus $f_{clock}\left(\frac{A}{16} \cdot \frac{B}{16}\right) = f_{clock}\left(\frac{1}{16} \cdot \frac{N}{16}\right)$ therefore $N = A \cdot B$.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4093 B

QUAD 2-INPUT NAND SCHMITT TRIGGERS

- SCHMITT-TRIGGER ACTION ON EACH INPUT WITH NO EXTERNAL COMPONENTS
- HYSTERESIS VOLTAGE TYPICALLY 0.9V AT V_{DD}= 5V AND 2.3V AT V_{DD}= 10V
- NOISE IMMUNITY GREATER THAN 50% OF V_{DD} (TYP.)
- NO LIMIT ON INPUT RISE AND FALL TIMES
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4093B** (extended temperature range) and **HCF 4093B** (intermediate temperature range) are available in 14-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage. The **HCC/HCF 4093B** consists of four Schmitt-trigger circuits. Each circuit functions as a two-input NAND gate with Schmitt-trigger action on both inputs. The gate switches at different points for positive and negative-going signals.

The difference between the positive voltage (V_P) and the negative voltage (V_N) is defined as hysteresis voltage (V_H) (See Fig. 1).

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4094B

8-STAGE SHIFT-AND-STORE BUS REGISTER

- 3-STATE PARALLEL OUTPUTS FOR CONNECTION TO COMMON BUS
- SEPARATE SERIAL OUTPUTS SYNCHRONOUS TO BOTH POSITIVE AND NEGATIVE CLOCK EDGES FOR CASCADING
- MEDIUM SPEED OPERATION - 5 MHz AT 10V
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4094B** (extended temperature range) and **HCF 4094B** (intermediate temperature range) are monolithic integrated circuits available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.

The **HCC/HCF 4094B** is an 8-stage serial shift register having a storage latch associated with each stage for strobing data from the serial input to parallel buffered 3-state outputs. The parallel outputs may be connected directly to common bus lines. Data is shifted on positive clock transitions. The data in each shift register stage is transferred to the storage register when the STROBE input is high. Data in the storage register appears at the outputs whenever the OUTPUT-ENABLE signal is high. Two serial outputs are available for cascading a number of **HCC/HCF 4094B** devices. Data is available at the Q_S serial output terminal on positive clock edges to allow for high-speed operation in cascaded systems in which the clock rise time is fast. The same serial information, available at the Q'_S terminal on the next negative clock edge, provides a means for cascading **HCC/HCF 4094B** devices when the clock rise time is slow.

GATED J-K MASTER-SLAVE FLIP-FLOPS

- 16 MHz TOGGLE RATE (TYP.) AT V_{DD}-V_{SS}= 10V
- GATED INPUTS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4095B/4096B** (extended temperature range) and **HCF 4095B/4096B** (intermediate temperature range) are monolithic integrated circuits, available in 14-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.

The **HCC/HCF 4095B** and **HCC/HCF 4096B** are J-K Master-Slave Flip-Flops featuring separate AND gating of multiple J and K inputs. The gated J-K inputs control transfer of information into the master section during clocked operation. Information on the J-K inputs is transferred to the Q and $\overline{Q}$ outputs on the positive edge of the clock pulse. SET and RESET inputs (active high) are provided for asynchronous operation.

HCC/HCF 4098B

DUAL MONOSTABLE MULTIVIBRATOR

- RETRIGGERABLE/RESETTABLE CAPABILITY
- TRIGGER AND RESET PROPAGATION DELAYS INDEPENDENT OF R_X, C_X
- TRIGGERING FROM LEADING OR TRAILING EDGE
- Q AND $\overline{Q}$ BUFFERED OUTPUTS AVAILABLE
- SEPARATE RESETS
- WIDE RANGE OF OUTPUT-PULSE WIDTHS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4098B** (extended temperature range) and **HCF 4098B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage. The **HCC/HCF 4098B** dual monostable multivibrator provides stable retriggerable/resettable one-shot operation for any fixed-voltage timing application. An external resistor (R_X) and an external capacitor (C_X) control the timing for the circuit. Adjustment of R_X and C_X provides a wide range of output pulse widths from the Q and $\overline{Q}$ terminals. The time delay from trigger input to output transition (trigger propagation delay) and the time delay from reset input to output transition (reset propagation delay) are independent of R_X and C_X. Leading-edge-triggering (+ TR) and trailing-edge-triggering (- TR) inputs are provided for triggering from either edge of an input pulse. An unused + TR input should be tied to V_{SS}. An unused -TR input should be tied to V_{DD}. A RESET (on low level) is provided for immediate termination of the output pulse or to prevent output pulses when power is turned on. An unused RESET input should be tied to V_{DD}. However, if an entire section of the **4098B** is not used, its RESET should be tied to V_{SS}. See Table I. In normal operation the circuit triggers (extends the output pulse one period) on the application of each new trigger pulse. For operation in the non-triggerable mode, $\overline{Q}$ is connected to -TR when leading-edge triggering (+ TR) is used or Q is connected to +TR when trailing-edge triggering (- TR) is used. The time period (T) for this multivibrator can be approximated by: $T_X = \frac{1}{2} R_X C_X$ for $C_X \geqslant 0.01\ \mu F$. Time periods as a function of R_X for values of C_X and V_{DD} are given in Fig. 8. Values of T vary from unit to unit and as a function of voltage, temperature, and $R_X C_X$. The minimum value of external resistance, R_X, is 5 kΩ. The maximum value of external capacitance, C_X, is 100 μF. Fig. 9 shows time periods as a function of C_X for values of R_X and V_{DD}. The output pulse width has variations of ± 2.5% typically, over the temperature range of -55°C to 125°C for C_X = 1000pF and R_X = 100 kΩ. For power supply variations of ± 5%, the output pulse width has variations of ± 0.5% typically, for V_{DD} = 10V and 15V and ± 1% typically, for V_{DD} = 5V at C_X = 1000 pF and R_X = 5 kΩ.

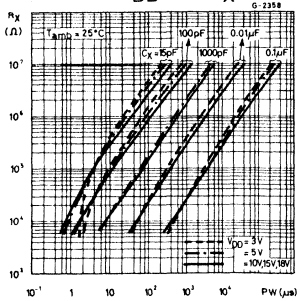

Fig. 9 - Typical external capacitance vs. pulse width at various V_{DD} and R_X

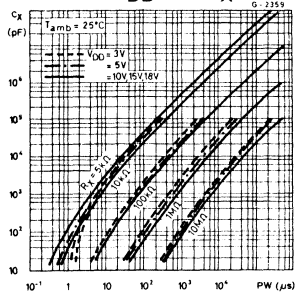

Fig. 10 - Typical minimum reset pulse width vs. external capacitance

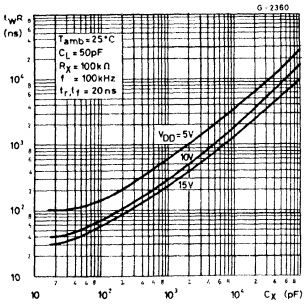

Fig. 11 - Average power dissipation for 100% duty cycle vs. one-shot pulse width

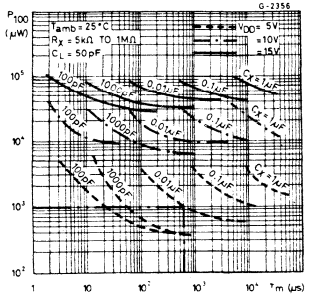

To calculate average power dissipation (P) for less than 100% duty cycle:

P_{100} = average power for 100% duty cycle

$P = (\frac{\tau_m}{\tau_T}) P_{100}$ where τ_m = one-shot pulse width

τ_T = trigger pulse period

e.g.: For τ_m = 600 μs τ_T = 1000 μs, C_X = 0.01 μF, V_{DD} = 5V

$P = (\frac{600}{1000})\ 10^3$ μW = 600 μW (see dotted line on graph)

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4099B

8-BIT ADDRESSABLE LATCH

- SERIAL DATA INPUT - ACTIVE PARALLEL OUTPUT
- STORAGE REGISTER CAPABILITY - MASTER CLEAR
- CAN FUNCTION AS DEMULTIPLEXER
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4099B** (extended temperature range) and **HCF 4099B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage. The **HCC/HCF 4099B** 8-bit addressable latch is a serial-input, parallel-output storage register that can perform a variety of functions. Data are inputted to a particular bit in the latch when that bit is addressed (by means of inputs A0, A1, A2) and when WRITE DISABLE is at a low level. When WRITE DISABLE is high, data entry is inhibited; however, all 8 outputs can be continuously read independent of WRITE DISABLE and address inputs. A master RESET input is available, which resets all bits to a logic "0" level when RESET and WRITE DISABLE are at a high level. When RESET is at a high level, and WRITE DISABLE is at a low level, the latch acts as a 1-of-8 demultiplexer; the bit that is addressed has an active output which follows the data input, while all unaddressed bits are held to a logic "0" level.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4502B

STROBED HEX INVERTER/BUFFER

- 2 TTL-LOAD OUTPUT DRIVE CAPABILITY
- 3-STATE OUTPUTS
- COMMON OUTPUT-DISABLE CONTROL
- INHIBIT CONTROL
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4502B** (extended temperature range) and **HCF 4502B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage. The **HCC/HCF 4502B** consists of six inverter-buffers with 3-state outputs. A logic "1" on the OUTPUT DISABLE input produces a high-impedance state in all six outputs. This feature permits common busing of the outputs, thus simplifying system design. A logic "1" on the INHIBIT input switches all six outputs to logic "0" if the OUTPUT DISABLE input is a logic "0". This device is capable of driving two standard TTL loads, which is equivalent to six times the JEDEC "B" series I_{OL} standard.

COS/MOS INTEGRATED CIRCUIT

SGS HCC/HCF 4503B

HEX BUFFER

- 1 TTL-LOAD OUTPUT DRIVE CAPABILITY
- 2 OUTPUT-DISABLE CONTROLS
- 3 STATE OUTPUTS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4503B** (extended temperature range) and **HCF 4503B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package, and ceramic flat package.
The **HCC/HCF 4503B** is a hex noninverting buffer with 3-state outputs having high sink and source-current capability. Two disable controls are provided, one of which controls four buffers and the other controls the remaining two buffers.

ABSOLUTE MAXIMUM RATINGS

V_{DD}*	Supply voltage: **HCC** types	-0.5 to 20	V
	HCF types	-0.5 to 18	V
V_i	Input voltage	-0.5 to V_{DD} +0.5	V
I_I	DC input current (any one input)	± 10	mA
P_{tot}	Total power dissipation (per package)	200	mW
	Dissipation per output transistor for T_{op}= full package-temperature range	100	mW
T_{op}	Operating temperature: **HCC** types	-55 to 125	°C
	HCF types	-40 to 85	°C
T_{stg}	Storage temperature	-65 to 150	°C

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

* All voltages are with respect to V_{SS} (GND).

DUAL 4-BIT LATCH

- TWO INDIPENDENT 4-BIT LATCHES
- INDIVIDUAL MASTER RESET FOR EACH 4-BIT-LATCH
- 3-STATE OUTPUTS WITH HIGH-IMPEDANCE STATE FOR BUS LINE APPLICATION
- MEDIUM-SPEED OPERATION: $t_{PHL} = t_{PLH} = 70$ ns (TYP.) AT $V_{DD} = 10V$ AND $C_L = 50$ pF
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4508B** (extended temperature range) and the **HCF 4508B** (intermediate temperature range) are monolithic integrated circuits available in 24–lead dual in–line plastic or ceramic package and ceramic flat package. The **HCC/HCF 4508B** dual 4–bit latch contains two identical 4–bit latches with separate STROBE, RESET, and OUTPUT DISABLE controls. With the STROBE line in the high state, the data on the "D" inputs appear at the corresponding "Q" outputs provided the DISABLE line is in the low state. Changing the STROBE line to the low state locks the data into the latch. A high on the reset line forces the outputs to a low level regardless of the state of the STROBE input. The outputs are forced to the high–impedance state for bus line applications by a high level on the DISABLE input.

- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4510B, HCC 4516B** (extended temperature range) and the **HCF 4510B, HCF 4516B** (intermediate temperature range) are monolithic integrated circuits available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 4510B** Presettable BCD Up/Down Counter and the **HCC/HCF 4516B** Presettable Binary Up/Down Counter consist of four synchronously clocked D-type flip-flops (with a gating structure to provide T-type flip-flop capability) connected as counters. These counters can be cleared by a high level on the RESET line, and can be preset to any binary number present on the jam inputs by a high level on the PRESET ENABLE line. The **HCC/HCF 4510B** will count out of non-BCD counter states in a maximum of two clock pulses in the up mode, and a maximum of four clock pulses in the down mode. If the CARRY-IN input is held low, the counter advances up or down on each positive-going clock transition. Synchronous cascading is accomplished by connecting all clock inputs in parallel and connecting the CARRY-OUT of a less significant stage to the CARRY-IN of a more significant stage. The **HCC/HCF 4510B** and **HCC/HCF 4516B** can be cascaded in the ripple mode by connecting the CARRY-OUT to the clock of the next stage. If the UP/DOWN input changes during a terminal count, the CARRY-OUT must be gated with the clock, and the UP/DOWN input must change while the clock is high. This method provides a clean clock signal to the subsequent counting stage.

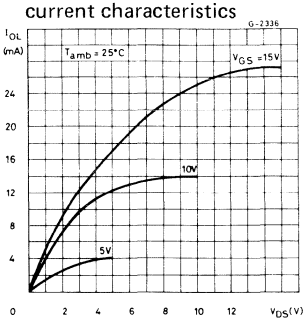
		10	100			
		15	75			

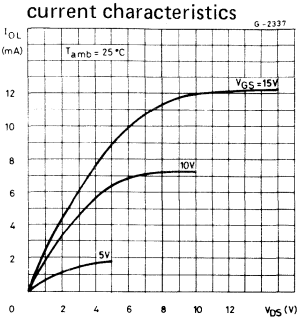
• Time required after the falling edge of the reset or preset enable inputs before the rising edge of the clock will trigger the counter (similar to setup time).

* If more than unit is cascaded in the parallel clocked application, t_rCL should be made less than or equal to the sum of the fixed propagation delay at 15 pF and the transition time of the carry output driving stage for the estimated capacitive load.

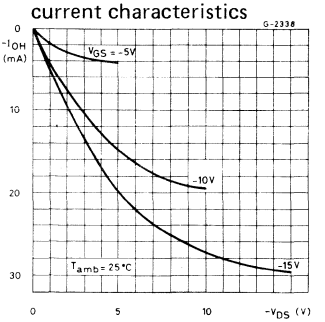
Typical output low (sink) current characteristics



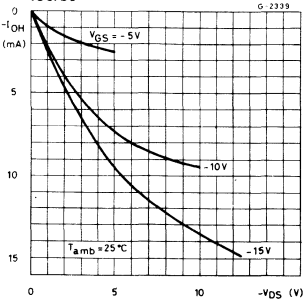
Minimum output low (sink) current characteristics



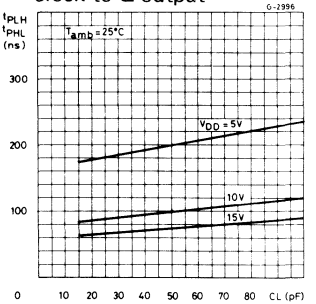
Typical output high (source) current characteristics



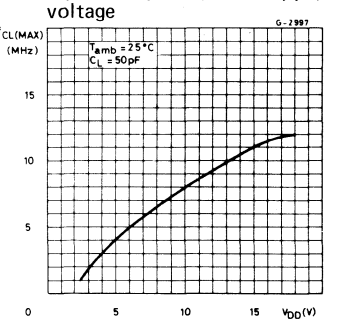
Minimum output high (source) current characteristics



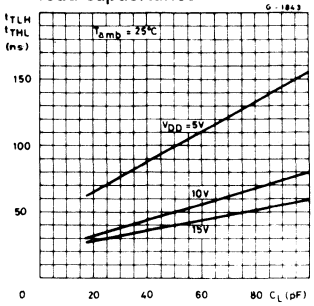
Typical propagation delay time vs. load capacitance for clock to Q output



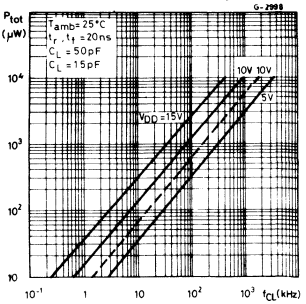
Typical maximum clock input frequency vs. supply voltage



Typical transition time vs. load capacitance

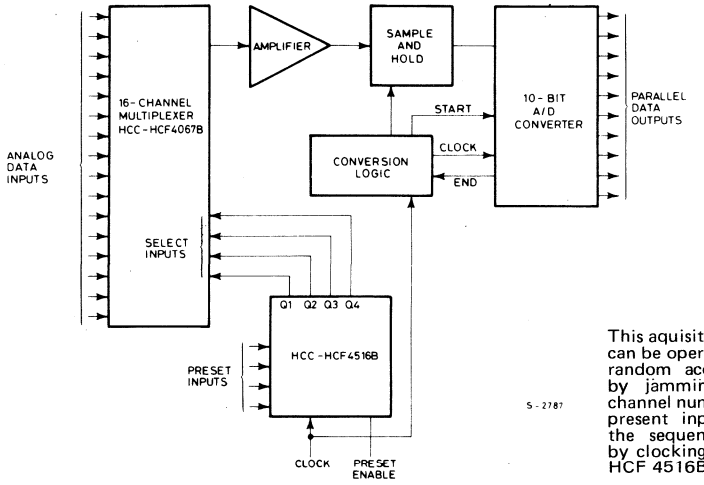


Typical dynamic power dissipation vs. frequency



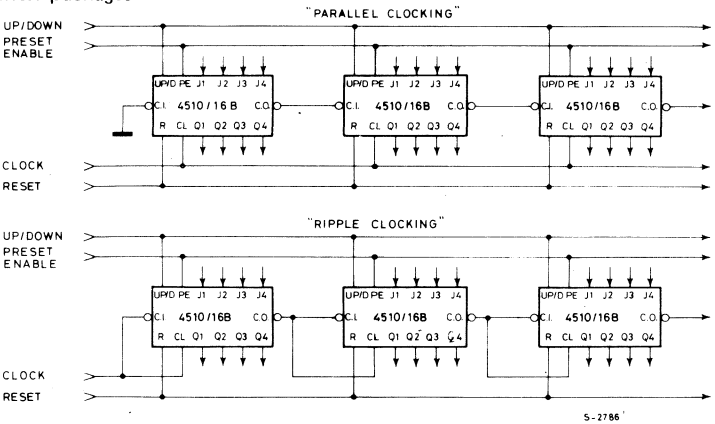
TYPICAL APPLICATIONS

Typical 16-channel, 10 bit data aquisition system



This aquisition system can be operated in the random access mode by jamming in the channel number at the present inputs, or in the sequential mode by clocking the HCC/HCF 4516B.

Cascading counter packages



COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4511B

BCD-TO-SEVEN SEGMENT LATCH/DECODER/DRIVER

- HIGH-OUTPUT-SOURCING CAPABILITY (up to 25 mA)
- INPUT LATCHES FOR BCD CODE STORAGE
- LAMP TEST AND BLANKING CAPABILITY
- 7-SEGMENT OUTPUTS BLANKED FOR BCD INPUT CODES > 1001
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 mA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4511B** (extended temperature range) and the **HCF 4511B** (intermediate temperature range) are monolithic integrated circuits available in 16-lead dual in-line plastic or ceramic package and ceramic flat package.

The **HCC/HCF 4511B** types are BCD-to-7-segment latch decoder drivers constructed with COS/MOS logic and n-p-n bipolar transistor output devices on a single monolithic structure. These devices combine the low quiescent power dissipation and high noise immunity features of COS/MOS with n-p-n bipolar output transistors capable of sourcing up to 25 mA. This capability allows the **HCC/HCF 4511B** types to drive LED's and other displays directly.

Lamp Test ($\overline{LT}$), Blanking ($\overline{BL}$), and Latch Enable or Strobe inputs are provided to test the display, shut off or intensity-modulate it, and store or strobe a BCD code, respectively. Several different signal may be multiplexed and displayed when external multiplexing circuitry is used.

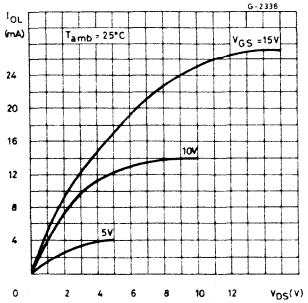
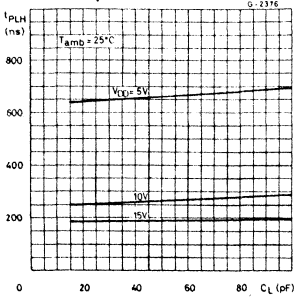
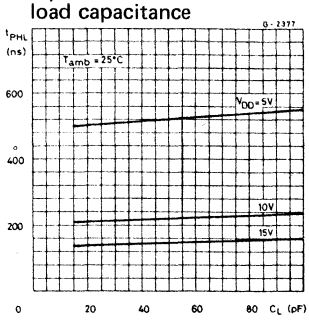
Typical output low (sink) current characteristics



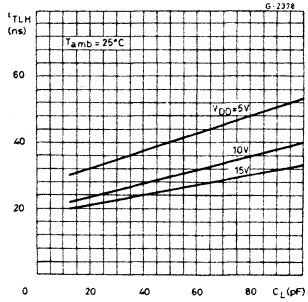
Typical data-to-output, low-to-high-level propagation delay time as a function of load capacitance



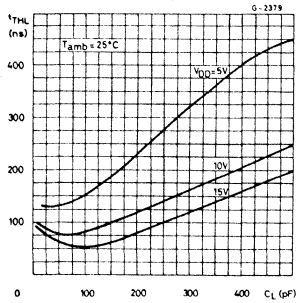
Typical data-to-output, high-to-low-level propagation delay time as a function of load capacitance



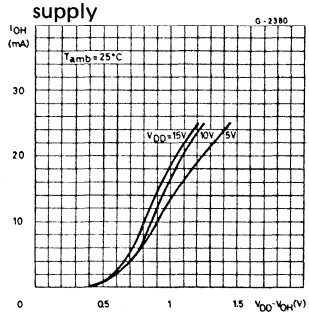
Typical low-to-high level transition time as a function of load capacitance



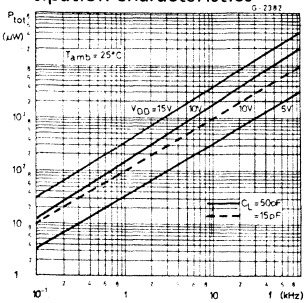
Typical high-to-low transition time as a function of load capacitance



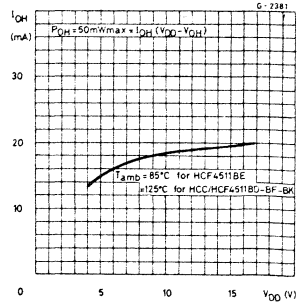
Typical voltage drop (V_{DD} to output) vs. output source current as a function of supply



Typical dynamic power dissipation characteristics



Derated static output current per output



Maximum continuous derated output current I_{OH} applies to a single output with all other outputs sourcing an equal amount of current at the supply voltages shown. Operation above the derating curve is not recommended.

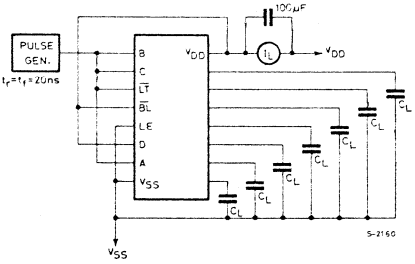
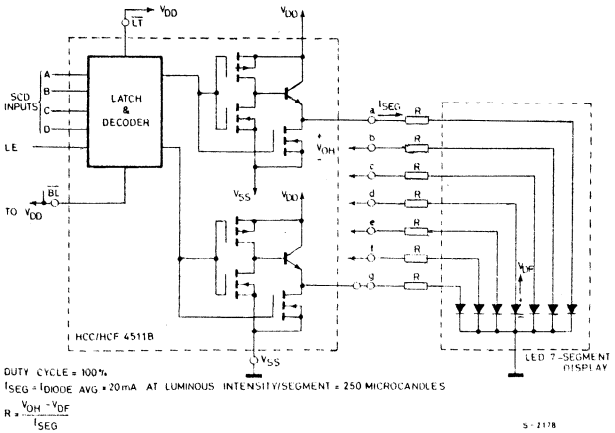
Dynamic power dissipation



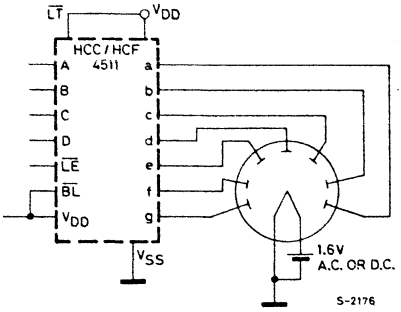
APPLICATIONS (Interfacing with various displays)

Driving common-cathode 7-segment LED displays



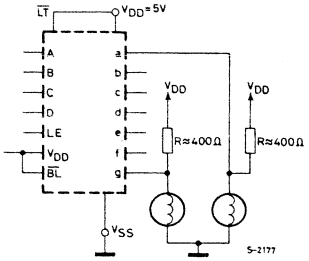
APPLICATIONS (continued)

Driving low-voltage fluorescent displays



A medium-brightness intensity display can be obtained with low-voltage fluorescent displays such as the Tung-Sot Digivac S/G Series.

Driving incandescent displays



2 of 7 Segments Shown Connected

Resistors R from V_{DD} to each 7-segment driver output are chosen to keep all Numitron segments slightly on and warm.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4512B

8-CHANNEL DATA SELECTOR

- 3-STATE OUTPUT
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4512B** (extended temperature range) and **HCF 4512B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.
The **HCC/HCF 4512B** is an 8-channel data selector featuring a three-state output that can interface directly with, and drive, data lines of bus-oriented systems.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4517B

DUAL 64-STAGE STATIC SHIFT REGISTER

- CLOCK FREQUENCY 12 MHz (TYP.) AT V_{DD}= 10V
- SCHMITT TRIGGER CLOCK INPUTS ALLOW OPERATION WITH VERY SLOW CLOCK RISE AND FALL TIMES
- THREE-STATE OUTPUTS
- QUIESCENT CURRENT SPECIFIED AT 20V FOR HCC DEVICE
- STANDARDIZED, SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4517B** (extended temperature range) and **HCF 4517B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package, and ceramic flat package.

The **HCC/HCF 4517B** dual 64-stage static shift register consists of two independent registers each having a clock, data, and write enable input and outputs accessible at taps following the 16th, 32nd, 48th, and 64th stages. These taps also serve as input points allowing data to be inputted at the 17th, 33rd, and 49th stages when the write enable input is a logic 1 and the clock goes through a low-to-high transition. The truth table indicates how the clock and write enable inputs control the operation of the **HCC/HCF 4517B**. Inputs at the intermediate taps allow entry of 64 bits into the register with 16 clock pulses. The 3-state outputs permit connection of this device to an external bus.

ABSOLUTE MAXIMUM RATINGS

V_{DD}*	Supply voltage: **HCC** types	-0.5 to 20	V
	HCF types	-0.5 to 18	V
V_i	Input voltage	-0.5 to V_{DD} +0.5	V
I_I	DC input current (any one input)	± 10	mA

	Dissipation per output transistor for T_{op}= full package-temperature range	100	mW
T_{op}	Operating temperature: **HCC** types	-55 to 125	°C
	HCF types	-40 to 85	°C
T_{stg}	Storage temperature	-65 to 150	°C

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

* All voltages are with respect to V_{SS} (GND).

DUAL UP-COUNTERS: HCC/HCF 4518B DUAL BCD UP-COUNTER
HCC/HCF 4520B DUAL BINARY UP-COUNTER

- MEDIUM-SPEED OPERATION - 6 MHz TYP. CLOCK FREQUENCY AT 10V
- POSITIVE - OR NEGATIVE - EDGE TRIGGERING
- SYNCHRONOUS INTERNAL CARRY PROPAGATION
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4518B/4520B** (extended temperature range) and **HCF 4518B/4520B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 4518B** Dual BCD Up Counter and **HCC/HCF 4520B** Dual Binary Up Counter each consist of two identical, internally synchronous 4-stage counters. The counter stages are D-type flip-flops having interchangeable Clock and Enable lines for incrementing on either the positive-going or negative-going transition. For single-unit operation the Enable input is maintained "high" and the counter advances on each positive-going transition of the Clock. The counters are cleared by high levels on their Reset lines. The counter can be cascaded in the ripple mode by connecting Q4 to the enable input of the subsequent counter while the clock input of the latter is held low.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4527B

BCD RATE MULTIPLIER

- CASCADABLE IN MULTIPLES OF 4-BITS
- SET TO 9 INPUT AND 9 DETECT OUTPUT
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4527B** (extended temperature range) and **HCF 4527B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package, and ceramic flat package.
The **HCC/HCF 4527** is a low-power 4-bit digital rate multiplier that provides an output-pulse rate which is the clock-input-pulse rate multiplied by 1/10 times the BCD input. For example, when the BCD input is 8, there will be 8 output pulses foe every 10 input pulses. This device may be used to perform arithmetic operations (add, subtract, divide, raise to a power), solve algebraic and differential equations, generate natural logarithms and trigonometric functions, A/D and D/A conversion, and frequency division.

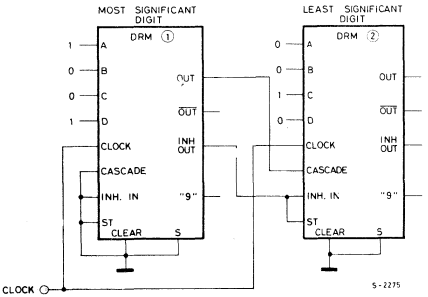
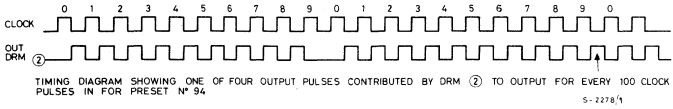
APPLICATIONS NOTE

For fractional multipliers with more than one digit, **HCC/HCF 4527** devices may be cascaded in two different modes: the Add mode and the Multiply mode. See figs. 1 and 3.

Fig. 1 - Two **HCC/HCF 4527B** cascaded in the "Add" mode with a preset number





TIMING DIAGRAM SHOWING ONE OF FOUR OUTPUT PULSES CONTRIBUTED BY DRM ② TO OUTPUT FOR EVERY 100 CLOCK PULSES IN FOR PRESET N° 94

5-2278/1

When two units are cascaded in Add mode and programmed to 9 and 4 respectively, the more significant unit will have 9 output pulses for every 10 input pulses and the other unit will have 4 output pulses for every 100 input pulses for a total of $\frac{9}{10} + \frac{4}{100} = \frac{94}{100}$.

APPLICATIONS NOTE (continued)

The Addition of two variables, A and B is instead obtained with this application:

Fig. 2 - Addition of two variables, A and B

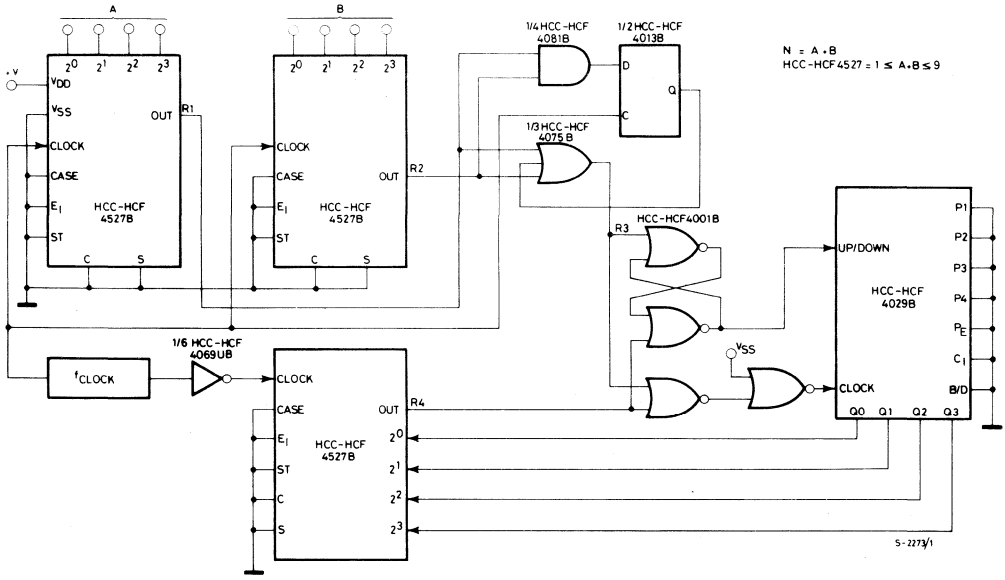


Fig. 3 - Two **HCC/HCF 4527B** cascaded in the "Multiply" mode with a preset number

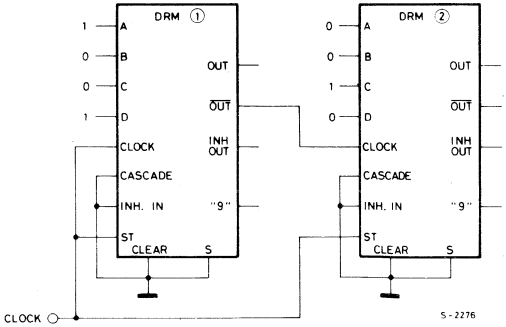


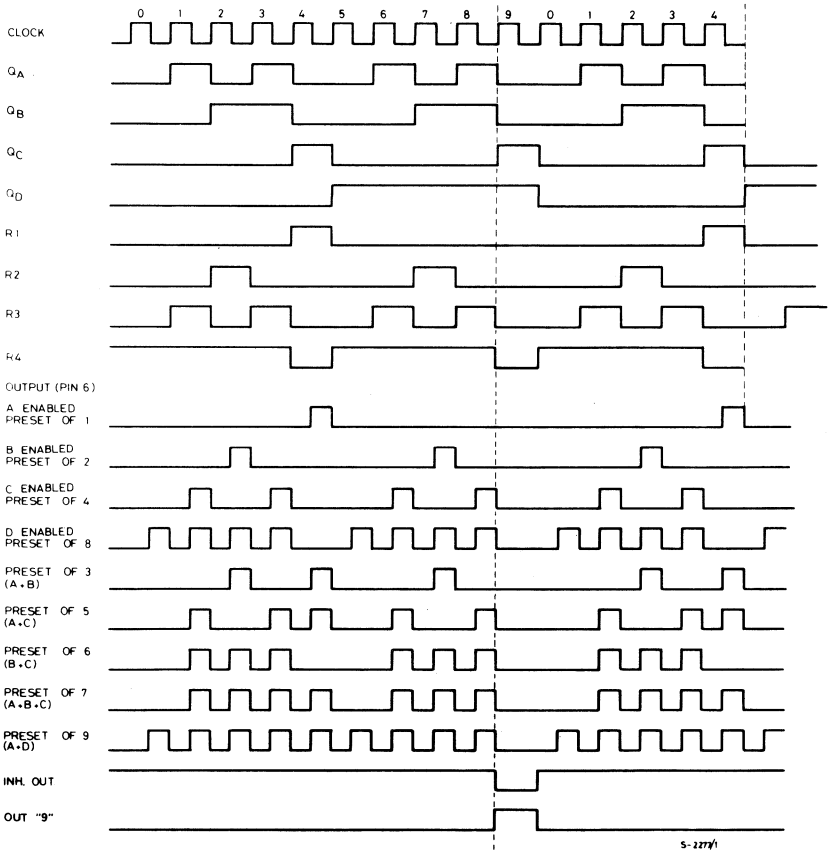
In the Multiply mode, the fraction programmed into the first rate multiplier is multiplied by the fraction programmed into the second one: I_f $N_1 = 9$ and $N_2 = 4$

$f_{out\,2} = (\frac{4}{10}) \cdot f_{out\,1}$ $\qquad f_{out\,1} = \frac{9}{10} f_{clock}$ $\qquad f_{out\,2} = \frac{4}{10} \times (\frac{9}{10} f_{clock}) = \frac{36}{100} f_{clock}$

There fore 36 output pulses for every 100 clock input pulses.

APPLICATIONS NOTE (continued)

Fig. 4 - Timing diagram (see Logic Diagram)



COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4532B

8-BIT PRIORITY ENCODER

- CONVERTS FROM 1 OF 8 TO BINARY
- PROVIDES CASCADING FEATURE TO HANDLE ANY NUMBER OF INPUTS
- GROUP SELECT INDICATES ONE OR MORE PRIORITY INPUTS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4532B** (extended temperature range) and **HCF 4532B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.

The **HCC/HCF 4532** consists of combinational logic that encodes the highest priority input (D7-D0) to a 3-bit binary code. The eight inputs, D7 through D0, each have an assigned priority. D7 is the highest priority and D0 is the lowest. The priority encoder is inhibited when the chip-enable input E_I is low. When E_I is high, the binary representation of the highest-priority input appears on output lines Q2-Q0, and the group select line GS is high to indicate that priority inputs are present. The enable-out (E_O) is high when no priority inputs are present. If any one input is high, E_O is low and all cascaded lower-order stages are disabled.

HCC/HCF 4536B

PROGRAMMABLE TIMER

- 24 FLIP-FLOP STAGES – COUNTS FROM 2^0 TO 2^{24}
- LAST 16 STAGES SELECTABLE BY BCD SELECT CODE
- BYPASS INPUT ALLOWS BYPASSING FIRST 8 STAGES
- ON-CHIP RC OSCILLATOR PROVISION
- CLOCK INHIBIT INPUT
- SCHMITT-TRIGGER IN CLOCK LINE PERMITS OPERATION WITH VERY LONG RISE AND FALL TIMES
- ON-CHIP MONOSTABLE OUTPUT PROVISION
- TYPICAL $f_{CL} = 3$ MHz AT $V_{DD} = 10$V
- TEST MODE ALLOWS FAST TEST SEQUENCE
- SET AND RESET INPUTS
- CAPABLE OF DRIVING TWO LOW POWER TTL LOADS, ONE LOWER-POWER SCHOTTKY LOAD, OR TWO HTL LOADS OVER THE RATED TEMPERATURE RANGE
- STANDARDIZED, SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT AT 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4536B** (extended temperature range) and **HCF 4536B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package, and ceramic flat package. The **HCC/HCF 4536B** is a programmable timer consisting of 24 ripple-binary counter stages. The salient feature of this device is its flexibility. The device can count from 1 to 2^{24} or the first 8 stages can be bypassed to allow an output, selectable by a 4-bit code, from any one of the remaining 16 stages. It can be driven by an external clock or an RC oscillator that can be constructed using on-chip components. Input IN1 serves as either the external clock input or the input to the on-chip RC oscillator. OUT1 and OUT2 are connection terminals for the external RC components. In addition, an on-chip monostable circuit is provided to allow a variable pulse width output. Various timing functions can be achieved using combinations of these capabilities. A logic 1 on the 8-BYPASS input enables a bypass of the first 8 stages and makes stage 9 the first counter stage of the last 16 stages. Selection of 1 of 16 outputs is accomplished by the decoder and the BCD inputs A, B, C and D. MONO IN is the timing input for the on-chip monostable oscillator. Grounding of the MONO IN terminal through a resistor of 10KΩ or higher, disables the one-shot circuit and connects the decoder directly to the DECODE OUT terminal. A resistor to V_{DD} and a capacitor to ground from the MONO IN terminal enables the one-shot circuit and controls its pulse width. A fast test mode is enabled by a logic 1 on 8-BYPASS, SET, and RESET. This mode divides the 24-stage counter into three 8-stage sections to facilitate a fast test sequence.

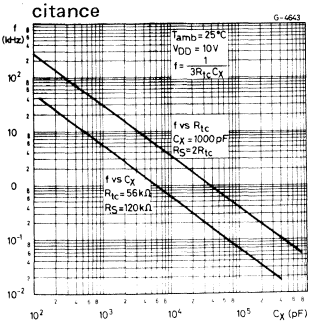
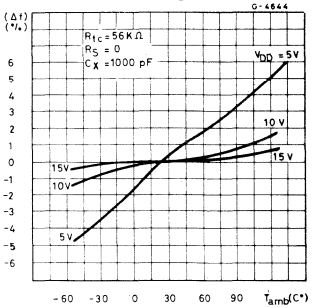
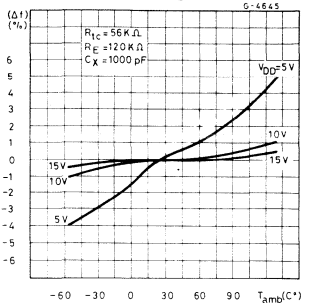
Typical RC oscillator frequency deviation vs. time constant resistance and capacitance



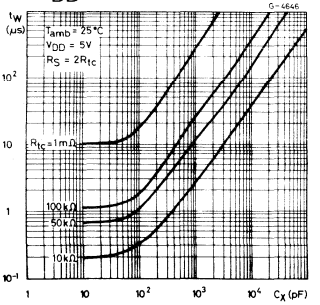
Typical RC oscillator frequency deviation vs. ambient temperature ($R_S = 0$)



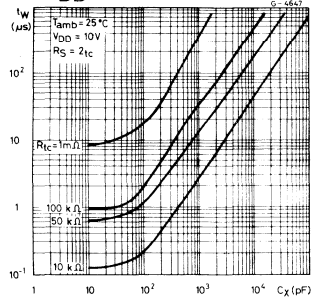
Typical RC oscillator frequency deviation vs. ambient temperature ($R_S = 120$ KΩ)



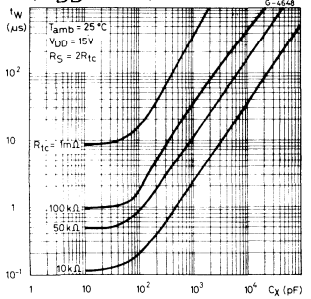
Typical pulse width vs. external capacitance ($V_{DD} = 5V$)



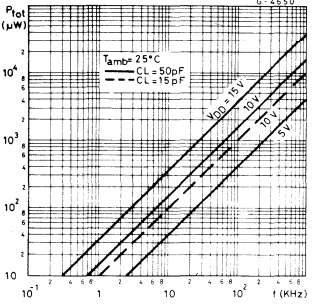
Typical pulse width vs. external capacitance ($V_{DD} = 10V$)



Typical pulse width vs. external capacitance ($V_{DD} = 15V$)



Typical dynamic power dissipation vs. input pulse frequency



FUNCTIONAL TEST SEQUENCE					
Inputs				Outputs	Comments
IN1	Set	Reset	8-Bypass	Decade Out Q1 thru Q24	All 24 steps are in Reset mode
1	0	1	1	0	
1	1	1	1	0	Counter is in three 8-stage section in parallel mode
0	1	1	1	0	First "1" to "0" transition of clock
1 0 — —	1	1	1		255 "1" to "0" transitions are clocked in the counter
0	1	1	1	1	The 255 "1" to "0" transition
0	0	0	0	1	Counter converted back to 24 stages in series mode. Set and Reset must be connected together and simultaneously go from "1" to "0"
1	0	0	0	1	In_1 Switches to a "1"
0	0	0	0	0	Counter Ripples from an all "1" state to an all "0" state

FUNCTIONAL TEST SEQUENCE

Test Function has been included for the reduction of test time required to exercise all 24 counter stages.

This test function divides the counter into three 8-stage section and 255 counts are loaded in each of the 8-stage sections in parallel. All flip-flops are now at a "1". The counter is now returned to the normal 24-steps in series configuration. One more pulse is entered into In_1 which will cause the counter to ripple from an all "1" state to an all "0" state.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4538B

PRELIMINARY DATA

DUAL MONOSTABLE MULTIVIBRATOR

- RETRIGGERABLE/RESETTABLE CAPABILITY
- TRIGGER AND RESET PROPAGATION DELAYS INDEPENDENT OF R_X, C_X
- TRIGGERING FROM LEADING OR TRAILING EDGE
- Q AND $\overline{Q}$ BUFFERED OUTPUTS AVAILABLE
- SEPARATE RESETS
- WIDE RANGE OF OUTPUT-PULSE WIDTHS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- SCHMITT TRIGGER INPUT ALLOWS UNLIMITER RISE AND FALL TIMES ON +TR AND -TR INPUTS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4538B** (extended temperature range) and **HCF 4538B** (intermediate temperature range) are monolithic integrated circuit, available in 16-lead dual in-line plastic or-ceramic package and ceramic flat package. The **HCC/HCF 4538B** dual precision monostable multivibrator provides stable retriggerable/resettable one-shot operation for any fixed-voltage timing application. An external resistor (R_X) and an external capacitor (C_X) control the timing and accuracy for the circuit. Adjustment of R_X and C_X provides a wide range of output pulse widths from the Q and $\overline{Q}$ terminals. The time delay from trigger input to output transition (trigger propagation delay) and the time delay from reset input to output transition (reset propagation delay) are independent of R_X and C_X. Precision control of output pulse widths is achieved through linear CMOS techniques. Leading-edge-triggering (+ TR) and trailing-edge-triggering (– TR) inputs are provided for triggering from either edge of an input pulse. An unused + TR input should be tied to V_{SS}. An unused –TR input should be tied to V_{DD}. A RESET (on low level) is provided for immediate termination of the output pulse or to prevent output pulses when power is turned on. An unused RESET input should be tied to V_{DD}. However, if an entire section of the **HCC/HCF 4538B** is not used, its inputs must be tied to either V_{DD} or V_{SS} (See table 1). In normal operation the circuit triggers (extends the output pulse one period) on the application of each new trigger pulse. For operation in the non-retriggerable mode, $\overline{Q}$ is connected to –TR when leading-edge triggering (+ TR) is used or Q is connected to +TR when trailingedge triggering (– TR) is used. The time period (T) for this multivibrator can be calculated by: $T = R_X C_X$. The min. value of external resistance, R_X, is 4KΩ. The max. and min. values of external capacitance, C_X, are 100 μF and 5 nF, respectively.

ABSOLUTE MAXIMUM RATINGS

V_{DD}*	Supply voltage: **HCC** types	-0.5 to 20	V
	HCC types	-0.5 to 18	V
V_i	Input voltage	-0.5 to V_{DD} +0.5	V
I_I	DC input current (any one input)	± 10	mA
P_{tot}	Total power dissipation (per package)	200	mW
	Dissipation per output transistor for T_{op}= full package-temperature range	100	mW
T_{op}	Operating temperature: **HCC** types	-55 to 125	°C
	HCC types	-40 to 85	°C
T_{stg}	Storage temperature	-65 to 150	°C

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for external periods may affect device reliability.

* All voltage are with respect to V_{SS} (GND).

COS/MOS INTEGRATED CIRCUITS

HCC/HCF 4555B HCC/HCF 4556B

DUAL BINARY TO 1 OF 4 DECODER/DEMULTIPLEXERS:
4555B OUTPUTS HIGH ON SELECT
4556B OUTPUTS LOW ON SELECT

- EXPANDABLE WITH MULTIPLE PACKAGES
- STANDARD, SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4555B**, **HCC 4556B** (extended temperature range) and the **HCF 4555B**, **HCF 4556B** (intermediate temperature range) are monolithic integrated circuits available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.
The **HCC/HCF 4555B** and **HCC/HCF 4556B** are dual one-of-four decoders/demultiplexers. Each decoder has two select inputs (A and B), an Enable input ($\overline{E}$), and four mutually exclusive outputs. On the **HCC/HCF 4555B** the outputs are high on select; on the **HCC/HCF 4556B** the outputs are low on select. When the Enable input is high, the outputs of the **HCC/HCF 4555B** remain low and the outputs of the **HCC/HCF 4556B** remain high regardless of the state of the select inputs A and B.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 4585 B

4-BIT MAGNITUDE COMPARATOR

- EXPANSION TO 8, 12, 16 . . . . . 4N BITS BY CASCADING UNITS
- MEDIUM-SPEED OPERATION: COMPARES TWO 4-BIT WORDS IN 180 ns (TYP.) AT 10V
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 4585B** (extended temperature range) and **HCF 4585B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package, and ceramic flat package. The **HCC/HCF 4585B** is a 4-bit magnitude comparator designed for use in computer and logic applications that require the comparison of two 4-bit words. This logic circuit determines whether one 4-bit word (Binary or BCD) is "less than", "equal to", or "greater than" a second 4-bit word. The **HCC/HCF 4585B** has eight comparing inputs (A3, B3, through A0, B0), three outputs ($A < B$, $A = B$, $A > B$) and three cascading inputs ($A < B$, $A = B$, $A > B$) that permit systems designers to expand the comparator function to 8, 12, 16.....4N bits. When a single **HCC/HCF 4585B** is used, the cascading inputs are connected as follows: ($A < B$) = low, ($A = B$) = high, ($A > B$) = high. Cascading these units for comparison of more than 4 bits is accomplished as shown in typical application.

ABSOLUTE MAXIMUM RATINGS

V_{DD}*	Supply voltage: **HCC** types	-0.5 to 20	V
	HCF types	-0.5 to 18	V
V_i	Input voltage	-0.5 to V_{DD} +0.5	V
I_I	DC input current (any one input)	± 10	mA
P_{tot}	Total power dissipation (per package)	200	mW
	Dissipation per output transistor for T_{op}= full package-temperature range	100	mW
T_{op}	Operating temperature: **HCC** types	-55 to 125	°C
	HCF types	-40 to 85	°C
T_{stg}	Storage temperature	-65 to 150	°C

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

* All voltages are with respect to V_{SS} (GND).

- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40100B** (extended temperature range) and **HCF 40100B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 40100B** si a 32-stage shift register containing 32 D-type master-slave flip-flops. The data present at the SHIFT-RIGHT INPUT is transferred into the first register stage synchronously with the positive CLOCK edge, provided the LEFT/RIGHT CONTROL is at a low level, the RECIRCULATE CONTROL is at a high level, and the CLOCK INHIBIT is low. If the LEFT/RIGHT CONTROL is at a high level and the RECIRCULATE CONTROL is also high, data at the SHIFT-LEFT INPUT is transferred into the 32nd register stage synchronously with the positive CLOCK transition, provided the CLOCK INHIBIT is low. The state of the LEFT/RIGHT CONTROL, RECIRCULATE CONTROL, and CLOCK INHIBIT should not be changed when the CLOCK is high. Data is shifted one stage left or one stage right depending on the state of the LEFT/RIGHT CONTROL, synchronously with the positive CLOCK edge. Data clocked into the first or 32nd register states is available at the SHIFT-LEFT or SHIFT-RIGHT OUTPUT respectively, on the next negative CLOCK transition (see Data Transfer Table). No shifting occurs on the positive CLOCK edge if the CLOCK INHIBIT line is at a high level. With the RECIRCULATE CONTROL low, data in the 32nd stage is shifted into the first stage when the LEFT/RIGHT CONTROL is low and from the 1st stage to the 32nd stage when the LEFT/RIGHT CONTROL is high.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 40101 B

9-BIT PARITY GENERATOR/CHECKER

- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED AT 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40101B** (extended temperature range) and **HCF 40101B** (intermediate temperature range) are monolithic integrated circuits, available in 14-lead dual in-line plastic or ceramic package and ceramic flat package.

The **HCC/HCF 40101B** is a 9-bit (8 data bits plus 1 parity bit) parity generator/checker. It may be used to detect errors in data transmission or data retrieval. Odd and even outputs facilitate odd or even parity generation and checking. When used as a parity generator, a parity bit is supplied along with the data to generate an even or odd parity output. When used a parity checker, the received data bits and parity bits are compared for correct parity. The even or odd outputs are used to indicate an error in the received data. Word-length capability is expandable by cascading. The **HCC/HCF 40101B** is also provided with an inhibit control. If the inhibit control is set at logical "1", the even and odd outputs go to a logical "0".

ABSOLUTE MAXIMUM RATINGS

V_{DD}*	Supply voltage: **HCC** types	-0.5 to 20	V
	HCF types	-0.5 to 18	V
V_i	Input voltage	-0.5 to V_{DD} +0.5	V
I_I	DC input current (any one input)	± 10	mA
P_{tot}	Total power dissipation (per package)	200	mW
	Dissipation per output transistor for T_{op}= full package-temperature range	100	mW
T_{op}	Operating temperature: **HCC** types	-55 to 125	°C
	HCF types	-40 to 85	°C
T_{stg}	Storage temperature	-65 to 150	°C

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

* All voltages are with respect to V_{SS} (GND).

40103B 8-BIT BINARY TYPE

- SYNCHRONOUS OR ASYNCHRONOUS PRESET
- MEDIUM-SPEED OPERATION: f_{CL} = 3.6 MHz (TYP.) @ V_{DD} = 10V
- CASCADABLE
- QUIESCENT CURRENT SPECIFIED TO 20V FOR HCC DEVICE
- 5V, 10V AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40102B, HCC 40103B,** (extended temperature range) and the **HCF 40102B, HCF 40103B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 40102B,** and **HCC/HCF 40103B** consist of an 8-stage synchronous down counter with a single output which is active when the internal count is zero. The **HCC/HCF 40102B** is configured as two cascaded 4-bit BCD counters, and the **HCC/HCF 40103B** contains a single 8-bit binary counter. Each type has control inputs for enabling or disabling the clock, for clearing the counter to its maximum count, and for presetting the counter either synchronously or asynchronously. All control inputs and the CARRY-OUT/ZERO-DETECT output are active-low logic. In normal operation, the counter is decremented by one count on each positive transition of the CLOCK. Counting is inhibited when the CARRY-IN/COUNTER ENABLE ($\overline{CI/CE}$) input is high. The CARRY-OUT/ZERO-DETEC ($\overline{CO/ZD}$) output goes low when the count reaches zero if the $\overline{CI/CE}$ input is low, and remains low for one full clock period. When the SYNCHRONOUS PRESET-ENABLE (SPE) input is low, data at the JAM input is clocked into the counter on the next positive clock transition regardless of the state of the $\overline{CI/CE}$ input. When the ASYNCHRONOUS PRESET-ENABLE ($\overline{APE}$) input is low, data at the JAM inputs is asynchronously forced into the counter regardless of the state of the $\overline{SPE}$, $\overline{CI/CE}$, or CLOCK inputs. JAM inputs JO-J7 represent two 4-bit BCD words for the **HCC/HCF 40102B** and a single 8-bit binary word for the **HCC/HCF 40103B**. When the CLEAR ($\overline{CLR}$) input is low, the counter is asynchronously cleared to its maximum count (99_{10} for the **HCC/HCF 40102B** and 255_{10} for the **HCC/HCF 40103B**) regardless of the state of any other input. The precedence relationship between control input is indicated in the truth table. If all control inputs are high at the tieme of zero count, the counters will jump to the maximum count, giving a counting sequence of 100 or 256 clock pulses long. The **HCC/HCF 40102B** and **HCC/HCF 40103B** may be cascaded using the $\overline{CI/CE}$ input and the $\overline{CO/ZD}$ output, in either a synchronous or ripple mode.

ABSOLUTE MAXIMUM RATINGS

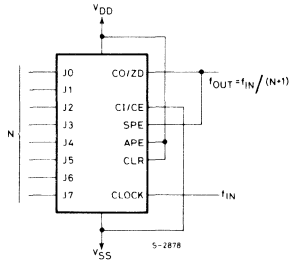
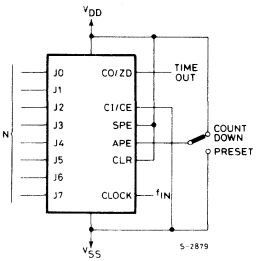
TYPICAL APPLICATIONS

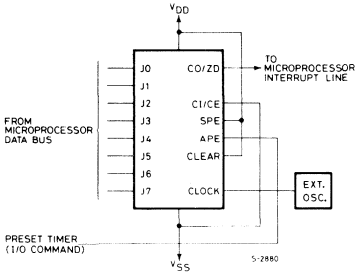
Divide-by-"N" counter



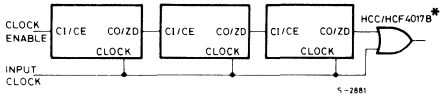
Programmable timer



Microprocessor interrupt timer

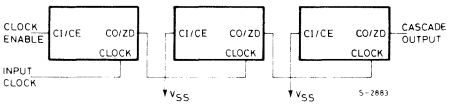


Synchronous cascading



* An output spike (160 ns @ V_{DD}= 5V) occurs whenever two or more devices are cascaded in the parallel-clocked mode because the clock-to-carry out delay is greater than the carry-in-to-carry out delay. This spike is eliminated by gating the output of the last device with the clock as shown.

Ripple cascading



COS/MOS INTEGRATED CIRCUITS

HCC/HCF 40104B
HCC/HCF 40194B

4-BIT BIDIRECTIONAL UNIVERSAL SHIFT REGISTER

- MEDIUM-SPEED OPERATION: f_{CL}= 9 MHz (TYP.) @ V_{DD}= 10V
- FULLY STATIC OPERATION
- SYNCHRONOUS PARALLEL OR SERIAL OPERATION
- THREE-STATE OUTPUTS (**HCC/HCF 40104B**)
- ASYNCHRONOUS MASTER RESET (**HCC/HCF 40194B**)
- STANDARDIZED, SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT AT 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40104B, HCC 40194B,** (extended temperature range) and the **HCC 40104B, HCF 40194B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 40104B** is a universal shift register featuring parallel inputs, parallel outputs, SHIFT RIGHT and SHIFT LEFT serial inputs, and a high-impedance third output state allowing the device to be used in bus-organized systems. In the parallel-load mode (S0 and S1 are high), data is loaded into the associated flip-flop and appears at the output after the positive transition of the CLOCK input. During loading, serial data flow is inhibited. Shift-right and shift-left are accomplished synchronously on the positive clock edge with serial data entered at the SHIFT RIGHT and SHIFT LEFT serial inputs, respectively. Clearing the register is accomplished by setting both mode controls low and clocking the register. When the output enable input is low, all outputs assume the high impedance state. The **HCC/HCF 40194B** is a universal shift register featuring parallel inputs, parallel outputs SHIFT RIGHT and SHIFT LEFT serial inputs, and a direct overriding clear input. In the parallel-load mode (S0 and S1 are high), data is loaded into the associated flip-flop and appears at the output after the positive transition of the CLOCK input. During loading, serial data flow is inhibited. Shift right and shift left are accomplished synchronously on the positive clock edge with data entered at the SHIFT RIGHT and SHIFT LEFT serial inputs, respectively. Clocking of the register is inhibited when both mode control inputs are low. When low, the $\overline{\text{RESET}}$ input resets all stages and forces all outputs low. The **HCC/HCF 40194B** is similar to industry types 340194 and MC40194.

- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40105B** (extended temperature range) and **HCF 40105B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package.

The **HCC/HCF 40105B** is a low-power first-in-first-out (FIFO) "elastic" storage register that can store 16 4-bit words. It is capable of handling input and output data at different shifting rates. This feature makes it particularly useful as a buffer between asynchronous systems. Each word position in the register is clocked by a control flip-flop, which stores a marker bit. A "1" signifies that the position's data is filled and a "0" denotes a vacancy in that position. The control flip-flop detects the state of the preceding flip-flop and communicates its own status to the succeeding flip-flop. When a control flip-flop is in the "0" state and sees a "1" in the preceding flip-flop, it generates a clock pulse that transfers data from the preceding four data latches into its own four data latches and resets the preceding flip-flop to "0". The first and last control flip-flops have buffered outputs. Since all empty locations "bubble" automatically to the input end, and all valid data ripple through to the output end, the status of the first control flip-flop (DATA-IN READY) indicates if the FIFO is full, and the status of the last flip-flop (DATA-OUT READY) indicates if the FIFO contains data. As the earliest data are removed from the bottom of the data stack (the output end), all data entered later will automatically propagate (ripple) toward the output.

APPLICATIONS INFORMATION

Loading Data – Data can be entered whenever the DATA-IN READY (DIR) flag is high, by a low to high transition on the SHIFT-IN (SI) input. This input must go low momentarily before the next word is accepted by the FIFO. The DIR flag will go low momentarily, until the data have been transferred to the second location. The flag will remain low when all 16-word locations are filled with valid data, and further pulses on the SI input will be ignored until DIR goes high.

Unloading Data – As soon as the first word has rippled to the output, DATA-OUT READY (DOR) goes high, and data can be removed by a falling edge on the SO input. This falling edge causes the DOR signal to go low while the word on the output is dumped and the next word moves to the output. As long as valid data are available in the FIFO, the DOR signal will go high again signifying that the next word is ready at the output. When the FIFO is empty, DOR will remain low, and any further commands will be ignored until a "1" marker ripples down to the last control register, when DOR goes high. Unloading of data is inhibited while the 3-state control input is high. The 3-state control signal should not be shifted from high to low (data outputs turned on) while the SHIFT-OUT is at logic 0. This level change would cause the first word to be shifted out (unloaded) immediately and the data to be lost.

Cascading – The **HCC/HCF 40105B** can be cascaded to form longer registers simply by connecting the DIR to SO and DOR to SI. In the cascaded mode, a MASTER RESET pulse must be applied after the supply voltage is turned on. For words wider than 4 bits, the DIR and the DOR outputs must be gated together with AND gates. Their outputs drive the SI and SO inputs in parallel, if expanding is done in both directions.

3-State Outputs – In order to facilitate data busing, 3-state outputs are provided on the data output lines, while the load condition of the register can be detected by the state of the DOR output.

Master Reset – A high on the MASTER RESET (MR) sets all the control logic marker bits to "0". DOR goes low and DIR goes high. The contents of the data register are not changed, only declared invalid, and will be superseded when the first word is loaded.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 40106B

HEX SCHMITT TRIGGERS

- SCHMITT-TRIGGER ACTION WITH NO EXTERNAL COMPONENTS
- HYSTERESIS VOLTAGE (TYP.) 0.9V at V_{DD}= 5V, 2.3V at V_{DD}= 10V and 3.5V at V_{DD}= 15V
- NOISE IMMUNITY GREATER THAN 50%
- NO LIMIT ON INPUT RISE AND FALL TIME
- LOW V_{DD} TO V_{SS} CURRENT DURING SLOW INPUT RAMP
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED AT 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40106B** (extended temperature range) and **HCF 40106B** (intermediate temperature range) are monolithic integrated circuits, available in 14-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.

The **HCC/HCF 40106B** consists of six Schmitt-trigger circuits. Each circuit functions as an inverter with Schmitt-trigger action on the input. The trigger switches at different points for positive-and negative-going signals. The difference between the positive-going voltage (V_P) and the negative-going voltage (V_N) is defined as hysteresis voltage (V_H).

HCC/HCF 40108B

4x4 MULTIPORT REGISTER

- FOUR 4-BIT REGISTERS
- ONE INPUT AND TWO OUTPUT BUSES
- UNLIMITED EXPANSION IN BIT AND WORD DIRECTIONS
- DATA LINES HAVE LATCHED INPUTS
- 3-STATE OUTPUTS
- SEPARATE CONTROL OF EACH BUS, ALLOWING SIMULTANEOUS INDEPENDENT READING OF ANY OF FOUR REGISTERS ON BUS A AND BUS B AND INDEPENDENT WRITING INTO ANY OF THE FOUR REGISTERS
- 40108B IS PIN-COMPATIBLE WITH INDUSTRY TYPE MC14580
- STANDARDIZED, SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED AT 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40108B** (extended temperature range) and **HCF 40108B** (intermediate temperature range) are monolithic integrated circuits, available in 24-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 40108B** is a 4x4 multiport register containing four 4-bit registers, write address decoder, two separate read address decoders, and two 3-state output buses. When the ENABLE input is low, the corresponding output bus is switched, independently of the clock, to a high-impedance state. The high-impedance third state provides the outputs with the capability of being connected to the bus lines in a bus-organized system without the need for interface or pull-up components. When the WRITE ENABLE input is high, all data input lines are latched on the positive transition of the CLOCK and the data is entered into the word selected by the write address lines. When WRITE ENABLE is low, the CLOCK is inhibited and no new data is netered. In either case, the contents of any word may be accessed via the read address lines independent of the state of the CLOCK input.

ABSOLUTE MAXIMUM RATINGS

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 40109B

QUAD LOW-TO-HIGH VOLTAGE LEVEL SHIFTER

- INDEPENDENCE OF POWER SUPPLY SEQUENCE CONSIDERATIONS-V_{CC} CAN EXCEED V_{DD}, INPUT SIGNALS CAN EXCEED BOTH V_{CC} AND V_{DD}
- UP AND DOWN LEVEL-SHIFTING CAPABILITY
- THREE-STATE OUTPUTS WITH SEPARATE ENABLE CONTROLS
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED AT 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40109B** (extended temperature range) and **HCF 40109B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage. The **HCC/HCF 40109B** contains four low-to-high-voltage level-shifting circuits. Each circuit will shift a low-voltage digital-logic input signal (A, B, C, D) with logical $1 = V_{CC}$ and logical $0 = V_{SS}$ to a higher-voltage output signal (E, F, G, H) with logical $1 = V_{DD}$ and logica $0 = V_{SS}$. The **HCC/HCF 40109B,** unlike other low-to-high level-shifting circuits, does not require the presence of the high-voltage supply (V_{DD}) before the application of either the low-voltage supply (V_{CC}) or the input signals. There are no restrictions on the sequence of application of V_{DD}, V_{CC}, or the input signals. In addition, there are no restrictions on the relative magnitudes od the supply voltages or input signals within the device maximum ratings; V_{CC} may exceed V_{DD}, and input signals may exceed V_{CC}, and V_{DD}. When operated in the mode $V_{CC} > V_{DD}$, the **HCC/HCF 40109B**, will operate as a high-to-low level-shifter. The **HCC/HCF 40109B** also features individual three-state output capability. A low level on any of the separately enabled three-state output controls produces a high-impedance state in the corresponding output.

ABSOLUTE MAXIMUM RATINGS

V_{DD}*	Supply voltage: **HCC** types	-0.5 to 20	V
	HCF types	-0.5 to 18	V
V_i	Input voltage	-0.5 to V_{DD} +0.5	V
I_I	DC input current (any one input)	± 10	mA
P_{tot}	Total power dissipation (per package)	200	mW
	Dissipation per output transistor for T_{op}= full package-temperature range	100	mW
T_{op}	Operating temperature: **HCC** types	-55 to 125	°C
	HCF types	-40 to 85	°C
T_{stg}	Storage temperature	-65 to 150	°C

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

* All voltages are with respect to V_{SS} (GND).

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 40110 B

PRELIMINARY DATA

DECADE UP-DOWN COUNTER/DECODER/LATCH/DRIVER

- SEPARATE CLOCK-UP AND CLOCK-DOWN LINES
- CAPABLE OF DRIVING COMMON CATHODE LEDS AND OTHER DISPLAYS DIRECTLY
- ALLOWS CASCADING WITHOUT ANY EXTERNAL CIRCUITRY
- MAXIMUM INPUT CURRENT OF 1 μA AT 18V (FULL PACKAGE-TEMPERATURE RANGE)
- QUIESCENT CURRENT AT 20V FOR HCC DEVICE
- 5V, 10V AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40110B** (extended temperature range) and **HCF 40110B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 40110B** is a dual-clocked up/down counter with a special preconditioning circuit that allows the counter to be clocked, via positive going inputs, up or down regardless of that state or timing (within 100 ns typ.) of the other clock line. The clock signal is fed into the control logic and Johnson counter after is preconditioned. The outputs of the Johnson counter (which include anti-lock gating to avoid being locked at an illegal state) are fed into a latch. This data can be fed directly to the decoder through the latch or can be strobed to hold a particular count while the Johnson counter continues to be clocked. The decoder feeds a seven-segment bipolar output driver which can source up to 25 mA to drive LEDs and other displays such as low-voltage fluorescent and incandescent lamps. A short duration negative-going pulse appears on the BORROW output when the count changes from 0 to 9 or the CARRY output when the count changes from 9 to 0. At the other times the BORROW and CARRY. output are a logic 1. The CARRY and BORROW outputs can be tied directly to the clock-up and clock-down lines respectively of another HCC/HCF 40110B for easy cascading of several counters.

P_{tot}	Total power dissipation (per package)	200	mW
	Dissipation per output transistor for T_{op}= full package-temperature range	100	mW
T_{op}	Operating temperature: **HCC** types	-55 to 125	°C
	HCF types	-40 to 85	°C
T_{stg}	Storage temperature	-65 to 150	°C

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

* All voltages are with respect to V_{SS} (GND).

The **HCC 40160B, 40161B, 40162B, 40163B** (extended temperature range) and **HCF 40160, 40161. 40162, 40163** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. **HCC/HCF 40160B, 40161B, 40162B,** and **40163B** are 4-bit synchronous programmable counters. The $\overline{\text{CLEAR}}$ function of the **HCC/HCF 40162B** and **40163B** is synchronous and a low level at the $\overline{\text{CLEAR}}$ input sets all four outputs low on the next positive CLOCK edge. The CLEAR function of the **HCC/HCF 40160B** and **40161B** is asynchronous and a low level at the $\overline{\text{CLEAR}}$ input sets all four outputs low regardless of the state of the CLOCK, $\overline{\text{LOAD}}$, or ENABLE inputs. A low level at the $\overline{\text{LOAD}}$ input disables the counter and causes the output to agree with the setup data after the next CLOCK pulse regardless of the conditions of the ENABLE inputs. The carry look-ahead circuitry provides for cascading counters for n-bit synchronous applications without additional gating. Instrumental in accomplishing this function are two count-enable inputs and a carry output (C_{OUT}). Counting is enable when both PE and TE inputs are high. The TE input is fed forward to enable C_{OUT}. This enabled output produces a positive output pulse with a duration approximately equal to the positive portion of the Q1 output. This positive overflow carry pulse can be used to enable successive cascaded stages. Logic transitions at the PE or TE inputs may occur when the clock is either high or low.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 40174B

HEX "D" - TYPE FLIP-FLOP

- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED AT 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40174B** (extended temperature range) and **HCF 40174B** (intermediate temperature range) are monolithic integraged circuits available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.
The **HCC/HCF 40174B** consists of six identical 'D'-type flip-flops having independent DATA inputs. The CLOCK and $\overline{\text{CLEAR}}$ inputs are common to all six units. Data is transferred to the Q outputs on the positive-going transition of the clock pulse. All six flip-flops are simultaneously reset by a low level on the $\overline{\text{CLEAR}}$ input.

ABSOLUTE MAXIMUM RATINGS

V_{DD}*	Supply voltage: **HCC** types	-0.5 to 20	V
	HCF types	-0.5 to 18	V
V_i	Input voltage	-0.5 to V_{DD} +0.5	V
I_I	DC input current (any one input)	± 10	mA
P_{tot}	Total power dissipation (per package)	200	mW
	Dissipation per output transistor for T_{op}= full package-temperature range	100	mW
T_{op}	Operating temperature: **HCC** types	-55 to 125	°C
	HCF types	-40 to 85	°C
T_{stg}	Storage temperature	-65 to 150	°C

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

* All voltages are with respect to V_{SS} (GND).

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 40181B

4-BIT ARITHMETIC LOGIC UNIT

- FULL LOOK-AHEAD CARRY FOR SPEED OPERATIONS ON LONG WORDS
- GENERATES 16 LOGIC FUNCTIONS OF TWO BOOLEAN VARIABLES
- GENERATES 16 ARITHMETIC FUNCTIONS OF TWO 4-BIT BINARY WORDS
- A = B COMPARATOR OUTPUT AVAILABLE
- RIPPLE-CARRY INPUT AND OUTPUT AVAILABLE
- TYPICAL ADDITION TIME 200 ns @ V_{DD}= 10V
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT AT 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40181B** (extended temperature range) and **HCF 40181B** (intermediate temperature range) are monolithic integrated circuits, available in 24-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 40181B** is a low-power four-bit parallel arithmetic logic unit (ALU) capable of providing 16 binary arithmetic operations on two four-bit words and 16 logical functions of two Boolean variables. The mode control input M selects logical (M = High) or arithmetic (M = Low) operation. The four select inputs (S0, S1, S2, and S3) select the desired logical or arithmetic functions, which include AND, OR, NAND, NOR, and exclusive-OR and-NOR in the logical mode, and addition, subtraction, decrement, left-shift and straight transfer in the arithmetic mode, according to the truth table. The **HCC/HCF 40181B** operation may be interpreted with either active-low or active-high data at the A and B word inputs and the function outputs F, by using the appropriate truth table. The **HCC/HCF 40181B** contains logic for full look-ahead carry operation for fast carry generation using the carry-generate and carry-propagate outputs $\overline{G}$ and $\overline{P}$ for the four bits of the **HCC/HCF 40181B**. Use of the **HCC/HCF 40182B** look-ahead carry generator in conjunction with multiple **HCC/HCF 40181B'S** permits high-speed arithmetic operations on long words. A ripple carry output C_{n+4} is available for use in systems where speed is not of primary importance. Also included in the **HCC/HCF 40181B** is a comparator output A=B, which assumes a high level whenever the two four-bit input words A and B are equal and the device is in the subtract mode. In addition, relative magnitude information may be derived from the carry-in input C_n and ripple carry-out output C_{n+4} by placing the unit in the subtract mode and externally decoding using the information in Table II. The **HCC/HCF 40181B** is similar to industry types MC 14581 and 74181.

ABSOLUTE MAXIMUM RATINGS

V_{DD}*	Supply voltage: **HCC** types	-0.5 to 20	V
	HCF types	-0.5 to 18	V

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 40182B

LOOK-AHEAD CARRY GENERATOR

- GENERATES HIGH-SPEED CARRY ACROSS FOUR ADDERS OF ADDER GROUPS
- HIGH-SPEED OPERATIONAL: $t_{PHL} = t_{PLH} = 100$ ns (TYP.) @ $V_{DD} = 10V$
- CASCADABLE FOR FAST CARRIES OVER N BITS
- DESIGNED FOR USE WITH **HCC/HCF 40181B** ALU
- STANDARDIZED, SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED AT 20V FOR HCC DEVICE
- 5V, 10V AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40182B** (extended temperature range) and **HCF 40182B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 40182B** is a high-speed look-ahead carry generator capable of anticipating a carry across four binary adders or groups of adders. The **HCC/HCF 40182B** is cascadable to perform full look-ahead across n-bit adders. Carry, propagate-carry, and generate-carry functions are provided as enumerated in the terminal designation below. The **HCC/HCF 40182B,** when used in conjunction with the **HCC/HCF 40181B** arithmetic logic unit (ALU), provides full high-speed look-ahead carry capability for up to n-bit words. Each **HCC/HCF 40182B** generates the look-ahead (anticipated carry) across a group of four ALU's. In addition, other **HCC/HCF 40182B's** may be emplayed to anticipate the carry across sections of four look-ahead blocks up to n-bits. Carry inputs and outputs of the **HCC/HCF 40181B** are active-high logic, and carry-generate (G) and carry-propagate (P) outputs are active low. Therefore the inputs and outputs of the **HCC/HCF 40182B** are compatible. The **HCC/HCF 40182B** is similar to industry type MC14582.

ABSOLUTE MAXIMUM RATINGS

V_{DD}*	Supply voltage: **HCC** types	-0.5 to 20	V

HCC/HCF 40192B
HCC/HCF 40193B

PRESETTABLE UP/DOWN COUNTERS (DUAL CLOCK WITH RESET)
40192B – BCD TYPE 4019B – BINARY TYPE

- INDIVIDUAL CLOCK LINES FOR COUNTING UP OR COUNTING DOWN
- SYNCHRONOUS HIGH-SPEED CARRY AND BORROW PROPAGATION DELAYS FOR CASCADING
- ASYNCHRONOUS RESET AND PRESET CAPABILITY
- MEDIUM-SPEED OPERATION - f_{CL} = 8 MHz (TYP.) @ 10V
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40192B, HCC 40193B,** (extended temperature range) and the **HCF 40192B, HCF 40193B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 40192B** Presettable BCD Up/Down Counter and the **HCC/HCF 40193B** Presettable Binary Up/Down Counter each consist of 4 synchronously clocked, gated "D" type flip-flops connected as a counter. The inputs consist of 4 individual jam lines, a PRESET ENABLE control, individual CLOCL UP and CLOCK DOWN signals and a master RESET. Four buffered Q signal outputs as well as CARRY and BORROW outputs for multiple-stage counting schemes are provided. The counter is cleared so that all outputs are in a low state by a high on the RESET line. A RESET is accomplished asynchronously with the clock. Each output is individually programmable asynchronously with the clock to the level on the corresponding jam input when the PRESET ENABLE control is low. The counter counts up one count on the positive clock edge of the CLOCK UP signal provided the CLOCK DOWN line is high. The counter counts down one count on the positive clock edge of the CLOCK DOWN signal provided the CLOCK UP line is high. The CARRY and BORROW signals are high when the counter is counting up or down. The CARRY signal goes low one-half clock cycle after the counter reaches its maximum count in the count-up mode. The BORROW signal goes low one-half clock cycle after the counter reaches its minimum count in the count-down mode. Cascading of multiple packages is easily accomplished without the need for additional external circuitry by tying the BORROW and CARRY outputs to the CLOCK DOWN and CLOCK UP inputs, respectively, of the succeeding package.

ABSOLUTE MAXIMUM RATINGS

V_{DD}*	Supply voltage: **HCC** types	-0.5 to 20	V
	HCF types	-0.5 to 18	V
V_i	Input voltage	-0.5 to V_{DD} +0.5	V

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 40208B

4x4 MULTIPORT REGISTER

- FOUR 4-BIT REGISTERS
- ONE INPUT AND TWO OUTPUT BUSES
- UNLIMITED EXPANSION IN BIT AND WORD DIRECTIONS
- DATA LINES HAVE LATCHED INPUTS
- 3-STATE OUTPUTS
- SEPARATE CONTROL OF EACH BUS, ALLOWING SIMULTANEOUS INDEPENDENT READING OF ANY OF FOUR REGISTERS ON BUS A AND BUS B AND INDEPENDENT WRITING INTO ANY OF THE FOUR REGISTERS
- 40108B IS PIN-COMPATIBLE WITH INDUSTRY TYPE MC14580
- STANDARDIZED, SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIFIED AT 20V FOR HCC DEVICE
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40208B** (extended temperature range) and **HCF 40208B** (intermediate temperature range) are monolithic integrated circuits, available in 24-lead dual in-line plastic or ceramic package and ceramic flat package. The **HCC/HCF 40208B** is a 4x4 multiport register containing four 4-bit registers, write address decoder, two separate read address decoders, and two 3-state output buses. When the ENABLE input is low, the corresponding output bus is switched, independently of the clock to a high-impedance state. The high-impedance third state provides the outputs with the capability of being connected to the bus lines in a bus-organized system without the need for interface or pull-up components. When the WRITE ENABLE input is high, all data input lines are latched on the positive transition of the CLOCK and the data is entered into the word selected by the write address lines. When WRITE ENABLE is low, the CLOCK is inhibited and no new data is entered. In either case, the contents of any word may be accessed via the read address lines independent of the state of the CLOCK input.

COS/MOS INTEGRATED CIRCUIT

HCC/HCF 40257B

QUAD 2-LINE-TO-1-LINE DATA SELECTOR/MULTIPLEXER

- 3-STATE OUTPUTS
- STANDARDIZED SYMMETRICAL OUTPUT CHARACTERISTICS
- 5V, 10V, AND 15V PARAMETRIC RATINGS
- INPUT CURRENT OF 100 nA AT 18V AND 25°C FOR HCC DEVICE
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC TENTATIVE STANDARD No. 13A, "STANDARD SPECIFICATIONS FOR DESCRIPTION OF "B" SERIES CMOS DEVICES"

The **HCC 40257B** (extended temperature range) and **HCF 40257B** (intermediate temperature range) are monolithic integrated circuits, available in 16-lead dual in-line plastic or ceramic package, ceramic flat package and plastic micropackage.
The **HCC/HCF 40257B** is a Data Selector/Multiplexer featuring three-state outputs which can interface directly with and drive data lines of bus-oriented systems.

ABSOLUTE MAXIMUM RATINGS

V_{DD}*	Supply voltage: **HCC** types	-0.5 to 20	V
	HCF types	-0.5 to 18	V
V_i	Input voltage	-0.5 to V_{DD} +0.5	V
I_I	DC input current (any one input)	± 10	mA
P_{tot}	Total power dissipation (per package)	200	mW
	Dissipation per output transistor for T_{op}= full package-temperature range	100	mW
T_{op}	Operating temperature: **HCC** types	-55 to 125	°C
	HCF types	-40 to 85	°C
T_{stg}	Storage temperature	-65 to 150	°C

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

* All voltages are with respect to V_{SS} (GND).

ORDERING NUMBERS:

HCC 40257 BD for dual in-line ceramic package.
HCC 40257 BF for dual in-line ceramic package, frit seal
HCC 40257 BK for ceramic flat package
HCF 40257 BE for dual in-line plastic package
HCF 40257 BF for dual in-line ceramic package, frit seal
HCF 40257 BM for plastic micropackage

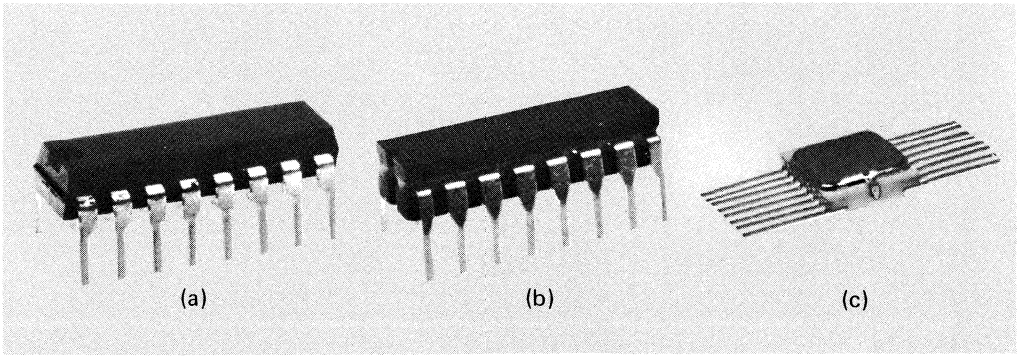
RELIABILITY REPORT

RESULTS OF THE RELIABILITY STUDIES AND OF THE IMPROVEMENTS MADE BY SGS-ATES TO ITS COS/MOS FAMILY

INTRODUCTION

The HB 4000 series of COS-MOS integrated circuits is a logic family of devices using P-channel and N-channel complementary MOS technology; since appearing in 1968, the family has achieved much success in consumer, industrial, military and space applications.
SGS-ATES started C-MOS (Complementary Metal Oxide Semiconductor) production in 1973 and now produces more than 100 standard types from the B family; these are mounted in both plastic and ceramic packages (Fig. 1).

Fig. 1 - C-MOS packages: a) Dual in-line plastic
b) Dual in-line ceramic
c) Ceramic flat-pack



In 1976, the devices of SGS-ATES C-MOS range become the first of their type to be approved by the European Space Agency (ESA); this followed a three-year evaluation-qualification programme which was carried out under the supervision of the European Space Technology Center (ESTEC). See also [1] and Appendix 1.

C-MOS CHARACTERISTICS

The main advantages offered by C-MOS devices with respect to corresponding bipolar devices (DTL, LPS, TTL, ECL, HLL) are:

a) Very low power dissipation (typically 10 nW/gate; 10 μW/MSI)
b) wide voltage range (3 to 18V)
c) high input impedance (typically $10^{12}\,\Omega$)
d) high noise immunity (typically 45% of supply voltage)

On the other hand, due to their high sensitivity to electrostatic discharge, C-MOS devices require greater care in handling and have a slower switching speed than certain bipolar IC families.
Table 1 shows the typical gate propagation times for C-MOS and for the other logic families.

Table I

Family	ECL	LPS	TTL	DTL	HLL	C-MOS
Propagation Time (ns)	2	5	10	30	110	35

From the consideration shown above, it can be seen that C-MOS can be used with advantage in all applications where high speed is not of fundamental importance.

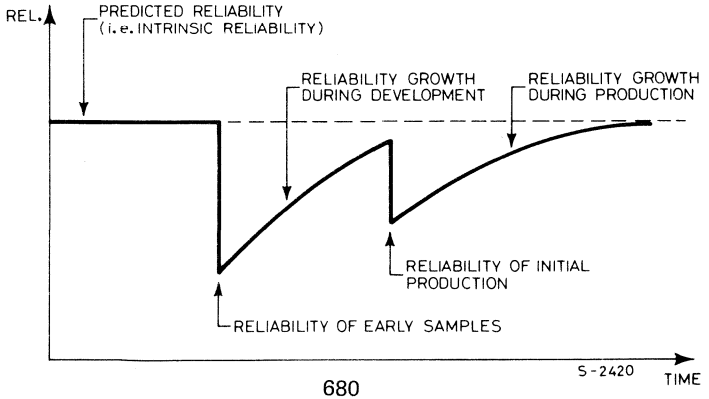
C-MOS RELIABILITY

It can now be said with confidence that the intrinsic reliability of C-MOS devices is equal to or better than that of the other logic families, for the following reasons:

a) greater simplicity of fabrication (fewer operations)
b) low operating temperature (high long-term reliability)
c) low thermal stress between die and package
d) low current density in aluminium paths (absence of electromigration)

Nevertheless, in the initial production phase, all major manufacturers and users encountered reliability problems; these problems could, on the one hand, be attributed to handling (electrostatic discharges and field failure due to overvoltages) and, on the other, to the fact that, unlike bipolar technology, complementary MOS technology was new and consequently the peak of the learning curve had not been reached (Fig. 2).

Fig. 2 - Learning curve during the development and production phases



The intrinsic reliability level of the technology having been ascertained through ESA homologation and accelerated laboratory tests, SGS-ATES took four principal actions to achieve this level through the identification and elimination of defects:

- intensive analysis of rejects from internal tests, from customer tests and from the field; the latter case involved close cooperation with the equipment manufacturers. Tests and failure analysis were also effected on competitors' devices;
- transfer of information concerning failure mechanisms to project and product managers;
- corrective actions by design and production engineering staff to eliminate the cause of failure or to improve device ruggedness;
- introduction or intensification of quality and reliability tests to maintain the process under control.

The main improvements introduced to C-MOS devices during the learning period relate to masking, passivation and electrical testing, in particular:

- layout of components in the integrated circuit
- phosphorous content in P-Vapox
- oxide contamination
- gate oxide thickness
- hermeticity of ceramic and plastic package
- metallization.

These improvements were achieved by means of the following actions:

- redesign of certain masks
- tighter control on the percentage of phosphorous in the P-Vapox
- oxide gettering and improved environmental conditions to eliminate process impurities
- electrical stress testing of gate oxide
- use of epoxy B resin for plastic packages and new sealing glass for ceramic packages
- modifications to the design of the oxide steps and inspection under Scanning Electron Microscope.

CONCLUSIONS

The intrinsic reliability of C-MOS technology has been reached by SGS-ATES products as a result of an intense testing and verification programme and a through understanding of the characteristic failure mechanisms.
We can now say that the reliability of C-MOS devices is equal to that of bipolar logic devices. In particular, the use of epoxy B resin and non-devitrifying glasses, have resulted in highly hermetic packages; this is a fundamental requirement of C-MOS devices since they are sensitive to adverse environmental conditions, especially moisture.
For plastic devices, the number of rejects in temperature-humidity-bias testing (85°C, 85% R.H., with bias) has been reduced by a factor of ten following the introduction of the epoxy B resin which has raised the wearout limit by a factor of four.
On the basis of long-term test data, failure rates of the order of 10^{-6} failures/hour (at V_{DD} = 18V; T_{amb} = 85°C for plastic, T_{amb} = 125°C for ceramic) have been established with a confidence level of 60%; this represents a failure rate of 10 to 200 FIT (*) under normal operating conditions (55°C).

(*) FIT: Failure in time = (failures/hour) x 10^{-9}.
= (%/1000 hour) x 10^{-4}

PACKAGE RELIABILITY

Apart from physically supporting the active element (the die), the main function of the package is to protect it from harmful environmental agents, especially humidity.
Until a few years ago hermetically sealed packages of metal or ceramic were used; more recently plastic packaging has become popular for high volume production, largely for reasons of cost.

A-PLASTIC PACKAGE

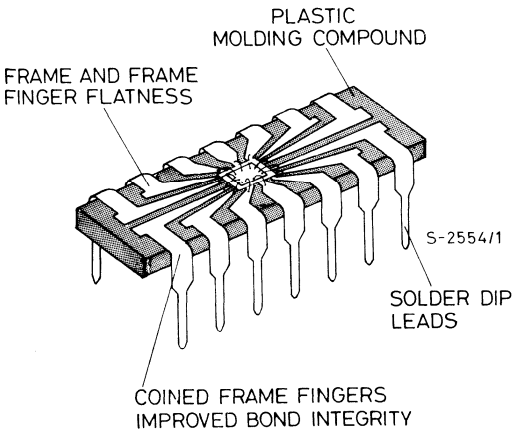
The plastic package for C-MOS circuits (figure 3) consists of:

- a KOVAR (Fe 54%, Ni 29%, Co 17%) or ALLOY 42 (Fe 58%, Ni 42%) frame
- gold interconnecting wires (1 mil)
- type B epoxy encapsulating resin (Novolac)

The resin used at SGS-ATES has optimum characteristics:

- strict control of contaminants ($< 10^{11}$ of Na^+, K^+, Cl^- ions per cm^2) capable of modifying device electrical characteristics and promoting metal corrosion;
- excellent adherence to frame metal, preventing moisture from entering at the resin-metal interface;
- optimum shrinkage (5 to 7‰) during polymerization so as to keep wires under pressure even at maximum operating temperature (150°C); the glass transition temperature, above which the expansion coefficient rises significantly, is greater than 165°C;
- resistance to such harmful environments as salt atmosphere or industrial fumes;
- high chemico-physical stability versus time;

Fig. 3 - C-MOS plastic package



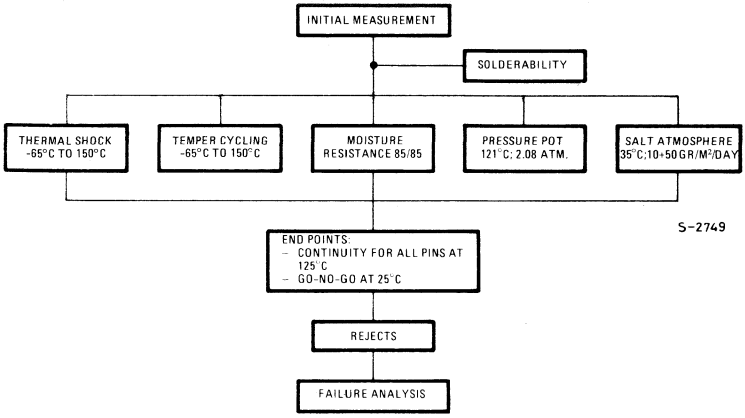
1A - EVALUATION OF PLASTIC PACKAGE RELIABILITY

To evaluate the reliability parameters of plastic package for C-MOS devices a series of tests (figure 4) is carried out to determine package behaviour in terms of:

- resistance to moisture
- resistance to temperature excursions.

N.B.: The plastic package, which represents a compact structure with the interconnecting wires rigidly encapsulated, is particularly resistant to mechanical stresses, such as shock, acceleration and vibration. Most of the mechanical tests carried out to evaluate the reliability of hermetic packages are not relevant, therefore, to plastic packages.

Fig. 4 - Reliability test programme for C-MOS plastic package

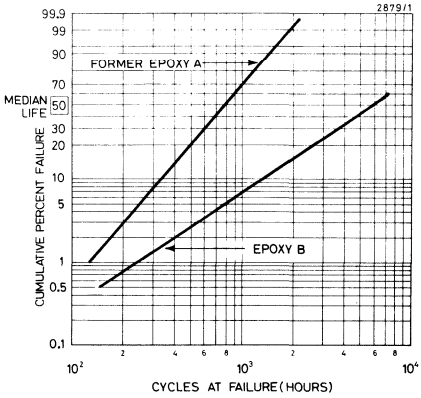


a) **Temperature cycling**

Thermal shock (liquid to liquid) and temperature cycling (air to air) tests at the extremes of operating temperature, check the internal interconnection system for resistance to mechanical stresses. In operation these derive from temperature excursions due to the different expansion coefficients of frame, wires, die and encapsulation.

Typical results of temperature cycling between -65°C and +150°C are given in the WEIBULL probability chart (figure 5).

Fig. 5 - WEIBULL graph with results of thermal cycling tests



b) **Climatic chamber and pressure pot**

These tests are carried out to determine the package's resistance to moisture reaching the die and reacting chemically with the aluminium.

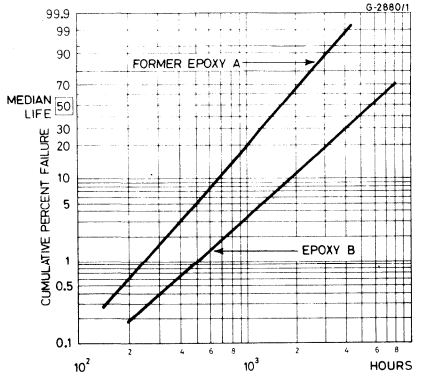
Such chemical reaction is particularly damaging if the moisture contains soluble ionic impurities drawn from the resin during penetration.

The pressure pot test forces moisture into the package through a combination of high temperature and high pressure.

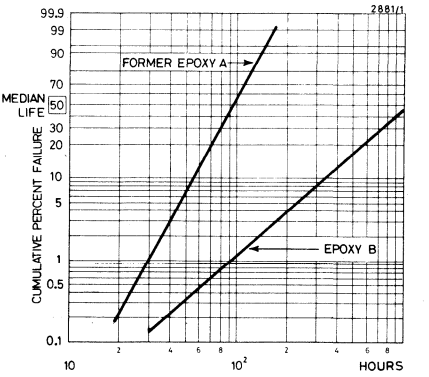
An electrical field externally applied will accelerate aluminium corrosion due to electrolytic conduction between adjacent tracks of different potential.

Figures 6a and 6b give the results obtained in moisture testing with the climatic chamber with biasing, and with the pressure pot.

Fig. 6 - Results of the 85°C/85% RH test with bias (a) and of the pressure pot test (b)



(a)



(b)

c) **Salt chamber**

The devices are subjected to the action of a saline mist obtained by evaporating a solution of sodium chloride (NaCl).

A substantial presence of salt accelerates aluminium corrosion even without biasing, the sodium penetrating the plastic and directly reaching the inside of the device.

Table II presents the data from internal homologation (*) testing of the C-MOS plastic package; table III gives the results of routine testing of production devices during the period May 1978 to May 1980.

(*) Tests to which a process or a product is subjected before being transferred to production. These tests are usually more severe than routine ones.

Table II
Summary of homologation tests carried out on C-MOS plastic package.

3-CERAMIC PACKAGE

The ceramic package for C-MOS circuits (figure 7) consists of:

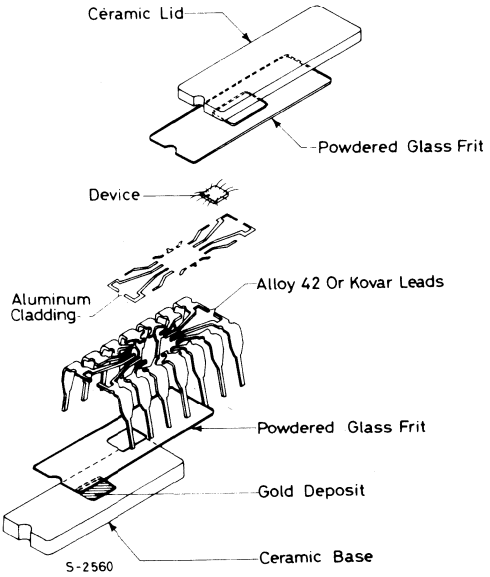
- a KOVAR or ALLOY 42 frame
- aluminium interconnecting wires (1 mil);
- ceramic base and cover having a layer of glass with low melting point (450 to 500°C) on one side to ensure hermetic sealing.

3B - CERAMIC PACKAGE RELIABILITY CHARACTERISTICS

The element of greatest importance for the reliability of a ceramic package is the glass seal, which must satisfy two contradictory requirements:

- a melting point low enough not to damage the semiconductor or its mountings (die attach, wire bonding, etc.) during sealing.
  The addition of metal oxides (Pb or Zn) lowers the melting point by affecting the purity of the material: this can have a negative effect as far as the second requirement is concerned;
- absence of solid or gaseous impurities which might be let free during the closure heating cycle and invade the internal cavity of the package and hence the die itself.
  Closure is in a dry nitrogen atmosphere to protect the metallization and to ensure that the cavity is filled with an inert gas.

Fig. 7 - Exploded view of C-MOS ceramic package



Another important characteristic of a sealing glass is its ability to withstand thermal stresses without cracking, which would lead to a loss of hermeticity in the package. The main advantages of the ceramic over the plastic package are:

- hermeticity, avoiding metallization corrosion by moisture which has penetrated from the external environment;

– elimination of rejects due to thermal intermittency, since the wires – not being encapsulated – are free to expand and contract within the cavity. Furthermore, defective bonds are more easily detected at electrical testing and can be completely eliminated with appropriate screenings;

– one-type metal interface (Al-Al) of wires and metallization, avoiding fragile cross-metal formations of the "purple plague" type (Au Al 2).

These characteristics, together with the fact that the active element operates in an inert atmosphere, make the ceramic package preferable for applications where:

– long periods of operation life (20 to 40 years) must be assured;
– operation may take place in uncontrolled environments;
– devices are to be screenable, ie, subjected to stresses designed to eliminate the early failure fallout.

On the other hand, the ceramic package is less resistant than the plastic package to mechanical stresses, and thermal stress may affect its hermeticity.

2B - EVALUATION OF CERAMIC PACKAGE RELIABILITY

Reliability testing of the ceramic package is intended particularly to evaluate hermeticity characteristics, including those after severe thermo-mechanical stresses (figure 8).

Fig. 8 - Reliability test programme for C-MOS ceramic package

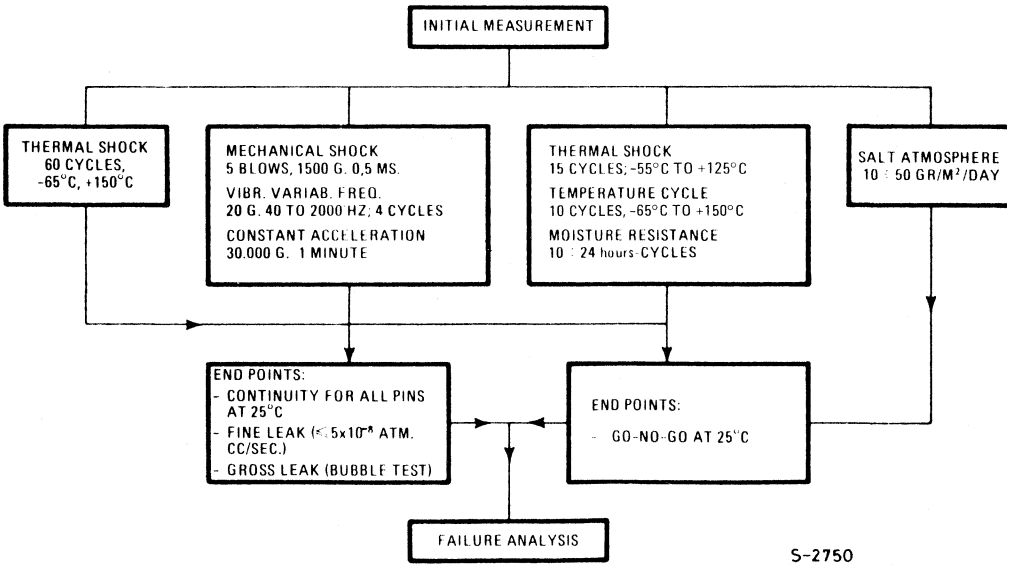


Table IV presents the data from homologation testing of the C-MOS ceramic package, table V gives the results of routine testing of production devices during the period May 1978 to May 1980.

Table IV
Summary of homologation tests carried out on C-MOS ceramic package

Test	Sample	Failures
Thermal Shock, 60 Cycles, -65°C to +150°C	125	0, After Final Leak (5×10^{-8} CC/Sec.) Gross Leak (Bubble Test)
Mechanical Shock, 1500 g., 0,5 MSec., 5 Blows in Each of the 6 Directions. Vibration Variable Frequency 20 g. Peak Acceleration, 40 to 2000 Hz., 4 Times in 3 Directions. Constant Acceleration, 30.000 g., 1 Minute in 3 Directions.	150	0
Thermal Shock, 15 Cycles, -55°C to +125°C Temperature Cycle, 10 Cycles, -65°C to +150°C Moisture Resistance, 240 hours, (10 - 24 hour Cycles)	100	0
Salt Atmosphere, 24 hours, 35°C	95	0

Table V
Summary of reliability test results for the C-MOS ceramic package for the period May 1978 to May 1980.

Test	Test Conditions	Quantity	
		Tested	Failure (%)
Solderability	230°C ± 5°C, 2 ± 0,5 Sec., In Sn (60) - Pb (40)	3616	0.16

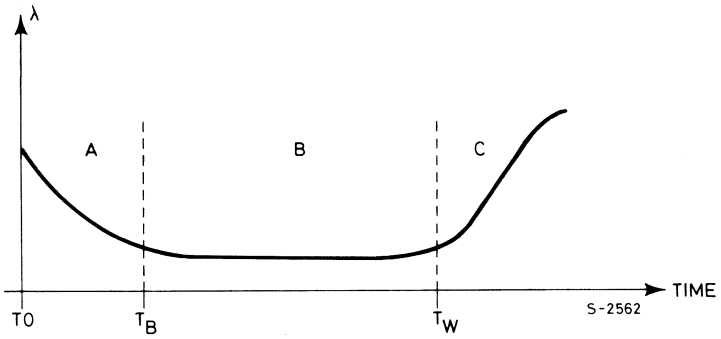
Vibration Variable Frequency	20 g., 40 to 2000 Hz., 4 Times In 3 Directions		
Constant Acceleration	20.000 g., 1 Minute In 3 Directions		
Thermal Shock	15 Cycles, -55°C to +125°C	880	0.2
Temperature Cycle	10 Cycles, -65°C to +150°C		
Moisture Resistance	240 hours (10 - 24 hour Cycles)		
Salt Atmosphere	24 hours 25°C	670	0

LIFE TESTING

Life tests are used to establish experimentally how well C-MOS devices maintain their electrical characteristics in time, and to investigate their failure mechanisms. In these tests the devices are subjected to high temperature storage, or to temperature and voltage stresses (operative life test).
Long term life testing also serves to establish the devices' failure rate (λ): an important design factor for the system manufacturer, bearing both on the performance of this equipment and on the cost of repairs.
The curve of failure rate λ of the components as a function of time is shown in figure 9.

Fig. 9 - This curve is characterized by three phases:

A) Period of infant mortality or initial failures.
B) Period of useful life or random failures.
C) Period of end of life (or wearout).



The failure rate λ curve is not constant for the first hours of operation of semiconductors. It may be wrong to give a single value of λ (the average) in the first 1000 h of life testing because it is not very representative of the two zones: infant mortality and random failures. This section gives the operational λ (random failures zone), while the λ of the initial period is given and analyzed later where the results of the principal screenings applied to C-MOS are examined.

A-HIGH TEMPERATURE STORAGE (150°C)

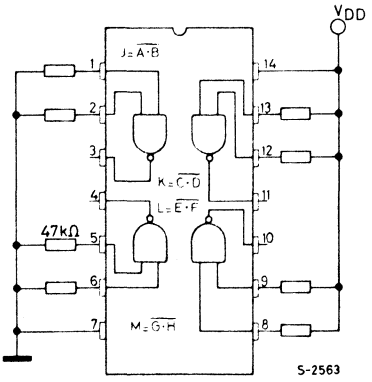
The high temperature storage test serves to investigate temperature-linked failure mechanisms by providing the energy required to trigger certain types of failure due to ion contamination. With plastic packaged devices it is important that the glass transition temperature (approx. 165°C for C-MOS resin) is not exceeded, as otherwise serious mechanical failures, such as breaking of interconnecting wires, can result.
Testing, for both plastic and ceramic packaged C-MOS devices, is for 1000 hours at 150°C.

B-OPERATIVE LIFE TEST

For plastic packaged C-MOS devices the static life test was carried out at a temperature of 85°C and for ceramic packaged devices at 125°C.
Supply voltage was 18V for a duration of 1000 hours.
This test is especially useful in revealing die failure mechanisms, particularly those which lead to increased leakage currents and which are usually due to the presence of small quantities of sodium or potassium ions from the fabrication process. These tend to migrate under the effect of the high temperature and the electrical field, to concentrate in certain areas and cause damaging surface inversions.
In the test configuration half the inputs are in the high state, and half in the low, ie: in half, the N-channel MOS inputs conduct and the P are inhibited, and viceversa in the other half.
The outputs are not electrically connected.
Figures 10a and 10b give the static life test diagrams for two typical C-MOS families: gates and shift registers.

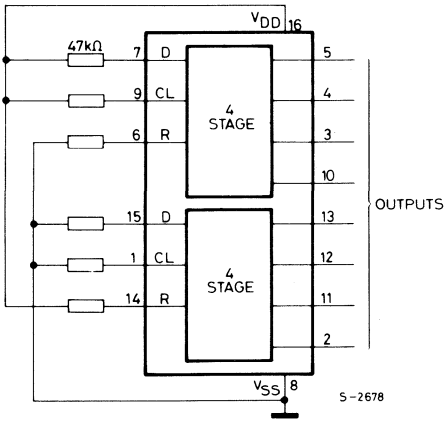
Fig. 10

Nand gate HCC/HCF 4011B



(a)

Shift register HCC/HCF 4015B



(b)

Table VI gives the results of static life and high temperature storage testing for the main C-MOS families.

Table VII and VIII give the failure rates for C-MOS devices in test temperature and in normal operating temperature conditions (55°C), for the two package types.
For the calculation of λ at 55°C, ARRHENIUS' formula was used with an activation energy, $E_A = 1,1$ Ev.

Table VI
Summary of results of life test performed on C-MOS devices over the period July 1979 to April 1980.

ELECTRICAL PARAMETERS CHECKED AND END-OF-TEST LIMITS

At suitable time intervals during the life testing (168, 670 and 1000 hours) checks have been made on the variations in certain parameters (reliability parameters), corresponding to characteristic C-MOS failure modes.
Table IX gives the parameters checked and the relative end-of-test limits.

Table IX

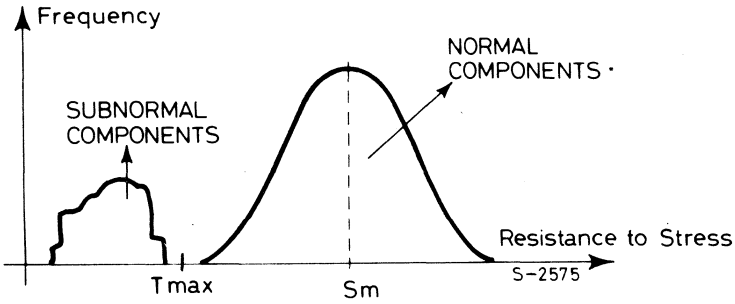
Parameters	End. Of. Test Limits
Functional Test	See Type Truth Table.
Quiescent Current (IL)	+ 100% of Spec. Limit
Input Leakage Current (IIL, IIH)	+ 100% of Spec. Limit
N-Channel MOS Output Current (IDN)	- 10% of Spec. Limit
P-Channel MOS Output Current (IDP)	- 10% of Spec. Limit

THE MOST COMMON SCREENINGS PERFORMED ON C-MOS

1. INTRODUCTION

Components manufacturers are frequently asked to carry out a 100% screening of their products in order to reduce the number of early failures.
Cost considerations are uppermost in a decision of this sort.
System cost will be lowered if the number of components requiring replacement at the assembly or run in phases of the system is itself reduced. On the other hand, components with better than standard initial reliability will be themselves more costly.
The various screenings are intended to eliminate or reduce the higher initial failure rate so that the system failure begins approximately at T_B rather than at To (figure 9).
This type of curve can be accounted for by the fact that a limited number of freak components escape the various checks carried out during and after the fabrication process.
An analysis of component stress resistance result in the curve shown in figure 11.

Fig. 11



With Tmax stress applied, freak components will be destroyed, whereas the resistance of normal components will not be affected.
Many different types of screening can be carried out in practice, and, depending on the cost hazard involved in replacement of the component at system level, a greater or lesser number will be chosen. It is to be borne in mind in this regard that not all screenings are equally effective in removing freak components, which in any event represent the various causes of malfunction in varying proportions.
Apart from more sophisticated applications such as aerospace, common experience has proved the validity of two basic types of screening: electrical burn-in and a sequence of thermal screenings listed below.
Components are 100% electrically selected and accepted by quality control with standard products procedure and at standard products quality levels. They are then subjected 100% to the selected screening and afterwards 100% electrically selected. The lot is finally accepted by quality control with stricter AQL levels than the pre-burn-in acceptance (1). This provides the dual effect of a "screening-double-selection": improvement of reliability with reduction of early failures, and improvement of quality with a lower proportion of pieces out of spec. at the moment of delivery.

2. RESULTS OF SCREENINGS

The above operations involve the rejection not only of the abnormal components destroyed or badly degraded by the screening itself, but also of a certain proportion of pieces close to electrical selection limits. The latter may be rejected because of measuring instrument tolerances or because of small variations in electrical parameters caused by burn-in (2).

(1) See new SGS-ATES SURE programme - 1977 edition.

(2) Large quantity automatic 100% selections may lead to small percentages or fractions of a percent of good pieces being rejected, for many different reasons. These percentages are included in the burn-in rejected figures. An example: contact rejects at sockets of automatic tester.

The second selection eliminates most of the defective pieces (pieces within normal AQL limits) surviving from the first selection. Data sheet limits are used to select the pieces for after burn-in, as they are before the test.

The percentage of rejects during a screening allows calculation of the cost of the screening itself and also provides useful information on product reliability, provided it is used together with reject analysis to determine the main failure mechanisms.

The various failure modes are illustrated and eliminated by means of different types of screening, as shown in the table X. Rejects for degraded electrical parameters alone have been omitted. The percentage, referred to the total number of pieces considered in the failure analysis, of each type of defect is given.

These results are also confirmed by other studies [2].

Table X

Miscellaneous	Unknown	Not Determined	13%	20%
TOTAL			100%	100%

NOTES: (1) Much reduced since introduction of gate oxide screening.

(2) Wire breakage much reduced since introduction of Epoxy B.

(3) Guard rings have been introduced in the new designs, and these defects have been drastical reduced.

(4) New sealing material for ceramic packages has virtually eliminated hermeticity problem

An analysis of the results of 168 hours static burn in follows.
The mean percentage of C-MOS burn-in rejects is about 5%.
Distribution is not symmetrical among the lots tested, tending to lengthen towards the high percentages (anomalous lots). The median percentage of rejects is below the mean: 3.7%.
These lots with higher reject percentage benefit most from the burn-in test (see figure 12 where yield patterns after burn-in are reported).
Figure 13 shows the curve of functional reject percentages after burn-in (average rejects 1.2%). Functional rejects include catastrophic or non-operative failures.
Figure 14 shows the average yield after burn-in versus the voltage applied during the test. Initially a voltage of 10V was applied to C-MOS devices of A series, but higher voltages have been made necessary by ever increasing applications and reliability requirements. At the same time SGS-ATES introduced, in 1976, the gateoxide stress test, and modified the 100% electrical selection to include much more severe leakage current measurements. The positive effect of these changes is indicated in figure 14 which shows an improvement in yield after burn-in.

Fig. 12 - Yields obtained through normal burn-in (including all types and all voltage applied).

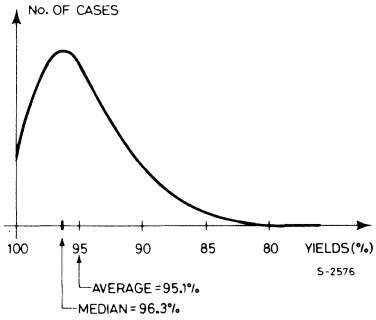

Fig. 13 - Yields obtained with functional test alone.

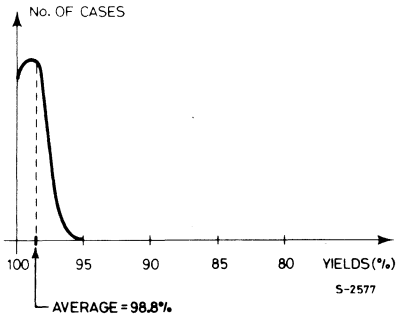

Fig. 14 - Yields curve versus burn-in voltage before the introduction of gate-oxide stress test and new selection criteria.

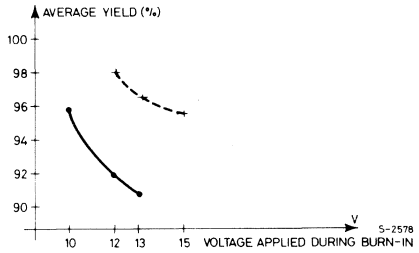
Yields curve versus burn-in voltage after introduction of gate-oxide stress test and new selection criteria.



Reject percentages in thermal screening (10 temperature cycles +168 h storage at maximum junction temperature) are lower than in the burn-in test, but the lot distribution of rejects is similar to the results in figure 12.
The number of pieces tested in this way is not yet large enough for quantitative conclusions to be drawn such as in figures 12 and 13.

3. EFFECT OF SCREENINGS ON FAILURE RATE

The manufacturer of a given system using C-MOS components must work out what advantage he derives from using screened integrated circuits, an advantage particularly in reduced failure rate in early operation, which should widely repay the extra cost of the components.
The following study of C-MOS devices subjected to electrical burn-in has been carried out, comparing their performance with that of standard pieces, i.e., pieces not subjected to any supplementary screening.
It is to be borne in mind (see paragraph 2) that the failure rate is lower than the burn-in results would indicate, since the majority of pieces rejected by burn-in would in fact function correctly in the user's equipment.
Burn-in conditions being identical to life-test conditions, the following considerations are based on life test results and λ curves.
Going back to figure 11, it is necessary for reliability purposes to distinguish between the freak population of components and the normal population.
It is the latter which defines operation failure rate in systems (i.e., useful life or random failures), a failure rate that is assumed to vary with junction temperature according to Arrhenius' law.
The freak population will define the failure rate for early failures. Rate variation versus junction temperature, as supposed for normal components, can not be taken as valid for this population.
The following considerations are based on the supposition that all freak components are destroyed during early period in systems and that varying proportions of such components can be eliminated by different types of screenings carried out before the components are installed.
The freak population is measured as a percentage of the total number of components and taken as equal to the average percentage of rejects during the first 168 h of electrical life testing. (This hypothesis is confirmed by the average percent of functional burn-in rejects, and by field data).
Information, including customer feedback, also confirms the following hypothesis:

a) 168 h (1 week) of burn-in eliminate from 90 to 95% of early failures [3]. The calculations which follow assume that 95% applies to the more screenable ceramic, and 90% to plastic.

b) Average system ambient temperature is 40 to 60°C. The calculation which follow are based on 55°C.

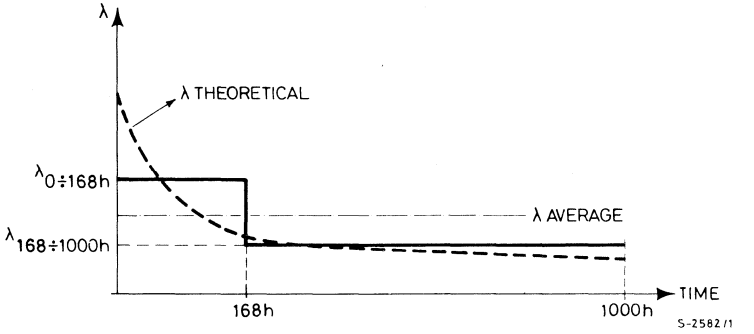
c) In normal system operating conditions early failures of integrated circuits cease after 2000 to 3000 h. The calculations which follow are based on 3000 h.

d) Variation of λ versus temperature during useful life is calculated with Arrhenius' law and activation energy $E_A = 1.1$ eV.

The failure rate curve during life test (bathtub curve) may be presented as in figure 15.
Operating life test failure rates have been calculated with 60% on sided confidence level and the reject percentages observed during Operating Life Test (0 to 168 h) and Storage

Test (0 to 168 h) plus temperature cycling have been plotted. With activation energy assumed to be 1.1 eV, λ has been calculated for 168 h to 1000 h at T_{amb}= 55°C.

ig. 15 - This is considered the steady-state failure rate for C-MOS devices installed in system



able XI*

	10 Temperature Cycles + Storage (0 to 168 h) % Observed	Oper. Life Test (0 to 168 h) T_{amb}= 85°C Plastic T_{amb}= 125°C Ceramic; % Observed	Oper. Life Test λ at 60% C.L. T_{amb}= 85°C-Plastic T_{amb}= 125°C-Ceramic		λ At 60% C.L. 168 to 1000 h Calculated With T_{amb}= 55°C
			0 to 168 h	168 to 1000 h	
Plastic	0.65%	0.81%	23.82×10^{-6} h^{-1}	6.0×10^{-6} h^{-1}	2.3×10^{-7} h^{-1}
Ceramic	0.82%	1.08%	31.76×10^{-6} h^{-1}	4.8×10^{-6} h^{-1}	5.2×10^{-9} h^{-1}

* See tables VII and VIII of section 3.

Considering that the reject percentages for the first 168 h of life testing represent the total early failures during 3000 h of system operation, and that, of these, temperature cycling and 168 h storage eliminate only the proportion observed in those tests, we can calculated failure rates for the following three cases:

A) Standard components (no screening).

- In the first 3000 h of system operation

  Plastic $\lambda = \frac{0.81\%}{3000\ h} = 2.7 \cdot 10^{-6} h^{-1}$ (observed)

  Ceramic $\lambda = \frac{1.08\%}{3000\ h} = 3.6 \cdot 10^{-6} h^{-1}$ (observed)

- After 3000 h λ returns to the value found during life tests between 168 and 1000 h, which, referred to ambient temperature T_{amb}= 55°C, gives:

  Plastic $\lambda = 2.3 \cdot 10^{-7} h^{-1}$ (at 60% C.L.)

  Ceramic $\lambda = 5.2 \cdot 10^{-9} h^{-1}$ (at 60% C.L.)

B) Components subjected to 10 temperature cycles + 168 h storage.

– In the first 3000 h of system operation

Plastic $\lambda = \frac{(0.81 - 0.65)\%}{3000\ h} = 5.3 \cdot 10^{-7} h^{-1}$ (observed)

Ceramic $\lambda = \frac{(1.08 - 0.82)\%}{3000\ h} = 8.7 \cdot 10^{-7}\ h^{-1}$ (observed)

– After 3000 h λ returns to the life test 168 to 1000 h λ, giving, at ambient temperature $T_{amb} = 55°C$:

Plastic $\lambda = 2.3 \cdot 10^{-7} h^{-1}$ (at 60% C.L.)

Ceramic $\lambda = 5.2 \cdot 10^{-9} h^{-1}$ (at 60% C.L.)

C) Components subjected to 168 h burn-in.
90% and 95% of potential plastic and ceramic failures, respectively, are eliminated by burn-in.
In the first 3000 h λ will be:

Plastic $\lambda = \frac{0.081\%}{3000\ h} = 2.7 \cdot 10^{-7} h^{-1}$ (observed)

Ceramic $\lambda = \frac{0.054\%}{3000\ h} = 1.8 \cdot 10^{-7} h^{-1}$ (observed)

– After 3000 h λ returns to the life test 168 to 1000 h λ, giving, at ambient temperature $T_{amb} = 55°C$:

Plastic $\lambda = 2.3 \cdot 10^{-7} h^{-1}$ (at 60% C.L.)

Ceramic $\lambda = 5.2 \cdot 10^{-9} h^{-1}$ (at 60% C.L.)

Ceramic components are more screenable than plastic, and this leads to slightly higher failure rates in ceramic in the early hours of operation, but once the period for early failures has passed (168 h in life test conditions or 3000 h in operating conditions) ceramic shows a better failure performance.
This means that the early failure period for plastic components is probably longer and that we cannot assume exactly the same premises for calculation.
To summarize these results we can now present failure percentages for plastic and ceramic components during the first 3000 h of their installed operation in a system.
Also indicated, for each type of screening, is the reduction factor in number of failures compared with standard components over this same period of time.

Table XII
Evaluation of failure rate in a system (measured in fit)

	FIRST 3000 h			
	Plastic		Ceramic	
	Average Failure Rate	Reduction Factor	Average Failure Rate	Reduction Factor
Standard	2700	–	3600	–
Temp. Cycling + Stor.	530	5	870	4
Burn-In	270	10	180	20
	AFTER FIRST 3000 h			
	230	12	5	700

It is to be borne in mind that the above are average figures.
Referring again to the failure distribution shown in figures 12 and 13, it is worth repeating that screenings are particularly efficient in eliminating those lots whose behaviour is sharply at variance with the average.

4. INDICATIVE COST OF SOME SCREENINGS

Screening cost depends on several parameters, of which the main are:

- quantity
- supply flow
- specs
- number of kit types and complexity
- time available, i.e., delivery commitments.

There follow some very general indications of how the main types of screening may increase component cost versus standard C-MOS prices.
These increases are read as a function of the expected improvement in failure rates during the first 3000 h of installed operation (figure 16).

Fig. 16 - Average failure rate during the first 3000 h of installed operation, as a function of screenings to which components have been subjected, or to their percentage cost increase relative to cost of standard product.

Hersteller / Manufacturer: SGS-ATES Componenti Elettronici SpA

Durchgeführt an Los Nr. / Performed at lot No.: 7921

Angewandte GfW-Einzelvorschrift / Applied GfW detail specification: IM 362 Ausgabe / Edition 26.2.1980

Kennzeichen des Fertigungsablaufplanes / Identification of production flow chart: SGS-CMOSB, 21.9.79

Ort der Fertigung / Location of production: Agrate,Brianza

Ort der Prüfungen / Location of testing: Agrate,Brianza

Bemerkungen / Notes: Types qualified by similarity:
IM 357, 359, 363, 364, 368, 369, 371, 372, 375, 379,
IM 383, 387, 392, 396, 398, 701, 702, 712-719, 721, 722
IM 733, 735 and IM 747

Dem Hersteller wird hiermit bestätigt, daß das o.a.Bauelement die Qualifikation nach Gfw-Vorschriften bestanden hat.

This is to certify, that the above mentioned part has passed qualification according to the GfW-specification.

Für die Aufrechterhaltung der Anerkennung der Qualifikation durch die DFVLR gelten die Richtlinien des GfW-Standards Ao3oo.

To maintain the certificate of qualification by DFVLR the guidelines of the GfW-standard Ao3oo have to be followed.
