

**2.2MHz Fast Transient 400mA Step-Down Converter**

**General Description**

The AAT1149A SwitchReg is a 2.2MHz step-down converter with an input voltage range of 2.2V to 5.5V. It is optimized to react quickly to load variations and operate with a tiny 0603 inductor that is only 1mm tall.

The AAT1149A can deliver 400mA of load current and operates in PWM only mode for low noise operation. The 2.2MHz switching frequency minimizes the size of external components while keeping switching losses low.

The AAT1149A is optimized for low noise portable applications.

The AAT1149A is available in a Pb-free, space-saving 5-pin wafer-level chip scale (WLCSP) package and is rated over the -40°C to +85°C temperature range.

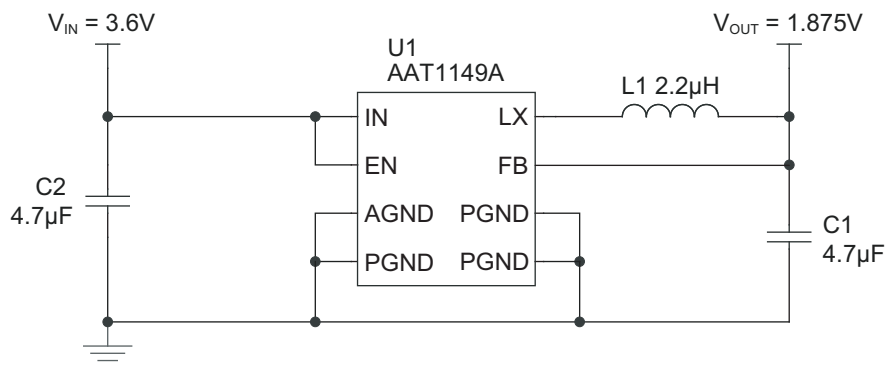

**Features**

- Ultra-Small 0603 Inductor (Height = 1mm)
- $V_{IN}$  Range: 2.2V to 5.5V
- $V_{OUT}$  Fixed 1.875V
- 400mA Max Output Current
- Up to 98% Efficiency
- 3mA No Load Quiescent Current
- 2.2MHz Switching Frequency
- 70µs Soft Start
- Fast Load Transient
- Over-Temperature Protection
- Current Limit Protection
- 100% Duty Cycle Low-Dropout Operation
- <1µA Shutdown Current
- 0.9x1.2mm WLCSP Package
- Temperature Range: -40°C to +85°C

**Applications**

- Cellular Phones
- Digital Cameras
- Handheld Instruments
- Microprocessor / DSP Core / IO Power
- PDAs and Handheld Computers
- USB Devices

**Typical Application**

**AAT1149A****2.2MHz Fast Transient 400mA Step-Down Converter****Pin Descriptions**

Pin #	Symbol	Function
1	FB	Feedback input pin. Connect this pin to the converted output voltage node.
2	EN	Enable pin.
3	AGND	Non-power signal ground pin.
	PGND	Main power ground return pins. Connect to the output and input capacitor return.
4	IN	Input supply voltage for the converter.
5	LX	Switching node. Connect the inductor to this pin. It is internally connected to the drain of both high- and low-side MOSFETs.

**Pin Configuration****WLCSP-5  
(Top View)**

**AAT1149A****2.2MHz Fast Transient 400mA Step-Down Converter****Absolute Maximum Ratings<sup>1</sup>**

Symbol	Description	Value	Units
$V_{IN}$	Input Voltage to GND	6.0	V
$V_{LX}$	LX to GND	-0.3 to $V_{IN} + 0.3$	V
$V_{FB}$	FB to GND	-0.3 to $V_{IN} + 0.3$	V
$V_{EN}$	EN to GND	-0.3 to 6.0	V
$T_J$	Operating Junction Temperature Range	-40 to 150	°C
$T_{LEAD}$	Maximum Soldering Temperature (at leads, 10 sec)	300	°C

**Thermal Information**

Symbol	Description	Value	Units
$P_D$	Maximum Power Dissipation <sup>2, 3</sup>	352	mW
$\theta_{JA}$	Thermal Resistance <sup>2</sup>	284	°C/W

1. Stresses above those listed in Absolute Maximum Ratings may cause permanent damage to the device. Functional operation at conditions other than the operating conditions specified is not implied. Only one Absolute Maximum Rating should be applied at any one time.

2. Mounted on an FR4 board; use the NSMD (none-solder mask defined) pad style for tighter control on the copper etch process.

3. Derate 3.52 mW/°C above 25°C.

**Functional Block Diagram****Functional Description**

The AAT1149A is a high performance 400mA 2.2MHz monolithic step-down converter. It minimizes external component size, enabling the use of a tiny 0603 inductor that is only 1mm tall, and is optimized for low noise. Apart from the small bypass input capacitor, only a small L-C filter is required at the output. Typically, a 1.8 $\mu$ H inductor and a 4.7 $\mu$ F ceramic capacitor are recommended (see table of values).

Only three external power components ( $C_{IN}$ ,  $C_{OUT}$ , and L) are required. Output voltage is fixed internally.

At dropout, the converter duty cycle increases to 100% and the output voltage tracks the input voltage minus the  $R_{DS(ON)}$  drop of the P-channel high-side MOSFET.

The input voltage range is 2.2V to 5.5V. The converter efficiency has been optimized for all load conditions, ranging from no load to 400mA.

The internal error amplifier and compensation provides excellent transient response, load, and line regulation. Soft start eliminates any output voltage overshoot when the enable or the input voltage is applied.

# AAT1149A

## 2.2MHz Fast Transient 400mA Step-Down Converter

### Control Loop

The AAT1149A is a peak current mode step-down converter. The current through the P-channel MOSFET (high side) is sensed for current loop control, as well as short circuit and overload protection. A fixed slope compensation signal is added to the sensed current to maintain stability for duty cycles greater than 50%. The peak current mode loop appears as a voltage-programmed current source in parallel with the output capacitor.

The output of the voltage error amplifier programs the current mode loop for the necessary peak switch current to force a constant output voltage for all load and line conditions. Internal loop compensation terminates the transconductance voltage error amplifier output. For the adjustable output, the error amplifier reference is fixed at 0.6V.

### Soft Start / Enable

Soft start limits the current surge seen at the input and eliminates output voltage overshoot. When pulled low, the enable input forces the AAT1149A into a low-power, non-switching state. The total input current during shutdown is less than 1 $\mu$ A.

### Current Limit and Over-Temperature Protection

For overload conditions, the peak input current is limited. To minimize power dissipation and stresses under current limit and short-circuit conditions, switching is terminated after entering current limit for a series of pulses. Switching is terminated for seven consecutive clock cycles after a current limit has been sensed for a series of four consecutive clock cycles.

Thermal protection completely disables switching when internal dissipation becomes excessive. The junction over-temperature threshold is 140°C with 15°C of hysteresis. Once an over-temperature or over-current fault conditions is removed, the output voltage automatically recovers.

### Applications Information

#### Inductor Selection

The step-down converter uses peak current mode control with slope compensation to maintain stability for duty cycles greater than 50%. The output inductor value must be selected so the inductor current down slope meets the internal slope compensation requirements. A 2.2 $\mu$ H inductor is recommended for a 1.875V output.

Manufacturer's specifications list both the inductor DC current rating, which is a thermal limitation, and the peak current rating, which is determined by the saturation characteristics. The inductor should not show any appreciable saturation under normal load conditions. Some inductors may meet the peak and average current ratings yet result in excessive losses due to a high DCR. Always consider the losses associated with the DCR and its effect on the total converter efficiency when selecting an inductor.

The 2.2 $\mu$ H CBC2518 series inductor selected from Taiyo Yuden has a 130mW DCR and a 890mA saturation current rating. At full load, the inductor DC loss is 21mW which gives a 2.8% loss in efficiency for a 400mA, 1.875V output.

#### Input Capacitor

Select a 4.7 $\mu$ F to 10 $\mu$ F X7R or X5R ceramic capacitor for the input. To estimate the required input capacitor size, determine the acceptable input ripple level ( $V_{PP}$ ) and solve for C. The calculated value varies with input voltage and is a maximum when  $V_{IN}$  is double the output voltage.

$$C_{IN} = \frac{\frac{V_o}{V_{IN}} \cdot \left(1 - \frac{V_o}{V_{IN}}\right)}{\left(\frac{V_{PP}}{I_o} - ESR\right) \cdot F_s}$$

$$\frac{V_o}{V_{IN}} \cdot \left(1 - \frac{V_o}{V_{IN}}\right) = \frac{1}{4} \text{ for } V_{IN} = 2 \cdot V_o$$

$$C_{IN(MIN)} = \frac{1}{\left(\frac{V_{PP}}{I_o} - ESR\right) \cdot 4 \cdot F_s}$$

Always examine the ceramic capacitor DC voltage coefficient characteristics when selecting the proper value. For example, the capacitance of a 10 $\mu$ F, 6.3V, X5R ceramic capacitor with 5.0V DC applied is actually about 6 $\mu$ F.

## 2.2MHz Fast Transient 400mA Step-Down Converter

The maximum input capacitor RMS current is:

$$I_{\text{RMS}} = I_{\text{O}} \cdot \sqrt{\frac{V_{\text{O}}}{V_{\text{IN}}} \cdot \left(1 - \frac{V_{\text{O}}}{V_{\text{IN}}}\right)}$$

The input capacitor RMS ripple current varies with the input and output voltage and will always be less than or equal to half of the total DC load current.

$$\sqrt{\frac{V_{\text{O}}}{V_{\text{IN}}} \cdot \left(1 - \frac{V_{\text{O}}}{V_{\text{IN}}}\right)} = \sqrt{D \cdot (1 - D)} = \sqrt{0.5^2} = \frac{1}{2}$$

for  $V_{\text{IN}} = 2 \cdot V_{\text{O}}$

$$I_{\text{RMS(MAX)}} = \frac{I_{\text{O}}}{2}$$

The term  $\frac{V_{\text{O}}}{V_{\text{IN}}} \cdot \left(1 - \frac{V_{\text{O}}}{V_{\text{IN}}}\right)$  appears in both the input voltage ripple and input capacitor RMS current equations and is a maximum when  $V_{\text{O}}$  is twice  $V_{\text{IN}}$ . This is why the input voltage ripple and the input capacitor RMS current ripple are a maximum at 50% duty cycle.

The input capacitor provides a low impedance loop for the edges of pulsed current drawn by the AAT1149A. Low ESR/ESL X7R and X5R ceramic capacitors are ideal for this function. To minimize stray inductance, the capacitor should be placed as closely as possible to the IC. This keeps the high frequency content of the input current localized, minimizing EMI and input voltage ripple.

The proper placement of the input capacitor (C2) can be seen in the evaluation board layout in Figure 1.

A laboratory test set-up typically consists of two long wires running from the bench power supply to the evaluation board input voltage pins. The inductance of these wires, along with the low-ESR ceramic input capacitor, can create a high Q network that may affect converter performance. This problem often becomes apparent in the form of excessive ringing in the output voltage during load transients. Errors in the loop phase and gain measurements can also result.

Since the inductance of a short PCB trace feeding the input voltage is significantly lower than the power leads from the bench power supply, most applications do not exhibit this problem.

In applications where the input power source lead inductance cannot be reduced to a level that does not affect

the converter performance, a high ESR tantalum or aluminum electrolytic should be placed in parallel with the low ESR, ESL bypass ceramic. This dampens the high Q network and stabilizes the system.

### Output Capacitor

The output capacitor limits the output ripple and provides holdup during large load transitions. A 4.7μF to 10μF X5R or X7R ceramic capacitor typically provides sufficient bulk capacitance to stabilize the output during large load transitions and has the ESR and ESL characteristics necessary for low output ripple.

The output voltage droop due to a load transient is dominated by the capacitance of the ceramic output capacitor. During a step increase in load current, the ceramic output capacitor alone supplies the load current until the loop responds. Within two or three switching cycles, the loop responds and the inductor current increases to match the load current demand. The relationship of the output voltage droop during the three switching cycles to the output capacitance can be estimated by:

$$C_{\text{OUT}} = \frac{3 \cdot \Delta I_{\text{LOAD}}}{V_{\text{DROOP}} \cdot F_{\text{S}}}$$

Once the average inductor current increases to the DC load level, the output voltage recovers. The above equation establishes a limit on the minimum value for the output capacitor with respect to load transients.

The internal voltage loop compensation also limits the minimum output capacitor value to 4.7μF. This is due to its effect on the loop crossover frequency (bandwidth), phase margin, and gain margin. Increased output capacitance will reduce the crossover frequency with greater phase margin.

The maximum output capacitor RMS ripple current is given by:

$$I_{\text{RMS(MAX)}} = \frac{1}{2 \cdot \sqrt{3}} \cdot \frac{V_{\text{OUT}} \cdot (V_{\text{IN(MAX)}} - V_{\text{OUT}})}{L \cdot F_{\text{S}} \cdot V_{\text{IN(MAX)}}}$$

Dissipation due to the RMS current in the ceramic output capacitor ESR is typically minimal, resulting in less than a few degrees rise in hot-spot temperature.

### Thermal Calculations

There are three types of losses associated with the AAT1149A step-down converter: switching losses, conduction losses, and quiescent current losses. Conduction losses are associated with the  $R_{DS(ON)}$  characteristics of the power output switching devices. Switching losses are dominated by the gate charge of the power output switching devices. At full load, assuming continuous conduction mode (CCM), a simplified form of the losses is given by:

$$P_{TOTAL} = \frac{I_o^2 \cdot (R_{DS(ON)H} \cdot V_o + R_{DS(ON)L} \cdot [V_{IN} - V_o])}{V_{IN}} + (t_{sw} \cdot F_s \cdot I_o + I_Q) \cdot V_{IN}$$

$I_Q$  is the step-down converter quiescent current. The term  $t_{sw}$  is used to estimate the full load step-down converter switching losses.

**2.2MHz Fast Transient 400mA Step-Down Converter**

For the condition where the step-down converter is in dropout at 100% duty cycle, the total device dissipation reduces to:

$$P_{\text{TOTAL}} = I_{\text{O}}^2 \cdot R_{\text{DS(ON)H}} + I_{\text{Q}} \cdot V_{\text{IN}}$$

Since  $R_{\text{DS(ON)}}$ , quiescent current, and switching losses all vary with input voltage, the total losses should be investigated over the complete input voltage range.

Given the total losses, the maximum junction temperature can be derived from the  $\theta_{\text{JA}}$  for the WLCSP-8 package which is 284°C/W.

$$T_{\text{J(MAX)}} = P_{\text{TOTAL}} \cdot \theta_{\text{JA}} + T_{\text{AMB}}$$

**WLCSP Package Light Sensitivity**

The electrical performance of the WLCSP package can be adversely affected by exposing the device to certain light sources such as direct sunlight or a halogen lamp whose wavelengths are red and infra-reds. However, fluorescent lighting has very little effect on the electrical performance of the WLCSP package.

**Layout**

The suggested PCB layout for the AAT1149A is shown in Figures 1 and 2. The following guidelines should be used to help ensure a proper layout.

1. The input capacitor (C2) should connect as closely as possible to IN (Pin 4) and PGND (Pin 3).
2. C1 and L1 should be connected as closely as possible. The connection of L1 to the LX pin should be as short as possible.
3. The feedback trace or FB pin (Pin 1) should be separate from any power trace and connect as closely as possible to the load point. Sensing along a high-current load trace will degrade DC load regulation.
4. The resistance of the trace from the load return to the PGND (Pin 3) should be kept to a minimum. This will help to minimize any error in DC regulation due to differences in the potential of the internal signal ground and the power ground.
5. The pad on the PCB for the WLCSP-5 package should use NSMD (non-solder mask defined) configuration due to its tighter control on the copper etch process. A pad thickness of less than 1oz is recommended to achieve higher stand-off.

**2.2MHz Fast Transient 400mA Step-Down Converter****Step-Down Converter Design Example****Specifications**

$V_O = 1.875V @ 400mA$  (adjustable using 0.6V version), Pulsed Load  $DI_{LOAD} = 300mA$

$V_{IN} = 2.7V$  to  $4.2V$  (3.6V nominal)

$F_S = 2.2MHz$

$T_{AMB} = 85^\circ C$

**1.875V Output Inductor**

$$L_1 = 1 \frac{\mu S}{A} \cdot V_O = 1 \frac{\mu S}{A} \cdot 1.875V = 1.875\mu H \quad (\text{use } 2.2\mu H)$$

For Taiyo Yuden inductor CBC2518T2R2M,  $2.2\mu H$ ,  $DCR = 130m\Omega$ .

$$\Delta I_{L1} = \frac{V_O}{L_1 \cdot F_S} \cdot \left(1 - \frac{V_O}{V_{IN}}\right) = \frac{1.875V}{2.2\mu H \cdot 2.2MHz} \cdot \left(1 - \frac{1.875V}{4.2V}\right) = 214mA$$

$$I_{PKL1} = I_O + \frac{\Delta I_{L1}}{2} = 0.4A + 0.107A = 0.507A$$

$$P_{L1} = I_O^2 \cdot DCR = 0.4A^2 \cdot 130m\Omega = 21mW$$

**1.875V Output Capacitor**

$$V_{DROOP} = 0.1V$$

$$C_{OUT} = \frac{3 \cdot \Delta I_{LOAD}}{V_{DROOP} \cdot F_S} = \frac{3 \cdot 0.3A}{0.1V \cdot 2.2MHz} = 4.1\mu F; \text{ use } 4.7\mu F$$

$$I_{RMS} = \frac{1}{2 \cdot \sqrt{3}} \cdot \frac{(V_O) \cdot (V_{IN(MAX)} - V_O)}{L_1 \cdot F_S \cdot V_{IN(MAX)}} = \frac{1}{2 \cdot \sqrt{3}} \cdot \frac{1.875V \cdot (4.2V - 1.875V)}{2.2\mu H \cdot 2.2MHz \cdot 4.2V} = 62mA_{RMS}$$

$$P_{esr} = esr \cdot I_{RMS}^2 = 5m\Omega \cdot (62mA)^2 = 19\mu W$$

**2.2MHz Fast Transient 400mA Step-Down Converter****Input Capacitor**Input Ripple  $V_{pp} = 10\text{mV}$ 

$$C_{IN} = \frac{1}{\left(\frac{V_{PP}}{I_O} - ESR\right) \cdot 4 \cdot F_S} = \frac{1}{\left(\frac{10\text{mV}}{0.4\text{A}} - 5\text{m}\Omega\right) \cdot 4 \cdot 2.2\text{MHz}} = 5.7\mu\text{F}; \text{ use } 4.7\mu\text{F}$$

$$I_{RMS} = \frac{I_O}{2} = 0.2\text{Arms}$$

$$P = esr \cdot I_{RMS}^2 = 5\text{m}\Omega \cdot (0.2\text{A})^2 = 0.2\text{mW}$$

**AAT1149A Losses (WLCSP-5 Package)**

$$P_{TOTAL} = \frac{I_O^2 \cdot (R_{DS(ON)H} \cdot V_O + R_{DS(ON)L} \cdot [V_{IN} - V_O])}{V_{IN}} + (t_{sw} \cdot F_S \cdot I_O + I_Q) \cdot V_{IN}$$

$$= \frac{0.4^2 \cdot (0.725\Omega \cdot 1.875\text{V} + 0.7\Omega \cdot [4.2\text{V} - 1.875\text{V}])}{4.2\text{V}}$$

$$+ (5\text{ns} \cdot 2.2\text{MHz} \cdot 0.4\text{A} + 3\text{mA}) \cdot 4.2\text{V} = 149\text{mW}$$

$$T_{J(MAX)} = T_{AMB} + \Theta_{JA} \cdot P_{LOSS} = 85^\circ\text{C} + (284^\circ\text{C/W}) \cdot 149\text{mW} = 127^\circ\text{C}$$
