

Serial LED Driver with Direct PWM and 32-Step S²C Dimming Control

General Description

The AAT1410 is a step-up single channel LED driver with an input voltage range of 2.7V to 5.5V. The wide input voltage range, small solution size, advanced dimming features and high efficiency is suitable for LED backlight solutions for single cell Li-ion based equipment. A precision, high voltage current sink maintains the maximum LED current set by an external resistor from 10 to 31mA. The high switching frequency supports ultra small, low cost filtering components.

Two dimming controls are available; 32 dimming steps using the S²Cwire™ interface, and direct PWM control. The frequency range of the PWM dimming extends up to 100 kHz eliminating audible noise and suitable for CABC (Content Adaptive Brightness Control) applications.

The device includes over-temperature protection and programmable over-voltage protection and recovers automatically when the fault is removed. The AAT1410 is available in a 10-pin wafer-level chip scale package (WLCSP) and is rated over the -40°C to +85°C temperature range.

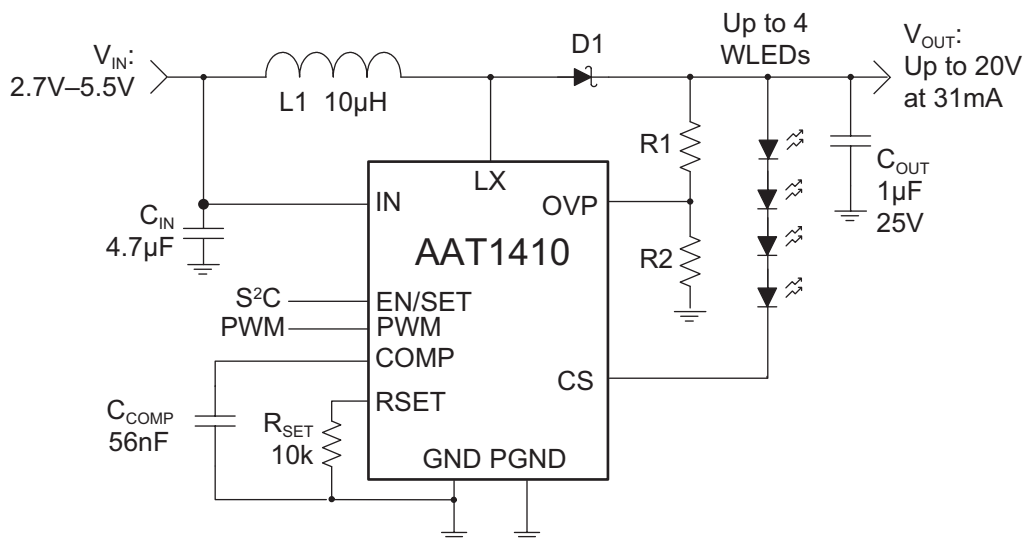

Features

- Input Voltage Range: 2.7 to 5.5V
- Drives up to 20V with 4 Series LEDs at 31mA
- 1MHz Switching Frequency Allows Small External Components
- Up to 86% Efficiency
- Dimming Control Options:
 - 32 Steps - S²Cwire Single Wire Interface
 - Direct PWM
- Low Operating Current at 2.3mA
- Shutdown Current < 1µA
- Over-Voltage Protection for Open-LED Faults
- Over Temperature Protection
- Ultra Small, Low Profile 10-pin 1.55 x 1.15mm WLCSP Package

Applications

- Digital Still Cameras (DSC)
- Mobile Handsets
- Netbooks and Notebooks
- Portable Media Players
- White LED Drivers

Typical Application

Serial LED Driver with Direct PWM and 32-Step S2C Dimming Control

Pin Descriptions

Pin #	Symbol	Function
A1	LX	Switching node of boost converter. Connect an inductor between LX and input supply (VIN); Schottky rectifier anode is connected between LX pin while cathode is connected to output capacitor.
A2	IN	Supply input for the IC. Connect a 4.7μF 6.3V/10V ceramic capacitor from this pin to GND.
A3	EN/SET	Enable on/off control and S ² Cwire interface input.
B1	PGND	Power ground pin.
B3	PWM	Input PWM pin. Pull high to disable the PWM dimming feature.
C1	GND	Ground pin.
C3	COMP	Compensation pin. Connect a capacitor from this pin to GND. Compensation components are mainly related to the output capacitor valued. See the Capacitor Selection section in the Application Information section of this datasheet.
D1	CS	Connect to the cathode of the last diode of the LED string.
D2	RSET	Connect a resistor to GND to set maximum LED current up to 31mA.
D3	OVP	Feedback pin for over-voltage protection.

Serial LED Driver with Direct PWM and 32-Step S²C Dimming Control**Functional Block Diagram****Functional Description**

The AAT1410 is a small size, high efficiency, current mode controlled step-up converter LED driver for up to 4 white LEDs. It is available with up to 20V output voltage to allow up to 4 series connected LEDs to be driven with currents up to 31mA. The device uses a single current sink to regulate the LED current by controlling the output voltage. The maximum LED current is programmed by an external resistor with range from 10mA to 31mA. The LED current dimming is controlled via one of two options, using either the S²Cwire 32-step single-wire interface or PWM control.

The over-voltage protection function is designed to protect the boost converter during the fault of the open circuit of the LED string. The over-temperature function is targeted to protect the converter if an over-temperature fault occurs. The AAT1410 will recover to normal operation automatically when the OVP or OTP fault is removed.

Soft Start / Enable

The AAT1410 is enabled by EN/SET pulled to high after power on with a certain delay time. Internal soft start circuitry limits the input inrush current and eliminates output voltage overshoot. When ENSET is pulled low the AAT1410 enters a low-power, non-switching state. The total input current during shutdown is less than 1 μ A. An external diode limits V_{OUT} to the level of V_{IN} during shutdown. The diode consumes a small amount of additional input current depending on the OVP resistor divider value.

Over-Temperature Protection

Thermal protection disables the AAT1410 when internal dissipation becomes excessive. Thermal protection disables the power MOSFET. The junction over-temperature threshold is 155°C with 15°C of temperature hysteresis. The output voltage automatically recovers when the over-temperature fault condition is removed.

Serial LED Driver with Direct PWM and 32-Step S2C Dimming Control

Over-Voltage Protection

Over-voltage protection prevents damage to the AAT1410's LX pin during open-circuit or high output voltage conditions. An over-voltage event is defined as a condition where the voltage on the OVP pin exceeds the over-voltage protection threshold (V_{OVP-T}). When V_{OVP} has reached the threshold limit, the converter stops switching and the output voltage decays. Switching resumes when the lower hysteresis limit of V_{OVP} is reached, thereby maintaining an average output voltage between the upper and lower OVP thresholds.

LED Current Setting

The maximum LED current is determined by the R_{SET} resistor value. With a fixed 1.2V voltage on R_{SET} , the LED maximum current is a linear ratio to the current flowing through R_{SET} .

$$I_{LED} = \frac{V_{SET}}{R_{SET}} \cdot 258$$

The LED dimming is controlled via one of two options, either using the 32-step S²Cwire single-wire interface via the EN/SET pin or PWM control with varied duty cycle up to 100kHz frequency. 32 S²Cwire rising-edge steps set the LED current from 100% to 2% percentage of the maximum LED current value when PWM control is disabled by pulling the PWM pin high. S²Cwire can also be used to set maximum LED current along with a PWM signal to dim the LED lighting from 100% to 1% of duty cycle.

S²Cwire™ Serial Interface

The LED current magnitude can be controlled by the EN/SET pin using the S²Cwire interface. The interface records rising edges of the EN/SET pin and decodes them into 32 individual current level settings. Code 1 is full scale (maximum LED current), and Code 32 is 2% of the full scale. The modulo 32 interface wraps states back to state 1 after the 32nd clock. The counter can be clocked at speeds up to 1MHz, so intermediate states are not visible. The first rising edge of EN/SET enables the IC and initially sets the output LED current to full scale after $500\mu s$ t_{LAT} . Once the final clock cycle is input for the desired brightness level, the EN/SET pin should be held high to maintain the device output current at the programmed level. The device is disabled $500\mu s$ after the EN/SET pin enters a logic low state. The EN/SET timing is designed to accommodate a wide range of data rates from 20kHz to 1MHz.

After the first rising edge of EN/SET, the boost converter is enabled and reaches full capacity after the soft-start time. Exact counts of clock pulses for the desired current level should be entered on the EN/SET pin with a single burst of clocks. The counter refreshes each time a new clock input to the EN/SET pin is detected. A constant current is maintained as long as EN/SET remains in a logic high state. To save power, the boost converter is switched off after EN/SET has remained in the low state for at least the t_{OFF} timeout period as shown in Figure 1.

S²Cwire Serial Interface Timing

Figure 1: S²Cwire Timing Diagram.

Serial LED Driver with Direct PWM and 32-Step S²C Dimming Control

Application Information

LED Current Setting

The maximum LED current is determined by value of the external resistor R_{SET} from 10mA to 31mA. The value of R_{SET} is determined by the voltage of R_{SET} and the LED current, and can be calculated by:

$$R_{SET} = \frac{V_{SET} \cdot 258}{I_{LED}}$$

Where $V_{SET} = 1.2V$. Table 1 lists examples of standard 1% metal film R_{SET} values for different maximum LED current requirements.

Maximum LED Current (mA)	R_{SET} (k Ω)
31	10
20	15
15	20
12	25
10	30

Table 1: Examples of Standard 1% R_{SET} Values for Setting Maximum LED Current Levels.

LED current dimming is controlled either via the S²Cwire single-wire interface through the EN/SET pin in 32 steps or via PWM control with varied duty cycle up to 100kHz frequency. The S²Cwire interface programs the LED current from the maximum LED current set by R_{SET} to 2% of the maximum LED current as shown in Table 2.

S ² Cwire Data	LED Current (% I_{MAX})	S ² Cwire Data	LED Current (% I_{MAX})
1	100	17	48
2	97	18	45
3	94	19	42
4	90	20	39
5	87	21	35
6	84	22	32
7	81	23	29
8	77	24	26
9	74	25	23

15	55	31	3
16	52	32	2

Table 2: S²Cwire Dimming Control Current Settings.

Figure 2 illustrates the LED current value at different S²Cwire code settings when R_{SET} is 15k Ω with a maximum LED current of 20mA.

Figure 2: S²Cwire Dimming Control at Maximum LED Current (20mA max).

Direct PWM Dimming

The AAT1410 provides a PWM input as an additional means of providing dimming control for CABC applications. The LED current reduces percentage linearly as the duty cycle decreasing. Frequencies of up to 100kHz can be applied. The PWM signal turns the LED string current on and off directly with the same duty cycle PWM fed in. The average DC LED current is dimmed linearly as the duty cycle decreases.

Figure 3: Direct PWM Dimming Duty Cycle vs. Maximum LED Current (31mA max).

AAT1410

Serial LED Driver with Direct PWM and 32-Step S2C Dimming Control

Capacitor Selection

A compensation capacitor C_{COM} is used for step-up converter loop compensation and soft startup time control. Loop compensation requires matching values for C_{COM} , C_{OUT} , I_{LED} , and V_{OUT} :

$$\frac{C_{OUT}}{C_{COM}} < \frac{I_{LED}}{30 \cdot 10^{-6} \cdot V_{OUT}}$$

The AAT1410 can drive up to 4 white LEDs with forward voltages up to 4V each. In a worst case with V_F of 4V, a C_{OUT} value of 1 μ F, and LED maximum current of 20mA, the value of C_{COM} should be higher than 3.6nF.

$$C_{COM} > \frac{C_{OUT} \cdot 30 \cdot V_{OUT}}{I_{LED}} \text{ (nF)} = \frac{1 \cdot 30 \cdot 16}{20} \text{ (nF)} = 24\text{nF}$$

A higher value for C_{COM} lengthens the soft startup time. The relationship between C_{COM} and startup time is almost linear, with startup time $\times 10^5$ magnification of C_{COM} ; thus 56nF C_{COM} leads to a soft startup time of 5.6ms. Table 3 gives several examples of minimum C_{COM} values at different C_{OUT} and I_{LED} and the step-up converter's operation stable. Values of 56nF for C_{COM} and 1 μ F for C_{OUT} are suitable in most cases.

I_{LED} (mA)	C_{OUT} (μ F)	V_{OUT} (V)	C_{COM_MIN} (nF)
31	0.1	16	1.6
31	1	16	16
20	0.1	16	2.4
20	1	16	24
10	0.1	16	4.8
10	1	16	48

Table 3: Minimum C_{COM} Values vs. I_{LED} and C_{OUT} (Step-Up Converter Operation Stable).

Multi-layer ceramic (MLC) capacitors provide small size and adequate capacitance, low parasitic equivalent series resistance (ESR) and equivalent series inductance (ESL), and are well suited for use as input, output and compensation capacitors in the AAT1410 step-up converter LED driver application. MLC capacitors of type X7R or X5R are recommended to ensure good capacitance stability over the full operating temperature range. A 4.7 μ F/6.3V input capacitor is recommended and a 1 μ F/25V output capacitor is suitable as noted above. Table 4 lists some recommended capacitors for use with the AAT1410.

Inductor Selection

Inductor value, saturation current and DCR is most important parameter in selecting an inductor for AAT1410.

The suitable inductance range for the AAT1410 is 4.7 μ H to 22 μ H. Higher inductance lowers the step-up converter's RMS current value. Together with lower DCR value of the inductor, it makes the total inductor power loss become much lower. Considering inductor size and cost, 10 μ H inductance is most suitable. Figure 4 illustrates AAT1410 efficiency at different inductance with similar DCR value.

Figure 4: AAT1410 Efficiency at Different Inductance with Similar DCR ($V_{IN} = 3.6V$).

Manufacturer	Part Number	Value (μ F)	Voltage (V)	Temperature Range	Case Size
Murata	GRM188R60J475K	4.7	6.3	X5R	0603
	GRM188R71H104KA93	0.1	50	X7R	0603
	GRM188R61E105K	1.0	25	X5R	0603

Table 4: Examples of AAT1410 Input and Output Capacitor Selection.

Serial LED Driver with Direct PWM and 32-Step S2C Dimming Control

Considering the inductor copper loss, the inductor DCR value together with the RMS current value flowing through the inductor leads to inductor conduction loss and also affects total efficiency. Larger DCR leads to larger conduction loss and decreases total efficiency. The inductor conduction loss can be estimated as shown in the equation:

$$P_{L_LOSS} = I_{L_RMS}^2 \cdot DCR$$

$$= \frac{1}{3} \cdot (I_{L_MAX}^2 + I_{L_MIN}^2 + I_{L_MAX} \cdot I_{L_MIN}) \cdot DCR$$

I_{L_MAX} and I_{L_MIN} are the inductor peak current and minimum current. Figure 5 shows DCR effects on efficiency with a 10μH inductor.

Figure 5: Inductor DCR Effects on Total Efficiency with 10μH at 3.6V V_{IN} .

Inductor saturation current is also a key parameter in selecting an inductor. For the step-up converter, the peak inductor current is the DC input current plus half the inductor peak-to-peak current ripple.

DC input current:

$$I_{IN} = \frac{V_{OUT} \cdot I_{LED}}{V_{IN} \cdot \eta}$$

Inductor peak-to-peak current ripple:

$$I_{L_PP} = \frac{V_{IN} \cdot (V_{OUT} - V_{IN})}{V_{OUT} \cdot L \cdot f}$$

Inductor peak current:

$$I_{L_PEAK} = I_{IN} + \frac{I_{L_PP}}{2} = \frac{V_{OUT} \cdot I_{LED}}{V_{IN} \cdot \eta} + \frac{V_{IN} \cdot (V_{OUT} - V_{IN})}{2 \cdot V_{OUT} \cdot L \cdot f}$$

For example, for a white LED with 3.2V V_F and 20mA current at 82% efficiency, the inductor peak current is

$$I_{L_PEAK} = \frac{3.2 \cdot 4 \cdot 0.02}{3.6 \cdot 0.82} + \frac{3.6 \cdot (3.2 \cdot 4 - 3.6)}{2 \cdot 3.2 \cdot 4 \cdot 10\mu \cdot 1M} = 218mA$$

Table 5 gives some examples of recommended inductors for use with the AAT1410.

OVP Setting

Over-voltage protection is designed to protect the step-up converter from a LED string open fault. The OVP threshold is 1.2V. For 4 white LEDs with V_F up to 4V, the resistor divider values for R1 and R2 can be calculated by:

$$R_1 = \left(\frac{V_{OUT}}{V_{OVP_TH}} - 1 \right) \cdot R_2$$

Higher resistor divider values decrease the power loss on the resistors. The total resistor value for 16V V_{OUT} should be less than 1.6MΩ for better noise immunity. Values of 634kΩ for resistor R1 and 51kΩ for resistor R2 are recommended.

Manufacturer	Part Number	Inductance (μH)	Maximum DC I_{SAT} Current (mA)	DCR (mΩ, typ)	Size (mm) LxWxH	Type

Table 5: Example of AAT1410 Inductor Selection.

Serial LED Driver with Direct PWM and 32-Step S2C Dimming Control**Rectifier Diode Selection**

An external rectifier diode is required for the non-synchronous step-up converter. A low V_F Schottky diode is recommended. The diode voltage rating should be higher than the OVP voltage. For an AAT1410 driving 4 white LEDs with up to 4V forward voltage, the diode voltage rating should be higher than 16V. Select a diode with DC rated current equal to the input current to allow an adequate margin for safe use.

Printed Circuit Board Layout Recommendations

For best performance of the AAT1410, the following guidelines should be followed when designing the PCB layout:

1. Make the power trace as short and wide as possible, including the input/output power lines and switching node, etc.
2. Make sure the ground bump connected to the printed circuit board with large copper area for better thermal dissipation.
3. Put the input and output capacitor close to the IC as close as possible to get the best filter result.

Manufacturer	Part Number	Maximum DC Blocking Voltage V_R (V)	Maximum DC Forward Current I_F (mA)	Non-repetitive Peak Forward Surge Current I_{FSM} (A)	Forward Voltage V_F (V)	Case	Size WxLxH (mm)

AAT1410**Serial LED Driver with Direct PWM and 32-Step S2C Dimming Control**

Component	Part Number	Description	Manufacturer
U1	AAT1410IUQ	High Efficiency Serial LED Driver for 4 White LEDs	Skyworks
U2	PIC12F675	8-Pin Flash-Based 8-Bit CMOS Microcontroller	Microchip
R1	RC0603FR-07634KL	Res 634k Ω 1/10W 1% 0603 SMD	Yageo
R2, R3, R4, R6	RC0603FR-0751KL	Res 51K Ω 1/10W 1% 0603 SMD	
RSET	RC0603FR-0715KL	Res 15K Ω 1/10W 1% 0603 SMD	
R5, R7, R8, R9	RC0603FR-071KL	Res 1K Ω 1/10W 1% 0603 SMD	
C _{IN}	GRM188R60J475K	Cap Ceramic 4.7 μ F 0603 X5R 6.3V 10%	Murata
C _{OUT}	GRM188R61E105K	Cap Ceramic 1 μ F 0603 X5R 25V 10%	
C1	GRM188R71C104K	Cap Ceramic 0.1 μ F 0603 X7R 16V 10%	
C _{COM}	GRM188R71C563K	Cap Ceramic 0.056 μ F 0603 X7R 16V 10%	
D1, D2, D3, D4	RS-0805UW	20mA White LED 0805	Realstar
DS1	SDM20U40	Surface Mount Schottky Barrier Diode	Diodes
L1	CDRH3D18-100NC	Power Inductor 10 μ H 0.9A SMD	Sumida
LED1	0805KRCT	Red LED 0805	HB
CYCLE, UP, DOWN	6*6*5	12V 50mA Pushbutton	E-LT

Serial LED Driver with Direct PWM and 32-Step S2C Dimming Control

Ordering Information

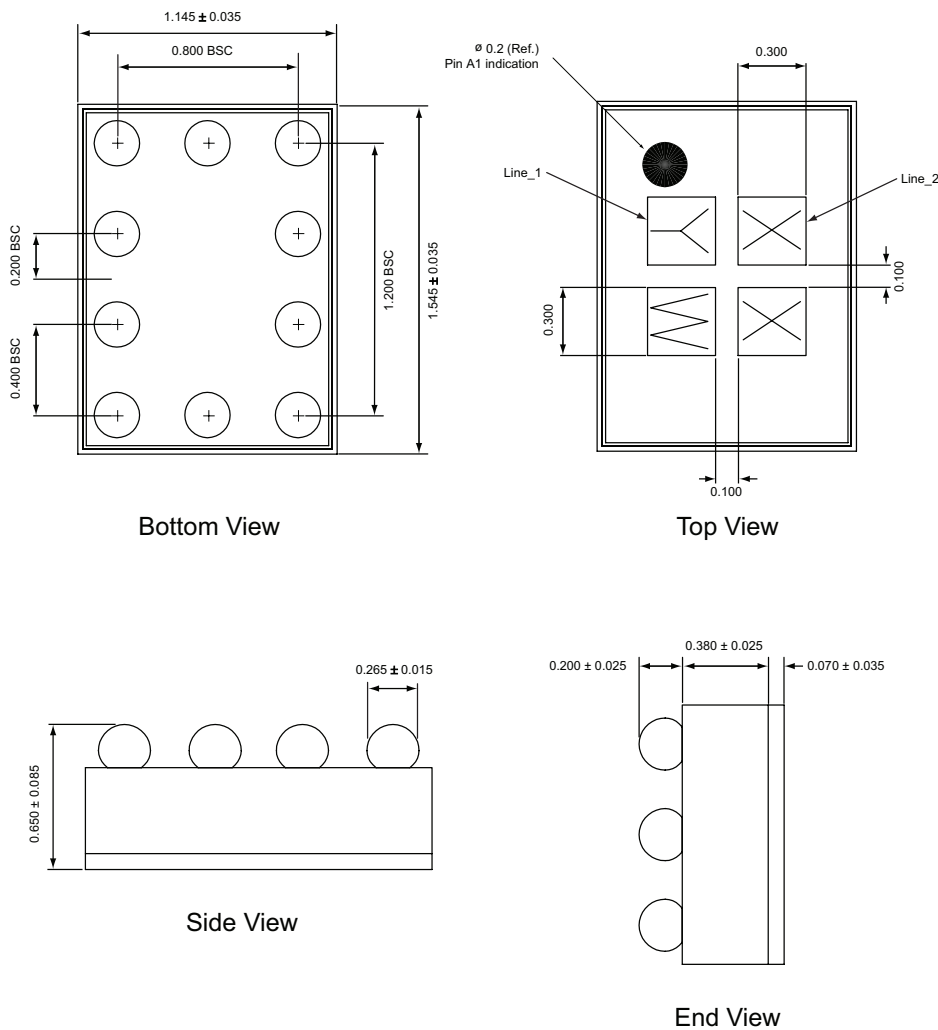

Package	Maximum # of LEDs	Interface	Marking ¹	Part Number (Tape and Reel) ²
WLCSP-10	4	S ² C, Direct PWM	G5YY	AAT1410IUQ-T1

Skyworks Green™ products are compliant with all applicable legislation and are halogen-free. For additional information, refer to *Skyworks Definition of Green™*, document number SQ04-0074.

Package Information

WLCSP-10

All dimensions in millimeters.

1. YY = date code.
2. Sample stock is generally held on part numbers listed in **BOLD**.
