

**FEATURES**

- Low cost integrated amplifier with step attenuator
- Attenuation Range: 0-58 dB, adjustable in 1dB increments via a 3 wire serial control
- Meets DOCSIS distortion requirements at a +60dBmV output signal level
- Programmable address allows multiple parts to share control bus
- Low distortion and low noise
- Frequency range: 5-100MHz
- 5 Volt operation
- -40 to +85 °C temperature range

**APPLICATIONS**

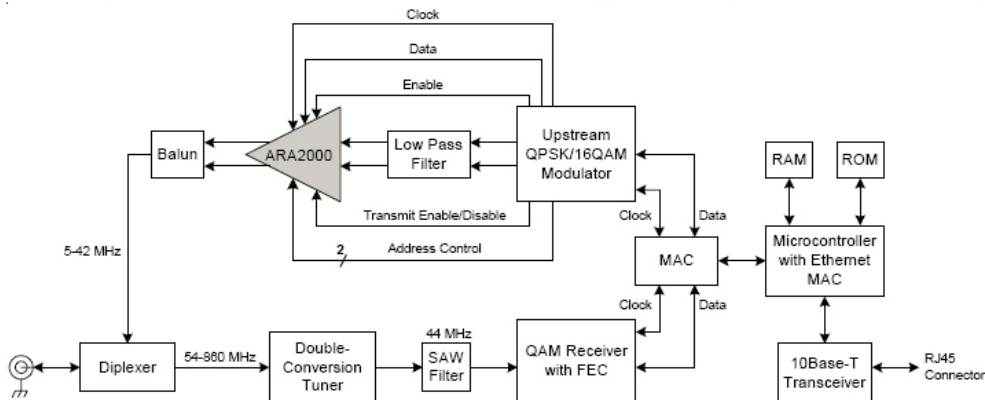

- MCNS/DOCSIS Compliant Cable Modems
- CATV Interactive Set-Top Box
- Telephony over Cable Systems
- OpenCable Set-Top Box
- Residential Gateway

**PRODUCT DESCRIPTION**

The ARA2000 is designed to provide the reverse path amplification and output level control functions in a CATV Set-Top Box or Cable Modem. It incorporates a digitally controlled precision step attenuator that is preceded by an ultra low noise amplifier stage, and followed by an ultra-linear output driver amplifier. This device uses a balanced circuit design that exceeds the

MCNS/DOCSIS requirement for harmonic performance at a +60dBmV output level while only requiring a single polarity +5V supply. Both the input and output are matched to 75 ohms with an appropriate transformer. The precision attenuator provides up to 58 dB of attenuation in 1 dB increments. The ARA2000 has a programmable address that allows multiple devices to share a common control bus. The ARA2000 is offered in a 28-pin SSOP package featuring a heat slug on the bottom of the package.

## Notes:

(1) All N/C pins should be grounded.

(2) Pins should be AC-coupled. No external DC bias should be applied.

## ELECTRICAL CHARACTERISTICS

Table 2: Absolute Minimum and Maximum Ratings

PARAMETER	MIN	MAX	UNIT
Analog Supply (pins 2, 4, 9, 21, 24)	0	9	VDC
Digital Supply: $V_{CMOS}$ (pin 11)	0	6	VDC
Amplifier Controls $V_{g1}$ , $V_{g2}$ (pins 6, 23)	-5	2	V
RF Power at Inputs (pins 5, 8)	-	+60	dBmV
Digital Interface (pins 12, 13, 14, 15, 16)	-0.5	$V_{CMOS}+0.5$	V
Storage Temperature	-55	+200	□
Soldering Temperature	-	260	□
Soldering Time	-	5	Sec

Stresses in excess of the absolute ratings may cause permanent damage. Functional operation is not implied under these conditions. Exposure to absolute ratings for extended periods of time may adversely affect reliability.

## Notes:

1. Pins 3, 5, 8, 10, 19, 20, 25 and 26 should be AC-coupled. No external DC bias should be applied.
2. Pins 7 and 22 should be grounded or pulled to ground through a resistor. No external DC bias should be applied.

Table 3: Operating Ranges

PARAMETER	MIN	TYP	MAX	UNIT
Amplifier Supply: $V_{DD}$ (pins 4, 9,21,24)	4.5	5.0	7.0	VDC
Attenuator Supply: $V_{ATTN}$ (pin 2)	$V_{DD} - 0.5$	5.0	7.0	VDC
Digital Supply: $V_{CMOS}$ (pin 11)	3.0	-	5.5	VDC
Digital Interface (pins 12, 13, 14, 15,16)	0	-	$V_{CMOS}$	V
Amplifier Controls $V_{g1}$ , $V_{g2}$ (pins 6, 23)	-5	1	2	V
Case Temperature	-40	25	85	□

The device may be operated safely over these conditions; however, parametric performance is guaranteed only over the conditions defined in the electrical specifications.

**LOGIC PROGRAMMING**

**Programming Instructions**

The programming word is set through a 16 bit shift register via the data, clock and enable lines. The data is entered in order with the most significant bit (MSB) first and the least significant bit (LSB) last. The

enable line must be low for the duration of the data entry, then set high to latch the shift register. The rising edge of the clock pulse shifts each data value into the register.

**Table 6: Programming Word**

DATA BIT	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

**APPLICATION INFORMATION**

**Transmit Enable / Disable**

The ARA2000 includes two amplification stages that each can be shut down through external control pins Vg1 and Vg2 (pins 6 and 23, respectively.) By applying a slightly positive bias of typically +1.0 Volts, the amplifier is enabled. In order to disable the amplifier, the control pin needs to be pulled to ground.

A practical way to implement the necessary control is to use bias resistor networks similar to those shown in the test circuit schematic (Figure 4.) Each network includes a resistor shunted to ground that serves as a pull-down to disable the amplifier when no control voltage is applied. When a positive voltage is applied, the network acts as a voltage divider that presents the required +1.0 Volts to enable the amplifier. By selecting different resistor values for the voltage divider, the network can accommodate different control voltage inputs.

The Vg1 and Vg2 pins may be connected together directly, and controlled through a single resistor network from a common control voltage.

**Amplifier Bias Current**

The ISET pins (7 and 22) set the bias current for the amplification stages. Grounding these pins results in the maximum possible current. By placing a resistor from the pin to ground, the current can be reduced. The recommended bias conditions use the configuration shown in the test circuit schematic in Figure 4.

**Thermal Layout Considerations**

The device package for the ARA2000 features a heat slug on the bottom of the package body. Use of the heat slug is an integral part of the device design. Soldering this slug to the ground plane of the PC board will ensure the lowest possible thermal resistance for the device, and will result in the longest MTF (mean time to failure.)

A PC board layout that optimizes the benefits of the heat slug is shown in Figure 18. The via holes located under the body of the device must be plated through to a ground plane layer of metal, in order to provide a sufficient heat sink. The recommended solder mask outline is shown in Figure 19.

**Figure 18: PC Board Layout**

### Output Transformer

Matching the output of the ARA2000 to a 75 Ohm load is accomplished using a 2:1 turns ratio transformer. In addition to providing an impedance transformation, this transformer provides the bias to the output amplifier stage via the center tap.

The transformer also cancels even mode distortion products and common mode signals, such as the voltage transients that occur while enabling and disabling the amplifiers. As a result, care must be taken when selecting the transformer to be used at the output. It must be capable of handling the RF and DC power requirements without saturating the core,

and it must have adequate isolation and good phase and amplitude balance. It also must operate over the desired frequency and temperature range for the intended application.

### ESD Sensitivity

Electrostatic discharges can cause permanent damage to this device. Electrostatic charges accumulate on test equipment and the human body, and can discharge without detection. Proper precautions and handling are strongly recommended. Refer to the application note on ESD precautions.
